PRESIDENT: My name is Brigadier General Carlton D. Everhart, II. We are investigating the C-17 accident that occurred on 28 July 2010 at Joint Base Elmendorf-Richardson, Alaska. This investigation, conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 91-204. The purpose of this investigation is to produce a publicly releasable report on the facts and circumstances surrounding the accident and to gather and preserve evidence for use in claims, litigation, disciplinary actions, and adverse administrative proceedings, and for all other purposes. A safety investigation was previously conducted on the accident. Any testimony you gave before the safety investigation board will be kept confidential, if you were so advised, and will be used only for accident prevention purposes. This board does not have access to any confidential testimony you gave before the safety investigation board. Your sworn testimony to us may be used for any proper purpose. Additionally, your testimony can be released to the public. Do you understand the differences between your testimony before the safety board and this accident board?

WITNESS: Yes, General.

PRESIDENT: Your testimony in this investigation will be under oath. At this time, I will administer the oath. Please stand and raise your right hand.

[The witness did as directed.]

PRESIDENT: Do you solemnly swear that the testimony you are about to give in the matter now under investigation shall be the truth, the whole truth, and nothing but the truth, so help you God?

WITNESS: Yes, sir.

PRESIDENT: Please be seated.

[The witness did as directed.]

PRESIDENT: Today is 16 September 2010, and time now is 1450 local Alaska time. This interview is being conducted in building 7309, room 106, Joint Base Elmendorf-Richardson, Alaska. The persons present are:

The witness,

### WITNESS 14

Pilot Advisor; Legal Advisor; Medical Advisor; Court Reporter;

MS S , Civilian Attorney; and me, [Brigadier General Carlton D. Everhart, II, Board President].

PRESIDENT: The witness has been sworn.

# **Questions by the Board President:**

| 1Q.<br>1A. | Please state your full name and rank. WITNESS 14                                         |
|------------|------------------------------------------------------------------------------------------|
| 2Q.<br>2A. | How long have you served in the Air Force? This November it'll be 8 years.               |
| 3Q.<br>3A. | And your unit assignment location? 249th Air National Guard at Elmendorf Air Force Base. |
| 4Q.<br>4A. | How long have you been with this unit? One year.                                         |
| 5Q.<br>5A. | What is your job title?<br>I'm a C-17 Instructor Loadmaster.                             |
| 6Q.        | How long have you been doing this duty?                                                  |

7Q. As an instructor loadmaster.

In the guard?

- 7A. As an instructor, since 2005.
- 8Q. Can you please describe your duties and responsibilities on 28 July 2010?
- 8A. I was returning from an off-station trainer that was taking place in England and Germany and I had landed that morning. I don't know the approximate time, but it was in the morning and that's pretty much it. We did our de-brief and then I went home that day.
  - 9Q. Are you familiar with the C-17 aerial demonstration program?
  - 9A. Yes, sir.

6A.

- 10Q. Can you describe your aerial demonstration background?
- 10A. Yes, sir. I became demo-qualified loadmaster around 2004 at Charleston Air Force Base in the 16th Airlift Squadron. There were a couple of flights involved. I got signed off and then I participated in I believe two or three air shows that year and then the following year. But like I said, I don't remember the exact dates on those.
  - 11Q. What was your aerial demonstration training process?
- 11A. Process obviously, you had to go through a couple of the meetings, the briefings that occurred. In general you bring in a group of people from all I think three or four different squadrons that were there at Charleston and you'd be flying with other people from other squadrons as well. They'd get everyone on the same page. They'd go over what procedures were going to be used and then you'd go and you'd do one or two flights with an instructor and they would sign you off via TMS. After that that was it.
  - 12Q. Then just to follow-up, TMS is the Training Manage --
  - 12A. Training Management System. Yes, sir.
- 13Q. For the record you said "on the same sheet." You mean make sure everyone knew the same information. Is that what you're saying?
  - 13A. Yes, sir.
  - 14Q. Is that what you're saying?
  - 14A. Yes, sir.
- 15Q. When you came to Elmendorf, did you have to go back through any training at all?
- 15A. Yes, sir. When I joined this unit, I was -- they took my instructor qual away and any other qualifications that I had and I pretty much started over. I think it was about 6 months later I had to go through a cert board again after I'd flown with a couple of their evaluators to regain my instructor qual. The other qual there showed demo. Yes, on July 9th I was brought in to fly a demo profile mission to become re-qualed on the demo team. Yes, sir.

PRESIDENT: I would like to show you a PowerPoint briefing that we have. If you could, please take a look at it and let me know after you're done.

#### PRESIDENT:

LEGAL ADVISOR: Yes. The general's handed me a 12-page PowerPoint presentation in hardcopy form. I'm handing that to WITNESS 14 for him to review.

[The witness did as directed.]

WITNESS: Yes, sir. I've seen this before. Not in this full format though.

WITNESS 14 I'm

LEGAL ADVISOR: I've retrieved the PowerPoint hardcopy from passing it over to the civilian attorney, MSS to review.

- 16Q. So you recognize the PowerPoint brief?
- 16A. Yes, sir.
- 17Q. What is it?
- 17A. The PowerPoint brief that I saw was presented to me a couple of days prior to when we started flying the demos. They pretty much brought everyone in that was going to be involved in the upgrade process as well as crew members that had already been demo qualified. It was an introduction to the air show demo profile to what we do. I know for a fact I don't know the date that we had this, but I did come in late. I was working in my civilian capacities and I only saw the last couple slides of this demo. I was able with -- MP asked me to look this over afterwards and I did. I went through it.
  - 18Q. So just as a follow-up, how do you recognize it? Do you recognize it through that
- 18A. I did not see a hard copy of it. I saw it on a PowerPoint presentation in the conference room. I'm sorry, not the conference room -- the small theater room at the squadron.
  - 19Q. So there, again, just for the record you did receive this briefing from MP
    - 19A. Yes, sir. He was the one that was up front giving the briefing.
- 20Q. Can you talk us through what you remember about the briefing and how it was conducted?
- 20A. Like I said I showed up late; it was towards the end. Essentially MP was up front talking to everyone -- addressing everyone on the procedures, on the rules, how the profile demonstration was going to occur. He went over that there's different types of profiles based on what the air show coordinator wanted at the time. He also wanted us -- we talked about scheduling -- a little bit about scheduling in terms of try to make yourself available. I believe I was the only traditional guardsman there at the time so I remember having many conversations with MP afterwards in terms of when can I fly, what can I get out of this, how's it going to work in your schedule -- that sort of thing. I was going to school full time at the time. The briefing concluded and I sat around with MLM and briefly talked about it. He had asked about my experience, what I had done at Charleston and whatnot.
  - 21Q. Then can you describe "traditional guardsman"?
- 21A. Yes, sir. A traditional guardsman is a person that is not considered an active guard/reservist or a fulltime person. Essentially I do my one weekend a month, my 2 weeks a year and I have an obviously currency to maintain and flying duties to maintain. So I fit those in my schedule as well.

| 22Q. Do you remember if anyone else was at the briefing besides yourself? You say MLM  22A. MLM was present at the brief.  WITNESS 5 I believe, was at the brief active duty loadmaster. MCP was there. MSO was there. Like I said MP was there. In terms of the guardsmen, I think that was about everyone that was present. There were quite a few other active duty that were there, but I don't I couldn't recall their names right now, sir. Pretty much anyone that had been called up to be on the demo to be qualified was at that briefing. There might have been a couple of people that weren't able to attend for certain reasons, but for the most part we were all there. |  |  |  |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|--|--|
| 23Q. Do you recall which pilots you flew the demonstration flights with, or your training flights with, here at Elmendorf?  23A. Yes, sir. I flew on July 9 with MP with WITNESS 5  MCP and with WITNESS 5                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |  |  |  |
| [numbering error noted]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |  |  |  |
| 23Q. You said that you were familiar or you had discussed demo profiles. Do you remember which demo profile you were flying or training for?  23A. It was brought up in the brief. I didn't remember and then when I spoke with I'm sorry. How do you pronounce your last name?                                                                                                                                                                                                                                                                                                                                                                                                         |  |  |  |
| LEGAL ADVISOR:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |  |  |  |
| 23A. he told me that it was the profile 3, the longer version of it. Yeah. That clicked.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |  |  |  |
| <ul><li>24Q. And the longer version meaning the 12-minute profile?</li><li>24A. Yes, sir. Yes, sir.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |  |  |  |
| 25Q. You mentioned that you flew with aerial demonstration profiles with him? 25A. On July 9, sir.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |  |  |  |
| <ul><li>26Q. And that was the only day?</li><li>26A. Yes, sir.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |  |  |  |
| <ul><li>27Q. Do you remember what the plan was for the training flight that day?</li><li>27A. Plan?</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |  |  |  |
| 28Q. How were you going to conduct the mission overall? 28A. I showed up during the regular alert sequence. We sat down, we had our briefings.  MP obviously, was the one running the he was the aircraft commander at the time running the show.  MSO and  MCP were both present there. I don't                                                                                                                                                                                                                                                                                                                                                                                        |  |  |  |

know if they had done profiles before. I think it was brought up that they had and that this was continuing training, but I don't know that for a fact.

WITNESS 5 was my instructor at the time. He was also -- it was not his first time doing this as well. So pretty much went through the sequence of events. I mean, really standard stuff in terms of when you show the aircraft, who's got primary duties, who's doing the pre-flights and then there was a lot of pilot talk, if you will, in terms of who's going to fly and how they're going to fly it. It seemed that I didn't -- if they had done any planning the day prior, I don't know if they did or not, but I wasn't privy to that. I didn't show for that planning. Stepped to the aircraft and -- do you want me to go into the flight?

- 29Q. Yeah, if you don't mind. Just a general plan overall.
- So we took off out of here. MSO was in the left seat. He did the first couple of iterations -- the shows, if you will. I believe there were three or four of those and then MCP got in the left seat. The whole flight MP they swapped out and was in the right seat acting as the instructor. The flight was really pretty standard, nothing that I wasn't too -- I hadn't done a demo profile in a few years. It's a rough ride in the back. I mean, you don't have very many initial references. You get sick. It's low; you're yanking; you're banking. So yeah, during the takeoff, we were in the back of the aircraft for the takeoff. We went right in. In terms of the duties of a loadmaster in flight, you land about halfway into the show the crew door gets -- I'm sorry. The paratroop door on the right side of the aircraft is opened, so we're waving at the crowd as the aircraft is backing and then it comes to a complete stop. So we waved goodbye to the crowd, closed the door up, buckle in and taking off again and do some more turns. So we did that for I guess that each pilot got about three or four of those and then he came back and landed.
- 30Q. When you doing your pre-brief, prior to heading out to the airplane, did the crew ever discuss bank angles and altitudes of what they were planning to fly?
- 30A. Specifically I don't remember. I'm sure it was discussed. I know it was just discussed throughout the flight. I mean, altitudes, obviously, you're going get some concern as well as your configuration of the aircraft and also the angle in which you're turning. So those are always brought up. After you do a 12-minute show, then you take off -- or we'd take back off and [inaudible] over Goose Bay, which is sort of a holding area and that's where we'd [whoo sound]. All right, everyone. Let's get back on the -- let's collect ourselves, let's de-brief how the show went, let's see what we can do to improve it, maybe what not to do, that kind of thing. Then we'd go back and we'd hit it again.
- 31Q. You said you thought they discussed bank angles. If they did, do you remember what those bank angles were?
- 31A. Obviously, the -- not obviously, but 60 degrees is always brought up. It's a don't-exceed angle.
  - 32Q. Were they planning on flying the 60 degrees the whole entire profile?
- 32A. No, sir. No. The 60 degrees, like I said I'm not a pilot, so I don't remember which turns involved the 60-degree turn or what came closer to 60-degree turns, but almost all your turns in this profile are fairly steep.

- 33Q. Do you remember what altitudes were discussed?
- 33A. No. sir.
- 34Q. Did the crew ever discuss the use of the rudders? You say it was pretty rough back there.
  - 34A. Yes, sir. Rudders. Nothing sticks out in terms of rudder usage, rudder control.
- 35Q. Then just for the record just to surmise, and tell me if I'm wrong: You said that MSO started off in the left seat first with three or four profiles and then was in the left seat for three or four profiles. Then MP flew in the right seat for all of them.
  - 35A. For the entire flight. Yes, sir.
- 36Q. For the entire flight and then after each profile you go out to a point and I think you said it was Goose Bay just to orbit and just to collect and debrief?
- 36A. That's right. In circles and debrief. After every show that we did, we did that. Yes, sir.
- 37Q. During an air show demonstration, the demo training flight, where were you stationed?
- 37A. Between myself and WITNESS 5 the first flight we were both downstairs. He was showing me the ropes. I think the first two or three we were both downstairs and then I said -- I told him, I said "hey, I'd like to go upstairs and watch this from the front seat." So we asked that through MP He's like "I always welcome an extra set of eyes." So I went upstairs, sat upstairs for a few of these and then came back downstairs and then allowed WITNESS 5 to go up and observe a few of these and then obviously, we recovered -- or returned to base, we were both downstairs doing our duties.
- 38Q. While you were downstairs, or while you were upstairs up on the flight deck observing, did you ever remember hearing or seeing aircraft alerts or stall warnings go off?

  38A. Yes, sir.
  - 39Q. Can you tell us about that, please?
- 39A. Yeah, the stalls -- I'm trying to think of all the warnings you hear. During the profile, CAWS is the term -- the caution and warning system is the lovely voice you have that tells you what you're doing wrong and this is not cool to the airplane.

PRESIDENT: If you could, I'd just like you to speak up because that --

WITNESS: Oh, yes, sir. I'm sorry.

39A. The stall horn you'd hear quite frequently. I'm trying to think of the other one. Stall was always what you heard it seemed like. And it always hit right as you were going out or more or less at the end of the maneuver before we were going to get straightened up [inaudible].

- 40Q. I'm going to walk you through and tell me yes or no. So you would do that initial climb out and you'd make the turn, what was called in the profiles an 80-degree turn. Do you remember that?
  - 40A. Yes, sir.
  - 41Q. Or the 80-degree offset?
  - 41A. Yes, sir.
  - 42Q. Would you it hear it there?
  - 42A. I don't remember.
- 43Q. And then the big turn coming back around was the 260-degree maneuver back to come across show center. Would you hear it there?
  - 43A. Yes.
  - 44Q. Then how long would you hear that?
  - 44A. Two or three times perhaps.
  - 45Q. Two or three times?
  - 45A. Yes, sir.
  - 46Q. Can you recall what the crew's response was to that?
- 46A. Yes, sir. They acknowledged -- on my flight they were very good. They acknowledged every CAWS hit or caution warning system hit. The whole time it seemed that they would be talking through the maneuver. They were perfectly well aware of the fact that okay, if I continue this, stall's going to occur. But it never happened.
  - 47Q. So when you say "acknowledged," what does that mean?
  - 47A. We're good. We're visual.
  - 48Q. That's what they would say?
  - 48A. Yes, sir.
  - 49Q. "Visual" means?
  - 49A. Visual with the ground.
- 50Q. Did you ever hear the word "acknowledge" and then the warning continue to go on as they were trying either to finish a maneuver or did it cease immediately?
  - 50A. No, sir. It pretty much would stop right at the end of the maneuver.
- 51Q. Are you familiar with the checklist that you would run during the demonstrations that you were training for?
  - 51A. Yes, sir. We were each given one.

- 52Q. What checklist, you say each was given one. So what were you given?
- 52A. I was given a fanfold checklist similar to this right here.

LEGAL ADVISOR: For the record WITNESS 14 has referred back to the hardcopy PowerPoint and the air show checklist slide that contains what is titled the "Third Wing Aerial Demonstration Checklist."

- 53Q. Do you remember how this checklist was executed?
- 53A. It was executed in a normal fashion that any other checklist would be executed -the normal flying checklist that they would use. This is just used to supplement of the normal
  checklist. There's some additional responses at least from the pilot side of the house. From the
  loadmaster side of the house, it's all pretty standard for us in terms of what we do.
- 54Q. So if I understand you correctly, the regular fanfold normal checklist that you use, they use this one instead of that one. Is that ----
  - 54A. Yes, sir.
  - 55Q. Did they verbalize these checklists?
- 55A. Yes, sir. I remember very distinctly them saying "air show demonstration checklist." Everyone -- putting everyone on the same page, if you will.
  - 56Q. Did they do normal challenge and responses during this checklist?
- 56A. Yes, sir. Yes, sir, they did. Between the pilots and then -- I mean, obviously the biggest one for me is the loadmaster's report. So yeah, they wouldn't continue with the checklist if it -- they wouldn't go onto the next one -- another step had not that one been closed out or completed.
- 57Q. So they always made sure that the step was closed out before they started the next portion of the checklist?
  - 57A. Yes, sir.
- 58Q. Did they verbalize when the flaps were moved up and slats to retract, or did the co-pilot do it automatically?
- 58A. No, sir. It was challenge obviously, then there was a response after the movement had been done [inaudible].
- 59Q. Was that done between the pilot and the co-pilot or was that done between the co-pilot and the safety observer?
- 59A. Mostly between the pilot and the co-pilot. The safety observer was always there to double-check. To be eyes in the checklist as well backing them up.
  - 60Q. So that's what the safety observer does. He really makes sure --
  - 60A. He keeps an eye on the altitude; keeps an eye on the turns.

- 61Q. Bank angles and --
- 61A. All that kind of stuff. Yes, sir.

### **Questions by the Pilot Advisor:**

- 62Q. On this day on 9 July, MP was in the co-pilot seat. So did he take that action to verbalize it? Did the pilot flying in the left seat, did they call for it -- for the deconfiguration?
  - 62A. Yes, sir.
  - 63Q. Or did MP in this case just say "flaps up"?
- 63A. That I don't remember. It was done so many times. The flaps cycled numerous times during all the time so I don't remember voices.
- 64Q. We talked about you flying the profiles; how did that make you feel? When the pilots flew the profiles, how did you feel safety-wise -- not just airsick-wise. I don't mean that. But I mean overall your general impression?
- 64A. The first one we did I was sort of like wow. We're moving quick. We're moving -- we're slow, low configured, but ----
  - 650. That was the first one here in the train --
- 65A. Yes, sir. The first one here. Then it sort of came back to me in terms of how you're going to feel. Yeah, this profile's aggressive. It's not considered standard operating procedures: How we do things on a daily basis here. The turns are aggressive. The climbs are aggressive. The checklists come a lot faster. The pilots are generally a lot busier. When I say "busier," reading checklists, configuring the aircraft, flying the aircraft that are normal procedures in a C-17. So yeah, there's an uneasy feeling, but I think anytime you do something outside your norm, or something different, there's an uneasy feeling. But at no point during the flight did I feel unsafe, that I felt like the crew didn't know what was going on.
- 66Q. Now just to clarify your background: You said you flew these at Charleston with the 16th. Correct?
  - 66A. Yes, sir.
- 67Q. Did you notice even though in generalities the profiles are the same, did you notice any differences between the way Charleston in the Sixteenth would execute profiles as far as bank angles and warnings versus the way Elmendorf just ----
  - 67A. No. sir.
  - 68Q. They were the same?
  - 68A. Very similar.

- 69Q. They were very similar?
- 69A. Yes, sir. Obvious, every air show is going to be a little bit different in what you train for. There's different distances involved, show center might not be show center, or air show coordinator might ask for a shorter profile or a longer profile. It seems as if everyone's just a little bit different and in terms of how the maneuvers were executed, that sort.

### **Questions by the Pilot Advisor:**

- 70Q. Do you remember when you were at Charleston conducting the air shows, do you remember the warnings going off in same manner?
  - 70A. Yes. The stalls you hear.

# **Questions by the Legal Advisor:**

- 71Q. Just following up on that, at Charleston you said you hear the stall warnings. Was during training or the actual demo or ----
  - 71A. Both, sir.
  - 72Q. Both of them.
  - 72A. Yes, sir.
  - 73Q. So in the simulator you'd also hear it?
- 73A. I believe. I haven't done a simulator profile basically, but I assume you would. Very similar.
  - 74Q. But you haven't done a simulator profile?
  - 74A. No. sir.
- 75Q. But in the training flights and the actual performance of the aerial demonstration you have?
  - 75A. Yes, sir.

- 76Q. There, again, just to follow up in the air show demo profiles, was it ever briefed that about the time out or knock-it-off calls?
- 76A. Yes, sir. That was briefed prior to us stepping into the aircraft and it was brought back up right before we took off. Everyone's familiar with it. Don't feel afraid to say it.
  - 77Q. What do those calls mean to you?
- 77A. The first one being "time out," which anyone on the crew could say. Bring the jet straight and level away the ground if that's where you're heading to straight and level. The "knock it off" would be to return now to base.

## **Questions by Pilot Advisor:**

- 78Q. Just follow up questions and then some of the things that you've already talked about. You said that they would go through the flight, either training or demonstration, and then they would go out to Goose Bay and do a holding pattern and then talk about it. Do you remember anything specific about what they talked about?
- 78A. The execution of the maneuvers, the timing, hey you could have done this a little bit steeper, you could have -- it's all pilot talk. They pretty much go at it and then they'd ask everyone how they felt. I mean, did everyone feel okay with that. Hey, load, how are you doing back there? Oh-h-h, I need help. Let's go home.

Legal: That sound was more like a - you know -- kind of a nauseous kind of thing.

WITNESS: Yeah, you get nauseous in the back. Yes, sir.

- 79Q. When you said that they could have done it steeper, do you know who was leading these conversations?
- 79A. Obviously, it was led by MP the instructor pilot. It would go back and forth and then the safety would give his input on that. I remember -- they asked me when I was in the LACM seat, hey how did that one feel over the last one? Yeah, I think that was -- like I said it's all pilot stuff.
- 80Q. Right, but what did you take from those conversations? What did you understand those conversations --
- 80A. Basically, MP did a very good job at allowing anyone on the crew to speak up and say something if they felt uneasy about something, or whatnot. But most of the talk was about timing, the turns. I don't think anything was brought up in terms of being over aggressive or under aggressive. Those are pretty standard and then we'd wait and then we'd head back in.
- 81Q. I know you said that it's all pilot speak and certainly I am not a pilot, and I don't know if MS S status as a civilian pilot or anything, but -- and she's indicated no. But I think we're on the only two non-flyers in here, so if you would help us understand what do you mean by the "pilot speak"? Do you remember any specific comments about bank angles?
  - 81A. No, sir. Not specific comments. Bank angle is always brought -- was brought up.
  - 82Q. You used the word "tighter" earlier.
  - 82A. A tighter turn, more aggressive, or a tighter turn rate.
  - 83Q. Just getting the aircraft around?
- 83A. Yes, sir. Because every maneuver needed to -- you want to bring that aircraft back over show center and so based on the inputs of the pilots and whatnot they would -- you'd have to adjust to bring that aircraft over show center and whatnot.

- 84Q. Do you remember who felt that they needed to be tighter, or that they could be tighter?
- 84A. MP obviously, was the one giving most of the input. The pilots of the other two were more or less okay. Like I said they were in training. They were practicing so you can always do something better I think.
- 85Q. At the time you said you were in the LACM seat. That's the left additional crew member seat?
  - 85A. Yes, sir.
- 86Q. When you were there for your time, who was the pilot in the left seat -- or who was flying the aircraft?
- MCP -- or

  I was able to sit upstairs and observe while all three pilots were flying. So while was, obviously, in the right seat the whole time, I was able to watch

  MSO first fly and then also

  MCP first fly.
- 87Q. The term "flying" is very vague -- is very generalized for the general public, but I meant the person in control of the flight controls, the stick.
  - 87A. Yes. It would be both MSO and MCP

- 88O. Did the crew seem comfortable with each other?
- 88A. Yes, sir.
- 89Q. Were you able to tell whether the other crew members were comfortable with the way they were flying with the warnings?
  - 89A. Yes, sir. They were comfortable.
- 90Q. So no one ever expressed, yes, you know, or make a comment or anything like that?
  - 90A. No, sir. The warnings are expected. They were briefed.
  - 91Q. So they were briefed, the way you ----
- 91A. Both during the presentation that he gave and also at the briefing prior to the mission departing.
- 92Q. So then the way you understand the -- just clarify for me then: They were understood and then how were they going to -- how did they brief to correct them? Did they brief any steps to correct them?
  - 92A. No, sir.

# **Questions by Pilot Advisor:**

- 93Q. Can you talk us through that part? Speaking of the warnings and the stall warning, you mentioned that the crew would say "acknowledged" and then they would discuss it. Can you talk through what you remember when the stall warning came on you said you would hear "acknowledge" and then they would discuss it. What types of things were discussing?
- 93A. Get the nose -- not the nose back up. They need to input more throttle input. But at no point did the aircraft during when I was flying stall or lose altitude. So I'm pretty sure the stall horn comes on to warn you that the aircraft is impending -- it's about to begin a stall. But most of the horns and the warning signs would go off after -- or I'm sorry. Not after, but shortly before the aircraft would be straightened on the [inaudible].
  - 94Q. When you said when the maneuver was finished?
  - 94A. Yes, sir.
- 95Q. And you said that it was pre-briefed and that they were expected. Did they say where they were expected or what that conversation was about?
  - 95A. No, sir.

### **Questions by the Board President:**

96Q. In your de-briefs, again, they were talking about steeper bank, which is believe is what you said?

96A. Yes, sir.

- 97Q. Did they ever say hey, you can use more rudder here?
- 97A. No. sir.
- 98Q. Or to get that turn around or anything like that?
- 98A. I don't remember that. No, sir.

PRESIDENT: If I may, we'd like to take a break now and we just want to get our thoughts and then we'll come right back just to clarify anything else we may have for the record.

[The interview took a break at 1524 hours and resumed at 1528 hours, 16 September 2010.]

LEGAL ADVISOR: This is we're back on the record. All attendees of the interview prior to the break are again present to include witness 14 and his attorney, MS S

PRESIDENT: WITNESS 14 again, we're back as you know. We have two questions to ask just for follow-up. First question:

# **Questions by the Medical Advisor:**

99Q. Just to clarify: You said you were a traditional guard status at the time of the accident because you were in school. Correct?

99A. Yes, sir.

100Q. What's your current status now?

100A. Traditional guardsman.

101Q. You're still a traditional guardsman?

101A. Yes, sir.

# **Questions by the Board President:**

102Q. Lastly, are there any other matters that we haven't covered that you believe may be important to our investigation?

102A. No, sir.

PRESIDENT: You are reminded of the official nature of this interview. You may not discuss this testimony with anyone without my permission at any time before the report of this investigation is officially released to the public.

LEGAL ADVISOR: I might add that doesn't include discussions with your attorney. You may discuss this matter with your matter with your attorney, but both are under the instructions not to discuss this with anybody else without General Everhart's permission.

WITNESS: Yes, sir.

PRESIDENT: This concludes the interview. Time is now 1530 local, Alaska time.

#### V15. AIB INTERVIEW WITH

## WITNESS 15

#### VERBATIM TESTIMONY OF

# WITNESS 15

PRESIDENT: My name is Brigadier General Carlton D. Everhart, II. We are investigating the C-17 accident that occurred on 28 July 2010 at Joint Base Elmendorf-Richardson, Alaska. This investigation, conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 91-204. The purpose of this investigation is to produce a publicly releasable report on the facts and circumstances surrounding this accident and to gather and preserve evidence for use in claims, litigation, disciplinary actions, and adverse administrative proceedings, and for all other purposes. A safety investigation was previously conducted on the accident. Any testimony you gave before the safety investigation board will be kept confidential, if you were so advised, and can be used only for accident prevention purposes. This board does not have access to any confidential testimony you gave before the safety investigation board. Your sworn testimony to us may be used for any proper purpose. Additionally, your testimony can be released to the public. Do you understand the difference between your testimony before the safety board and this accident board?

WITNESS: Yes, sir.

PRESIDENT: Your testimony in this investigation will be under oath. At this time, I will administer the oath. Please raise your right hand.

[The witness did as directed.]

PRESIDENT: Do you solemnly swear that the testimony you are about to give in the matter now under investigation shall be the truth, the whole truth, and nothing but the truth, so help you God?

WITNESS: I do.

PRESIDENT: Today is the 16th of September 2010. The time is now 1635local, Alaska time. This interview is being conducted in building 7309, room 106, Joint Base Elmendorf-Richardson, Alaska. The persons present are:

The witness,

WITNESS 15

Pilot Member;

Legal Advisor;

Medical Advisor;

Court Reporter; and,

me, [Brigadier General Carlton D. Everhart, II, Board President]

PRESIDENT: The witness has been sworn.

- 1Q. Please state your full name and rank.
- 1A. WITNESS 15.
- 2Q. How long have you served in the Air Force?
- 2A. Seven years.
- 3Q. What is your unit and location?
- 3A. 517th Airlift Squadron, Joint Base Elmendorf-Richardson.
- 4Q. How long have you been with this unit?
- 4A. Approximately 6 months.
- 5Q. What is your job title?
- 5A. Resource advisor, instructor pilot, C-17A.
- 6Q. How long have you been doing this job?
- 6A. Six months.
- 7Q. Can you please describe your duties and responsibilities on 28 July 2010?
- 7A. I'm not sure I understand the question.
- 8Q. What were your duties in the squadron, and your responsibilities?
- 8A. Just doing more resource advisor work.
- 9Q. Are you familiar with the C-17 aerial demonstration program?
- 9A. Yes.
- 10Q. Can you describe your C-17 aerial demonstration background?
- 10A. Yes, sir. This was my initial qualification. I started early July to become an air show pilot for the upcoming air show.
  - 11Q. So, you are a qualified demonstration pilot now?
  - 11A. Yes, sir. I was supposed to fly the joint forces demo, the airdrop portion.
  - 12Q. Joint forces demo, where was that?
  - 12A. To be here.
  - 13Q. It was going to be here?
  - 13A. Uh huh.

- 14Q. What was involved in the certification process during the training?
- 14A. We had ground training, simulated training, and flight training.
- 15Q. Would you mind describing your demonstration training and those profiles or what you did on the ground, what you did in the sim and what you did in the air?
- 15A. Yes, sir. MP had the pilots who were upgrading meet in the squadron auditorium and we went over the applicable AFI and regulations. He explained a little bit of the background and the air show profile. He showed us 1 or 2 videos on profiles that have been flown in the past and then basically told us what the whole program entailed and what we are going to be doing as far as our responsibilities and what position we were upgrading to. The simulator profile, also with MP we flew the 10 minute profile and then talked about the 6 minute profile and then we did the same thing in the aircraft, flew the 10 minute profile and debriefed verbally the 6 minute profile.
- 16Q. So, MP provided your upgrade training for the entire upgrade process?
  - 16A. Yes, sir.
- 17Q. You mentioned that--you said others. Who were your other people that trained with you?
- 17A. I flew with really say with certainty. WITNESS 18 and then as far as the other groups, I couldn't
  - 18Q. So, WITNESS 18 was with you as a?
  - 18A. He was upgrading to pilot as well.
- 19Q. Are you familiar with Air Force Instruction 11-246, vol 6, chapter 3, demonstration profiles?
  - 19A. Yes, sir.
- 20Q. Can you explain in general terms how these profiles are used for aerial demonstration performances?
- 20A. Yes, sir, basically to give the crew a baseline, if you will, on how to fly the profile, whichever profile applied for the show.
  - 21Q. When you say a baseline, what do you mean by that?
- 21A. Just as far as procedures for the crew to follow, i.e. high speed pass, low-speed pass, 360-degree turn, altitudes, and for the most part air speeds.
- 22Q. So as of right now as a demonstration pilot, you have flown in no demonstrations yet?
  - 22A. Correct.

- 23Q. Except for your upgrade training?
- 23A. The training.
- 24Q. You said you are familiar with the 12 minute program or profile three?
- 24A. Yes, sir.
- 25Q. Please describe the parts or portion of the profile three from the static takeoff to the completion of the high speed pass, the initial high speed pass.
- 25A. Okay. It's a max climb performance takeoff to 1500 feet AGL and then a 45-degree 80/260 bank maneuver accelerating to 300 knots back to show center, clean configuration.
  - 26Q. In your training, do you always go to 1500 feet AGL?
  - 26A. At that first initial takeoff, no, sir. 1000 to 1500 AGL.
  - 27Q. If I may ask you, why is it you have a range between a thousand and 1500 feet?
- 27A. For that initial portion, it was because losing 1000 feet while accelerating was quite difficult, we're told, for pilots and that your climb when you are away from the crowd needed to be 1000 feet minimum.
  - 28Q. So it was due to basically----
  - 28A. To enhance the profile, basically.
  - 29Q. And 1000 feet was because it was difficult?
  - 29A. Yes, sir.
  - 30Q. But you did it at 1500 feet, correct?
  - 30A. A range of a thousand to 1500 feet. I can't say what altitude we climbed to.
- 31Q. The reason I'm asking is because if you did it at 1500 feet, I'm just wondering if you thought it was difficult to get down and around it.
- 31A. To be honest, sir, I don't remember what altitude. It was in the range of 1000 to 1500.

### **Questions by the Pilot Member:**

- 32Q. For clarification, did I understand that correctly, the range existed with 1000 being the lower end of that altitude because if you went all the way to 1500 then it could be difficult to lose that whole thousand feet during descending to the high speed pass? Is that accurate?
  - 32A. It could be, if you don't get on top of it right away.
  - 33Q. Who taught you that?
  - 33A. MP taught a range of 1000 to 1500 AGL.

- 34Q. And that range was what was taught to you? 1000 feet was what was taught?
- 34A. Um.
- 35Q. You mentioned that it was difficult to lose 1000 feet during that turn. Was that your understanding from MP
- 35A. Yes, sir. That's what he said, that if you didn't get on top of your descent right away, it was difficult to lose 1000 feet.
  - 36Q. Was it fair to say 1000 feet was his preferred altitude?
- 36A. No, sir. I think it was more for us in initial training, perhaps, but I think--to be honest, I don't remember what altitude he climbed to when he flew it. All I know is he briefed us 1000 to 1500 as the altitude.

- 37Q. You talked about that next portion of the profile after that static climb was the 80/260 maneuver?
  - 37A. Yes, sir.
- 38Q. For the record, we talked about a thousand to 1500 feet AGL. AGL is above ground level, correct?
  - 38A. Yes, correct.
- 39Q. On the 80/260 maneuver, it was the initial climb out and then it was an 80-degree turn off that initial heading?
- 39A. Yes, sir, a guestimate. Before we flew the profile in the simulator or the aircraft, MP would give us an aerial snapshot from Falcon View of the airfield with our headings, so we would turn left or right respectively to those settings.
  - 40Q. Falcon View is what?
  - 40A. A computer program that has imagery of the terrain and airfields.
- 41Q. Then, just to complete that, once you did the 80 degree offset maneuver, you would take 260 degree and come back into show center?
  - 41A. Yes, sir.
- 42Q. What was your instruction, specifically regarding the bank angle for the 80/260 degree turn?
  - 42A. 45 to 60 degrees.
- 43Q. Were both segments, the 80 and the 260 degree turn, given the range of 45 to 60 degrees?
  - 43A. Yes, sir.

- 44Q. What did MP teach you? What you're saying is MP taught you 45 to 60 degrees, correct?
  - 44A. Yes, sir.
  - 45Q. Did you ever use 60?
  - 45A. Normally, 60.
  - 46Q. Did he explain why there was a range there?
  - 46A. No, sir.
- 47Q. What was your instruction regarding the use of rudder during the 80 and 260-degree turn?
  - 47A. Up to full rudder?
  - 48Q. Why is that?
  - 48A. To enhance your turn capabilities.
  - 49Q. What particular bank angles would you use full rudder on?
  - 49A. 60 degrees.
  - 50Q. Did you think you needed to use full rudder at 45 degrees?
- 50A. Again, sir, it was sort of depending on the situation. The rudder was basically used to align your predictive flight path vector with the extended centerline. Once you had that on show center line, you pretty much held what you had to maintain it onto the rollout.
  - 51Q. Show center line, what were you taught about how far that extended? To infinity?
- 51A. No, sir. We built in the mission computer a 5-mile final approach fix using a custom database for the airports so you would have 5 miles, basically, from each runway, extending.
  - 52Q. 5 miles from the center of the runway or from the----
- 52A. From the approach end. You had one continuous line that you saw on your multifunction display.
- 53Q. Did you use your--were you taught on the flight path predictor--was that the standard configuration that you used all time, the worm?
  - 53A. Yes, sir.
  - 54Q. Were you taught to use that all the time?
  - 54A. Yes, sir.
  - 55Q. Did MP use that all the time?
  - 55A. Yes, he did.

- 56Q. Going back to the 80/260 maneuver, during that maneuver, how was the aircraft configured or deconfigured?
- 56A. It was briefed among the crew that copilot would auto clean up the aircraft, i.e. retract the landing gear, flaps and slats on initial departure and then throughout the rest of the maneuver the aircraft would be clean.
  - 57Q. Was that done on airspeed?
- 57A. Yes, sir, with the exception of the landing gear which was once you received a positive rate of climb.
- 58Q. When that deconfiguration happened, you said it was on airspeed. Who called for it? Was it silently done or was it called for by the pilot with normal checklist response?
- 58A. No, sir. The pilot didn't call for it. The pilot briefed that the copilot would automatically retract, so for example, the copilot would say flaps but would have positioned them to the--or flaps up.
  - 59Q. So, copilot would announce it?
  - 59A. He would announce it while he was doing it.
- 60Q. Do you ever remember in your training where you always--once you made the 80-degree turn, by that time that is when you started hitting your speeds for flap retraction and slat retraction. Do you ever remember making the 260-degree turn deconfigured, i.e. slats extended?
- 60A. No, sir. Traditionally, we would fly outbound 5 to 8 seconds, normally about 7 seconds with the weights we were using on the fuel so you were clean a while before you started that right turn towards the runway.
- 61Q. But if you were not, you would still start your turn and then deconfigure on speed?
  - 61A. I would imagine, sir. We never discussed that. Never came out.
- 62Q. Overall regarding the AFI 11-260 C-17 profiles, what were you taught about the adherents to the profile and by adherence, were they to be regarded as guidelines or procedures?
- 62A. I would say more guidelines, sir. They were a basis to start the profile, i.e. to fly the high speed passes, low speed and the turns. As far as bank angles, it was more guidelines.
  - 63Q. Is that what you were taught?
  - 63A. We weren't taught that, not specifically, that's what I understood after reading.
- 64Q. Regarding the use of checklists, there again just to follow-up on it, the copilot initiated the checklist and then it was monitored by the safety observer?
  - 64A. Yes, sir.

- 65Q. Speaking of the checklist, do you recall something called an aerial demonstration checklist?
  - 65A. Yes, sir.
  - 66Q. What was that?
- 66A. It was a--I guess you could call a guideline that was produced from a compilation of our checklist that had all the required--not required, but the safety calls and the steps that we used to complete the profile.
- 67Q. So, would you use the normal checklist and the aerial demonstration checklist or did you just use one or the other?
- 67A. Traditionally, sir, we would have both checklists out. You would reference the demo checklist while flying.
  - 68Q. Do you know where that came from?
  - 68A. No, sir.
  - 69Q. Was it given to you as a fan fold?
  - 69A. Yes, sir. As part of our initial training, we were provided with that.
- 70Q. Was that the same type of fan fold you have in your normal checklist, or what was it?
  - 70A. It was presented just like that, a piece of paper.
  - 71Q. Who approved it?
- 71A. I don't think the checklist is official, sir. It's not really approved, but again, I don't really have any knowledge on the checklist as far as where it came from.
  - 72Q. Can you talk to us about how it was utilized?
  - 72A. Before the departure, you would run all the steps with the pilot and the copilot.

Legal: Major is now handing witness 15 a one-page document marked 3d Wing Aerial Demonstration Checklist for her review.

72A (continued). So, you would run through, for example, the before takeoff checklist with the required responses from the pilot and copilot and then once you had reached the approach checklist, once you were flying, then the checklist would be run with the copilot and the safety verbalizing all response items. So, the pilot would not actually run the checklist and verbalize anything.

- 73Q. So, if the copilot was running the checklist, then how did you know to start the next following checklist, i.e. if you had the before takeoff, did the copilot called the before takeoff checklist complete in the next phase it would start the next portion? Does that make sense? In other words, the before takeoff checklist, it was called completed, and then the following before takeoff—as I look at this document, the same document that you just reviewed, and that was—the before takeoff would be called complete and then in the next segment when you need to run the following before take off, that was, then that was completed, et cetera, et cetera?
- 73A. Yes, sir. We were briefed specific points in the profile to run these checklists as well.
  - 74Q. Then, if the checklist was not called complete would you hold the checklist there?
  - 74A. As the copilot? Yes, sir. I would imagine so.
- 75Q. Do you remember getting warnings and alerts on the aircraft during the aerial demonstration profiles?
- 75A. Yes, sir. I know when we flew in the sim, we got the stall warning. When we flew in the aircraft, we had the stab strut door on the way up, just a transient.
  - 76O. What was it?
  - 76A. Stab strut door.
  - 77O. For the record, if you would describe that.
- 77A. It's the stabilizer on the aircraft, the door, that opens when they are extended which is usually done by the load masters on the ground. It's a fault, basically the sensor with the door.
  - 78Q. I think you mentioned getting stall warnings in the simulator?
  - 78A. I don't remember getting them in the aircraft. No, sir.
  - 79Q. In the simulator, which profiles did you get them under?
  - 79A. The 10 minute and the 12 minute profile.
- 80Q. So, when you heard the stall warnings during your training, was that verbalized between crew members?
  - 80A. One of the pilots would typically say acknowledged.
  - 81Q. What do you think acknowledged means?
  - 81A. That they recognize the conditions and if needed, are taking corrective action.
  - 82Q. So, when that happened, do you recall which part of the profile that occurred in?
  - 82A. It was typically during turns. As far as that, I don't recall, sir.

- 83Q. Now, if you got the stall warning during the turn, and it was called acknowledged, do you recall as-first of all, was the profile ever demonstrated to you by
  - 83A. Yes, sir. He flew the first profile in the simulator before the flight.
  - 84Q. So, when he flew the profile, do you recall him getting a stall warning?
  - 84A. I couldn't say with certainty, sir.
- 85Q. Now, you're flying the profile and you get the stall warning. Did you call acknowledged?
  - 85A. No, sir. MP called acknowledged.
- 86Q. What did you do? Did you allow that to continue on until you completed the maneuver or did you----
  - 86A. He would say acknowledged, continue, so I kept flying the maneuver.
  - 87Q. That's what was taught to you in the training then?
  - 87A. Just acknowledged. We are not stalling, continue.

### **Questions by the Pilot Member:**

- 88Q. How did you know you weren't stalling?
- 88A. At the time, I didn't. It was my first with the profile and I was a little bit behind the aircraft.

### **Questions by the Board President:**

- 89Q. But then, if you heard that in the airplane, the airplane is giving you-- if you're hearing that in the airplane, what is it telling you?
- 89A. Basically, you need to consider ceasing whatever maneuver you are doing until the enunciation stops.
- 90Q. How would you rectify that situation? When you say cease the maneuver, what does that mean?
- 90A. I.e. if I were in a bank, roll out, wing level. If I had my power back, to move the throttles to maximum power.

### **Questions by the Pilot Member:**

- 91Q. You mentioned in the simulator when you got that, you were a little bit behind, heard the stall warning, continue the maneuver and you didn't know whether at that time you were in a stall condition, but was there any discussion from the other pilot, in this case,
  - MP
- 91A. We talked about in the debriefing and he said it was a transient when you roll into the initial bank that you get in the sim sometimes.

- 92Q. What do you think he meant by transient?
- 92A. i.e. when we were going from wings level to 60 degrees of bank. That's sort of a rapid rate and the simulator couldn't keep up or something.
  - 93O. Did he consider that----
  - 93A. An anomaly in the sim.
- 94Q. In his perception, based on your conversation with him, he didn't think the simulator was----
- 94A. He wasn't concerned about us stalling in the profile we flew together and in that instance, no.

- 95Q. I would like to talk to you a little bit about your demo training flight you took with MP on the 19th of July. How did that flight make you feel? Did that flight make you feel uncomfortable? Was it good? How was it?
- 95A. No, sir. Not at all. Actually, I left that flight very excited and a lot more comfortable with the profile since I had been in the sim. I had a much better grasp of how to actually fly the profile and make it look good.
  - 96Q. What do you mean by make it look good?
- 96A. i.e. as a new demonstration pilot, for example, sometimes you would overshoot or undershoot bank and MP would teach us to, if, for example, you needed to use 30 degrees of bank to maintain your turn rather than maintain a shallow bank the whole time, to roll out and make two different maneuvers. i.e. 30 is the bank rollout until you about reach the center line and then roll back in, so.
- 97Q. Did you talk about or debrief each of the demo portions when you completed each profile?
- 97A. Yes, sir. We would typically fly the whole profile first and then go out to Goose Bay, a VFR point up here, hold----
  - 98Q. VFR stands for?
- 98A. Visual flying. Hold there for 5 minutes or so, talk about what we just did, what we did wrong, what we did well, what we could improve on and then come back in for the 10-minute profile.
- 99Q. At any time you are doing all the flying, did MP actually fly a 10-minute profile on that day to demonstrate to you how it was performed?
  - 99A. He flew a 12-minute profile, sir.
  - 100Q. I'm sorry, a 12 minute?
  - 100A. Yes, sir.

- 101Q. Do you recall how he flew the airplane?
- 101A. As far as?
- 102Q. Bank angles and----
- 102A. 60 degrees of bank.
- 103Q. Did he do that from a static takeoff?
- 103A. Yes, sir.
- 104Q. So his initial turn for the 80 was at 60 degrees of bank and then the 260 was at 60 degrees of bank?
  - 104A. Uh huh. Yes, sir.
  - 105Q. Did he ever say why he did that?
  - 105A. No, sir.

# **Questions by the Pilot Member:**

- 106Q. Do you know what altitude you went up to?
- 106A. No, I know it would be in the range of 1000 to 1500, but specifically, I don't know.

- 107Q. Did you catch any warnings going on at all during the 19th of July?
- 107A. Besides that stab strut we talked about that we already you talked about, no.
- 108Q. Were you able to tell whether other crew members were comfortable with the way you were flying or any of the warnings you might have gotten?
  - 108A. No one voiced any concerns, so.
- 109Q. At any time before or after your training, did MP mentioned to you his philosophy or viewpoint regarding aerial demonstrations?
- 109A. Yes, sir. He kind of went off on that a little bit through the training. He was very, very serious about flying the profile well and providing a good show to the spectators, sort of what I already talked about, i.e. very professional, knowing how to fly the profile, chair flew a lot. Like if we messed something up during the profile we were flying, he would have us go back out to that Goose Bay point I talked about, hold, talk about it, come back and start over. He was very intent on putting on a good show for the crowd.

- 110Q. What does that mean, to put on a good show for the crowd?
- 110A. i.e. the profile should be 12 minutes. If you are flying it like it is supposed to be, it should take you no longer than 12 minutes. If it takes you 14 minutes, you have done something wrong. The crowd shouldn't have to be watching you fly around at 30 degrees bank and waiting for you to come back in.
  - 111Q. So right around 12 minutes. What if it's less? Is that okay?
  - 111A. He never really mention anything about that.
  - 112Q. Did he ever mentioned anything about crisp turns?
  - 112A. Yes, sir. He was also very intent on crisp turns, roll in, roll out efficiently.
  - 113Q. What does that mean, crisp turns?
- 113A. Sort of an expeditious rolling in and rolling out as opposed to lackadaisically moving the control stick from the center position to left or right depending on which way you are going, but to move the stick at a fast rate.
  - 114Q. Do you think you were taught to max perform the airplane?
  - 114A. I wouldn't say max perform the aircraft. No, sir.
  - 115Q. In your mind, what do you believe that definition to be?
- 115A. To perform the aircraft at the absolute limit of its capabilities, i.e. what test pilots do.

### **Questions by the Pilot Member:**

- 116Q. You mentioned some of the weights you were at with the cleanup. Do you remember how much fuel you had on board on the 19th?
- 116A. The day we took off we had more than we wanted because of an issue with maintenance, but typically flying the profile he wanted around 20,000 pounds. I think we had somewhere around 50 or 60, but I can't say for sure.
- 117Q. And the simulator that you mentioned, do you remember how much fuel was put on then?
  - 117A. No, sir. I don't remember.

### **Questions by the Legal Advisor:**

- 118Q. You said they wanted about 20,000 pounds of fuel typically, but on a particular day it was 50 or 60. How does the fuel weight affect or does it affect flying?
- 118A. It affects the aircraft performance. The heavier the aircraft gets, the less responsive she is to maneuvering and climbing. i.e. if she is heavier, she will not be able to climb out as fast or roll as fast as a lighter aircraft would, or land in a shorter distance.

119Q. In the simulator, my understanding is you can program the fuel weights or the weights to load up the aircraft?

119A. Yes.

120Q. What weights did you use in the simulator?

120A. I can't remember in this one.

121Q. Do you remember if the weights ever changed, or you just can't remember, period?

121A. I don't remember what we used.

President: I would like to take a break now. I will just ask you to step out and then we will come back and get you when we are ready then we will continue.

[The board recessed at 1705, 16 September 2010.]

[The board reconvened at 1733, 16 September 2010.]

Legal: We are back on the record. All attendees to the interview are again present, to include

#### **Questions by the Board President:**

122Q. We have some follow up questions from the course of your interview. Earlier, you mention that the initial takeoff range was from 1000 to 1500 feet AGL. You said it was because it was harder to do, harder to lose altitude, that thousand feet as you came back around from the initial 260 and during that 260. Who taught you that?

122A. I think I may have misled you their a little bit. The range that MP taught us in his notes for the 12-minute profile was 1000 to 1500 AGL and he stated on an unrelated occasion that if you didn't--if you weren't aggressive with your descent from 1500 AGL to 500 then you wouldn't be able to make it down to 500 AGL while accelerating to 300 knots at the same time. That is sort of what I interpreted as the reason for the range.

123Q. Would you consider that enhancing the profile?

12A. Yes, sir.

124Q. You also stated that you thought-- you specifically stated that AFI 11-246, vol 6, chapter 3 was guidelines. Why do you think that?

Legal: I'm handing a copy of AFI 11-246, vol 6, chapter 3, a 14 page document.

125A. If you look on the front, you have the "will statement," will adhere. However, if you go to the end, after they finish talking about profile 4, they have the statement and the procedures and these profiles are general guidelines, emphasis on profiles plural, not singular.

## **Questions by the Legal Advisor:**

126Q. You are indicating on page 3?

126A. Correct.

#### **Questions by the Board President:**

127Q. I would like to discuss this just so we get your interpretation on it. If you look at it itself, and you see how it is broke down into each section, correct?

127A. Correct.

128Q. So you see profile one, and it is in bold and it is underlined. Then it says profile two. Each time they start a new section, is says profile, correct?

128A. Correct.

129Q. But then on the page you referenced, there is not a break and it starts a new paragraph.

129A. Uh huh.

130Q. Does this go with profile 4?

130A. My interpretation was it didn't because it didn't say profile, singular. It says plural. It says, to clarify, it discusses different demonstrations within profile 4, but at no point does it call them different profiles. That was strictly my interpretation.

MP never addressed that.

Legal: I'm retrieving AFI 11-246, vol 6, chapter 3 from

WITNESS 15

# **Questions by the Board President:**

131Q. Earlier in your testimony you said you normally use 60 degrees of bank. I'm just curious, at what occasion would use anything less?

131A. If you are required to use less bank to roll out on runway centerline or show center. For example, if you were overshooting at 60 degrees of bank or 45, to roll out and use whatever bank you needed to roll out on centerline without overshooting or under shooting the runway.

132Q. To follow up on that, you said traditionally after you're climb out and through the range of a thousand to 1500 feet, you made the turn 80 degrees or so and then you would time. You would time for 5 to 8 seconds, you said, traditionally. Then you said usually it was 7 seconds. What was that based on?

MP notes said 5 to 8 seconds time outbound for that turn. Before we would fly, be it in the simulator or the aircraft, he provided us with that graphical depiction I already talked about, and it would have how many seconds on there as well, or he would brief us

how many seconds to fly outbound. So, for the profile that we flew in the aircraft on the 19th, we flew outbound for 7 seconds.

- 133Q. Was that based off bank angle? Why did you fly 7 seconds?
- 133A. Weight and altitude, I believe.
- 134Q. If you fly at that weight and altitude, and you are at 60 degrees bank, you should roll out at center line based off that timing?
  - 134A. Yes, sir.
  - 135Q. When would you ever go to less than 60 degrees of bank?
- 135A. If you misjudged the winds or basically if you started, assuming you are on runway 6, you make that initial left hand turn for the 80/260 and when you start turning right back around, if you look inside at your multi-function display and notice your predicted flight path vector is not lining up on center line and that you needed to do less bank to get it there, then you would roll out of 60 and roll in 45, or roll out and drive it in--drive in the aircraft to the extended show center and roll back in. The goal was always to roll out without over shooting or under shooting on extended show center line.
  - 136Q. But you said usually it was 7 seconds?
  - 136A. That's what we flew the day I flew, sir.
  - 137Q. What would happen if you used 5 seconds?
  - 137A. You would have to make a tighter turn.
  - 138Q. But you had 60 degrees of bank, correct?
- 138A. Yes, sir. Well, if you accelerated faster, say you were already at 250 on your outbound leg, then if you were at 5 seconds timing outbound versus 230 going outbound for 7 seconds, then it's also dependent on your airspeed as well.
- 139Q. You were briefed that in the use of the checklist you said it was auto cleanup. What does that mean?
- 139A. That the pilot was not going to call for flaps up, slats retract or gear up and the copilot would, once a safe airspeed was reached, cleans up the configuration without being told to.
  - 140Q. Was that briefed?
  - 140A. Yes, sir.
- 141Q. While we are talking about checklists, you said the aerial demonstration checklist was unofficial?
  - 141A. My understanding, sir.

- 142Q. So, what makes you think it is unofficial?
- 142A. I never--it's not on our e-pubs, so, like I said, I don't really have any knowledge as to where the checklist originated from. That is strictly my interpretation.
- 143Q. In your demo training, did you ever brief, or was it ever briefed, knock it off or time-out calls?
  - 143A. Yes, sir. We would brief them during the pre-mission briefing.
  - 144Q. What does that mean to you? What are those definitions?
- 144A. If we were doing a maneuver that we had exceeded the parameters that we had set, someone calls terminate and it is acknowledged and you cease the maneuvering, talk about it and continue. Knock it off, you are pretty much done for the day and you come back to Elmendorf.
  - 145Q. Land at full stop?
  - 145A. Yes, sir.
- 146Q. When I asked you the last question about MP philosophy toward and regarding air show demonstrations, you said, if we mess something up. What did you mean by that?
- 146A. Um, if--if we did something like not towards the profile, for example, for the 360 degree turn you are supposed to fly up at 160 knots, do the 360 and then go outbound. On one occasion, we got slow and didn't complete the full 360 degrees so he sent the pilot out to Goose Bay to hold and talk about it and come back in and start the profile over from scratch.
- 147Q. Were you ever taught what would happen if you didn't execute a maneuver properly during an actual air show demonstration?
  - 147A. I'm not sure if we ever discussed that, no, sir.
- 148Q. Talking about going out to Goose Bay, when you actually flew on the 19th in the VFR pattern doing orbit and you would discuss--you would debrief each profile that you flew, correct?
- 148A. Yes, sir. You would fly and then we would take a break, if you will, out there for 5 minutes, talk about it and come back in for the 10-minute profile.
  - 149Q. What specifically do you remember being discussed?
- 149A. Position relative to show center, gaining or losing altitude during the 360-degree turn, whether you were under shooting or over shooting. That's about all the specifics.
  - 150Q. In the profile, was it ever verbalized about temperature and altitude?
  - 150A. As far as what, sir?
  - 151Q. Checking temperature and altitude? Does temperature and altitude look good?
  - 151A. You mean the altitude we were flying at?

- 152Q. Sure.
- 152A. It wasn't really ever discussed. No, sir.
- 153Q. Was it ever cross-checked?
- 153A. Yes, sir. It was not necessarily verbalized, but I think on the initial departure I would say approaching altitude, once you hit that range. Then if you were flying back in on that first initial takeoff, when you are coming back into show center, once you are approaching 500 feet, whether you were high, descend, or low, climb up. I remember that being referenced.

154Q. If we could, I would like you to read this just for a second, aerial demonstration checklist.

Legal: I'm handing the 1 page document entitled Third Wing Aerial Demonstration Checklist for to review.

- 154Q (continued). If you could maybe--I know you talked us through earlier, how it was utilized, but maybe you can provide a little more insight. If you take a look at that, there are some large font steps and there are some small font steps on there. Can you explain your understanding of the difference?
- 154A. The steps that are in bold are those items that we were most concerned with while flying the profile and the smaller items were those taken from the checklist that may or may not be applicable to us during the profile.
  - 155Q. Is whether or not they are applicable decided real time or ahead of time?
  - 155A. I can't remember us ever briefing it.
  - 156Q. By real time, I mean during flight and why you are flying versus ahead of time.
  - 156A. We never really briefed it, sir, so I would have to say in real time.
- 157Q. My last question would be, on the minimized items, are those items verbalized or not verbalized?
  - 157A. I don't remember, to be honest, sir, whether or not we called them or not.

Legal: Retrieving the 1-page document from

WITNESS 15

# **Questions by the Board President:**

158Q. I do have one last question. Are there any matters that we haven't covered that you believe may help us in this investigation?

158A. No, sir.

PRESIDENT: You are reminded of the official nature of this interview. You may not discuss your testimony with anyone without my permission at any time before the report of this investigation is officially released to the public.

This concludes the interview. The time is now 1121 local, Alaska time.

[END OF PAGE]

#### V16. AIB INTERVIEW WITH

### WITNESS 16

#### VERBATIM TESTIMONY OF

# WITNESS 16

PRESIDENT: My name is Brigadier General Carlton D. Everhart, II. We are investigating the C-17 accident that occurred on 28 July 2010 at Joint Base Elmendorf-Richardson, Alaska. This investigation, conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 91-204. The purpose of this investigation is to produce a publicly releasable report on the facts and circumstances surrounding this accident and to gather and preserve evidence for use in claims, litigation, disciplinary actions, and adverse administrative proceedings, and for all other purposes. A safety investigation was previously conducted on the accident. Any testimony you gave before the safety investigation board will be kept confidential, if you were so advised, and can be used only for accident prevention purposes. This board does not have access to any confidential testimony you gave before the safety investigation board. Your sworn testimony to us may be used for any proper purpose. Additionally, your testimony can be released to the public. Do you understand the difference between your testimony before the safety board and this accident board?

WITNESS: Yes, sir.

PRESIDENT: Your testimony in this investigation will be under oath. At this time, I will administer the oath. Please raise your right hand.

[The witness did as directed.]

PRESIDENT: Do you solemnly swear that the testimony you are about to give in the matter now under investigation shall be the truth, the whole truth, and nothing but the truth, so help you God?

WITNESS: I do.

PRESIDENT: Today is the 20th of September 2010. The time is now 0923 local, Alaska time. This interview is being conducted in building 7309, room 106, Joint Base Elmendorf-Richardson, Alaska. The persons present are:

The witness,

WITNESS 16 Pilot Member: Legal Advisor; Medical Advisor: Court Reporter; and,

me, [Brigadier General Carlton D. Everhart, II, Board President]

PRESIDENT: The witness has been sworn.

- 1Q. Pleased state your full name and rank.
- 1A. WITNESS 16
- 2Q. How long have you served in the Air Force?
- 2A. 23 plus years.
- 3Q. And your unit of assignment and location?
- 3A. 3rd Ops Group, Elmendorf Air Force Base, Alaska.
- 4Q. How long have you been with this unit?
- 4A. I have been here for approximately 14 months.
- 5Q. And your job title?
- 5A. Ops Group Commander for the 3rd.
- 6Q. As Ops Group Commander, how long have you been doing that job?
- 6A. The same amount of time.
- 7Q. Would you please describe your duties and responsibilities as the 3rd Operations Group Commander?
- 7A. My job as the Operations Group Commander is to conduct the flying operations of the 3rd Wing and ensure that the efficiency, mission, and safety are all in compliance as well as up to speed so that we can take the aircraft and/or personnel to serve the nation whether that is in O-plans or relief or whatever other purposes.
  - 8Q. Are you familiar with the C-17 aerial demonstration program?
  - 8A. I am.
- 9Q. Who had oversight of the demonstration program once it was established here at Elmendorf?
- 9A. First and foremost, oversight of the program is largely within this situation, for instance, the Command. In this case, Air Mobility Command is the governing mother, if you will, much like ACC is to the fighter program. Nevertheless, for the actual demonstration team on Elmendorf Air Force Base, it would come down to a certification process from the Numbered Air Force Commander, himself, and at the same time, the current Standardization and Evaluation is the oversight for the particular program.

- 10Q. When the program was originally established, there were 2 units. There was the 49th Airlift Squadron on the Guard side and the 517th on the active duty side. How were those 2 units integrated as far as this program, this particular program, goes?
- 10A. I don't know the details to that. I can say that as the C-17s came to Elmendorf Air Force Base, you had both the Guard 249th as well as the 517th Airlift Squadrons both standing up together with that platform. So, I don't know exactly how it was established together.
- 11Q. You mentioned that the Operations Group Stan Eval had, I'm assuming, administrative oversight. Can you explain that a little bit more for me?
- 11A. As I understood it at the time and continued to understand it, Stan Eval simply, as much as Stan Eval is to every other program, is the IP instructor pilots of instructor pilots. They sit there and govern them and makes sure things are up to speed with regards to Form 8 processes and whatnot. In this case, what you had was oversight to where you had the demonstration pilot within the branch chief of the standardization and evaluation and he will sit there and watch and make sure things are being conducted or they are supposed to be conducted in accordance with AFIs.
  - 12Q. So, as a branch chief, what you means is?
- 12A. Well, our Stan Eval program has a chief of Stan Eval, has a deputy chief of Stan Eval, and then has branch chiefs based upon the weapon system and their actual position within the weapon system. In some cases, for instance, like the E-3. In this case, we had Major witness 10
- , then a Captain, at the point as our branch chief and our deputy chief of stan eval-actually, our chief now is  $\mbox{MAJ B}$  , another C-17 pilot who is not demo qualified to my understanding.
- 13Q. What is the relationship of Stan Eval to the Operations Group itself, that overall encompassing relationship?
- 13A. Stan eval is there to ensure that we are--is as it sounds, standardization and evaluation. Plain and simple, standardization is to ensure that we are actually performing up to the ability to meet the mission that we are required to meet. Evaluation, they're also responsible for ensuring the evaluation portion of that and documenting it as such that we are able to meet our mission requirements whether that be within an F-22, F-15 or C-17, in this case, or even E-3. Their job as instructor evaluators and this case is to evaluate whether or not our air crews and or mission essential elements are up to speed and are being able to carry on the mission.
- 14Q. How do the 3rd Operations Group and the 176th Operations Group integrate with relationship to the aero demonstration program?
- 14A. It was very integral, as I understand it. One of the biggest things in the world was we had some of our most experienced pilots within the 249th Airlift Squadron. In this situation, we are bringing up individuals and many of them are being trained by the airlift squadron from the 249th and vice versa as well. For instance, by Deputy Group Commander was a demo pilot as well, so there was interaction back and forth without any hesitation.

- 15Q. Who was your Deputy Group Commander?
- 15A. WITNESS 29
- 16Q. He was with the--was he a Guardsman?
- 16A. No, he is active duty. He is the Deputy Group Commander of the 3rd Group. We have 2 deputies. One--I don't like to call them fighter or heavy deputies, but at the same time you have expertise in each round. One is an who happens to be an F-22 pilot, former F-15 pilot. The other is an , in this case, WITNESS 29 who happens to be a C-17 pilot.
  - 17Q. He is a demo qualified pilot?
- 17A. Not currently. He was a demo qualified pilot at a previous location. I believe it was Charleston.
- 18Q. There were several air crewmembers, approximately 10, that were certified after July 2009. What was your role in the aerial demonstration certification process?
- 18A. What I would do and I have done recently prior to the actual accident itself was we had a few more people added to the demo currency. I would get a certification letter from the Squadron Commander of the 517th. I would then put my endorsement on that letter whether or not I approved. It would then go to the 3rd Wing Commander and I know it was to go from him to the 11th Air Force Commander, in this case.
  - 19Q. In the process, what materials did you review?
- 19A. Typically, what I would review in this case is I would bring in my deputy, like I said, WITNESS 29, and say okay, are we on the up and up with this? What else is going on? He was able to inform me that it is governed by AFIs themselves. He was able to recite the regs. I did not know the actual nomenclature of them at the time. I do now. Nevertheless, it was more along the lines of did we followed the instructions? Yes, we have. Okay, press.
- 20Q. Instructions as far as getting crews and making sure those crews were a full up round?
  - 20A. Yes
  - 21Q. Meaning they were crew certified ready?
- 21A. Absolutely. As a former demo pilot, he was quick to add how stringent the whole process was and on numerous occasions we talked about the process and the amazing portion of the actual flight and how impressive it was and how you had to have very experienced individuals.

- 22Q. Then what did you do with the packages and materials, in other words, when you certified them--or, did you certify them, first of all?
- 22A. As I understood it, I was not authorized to certify them. I was there to recommend their certification by the Numbered Air Force Commander through the Wing Commander.
  - 23Q. So, once the packages left you, what's the next step in the process?
  - 23A. They went to the Wing Commander.
- 24Q. Did you happen to receive any feedback at all on the performance of the aircrews performing the aerial demonstrations, whether it is in their training, upgrade, or actually on the road performing a demo?
  - 24A. No. I have not received feedback.
- 25Q. Did you ever receive feedback regarding MP performance, flying or teaching the aerial demonstration throughout?
- 25A. The feedback, I did receive feedback on MP and that was he was considered to be the most experienced and a certifying official because he had been with the program from its inception is was what I was told.
- 26Q. Was he allowed to certify as a Guardsman, because the program belongs to the 3rd Wing, correct? I just want to make sure I got the relationship correct.
- 26A. It is difficult to say definitively. However, the program belongs to the Air Force AFI and the mother MAJCOM, in this situation, AMC.
- 27Q. You were scheduled to fly with the mishap crew on the day of the mishap. We understand that you had a real world situation that you had to take care of with another major weapons system that prevented you from taking the flight. Why did you want to fly with the crew?
- 27A. Two reasons. First reason, shortly after I took over the job, about 14 months ago, I had spoken to a couple of the folks and found out we had a demonstration team here, the C-17. I thought it would be very, very interesting be able to see it, enjoyable to see it, as well as I thought perhaps I would be able to understand the aircraft a little bit better. Prior to the actual accident itself, I was reminded that we are going to be doing a demonstration for the air show here at Elmendorf and I wanted to do a couple of things. One, I want to be able to see for fun, and two, I want to be able to QC what exactly was going on and what my aircrew were actually doing. In the case of the day of the event--actually, I was originally going to go on an earlier flight approximately 3 days previous to that. I was given, as a matter of fact by MP a list of their demonstration practices they were going to be doing for two reasons. One, I could observe them from the ground, and two, I was being offered because I had inquired and asked if I would be able to get on one of the flights to observe and see what exactly it entailed. As it turns out, I was originally going to go on an earlier one, then I was moved to this one, the last one prior to the actual air show. While I was heading out the actual squadron to get on the airplane itself, that's when my Deputy for the fighter side took the actual cable in an F-22 causing F-22s

to be diverted to Anchorage. It was at that time that I chose I could not sit there and leave it to my deputy because he was the one actually involved in the incident and I had to go make sure the security was taken care of. I called approximately 25 minutes prior to actual going to the aircraft and told the Director of Operations I wasn't going to be able to make it. He offered potentially the next day that there might be another one. So, I told him, I can't make it.

- 28Q. I know you are busy at the time, but did you happen to see the accident?
- 28A. I did not. As a matter of fact, I was sitting at my desk and talking to the Supervisor of Flying, originally, up in the tower itself. Shortly after that I had gotten off the phone and was taking phone calls to witness 30 from the 249th over at Kulis to try and make sure that we were getting gas as well as security on our F-22s and that's when I got the phone call from the Supervisor of Flying that it was down, I looked out my window and saw the smoke. I did not actually see the crash.
- 29Q. When you say witness 30 at the 249th, you mean witness 30 was the 1----
- 29A. You're absolutely right, WITNESS 30 with the 176th. That's a confusion between us. It's the 249th Airlift Squadron, 176th Air Wing.
- 30Q. Did you ever fly on any other demonstration flights, sims, or observe them on the ground or anything like that?
- 30A. I have not flown on a demonstration sim and/or flight. I have flown in the C-17 simulator and I have actually flown the C-17. I've flown on multiple flights.
  - 310. Did you ever attend any demo planning or mission brief?
  - 31A. I did not.

President: What I would like to do now is take a short break and then that will allow us to collect our thoughts and ask you any clarifying questions that we may have. I will bring you back in and we will be good to go.

[The board recessed at 0938, 20 September 2010.]

[The board reconvened at 0950 2, 20 September 2010.]

Legal: All attendees to the interview prior to the break are again present, to include WITNESS 16

- 32Q. WITNESS 16 you said that--we just want a clarification for the record. The crew the day of the accident obviously had a step brief that day, or mission briefing. Did you attend that brief?
  - 32A. No, I did not.

- 33Q. You talked about standardization and evaluation and how they evaluate aircrews and programs and things like that, correct?
  - 33A. Correct.
- 34Q. How do they perform their duties? How do they go through that function? How do they do that?
- 34A. Stan Eval will-- I don't know in particular what they do per se in detail to the demonstration program itself other than they have oversight and that you are to have an individual within your Stan Eval program who is a qualified demonstration pilot to be able to oversee it. For the normal mission, day-to-day events, Stan Eval will be able to tell whether or not you are instrument qualified and whether you are mission qualified in order to be able to perform the duties within your major weapons system.
- 35Q. Would it be fair to say the branch chief in Stan Eval is qualified in the aerial demonstration to provide checks and balances to the program?
  - 35A. Likely, yes. I think so.
- 36Q. You mentioned that you had feedback from folks that MP was the most experienced, and I don't want to put words in your mouth, were they there to do an aerial demonstration and check out, those types of things, for other folks. Where did that come from?
- 36A. That came from the squadron commander, WIT 27 He was telling me that MP was one of the original and one of the best out there qualified to teach people.
  - 37O. Do you know what his basis that was--what that was based on?
  - 37A. No, I do not.
- 38Q. You talked about as he reviewed the packages in the certification process, they came up to you. As he reviewed the package with WITNESS 29 you stated that it was a very stringent program or at least that's what he inferred to you and that is what you relayed to us. I just want to make sure I've got that correct.
  - 38A. Okay.
  - 39O. What does that mean?
- 39A. I'm not sure if I meant to say stringent. I do know that I understood it to be and it was portrayed to me that it was very much AFI driven as far as Air Force Instruction. What does that mean to me? Just that there were rules and there were governing processes that you had to follow that were not necessarily technique or procedure.
  - 40Q. That came from WITNESS 29
  - 40A. Yeah, WITNESS 29 as well as WIT 27 told me it was AFI driven.

- 41Q. Do you know if while assigned here, did WITNESS 29 ever watch the aerial demonstrations from the ground or participate in briefings or demo training?
  - 41A. I don't know.
- 42Q. Just going back, right prior to the break I asked you if you had ever seen the demonstration program from the ground. Have you?
- 42A. I had seen parts of it from the ground from parking lots. I actually also observed it from my window, not in its entirety, but so much of it as it was over the field itself.

### **Questions by the Legal Advisor:**

- 43Q. Just to clarify or to follow that last question about watching it from the ground. You said in parts, not in its entirety. Do you know what portion of the aerial demonstration you watched at that point, or what did you see?
  - 43A. I just saw some of the turns, if you will. I do not know what portions, no.
- 44Q. When you said the parking lot or the office, how far was it from the aircraft? Could you estimate a distance in feet?
- 44A. My office is approximately a hundred and 50 yards from the actual runway itself, and has a window out-looking the runway. It is obscured in some cases by a hangar, but in many of the cases I could see much of it.
  - 45Q. And the hangar is on the ground level, of course?
  - 45A. Right.
  - 46Q. And maybe just slightly above the roof you can see portions of the sky?
  - 46A. Yes.

### **Questions by the Pilot Member:**

- 47Q. Do you remember what dates, by chance, you happened to see it from the ground?
- 47A. I don't remember. I know that as stated earlier, I believe there were four dates that were given to me because I had inquired about getting onto the aircraft itself. For each one of those, something would incur and inevitably I would be driving back from whatever occurrence I had going on right before that and saying, ah, there it is. That is the demo. I should've been on that one, as we press towards it.

- 48Q. As you saw segments, or anything like that, did you ever have any concerns?
- 48A. I don't know if it was concerns. It was, in many cases, awe. When I would join my fellow pilots or anybody else, I would say that is impressive. What am I looking at? What kind of banks are we looking at and whatnot, so I made some inquiries on that and I was told 45 degrees of bank. I remember someone specifically saying you can't tell the difference, just like if

you do a max climb in an F-22, whether or not you are 70 degrees nose high or whether or not you are 90 degrees nose high. There are ways that--it's pretty impressive. I also remember inquiring to my deputy. He was telling me that nowadays the profile is much tamer than it used to be. It used to be up to 60 degrees of bank, is what he was telling me, and now its 45 degrees of bank, but that was it.

- 49Q. So, that was your feedback that you had with WITNESS 29 now?
- 49A. Yes, and there were others in this case. Largely, it was just myself and other pilots going that's an impressive show much like you say that's an impressive show for any of the demos that I have seen. I fly the F-22. I see the F-22 demo and I'm just in absolute awe that the aircraft can do that. I have flown in the C-17, observed, and flown the C-17. Once again, as I saw the demonstration going on overhead, I said wow, that's amazing. Were there concerns at the time? Only that the fact that I went, I don't know per se necessarily if I should be concerned. I went inquiring and they said oh, no. The thing is rock solid.
  - 50Q. That's the reason why you wanted to QC it?
  - 50A. Yeah. I wanted to see it, and I wanted to see it from the cockpit.
- 51Q. Is there anything else that you want to add that would help us in our investigation?
  - 51A. I can't think of anything. No. I don't.

PRESIDENT: You are reminded of the official nature of this interview. You may not discuss your testimony with anyone without my permission at any time before the report of this investigation is officially released to the public.

This concludes the interview. The time is now 1001 local, Alaska time.

#### V17. AIB INTERVIEW WITH

### WITNESS 17

#### VERBATIM TESTIMONY OF

### WITNESS 17

PRESIDENT: My name is Brigadier General Carlton D. Everhart, II. We are investigating the C-17 accident that occurred on 28 July 2010 at Joint Base Elmendorf-Richardson, Alaska. This investigation, conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 91-204. The accident investigation board is a legal investigation that was convened to inquire into the facts surrounding the aircraft and aerospace accident, to prepare a publicly releasable report and to gather and to preserve all available evidence for use in litigation, claims, disciplinary actions, administrative proceedings, and for all other purposes. A safety investigation was previously conducted on this accident. You did not provide testimony or a statement to the safety board. Your sworn testimony to me and to this board may be used for any proper purpose. Additionally, your testimony can be released to the public. Do you understand how your testimony may be used?

WITNESS: Yes, sir. I do.

PRESIDENT: Your testimony in this investigation will be under oath. At this time, I will administer the oath. Please stand and raise your right hand.

[The witness did as directed.]

PRESIDENT: Do you solemnly swear that the testimony you're about to give in the matter now under investigation shall be the truth, the whole truth, and nothing but the truth, so help you God?

WITNESS: I do.

PRESIDENT: Please sit down.

[The witness did as directed.]

PRESIDENT: Today is 21 September 2010; time now is 0916 local Alaska time. This interview is being conducted in building 7309, room 106, Joint Base Elmendorf-Richardson, Alaska. The persons present are:

The witness, WITNESS 17;
myself, Brigadier General Carlton D. Everhart, II, Board President;
Pilot Member;
, Maintenance Officer Advisor;
Legal Advisor;
Medical Advisor;
Maintenance Advisor; and
Court Reporter.

PRESIDENT: The witness has been sworn.

- 1Q. Please state your full name and rank.
- 1A. WITNESS 17
- 2Q. How long have you served in the Air Force?
- 2A. It's going like just over 7 years now.
- 3Q. What is your unit assignment and location?
- 3A. 517th here at Elmendorf flying C-17s and Chief of Training.
- 4Q. How long have you been with the unit?
- 4A. Just over 2 years.
- 5Q. Again, your job title?
- 5A. Chief of Training. That's changing now, but Chief of Training right now.
- 6Q. How long have you been with that job?
- 6A. Six months.
- 7Q. Can you please describe your duties and responsibilities?
- 7A. Yes, sure. As Chief of Training just overseeing all the currency and proficiency items, as an instructor pilot trying to look at training to try and get everybody a little bit more proficient in the job as well, and just ensure that's being done.

- 8Q. In previous testimony it was mentioned that you witnessed an aerial demonstration practice, and we believe or a show, from the roof of the squadron building. Do you remember this?
  - 8A. I do.
- 9Q. Who else was present with you?
  9A. MCP was there, --WITNESS 21 CAPT CM , and I believe that was everybody.
  - 10Q. And that was CAPT CM or CAPT CM?

# PRESIDENT: CAPT CM . Okay.

- 11O. When was this?
- 11A. The 19th, sir, it would be July 19th. I believe that's a Monday.
- 12Q. Please tell us what was discussed and said while that profile was going on.
- Well, they did a couple of profiles. I was a little bit late; we were there until 7 anyway that evening so we all were just kind of hanging out. We knew what time the demonstration was going to go so we all decided to go up there and watch it. So the first one I was a little bit late; I got there right as they were going -- taking off. Really nothing was discussed. We just kind of watched it. Nothing in particular, it was maybe work-related or family related or something like that, and I don't remember any specific conversations about that. MCP and myself. The The second one there was a little bit more discussion between thing that comes to mind -- a lot of it is fuzzy, the thing that does come to mind is when the second one started we kind of backed up because what we wanted to do is kind of count off when they started the turn after the initial pull-up. That was just interesting to both him and I just for whatever reason it was interesting. So we counted it off and I think we counted 5 seconds in that, which I've done the demonstration in a sim but never in the plane. I couldn't MCP and he kind of gave remember if that was aggressive or not. I just kind of looked at me one of those eyebrow-raising looks kind of like "wow". We were kind of off by ourselves and I looked at him and I said wow, that's a lot of rudder. And he said yeah, it is.
  - 13O. And that was on the initial turn or --?
- 13A. That's on the initial turn. Yes, sir. I said yeah, that's a lot of rudder. He said yeah, that is a lot of rudder. You should feel it in the plane. I said something like wow, I bet you can really feel it. I asked him -- I was like is that not too much rudder and he said no, no. I asked that question too and I asked that to MP and he said the rudder can -- or the EFC can take it and will not let you overstress the rudder.

- 14Q. And the EFC is the Electronic Flight Controls?
- Thank you. Yeah, Electronic Flight Control computer. So that made me feel better and just doing it. It was more of a question of ignorance on my part as I was just like yeah, I guess that's true. So that was the basic conversation. The only other thing was he looked MCP looked at me and he just said it makes me nervous and just kind at me and he said -of gave me one of those looks again. I didn't know if he was confiding in me or anything like that so I looked back at him and said well, MP has been doing this --MP has been doing this forever and he knows what he's doing and he's awesome. He nodded and said yeah. Yeah, he's awesome. I said MSO --MSO sat there in front with him, and he interrupted me and said MSO awesome. That was it. We just both looked at each other, gave each other a nod and that was the end of any kind of conversation about the plane. Yeah, that sums up kind of the conversation that I remember. That does stick out in my head just because after the accident I think back at that conversation just -- I don't know I've never been through this before, but that's kind of what sticks out in my head.
  - 15Q. The use of rudder, you say it was a lot of rudder?
  - 15A. It was a lot of rudder, but that's I think pretty normal for the profile.
- 16Q. Did you and MCP discuss -- or you and MCP discuss why the rudder on that initial turn? What was the purpose of it? In your training was it -- you said you've had one simulator ride. Correct?
  - 16A. Right. Correct.
  - 17Q. So are you going through the training?
- 17A. I went through the training. I never certed. You have to go through the actual flight portion to be certed.
  - 18Q. So you were in the process of being upgraded also?
- 18A. Yes, sir. I was. I went through -- my background is I went to a New Zealand airshow as just an air/land -- this was during my upgrade -- and I rode along.

  was the demo pilot on that one. I rode along twice and had a blast.

  was in charge of the program at the time.

  asked me if I wanted to be part of it and, of course, I jumped at the opportunity and said yes. So I flew with

  in the sim portion; and we did probably six profiles in the sim all of them. As a co-pilot I was sitting in the right seat then. That's my background. I never flew in the plane.
- MCP Now did they discuss -- so just part of your background between you and now, and any other demonstrator, did you discuss why the use of the rudder on that initial turn? At all did that ever come up?
- 19A. I guess a little bit, but we just talked about obviously the rudder will help you get around. Because that first initial turn you want to get over centerline of the runway and line up with it and that just allows you to -----.

- 20Q. Is that the centerline out here at Elmendorf?
- 20A. Well, again, I only did that in the sim. When I flew it with

  little bit different. I would say he was well within any kind of limits and probably on the safer side of them. He would use the rudder, but -- when I was in New Zealand

  the rudder, but it was never uncomfortable. In the sim it was never uncomfortable. No maneuver was uncomfortable and that's hard to say in the sim because a sim doesn't really recreate the jet. Something that

  told me was like make sure that you're showing off the aircraft and not yourself. Stay within the limits. So I always took that to heart as I went on. So sitting outside on top of that hangar top looking at it, it was more when I looked at

  MCP I was just asking how does that feel in the plane? Is that normal? I mean, because I've only done it in the sim and once in the aircraft and only seen it once and he seemed like it was completely normal -- felt completely normal.
- 21Q. Now you said that he said "it makes me nervous." Can you describe what portion he was looking at and said that makes me -- or did just the airshow profile make him ----?
- 21A. Yeah, and again, that's why it sticks out in my head because it was that initial turn. I should caveat that with I don't know specifically what he was talking about. He said that about other things before. We went out and flew some AR and he said the same thing. So it's not like saying he wasn't necessarily a red flag about that initial turn or anything like that. But in hindsight I look at it and I think maybe that's what he was talking about; I don't know. I can't speak specifically for him by any means.
  - 220. So you don't know what was actually making him --?
- 22A. I have no idea what was making him nervous. I know that when he said it we were talking -- it was in the context of what we were talking about and that was it.
  - 23Q. You said that you went to New Zealand?
  - 23A. I did. Yes, sir.
  - 24Q. Did you watch the profile from the ground?
  - 24A. I was in the jet on both of those so I didn't see the profile.
  - 25Q. Okay, so you were actually in the cockpit then?
  - 25A. I was. Yeah.
- 26Q. Do you remember when you did the initial climb out and you made that first 80 -- you're familiar with the profiles. Correct?
  - 26A. I am. It's --
  - 27Q. And we're talking about profile III?
- 27A. -- again, it's been about a year and a half so it's a little fuzzy on exact procedures, but I am familiar.

- 28Q. Do you remember when you did the initial climb out and you make the 80-degree heading change from your runway centerline, do you remember the bank angle that was used typically?
- 28A. I don't remember. I want to say it was 45 is what we used, but I don't remember. I know that both WITNESS 13 -- WITNESS 13 and when we did it, they didn't use any rudder in that at all.
  - 29Q. Do you remember what altitude they climbed to?
  - 29A. I want to say 1200 or 1500.
- 30Q. Do you remember on the 260-degree turn coming back around, do you remember in the airshow do you remember what bank angle, and then do you remember what bank angle was used in the profile that you witnessed on top of the building? What your --
- 30A. Yeah, I don't know what bank angle was used in the profile that I witnessed. I didn't ask

  MCP what bank angle. We just talked specifically about rudder. Just because as you sat up there, you could really see the plane just kind of pivot on a axis when using the rudder and I was just -- we were just I think more amazed. That wow look was just amazed that the jet could do that, not anything else. So when I say "wow," it was like wow, that rudder really pushes the jet around. Bank angles, I want to say that it was 60, nothing over 60.
  - 31Q. When was --?
  - 31A. In that you talked about the 270 coming back around.
- 32Q. Yeah, the 260 maneuver, so in the profile that you saw -- and I'm sorry I gave you a two-part question. First of all, the profile that you saw on top of the building, what was the bank angle?
  - 32A. I have no idea what it was.
  - 33Q. What do you estimate it to be?
  - 33A. It didn't look anything over 60 to me. So I would guess 60.
  - 34Q. Then in New Zealand?
  - 34A. Sixty again, yeah.
- 35Q. Do you recall when you were watching the profile on top of the building who was in the aircraft?
  - 35A. I do. It was --
  - 36Q. Actually flying the aircraft?
- 36A. Yeah, MP was flying, I believe was upgrading to copilot demo and CAPT SCO was safety and I know that because he would be the only qualified to fly it. As far as don't know who was flying what.

PRESIDENT: So MP was actually flying -- or MP

WITNESS: Sorry. Yeah, MP

37Q. There, again, I just wanted to touch on: What was your perception of MCP comfort level?

37A. In as far as the demo goes?

38Q. At any time.

38A. Well, I don't know if I can really speak for his comfort level. I don't really know. I mean I told you about that conversation, but I felt like he was completely comfortable. I know he was extremely proud to be part of it, and he enjoyed it. Any conversations that had it was always positive and he enjoyed it. As far as his comfort level, I can't really speak to that. It seemed like he was comfortable. Again, the only conversation we had was that one little bit and he said it just makes me nervous. I think he was just talking about in general that -- and specific with rudder, or whatever, it makes him a little bit nervous. Again, for MCP that doesn't really mean anything because he -- some of the maneuvers that we do like low levels or AR he would say that. I flew with him and he was just like yeah, this makes me nervous. So I think that was his kind of cue -- just like he always erred on the side of caution. So that was kind of his timeout call, if you will, which aviators use. That was just kind of his saying hey, I just take a step back kind of thing and he was really good at that. Every time I flew him just everybody what we do has a dangerous aspect to it. When he said that, that's how I took that statement specifically.

- 39Q. Do you know if MCP ever mentioned any concerns that he may have with the profiles to anyone else?
- 39A. To as far as the profile, no. I don't think he -- he never expressed any concerns about the profile to me.
  - 40Q. How about to leadership or anybody like that?

40A. Not that I know of.

LEGAL ADVISOR: I am I'm the legal Advisor. I just had a couple of follow-up questions to some of the General's questions.

WITNESS: Okay.

### **Questions by the Legal Advisor:**

- 41Q. You had mentioned that when you flew in New Zealand, you flew the aerial demonstrations with and witness 13 it wasn't an uncomfortable feeling I think is how you described it.
  - 41A. It wasn't uncomfortable.

- 42Q. In executing the turns and the bank angles and whatnot?
- 42A. Yeah.
- 43Q. Or even if they used the rudder, it wasn't uncomfortable.
- 43A. It was not uncomfortable.
- 44Q. What did you mean by "it's not uncomfortable"? What do you mean by it?
- 44A. I guess as an aviator you get kind of the feeling and when you're not at the controls, sometimes you just want -- you're like what-are-you-doing type of question when people are doing. It always felt like it was under control within the aircraft limitations. That's what I mean by uncomfortable. It seemed like it was all within limits and completely comfortable. That's from an observer, which sometimes that's hard to feel comfortable.
- 45Q. Because we are recording and this may be transcribed, or at least being recorded, you used the word "wow" a lot like to describe some of the reaction like wow?
  - 45A. Right.
- 46Q. When you say it though, how are you describing "wow"? Was it in the amazed and excited kind of way, or is it another way?
- 46A. Yeah, and again, I wanted to -- let me just say that nobody ever said "wow." I was just saying that for the transcribe that he gave me a look of wow. It was kind of one of those looks that only MCP could give you, just kind of like -- and it was more amazed, excited, probably caveated with his statement that he said it makes me nervous. So it was like wow, I can't believe the plane that reacts like that. So when he said it in that specific context, we were watching the rudder. We'd both stepped back; we were watching how much rudder he used and it was "wow, I can't believe the plane -- a big plane like this can do that.

LEGAL ADVISOR: It's always hard to describe someone's look, but that was fine so I appreciate that.

- 47Q. How long had you known MCP by this point when you watched the aerial demonstration practice from the roof of the squadron?
- 47A. By that point we got here about the same time, so I've known him for the full 2 years.
  - 48Q. Then you said you flew with him as well?
- 48A. You know what, I never flew with him until the week prior to that rooftop to the 19th. We went out and did a local and then a week after I did my check ride and he was on there with me and we did some air refueling at a low level and some other things. But those are the only two times I've ever flown with him.

- 49Q. I just wanted to verify: You had said you'd mentioned the word "time out," and that MCP would be the type to at least be able to say or he would be comfortable to tell you what's going on?
- 49A. Yeah, and like I said he always erred on the side of caution. Mission planning for our local he was always erring on the side of caution. I was down at IP school with him as well -- not flying with him, but he always was just on the cautious side, which I really enjoyed about him.
- 50Q. Lastly, you had mentioned earlier that you had asked MP about the use of the rudder, or the full rudder, or can the full rudder be used. When was that conversation? 50A. I'd never asked him specifically. When we were on the rooftop, asked him and I asked MCP I said, that seems like a lot of rudder and MCP asked Can we use that much -- or it was like something about the rudder. I don't remember the exact specifics on it. What he said is yeah, that EFC, electronic flight computer.
- 51Q. So just to make sure I understand: It's the conversation between you two on the rooftop and he's relaying a separate conversation he had with
- 51A. Right, and I guess just to say that we talked about err on the side of caution. So what I took from that was that MCP had asked the question about it and he felt totally comfortable with the answer he was given; therefore, I felt totally comfortable too with the answer that was given to me.

LEGAL ADVISOR: Thank you, sir.

PILOT MEMBER: I just have one, sir.

#### **Questions by the Pilot Member:**

- 52Q. You mentioned your previous demonstration observer experience and then a little bit in the sim. Also, you mentioned that you're an instructor pilot in the squadron here. When you were with MCP on the rooftop on the 19th of July and you witnessed the profile being performed, what was your impression?
- 52A. Of the profile itself? I'd say my impression was that it was --I'm choosing my words here. My impression was it was aggressive. That's not incriminating at all. I just thought that it was aggressive and more than what I had seen in New Zealand. I only have that one -- or these two experiences to base it off of. I did ask

  withess 8 afterwards about that specific profile and I said those words. I was like man, that seemed aggressive. He was like no, it actually wasn't. I was like well, it looked like it from the ground. He was like no, that actually wasn't. We're at heavier weights. I think they were at 90K probably for that profile, which usually when we do this profile, it's a lot lower. It's probably 30K -- 30,000 pounds on fuel. So he was at heavier weights and so I asked

  with less 8 I was like it seemed aggressive, and he said no, actually it wasn't. So, again, my perspective and my inexperience it really means nothing. It looked cool from the ground and if you ask for one word, I'd say aggressive, but not necessarily in a bad way.

PRESIDENT: If we could, I'd like to take a break and then just to collect our thoughts and we'll bring you right back in.

[The recessed at 0940, 21 September 2010.]

[The board reconvened at 0950, 21 September 2010.]

LEGAL ADVISOR: We're right back on the record. All attendees to the interview prior to when we broke are again present to include

PRESIDENT: WITNESS 17 thanks for coming back. I have one last question to ask you.

## **Questions by the President:**

53Q. Are there any matters that we haven't covered that you believe are important to this investigation?

53A. No. sir.

PRESIDENT: You are reminded of the official nature of this interview. You may not discuss your testimony with anyone without my permission at any time before the report of this investigation is officially released to the public.

PRESIDENT: This concludes the interview. Time now is 0952 local, Alaska time.

#### V18. AIB INTERVIEW WITH

### WITNESS 18

#### VERBATIM TESTIMONY OF

# WITNESS 18

PRESIDENT: My name is Brigadier General Carlton D. Everhart, II. We are investigating the C-17 accident that occurred on 28 July 2010, at Joint Base Elmendorf-Richardson, Alaska. This investigation, conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 91-204. The purpose of this investigation is to produce a publicly releasable report on the facts and circumstances surrounding this accident and to gather and preserve evidence for use in claims, litigation, disciplinary actions, and adverse administrative proceedings, and for all other purposes. A safety investigation was previously conducted on the accident. Any testimony you gave before the safety investigation board will be kept confidential, if you were so advised, and can be used only for accident prevention purposes. This board does not have access to any confidential testimony you gave before the safety investigation board. Your sworn testimony to us may be used for any proper purpose. Additionally, your testimony can be released to the public. Do you understand the difference between the testimony before the safety board and accident board?

WITNESS: Yes.

PRESIDENT: Your testimony in this investigation will be under oath. At this time, I will administer the oath. Please stand and raise your right hand.

[The witness did as directed.]

PRESIDENT: Do you solemnly swear that the testimony you are about to give in the matter now under investigation shall be the truth, the whole truth, and nothing but the truth, so help you God?

WITNESS: Yes.

PRESIDENT: Today is 20 September 2010. This time is now 1540 local, Alaska time. This interview is being conducted in Building 7309, Room 106, Joint Base Elmendorf-Richardson, Alaska. The persons present are:

The witness, WITNESS 18;
Brigadier General Carlton D. Everhart, II, Board President;
Pilot Member;
Legal Advisor;
Maintenance Officer Advisor;
Medical Advisor;
Maintenance Advisor; and
Court Reporter.

PRESIDENT: The witness has been sworn.

- 1Q. Please state your full name and rank.
- 1A. WITNESS 18
- 2Q. How long have you served in the Air Force?
- 2A. A little over 6 years.
- 3Q. What is your unit of assignment and location?
- 3A. 517th Airlift Squadron, JBER.
- 4Q. How long have you been with the unit?
- 4A. Since March of this year.
- 5Q. What is your duty title?
- 5A. I am currently the Assistant Flight Commander, Readiness.
- 6Q. How long have you been doing this job?
- 6A. Since August 6.
- 7Q. Please describe your duties and responsibilities?
- 7A. Currently, I am in charge of two shops: Plant Shot and Mobility Shop. I basically handle administrative responsibilities for all the officers and enlisted personnel in those two shops.
- 8Q. As part of this, you made a non-privileged statement to the Safety Board. It was transcribed as part of Tab R. Have you had a chance to review it?
  - 8A. Yes.

- 9Q. That statement was not take under oath. Do you want to adopt that statement as part of your testimony today?
  - 9A. That's okay.
- 10Q. As we go through this, if you have any clarifications, you may make them. Just let us know, and we will follow-up with any questions. Okay?
  - 10A. Yes, sir.
  - 11Q. When did you go through the upgrade process for the aerial demonstration?
  - 11A. I did the upgrade process in late June, early July 2010.
  - 12Q. How many demonstration flights and sounds did you fly during your upgrade?
  - 12A. I flew one simulator and one flight in the training program.
  - 13Q. Are you familiar with the 12-minute program, i.e., Profile 3?
  - 13A. Yes.
  - 14Q. Could you describe the departure portion of that profile from the static takeoff?
- 14A. Yes. We would adjust throttles to max. Once throttles are maxed, we released the breaks. Once we got to V-GO, we would pause approximately 2 seconds for delayed rotation, rotate to achieve a max rate of climb, typically, between 30 and 40 degrees, nose high. Once we got to that pitch altitude, we would lower the nose to approximately 25 degrees to make sure we maintain a safe airspeed, climbing to 100 feet, we initiate a left hand turn -- or right hand turn, depending on which runway we were on -- to begin our 80/260 maneuver, the whole time we would be accelerating. Once we reached our rollout heading, we rollout time; it varied about 7 to 10 seconds. Then we would begin our turn inbound and descend to 500 feet for the high speed pass.
- 15Q. You said you climbed out 1000 to 1200 feet during the climb-out, when you made that initial climb. The target altitude, the way we understand it, is 1500 feet. Why are you lower? Why not 1500 feet?
- 15A. We were briefed in training: 1000 to 1500 feet -- we were told that. To the best of my knowledge, from what I can remember from the ground training, we were told that climbing to 1500 feet, it would be hard to us to lose the thousand feet in the turn inbound to make our high speed pass at 500 feet.
- 16Q. It would be hard to lose. But, if you train to it, would it still be hard? Would it become routine?
- 16A. I can't really say, because I don't have any prior air show experience. I would say, if we train to that, probably, we could do it.
  - 17Q. So, you never trained going to 1500 feet?
  - 17A. Correct.

- 18Q. Who trained you that?
- 18A. **MP**

- 19Q. Excuse me, sir. When you were trained, did your trainer state what was hard about losing it, why it was hard to lose that altitude?
  - 19A. I cannot remember.

### **Questions by the President:**

- 20Q. About the 80/260, what was your instruction regarding bank angle on the 80/260 turn?
- 20A. Initial turn: 45 to 60 degrees of bank. We were instructed not to go less than 45 degrees of bank.
- 21Q. What would you normally -- what was the normal bank angle you were trying to --?
- 21A. I think, normally, we were trained to 60 degrees of bank, although -- that's what we were taught to do.
  - 22Q. At the 260 degrees of turn, what was your bank angle?
- 22A. We were taught to used 60 degrees of bank, although, it was, as required, to rollout on the center line of the runway. That is the way I understood it.
  - 23Q. It was taught "as required" -- go to 60 degrees bank, but, as required?
- 23A. The technique we were taught was 60 degrees of bank. But, sometimes, you didn't need 60 degrees of bank, so it did not make sense to fly 60 degrees of bank if we were going to undershoot the runway.
- 24Q. So, when you hit -- at the 80 degree point before the initiation of that turn, was that based off timing? Airspeed? What was that based off?
  - 24A. We would rollout and then we would time.
  - 25Q. How long would you time for?
  - 25A. I would say an average of 7 to 10 seconds.
  - 26Q. Average of 7 to 10 seconds. But what was it, normally, your turn period?
  - 26A. It was whatever was briefed prior to that particular flight.
  - 27Q. What was normally briefed?
- 27A. I am trying to remember for the actual flight we did. I think it was briefed -- I want to say 9 seconds, but I can't be 100 percent sure on that.

- 28Q. For the record, let me understand. You said on your flight you timed for 9 seconds and then went to 60 degrees of bank, correct?
  - 28A. Return inbound.
  - 29Q. For that turn inbound?
  - 29A. Correct.
  - 30Q. And 60 degrees of bank is the maximum bank you can fly, correct?
  - 30A. Correct.
- 31Q. What would happen, you timed, you went to 60 degrees of bank and you had the show center and you are going to over-fly show center?
  - 31A. I would over-shoot.
  - 32Q. What were you taught?
  - 32A. I really can't remember addressing that specifically. I'm pretty sure MP never taught to exceed 60 degrees of bank on the turn.
- 33Q. If you were taught 7 to 10 seconds and you hit 7 seconds, 60 degrees of bank, and you are going to go over, you said you would go over. But you don't remember what was taught?
  - 33A. As far as bank angles?
  - 34Q. [Affirmative response.]
  - 34A. I don't remember ever being taught to exceed 60 degrees of bank.
  - 35Q. Are you saying "take what you got"? Is that what you're telling me?
  - 35A. Personally, that's --
  - 36Q. In your instruction?
  - 36A. Just as far as bank angles, or, are you talking about the rudder?
  - 37Q. The rudder is my next question. What would you do with the rudder?
  - 37A. We were taught to use rudder, as required, to help increase the turn radius.
  - 38Q. What does rudder do for you?
- 38A. Rudder would -- the way I understand rudder, it disrupts the horizontal lift over the vertical stabilizer and then causes the nose of the aircraft to yaw left to right. It a turn, it would help you increase your turn, or decrease your turn.
  - 39Q. Does it increase drag if you put that rudder out?
  - 39A. I would say yes.

- 40Q. In your testimony, you said you were hesitant to use the rudder, at first. As you gained more comfort in using it, do you use it routinely?
- 40A. I can't remember if I used full rudder, routinely, as part of the profile. I would say we were taught to feed it in every time we turned, initially, and then use it, as required, to maintain the centerline, I guess.
- 41Q. But then you just said you were taught to use full rudder? You said full rudder and then you said I was taught to feed it in. Is it feed it in? Is it full rudder? Or, is it feed it in to full rudder?
  - 41A. Feed it in to full rudder.
  - 42Q. At some point, you were using full rudder, because that is what you were taught?
  - 42A. That's what we were taught, correct.
- 43Q. During the maneuver, the initial climb-out and then the turn to 80 degrees. When would you configure/de-configure? I should say, at that time, you already configured. When would you de-configure?
- 43A. We were taught that the co-pilot would retract the landing gear immediately after takeoff and then de-configure on speed.
  - 44Q. Is that what MP taught you, to de-configure on speed?
  - 44A. Yes.
- 45Q. When you de-configure, then, if it's always on speed, in your training, was there ever a time when you de-configured while, either, in the turn going into that 260 degree maneuver?
  - 45A. I'm not sure. I cannot remember.
- 46Q. Regarding AFI 11-246, C-17 profiles that you were taught and adherence to these profiles, were they regarded as guidelines or procedures?
  - 46A. Procedures.
- 47Q. Again, regarding the use of the checklist during the demo, who called for or initiated the checklist?
- 47A. It was primarily during a flight -- a co-pilot safety observer, challenge response checklist. When I was flying, I typically called for them out of habit, because I knew what checklist we were supposed to be running at the time.
- 48Q. So, the co-pilot would go -- when you say "challenge and response," someone would call for the checklist and the co-pilot would say gear up and the safety observer would say, roger, gear up?
- 48A. I think it was briefed that the co-pilot would initiate the checklist, automatically, at the right time.

- 49Q. The challenge and response items on the checklist, were they verbalized?
- 49A. Yes.
- 50Q. What did MP teach you about the checklist?
- 50A. That the co-pilot would initiate it at the appropriate time and there would be a challenge response between the co-pilot and the safety observer.
- 51Q. Do you remember getting warning alerts from the aircraft during the demonstration profiles, either in a simulator or an actual flight?
- 51A. The only ones -- I can only remember getting the oral alert, twice, while I was flying. I don't really remember getting it any other time. The two times I got it, I remember both of them were, to me, not normal, but what you might see on a local training sortie. One time, for me, I was a little below approach speed on the final turn, so I shoved the power in. In the low speed 360 degree maneuver, again, I just did not have enough power in, so, as soon as I got it, I added power to compensate. It did not seem abnormal to me. I really can't say for sure at the other times.
  - 52Q. What did MP teach you about stall warnings?
- 52A. I can't remember him, specifically, addressing the stall warnings. I remember when we got it, he said add power, so I added power. I don't remember, specifically, being taught, if the stall warning happens, this is what we are going to do.
  - 53Q. What would you do if a stall warning happened in a profile?
- 53A. One time I was flying, we got a wind shear warning. I rolled to wings level, I added power and raised the nose. That is what I would do -- not necessarily for a stall, raise the nose, but I would add power and roll to wings level.
  - 54Q. We would like to ask you about the demo training flight you had with MP When did you fly with him?
    - 54A. July 12.
    - 55Q. How did that make you feel?
    - 55A. Could you be a little more specific, sir?
    - 56O. How did you feel about the flight? It was good, bad?
- 56A. I thought it was good. I thought it was challenging. It would be my first time ever doing it. But I thought it went okay.
  - 57Q. How many profiles did you accomplish?
  - 57A. I think I did three, myself.

- 58Q. After each profile, what happened?
- 58A. We would take off and go out to Goose Bay -- a point. I don't know whether it is east or west of the runway; I am still new here. We would haul her about 2000 feet and cool the gear, discuss the profiles.
  - 59Q. How did that discussion go?
- 59A. Typically, we would start at the beginning of profile. MP would talk about what he saw that we did well, what we could improve upon. That was about it. Just normal debrief.
- 60Q. Did he ever talk about how you could roll on the bank, perform a maneuver, use a rudder, those types of things?
  - 60A. I think so.
  - 61Q. What did he say?
- 61A. It was like a normal -- if you ever shot in this turn, make sure you use more bank, or something, next time. I guess he would say -- because, I probably tend to use less bank in my turns and, consequently, I probably overshot. He's, like, hey, you didn't go to 60 degrees of bank, you just went to 45 -- or whatever you did -- you let it out while you were turning, stuff like that.

- 62Q. Why did you use less bank?
- 62A. Habit, I guess, to be honest with you. We do train to use 60 degrees of bank a lot. I would say, for me, it was probably a little task management. It would just slip out of my crosscheck the whole bank and I would just naturally let it out in the turn, because I was thinking about something else -- my climb, leveling off -- rather than trying to hold the bank the whole time. I would naturally roll a little bit -- less bank.

# **Questions by the President:**

- 63Q. Did you find it harder to roll on a bank with no rudder, or roll on a bank feeding rudder, trying to hold that 60 degrees of bank?
- 63A. I would say it was probably -- I can't differentiate, really, in my brain, between the two. I thought it was -- like I said before, I thought it was -- you had to think about holding it at 60 and you tended to roll out. From that standpoint, I would say it was hard. But I can't differentiate between whether the rudder was being fed in or not. I don't know if that answers your question.
  - 64Q. In your statement, you said that you had written copies of the notes that MP had?
    - 64A. Correct.

- 65Q. When you get a chance, can you provide for us, please?
- 65A. Okay.

- 66Q. I had asked you earlier about the altitude. Your instructor, MP said that it was hard to lose that thousand feet, if you went all the way up to 1500. Do you remember what you went to when you flew the profiles during your flight?
  - 66A. If I remember correctly, typically, leveled off around 1200-1300 feet.
  - 67Q. So, you never tried it at 1500 feet; is that correct?
  - No. I never got all the way up to 1500 feet.
- 68Q. In your mind, or, in your judgment, what would you think would be hard about losing a thousand feet, versus what you were at 1200? The difference would be if you had to lose -- like you said before, if you went all the way to 1500, to get down to 500, you would have to lose a thousand feet. In your case, you had to lose approximately 700 feet; is that correct?
- 68A. Correct. I was thinking about this. Because, we do 80/260s to land and we lose that altitude, the only thing I could think of was -- we are accelerating all the way through that turn to get to the high speed pass. In my experience, the two or three times I flew it in the jet, when I had to -- at that higher air speed, to try and lose that altitude, it was coming a lot quicker and you had to have an uncomfortable descend rate, to me, to lose a thousand feet in that turn. I don't know if that makes sense. At a slower speed, it is easier; you have more time to lose the altitude. But accelerating up to 270-280, whatever we could get, it seemed like I had to -- typically, I'm not sure I even made it down to 500 feet on a lot of my passes in the turn -- it was kind of as we were crossing the runway, because I just did not descend enough. Does that answer your question?
- 69Q. Yes, I think it does. Maybe you could further clarify. When you started the 80/260, you would time outbound, you said, between 7 and 10 seconds?
  - 69A Correct.
- 70Q. During that time, based on the profiles that you previously described, if you went into 60 degrees, at 1000 or 1200 AGO -- or, let's say you went all the way to 1500. I can see where there would not be a lot of time in there to, also, get a thousand foot descent because of the way the profile is set up?
  - 70A. Correct.
  - 71Q. Am I wording that --?
  - 71A. No, I think it is probably what I -- I would agree with that.

# **Questions by the President:**

- 72Q. I understand what you describing about the use of rudder at the 260 degree turn point. On the 80 degree point, you were also taught to use rudder, correct?
  - 72A. I think.
  - 73Q. Do you remember what you were taught?
- 73A. No. I don't remember what -- I remember it being not as much of an issue to make that initial turn.
- 74Q. You said you practiced at 60 degrees of bank on that initial turn. Why would you use rudder there?
- 74A. There's really no reason to. Like I said before, the way I understood it, 45 to 60 degrees of bank, no less than 45 degrees of bank, which is always what I kept in the back of my head. But we were taught to use 60 degrees of bank.

[The board took a recess.]

### **Questions by the President:**

- 75Q. You said on the initial turn to 80 degrees, you would time a range of 7 to 10 seconds. Did you ever use longer than 7 seconds?
- 75A. In the sim. I don't think it was planned that way. We just got a little bit behind, so we extend it.
  - 76Q. You basically trained to 7 seconds all the time?
- 76A. Seven would be on the short end of it. I was never the first flight or the first sim that MP did. What would happen, they went in the sim the day before us, or they flew Friday before we flew -- and said this is what worked, so we'll use this. That is how it was briefed to us.
- 77Q. When you went out to the airplane, or in your simulator profiles, what was the heck on the clock?
  - 77A. That is what I cannot remember. I think for the flight, I think it was 9 seconds.
  - 78Q. On the flight, so why did you go to 9?
- 78A. I can't remember. They just that said it worked out better than what they had initially planned -- mission planned.

- 79Q. You confused me. You said I had a range of 7 to 10 seconds. Then I asked you: What did you train for? You said 7 seconds; but, I went to 9 seconds on the airplane. Is that correct? Did I get that right?
- 79A. No. The range was -- that was kind of an average range that I saw while I was flying. The actual time was never like: This is what we will do every single time. It was more of----
  - 80Q. So, what was the standard that you trained to?
  - 80A. 7 to 10 was what we were taught.
  - 81Q. Why would you go to 10 versus 7?
- 81A. If we had winds pushing us farther out -- excuse me, headwind -- or, we did not have enough displacement.
  - 82Q. If it was a no wind situation, what was it?
  - 82A. I never had to do that because----
  - 83Q. In a simulator, if you had no wind, what would time for?
- 83A. No, that's what I'm saying. It was always the -- like when we showed up for our simulator, MP sat with us and he showed us the profiles they flew in the sims using the same weather. And they said we did 8 seconds, for instance. I cannot remember if that's what it was. He said that that time gave us enough displacement to make the turn inbound. So that is what we would use.
  - 84Q. When you say "to make the displacement," what was that displacement?
- 84A. It was never briefed. Like I said "displacement" enough to make the turn back inbound without overshooting the runway, or undershooting. That is the way I understood it.

### **Questions by the Legal Advisor:**

- 85Q. I just want to clarify. "Displacement," what is displacement?
- 85A. Distance, offset from the runway. If the aircraft was parallel to the runway, the distance between the aircraft and the runway -- the centerline of the runway.
- 86Q. Displacement encompasses the area, within the turn, in order to get back to the runway?
  - 86A. Correct.
  - 87Q. You said "they" had worked it out in the sim the day before? Who is "they"?
- 87A. The day before, it was MP MSO and one other pilot. I can't remember who it was.

### **Questions by the President:**

- 88Q. I have one question I need to clarify. As precise as these maneuvers are, you had a range of 7 to 10 seconds to get your displacement, but you all never talked about what displacement should be, never? You never talked about the parameters that you should fly, ever, is that what you're telling me?
  - 88A. The actual distance displacement, I don't remember being briefed, no.
- 89Q. As precise as you are talking about maneuvering the airplane, that was never discussed?
- 89A. Not in the briefs that I was at, sir. They made us the mission planning cards. I was not at the mission planning when they determined the headings and the arrows and the timings that they based it on. I'm assuming they talked about it, to say: Hey, how long is it going to take us if we are flying this air speed to get a set displacement? But, no, I didn't, specifically, brief that. I was given a card that said this is what we came up with.
- 90Q. You did not question anything about the card? You just go: That's great; thank you; I'll fly?
  - 90A. Because we had done it in the sim and it looked similar.

PRESIDENT: Are there any other matters you want to talk about this investigation that would help us?

WITNESS: No, sir.

PRESIDENT: You are reminded of the official nature of this interview. You may not discuss your testimony with anyone without my permission. Is that understood?

WITNESS: Yes, sir.

PRESIDENT: At any time before this report of this investigation is officially released to the public. This concludes the interview.

The time is now 1638 local, Alaska time.

[The board recessed at 1638, 20 September 2010.]

[The board reconvened at 1736, 20 September 2010.]

[The witness was reminded that he was still under oath.]

PRESIDENT: when we ended our interview today, I got the impression you may not have said everything you wanted to say and that my questions, tone, and pacing indicated frustration, on my part, in that I was seeking particular answers from you. I want you to know

that I was not targeting you or seeking specific answers from you. I want you to be able to answer my questions fully and to the best of your knowledge, ability, and recollection. With that in mind, I bought us back on the record to make sure that you have the full opportunity to clarify any questions that you gave during the previous interview.

91Q. We were last discussing your training regarding the timing on the outbound portion of the initial 80 degree heading from the initial takeoff and the 12-minute program. Do you want to add or clarify anything about that?

91A. I guess I would say that, I think there was a little misunderstanding when I said 7 to 10 seconds time outbound. It was not a range, if we turn in that window, we would be good. I was simply using that to refer to the average of what I saw every time I flew it, based on our notional time. But there was a time briefed, prior to each, either sim or flight, that we were expecting to use "a turn no earlier than time" based on what was a predicted displacement for the profile. What I was saying was when the mission planned for our flight, they used the notional time they had calculated in mission planning, I assume, and then when profile the day before, realized that this time worked as a notional time to start in the training profile, so we were all briefed: We will use this time for our turn. So, it did not have to be in between 7 and 10 seconds, but there was a time that we did establish, as a crew, that we were going to wait before we started our turn inbound. And then there were a few times in the profile MP being the instructor, specifically told us they were extending that time when because he could see that we did not have the proper displacements. I remember him starting countdown from 10, maybe, when I expected him to count from 8, 7, 6, 5, and he would start from 10. I think there was a little confusion as to -- it wasn't like: Hey, we're going to use 7 to 10 seconds every single time. It was varied.

PRESIDENT: All right. Are there any other matters that we have not covered that you believe is important to this investigation?

WITNESS: No, sir.

PRESIDENT: You are reminded of the official nature of this interview. You may not discuss your testimony with anyone without my permission and at any time before the report of this investigation is officially released to the public. This concludes the interview.

The time is now 1745 local, Alaska time.

#### V19. AIB INTERVIEW WITH

### WITNESS 19

#### VERBATIM TESTIMONY OF

### WITNESS 19

PRESIDENT:My name is Brigadier General Carlton D. Everhart, II. We are here investigating the C-17 accident that occurred on 28 July 2010 at Joint Base Elmendorf-Richardson, Alaska. This investigation, conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 91-204. The purpose of this investigation is to produce a publicly releasable report on the facts and circumstances surrounding the accident and to gather and preserve evidence for use in claims, litigation, disciplinary actions, and adverse administrative proceedings, and for all other purposes. A safety investigation was previously conducted on this accident. Any testimony you gave before the safety investigation board will be kept confidential, if you were so advised, and can be used only for accident prevention purposes. This board does not have access to any of the confidential testimony that you gave before the safety investigation board. Your sworn testimony to us may be used for any proper purpose. Additionally, the testimony can be released to the public. Do you understand the difference between your testimony before the safety board and this accident board?

WITNESS: Yes, sir.

PRESIDENT: Your testimony today in this investigation will be under oath. At this time, I will administer the oath. Please stand and raise your right hand.

[The witness did as directed.]

PRESIDENT: Do you solemnly swear that the testimony you're about to give in the matter now under investigation shall be the truth, the whole truth, and nothing but the truth, so help you God?

WITNESS: I do.

PRESIDENT: Please be seated.

[The witness did as directed.]

PRESIDENT: Today is 20 September 2010, and time now is 1311 local Alaska time. This interview is being conducted in building 7309, room 106, Joint Base Elmendorf-Richardson, Alaska. The persons present are:

The witness, [ WITNESS 19
myself, Brigadier General Carlton D. Everhart, II, Board President;
Pilot Member;
Legal Advisor;
Maintenance Officer Advisor;
Medical Advisor;
Maintenance Advisor; and
Court Reporter.

### **Questions by the Board President:**

- 1Q. Please state your full name and rank.
- 1A. WITNESS 19

LEGAL ADVISOR: I'm sorry, sir. You need to make a clarification that also the witness has been sworn.

PRESIDENT: And the witness has been sworn. Thank you.

- 2Q. How long have you served in the Air Force?
- 2A. Eight years.
- 3Q. What is your unit assignment and location?
- 3A. 517th Airlift Squadron, Joint Base Elmendorf-Richardson.
- 4Q. How long have you been with this unit?
- 4A. Approaching 3 years.
- 5Q. What is your job title?
- 5A. 517th Director of Staff.
- 6Q. How long have you been doing this job?
- 6A. Two weeks.
- 7Q. First of all, were you ever a Readiness Flight Commander?
- 7A. Yes, sir.

- 8Q. Can you please describe your duties and responsibilities as the Readiness Flight Commander?
- 8A. Yes, sir. As the Readiness Flight Commander I was responsible for ensuring that members were properly trained and equipped to deploy worldwide, for ensuring that we deploy members and re-deploy members with the proper training and equipment, and also monitor AF reporting to Defense Readiness Reporting System. That pretty much sums it up.
- 9Q. Prior to this you made a non-privileged statement to the safety board and it's transcribed as now as a part of Tab R. Have you had a chance to review it?
  - 9A. Yes, sir.
- 10Q. That statement was not taken under oath. Do you want to adopt the statement as part of your testimony today?
  - 10A. Yes, sir.

PRESIDENT: As we go through this, we understand that you may have some clarifications, which is perfectly fine. We'll also have some follow-up questions, but if you need to clarify them, we'll get there as we go along. Okay?

- 11Q. Are you a demo-qualified aircrew member?
- 11A. No. sir.
- 12Q. I would like to talk to you about some things that you mention in your earlier testimony. You talked about how good of a friend you and MCP were. Correct?
  - 12A. Yes, sir.
  - 13O. Have you ever flown with him?
  - 13A. Yes, sir.
  - 14Q. Please tell us about those instances when you've flown with him?
- 14A. I have the upmost respect for MCP as an aviator as well as all the other facets of his life. The instances where I've flown with him, he's been a constant professional, an extremely competent pilot. I flew with him -- the last time that I definitively remember flying with him was just prior to his departure for Instructor Pilot School at Altus. We did a local training at Allan Army Airfield and MCP did a great job. Obviously, as a result of that flight, he was recommended to continue in his training and progressed towards Instructor Pilot School at Altus.
- 15Q. When you say he did a great job during that flight, what did he do that was so good?
- 15A. I specifically remember there was some issues with some pattern work at the beginning. I think he was just knocking some rust off, but there was definite progression with each pattern. By the end of that sortie after five or six VFR patterns, or visual flight ----

- 16Q. Visual Flight Rules?
- 16A. Yes, sir. He was back up to speed exactly where he should have been for the crew qualification that he held.
  - 17Q. You said also that both of you were on the same wave length. What does mean?
- 17A. We both shared similar philosophies as far as flying the C-17, how we handled office work, the perspective that we had about our families and just a general attitude: Laid back is the word that comes to mind. I don't know if other people would agree with that, but -- and I don't know if laid back is the exact right word because MCP was kind of at both ends of that scale and that's a very complicated thing for me explain. You all probably don't care about that, but he -- I think we just looked at the world the same way.
- 18Q. Now when you said both ends of that scale, so he could be laid back at one time and then what we would call a Type A at another time?
- 18A. Yes, sir. I'll take a couple of minutes and try to sum this up the best I can. But I knew MCP since pilot training and he can get spun up very easily and he's always stressed is a good word. Good stress. He's always feels the stress to perform and it's the little things and the big things, but he never -- that stress doesn't affect his good nature and his personality, i.e., you can enjoy MCP when he's stressed or when he's not stressed. I would call that stress healthy for the most part. But he wore it more on his sleeve so you knew when he was dealing with a lot of stuff because he just talked about it and it showed.
- 19Q. Now as you said you flew with him, did that stress ever make it into the cockpit you think or --
- 19A. I think the best way for me to describe that is the stress made it up to the cockpit or up to the mission brief. He might talk a lot about how he was not looking forward to a certain aspect of the flight, or how -- I remember a lot of MCP from pilot training because that's a very influential time in your life. The guy would be through the roof going into a flight just almost work himself sick, but go up and do an incredible job. So the guy could perform. I would say that that's similar -- that was a similar mindset that he carried now but just toned back a lot because you don't have that intense day-to-day pressure to perform in this environment.
- 20Q. Also, you stated that he was a conservative flyer like you. What does that mean? 20A. I mentioned in that brief to the safety board about the two different aspects of the airplane: the tactical and the more strategic air/land portion. MCP -- or MCP didn't -- I think neither one of us really enjoy max performing the C-17 in a tactical environment. We prefer to take off, do an ILS, full stop, and dump the toilet paper and the fruit out the back and go to bed. I mean, that's really the best way to put it. Flying low levels and doing threat reactions, we did it because that was our job, but that's not the place that we like to really hang out.
  - 21Q. You mean the hang out as far as the flying envelope?
  - 21A. Yes, sir.

- 22Q. Then you said -- just then you mentioned "max performing," what is max performing? What does that mean to you?
- 22A. Well, it means taking the airplane to the limits that the regulations allow, which for a big airplane I'd say those are fairly liberal compared to other big airplanes.
  - 23Q. And you base that off of?
- 23A. Well, opinion because I don't know -- I knew what I did in the C-21. That's the only other airplane I flew. It was a small airplane and we definitely fly this large airplane more aggressively than we did the C-21, but a completely different mission as well.
  - 24Q. You talked with MCP on the day of the mishap?
  - 24A. Yes, sir.
- 25Q. You said that he was in your office right before he stepped or right before he briefed.
  - 25A. Yes, sir.
- 26Q. Was that before he stepped to the jet, or was it before he went to his mission brief for that flight?
  - 26A. It was before the mission brief.
  - 27Q. Can you tell us about that conversation please?
- 27A. It had been a stressful period in the squadron for MCP and I. It had been a stressful week, and I would say a particularly stressful day. Not extra-ordinary or extraordinarily stressful, but stressful: a lot going on and a lot happening that day that had to be taken care of.
- MCP came to my office and shut the door and we just kind of shot the bull, de-briefed each other, which we did frequently just to relieve some of that stress. That particular conversation focused on some of the events that had happened that day, and I mentioned that in the safety investigation, i.e., the two missions that had dropped to the squadron that we had to fill. We had spent a lot of time trying to make that happen that day because those folks, I think they were -- I'm trying to remember. This may not be exactly accurate, but I'm pretty sure we were inputting two crews into a stage and one was leaving that next morning and the other one shortly thereafter. So it was extremely urgent.
  - 28Q. The just for the record, a "stage" is?
- 28A. A stage is essentially a particular place, like Charleston, where we send an aircrew without an airplane and then Charleston utilizes that aircrew with their airplanes to go do the mission.
  - 29Q. So you were talking about the conversation.
- 29A. We were talking about that. We were talking about -- MCP and I were both intimately involved in the booster club. I was the president and he was the vice president. It sounds a little silly, but like we were all in on that booster club and we had made a ton of money for the squadron and done a lot of things and this airshow was like the pinnacle of that.

We just had a great plan and everything that went into executing that plan was on our plate.

MCP was involved in a lot of the aspects of the airshow from the demo to the booster club portion of it to being the Ops Flight commander and organizing some of the logistics of the crews that were going to man the airplanes and the flightline. So he was -- he had all that on his plate that week and those were the things we discussed in that conversation. Towards the end of that conversation we talked about this demo profile. It was not the first time we had talked about it, but it would be hard for me give you factual information about conversations previous to that. All I can tell you is that I know we talked about it. This conversation

Supposed to be on the airplane so that was a little added stress for him because of all the things that I mentioned earlier, MCP desire to perform. Then he talked about -- let me caveat this with I can't -- all I can give you is my general impression of what transpired in that conversation. I can't tell you exactly what was said. So this is the general nature, but not specific quotes from MCP. But he talked about how the profile made him nervous. I know that the word

MCP But he talked about how the profile made him nervous. I know that the word nervous was used, and I know that the word scared ---

PRESIDENT: It's okay. It's okay. Just hang on. We'll take a break right here.

[The board recessed at 1324 hours, 20 September 2010, due to an earthquake. The board resumed at 1327 hours, 20 September 2010.]

LEGAL ADVISOR: I just wanted to clarify that all attendees to the interview prior to when we took a break are again present to include

#### **Questions by the President:**

witness 19 right prior to the break you were talking about the conversation 30O. MCP stepping to the aircraft. If you please, the floor is yours. that you had prior to MCP mentioned that the profile made him nervous. In fact, he left my 30A. So office at the end of the conversation and he actually stepped back into the doorway and said, "You know, it just scares me a little bit." That is a quote. Now let me be sure and caveat or put some context around all these statements that he made. That was he never alluded to the fact that that profile was being flown out of regulations. He never alluded to the fact that anybody on the demo team was -- you know -- scared him. It's just the nature of the profile that flying that aggressively that low to the ground. I mentioned this in my safety interview that I know that he said sometimes he felt like kind of putting his hand up and blocking the stick. I know that flying that profile with his head down for a majority of the time didn't make him feel good physically and it made him nervous because he had a lower situational awareness on what was actually going on with the jet at whatever point in the profile they were at.

- 31Q. Now you just said "putting his hand up and blocking the stick." What portion of the maneuver was that in?
- 31A. What I believe -- the impression that I'm left with now is that it was a bank angle that he wanted to -- he wanted to limit the bank angle on the airplane or the roll -- the rate of roll into that bank angle. Does that make sense?

- 32Q. In your statement you responded to a question by **CAPT H** about whether he mentioned the week prior or last week about the airshow profile itself. There, again, you said he wasn't comfortable there. What did you mean by "not comfortable there"?
  - 32A. Could you read that question again, sir? I'm just trying to --

PRESIDENT: Yeah, you said Captain -- we'll get the question right here for you. But about whether he mentioned anything in that last week about the airshow profile, and you said he wasn't comfortable there. Please,

LEGAL ADVISOR: Yes, sir. I am reading from Tab R38.

- 33Q. The question from **CAPT H** was: Had he mentioned earlier then that last week or so practicing about the airshow profile.

  Had he mentioned earlier then that witness 19 response at the time: He had mentioned it before -- you know -- and I can't tell you a specific time and place, but it was -- it wasn't new news to me that day. Okay. I knew that he wasn't comfortable there.
- 33A. Wasn't comfortable -- he wasn't comfortable in that profile. I said this in the safety interview as well and I want to caveat this again with he was proud to be on the demo team. He was comfortable enough to fly the profile and I believe that he definitely had a threshold. I don't want to be insensitive, but prior to this I would have said that he had a very healthy safe threshold that would have prevented something like this from happening. But, obviously, we're here now. That's the label I would attach to MCP up there with the most conservative aviators that I know. He would definitely be in that category. So just by that classification, this demonstration profile would not be a comfort zone for MCP I also said in the safety investigation that that's not necessarily a bad thing in my opinion, the way that I -- the impression that I was left with: A bit of healthy fear, healthy respect for how close you are to the threshold of being unsafe.
  - 34Q. What is a healthy fear? What are you saying?
- 34A. A healthy respect of how fine the lines are between being in control and out of control, being safe and unsafe. I mean, that's why we write regulations because there is a point we cross from being safe to unsafe. We try to build margins so that we stop short. But I believe that -- I do not know because I'm not a demonstration pilot, but I believe that the nature of this demonstration reduced those margins a little bit. Fear might not be the best word, maybe a healthy respect for sensitivity of that line.

PILOT MEMBER: If I may, sir.

#### **Questions by the Pilot Member:**

- 35Q. WITNESS 19 have you had a chance to look at the demonstration profiles in the 11-246?
- 35A. I have not. I have not and I've purposely not looked so that I could convey my impressions. I have seen the -- I've obviously seen the demonstration, and I've seen the video of a practice demonstration.

# **Questions by the President:**

- 36Q. You said that a significant part of that really bothered him and that you weren't the only person that he told that to. What significant part of the profile? That's what I believe that's what you were alluding to -- and correct me if I'm right or wrong.
- 36A. I apologize for it. I just want to make sure I get this question right. Can you read that one more time?

PRESIDENT: Sure.

LEGAL ADVISOR: I can assist.

# Question by the Legal Advisor:

- 37Q. It was at the end of that same question about the last week or so of practicing about the airshow profiles. You were talking about the -- the quote is: I don't know any other way to say it other than there was just a significant part of it that really bothered him. And that I wasn't the only person that he told that to, you know. I know that.
- 37A. That really is -- I can try to clarify that, but the bottom line for WITNESS 19 and the impression that I had was that he was just -- he was not comfortable. Flying this demonstration profile was not a comfortable place for him relative to taking the airplane off and flying at a three-quarter flight -- visual flight rules pattern doing a touch-and-go, or doing an instrument approach to a full stop. There were just things that made him uncomfortable.
- 38Q. Do you think the discomfort was caused by the profiles, or was it caused by who was flying them, or it was caused by how they were flown?
- 38A. I believe, WITNESS 19 that it was caused by the aggressive nature of the profile itself, i.e., the maneuvers that are flown in the profile compounded by the aggressive nature that the profile was flown, i.e., rate of roll, bank angle, hard parameters.

PILOT MEMBER: If I may, sir.

## **Question by the Pilot Member:**

- 39Q. Just to establish that when say the "aggressive nature of the profile," that's the profile that you are familiar with, that you have seen, but not necessarily that you can confirm is the same demonstration profile from the AFI 11-246?
  - 39A. Correct because I've never read the 214.
- 40Q. Just one more clarification: Have you seen other profiles being flown other than here at Elmendorf and performed by other units?
  - 40A. No. sir.

# **Questions by the President:**

- 41Q. Talking about this part that bothered him, did you talk to him about that?
- 41A. I did. The context for me this is this general sense from MCP on this profile is not out of character with who I knew him to be and what I thought him to be as an aviator. Because I would have been -- I would have described myself as uncomfortable in that profile. Does that make sense? So when I use terms like "uncomfortable" and "aggressive," those are all relative terms towards WITNESS 19 and what I think that go back to me looking at

MCP through my own eyes because I did believe that we think a lot alike. So that's why I project a lot of that onto him, the way I would think. So when I say a "significant part," I mean that he was proud to do it, but mostly

MCP was uncomfortable doing it.

#### PRESIDENT:

LEGAL ADVISOR: Thank you, sir.

## **Questions by the Legal Advisor:**

- 42Q. Just to clarify: You had mentioned earlier that you had watched the video of the demonstration flight. Is that correct?
  - 42A. Correct.
  - 43Q. Do you know who was flying in that video that you saw?
  - 43A. Well, I ----
  - 44Q. What video was that? When was flight, or when did you see the video?
  - 44A. I saw the video recently when I provided it to this board.
  - 45Q. So are we talking the 9 July video?
  - 45A. Correct.
  - 46Q. You saw it recently?
  - 46A. Correct.
  - 47Q. You didn't see it before the mishap?
  - 47A. I did not.
- 48Q. Did you watch -- you just watched the video but not the actual demonstration flight itself in person?
- 48A. Correct. Well, I actually -- I have watched the demonstration flight and this is -- I just remembered this for the first time. I was in a car with folks from the squadron coming back from lunch and we pulled over at the end of runway 06 as those guys were taking off and practicing that profile and watched it.

- 49Q. Do you know who was flying on that day?
- 49A. Well, I don't know. That's probably the fairest answer.
- 50Q. Do you know what day it was? The date?
- 50A. I don't for sure.
- 51Q. If you do think of the date, can you let us know after this interview if you do remember the date?
- 51A. Yes. Yes. I'm fairly certain that it was or I don't know if he was flying; he was in the airplane.
  - 52Q. So he was on the flight deck somewhere?
  - 52A. He was somewhere in the airplane.
  - 53Q. What makes you say that?
- 53A. Remembering the reason that we pulled over and some of the conversation in the car and that's one of those deals where I couldn't tell you exactly what we talked about, but I knew that we were laughing and joking about MCP
  - 54Q. Laughing and joking in what sense?
  - 54A. Just critiquing the profile in a joking manner.
  - 55Q. So in other words just in a friendly manner?
  - 55A. Yes.
  - 56Q. Because he was one of your good friends?
  - 56A. Correct.
  - 57Q. You had the upmost respect for him and his flying abilities.
  - 57A. Correct.
- 58Q. In critiquing him, you mean like oh, look at how he did certain things or look at how that aircraft is doing certain things?
- 58A. Yes. Yes. And the context of the joking was more on the conservative side because a lot of people had that impression of MCP as a conservative pilot and so flying the airshow profile conservatively.
- 59Q. So fair to say that when you saw that day when you pulled over in the car and watched the C-17 performing an aerial demonstration profile, it looked conservative to you?
- 59A. The portion that I remember -- somewhat remember joking about was the initial take off and yes, we were joking about the initial rotation attitude not being as aggressive as you'd normally see in an airshow profile.

- 60Q. What else did you see about that profile? You watched the initial take-off. How much more did you watch after that?
- 60A. We watched those initial two turns back to the flightline. I think they may have practiced that a couple of times, but I don't remember anything out of the ordinary.
- 61Q. Were you able to observe from your position anything about those turns, bank angles correct?
- 61A. Well, WITNESS 19 opinion again having zero knowledge -- or never having flown that profile, I remember thinking man, that's aggressive. I use that word a lot because I fly 30 degrees bank unless I ----
  - 62Q. So aggressive in that instance meant what exactly?
- 62A. Just a high and accelerated rate of roll and bank angle that you're just not used to seeing from an airplane that big, that close to the ground.
  - 63Q. Were you able to estimate the bank angle that you were not used to seeing? 63A. No, that would be -- I think it would probably be irresponsible for me to guess. Yeah.
  - 64Q. What about that video? When you watched it, what did you observe?
- 64A. Well, similar to the -- I mean when I watched the video, there's a whole another context for looking at that thing so I don't think I could really offer a good opinion, an objective opinion about that video other than it invoked some of the same feelings when I watched that practice.
- 65Q. And you said you couldn't be objective; it's because you've watched it after the mishap. Is that correct?
  - 65A. Correct.

LEGAL ADVISOR: Sir, that's all I have.

# **Questions by the President:**

- 66Q. Going back to the significant part of your conversation, you said that he had talked -- that you were not the only person that he'd told that to. Who else did he tell it to?
- 66A. Well, he had watched that demo from the roof with some other guys in the squadron and essentially offered a running critique of the demo while somebody else was flying it to other guys in the squadron.
  - 67Q. Do you remember who was flying it that day?
  - 67A. I don't. I don't know who was flying the airplane.

- 68Q. Was it a habit or when people were practicing the aerial demo, would people go upstairs and watch it on the roof?
- 68A. I think that -- I don't know if it was a habit. I never did it. I mean, it's a great opportunity to get away from the office. I think everybody was always interested in watching that profile just because it's cool to watch. So when they had an opportunity, they would.
- 69Q. Then that day, do you remember who was watching the demo on the roof?
  69A. The day of the crash? Oh, on the day that MCP was up there? I don't know -- I think that WITNESS 21 was up there with him.
- 70Q. Then were there people -- you just mentioned on the day of it -- on the day of the accident of 28 July, were there people up on the roof watching it then?
- 70A. That I don't know. I know that there were a lot of people that saw that accident. I just -- because of the time of day that it happened. I mean, that's -- so you have trouble deciphering who saw what where and for what reason. I have heard that -- I knew that Wing PA was supposed to video -- be videoing that day. And I knew that was supposed to be flying on the airplane that day, so that was a -- it was close to the airshow, so that practice in particular seemed more familiar to me, but that was probably because I was with MCP all day and all week. That was part of the conversation; obviously, that leaves an impression on you when something like that happens.
  - 71Q. Do you know of anyone else who had seen the accident?
- 71A. Well, I know that the reason that I was sitting at my dinner table when the phone call came into my wife -- somebody that works with my wife who saw the accident. In a round-about way they were trying to ask where I was and when they figured out I was at home, then they told her they just saw the plane crash.
  - 72O. Who was that?
- 72A. His name is MP something. I mean, I could figure it out, but I don't know it right now. MP -- yeah, I'd have to call my wife.
- 73Q. Did MCP ever mention -- MCP did he ever mention using knock-it-off calls or time-out calls during the profiles?
  - 73A. I don't recall him ever mentioning that.
  - 74Q. Did you ever attend any of the pre-briefs or aerial demonstration briefs?
  - 74A. I did not.
- 75Q. MCP told you they get a lot of stall warnings during the airshow profile. You said that the impression that you had is that they were somewhat desensitized to the warnings?
- 75A. I want to clarify that statement just a little bit because I don't remember him saying anything about the stall warning necessarily. I think maybe that's an impression I developed as a result of -- I don't know exactly what -- I mean, it's probably for a good reason,

but I just can't tell you definitively where that came from. I do remember him mentioning the ALS flashing. That I do know.

- 76Q. What did he say about that?
- 76A. That was in the context of the conversation -- part of the conversation where he was talking about being a little uncomfortable and the profile being a little aggressive and him -- I can't quote him and I can't tell you exactly how much the ALS flashed, but it flashed enough for him to mention it.
- 77Q. Then for the record: If the ALS is flashing, that's a subsequent set of the stick shaker and the stall warning. Correct?
  - 77A. Yes, sir.
- 78Q. So for the ALS to flash, then the stick shaker and the stall warning had to have been going off. Correct?
  - 78A. That is the assumption that I had.

## **Questions by the Legal Advisor:**

- 79Q. Just for clarification: When you say assumption, how long have you been -- your current rating is what?
  - 79A. Instructor pilot.
  - 80Q. In the C-17?
  - 80A. Yes, sir.
  - 81Q. How many hours do have?
  - 81A. In the C-17?

#### LEGAL ADVISOR: Yes.

WITNESS: About 1200.

- 82Q. So based on your experience, the ALS flashing would come --?
- 82A. With the stick shaker and the stall.

## **Questions from the Pilot Member:**

- 83Q. What is the ALS mean to you from your -- based on your experience?
- 83A. That I'm approaching a stall condition; that I need to -- it's basically a warning to gain situation awareness on what you're flight parameters are and fix something.

# **Questions by the President:**

- 84Q. How would you fix that?
- 84A. Well, reduce my bank angle, push the power up and lower the nose.
- 85Q. The ALS constantly flashing, did you ever hear any other demo crew members talking about that?
- 85A. I did not. For the record: I never heard any other -- I work with a demo crew member in my office; I never heard anything from him that wasn't positive.
  - 86Q. Who is that demo crew member?
  - 86A. WITNESS 18
- 87Q. Have you ever heard anyone talk about the differences between flying the simulator profile versus actually flying it in the airplane the air demo profile?
  - 87A. No.
- 88Q. MCP also told you that he wanted to -- well, we talked about that. Talking about stick my hand up there and stop the aggressive movements, but you said it was bank angle specifically just to clarify that.
  - 88A. [Affirmative response]

PRESIDENT: Thank you.

89Q. You mentioned earlier that he felt -- specifically really about flying the demo with 89A.

MCP felt a little bit spun up about with witness 16

PRESIDENT: WITNESS 16 Thank you.

- 90Q. What was he spun up -- I mean, what was his concerns?
- 90A. Well, once again, this is completely consistent with the known from the beginning. Just the fact that you've got a senior officer on board the airplane and you don't want to look like an idiot in front of him.
  - 91Q. He wasn't worried about the profile itself or anything like that?
  - 91A. No. Nothing about -- just not screwing up.

- 92Q. Then you also mentioned that -- you said during the demo profiles the aircraft was "going to 60 or past 60 and that was an uncomfortable thing for MCP What did he tell you -- what did he specifically tell you about that?
- 92A. I think that I wasn't -- to clarify that statement I don't think I was quoting MCP I think I was quoting my impression of kind of the nature of the discussion with MCP So I was left with the impression that they were going to 60 degrees of bank, which is consistent in my mind with what I've seen of that airshow profile.
  - 93Q. Did he ever mention going past 60?
  - 93A. He -- I can't give you a definitive answer on that question.
  - 940. Did he allude to it?
- 94A. I think he alluded to it. That's the best -- I apologize. That's a crappy answer, but I can't -- I'm going to tell you that I made that statement because I thought that he may have alluded to that. Unfortunately, that's the best I can do.
- 95Q. In the same conversation that you had with MCP you said that you got the idea that he was more comfortable with MSO in the seat other than with

MP Why was that?

- 95A. I know he was friends with MSO I know that MP was -- I'd call him a good dude, but he was -- probably the best analogy I can give if you've got to go up and fly a check ride and you've got to pick between MP or MSO I would have picked MSO and I don't even know him that well. Because MP seemed like a very by-the-book guy -- you know what I'm saying. It was a little intimidating in that sense and I don't think a quiet -- I think is what I said in the safety board, but thinking about my impression of MP a little further, he just seemed like a very knowledgeable intelligent by-the-book evaluator. I'd flown with him once a long time ago and the impression that I had with him when he flew that was fairly consistent is he's not scared to tell you when you're screwing up and he's not one to really sugarcoat things.
  - 96Q. What makes you say he was by-the-book?
- 96A. He's an evaluator, which we think all those guys are by-the-book. I do. Very experienced in the C-17, just that's the impression I was left with. So I couldn't -- I'm not doing you a favor by giving you anything specific, but it's hard for me to recall anything.
  - 97Q. Did MCP ever mention anything called the aerial demonstration checklist?
  - 97A. Not that I remember.

PRESIDENT: Why don't you take a break right now and just so we can collect our thoughts here and then we'll give you a call in just a couple of minutes and then bring you back in if we may.

WITNESS: Okay.

[The board recessed at 1358 hours, 20 September 2010.]

[The board reconvened at 1409 hours, 20 September 2010.]

LEGAL ADVISOR: Yes, sir. All attendees to the interview are again present to include witness 19

PRESIDENT: Just have two questions for clarification in your testimony today.

### **Questions by the President:**

98Q. You said that MP was by-the-book. What did you mean by that?
98A. What I meant is pretty much -- this is a perception that I had based on man,
whatever. Working in the office and the interactions that I did have with him, which that's a hard
thing to really define in this case for me. I perceived him as by-the-book because the few
occasions that stand out in my mind were -- it was like a training day or something similar to
that. It was an aircrew conversation. MP was a leader in that discussion and very
adamant about procedure in the C-17 that was up for debate or discussion. He was, obviously,
the most knowledgeable person in the room on the subject and had -- the answers that he offered
were by-the-book in this debate versus whatever the conflicting opinions were out there. That's
one conversation that I can think about.

- 99Q. And you know they were by-the-book because you went and referenced it afterwards or how did you --?
  - 99A. He referenced the regs there.
  - 100O. He referenced it then?
- 100A. Yeah. I couldn't tell you what the conversation was about now though. That's the sense I got from everybody else about him was that he was an expert in the C-17 and he operated by the book and that's why he was an evaluator and I know that we're a guard and an active duty unit together. The active duty folks relied on the opinions and knowledge of the guard folks and he was one of them.
  - 101Q. For my own edification then, what was his reputation in the squadron?
- 101A. He was respected. I would not -- this is strictly WITNESS 19 speaking. He's not the guy I'd want to go over and drink beer with at night, but I know some people did. I believe that he was well thought of in general, a good guy. Maybe not very outgoing and friendly by nature, but not to detract from what I think and what I think other people thought about his expertise in the jet.
- 102Q. Then you said if you had to fly with either MP or MSO you said you were more comfortable with MSO Why was that?

  102A. I'll first of all say that I had less interaction with easier personality for me to digest, MSO that is versus MP

103Q. Then I think you used the word when you described MP as intimidating. What do you mean -- what did you mean?

103A. Yeah, that's an accurate word I think. Well, I would say I'm not easily intimidated, but I am somewhat intimidated by I think someone I would somewhat respect and I respect his knowledge base and my lack thereof at different times in my progression in this airplane. I would compare it to any young aviator in an aircraft that's somewhat intimidated to fly with a person that has a reputation for knowing an airplane very well and holding other folks accountable for what they do or don't know about that airplane. Obviously, as a young co-pilot you're not going to know everything.

LEGAL ADVISOR: I just wanted to ask a follow-up on that.

# Questions by the Legal Advisor:

- 104Q. It sounds like he had a reputation for holding folks accountable for things, and by accountable I think you meant -- and I'm not sure what you mean, so tell me if I'm wrong. But that he would challenge -- or he would discuss certain viewpoints?
- 104A. He would not hesitate to verbalize a critique that he had or a better technique, if that's the way he felt.
  - 105Q. What gave you this impression?
- 105A. That's a tough one. I flew with him a long time ago and I would say that's certainly where that impression started. I mean, I had it a little easier because I was a prior qualified pilot in another airplane, so I wasn't brand new. But I would say that most likely that impression has developed from seeing his interaction with other young co-pilots, hearing other young co-pilots talk about him. You know, you all, this is one of those things that really difficult to verbalize because it only takes one or two stories to form an impression about somebody that you don't know that well. That's the category that I would put this into.
- 106Q. Understanding that maybe one or two stories is all you've heard in the last year and you didn't know MP very well, but you do have this impression and I was just trying to figure out where it came from. You said you had talked to younger pilots. Well, let me ask you: first, did you ever talk to MP in this regard?
- 106A. I can't give you a definitive answer. That's a tough question. Like there's a lot of things I want to speculate about, but I can't -- it's hard for me to give you facts to back up things I speculate about. So it's a difficult question for me to answer.
- 107Q. Maybe if I may, it sounds like since your knowledge is based over -- you've been here for about 3 years and you may have heard things here and there, but you can't remember them specifically. Fair to say though that it sounds like from your answers that you do have this kind of idea about it, but you're not sure what exactly that brought you to that idea?
  - 107A. That's a great way to describe it.

108Q. So you'd agree with that?

108A. Yes.

- 109Q. Then also that you -- fair to say that you had conversations with maybe on the subject of MP but you can't remember exact conversations?

  109A. Yes. That is fair to say.
- 110Q. Again, to be fair, you've had conversations with other younger aviators in the squadron along the same lines of MP reputation perhaps?

  110A. Yes, but not recently.
- 111Q. Not recently. So again, your memory is not as good about specifics, but just the general feeling that you had?

111A. Correct.

112Q. And that's what you meant by you don't want to speculate because you only have a general feeling?

112A. Correct.

LEGAL ADVISOR: That's all I have, sir.

## **Questions by the President:**

113Q. Were there any other matters that we haven't covered that you believe may be important to this investigation?

113A. No, sir.

PRESIDENT: You are reminded of the official nature of this interview. You may not discuss your testimony with anyone without my permission and at any time before this report of this investigation is officially released to the public.

PRESIDENT: This concludes this interview. Time now is 1421 local, Alaska time.

### V20. AIB INTERVIEW WITH

## WITNESS 20

#### **VERBATIM TESTIMONY OF**

# WITNESS 20

PRESIDENT: My name is Brigadier General Carlton D. Everhart, II. We are investigating the C-17 accident that occurred on 28 July 2010 at Joint Base Elmendorf-Richardson, Alaska. This investigation, conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 91-204. The purpose of this investigation is to produce a publicly releasable report on the facts and circumstances surrounding this accident and to gather and preserve evidence for use in claims, litigation, disciplinary actions, and adverse administrative proceedings, and for all other purposes. A safety investigation was previously conducted on the accident. Any testimony you gave before the safety investigation board will be kept confidential, if you were so advised, and can be used only for accident prevention purposes. This board does not have access to any confidential testimony you gave before the safety investigation board. Your sworn testimony to us may be used for any proper purpose. Additionally, your testimony can be released to the public. Do you understand the difference between your testimony before the safety board and this accident board?

WITNESS: Yes, sir.

PRESIDENT: Your testimony in this investigation will be under oath. At this time, I will administer the oath. Please stand and raise your right hand.

[The witness did as directed.]

PRESIDENT: Do you solemnly swear that the testimony you are about to give in the matter now under investigation shall be the truth, the whole truth, and nothing but the truth, so help you God?

WITNESS: I do.

PRESIDENT: Today is the 14<sup>th</sup> of September 2010. The time is now 1555, local Alaska time. This interview is being conducted in Building 7309, in Room 106, Joint Base Elmendorf-Richardson, Alaska. The persons present are:

The witness, TSgtWITNESS 20,

Pilot Member;

Legal Advisor;

Medical Advisor;

Court Reporter; and,

me, [Brigadier General Carlton D. Everhart, II, Board President]

PRESIDENT: The witness has been sworn.

- 1Q. Please state your full name and rank.
- 1A. WITNESS 20.
- 2Q. And how long have you served in the Air Force?
- 2A. Just about 11 years.
- 3Q. And what is your unit of assignment and location?
- 3A. 249<sup>th</sup> Airlift Squadron, Elmendorf Air Force Base, Alaska.
- 4Q. And your job title?
- 4A. I'm an Instructor Loadmaster, C-17.
- 5Q. How long have you been doing this job?
- 5A. I've been a Loadmaster for about four years.
- 6Q. And please describe your duties and responsibilities in July 2010.
- 6A. As an instructor, I am responsible for upgrading loadmasters that come back from school or that have been downgraded or that require additional training. I was also being upgraded for demonstration qualification at that time.
  - 70. Are you familiar then with the C-17 Aerial Demonstration Program?
  - 7A. Yes, sir.
  - 8Q. Can you describe your C-17 aerial demonstration background?
- 8A. I flew with a crew which included MP MSO SSgt BE . Last year we flew with the Thunderbirds throughout the Asia-Pacific area doing aerial demonstrations and then this upgrade in July of this year.
  - 9Q. What was your aerial demonstration training process?
- 9A. I flew a couple of the practice runs last year with the crew, got a feel for what was going on with that, and then I also was the orator for the demonstrations for all those we did in the Pacific. And then we got briefed as to what was required for the demonstration team in about December of last year when we started talking about doing the demonstration program, and then we got an e-mail with all the AFI regulations we needed to review, sim schedules, and then the flight with an instructor to get checked out.
  - 10Q. Do you know which demo profile you were training to fly or flying?
- 10A. I believe we were flying the Profile 3 which is the 12-minute profile, however, we did train on Profile 1 as well which is a 6-minute profile.

- 11Q. Do you recall which pilot you flew the demonstration flights or training with?
- 11A. Yes, sir. When I flew last year, it was with the people I previously described. And in July when I flew my upgrade flight, it was with WITNESS 5 as my instructor. MP WITNESS 8 and CAPT SCO
  - 12Q. So CAPT SCO is still a captain now?
  - 12A. Yes, sir.
- 13Q. I just wanted to make sure I had that -- the names correct. You mentioned you flew with MP When did you fly these aerial demonstrations profiles with him?
- 13A. I don't remember exactly which ones it were. It was last year when we did them in the Asia-Pacific. I flew one of the practices in Malaysia when we did the sight-over for the -- when we did a fly-by for the -- to survey the field prior to doing the demonstration. And then I flew again with them in Korea. And then I think there is one more, but I don't remember the locations, we flew so many. And then the last one was just flying, I believe, on the 9<sup>th</sup> of July of this year.
- 14Q. Okay. And, there again, you mentioned those previous crews. Was there anyone else at that time that was there?
  - 14A. No, sir, just the four pilots, myself and one other loadmaster.
  - 15Q. And then, for the record, if you would, just state those crew members again for us.
  - 15A. Sure. The loadmaster is MTNESS 3 and South MTNESS 3 The pilots were

# **Questions by the Legal Advisor:**

- 16Q. And this is Major SSgt BE first name, how do you spell that?
- 16A. It's **SSat** BE, I believe.

- 17Q. You flew in several different countries. Did you need to modify the demonstration profiles for any of the air shows you flew?
  - 17A. No, sir.
- 18Q. And then what about flying with MP in July of 2010? Do you recall what those dates were?
  - 18A. I do not recall. I believe it was approximately the 9<sup>th</sup> of July.
  - 19Q. And who else were on those flights or that flight?
- 19A. That was WITNESS 8 MP CAPT SCO and WITNESS 5

- 20Q. Do you remember what the plan was for training the flight that day?

  20A. Yes, sir. The primary focus was to upgrade myself, upgrade

  upgrade CAPT SCO We were all new to being qualified for the demo teams. They each

  and CAPT SCO had to fly Profile 1, the 6-minute profile and then Profile 3 each. And then that was pretty much all that we had to do. I think we did a total of six profiles that day.
  - 21Q. All right. Were you at the pre-briefings?
  - 21A. Yes, sir.
  - 22Q. Do you recall what was briefed?
- 22A. Yeah, we briefed the profiles we were going to go through. We had charts of everything. We had the AFI 11-246, Vol.6 which shows the profiles that we were going to fly. We went through them in depth one more time, who was going to be in the seat, when we were going to do our seats-swaps. We verified that we had clearance with the tower, we weren't going to have the fighter window or anything else, that we were good for that flight that day, had to be a practice demonstration. I think that was pretty much all we went through.
  - 23Q. Did you brief any things on safety or anything like that?
- 23A. Yes, sir. We talked about you're going to get a lot of enunciations which was apparent to the pilots in the simulator when they went through. They had to do extensive simulator training prior to actually flying the jet, and we talked about a lot of the enunciations you're going to receive. And then I also talked with my instructor loadmaster about what to expect because I never actually had opened the doors or anything and what profiles we were actually going to fly so --
- 24Q. Did you actually talk about knock-it-off calls or time-out calls or anything like that?
- 24A. Yes, sir. We followed the checklist that they have, the aircraft commander checklist that they go through prior to all off station departures. So you went through that and it goes over knock-it-off, time-outs. And MP was the AC for that one. He also said, "If you have any problems, let us know. We'll stop immediately. You know, we'll ascend to a safe altitude and we'll talk about it."
- 25Q. I want to show you a Power Point briefing that we have, and then I'm going to give you just a couple of minutes to take a look at it and see if you're, you know -- and let me know when you're done. And, for the record, the witness is going over the briefing at this time. Do you recognize that Power Point briefing?
  - 25A. Yes, sir.
  - 26Q. And what is it?
- 26A. It's a synopsis of the PACAF demo true con-ops, the 3<sup>rd</sup> Wing Aerial Demo Program. It's just a -- kind of a broken down version of that, makes it real easy to read, but it's the same stuff you got in the e-mail that follows the 11-246, Vol 6.

- 27Q. And so you recognize that through the e-mail?
- 27A. Yes, sir.
- 28Q. Is this the upgrade briefing that you received from MP during your July 2010 training?
  - 28A. Yes, sir.
- 29Q. Could you walk us through what you remember about this briefing and how it was conducted?
- 29A. I honestly don't know because he briefed the rest of the crews, all the other guys that were going through the upgrade process which is on the 3<sup>rd</sup> Wing letter. I don't know who the other people were besides the guys that actually(inaudible), but everyone that was on the letter that was getting upgraded, they actually had a briefing where they went through the slides. I had them e-mailed to me just because I was on leave at the time, so I went through it after the fact.
  - 30Q. So you don't recall who was actually at that break?
  - 30A. No, sir.
  - 31Q. We talked about the crew mission brief and then you said that there was one?
  - 31A. Yes, sir.
- 32Q. We talked a little bit about what was discussed. What was your overall general plan again?
  - 32A. My general plan was to get upgraded to be a loadmaster for the demo crew.
- 33Q. And then how about the overall plan as far as inside the aircraft how it was -- what the plan was to go out with those profiles?
- 33A. Our plan was to do a Profile 1, I believe, followed by a Profile 3 holdover inlet, let the brakes cool, and then do a cruise seat-swap, come back, do it again, and then the same thing, Profile 3, back on the inlet, seat-swap, and then finish it up.
  - 34Q. Did the crew ever discuss bank angles and altitudes they planned to fly?
  - 34A. I believe so. It's part of what's written in the profiles.
  - 35Q. And do you recall what they were?
  - 35A. I'd have to look at the profile.
  - 36Q. Did the crew ever discuss the use of rudder?
  - 36A. Not that I remember.

# **Questions by Pilot Member**

- 37Q. Sir, you mentioned during the briefing that they discussed enunciations. Can you elaborate a little bit on what they meant by enunciations during the pre-brief?
- 37A. Well, I know you get some oral enunciations. You get stalled, sometimes you get sink rate, definitely get terrain, especially flying here on Elmendorf, you always get the terrain over on the end of Runway 6. So we talked about those. Anything other than that that came up they were told to bring it to anyone's attention, anyone who hears anything or sees anything different please bring it to our attention because everyone is very task saturated during the demo.

## **Questions by the Legal Advisor:**

38Q. A follow-up to that, this is You said that anything other than stalls, sink rate, or terrain they were told to bring it up to the aircraft commander's attention?

38A. I'm sorry. Let me clarify. We were supposed to bring up everything, however, those are kind of like an expected enunciation. We know that we're going to get those. You expect to get them through some of the maneuvers we're doing----

- 39Q. Now, are you referring specifically to any of those specifically when you say you expect to get it during the maneuver?
- 39A. Yeah, during the teardrops we tend to get those a lot and that's been in my experience as well----
  - 40Q. When you say, "those," you're referring to --
- 40A. Excuse me, the stall or sink rate or terrain, those three specifically. Those are the three that I remember the most when we were flying.
- 41Q. Do you remember -- when you flew the profiles, not only in training but also in air shows, where do you happen to get those stalls, those enunciations, not only stalls but any enunciation? Was that on the initial -- in Profile 3 when you did the initial climb and then turn the 80 degrees off and then the 260 where do you ----
- PILOT: I think you mentioned teardrop, is that what you were referring to?
- 41A. Sure. On the initial climb-out you do the max thrust takeoff. That's when you tend to get a sink rate. My understanding they're pulling up to Vmma and then----
  - 42Q. Which is minimum maneuvering air space?
- 42A. Yes, sir. And then when they make their bank from there and you go into your teardrop maneuver, that's when we tend to get either a stall or your terrain depending on how the aircraft is oriented.

# **Questions by the Pilot Member**

- 43Q. Can you talk us through what the teardrop is, what you mean by that?
- 43A. All I know is how it's written in the 11-246, Vol 6. I know it's like a 60-degree bank

## **Questions by the Legal Advisor:**

- 44Q. You can go ahead and take a look at the 11-246 excerpt that you brought. I mean, you're referring right now to the -- it looks like the Profile 3?
  - 44A. Yes, sir.
  - 45Q. And that is the 12-minute demo?
  - 45A. Yes, sir.

## **Questions by the Board President:**

- 46Q. So just to clarify again for the record, this is the -- Profile 3 is the initial 80/260?
- 46A. Yes, sir.
- 47Q. Is that what you're referring to?
- 47A. Yes, sir. On your initial 80/260 that's when we tend to get our sink rate enunciation, that's on our initial takeoff. And then when we make the circle and come back towards the flight line, that's when you tend to get your stall or sometimes sink rate as well, depending on how the pilot is flying I guess, but you definitely get them through there quite often.

#### **Questions by the Legal Advisor:**

- 48Q. As a follow-up to that, where are you when these enunciations are going on?
- 48A. I am seated at the rear of the aircraft by the troop doors. We do the whole flight back there because obviously you can't walk around while they're doing all the maneuvering, so we're strapped in the back by the troop doors and we're on headset, so we're in contact with the crew and we get all the oral and none of the vision.
  - 49Q. So the enunciations come through the headset that you're wearing?
  - 49A. Yes, sir.
  - 50Q. Through some sort of --
  - 50A. ICS, intercom system.

# **Questions by the Board President:**

- 51Q. And how long would these warnings stay on?
- 51A. They're momentary warnings, however, sometimes they repeat. You'll get it once and then you'll get it again in the same turn and again in the same turn, so sometimes you get them numerous times, sometimes it's maybe once in the turn.
- 52Q. Did the crew ever acknowledge them or anything like that, or you said if you got warnings, you would call knock it off. So, if you were in an air show in the Pacific, did anybody ever knock-it-off or call time-out?
- 52A. No, sir, we didn't. However, when we were flying on the 9<sup>th</sup> of July, we had numerous stall indications on a turn and MP did call acknowledge to the crew and he did tell us that they are watching the altitude and we're okay, so he did call and acknowledge when we have the numerous stall indications.

## **Questions by the Pilot Member:**

- 53Q. When you say, "numerous," now do you mean that you're continually hearing "stall, stall, stall."?
  - 53A. Yes, sir.
- 54Q. Is that what you mean by numerous, not necessarily maybe multiple iterations, but you're actually hearing the stall repeated for an extended amount of time, is that what you mean? Or maybe you can clarify what you mean by --
- 54A. I'm not that familiar with the system, so it's kind of hard for me to say, but I'd say there's probably -- there is a small gap in between. I don't know how often it repeats. To me, there seemed like a gap in between but I honestly don't know. I'd have to look up in the Vol 1 and find out how often it is.
  - 55Q. Sure. How many times do you think you heard the word "stall" repeated?
- 55A. We probably heard it -- I think the second time we heard it -- and it was pretty quick. I mean, it was like stall, stall, and then it got acknowledged and then we got another stall and another stall after that and then we came in and finished our profile.
- 56Q. So, after you heard to word "acknowledge," did you hear the word "stall" continue?
  - 56A. Yes, sir.
  - 57Q. And about how long did it continue after you heard acknowledge?
- 57A. I think maybe two seconds because then we finished our turn and then it went away and MP said, "It's still acknowledged." And then when we got out over the

inlet for our brake cool down, we debriefed it there and then we debriefed it again after we were done with the whole sortie.

- 58Q. So MP was flying in the left seat at that time?
- 58A. I don't know, sir. I know he was in control of the stick. I don't know if he was in a left seat or right seat, I was in back.
  - 59Q. But usually, typically, the demonstration pilot is in the left seat?
  - 59A. I honestly don't know. I honestly don't know -- I'm a back seater -- I don't know.
  - 60Q. When you say you debriefed it, what was discussed?
- 60A. We discussed the numerous enunciations, and he asked us if we were comfortable with it. I told him that I was comfortable, and we talked to the rest of the crew and we also were comfortable with that. Me and the other loadmaster asked about what was going on and did we have any drop in altitude or anything and we didn't. Our third pilot up there was watching the altitude the whole time through the turn between that and calling out the profile terms. So, we all felt safe with it and we discussed what was going on with that.
- 61Q. So that teardrop turn, that big turn, the 260-degree turn back around, when you got those warnings, "stall, stall," you said that they were watching the altitude. Was it a level turn? What were they watching?
- 61A. Yes. To my understanding, they are shooting to do a level turn and then descend after the turn down to 500 feet. We're not descending through the turn, so does that kind of answer your question, sir?
  - 62Q. Do you remember what altitude they went to?
- 62A. I don't know. I know some of the profiles according to the Vol 6 there it says it's either 1,000 feet or 1,500 feet down to 500 depending on which profile you're applying, profile one or profile three.
  - 63Q. Before the 9 July training, had you heard the stall warnings before?
- 63A. I have, but not repeated as much. Because when I flew with them, I wasn't a qualified demo load so I could actually fly during the demonstration. So I went through the practices. And when we did the practices, we're not flying the profile per say 100 percent because you're making sure you're clearing all the ground clearances, making sure you're not departing or whatever the seven-mile or ten-mile -- whatever air traffic control gives you as your corridor. And then we're also trying to line up and show center and make sure that our SA is where it needs to be.

# **Questions by the Legal Advisor:**

- 64Q. Just to clarify, it's When you say did the practices, are you talking -- when are you talking about?
- 64A. Prior to flying a demonstration flight at -- before a foreign airfield, we have to do a practice flight at that airfield, and we did it the day prior.
- 65Q. And I'm sorry. I should clarify. I meant was this during the air shows in the Pacific?
  - 65A. Yes, sir.

- 66Q. Are you familiar with the checklist you run for aerial demonstrations that you were training for?
  - 66A. Yes, sir, I have it right here.
- 67Q. And just for the record, you're pointing to the aerial demonstration checklist 3<sup>rd</sup> Wing?
  - 67A. Yes, sir.
  - 68Q. Do you remember how the crew executed the checklist?
- 68A. To the best of my knowledge they follow the checklist. I also follow my dash one procedures in my checklist which for the loadmaster it's not very different for flying a demonstration versus flying a regular sortie because we are that active in the back of the jet.
- 69Q. So you had a dash one -- the operations manual dash one for the C-17 and they had this aerial demonstration checklist?
  - 69A. Upfront, yes, sir.
  - 70Q. Did they verbalize the checklist?
  - 70A. Yes, sir.
  - 71Q. Challenge and response?
  - 71A. Yes, sir.
- 72Q. Did they verbalize when they moved the flaps up and down and retracted the slats or did they just -- or did the co-pilot do it automatically?
  - 72A. No, sir, no, they did verbalize.
  - 73Q. Not only during practices but also during air shows?
- 73A. I don't know during air shows. I just got certified on the 9<sup>th</sup> and I was scheduled to fly during the Elmendorf one which I never flew.

74Q. I'm going to ask you to describe a little bit about the way the crew flew the profile. You said comfortable. How did it make you feel overall?

LEGAL ADVISOR: Were you referring to the 9<sup>th</sup>, sir, the practice on 9 July?

#### PRESIDENT: Yes.

74A. I felt that we followed the Vol 6 and from what I had flown before and what I had read in the TO or the AFI-- excuse me -- I thought that we followed it well. It's kind of hard to tell from in the back. Your sight windows are about an eight-inch window, you know, so all you see is blue, green, blue, green, blue, green.

- 75Q. Do you mean sky, ground, sky, ground?
- 75A. Yes. So it's really hard to tell. You just feel the air moving left, right, left, right, you know, and then we're done and then they call for a checklist and then we prepare for it when we get on the ground and open the doors.
  - 76Q. And then once you're complete, did you debrief each of the demo training flights?
- 76A. Yes, sir. We did an overall debrief with myself, the other load and all the pilots. And then myself and the other loader were released and then MP debriefed with each pilot as he was upgrading each.
  - 77Q. And then what would you discuss in your debrief?
- 77A. We talked about the enunciations again. We talked about any kind of CRM issues.
  - 78Q. Cockpit Resource Management?
- 78A. Yes, sir. Where maybe they were talking so fast, we couldn't interrupt or something like that. However, that wasn't the case with this, but that would be the sort of things that we would debrief.
  - 79Q. You said again the enunciations. What would you talk about?
- 79A. We talked about the multiple enunciations, the audio or audible enunciations that we got. That's kind of one of the big items for myself and the other load just because we don't have any indications -- we don't know what's going on. So we told the pilots that it's great to say acknowledge, not just for the people in the cockpit, but for the people in the back, so it was high interest item for myself and the other loadmaster saying, yes, that was great, you did acknowledged because it's not something that always happens.
  - 80Q. Well, when you hear "acknowledge," what does that mean?
- 80A. To me, that means that the pilot has seen the indication, he's verified that it's either a nuisance or that something is happening, and we're taking appropriate action.

- 81Q. If he says, "acknowledged" and it still goes on for some time after that, what does that mean to you?
- 81A. That's when I would probably call a knock-it-off or ask him to use one of our terms, you know, so that we can get away from the ground and discuss what's going on and such. However, MP acknowledged it multiple times, so it wasn't so much an issue at the heart.

# **Questions by the Pilot Member:**

- 82Q. When you say, "acknowledged multiple times," after he said, "acknowledge," did I understand you correctly that the stall at a certain point continued for a little while, the stall warning continued to go off after he said, "acknowledged"?
- 82A. Yes, sir. In my estimation I'd say maybe one to two more seconds because doing that teardrop turn, it's a pretty rapid maneuver, but we had the indication to go for another one to two seconds and then he called another acknowledge at that point as well, so it wasn't, you know, he gave an acknowledge and then it just continued to go on and we just ignored it and then when he did the next one, he called acknowledge again. It was once and then when it continued to happen, he did another acknowledge as well.
- 83Q. And when he did that other "acknowledged", did he do anything different with the aircraft? What ultimately lead to it ceasing?
- 83A. Immediately after his second acknowledge we completed our maneuver and we leveled off and came in, descended down 500 feet.
- 84Q. And you had mentioned previously too that when -- earlier when you had gotten the stall warnings on July 9<sup>th</sup> and you had went up to -- while you were still airborne to talk about this, you had mentioned that the consensus was, in your words -- correct me if I'm wrong that the crew was comfortable with those enunciations. Is that accurate?
- 84A. Kind of. I think what we were comfortable with was how the crew was handling those enunciations. For one, they're pretty loud, so you have to talk over them. And then the second thing being the acknowledging them and describing especially to the loadmaster in the back what's going on. I think that's what we were all comfortable with was how we were handling those enunciations, not so much the enunciations happening themselves.
  - 85Q. And how were they being handled?
- 85A. Like I said before, I think the pilots were aware of what was going on. They were watching their indications. They were watching their -- the altimeter and such. And when we did get those indications, they were acknowledged and then give us a quick update.

- 86Q. Now, when you got the stall, stall, you could hear the stick shaker also?
- 86A. I don't know. I don't know if you could actually hear that on the earphone. I don't recall hearing a stick shaker but I'm not familiar enough with the system.

- 87Q. Real quickly, the air shows that you did in the Pacific, were they filmed?
- 87A. Yes, sir. There were some that civilians videotaped and put on line and then I believe WITNESS 3 got a couple on a personal camera from the cockpit point of view.

#### **Questions by the Legal Advisor:**

- 88Q. And what leads you to that belief?
- 88A. I know when we were flying one of the practices for the demonstrations, we set a camera up in there to see how we were doing as a crew and watching. However, there wasn't any audio with that, I believe, but I think we didn't get the video but I'm not 100 percent positive of that. You would have to talk to

  WITNESS 3 and he could tell you for sure.
  - 89Q. Did you see any other videos from the cockpit?
- 89A. Not from the cockpit, no, however, there is some on U-tube. You've got someone taking pictures here and there, so some of those were on U-tube, however, they're not very indicative of what you're doing, you know, because it's not been right on the flight line.
- 90Q. Just to clarify, you had said WITNESS 3 Do you think WITNESS 3 got a couple of videos with a personal camera? Did you actually mean two or at least one?
- 90A. I believe it's at least one. I don't know if he got a second one or not. Once again, I don't know if he got any audio on that or not either.
  - 91Q. Do you remember seeing the video?
  - 91A. I personally did not, no
  - 92Q. But you remember seeing him set up the camera?
- 92A. Yeah, we set up the camera. It's a smaller camera just so we could kind of see how we were doing.
  - 93Q. Do you remember what the camera looked like?
- 93A. I honestly don't. I just remember it being a smaller camera like -- maybe like a two by two-inch maybe. It kind of clips up on -- we ended up tapping it up onto the -- like a bulkhead, you know, so you could see down through the windows and then kind of see the center console.
  - 94Q. Do you know -- when was this -- when was this attempt?
- 94A. I believe it was in Malaysia but it could have been Thailand. I honestly don't remember because we did so many over there, but it was definitely about in the middle of our tour.
  - 95Q. Your tour of the air show in the Pacific?
  - 95A. Yes, sir. Yes, sir.

# **Questions by the Board President:**

PRESIDENT: WITNESS 20 if I may, we'd like to take a break at this time and then I'll ask you to leave the room and then we just want to gather the rest of our notes that we have or any notes that we might have talked about and then we'll bring you back in. If we have any other questions, we'll definitely give you an update on the questions we're going to ask and you can be prepared and then we'll go from there. So at this time I would like to take a break

[The board recessed.]

[The board reconvened.]

LEGAL ADVISOR: All parties present before the break are again present, to include WITNESS 20

PRESIDENT: witness 20 it's Brigadier General Everhart. I have three questions to follow up on if I may.

# Questions by

96Q. Yes, sir. WITNESS 20 this is Doctor The first question is what's your guard status right now?

96A. I'm an active guard reservist AGR full-time duty.

97Q. And how long have you been in that capacity for?

97A. For about three years.

## **Questions by the Board President:**

98Q. You mentioned earlier that in your upgrade you received an e-mail that contained the 2010 air show upgrade program and in that e-mail it had reference regulations and things like that. Who sent you that e-mail?

98A. I received that from MP sir.

99Q. And then that also had a copy of the aerial demonstration checklist in it?

99A. Yes, sir.

100Q. Are there any other matters that we haven't covered that you believe would be important to our investigation?

100A. I don't believe so, sir.

PRESIDENT: Okay. At this time I'd like to read you out. You are reminded of the official nature of this interview. You may not discuss your testimony with anyone without my permission or at any time before the report of this investigation is officially released to the public.

This concludes the interview at this time. The time now is 1644 local, Alaska time.

[END OF PAGE]

### V21. AIB INTERVIEW WITH

# WITNESS 21

#### **VERBATIM TESTIMONY OF**

# WITNESS 21

PRESIDENT: My name is Brigadier General Carlton D. Everhart, II. We are investigating the C-17 accident that occurred on 28 July 2010 at Joint Base Elmendorf-Richardson, Alaska. This investigation, conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 91-204. The purpose of this investigation is to produce a publicly releasable report on the facts and circumstances surrounding this accident and to gather and preserve evidence for use in claims, litigation, disciplinary actions, and adverse administrative proceedings, and for all other purposes.

The testimony that you provided in that safety investigation was privileged information and we have no access to privileged information.

LEGAL: Just to add, prior to that, General, just for the record,
statement to the safety board but it was non-privileged. We received copies of that which have
been placed in tab R of our report. If he has made any privileged statements to the safety board,
we do not have access to those and they will remain privileged so long as you were promised
that. Do you understand that definition?

WITNESS: Yes, sir.

PRESIDENT: Do you understand the differences between the testimony you gave the safety investigation board and the testimony you will give to this accident board?

WITNESS: Yes, sir.

PRESIDENT: Your testimony in this investigation will be under oath. At this time, I will administer the oath. Please raise your right hand.

[The witness did as directed.]

PRESIDENT: Do you solemnly swear that the testimony you are about to give in the matter now under investigation shall be the truth, the whole truth, and nothing but the truth, so help you God?

WITNESS: Yes, sir.

PRESIDENT: Today is the 21st of September 2010. The time is now 1438 local Alaska time.

This interview is being conducted in building 7309, room 106, Joint Base Elmendorf-Richardson, Alaska. The persons present are:

The witness,

WITNESS 21

Pilot Member;

Maintenance Officer;

Legal Advisor;

Medical Advisor;

Maintenance Member;

Court Reporter; and,

me, [Brigadier General Carlton D. Everhart, II, Board President]

The witness has been sworn.

- 1Q. Please state your full name and rank.
- 1A. WITNESS 21
- 2Q. How long have you served in the Air Force?
- 2A. Approximately 7 1/2 years.
- 30. What is your unit of assignment and location?
- 3A. 517th Airlift Squadron, Elmendorf Air Force Base, Alaska.
- 4Q. How long have you been with this unit?
- 4A. Approximately 2 1/2 years.
- 5Q. And your job title?
- 5A. Pilot, and Operations Flight Commander.
- 6Q. How long have you been doing that specific job?
- 6A. Operations Flight Commander sine the first of August and pilot since I got here.
- 7Q. Can you describe, please, your duties and responsibilities as the flight commander?
- 7A. Yes, sir. We are in charge of scheduling, training, and the SARM folks, the aviation research management folks, and administering all the people caring actions, the performance reports, the awards, the decorations, as well as the day-to-day care and feeding of the personnel.
- 8Q. Prior to this you made a nonprivileged statement to the safety board. It was transcribed and is now part of tab R. Have you had a chance to review it?

- 8A. Yes sir.
- 9Q. That statement was not taken under oath. Do you want to adopt that statement as part of your testimony today?
  - 9A. Yes sir.
- 10Q. As we go through this, we understand you may have some clarifications to make about your testimony. Do you want to make any clarifications on anything in that statement now?
  - 10A. No, sir.
- 11Q. The previous testimony mentions that you witnessed an aerial demonstration, a practice, I believe, from the roof of the squadron building. Do you remember this?
  - 11A. Yes sir.
- 12Q. During that time, I believe you had a conversation with MCP Is that correct?
  - 12A. Yes sir.
  - 13Q. About the particular profile, and that was dated--do you remember the date?
- 13A. No, sir. I do not remember the specific date. It was approximately the week before the accident.
- as you were discussing what you saw in the profile as the aircraft was going through the demonstration. You said that MCP said, look at the amount of rudder he is kicking in, he said, I don't believe it was during--and he said, I don't believe it was during that particular part when we were up there watching. It was a different time when he was like yeah, you know you wouldn't believe all the squawks that are going on. I'm heads down in the box, just running stuff, and you are hearing all the bells and whistles going off. Can you tell me, please, what he meant by the squawks, and bells, and whistles?
- 14A. Sir, just mostly the warnings that were going off and my understanding of the profile, having never flown it, in max performing the aircraft he was speaking specifically about the stall warnings that were going off because they were at higher bank angles as well as slower speeds.
- 15Q. You just mentioned that you have never flown a C-17 aerial demonstration profile. Have you ever been checked out in a program?
  - 15A. No, sir.
- 16Q. Are you somewhat familiar, or are you familiar with the aerial demonstration profiles themselves?
  - 16A. Sir, only because of what MCP described to me.

- 17Q. Do you know what MCP did you talk about the bells and whistles? He is talking about the warnings going off. Do you know what his comfort level was with the profile?
- 17A. Sir, not specifically. He had spoken to me then, the maximum performing of the aircraft capabilities was, and again, as I said in my previous statement, I don't want to put words into MCP mouth so without remembering specifically, exactly the words he used, I couldn't say. My impression of what he thought of that was that it was both slightly scary and a little bit exciting at the same time.
  - 18Q. What is your definition of max performance of the aircraft?
- 18A. Doing more than a normal, local would entail, banking the aircraft up to levels we don't in a normal visual pattern when we are doing our local training patterns, performing at higher climb angles than what we normally perform, inducing the aircraft to provide warnings when you are intentionally trying to get it to give you those warnings.
- 19Q. So, you said just then, normal climb angles and different bank angles than what you normally perform, what are those?
- 19A. Sir, for me, normally in the pattern you're looking at 30 degrees of bank. You are climbing out at 15 degrees nose high, approximately, depending on the nature of the takeoff. Non-tactical, of course, when we are just doing our visual patterns--normal visual patterns.
  - 20Q. A normal tactical pattern would include bank angles of?
  - 20A. Up to approximately 60 degrees.
- 21Q. You just mentioned, so, if normal bank angles are 60 degrees on tactical, during those profiles did you happen to see bank angles that you thought maybe did that?
  - 21A. I never have, sir. No.
- 22Q. Did MCP ever mention any concerns that he might have had to anyone else about the profiles?
- 22A. Sir, complete hearsay, I know in speaking with a couple other pilots in our squadron that he had talked to them about the profiles as well, but again, it would be completely hearsay for me to speak of that.

President: Okay. I would like to take a break now and then we'll get some clarification and then we'll call you back.

[The board recessed at 1446, 21 September 2010.]

[The board and reconvened at 1449, 21 September 2010.]

Legal: All attendees to the interview prior to the break are again present, to include

# **Questions by the Board President:**

23Q. witness 21 is there anything else you want to add that you think may contribute to our investigation?

23A. No, sir.

PRESIDENT: You are reminded of the official nature of this interview. You may not discuss your testimony with anyone without my permission at any time before the report of this investigation is officially released to the public.

This concludes the interview. The time is now 1450 local, Alaska time.

#### **V22. AIB INTERVIEW WITH**

WITNESS 22

#### **VERBATIM TESTIMONY OF**

## WITNESS 22

PRESIDENT: My name is Brigadier General Carlton D. Everhart, II., and we are investigating the C-17 accident that occurred on 28 July 2010 at Joint Base Elmendorf-Richardson, Alaska. This investigation, conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 91-204. The purpose of this investigation is to produce a publicly releasable report on the facts and circumstances surrounding the accident and to gather and preserve evidence for the use in claims, litigation, disciplinary actions, and adverse administrative proceedings, and all other purposes. A safety investigation was previously conducted on this accident. Any testimony you gave before the safety investigation board will be kept confidential, if you were so advised, and can be used only for accident prevention purposes. This board does not have access to any confidential testimony you gave before the safety investigation board. Your sworn testimony to us may be used for any proper purpose. Additionally, your testimony can be released to the public. Do you understand the difference between your testimony before the safety board and this accident board?

WITNESS: Yes, sir.

PRESIDENT: Your testimony in this investigation will be under oath. At this time, I will administer the oath. Please stand and raise your right hand.

[The witness did as directed.]

PRESIDENT: Do you solemnly swear that the testimony you are about to give in the matter now under investigation shall be the truth, the whole truth, and nothing but the truth, so help you God?

WITNESS: I do.

PRESIDENT: Please be seated. Today is the 18<sup>th</sup> of September 2010. This time is now 0933 local, Alaska time. This interview is being conducted in building 7309, room 106, Joint Base Elmendorf-Richardson, Alaska. The persons present are:

The witness, WITNESS 22
myself, Brigadier General Carlton D. Everhart, II, the Board President
the Pilot Member;
the Legal Advisor;
the Maintenance Officer Advisor;
the Medical Advisor;
the Maintenance Enlisted Advisor; and
the Court Reporter.

PRESIDENT: The witness has been sworn.

## **Questions by the Board President:**

- 1Q. Please state your full name and rank.
- 1A. WITNESS 22
- 2Q. And how long have you served in the Air Force?
- 2A. I've been in since September 21<sup>st</sup> of 1985, in the Air National Guard, so coming up on 25 years.
  - 3Q. And what is your unit of assignment and location?
  - 3A. 249<sup>th</sup> Airlift Squadron, Squadron Commander.
  - 4O. And location is --
  - 4A. Is Joint Base Elmendorf-Richardson. Sorry.
  - 5Q. Okay. And how long have you been with this unit?
  - 5A. I started in 2007.
  - 6Q. And your current job title?
  - 6A. Squadron Commander.
  - 7O. And how long have you been doing this job?
  - 7A. Since last year, approximately the summer time of 2009.
  - 8Q. Okay.
- 8A. And I'd like to add to that, too, we were a detachment for a long time and we were working through the programming and the processes to become a squadron. So the squadron actually -- in fact, we just got federal recognition this last winter.

- 9Q. What has been your duty assignments while assigned to Joint Base Elmendorf-Richardson, and then just for the record, we'll refer to that now, from now on as Elmendorf Air Force Base.
- 9A. I came over -- before I came over to Elmendorf Air Force Base, I was the Director of Operations for the 211<sup>th</sup> Rescue Squadron. I was scheduled to be the squadron commander and then what happened was, is the Alaska Guard got the C-17 and I came over as the PIO, the Program Integration Officer, and then I was the DO, and then transitioned to the squadron commander.
  - 10Q. Okay, and then you said the 11th Rescue Squadron, was that -- where was that?
  - 10A. That's at Kulis Air National Guard Base.
- 11Q. Would you please describe your duties and responsibilities as commander for the 249<sup>th</sup> Airlift Squadron?
- 11A. Well, my duties are many-fold. Basically, the training and equipping and organizing of an Air National Guard squadron, and there's quite a bit to that. Hiring -- recruiting and hiring people. Training people for -- training aircrew members for the mission, and taking care of the people, responsible for the discipline, the morale. Squadron commander duties.
- 12Q. All right. Prior to this, you made a non-privileged statement to the safety board. It was transcribed and is now part of Tab R. Have you had a chance to review it?
  - 12A. Yes, sir.
- 13Q. That statement was not taken under oath. Do you want to adopt that statement as part of your testimony today?
  - 13A. That's fine.
- 14Q. As we go through this, we understand you may want to make some clarifications about that particular testimony, and we'll also follow-up with any questions, but does that statement contain any information that you previously provided?
  - 14A. (No response.)
- 15Q. And what I mean by that is, you know, as far as the clarifications and things like that, if you want to go ahead and make clarifications now, you can do so.
- 15A. Not really. There are a couple of grammatically errors, but other than that, I think I'll just clarify as we go through the interview process.
  - 16Q. Okay. When did the C-17s first arrive at Elmendorf?
- 16A. Of course it's a matter of record, but June, I think, we got the first one in June of 2007, and I wasn't here, I was down at Altus, at the schoolhouse, when the first one arrived. And then they trickled in over the next couple of months, or the next couples months I think we had all eight C-17s by the October/November, and that's all a matter of record. So...

- 17Q. Okay, tell us about the 249<sup>th</sup> Squadron; what's its mission, its relationship with the 517<sup>th</sup>?
- 17A. Okay, the 249<sup>th</sup> was a classic association. It's a C-17 airlift squadron and under the classic association arrangement, the 517<sup>th</sup>, the Third Wing, the aircraft belonged to the Third Wing. The 517<sup>th</sup> was the host and we were the associate, and so primarily, they were the -- they provided the operational direction. Of course, we had separate ad-con, but they provided the overall operational direction, they call it op-dir, and basically, working together to form the global mobility mission of the C-17.
  - 18Q. What does associate mean?
  - 18A. It's where we associate. Associate.
  - 19Q. Like when you say it's an associate unit, what does that mean?
- 19A. It's the being two separate stand alone units. Under the classic association, there's a host and there's an associate.
  - 20Q. Okay, and where was the Third Wing?
  - 20A. The Third Wing was located at Elmendorf Air Force Base.
  - 21Q. Okay.
  - 21A. But they were the parent wing of the 517<sup>th</sup>.
  - 220. So both units were here, at the base?
- 22A. Yes, the 249<sup>th</sup> and the 527<sup>th</sup>, yes. In fact, we were the first flying squadron from the Air National Guard to be assigned to Elmendorf.
  - 23Q. Okay. MP was assigned to the 249<sup>th</sup>?
  - 23A. MP was assigned to the 249<sup>th</sup>.
  - 24Q. And what was his duty status?
- 24A. He was -- initially, when he started out, with his background, he was former active duty. He was at Charleston and he was at McCord as a C-17 pilot, original C-17 pilot, and we hired him as part of our initial cadre to stand up the squadron, and initially, we hired him as a part-timer, but they call it drill status guardsman, or a DSG, and then he was -- his fulltime civilian employment was at the Boeing simulator and I think the contractor that -- I think he actually worked for the DRG, and I'm not so sure what the -- Delaware Resource Group, which was the contractor that was running the sim for Boeing. He was a Boeing simulator instructor at the same time he was a pilot for us. And then, when we got a fulltime manning, because we were working the program because the C-17, we were late to come to the C-17 program, so we were doing a lot of programming as we were standing things up, and we got our fulltime manning later on, and then we hired MP as a technician.

- 25Q. Okay, and can you tell us about us about the hiring process he went through? And maybe what inputs you had into it?
  - 25A. Okay, LT COL GY, like LT COL GY was the one who was screening all the folks.
  - 26Q. And who was he at the time?
  - 26A. He was the 176<sup>th</sup> OSS or OSF flight commander.
  - 27Q. Operations Support Flight?
- 27A. Yes, and he was screening all the folks, and what happened was, is normally we would do a board interview, but what happened was, is with MP he came up and he came in, and this is when I was at the 211<sup>th</sup> as the DO. He came over to Kulis; he got off the airplane and came over to Kulis and I had an interview with him, and we brought him on. I hired him as a C-17 guy, but LT COL GY was doing the screening and then I interviewed him, and we hired him on.
- 28Q. Okay. Are you familiar with the C-17 Aerial Demonstration Program at Elmendorf?
- 28A. Somewhat. I'm not a detailed expert, but I'm somewhat. I knew that we had an air demonstration team. I know some of the details, but not much. I'm not a demo pilot and I'm not an expert in the profile or how it's flown or anything, but you know, I know that we had an aero-demonstration team. When we first started up -- when they were first starting it up, we wanted to have a total force, and the way we operate the airplanes is, is through this total force classic association. So we wanted to have guard participation and it was primarily an active duty team and we wanted to put some guard guys on it so we could show the total force -- the total force piece of the equation, and there was a lot of discussion about that because the Air National Guard doesn't do demo teams. So we went back to the guard --to the A3 to see if it was okay, and we got a sign-off on that, that it was okay to put a guard guy on the demo team.
  - 29Q. And what was your duty position at that time, during that initial standup?
  - 29A. The DO.
  - 30Q. The DO, Director of Operations?
  - 30A. Yes.
  - 31Q. Okay. And then, how did the -- the demonstration program, how did it start here?
- 31A. You know, I'm doing this from recollection, and of course, as I get older my mind starts to get away from me, all the details, but what happened was, is I think it was WITNESS 11 who was the initial cadre for the demo team and he started it up, and then he started training -training folks and you had -- on the guard side initially, we only had everybody else was active duty, and he was the token guard guy in the show, the total force. And he started up the demo team and they did it over the years, and then it kind of built, and then on the guard side, we expanded it a little bit. We had -- we had and then" MSO as far as the pilots, and then we had loadmasters, we had MLM witness 14 and WITNESS 20. LJ and then

- 32Q. Okay.
- 32A. And we were in the process of getting some more guard participation. What happened was, is originally, when the air show demonstration team was set up, you know, there was very few people, and then there was these requests from PACAF to do these air shows in New Zealand and you know, Australia and other places. And what happened, they had a hard time manning it because there was few people, so they expanded it a little bit because of the --you know, with everybody's schedules and so forth, so they expanded it. So they had a few more people so they could meet some of these requirements.
- 33Q. All right. And as the program stood up, who was in charge for standing up the Pacific demo program?
- 33A. It was the Third Wing Stan/Eval. WITNESS 11 was the -- I think WITNESS 11 was the main belly button. I guess that's not a very good technical term, but he was the --
  - 34Q. Point of contact?
  - 34A. Point of contact.
- 35Q. Right, and what was your involvement in the startup of the demo program? Your specific --
- 35A. Basically, I just provided -- I just provided a body for it, I provided MP and you know, we, like I said, the guard doesn't have demo teams, but we wanted to have somebody on the show, you know, total force, and he was our contribution and he was one of our more experienced C-17 pilots at the time, and of course, we didn't want to deny anybody the opportunity to participate.
  - 36Q. So MP was your selection; why did you pick him?
- 36A. Because of his time in the airplane and he was a good pilot. He knew the airplane very well, and he had good flying skills, good hands, as they say.
- 37Q. And then, if I may, how do you know he had good hands? How do you know he had good flying skills?
  - 37A. Because we had flown with him, his reputation.
  - 38Q. And then do you recall how much time he had in the airplane?
- 38A. Oh, when he came to us, he had, I think, and this is a matter of record, but I think he probably had 20 -- and I'm just taking a guess at this -- it's a matter of record -- it's probably 25, 26, 27, 28, 2900 hours, somewhere in there.
  - 39Q. Okay.
  - 39A. It's a matter of record.
  - 40Q. And then how much time do you have in the airplane then?
  - 40A. Oh, I think I have about 800 hours.

- 41Q. Okay.
- 41A. But you know, I have over 6,000 hours in military time, but you know, C-17 time, I look at myself as a low time C-17 guy.
- 42Q. Have you ever flown a demonstration profile or simulator as an observer in any other crew position?
  - 42A. No.
  - 43Q. Did you ever fly a demonstration profile in the actual airplane with MP or MSO or MCP
- 43A. No, I did not. I hadn't thought about it, but I never acted on it. I though, well, one of these days, maybe I'll go take a ride with them and take a look at it and see how it looks, but I never did. I never flew it in the sim or never flew it in the airplane.
  - 44Q. Did you ever attend any of the aerial demonstration briefs?
  - 44A. No, I did not.
- 45Q. How about upgrade briefs, or how about mission briefs? When they were getting ready to step out to the jet, that's what I mean by mission briefs.
- 45A. No, I never attended any mission briefs. I mean, I've walked passed the door when they were briefing, but I never stepped in and you know, listened to the brief.
- 46Q. And you've already mentioned this, but I just want to make a clarification, was the demo program integrated with the 249<sup>th</sup> and the 517<sup>th</sup>?
- 46A. I think it was -- primarily, I looked at it as a Third Wing program, and we were providing a body. That's been -- you know, in the guard, a lot of times it seems like with some of the stuff it seems like we're more of a manpower pool than anything else.
- 47Q. So if I -- I don't want to put words in your mouth, and please correct me. So if I understand correctly, the Third Wing provided the oversight, provided a standardization, evaluation for the -- maybe not the standardization, but they provided the oversight for the program and then as far as providing individuals to fly it, that was the contribution of the 249<sup>th</sup>?
- 47A. That was the contribution of the 249<sup>th</sup>, however, I know that MP was involved in it because he got involved in the training and because of the --WITNESS 11 trained him and I think MP out of -- I don't know if it was out of necessity, but just from the experience, I know he did training, but the guard and one of the regulations, and I can't remember which one, you know, we do not have "demo teams." So we went back to the guard drill and asked the A3, "Is it okay if we have a guard guy -- guard guys, on this demo team," and they said "Yes." And so the program, I look at it as a Third Wing program. We were providing bodies for the program -- personnel for the program, but I know of recent -- that MP had been doing some of the training and of the other folks, but you know, we have a lot of cross-flow as far as, you know, if they need an IP for checking on the new AC for LTMs or doing OMEs, we'll provide one and vice versa. So...

- 48Q. LTM?
- 48A. Line Training Mission. And OME, Operational Mission Evaluation.
- 49O. And then when WITNESS 11 PCS'd, permanent change of station, so he moved to as taking it over and running, as far as another unit, did the program default to MP the execution of it?
  - 49A. He did a lot of work for it.
- 50Q. When you say "provided a body" for the demo team, did you all want to do that, or were you just asked to do so?
- 50A. Actually, we discussed it and it was to show that, you know, the way we operated the air plans was through the total force with the active duty and the Air Guard, and what it was, is to show the total force piece of the equation, and the -- it wasn't -- we weren't asked or we weren't told to do it, it was just a discussion between the two squadrons and we try and do a lot of stuff together. It's like, if we have like a high visibility mission, we'll try and have a guard person on it and we'll try and have an active duty person on it.
  - 51Q. And then you talked about the discussion; who did you discuss that with?
  - 51A. It was with the squadron commanders and the DOs.
  - 52Q. Do you remember who they were?
  - WITNESS 23 and the DO was 52A. Initially, the first squadron commander was WITNESS 27
- 53Q. Okay, and then it was discussed with yourself and who owned that?
  53A. Well, WITNESS 30 and myself, and then you know, when he became the OG, then it was myself and with LT COL FZ , is the DO now, and there was a lot of discussion. And the demo team, there was a lot discussion when we first started it up, and then it was one of those programs where, "Hey, it's going, it's operating," and then it was kind of -- it wasn't like front-burner stuff anymore, it was like, you know, on the back burner.
  - 54Q. And then, I'm sorry, OG means -- he was the --
  - 54A. Ops Group.
  - 550. -- and then he became the commander?
  - 55A. The Ops Group Commander.
  - 56Q. Okay.
- 56A. And with him, he wasn't with the aero demonstration team. When we had talked about it, he was not thrilled about it, but he didn't want to deny anybody the opportunity. I mean, that was his take on it, and I think some of that, he's an old SAC pilot, and I think, you know, heavies had not had -- historically have not had a good showing in air shows, with some of the stuff that has happened with B-52s and 135s in the past. So -- and I think that kind of influenced some of his attitude towards it.

- 57Q. So when the crews were -- based off what you just said -- so when the crews were checking out, did -- and I mean by checking out, I mean going through their upgrade program, did he or your or anyone else in the leadership take a -- just out and monitor the program? Did they go and monitor the program, make sure that hey it was done, how it was performed?
- 57A. Well, most of the people on the demo team, most of them were stan/eval folks. I mean, if you look at it in the past, that was mostly like on the active duty side, it was evaluator pilots, and you know, on our side it was MP who became our squadron stan/eval guy and you know, the program, did we get into the details on how the profiles were flown; no, we didn't. I mean, we figured it was pretty much of a standard thing, and the profile -- that I looked at the profile before, and I looked the 246, I read the reg and looked at the profiles and to tell you the truth, I didn't think too much of it because there was basically -- there's just not much you can do with a heavy airplane. I mean, it's like takeoff, a steep climb-out, some steep turns, some assault landing with some backing straight up on the runway, and I looked at it and it's just basic maneuvering of the airplane, and it was nothing more than what some people do -- what guys do on like tactical arrivals and departures.
- 58Q. Okay. You talked about WITNESS 30 How did he provide the opportunity to your pilots? When you said opportunity, how did he provide opportunity for your pilots?
- 58A. It was -- the thing is, is he didn't want to deny the opportunity for like a guard guy to be able to participate on the aerial demo team. It's just like with the Thunderbirds, they have a reserve guy and have a guard now. For the community, went to show the -- you know, the association, because not only were we getting C-17s, the big thing was this total force initiative showing that the guard and the active duty, working together, to do the mission.
  - 59Q. You talked about MP being the chief of stan/eval. What --
  - 59A. Well, he was not OGV, he was the squadron stan/eval.
  - 60Q. Okay.
- 60A. And on it with the Air National Guard, we have, because of the manpower issues, we have OGV. We don't really have stan/eval at the squadron level, but what we did is, and this is separate from what happens out at the Air National Guard at Kulis. What we do is, we have a squadron stan/eval guy because they were sitting in the office just for the communication flow and the cross-flow of information, and they sit together in the same office. Even though they're separate programs, it's so we have the -- and we have that in scheduling also, so they're next to each other. So there's a good working relationship between the squadrons.
  - 61Q. So there's not really a chief, per se? Is that -- is that a correct --
  - 61A. Well, we have a chief of stan/eval in the guard, but that resides at Kulis.
  - 62Q. Okay.
- 62A. And since we have limited manning in the guard, our stan/eval is done at the OG level, and on active duty they have stan/eval at the squadron level, and they have it at the OG level, and what we did is, we basically took it out of hide to have somebody at the OG level, and then somebody at the squadron level, and then basically, the reason why we did that at the

squadron level is so we had good communication flow between the stan/evals because the stan/eval, if we had the OGB guy, he would be sitting over at Kulis and we wouldn't have that --you know, we'd be cross-town. We wouldn't have that communication and that's why we did the squadron stan/eval to mirror the active duty.

- 63Q. So in that pyramid scheme then, would the OGV, your stan/eval and OGV, would they provide oversight for the squadron stan/eval? As we normally would do it on the active side?
  - 63A. Yes.
  - 64Q. So you always have a checks and balance?
  - 64A. Yes.
  - 65Q. Were they familiar with the aerial demonstration program?
- 65A. OGB -- our OGB was familiar, but the OGB stan/eval pilot, we had LT COL BB, as our OGB stan/eval -- well, originally we had LT COL FZ and then it went to LT COL BB, and they had -- you know, they were aware of it, but they weren't providing -- I didn't view the aero demonstration as a guard program. I viewed it as a Third Wing program. We were providing bodies, we were providing instructors for the training, like MP was doing a lot of the training because of his experience, but that's the extent of it.
- 66Q. And then a couple of statements earlier you mentioned a steep turn; what is a steep turn?
  - 66A. A steep turn is 45 degrees of bank, or 60 degrees of bank; somewhere in that area.
- 67Q. Okay. What were your responsibilities toward -- you talked about an integrated unit -- what were your responsibilities, either specified or unspecified, towards the 517<sup>th</sup>?
- 67A. Responsibilities -- and actually, we're separate squadrons and with the administrative control staying within each squadron. However, the 517<sup>th</sup> being the host or the lead host for the classic association, they provide operational direction, and of course, operational direction is a very -- is a term that's open to a lot of interpretation and basically, a lot of times it's like a dance. You have a partner that leads and one that follows, and for the most part, we followed a lot of their lead stuff.
  - 68Q. Okay. How did you certify demo air crews?
- 68A. Well, what happened was, is the -- in this process, I know they went through some ground training. They went and practiced the profile in the sim, then they flew the profile in the airplane, and then, of course, it had to be videotaped and there was, in fact, when we first started this up, there was like a MAJCOM had to -- is the one who had the final say on the crew. So what would happen is, is they would videotape it, they would have to go talk to the wing commander, and we had them going and talking to the Third Wing commander -- not our wing commander, because it's the Third Wing commander, so we had guard guys marching them to the office, talking to the Third Wing commander. He'd give them a briefing. That package

would be put back to PACAF and then the MAJCOM was the one who gave the thumbs up or the thumbs down on it.

- 69Q. Now, you mentioned it was videotaped; who -- at what level was that videotape reviewed?
- 69A. I think the videotape was for the MAJCOM. I mean, the wing PA, I think, is the one who videotaped the demonstration, you know, for the certification, but they would then videotape it and it would be sent up to the MAJCOM because like the MAJCOM couldn't be here in person. So I think that was the way they did it, and then it went up to the MAJCOM and the MAJCOM was the one who actually did the approval process. And with us, under a letter of Xs, we had -- for our guys, we had an aerial demonstration letter -- or under a letter of Xs we had a column for aerial demonstration, and guys that were certified were checked off on that, and with the pilots we had MP MSO was in the process. WITNESS 25 who did it last year and then the loads, we had MSGT LJ, and then that Monday before the crash, we just had -- we just had some of the loads go talk to the wing commander, and the letter of Xs hadn't been updated yet, but we were getting that updated. And then the one individual, WITNESS 14 he was gone on a trip, so he didn't get a chance to talk to the wing commander, so we couldn't do anything with him, you know, for the air show. You know, he was scheduled but he wasn't going to fly in it because he hadn't talked to the wing commander.
  - 70Q. And there, just for clarification, a letter of Xs? What is that?
  - 70A. A letter of Xs is a product or tool to show qualification and certification.
- 71Q. And then you mentioned, MP was initially certified. He went through a process, and then you mentioned MSO and your loadmasters going through. Did that process, certification process, stay the same, or was it changed significantly, or was it based lined the same? How was that?
- 71A. I think it was base lined the same. I mean, the exact details, I'm constantly putting out 100 fires or running to whatever fire is burning the brightest most of the time, and you know, it was like with the aero -- the air demo thing, there was a lot of discussion about it when it first started up, but you know, we had some experience with it, you know, where we've done it for a couple of years, and it was kind of like, okay, it's a program that's up and running, and so...
- 72Q. You mentioned about hard crews and crews themselves and things like that; in the original demo air crew members chosen to go through the process, who were they? When you finally had a crew, who were your crew members?
- 72A. Well, what they were doing is, is there were some requirements to fly hard -- or to do the demo, practice the demo before you actually did the demo in a public setting. So what would happen is, is they had this pool of folks, and then what they'd do is, they'd harden up the crews to do a particular air show. So what would happen is, is you'd have not a big pool, but a small pool of people, experienced people, to do the air show, or who were demo qualified. And then if there was a requirement for an air show, like Arctic Thunder, then what would happen is, is you would start to harden up the crew and they'd start practicing together for the air show, and that was kind of our concept of hard crews and what had happened was, is, I remember when

- PACAF -- in fact, it was like -- they came down and it was like, "Hey, we need an air crew to go to India to do an air show," and there was one at New Zealand and then we followed the Thunderbirds around last spring, and what happened was, is you just started running out of, you know, qualified, certified guys to do air shows. So there was a pool and then you just harden it up for, you know, to meet the requirement.
- 73Q. Now, you talked about those air shows; what the last air show that the 249<sup>th</sup> participated in prior to 28 July of 2010?
- 73A. There was one in -- don't quote me -- it was in the spring time, I think it was April/May time frame, that there was a --
  - 74O. Of 2010?
- 74A. 2010, there was an air show and it was the Thunderbirds were making a tour of the Pacific, and there was a requirement to provide logistic support for the Thunderbirds, but they also wanted C-17 demonstrations. So, in that one, we had, I think, it was WITNESS 3, MP
- and MSO that did that trip, and I think it was like about a 17- or 18-day trip, and they toured the Pacific and they did air shows in several different locations.
  - 75Q. So they were pretty current then as far as the profiles and things like that?
  - 75A. I would think that -- I think that's a fair assessment.
- 76Q. Okay. Talking about the original air crew members, the air crew demo members, did you happen to interview the candidates when they were selected?
- 76A. Actually, what happened was, is we had discussions about it on our side of who we were going to provide -- you know, put forth, and we had some people that wanted to do it, and we said no, because we had like one part-timer who was flying for an airline out of state, and you know, his participation wasn't -- he was meeting the requirements, but it wasn't -- he wasn't flying the C-17s as much as we liked, so we said no. We said, there's some people that wanted to do it, so we said no to them, and we only had -- the only other person was our DO,

we said it was okay for him to do it, but you know, he never got around to doing it.

- 77Q. And then as the members went through their upgrade process, did you get feedback on their performance?
- 77A. The -- I'd say I didn't really get feedback per se. You know, sometimes I operate with just kind of management by exception A, is there a problem, and deal with the problems there, but I never got any feedback. I knew things were proceeding, but I never got any positive or negative feedback.
  - 78Q. Just a minute ago you mentioned part time; what does that mean?
- 78A. Oh, that's one of our drill status guardsman, who's -- you know, we have full time folks and we have part time folks, and about 30 percent of our staff is -- about 25, 30 percent of our staff is full time, and the other 70 percent -- 75 percent is part time.

- 79Q. Okay.
- 79A. Which is, the drill status guardsman is what you normally think of as a guard unit.
- 80Q. All right. And then, going back to the demo crew members themselves, how they were chosen, were people asked to do it?
- 80A. Mostly what we had is people who -- people who would volunteer to do it, and then we would decide that way, but we were selective on who we put forth. In fact, I have no regrets on the individuals we selected for the air show. All of them were good pilots.
  - 81Q. Now, was MP asked, or you just said --
- 81A. We did ask him when it came about, and at that time, when we first started up at that time, he was the only one that we would consider because of the experience in the airplane and two, with the part-timers, some of them, they're currently qualified in the airplane, but they're not flying the airplane like say a full-timer, and MP was flying quite a bit, and we thought his proficiency level was such that he'd be a good selection. And when we first started up, he was the only one that was doing it.
- 82Q. Okay. And then, we were talking about MP and then we also talked about gaining feedback; did you ever receive any feedback on how he was doing in his upgrade process, or during the profiles, or during -- when he came back from the air show?
- 82A. Not specifically. I never got feedback on how he was doing in the air show arena, but I got feedback from my active duty counterparts that, you know, like going on trips and stuff with him -- in fact, he took our first trip with WITNESS 23 and WITNESS 23 came back to me and said, "Hey, great." And I'd gotten feedback, positive feedback, you know, about him, as far being very -- knowing the airplane very well. And of course, you know, he was the sim instructor at the Boeing facility. So the airplane, he knew the airplane very well.
  - 83Q. And just for clarification, that first trip was a standard trip, not a --
  - 83A. Just a standard trip.
  - 84Q. Okay.
- 84A. But as far as the air show, I never really got any positive or negative feedback. And the thing is, is that the folks that are on this, I mean, they're all -- on the air show -- I mean, you pick your best, and most of them were -- like on the active B side, it seems like almost all of them were like evaluator pilots, almost all of them. And so you're expecting, you know, there's expectations when you're sending a stan/eval pilot.
- 85Q. Okay. There again, feedback. Do you remember feedback from MP -- on MP 85A. No, I don't --

- 86Q. In the upgrade process, or --
- 86A. No, uh huh. And the thing is, is when MP checked out, I think WITNESS 11 was the one who checked him out, and they were pretty close because they had flown together at Charleston.
- 87Q. And then, one last question on feedback: do you remember WITNESS 27 as a Director of Operations at the 517<sup>th</sup> receiving any feedback on performance?
- 87A. I don't know if he did or not. I mean, that would be a question for WIT 27
  The thing is, is if he'd got any feedback, he did not relay it back to me, but I think would -- and I'll go out on a limb here, I think would say that MP was, as far as on the guard side, he was the right guy for doing the demo team because of the experience and the proficiency.
- 88Q. Okay. In your earlier statement, you said that about the demonstration program. Can you just elaborate on that?
- 88A. Well, he was -- you know, when we talked about it initially, whether we were going to have a guard guy on it, he had told me that he's -- it's kind of interesting because he doesn't go to air shows and aero demonstrations. You know, he wasn't opposed to it, but he was just like -- I think he had -- I don't know if he knew people or if he had seen an accident or something, but in SAC, with the B-52s and 135s, and he was an old SAC pilot. They have had some bad history. I'm thinking like they had the Fairchild incident. But we had talked about that a little bit, how that was a cultural thing, but I don't think -- we did not have that kind of culture. I mean, it wasn't -- like I remember on that one where the squadron commander went and flew with the one pilot because they had the one pilot who was the head of stan/eval and the squadron commander said, "I'm going to be the one to fly with it," because he didn't want anybody else, because all the other pilots were complaining about him. But we did not have that culture. It wasn't like -- I didn't feel like I had to go fly on the airplane like that. I mean, like you had in the Fairchild incident where you had kind of a rogue pilot, I guess, would be a way to characterize it.
- 89Q. Okay. You also said that -- going back to MP -- that he talked beyond the book. So he knew the system and he talked beyond the book. Could you please elaborate and maybe what examples you were thinking of?
- 89A. Well, with MP he had a degree in physics, and he was one of the guys where -in fact, he was one of the guys I was thinking we might send to the WIC, the Weapons Instructor
  Course, because he was always constantly -- like for example, with the FMS box, it's like why
  does it do this, and he would go, you know, if he had -- he'd go beyond the dash-one where he
  would ask the engineers, "Hey, why does it do this." He'd call up people, you know, why does
  the box do this, and he was trying to just basically increase his understanding, and you know,
  flying the airplane like tactical arrivals. He would calculate it out to just -- you know like in the
  decent be where you would spool up to keep a low heat signature till the last moment till 500 feet
  or whatever was the safe altitude, then where you'd start powering up. But he was always trying
  to optimize and perfect everything, and he was always trying to increase his knowledge, which I
  think is an important thing in aviation. I think you've always got to keep on learning, because if

you don't, then you need to get out of the business, and then of course, you need to share what you learned.

- 90Q. After the air shows, especially on the overseas shows and things like that, did you ever see trip reports, or how it went, or --
- 90A. Oh, there's mission reports. I remember after the Thunderbird air show I asked how it went, and I remember asking MSO and MP and they said, "Oh, everything went okay." So I never got any feedback positive or negative that stood out.
  - 91Q. And then you're also -- yeah, please.

#### **Questions by the Legal Advisor:**

- 92Q This is the legal advisor. I just have a clarifying question. When you answered the question, you did kind of a raised eyebrow kind of look to the side, like (gestured). Kind of like a hmmmm, nothing.
  - 92A. What question was that?
- 93Q. That was in response to General Everhart's question about when you asked MSO -- excuse me -- MSO and MP and --
  - 93A. Yeah, I just --
  - 94Q. -- did they make that facial expression?
- 94A. No-no-no, it was just -- it was a gesture; I didn't even know I was doing it. When I asked him about how things went with the Thunderbird trip and they'd go, "Everything was fine," nothing that stood out as far as, you know -- they did the trip and nothing. There was no positive or negative or nothing glaring that stood out.
- 95Q. Right, and it's because you're making those kind of -- it's body language in the interview --
  - 95A. Okay, okay.
  - 96Q. -- and that's why I'm discussing. No, it's fine, I'm just discussing it.
- 96A. I've got my -- yeah, I can't control my body -- or I guess I can control my body language. I'll just sit ...
  - 97Q. Oh no, understood, sir. I mean, the body language is fine. I just wanted to clarify.
  - 97A. I'll sit here with my hands in my lap.
- 98Q. And I'm sorry, sir, I don't mean to frustrate you or anything, I'm just trying to tell you that -- I'm just trying to clarify that that was not related to their response. That they did not respond that way.
  - 98A. I don't know what to say.

# **Questions by the Board President:**

- 99Q. You said that the FMS box -- what is the FMS box?
- 99A. Flight Management System, or the mission computer.
- 100Q. The mission computer, okay. And then you'd also talked about optimization of flights as we were talking about MP performance; did he ever optimize or the performance in tactical arrivals [sic], but did he also optimize performance in other profiles, such as the air demonstration?
- 100A. The aerial demonstration I don't know because I didn't fly the profile. I wasn't familiar with the details of the profile, but I know, you know, like with the tactical departures and with AR he was always trying to optimize things, and it was one of those things where he was pushing himself to be better, and he was pushing other people to be better. I mean, we relied on his pretty heavily to help us start up the unit, and he was -- you know, when you start up a new unit and you start a new airplane, you have to be very careful because of your inexperience in the airplane, and so we were building up our experience base and he was basically -- he was worried about the reputation of the unit and making sure that we had a good reputation. So -- but prior to the ASAV, he sat down with almost everybody in the squadron and gave them a ground eval, and that's the kind of guy he was.
- 101Q. So then just to clarify, when you say "pushing people to be better," what did you mean by that?
- 101A. Well, not pushing people, not push in a bad way, but to increase your knowledge, to increase your proficiency, to know more about the airplane, to be a better pilot in a good way.
- 102Q. Do you recall who was the standard evaluations chief of the C-17 in the Operations Group at the time of the initial certification?
  - 102A. You mean on the active duty side?
  - 103Q. Uh huh (affirmative).
- 103A. It might have been -- MAJ W started out as the stan/eval person. That's a matter of record, but with the active duty, they seem to change out folks a lot more than we do. I think with us, we're more -- we keep people in a position for a lot longer time than, you know, we're not as concerned with like having bullets on your OPR like you did this position or that position, because usually in the guard, you know, we've got him for -- you're a C-17 pilot for the next 20 years of your career. So there's not the big push to make sure you got the -- you know, this job, that job, the square filling, that you see on the active duty. OGB, I think, there's been ...there's been MAJ W there's been WITNESS 10, there's been MAJ B and there's one or two other people in there, you know, who'd been, I think, stan/eval at the OG level.

104Q. Okay. At this time, what I'd like to do is take a break and let you go back to the break room, or if you need to head down the hall, and then we'll just check off any more questions that we may have and then we'll bring you back in and then we'll finish up.

104A. Okay, okay, and perfect timing.

(At 1025 hours, comfort break.)

(At 1052 hours, the interview resumed.)

This is we're back on the record. All attendees to the interview that were present prior to the break are again present to include WITNESS 22

105Q. WITNESS 22 we have just a few more questions to follow up on and it's for clarifications from your previous testimony you just provided. Initially, we were talking about the C-17 demonstration pilots, and we were talking about the program and how it came it about. Was the program announced overall, "Hey, we're going to start?" How did that work? Was it announced in the squadron and then you asked for volunteers, or you said -- was it discussed -- how did that --

105A. You mean initially, back in like 2007, 2008 time frame?

106Q. Right.

squadron, we were a detachment, and we didn't even start getting our full time manning until, I think it was -- it was that summer, so we were very small, and there wasn't really many options, and the thing is, is that MP -- you know, it was discussed at one of the TFI meetings about the aero demo team and you know if we were going to have guard participation and so forth, and basically, the only person at that time that had any appreciable C-17 time was MP and so -- except we had some other folks that did, too, but his name was the one that came up for doing it, for being a guard participant. But there was no -- there was no pressure on us to do it. It was one of those things where, you know, with this total force initiative, we wanted to have -- you know, we were trying -- guard and active duty were trying to show the, I guess, togetherness of the guard and the active duty working together, like when we did the -- hauled the elephant down to California, we made sure there was a guard pilot and an active duty pilot, and there's a lot of other missions where we've -- when we've done -- that have had high vis or PA. It's like make sure there's a guard guy and there's an active duty guy, and that's part of showing how we're doing the mission together.

107Q. And then just for my clarification, MP -- did the leadership talk to him, or did he say, "I'd like to do this? I would like to do the air" --

107A. Well, he came...well, he wanted to do it, but, it was kind of a mutual thing. I don't -- I can't -- the way it came about, in fact, there's -- we had another guy who was a part-timers who wanted to do it, and he came up to me and was like, "Hey," and we passed on him. And so it was -- you know, we had talked to MP about it, but he knew this was coming. I mean, a lot of times -- sometimes I'm the last one to know about stuff, or the rank and file talk about stuff, and I don't know how it came about, but yeah, it was discussed mutually between us. We didn't force him into doing it, and that was one of the things with MP that the guard -- it's like he

came off active duty and he felt like he had to -- you know, he felt obligated to do everything. It's like in the guard, is more based on volunteerism then it's like active duty where you're directed to do stuff. I mean, we ask people to do stuff more than task them.

- 108Q. You said that you were a detachment and then you got federally recognized? What is --
- 108A. Well, what happened was, is -- we were a detachment. What happened was, is the C-17s were originally supposed to go to the reserves, and then when the F-22 came, the reserves took the F-22 and then we took the C-17. And so the C-17, when we started up, there was no -- basically, we started from behind. There was no programming or anything, and we had to basically build a squadron -- build the squadron up. It wasn't like the Hawaii unit where they knew they were going to get C-17s. There was lots of -- we did a lot of the work concurrently for standing up the squadron, where instead of before, where you had a PIO office and spent -- like in Hawaii, they spent a couple of years dealing with it, and then they stood up the squadron. Where we started as a detachment and then had to go through all the programming and actions, all the working to get federal recognition, building the squadron and so forth. So we were working on building up the squadron at the same time as we were starting it, and we started out very small and started to grow.
- 109Q. So, federal recognition, is it an order that says you are now able to stand up as a squadron? Is that how that works?
- 109A. What it is, is it's federal recognition. Guard units have to be federally recognized, but it was us giving birth to the 249<sup>th</sup>, basically.
  - 110Q. Okay. Do you remember the date?
- 110A. It's all a matter of record. I mean, I can -- that was -- we started as a detachment and we grew into a squadron.
  - 111Q. We're talking about --
  - 111A. And I can get you the dates. I mean, if you need it, it's ...
- 112Q. We were talking about -- there again, the demonstration program -- I don't mean to be skipping around on you, it's just that you jogged my memory. You said that you would pick the best and what I'd like to know is, to be a demonstration pilot or a demonstration crew, what does that mean? What criteria was used?
- 112A. Somebody who -- somebody who is basically -- somebody who is a good pilot, somebody who had good flying skills, somebody who was proficient, somebody who would take it seriously.
  - 113Q. And then also you said that as you were doing the selection process, it was  $^{\rm WIT\, NESS\, 30}$  yourself,  $^{\rm WIT\, 27}$  and Lt Col --
  - 113A. For us providing bodies?

114Q. Yeah, and as you discussed --

114A. It was us providing -- what happened was, is it was

providing the guard bodies to the active duty, and that's what happened with MSO too. In fact, it was myself and LT COL FZ for the last couple -- like for MSO you know, making those choices, and we had a TRB, and at the end of the TRB we talked about it.

115Q. TRB is?

115A. Training Review Board, or they call it a TRP now, I guess. Training Review Panel.

116Q. And so where did witness 30 go in that process? To the --

116A. Well, he went to go become the Ops Group commander.

117Q. We talked a little bit about the Pacific air show with the Thunderbirds, and I asked you if you'd received any feedback per MP and MSO but then you just mentioned that you always hear rank and file talk. What was the rank and file talk about that? I mean, you were with the Thunderbirds.

117A. Well, I asked them how the trip went and they said it went fine. The only comment they really said was that it's just a long trip. That's all they said, but yeah, in rank and file talk, I didn't hear anything about -- pertaining to that trip, and I think that rank and file comment be out of context. I was just talking in general terms that sometimes, you know, something's coming up and it will be known on the active duty side before it gets over on the leader -- before it's cross-over on the leadership side, and you know, I'll have people coming over, "Hey, the active duty has done this. Are we going to do this?" And you know, sometimes the communication flow, sometimes the bottom beats the top on it.

118Q. So then, there again, about that Pacific air show, and the reason why I'm asking is because with the Thunderbirds, what was the scuttlebutt? I mean, would people say, "Hey" -- I mean, stories are always out there, but...

118A. Actually, I did not -- they just said that it was a long trip, and I didn't get any feedback, you know, I didn't get any feedback from anything. I don't know if there's any scuttlebutts at the lower rank and file, I don't know, but I wasn't aware of anything.

119Q. Okay. And then earlier, we talked about the standardization/evaluation; for clarification of the record, you said LT COL BB? Is that --

119A. LT COL BB is his actual name.

120Q. LT COL BB, okay. 120A. He's our OGV

1210. He's at Kulis then?

121A. Well, he's over here, but that's been kind of a ...point of contention where we kind of wanted him over here. So the office, we had the OGV in the squadron stan/eval, but he's assigned to the OGV over there, and of course, the rest of Kulis is moving over here. So, you

know, people are starting to trickle in over here, and so it's like he's, in fact, he's assigned to the OGB, but his desk is over here. But he does go over to Kulis to work on stan/eval issues periodically.

- 122Q. So is he the chief of OGV
- 122A. He's not the chief of OGV he's the C-17 pilot. He's not the chief. LT COL DP the chief of OGV
- 123Q. Okay. All right. I have one last question. Are there any matters that we haven't covered that you'd like to -- think are pertinent to our investigation, may be important to assist us in our investigation?
- 123A. I just would like to get this on the record. You know, before the air show, I'd LT COL FZ talked to our DO, , and I said, "Hey, the air show is coming up. Make sure you sit MSO down and MP and talk about the air show and say safety is job number one," because there is kind of a -- sometimes if you look in aviation, there is kind of an air show mentality sometimes, and I had talked to LT COLFZ about -- I talked to LT COLFZ is his nickname -- I talked to I said, "Hey, set them down and make sure they understand safety is job one for flying the air show." And so he had sat them down that Tuesday and they had discussions about -- because WITNESS 16 was going to fly on the practice that Wednesday, and so there was some discussion about how to do the flight orders correctly, and then he did sit down and talk to -- in fact, he talked to WITNESS 25 and MP in that setting. I was gone to New Orleans on MSO a trip. We had -- I was supposed to fly with MP I was going to talk to MP on that Sunday prior. To the Wednesday mishap, I was supposed to fly with MP down to New Orleans, but the airplane broke, and I was going to talk to MP during the trip, and then what happened was, is he had to drop off the trip because he had this air show demo practice that he had to do, and I ended up doing the New Orleans trip. And then so I had sit down and talk to him, you know, about the flight orders and about safety is job number one, and I'd just like to get that on the record.
  - 124Q. So did he give you feedback on how that discussion went?
- 124A. He said he talked to him and he said it went okay. I mean, you know, the big thing is that I was like -- most of my discussion with was "Hey, did you sit down and talk to him?" "Yeah, I talked to him." So...that was -- but you know, no -- again, no, you know, no glaring, you know, feedback once or -- a lot of that is a one-way conversation. It's like, just make sure, reminding them, you know, from a leadership standpoint that safety is always job one.
- 125Q. Okay. Was there any specific in that briefing about the instructions of what was said beside safety? Anything else specific?
  - 125A. Just safety. Making sure that they're safe.
- 126Q. Okay. And then, my follow-up then, you said that you were going to talk to him, or talk to the crews --
  - 126A. Well, I was going to talk to MP on the flight.

- 127Q. What would you have said?
- 127A. I would have said, you know, because I've flown in air shows before and what I would have told him is, is that, "Don't worry about the crowd. Just concentrate on flying the airplane, being disciplined and precise, and you know, if you have to -- if you botch up a maneuver, just go around. Recover, straight and level, and basically not to -- make sure you go into the air show with the right mindset."
- 128Q. Now, you say you flew air shows before; was that -- with what airframe?
  128A. In the 130, but not as -- just doing like air drops in the Elmendorf air show. I've gone out on about, oh, five or six times.
- 129Q. You just mentioned air show mentality; what does that mean to you?
  129A. Well, you know, sometimes in aviation, sometimes people get in the air show mentality and they get into the showoff phase, and sometimes they fly more aggressively or they fly more on the edge than they should, and that's -- I'll go back to the B-52 incident down in Fairchild, and I don't think that was an air show, but it may have been a fini flight or a practice, but you know, where there's an audience and sometimes people have to try and get oohs and ahhs out of it, and you know the thing to do is fly disciplined and precise, and you know, and just kind of factor out the audience.
- 130Q. Yeah, there again, for my own clarification, you say flying the edge; what do you mean by that?
- 130A. You know, maybe max performing the airplane, or maybe over performing the airplane, or you know, flying steeper than -- flying steeper than -- or you know, banking steeper than you should be, or flying faster than you should be, or slower than you should be, or...
- 131Q. Okay. Okay. We've asked some other folks and I would just like to ask you also, in the aerial demonstration program, what is the aerial demonstration designed to do?
- 131A. It's designed to show the capabilities of the airplane, and just the regular capabilities of the airplane. It's not --
  - 132Q. Just it's normal performance? Is that what you're saying?
- 132A. It's normal performance, yeah. It's not to show acrobatics or something that's wild. It's just to show the capability of the airplane. You know, what we do on a day-to-day basis. In fact, when you look at the profile, you look -- you know, like in these capability demonstrations for the 130 or C-17, you look at it and it's pretty plane Jane. It's what every crew member does every day. The only thing with when I looked at the C-17 demonstration, there was nothing cosmic about it. It was just basic maneuvering of the airplane. The only thing is, is it was in rapid succession. You know, there was a lot going on, you know, there was a lot going on in a short period of time, and that's how I look at the -- but I didn't see anything -- when I looked at it originally, I didn't see anything. I was, oh, this is pretty simple. There's not -- you know, there's nothing really too much here. Any crew -- any crew practicing tactical departures or arrivals, you know, this is the same kind of stuff they would do.

133Q. So it's pretty much set by -- the profiles are pretty much set by the regulation on how to perform?

133A. Yes. Yeah.

- 134Q. Those profiles, did you ever discuss them with were described, or the purpose of them or anything like that?
- 134A. No, I did not. And the way I looked at it, the profile was a pretty canned profile. I mean, it's just like go fly -- in fact, when I looked at the reg initially, it's like there's very little guidance in the reg on how to fly it. You know, there's no warnings or cautions or anything. All it is, is most of the reg, when I looked at it, was like, well, it's basically narration. I mean, it's the narration of the air show, if you look at it. That was the bulk of the reg.
- 135Q. And then as far as the regulation goes itself, do you consider that guidelines, or do you consider it procedure?
- 135A. Well, regulation, I consider it -- it's a regulation. It's procedural. That's the way I look at regulations.

PRESIDENT: Okay. You're reminded of the official nature of this interview. You may not discuss the testimony with anyone without my permission, or at any time the investigation is officially released to the public. At this time, this concludes the interview. It is now 1113 local, Alaska time.

#### **V23. AIB INTERVIEW WITH**

### WITNESS 23

#### VERBATIM TESTIMONY OF

## WITNESS 23

[17 September 2010, 1933 hours, local Alaska time.]

PRESIDENT: My name is Brigadier General Carlton D. Everhart, II, President of the Accident Investigation Board, convened to investigate the C-17 mishap that occurred on 28 July 2010, Tail Number 00-0173, at Joint Base Elmendorf-Richardson, Alaska. The accident investigation board is in Building 7309, Room 106, JBER, Alaska. We are conducting a telephonic interview with the witness, WITNESS 23 who is in Building 6875, Room C104, Al Udeid Air Base, Qatar. Also present with the witness, WITNESS 23 is LEGAL REP with the Combined Air Operations Center, Al Udeid Air Base, Qatar. Prior to the start of this interview, LEGAL REP positively identified the witness in accordance with AFI 51-503, Chapter 6, Paragraph 6.7.

The persons present in this interview are:

Brigadier General Carlton D. Everhart, II, Board President;
Pilot Member;
Legal Advisor;
Maintenance Officer Advisor;
Medical Advisor;
Maintenance Enlisted Advisor; and
Court Reporter.

This investigation, conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 91-204. The purpose of this investigation is to produce a publicly releasable report on the facts and circumstances surrounding this accident and to gather and preserve evidence for the use in claims, litigations, disciplinary actions, adverse administrative proceedings, and for all other purposes. A safety investigation was previously conducted on the accident. Any testimony you may have given before the safety investigation board will be kept confidential, if you were so advised, and can be used only for accident prevention purposes. This board does not have access to any of the confidential testimony you may have given before the safety investigation board. Your sworn testimony to us may be used for any proper purpose. Additionally, your testimony can be released to the public.

WITNESS 23 do you understand the difference between any testimony you may have given before the safety investigation board and your testimony to the accident investigation board?

WITNESS: Yes, sir.

PRESIDENT: WITNESS 23 do you consent to having this interview recorded?

WITNESS: Yes, sir.

PRESIDENT: Your testimony in this investigation will be under oath. At this time, please administer the oath to the witness.

LEGAL REP WITNESS 23 please raise your right hand.

WITNESS: [Did as directed.]

**LEGAL REP** Do you solemnly swear that the testimony you are about to give in the matter now under investigation shall be the truth, the whole truth, and nothing but the truth, so help you God?

WITNESS: I do.

PRESIDENT: Thank you, LEGAL REP for your service. You may be excused.

LEGAL REP [Withdrew.]

#### **Questions by the Board President:**

- 1Q. Please state your full name and rank.
- 1A. WITNESS 23
- 2Q. How long did you serve in the Air Force?
- 2A. Over 20 years active duty.
- 3Q. What is your unit of assignment and location?
- 3A. The 609th Combined Air and Space Operations Center, Al Udeid Air Base, Qatar.
- 4Q. How long have you been with this unit?
- 4A. Since June 2010.
- 5Q. What is your job title?
- 5A. Air Mobility Division Director.
- 6Q. How long have you been doing this job?
- 6A. Since June 2010.

- 7Q. What was your duty assignment while assigned to Joint Base Elmendorf-Richardson?
- 7A. I was the Commander of 517th Airlift Squadron for about 21 months, and then I was Deputy Support Group Commander for 3d MSG.
- 8Q. Please describe your duties and responsibilities as commander of the 517th Airlift Squadron?
- 8A. As Commander of the Airlift Squadron, I was in charge of training and equipping C-17 crewmembers based off our unit description for the amount of cruisers we are required to have. Also, we trained C-12 planes and execute the mission of two C-12 aircrafts and the crews required to execute that mission.
  - 9Q. When did the first C-17s arrived at Elmendorf?
  - 9A. I am pretty sure it was June 07.
  - 10Q. Are you familiar with the C-17 aerial demonstration program at Elmendorf?
  - 10A. Yes, sir.
  - 11Q. How did it start at Elmendorf?
- 11A. What I remember, it was winter, maybe early spring of 08, a request from PACAF to have a demo team for the following year. I think that was to go do some shows in the PACOM AOR. I remember discussing that with the Wing Commander, to have a demo team prior to the air show at Elmendorf for the summer of 08.
  - 12Q. Who was in charge of standing up the demo program?
- 12A. Standing up the demo program was a coordinated effort between PACAF STAN EVAL, approval by the NAF, and then recommendations for crew members from both the active duty squadron and the guard squadron.
  - 13Q. What was the identification of that Guard Squadron? What was that unit?
  - 13A. The 249th.
  - 14Q. What was your involvement in the startup of the demo program?
  - 14A. I was involved in selecting the active duty crew members.
  - 15Q. Can you tell us about the 249th Airlift Squadron?
- 15A. The 249th Airlift Squadron is the Alaska Guard Squadron and they flew the C-17s, also, in '07. It was a total force initiative where the 517th active duty squadron and the Wing owned the aircraft. We shared facilities, buildings, and other support with the 249th Guard Squadron, and both squadrons flew the aircraft.
  - 16Q. Is the demo program integrated with the 249th and the 517th?
  - 16A. Correct.

- 17Q. How is it integrated?
- 17A. The demo team was integrated with two active duty pilots and one guard pilot, and then one active duty load master and one guard load master.
  - 18Q. Do you recall who those members were?
  - 18A. I remember the pilot, WITNESS 11 and WITNESS 26 and MP I do not remember who the load masters were.
- 19Q. Who had oversight over the demo program once it was established and the two units were integrated?
- 19A. I would say it was a combined oversight between the two squadrons for approval, for requests, for the demo team to fly, and then coordination to make sure the required practice training occurred with coordinated efforts.
- 20Q. In that coordination effort, what were your responsibilities to the 249th Airlift Squadron?
- 20A. I do not remember having formal responsibilities. I think the active duty side was more responsible to our leadership -- PACAF Headquarters -- to ensure we followed guidance and procedures to do the upgrade and accomplish the required event in accordance with directives.
  - 21Q. How did you certify the demo aircrew?
- 21A. I do not remember exactly, except that I remember that we were required to bring up a current qualified crew. I remember coordination with PACAF Headquarters to ensure we followed the directives on upgrade process and that approval was required. I remember that the NAF -- the 11th Air Force Commander -- I remember that we coordinated and followed everything required.
- 22Q. Once training was complete, do you recall the exact method of how you certified the demo crewmembers, specifically, that initial crew?
  - 22A. I do not remember.
- 23Q. Do you think subsequent crews would follow through the same procedures? How did that work?
- 23A. While I was there, that was the only crew we did. So, yes, I would think we would have followed that same procedure; it seemed pretty formal.
- 24Q. Did you only recommend active duty members for the demo team, or, was your endorsement required for all pilots, to include the 249th?
- 24A. I do not remember. I am sure I did the active duty. I don't think I did, but I thought very highly of MP and supported his endorsement.

- 25Q. Going back to the certification process, I know you said you didn't remember some of the pieces. Do you recall what was actually forwarded from the Squadron, to the Operations Group, or the next level in the echelon in the process, what specific documents or what was forwarded up: I sign off on these individuals?
  - 25A. I do not remember.
  - 26Q. Do you recall who the 249th Squadron Commander was at that time?
  - WITNESS 30 26A. I do. It was
- 27Q. Is WITNESS 30 his last name, or, is WITNESS 30 his last name?
  27A. WITNESS 30 WITNESS 30 is his first name. WITNESS 30 is his last name. He goes by
- 28Q. Going back to that initial aircrew, do you recall how they were actually, specifically chosen?
- 28A. I do not recall specifically. I remember discussions with myself and the other squadron commander, both Dos, but I do not recall specifically.
  - 29Q. Did you ever interview the candidates?
- $\begin{tabular}{ll} I do not recall a formal \\ \end{tabular}$ 29A. I did with the active duty, specifically, interview, but multiples discussions with him before, during, and after the upgrade of the team.
  - And what was discussed? 30O.
- Specifically how the upgrade was going, how the other members of the demo team -- were they meeting the requirements and getting the support they needed. What I remember, from those conversations and watching the demo, everything went very well -- very competent, professionalism and the skills of that entire crew.
- 31Q. You said that you watched the demo. Did you watch it from the ground when the aircraft was performing the demo?
  - 31A. Correct, sir.
  - 32Q. How was that demo performed?
  - 32A. It was performed, flying at Elmendorf, in an Elmendorf pattern.
  - 33Q. Are you familiar with the C-17 demo profile or profiles?
  - 33A. I am somewhat.
- 34Q. Do you recall, when you were watching the aircraft fly the demo, do you recall what profile it flew?
  - 34A. No. sir.

- 35Q. Was there a video that captured that flight?
- 35A. I think so. I remember something about a video and then that, also, being sent up for review by senior leadership.
  - 36Q. When was that flight?
  - 36A. I do not remember, sir.
- 37Q. You said that you knew that the aircrew performed the demo within parameters. How did you know it was within parameters?
- 37A. No indication from watching or talking with of parameters.
- 38Q. Do you remember, specifically, how the aircrew performed; referenced bank angles, things like that?
  - 38A. I do not, sir.
- 39Q. Going back to the aircrew members themselves, did you ever receive feedback on their performance and, if so, from whom?
- 39A. I received a feedback from That is the only feedback I remember receiving.
  - 40Q. Do you remember feedback given on MP
  - 40A. No, sir. I do not remember specific feedback on MP
- 41Q. Do you know if WITNESS 27 Director of Operations for the 517th, do you know if he received any feedback on MP
  - 41A. I do not know, sir.
- 42Q. Who was the standardization evaluation chief for the C-17 in the Operations Group at the time of the initial certification of the demo crew?
- 42A. It was either MAJW or MAJB ; but I'm not sure at that time.
  - 43Q. What is your C-17 experience?
- 43A. I started flying the C-17 in 1994. I have around 3000 hours experience, instructor and evaluator time.

[The board recessed.]

[The board reconvened.]

## **Questions by the President:**

- 44Q. WITNESS 23 you stated that you highly regarded MP Would you elaborate on that please?
- MP sits in a simulator instructor and is a traditional guard member, and then became fulltime guard; that became his fulltime job. I accomplished training in the simulator with him as the contractor/instructor. He was an outstanding simulator/instructor, very thorough, and would provide additional training above what was required in a syllabus. I had flown with MP He has outstanding pilot skills and instructor skills with younger, less experienced pilots.
  - 45Q. Did you ever fly a demo flight or a demo simulator?
  - 45A. No, sir, not that I can remember.

### Questions by the Legal Advisor:

- 46Q. Can you tell us about the occasions in which you flew actual flights with MP
- 46A. I remember observing him instruct some junior pilots. He was very thorough and all the events he accomplished were excellent.
  - 47Q. You said instruct junior pilots. What were the events; do you remember?
- 47A. I do not remember specifically. From what I recall, it was some local training with touch and go landings and, I think, air refueling. I do remember him doing and teaching landings. I vaguely remember, also, doing air refueling; but nothing significant to remember from that.
- 48Q. And then you said that you had done some simulator training with him, and that he had provided some additional instruction that was above the syllabus. Can you describe some of that, please?
- 48A. I remember MP in additional to teaching the required syllabus items with us at several lessons, on cold obstacle clearance performance that he had researched on his own and would provide that instruction, I remember him covering, in further detail, cold weather procedures, since we were in Alaska and more specific to that location. I remember him providing good instruction while I was performing the required quarterly training events in the simulator.
- 49Q. From those interactions with him, were you able to get a sense of his style of teaching -- anything that stands out to you, sir?
- 49A. I remember him being very calm and very effective. He had excellent communication skills. I remember watching him with the younger pilots, being positive, patient, and just very thorough instruction.

# **Questions by the President:**

50Q. WITNESS 23 is there anything else that you would like to add that would aid us in our investigation?

50A. I thought very highly of MP and the other pilots we discussed. No, sir, I can't think of anything further to aid you in the investigation.

PRESIDENT: Thank you. You are reminded of the official nature of this interview. You may not discuss your testimony with anyone without my permission at any time before the report of this investigation is officially released to the public.

This concludes the interview. The time is now 2013 local Alaska time.

#### **V24. AIB INTERVIEW WITH**

### WITNESS 24

#### VERBATIM TESTIMONY OF

# WITNESS 24

PRESIDENT: My name is Brigadier General Carlton D. Everhart, II. We are investigating the C-17 accident that occurred on 28 July 2010 at Joint Base Elmendorf-Richardson, Alaska. This investigation, conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 51-204. The purpose of this investigation is to produce a publicly releasable report on the facts and circumstances surrounding this accident and to gather and preserve evidence for use in claims, litigation, disciplinary actions, and adverse administrative proceedings, and for all other purposes. A safety investigation was previously conducted on the accident. Any testimony you gave before the safety investigation board will be kept confidential, if you were so advised, and can be used only for accident prevention purposes. This board does not have access to any confidential testimony you gave before the safety investigation board. Your sworn testimony to us may be used for any proper purpose. Additionally, your testimony can be released to the public. Do you understand the difference between your testimony before the safety board and this accident board?

WITNESS: Yes, General.

PRESIDENT: Your testimony in this investigation will be under oath. At this time, I will administer the oath. Please raise your right hand.

[The witness did as directed.]

PRESIDENT: Do you solemnly swear that this testimony you are about to give in the matter under this investigation shall be the truth, the whole truth, and nothing but the truth, so help you God?

WITNESS: I do.

LA: This is I just wanted to ask you, WITNESS 24 is it all right if we record

your testimony today?

WITNESS: Yes.

LA: And LEGAL REP if you would please make your appearance for the record.

**LEGAL REP**: This is **LEGAL REP** I'm the deputy SJA at 13 Air Force, Hickam Air Force Base, Hawaii -- or actually I'm sorry, Joint Base Pearl Harbor Hickam, Hawaii.

LA: Thank you, ma'am. And you were in the room at the time when oath?

witness 24 had taken the

LEGAL REP: Yes.

LA: And you witnessed him taking the oath; is that correct?

LEGAL REP : I did.

LA: And did you verify his identity?

**LEGAL REP**: I did. I used his military identification card to do so.

LA: Thank you, ma'am. As discussed, you do not need to remain in the room for the remainder of this interview.

**LEGAL REP**: Okay. Thank you.

LA: Thank you. And witness 24 it's again.

WITNESS: Yes.

LA: Has LEGAL REP departed the room?

WITNESS: She has.

LA: And are you alone in the room?

WITNESS: I am.

LA: Okay. Thank you. Go ahead, sir.

PRESIDENT: Today is the 10th September 2010. This time is now 1215 local, Alaska time. This interview is being conducted telephonically. The 13th Air Force Judge Advocate at Joint Base Pearl Harbor, Hawaii has verified the identity of the witness. The persons present here are:

The witness,

WITNESS 24

Pilot Member;
Legal Advisor;
Medical Advisor;
Court Reporter; and,

me, [Brigadier General Carlton D. Everhart, II, Board President]

PRESIDENT: In room 105 at building 7309 Joint Base Elmendorf-Richardson, Alaska. The

witness is at Joint Base Pearl Harbor, Hawaii in building 2043, room A102. The witness is sworn.

#### **Questions by the Board President:**

- 1Q. Can you please state your full name and rank?
- 1A. WITNESS 24 United States Air Force.
- 2Q. How long have you served in the Air Force?
- 2A. Served in the Air Force 10 and a half years.
- 3Q. And what is your unit of assignment and location?
- 3A. Current unit of assignment is 13the Air Force, Joint Base Pearl Harbor Hickam, Hawaii. I am attached for flying with the 535<sup>th</sup> Airlift Squadron Joint Base Pearl Harbor Hickam, Hawaii.
  - 4Q. And how long have you been with this unit?
  - 4A. Been with this unit approximately one month.
  - 5Q. And what is your job title?
  - 5A. I am currently the aide-de-camp to the commander, 13<sup>th</sup> Air Force.
- 6Q. And your job title you just told me, just for the record, can you speak your job title, please, one more time?
  - 6A. Sure. It's aid de camp to the Commander, 13<sup>th</sup> Air Force.
  - 7Q. Okay. And how long have you been in that job?
  - 7A. One month.
- 8Q. Okay. Perfect. Could you please describe your duties and responsibilities on 30 July 2007?
- 8A. My duties and responsibilities on 30 July 2007, I was the Chief of Wing Current Ops, Wing Current Operations, in the 15<sup>th</sup> Operations Support Squadron, in the 15<sup>th</sup> Wing, Joint Base Pearl Harbor Hickam, Hawaii.
  - 9Q. Okay. And were you a Stan Eval pilot at that time?
  - 9A. I was a C-17 Evaluator Aircraft Commander, correct.
  - 10Q. And were you qualified in the C-17 aerial demonstration profiles?
  - 10A. I was qualified in the C-17 aerial demonstration profiles, yes.

PRESIDENT: I will now turn the questioning over to

# **Questions by the Pilot Member:**

- 11Q. Hello, WITNESS 24 it's the Pilot Member of the board. We established that you're aerial demonstration certified and you have been certified since you were called in 2007, correct?
  - 11A. Correct, I believe it was 2007 or 2008.
  - 12Q. Okay. And have you flown actual air shows in this capacity?
  - 12A. I have.
  - 13Q. Can you describe the certification program for aerial demonstration?
- 13A. The certification program that we have is directed by the PACAF Con Ops. We have 15<sup>th</sup> Wing, it was called 15<sup>th</sup> Airlift Wing Certification Program. And basically it started off with selection. The selection was by the Wing Commander, but really through the Squadron Commander, who would select the pilot, copilot, safety and loadmaster on the demo team. After selection, was basically instruction in the regulations surrounding air show demo. Following just the instruction and the familiarization with the regulations, there was a simulator. Simulator went through the three profiles, 1 through 3, the 6, 10, and 12 minute profiles in the simulator.
  - 14Q. Can you define a profile?
- 14 A. Sure. In the AFI 11-246, Vol 6, Chapter 3, defines the profile, the standard demonstration profile for the C-17. And there are, I believe it has four demonstration profiles. The three main ones that we practice and are certified for are the six minute profile, the 10 minute profile and the 12 minute profile. And they all involve various passes and landings and takeoffs over the airfield for demonstration. And obviously six and 10 and 12 minute is the total demonstration length.
  - 15Q Okay. And you were describing the certification program.
- 15A. Yes. So from the simulator we go to the aircraft. And in the aircraft and in the ground training, the simulator and the aircraft, when you're unqualified in demonstration, you have a qualified person with you instructing you. So for myself, I was instructed by MAJ A, who is another demonstration qualified pilot here in the 15<sup>th</sup> Wing. So you have the ground training, the simulator, and then the flight. And the flight, you perform the three demonstrations with a qualified demonstration pilot, followed by you have at least one profile that you do with your team.
  - 16Q. Okay. And can you define "qualified"?
- 16A. Sure. To define trained and qualified, obviously it's used synonymously, but basically trained or qualified is someone who's been previously trained and certified in the aircrew, in the air show demonstration certification. And so they are basically trained and qualified per the 15<sup>th</sup> Wing syllabus and certified by the NAF Commander, which is the 13<sup>th</sup> Air Force here at Hickam.

# **Questions by the Board President:**

17Q. And then, WITNESS 24 it's Brigadier General Everhart. Just for clarification on the record. When you say "con ops," you mean Concept of Operations?

17A. Correct, sir.

PRESIDENT: Okay. Thank you.

### **Questions by the Pilot Member:**

- 18Q. Okay. And you mentioned, you had talked us through the ground training, the simulator and the flight as part of certification. And then you mentioned that then the crew would fly together.
- 18A. Correct. And the flight together was either observed or taped for the Wing Commander and the numbered to Air Force Commander. In my case, it was taped and it was taped by a PA member who was in the tower while we were flying the demonstration profile. So we would fly that demonstration profile, they would tape that. Following the flight, if you were certified by the person who was instructing you on the air show, demonstration so for, again, for myself and the three people upstairs, there was a demonstration instructor pilot, and for the person downstairs there was a demonstration loadmaster who is certified. So if you were recommended for certification, it would be followed by a squadron commander's certification, then to the Wing Commander for certification, then to the numbered Air Force Commander for certification. Which at the time when I was certed, the 13<sup>th</sup> Air Force Commander was Lieutenant General Utterback. And there was a memo that traveled along with you in that certification, and the signed memo would reside in your flight evaluation folder. Following the certification from the numbered Air Force Commander, you were added to the letter of Xs, which is a document used by the squadron commander to document various certifications of aircrew members in the squadron.
- 19Q. Okay. And is this the standard PACAF, Pacific Air Force's Certification Program across Pacific Air Forces to your knowledge?
- 19A. It is my understanding that it is. The guidelines for it are written in the PACAF con ops. There may be some slight nuances that are different between the two Wings, but it is instructed by the PACAF, con ops, and that is what the training syllabus is designed around.
- 20Q. And you said slight differences between the two Wings, were you referring to the 15<sup>th</sup> Wing at Hickam and the 3<sup>rd</sup> Wing at Elmendorf?
  - 20A. Affirmative.
- 21Q. Okay. And you had mentioned earlier, you had used the terms "upstairs" and "downstairs." Can you explain that for us?
- 21A. "Upstairs," meaning the flight deck or cockpit crew; the pilot, the copilot and the safety. And then "downstairs," referring to the loadmaster, demonstration loadmaster.

- 22Q. Great. You mentioned the AFI 11-246, Vol 6, Chapter 3 profiles. Can you describe specifically the profile number 3, the 12-minute profile?
- 22A. Sure. The profile number 3, 12-minute profile is obviously the longest profile that we do. It starts out with a max effort take off, so max power take off. Usually, depending on the runway length, you adjust the point of initiation where you release the wheel brakes and begin your takeoff roll so that you'll rotate roughly at show center.
  - 23Q. Okay. And by rotate, you mean?
- 23A. And by rotate, I mean bring the aircraft from a three point attitude to a two point attitude.
  - 24Q. And then proceed airborne from there?
  - 24A. And then proceed airborne from there.
  - 25Q. Okay.
- 25A. So rotate the aircraft, fly it airborne, and then rotate farther than normally to attain VMCO, which is the min climb out air speed for the initial takeoff.
- 26Q. Okay. And when you were speaking about the rotation, can you just talk us through what you mean from three point to the airborne?
- 26A. Certainly. So basically take the aircraft from the normal attitude of three wheels on the ground, and you pitch the aircraft back so that it will then have two wheels on the ground and you rotate it to 12 to 15 degrees nose high attitude.
  - 27O. Okay.
- 27A. And then basically a VMCO climb, up to 1500 feet. At approximately 1200 feet, begin a pushover maneuver to lower the nose, so that at 1500 feet you become level.
- 28Q. Okay. And you mentioned prior to getting to that 1500 feet that you climb out at VMCO?
  - 28A. Correct.
  - 29Q. So if you could define VMCO for us?
- 29A. It's basically the minimum air speed for climb out, normally used for an engine out scenario.
  - 30O. But in this case used --
  - 30A. In this case used in a normal four engine scenario.
  - 31Q. Great. And then you go to 1500 feet?
  - 31A. Affirmative.

- 32Q. And is that above ground level or is that --
- 32A. That is above ground level. Again, at approximately 1200 feet, lower the nose to maintain a level attitude at 1500 feet AGL. From that you begin a right turn out for an 8260 maneuver.
- 33Q. And prior to your right turn, was it common for you to be slower than the VMCO that you had mentioned?
  - 33A. Was it common to be slower than the VMCO? No.
  - 34Q. Okay.
- 34A. You rotate the aircraft so that tames VMCO. Initially it may be approximately 25 degrees nose high.
  - 35Q. Okay.
  - 35A. And then you would lower the nose to maintain VMCO throughout the climb.
- 36Q. Great. And then you were talking to us, I believe you had mentioned, you said, "8260 maneuver." So if you can define that?
- 36A. It's basically 80 degrees of heading change from the initial takeoff heading, followed by a 260 degrees of heading change. So depending on the location of where the crowd was sitting, it could be a right or a left turn.
  - 37Q. Great.
- 37A. So a heading change of 80 degrees followed by a heading change of 260 degrees, and back around for your initial pass.
  - 38Q. Okay.
- 38A. The 8260 maneuver used -- you basically turned to that -- normally the pilot monitoring or the copilot would bug your heading. And by "bug," I mean he would select there's a heading select knob. And you would have that and it would bring up two bars in the window that would show you what heading you were turning to. You would turn to that heading, and then turn back around to a heading to align yourself with the runway centerline.
- 39Q. And there again, just for clarification of the record, when you say "bug," with the heading set knob, you're actually setting that heading with that knob into the instrument panel, correct? So you can see the display, your heads up display, is that what I understand?
  - 39A. Affirmative, General.
  - 40Q. Okay.
- 40A. So they would set that knob. You would turn to that heading. And then while you're turning to that heading, you're also beginning to accelerate and to de-configure the aircraft so that you approach the next pass in a clean configuration.

- 41Q. Okay. And during that turn, what bank angles do you use during that initial turn for the 8260 maneuver that you described?
- 41A. Again, that initial bank angle is probably no more than 30 degrees while you're accelerating through VMCO. And then as you get established in accelerating your airspeed, the bank angle can be all the way to 45 degrees.
- 42Q. Okay. And that 45 degrees is per in the regulation that you previously mentioned; is that correct?
  - 42A. Per the 11-246, Vol 6, Chapter 3, yes.
- 43Q. Great. And you were talking us through the term you used was "de-configuring the aircraft."
- 43A. Affirmative. So basically de-configure the aircraft. So as the air speeds accelerate through, you have a minimum flap retraction speed, referred to as VMFR, and a minimum slat retraction speed, referred to VSR, VMSR. And so basically as you accelerate through those speeds, you either normally call for flaps up, or the pilot monitoring may say "flaps," and then you'd say "flaps up," and flap the track at the appropriate air speed. Following de-configuration, you would turn back around to the extended runway centerline and align for your high speed pass, which would be 250 knots or 300 knots with an FAA waiver, depending on what location you were doing your air show at. And you would descend to 500 feet AGL for the initial pass.
- 44Q. Okay. So to summarize, throughout the initial departure you will climb at, you stated in VMCO, and then you will initiate a right or a left turn to a predetermined heading of 80 degrees of heading change. And you will be accelerating and you will, in your term "deconfigure" the aircraft, and you said at your VMFR, which is your flap retraction speed and VMSR, which is your slack retraction speed. What is your understanding of what those speeds provide to the aircrew?
- 44A. What does speed provide to the aircrew? They provide, they're basically a minimum safe speed and they provide a different percentage of speed above the normal stall envelope of the aircraft to a particular bank angle.
  - 45Q. Okay. And can you define a stall or stall envelope, from your understanding?
- 45A. A stall, or a stall envelope is basically the point at where the air flow above the wing is being disturbed to a point of where lift is I'm trying to think about how to describe this the best way. The airflow above the wing is disturbed to a point where you are losing lift and the angle attack is exceeding the point where the aircraft will stall, or basically no longer fly in the current configuration. And normally, a stall is perpetuated by angle of attack and will result in lowering the nose, un-commanded lowering of the nose or other similar maneuver.
- 46Q. And so is it, in summary, if your understanding of those airspeeds that you previously mentioned are provided to give you a margin above the speed at which the stall that you just referred to may or could potentially occur, is that accurate?
  - 46A. Affirmative.

- 47Q. Okay. And you mentioned angle of attack, and if you could just describe your basic understanding of that for us, also?
- 47A. Basic understanding of angle of attack is basically the difference between the flight path of the aircraft versus the attitude of the aircraft.
- 48Q. Okay. So you mentioned that during the de-configuration, the pilot flying calls for that verbally, correct?
  - 48A. Correct.
- 49Q. And does the pilot -- you said earlier pilot monitoring, is it accurate to say that that would be the copilot?
  - 49A. Correct.
- 50Q. And do they verbalize when they move, when they begin de-configuring the aircraft?
  - 50A. Yes.
- 51Q. Okay. You mentioned the bank angles during the 8260 maneuver. Does the 11-246, Vol 6 say anything about rudder, specifically?
  - 51A. Not that I know of.
- 52Q. Do you have any personal techniques or employment of the rudder that you use or teach to other demonstration aircrews?
- 52A. Nothing specifically in the air show demonstration profile do I instruct the use of rudder, any more than normal instruction of the use of rudder.
  - 53Q. And could you just clarify for the record what that is?
- 53A. The normal instruction on the use of rudder, I'd say I don't normally teach anyone to use the rudder, specifically. However, in the final turn to an approach to landing, there are times when you might add a small amount of rudder to bring the nose of the aircraft around to the runway centerline. And I would consider that normal use of rudder.
  - 54Q. And then when you say "small amount," how do you describe a small amount?
- 54A. It's a displacement of rudder. As far as a quantifiable number, I don't know that I could quantify it for you, other than a large displacement would be a full displacement of the rudder, a medium would probably be half, and a small amount would be a small change in the use of rudder.
- 55Q. Okay. Do you instruct regularly to use would you consider it prudent to use full rudder? Do you find that normally throughout the flight profile or envelope, that you find yourself having to use full rudder during a demonstration?
  - 55A. No.

- 56Q. Okay. And can you describe what the rudder does for the aircraft?
- 56A. The rudder is used to basically -- obviously three different axis; pitch, roll and yaw. And the rudder basically is controlling the yaw axis, which brings the nose of the aircraft to the left or the right.
- 58Q. Great. During this particular part of maneuver which we've been discussing, the 8260 maneuver, do you normally get stall warnings during a particular segment of that maneuver?
  - 58A. No.
  - 59Q. How about during other parts of the profile, during the demonstration profile?
- 59A. Not specifically in the demonstration profile. The only time that I would say where I may have had a stall warning occur, and I would define it as momentary, i.e., possibly one stall warning in a stick shaker, would be if you used DLC, which is directive lift control, which is used at times when you're on final approach to bring aircraft to a lower altitude, at times when you use the DLC, then you may have a momentary stall enunciation.
- 60Q. And what is your understanding of what the stall warning system provides to the aircrew?
- 60A. It basically notifies you that a stall condition is eminent, and is alerting you to correct your current flight path or configuration or what have you, to avoid a stall.
  - 610. And how does it enunciate that to the crew?
- 61A. There is a stick shaker, so it's an actual mechanical hookup to the stick, which is the pilot and the copilot's control mechanism, and it moves the stick. And then also it audibly says "stall, stall" over the CAW system or caution and warning alert system.
  - 62Q. And if you were to encounter that, what is your reaction?
- 62A. If I obviously it depends on the current maneuver that I was in. But most likely I'd be relaxing the pitch and moving the throttle forward to the max power range, and then followed by -- depending if I was turning or not, rolling wing levels.
- 63Q. And when you get the stick shaker that you referenced, how much does it move the stick? Is it enough to get your attention?
- 63A. It is enough to get my attention, yes. I don't know how to describe it. It basically vibrates the stick in your hand.

- 64Q. But it doesn't necessarily change the vector of flight, it's just a warning?
- 64A. Correct, General. It doesn't change the warning or the vector of flight.

- 65Q. Flight path?
- 65A. Flight path. It's just a warning to notify you that you're approaching a stall condition.

## **Questions by the Pilot Member:**

- 66Q. You mentioned checklists earlier. Can you describe how you run checklists, such as the approach and before landing checklists?
  - 66A. You mean in an air show demonstration?
  - 67Q. Correct.
- 67A. The approach checklist and the before landing checklist are run similar to how we run it anytime in the C-17. However, I will say that the demonstration profile is a little bit busier and faster pace than a normal C-17 profile. So there may be times when rather than normally the copilot or pilot monitoring would be waiting for you to call the approach check, he may enunciate "approach checklist," and then you might say "approach checklist," rather then he just waiting on you to call for it. Basically, the checklists, though, are run similar to how we normally run them, through a full approach check and a before landing checklist. The only stipulation that we add on is everything that's challenge and response, we also have a safety on there, as well. So if the normal call would be "gear down," "copilot," "pilot," then we'd add in "safety," as well.
  - 68Q. And these checklists are always called for verbally?
  - 68A. Yes.
- 69Q. And the challenge and response is, and when I say challenge and response, that means when one pilot moves, when one pilot takes an action, he verbalizes that to the other pilot, and that pilot confirms it, are those challenge and responses always run according to the flight manuals?
  - 69A. Yes.
  - 70Q. And can you just explain in general the purpose of the checklists?
- 70A. The purpose of the checklists is basically, the checklists are basically, come out of the way the flight manual is written. And they are to configure the aircraft for different phases of flight. So for instance, the approach checklist is to configure the aircraft to prepare it for one approach to landing, and the before landing checklist is to configure the aircraft for a final landing. And there is different systems and configurations that you are basically preparing the aircraft for, getting the aircraft in appropriate configurations for that phase of flight.
  - 71Q. And when do you run those checklists?
- 71A. The approach check, you normally run on an air show demonstration profile, you run it basically, sometime after the initial takeoff, after you de-configure. And you may run it again in the profile. Because there are times when you might do something to a system, such as when you do the slow speed pass to a go around, later on in the profile, if you initiate TOGA for

the takeoff go around button, you may have to reengage the approach mode so that you have to re-accomplish an approached check. So basically sometime prior to initiating the before landing checklist, you initiate the approach check. And then normally in the final turn before the final turn on final – while you're configuring the aircraft for landing, you run the before landing checklist.

- 72Q. And you always run these checklists, correct?
- 72A. The copilot always runs the checklist.
- 73Q. Yes, the crew always runs the checklist, correct?
- 73A. Yes.
- 74Q. And regarding checklists, do you use anything other than the flight manual checklist?
- 74A. No, not in the aircraft. Not airborne, I should say. There is a guide that many people use to set up the aircraft as far as the systems or the mission computer, in a way that we like to see it for the air show demonstration profile, just to remind you to set different things. But there are no checklists that we use that are any different than our normal checklists.
  - 75Q. And then the purpose of a checklist is what?
- 75.A. The purpose of a checklist is to ensure that the aircraft is properly configured for different phases of flight and to ensure all the systems are set appropriately for those phase of flight. And to make sure that nothing is missed in preparing the aircraft for the appropriate phase of flight, to make sure that everything is covered per the flight manual or tech order.
- 76Q. And you mentioned earlier that some pilots fly with a guideline. Is it accurate to say, would you consider this a technique versus a checklist, is that accurate?
- 76A. Yes. And again, the technique is really on the ground before the demonstration begins.

PRESIDENT: witness 24 can we just put you on a – just take a real short break? We just want to collect our notes up, make sure we got everything covered that we need to cover.

WITNESS: Okay. Roger that, General.

PRESIDENT: We'll be right back with you.

WITNESS: Okay.

[The interview recessed from 1247 to 1300.]

LA: We're back on the record.

# **Questions by the Board President:**

77Q. WITNESS 24 you talked about the stall warning and what is heard and seen. Can you describe that, what goes on as far as what you hear, what you feel, what you see, what enunciations occur, if you're in that stall condition with the airplane? And then, secondly, how do you stop that from happening as far as those senses, what's going on? How do you prevent that from happening, if that enunciation, if that warning occurs?

77A. Okay. So the first question on describing some of the stall warnings, basically, you have an audible warning. So we refer to it often as "Betty." We'll basically have an audible warning that says, "stall." And it's enunciated over the headset intercom, over the speakers in the cockpit. And then in addition to that, there is a stick shaker, so a mechanical movement of the stick when the stall warning is going off, and it basically, physically shakes the stick, vibrates the stick. And then also you can hear it enunciate, the vibration of the stick, not only can you feel it, but you can almost hear it actuate. And then in addition, in the primary flight display or the heads up display, there's a graphical bar that comes down over your air speed, and basically shows you where the correct speed is to fly to exit that envelope, or how far in that stall warning envelope you are.

And then as you said, how do you prevent that or what do you do to recover from the impending stall condition? As we talked about before, it really depends on where you are as far as configuration, as far as bank angle, as far as altitude goes. Or I should say really configuration of the aircraft, whether you are going to turn, whether you're straight level and so forth, on what you do to recover from that impending stall or stall warning. And as we talked about before, basically, normally relaxing the pitch and then accelerating the aircraft and rolling wings level will get you out of that stall warning. Did I answer your question, General?

PRESIDENT: You did, thank you. Okay. I'm just checking the room here, and we have nothing further at this time. I do have one last question, if I may?

WITNESS: Of course.

PRESIDENT: Are there any other matters that we haven't covered that you might believe is important to our investigation?

WITNESS: No, General, none that I can think of.

PRESIDENT: And witness 24 there again, if I may, I just want to give you an official readout. You are reminded of the official nature of this interview. You may not discuss your testimony with anyone without my permission, or at any time before the report of this investigation is officially released to the public.

This concludes this interview at 1304 local, Alaska time.

### **V25. AIB INTERVIEW WITH**

## WITNESS 25

#### VERBATIM TESTIMONY OF

# WITNESS 25

PRESIDENT: My name is Brigadier General Carlton D. Everhart, II. And we are investigating the C-17 accident that occurred on 28 July 2010 at Joint Base Elmendorf-Richardson, Alaska. This investigation, conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 91-204. The purpose of this investigation is to produce a publicly releasable report on the facts and circumstances surrounding the accident and to gather and preserve evidence for use in claims, litigation, disciplinary actions, and adverse administrative proceedings, and for all other purposes. A safety investigation was previously conducted on the accident. Any testimony you gave before the safety investigation board will be kept confidential, if you were so advised, and can be used only for accident prevention purposes. The board does not have access to any of the confidential testimony you gave before the safety investigation board. Your sworn testimony to us may be used for any proper purpose. Additionally, your testimony can be released to the public. Do you understand the difference between your testimony before the safety board and the accident board?

WITNESS: Yes, I do.

PRESIDENT: Your testimony in this investigation will be under oath. At this time, I will administer the oath. Please stand and raise your right hand.

[The witness did as directed.]

PRESIDENT: Do you solemnly swear that the testimony you are about to give in the matter now under investigation shall be the truth, the whole truth, and nothing but the truth, so help you God?

WITNESS: I do.

PRESIDENT: You may be seated. Today is 13th of September 2010. The time is now 1133 local, Alaska time. This interview is being conducted in building 7309, room 105, Joint Base Elmendorf-Richardson, Alaska. The persons present are:

The witness,

WITNESS 25

Pilot Member;

Legal Advisor;

Medical Advisor;

Court Reporter; and,

me, [Brigadier General Carlton D. Everhart, II, Board President]

PRESIDENT: The witness has been sworn.

- 1Q. Please state your full name and rank.
- 1A. WITNESS 25
- 2Q. And how long have you served in the Air Force?
- 2A. For 11 years.
- 3Q. And what is your unit of assignment and location?
- 3A. 249<sup>th</sup> Airlift Squadron, Elmendorf, Alaska.
- 4Q. And how long have you been with this unit?
- 4A. Approximately two years.
- 5Q. And what is your job title?
- 5A. I'm the Chief of Squadron Weapons and Tactics.
- 6Q. And how long have you been doing this job?
- 6A. Same time, approximately two years.
- 7Q. Would you please describe your duties and responsibilities on the 28 July 2010?
- 7A. Yes, that was just a normal day. So my duties and responsibilities included going to the office and making sure the tactics shop was running as it should.
- 8Q. Prior to this you made a non-privileged statement to the safety board. It was transcribed as now as part of what we call Tab R. Have you had a chance to review it?
  - 8A. Yes.
- 9Q. The statement was not taken under oath. Would you like to adopt that statement as part of your testimony today?
  - 9A. Yes, with some clarifications that I think we can cover at the end of this.
- 10Q. And we'll give you the opportunity to do so. And if I may, can I just ask you to speak up, just for the mike purposes.
  - 10A. Certainly.
- 11Q. We'd like to ask you some follow-up questions, if it doesn't touch on any of the clarifications you make. And we'll allow you to address those at the end. And if I may, I'd like to go ahead and proceed into the questions. Are you familiar with the profiles contained in AFI 11-246, Vol 6, Chapter 3?
  - 11A. Yes.

- 12Q. And how do you regard these profiles?
- 12A. Well, those, sir, are an AFI, so those are procedure versus technique or some other suggestion of flying.
- 13Q. We had some follow-up questions to your previous statement. First of all, in your previous statement you mentioned that you flew the long program, ie., 12 minute Profile 3, and it was flown at 60 degrees at bank for the initial turns, the 80 degrees off initial alignment and then the 260 degree coming back toward runway show center. Was this typical?
  - 13A. Yes.
  - 14Q. And where did you learn this from, ie., who taught you?
- 14A. We learned that in our training. Who taught us? MP was my primary I'm sorry, MP was my primary instructor.
- 15Q. Also you stated that the copilot would retract the flaps and slats on speed or at a safe speed. What is a safe speed to retract the flaps and slats?
- 15A. Depends on your bank angle and your energy level. A safe speed you can measure with a safe speed varies with your weight and your configuration and your air speed and banking. So there's no set airspeed number that pilots would aim for a safe speed.
  - 16Q. So how would you know what speed is safe?
- 16A. Well, you know when you're within the safe regime. We know that when you're cleaning up the flaps versus when you're cleaning up the slats, you have a stall margin built into your minimum maneuver airspeed, your VMMA, as we refer to, and that's one point three times your V stall for your flaps and one point four for slats. And so you can just do some quick arithmetic if you're going to be at 100 knots, then one point three would be roughly 30 knots, that's a 30 knot margin. Point four is roughly a 40 knot margin. Likewise, if you're 200, you can double that to 60 knots or 80 knots. So you can look at your airspeed and know when you are within that safe regime, when you're in that safe airspeed.
  - 17Q. What is the pitch angle during the initial climb out of the Profile 3?
- 17A. The initial pitch angle is to hold 15 initially so you don't tail strike, and then we would pitch for min climb out airspeed, VMCO. So we would pitch for an airspeed and not an angle on our profile.
  - 18Q. Then if I may, in your previous statement you mention 45 to 50 degrees of pitch.
- 18A. I did. And that was just an estimate of when we delayed our rotation, also, which is prior to your rotate speed, so you have more airspeed that you've gained on the ground when you're accelerating for takeoff, and so you can trade that initially to get back to your min climb out I'm sorry -- and adjust your (inaudible.)

- 19Q. You're doing fine.
- 19A. So your banking your pitch angle would increase from 15 to 25, 30 up to 45, 50, but I wouldn't I guess I need to be certain that I've seen that, and I may not have, that may be a tad bit too steep.
  - 20Q. Also you mentioned leveling off at 1500 feet.
  - 20A. Correct.
  - 21Q. Did you ever level off at a lower altitude in the profiles?
  - 21A. No.
- 22Q. No? Okay. You also mentioned it was necessary, and we just discussed it, to bank at 60 degrees of bank with 2Gs, Gs being two times the force of gravity if it's 2Gs. Do you remember aircraft alerts or warnings such as stall warning during this turn?
  - 22A. The initial turn?
  - 23Q. In any of the turns of profile.
- 23A. Yes. The initial turn, no, the initial first 80 degree turn. Subsequent turns would come occasionally, and they were momentary. And they would occur, usually during the training, during the upgrade, when people were either overbanking or tracking the nose too far without having max power and cleaning up a little early.
  - 24Q. And then you said, "momentarily." Do you have in your mind --
  - 24A. A time?
  - 25Q. Yes. What does momentary mean?
- 25A. Momentary, a couple seconds at the most. As pilots, you have that pilot feel of how long an alert lasts. And if it's too long you start knowing and saying something's not right.
  - 26Q. So what was your reaction to these warnings?
- 26A. I'm sorry. My reaction was I've seen this before in simulator and other configurations. [Noise interruption.] My reaction was I've seen this before on other flights and I know that we're in energy increasing state and I know that it should go away, the warning should extinguish soon.
- 27Q. And then did you happen to address stall warning recovery or anything about the warnings in your pre-brief prior to going out to the aircraft or in your training?
- 27A. We addressed it in as much to say "roll out," "get level." Sure. "Knock it off," we talk about knock it off criteria (inaudible) criteria.
  - 28O. What does "knock it off" mean?
- 28A. I'm sorry. Knock it off is a term that means cease all maneuvers, flow away from where you are, fly level, slow down or speed up to maintain your energy state and make an orderly recovery back to base because usually something unplanned has happened.

- 29Q. There was an air show demonstration briefing during the early part of July or the end of June time frame held in the squadron auditorium. Did you attend that brief?
  - 29A. No.
  - 30Q. Did you see the accident on 28 July 2010?
  - 30A. Yes.
  - 31Q. Would you please describe what you saw?
- 31A. Without hand gestures it's hard. What I saw was the initial takeoff, climb out, initial turn on a left 80 degree turn, or whatever the initial left turn was, I don't know the degrees. I saw the aircraft fly outbound for a few seconds, level, and then I saw the aircraft make a right turn, and I saw the aircraft settling, losing altitude in the turn, and then I saw the nose drop down below the horizon a few seconds later. At the time I said out loud, "Man, those guys better recover quick." And then I saw the aircraft go behind the building, from where I was standing, and about, a short amount of time later, it's hard to measure, I saw an explosion.

#### PRESIDENT:

All right. If we may, just like to take a break right now.

[A recess was taken from 1146 to 1206.]

LA: This is We're back on the record and all parties present before the break are again present.

- 33A. WITNESS 25 just a few more questions from myself and Earlier we talked about the level off altitude, leveling off at 1500 feet and I asked you specifically if you had flown that profile at a lower altitude. Have you seen anyone else fly at a lower altitude or have they always been at 1500 feet or do you know of anyone who may have?
- 33A. I don't know of anyone who may have. I have never seen it and I'll even add that MP was very clear in our training that that was important because we use that altitude to trade for airspeed.
- 34Q. And then real quick, just to talk about checklists and things like that. Have you ever heard of an aerial demonstration checklist?
  - 34A. Yes.
  - 35Q. What type of checklist is that?
- 35A. It's a checklist that pilots will use for reference when they're flying the aerial demonstration profile.

- 36Q. Is it an official checklist or is it --
- 36A. It was coordinated up through chain of command. I don't know the specifics of who approved it and how high it went. But it was yes, it was official.
  - 37Q. It was official? Okay. All right.

#### PRESIDENT:

LA: It's If I may ask a follow-up question?

PRESIDENT: Please.

### **Questions by the Legal Advisor:**

- 38Q. You said that it was an official checklist, that you thought it might have been coordinated through command, but you don't know how high it went. Do you remember when you first saw that aerial demonstration checklist?
- 38A. I first saw the checklist on my initial upgrade. The time frame was roughly spring of 2010.
  - 39Q. Spring of 2010? Okay. Thank you.
  - 39A. Late winter, I don't know the exact time.

### **Questions by the Pilot Member:**

- 40Q. WITNESS 25 you talked us through, earlier, through the cleanup, meaning when you put the flaps up and retract the slats. And you mentioned that a safe airspeed is based on a number of things, including your weight, bank angle, et cetera. Can you talk us through a little bit how that interaction happened when normally the copilot would move the handle and move the flaps to the upward position and the slats to the retract position?
  - 40A. When you say normally, do you mean every time we fly or normally --
  - 41Q. For an aerial demonstration.
  - 41A. -- in an air show?
  - 42Q. For an aerial demonstration specifically, and what you would brief as far as that.
- 42A. That was usually pre-briefed. So, we would brief to, as I said in my testimony before, we would brief you can clean up on speed as a technique. I remember we talked about that we liked to have the pilot not flying announce what he was doing in the terms of flaps up. And then who would move the handle. Yes, in this case the copilot. In terms of slats retract, move the handle. We discussed that in my upgrade among our crew that we liked that because it was a situational awareness enhancement for the pilot flying.

# **Questions by the Board President:**

- 43Q. Now you say, "your crew."
- 43A. Correct.
- 44Q. Who was your crew? Who was on your crew?
- 44A. My crew was going to be me, MSO MSO and MP

## **Questions by the Pilot Member:**

- 45Q. And you mentioned on speed. In that particular case, can you define what "on speed" was?
- 45A. Yes. On speed is defined in our head up display for our airspeed, and we have an indicator that shows the airspeed that the aircraft is calculated to retract flaps and retract slats.
- 46Q. So that's what you mean by "on speed," that under those conditions that you spoke of, it would be your flap retract speed or slat retract speed?
- 46A. Correct. And we talked about earlier, what the math and the aerodynamics that go into determining -- identifying that speed.
- 47Q. You also previously mentioned that as part of your briefing for demonstrations, and maybe other flights, but specifically for this question, for demonstrations, that part of your briefing was for knock off plans, or knock it off plans. Did you ever have to execute any knock it off plans for during demonstrations?
- 47A. We had to we didn't stop the profile, but we debriefed where we had made mistakes and said we would go back and try it again. The most common one is well, actually there's two. The common places are the initial 260 turn to come back around on the high speed pass just because your airspeed is increasing so quickly and your turn radius is increasing, it's common to overfly the target runway center line. And then a second area is on the final approach to landing, coming back around for a final.
- 48Q. Okay. So those were common areas where you remember encountering that. And was it specific to your crew, and then did you debrief that as a crew?
- 48A. We certainly debriefed it as a crew. My sense is it is not specific to the crew because it was something that we would talk about frequently with, talk about it with other guys, "Hey, so did you overshoot the initial turn?" Because it seems like everyone does that, especially in the sim the first couple of times trying it, as we're trying to manage the dynamics of (inaudible.)
- 49Q. Now, were the overshooting, was the overshooting situation the only situation that you can recall having to execute that knock it off procedure for?
  - 49A. Yes.

- 50Q. Previously also you mentioned that during the demonstration flights that you have heard before or the crew has heard before stall warnings go off, alerts go off. Can you talk about where those occurred and what was verbalized to the crew when you heard those stall warnings?
- 50A. Sure. First off, I'll say that hearing a stall warning or a stick shaker is not an uncommon thing in the aircraft and it happens on a variety of sorties. A common example is coming up initial for an overhead with a clean wing, with a young C-17 qualified aircrew member, and they'll do an overhead bank at 45 or 60 degrees bank and be surprised that the stall warnings went off while you have a clean wing and that will happen. So there are other times when the technology on the airplane does not accurately reflect the truth of what's happening right now. We talked about our (inaudible), we talked about our CAWs, the ground proximity warning system and our terrain awareness warning system, where we will get alerts inside the airplane that we will say, "acknowledged, I know what's going on here," and we are correcting the situation. Or the technology is not accurately reflecting what's going on. Okay. So, that happens on the air show profile at times. But it's momentary, like I said before. And it's because it's in an increasing state. So I've heard it when we're coming around that first initial turn, and we have max power range, so we're accelerating as we're cleaning up. And it doesn't happen every time. Does that answer your question?
- 51Q. Well, you mentioned that it incorrectly might have alerted a crew. And in your perception, what made those alerts, specifically talking again about the demonstration and that turn, that 260 degree turn. What made those alerts incorrect?
- 51A. Well, the alerts are a function of the ADCs, the aircraft data computer something. They're sensing the whole number of parameters that go into flying the aircraft. And especially on rapid aircraft movement, ie., from level to 45 or 60 degrees of bank very quickly, the ADCs are not computing fast enough to reflect what's going on. And they are so you'll have a momentary stick shaker, a momentary stall, a warning. And now the whole duration of that morning can be and sometimes several seconds more than –

[Telephone rings loudly. A brief recess was had from 1216 to 1217.]

LA: This is We're back on the record. All those who were attending the interview are again present.

- 52Q. Please continue.
- 52A. So I was clarifying a momentary stall or stick shaker. It's momentary and it's not an uncommon thing for the technology on the airplane to not accurately reflect the truth. And so when the pilot would say "acknowledged," it's his way of saying I understand what's going on, I know what's happening here and we are, in the case of the air show, we were accelerating, the power's at max and so the warnings go away, if they're not already overcome. What I was saying before the phone rang was that the duration of the warning, for example, you hear stall, stall, that's a set amount of time. Well, the airplane may hit a stall may meet the criteria for

that alert to go off. However, by the time that alert has terminated, the aircraft is likely already beyond those parameters, safe flying configures.

- 53Q. So would you say that, so you would momentarily get a stall, but that's erred on the side of safety, then. Because even though the airplane is not the cause of the abrupt angle, or how rapid you went into the movement, you've got a warning. So the warning would be erred on the side of safety.
  - 53A. Certainly. The warning –
  - 54Q. Do you see what I'm saying?
- 54A. You're going to get the warning and you still have flying energy. So you're not actually going to stall in that configuration or if you are, you're accelerating, so your airspeed will increase by several knots and so you're beyond the parameters. Or, your bank will decrease by a few degrees, so you're not in those parameters anymore. And generally, in our community, when a warning of some sort goes off, stall, terrain, flaps, what have you, the aircraft commander will state the term "acknowledged." And that term is commonly understood among the C-17 community as, "yes, I see we're getting a warning or an alert of some sort," and that, "yes, I understand that's it happening and it is being corrected right now," or it is already corrected.

## PRESIDENT: Anything else?

- 55Q. If I may, I notice that you're a weapon school graduate, the WIC, Weapons Instructor Course. Can you give me a description of what that entails and what that means?
- 55A. Okay. The Weapons Instructor Course, the WIC, is a six month course, it's a flying course that instructs C-17 and WS qualified pilots to --
  - 56Q. MWS, Major Weapons System.
- 56A. Major Weapons System, yes. Major Weapons System pilots into a deeper understanding of the aircraft and then the application of that depth to the broad application of air power that the Air Force packages themselves to other component commanders.
  - 57Q. So is it fair to say it's at a master's level of knowledge of understanding?
  - 57A. Some have said that.

PRESIDENT: Good. All right. That's all I have. What I'd like to do now, offer you the opportunity, you said you would like to have an opportunity to clarify your previous statement in Tab R. I'd like to offer you now that opportunity to make any clarification that you may have.

WITNESS: Okay. Thank you. Tab R, page R-51, it's the largest paragraph, right in the center of the page, I would like to clarify that on the initial takeoff, we briefed in my training and on our hard cruise that on initial rotation, rather than what is commonly done in the C-17 community of statement terms, positive rate gear up, we pre-briefed that the pilot not flying can look outside, measure whether we have a positive rate and bring the gear up themselves.

PRESIDENT: Okay.

WITNESS: Page R-52, in response to a question towards the bottom, response to a question from CAPT H about, "What is your opinion of flying guard and active together?" My intent in my response is to talk about a larger scale of TFI in general, not specifically to the 249<sup>th</sup> and the 517<sup>th</sup>. I think that as time goes forward the intent of TFI will not meet its criteria in that the active will want to reach out to an ANG unit and be able to have someone who is proficient and equipped at the same level that the active duty is. I have reservations on that one.

PRESIDENT: That's it. Okay, then one last question: Are there any other matters that we haven't covered that you believe may be important to our investigation?

WITNESS:No.

PRESIDENT: As part of the readout to conclude this interview, you're reminded of the official nature of this interview. You may not discuss this testimony with anyone without my permission or any time before the report of this investigation is officially released to the public.

At this time this concludes the interview. Time is now is 1224 local, Alaska time.

#### **V26. AIB INTERVIEW WITH**

### WITNESS 26

#### VERBATIM TESTIMONY OF

# WITNESS 26

PRESIDENT: My name is Brigadier General Carlton D. Everhart, II. We are investigating a C-17 accident that occurred on 28 July 2010 at Joint Base Elmendorf-Richardson, Alaska. This investigation, conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 51-204 – thank you -- AFI 91-204. The purpose of this investigation is to produce a publicly releasable report on the facts and circumstances surrounding this accident and to gather and to preserve evidence for use in claims, litigation, disciplinary actions, and adverse administrative procedures, and for all other purposes. A safety investigation was previously conducted on the accident. Any testimony you gave before the safety investigation board will be kept confidential, if you were so advised, and can be used only for accident prevention purposes. This board does not have access to any confidential testimony you gave before the safety investigation board. Your sworn testimony to us may be used for any proper purpose. Additionally, your testimony can be released to the public. Do you understand the differences between your testimony before the safety board and this accident board?

WITNESS: Yes, sir.

PRESIDENT: Your testimony in this investigation will be under oath. At this time, I will administer the oath. Please stand and raise your right hand.

[The witness did as directed.]

PRESIDENT: Do you solemnly swear that the testimony you are about to give in the matter under investigation shall be the truth, the whole truth, and nothing but the truth, so help you God?

WITNESS: I do.

PRESIDENT: You may be seated. Just as a reminder, I'll have to have you to speak up, if that's okay?

WITNESS: Yes, sir.

PRESIDENT: Today is the 13th September 2010. This time is now 1641 local, Alaska time. This interview is being conducted in building 7309, room 105, Joint Base Elmendorf-Richardson, Alaska. The persons present are:

The witness,

# WITNESS 26

Pilot Member;
Legal Advisor;
Medical Advisor;
Court Reporter; and,
me, [Brigadier General Carlton D. Everhart, II, Board President]

PRESIDENT: The witness has been sworn.

- 1Q. Please state your full name and rank.
- 1A. Sir, it's WITNESS 26
- 2Q. And how long have you served in the Air Force?
- 2A. Sir, I commissioned in 2002.
- 3Q. 2002, so?
- 3A. About eight years.
- 4Q. Eight years.
- 4A. Uh-huh.
- 5Q. And what is your unit of assignment and location?
- 5A. I'm with the 517<sup>th</sup> Airlift Squadron, Elmendorf Air Force Base, Alaska.
- 6Q. And how long have you been with the unit here?
- 6A. I PCSed here in December of 2007.
- 7Q. 2007. And what is your job title?
- 7A. I am the Chief of Stan Eval.
- 8Q. And how long have you been doing this job?
- 8A. I believe I moved over there February or March of this year, 2010.
- 9Q. 2010. And please describe your duties and responsibilities on 28 July 2010.
- 9A. I was Chief of Stan Eval at the time. I had an additional duty, I was the DO for the ground part of our air show.

- 10Q. And "DO" is?
- 10A. Director of operations. Also, I serve as flight commander for that, the stand eval flight group, so it's kind of both flight commander and Chief of Stan Eval.
  - 11Q. And as a flight commander, you're responsible for how many people?
- 11A. It's about eight, I think, I believe I have eight Airmen, Airmen and Lieutenant's between both that work for me.
  - 12Q. Are you familiar with the C-17 aerial demonstration program?
  - 12A. Yes, sir.
  - 13Q. Can you describe your C-17 aerial demonstration background?
- 13A. Sir, at McCord, was my previous base, I was at McCord Air Force Base. I entered training to be a safety observer. I completed the training because our flight was weathered out and it wasn't required at the time for a safety observer, but I never flew an actual demo. I came up here in December '07, and we had an air show July or August '08, I believe, that we wanted to stand up our demo team so we could fly. So I received training sometime spring of '08, and flew in that air show up here. And then also flew, the last time I flew was the only other time in, I believe, March of '09, I flew a New Zealand air show.
  - 14Q. So you're familiar with AFI 11-246, Vol 6, Chapter 3, demonstration profiles?
  - 14A. Yes, sir.
- 15Q. And then, just for the record, how many air shows have you performed while certified as a now you're a demonstration copilot now?
  - 15A. Correct.
  - 16Q. And how many air shows have you been in, total?
- 16A. I believe oh, I forgot one. We did a London, Ontario just before the New Zealand show, I believe. It was sometime around there, within a month of two of each other, so that would be three air shows
  - 17Q. Three total. Okay. All flown with you as the copilot or pilot monitoring?
  - 17A. Yes. Yes, sir.
  - 18Q. And who did you fly with?
- 18A. Two of the demonstrations, I flew with air show, I flew with WITNESS 13.
  - 19Q. And they were in the last seat, they were the pilot?
  - 19A. Correct. Correct.

- 20Q. Can you provide some background information on the 3<sup>rd</sup> Wing Aerial Demonstration Program, specifically, the certification process?
- 20A. Sir, I'd have to review the program itself. It's been a while since I've even looked at it. Would you just like to know my upgrade process, is that what you mean?
  - 21Q. What was your upgrade process?
- WITNESS 12 flew up from Hickam, they had a demo team and they We had, 21A. wanted to stand up our team. He did ground training with us to start, and maybe an hour or two of that, just sitting one day at work and talking about here's the demo, here's what we do, how it's flown. Then I don't know if it was the next day, it was all a short time span, we went to the simulator. Again, did a pre-briefing for an hour and went over a specific, where we were going to be flying, which was Allen Army Airfield, north of here. And that was with respect to the runways, so we had actual headings at that point, is what we were reviewing. And then he did a couple demos in the sim just to show us, teaching us, he wouldn't obviously because people hadn't done it yet. I don't remember if everyone was certified as a copilot. That's if my memory serves me, we all went through the copilot portion, also obviously the safety observer, someone was watching at all times. Once we were all slapped through that he put us in the pilot seat, which was over the course of several days, to get each of us enough simulator training, I think it was maybe two. We've done enough others that I'm not sure how many, initially. And then we went and flew an airplane, went up to Allen Army Airfield and he trained us with an actual flight.
- 22Q. When you say, "trained us," who else was in your training class, so to speak, or your fellow trainees?
- 22A. It was, I know for sure WITNESS 11 who was at the time. And the other pilot was MAJ W, and he's the one I'm trying to recall if he was in our training group. I'm definitely sure it was WITNESS 11 but I'm not sure about MAJ W And then for loadmaster, I don't remember who trained him, the name anymore, but it was SGT MK, was the loadmaster who was trained in the initial group.
- 23Q. And earlier you said you were familiar with the demonstration profiles. Can you explain in general terms how these profiles are used for aerial demonstration performance?
  - 23A. Sir, are you asking like basically how it would look from the ground?
- 24Q. Well, that. And then how would you use them, what was their purpose? What was the purpose of the profiles themselves?
- 24A. We discussed that. I'm trying to think how to say this. Sort of showcase the capabilities of the aircraft, highlight -- the particular thing that we were proud of was the assault landing with the backing. And then just because there was a high pass followed by a low-speed pass, kind of the contrast between we can fly fairly fast and also fairly slow.
  - 25Q. Now, you say high pass?
  - 25A. High speed.

26Q. High-speed pass.

26A. Yes, uh-huh. It was definitely a recruiting tool, just like most of the air show demos. Does that answer – do you have more questions about that?

27Q. No, we'll just keep going.

27A. Okay.

28Q. Can you provide an overview of Profile 3?

28A. Yes, sir. And as I mentioned, or I was thinking before, I hadn't -- at the time when I was interviewed for the safety board, I did not recall everything from the Profile 3. I've since reviewed it, so I'm more aware of some of the bank angles. I don't remember headings off the top of my head, but that was something we'd review in-depth before each practice. But it starts with a takeoff and climb to 1500. And that was one I didn't remember.

290. 1500?

29A. Feet AGL.

30Q. AGL, which is?

30A. Above ground level.

31.Q. Above ground level. Okay.

31A. Then it – there's an outbound turn for a certain heading. The objective is, you are accelerating so you're trying to get further offset from the runway. Because one of your main goals is not overfly the crowd line. We have very strict rules and the air boss can tell you to land if you break things like that. So you fly outbound, correcting for winds. At this time, takeoff, you're cleaning up the aircraft, which means pulling up the gear, retracting the slats, the flaps and slats. At that time you turn back around towards the airfield, descend to 500 feet above ground to pass by the crowd. And this is what we refer to as the high-speed pass. What we try and do is be a clean aircraft again within the configuration out. Depending on if you had a high-speed waiver during the air show or the airfield you can go about 300 knots. You try to pull idle without approach end, you still have the air speed, but that wasn't a concern, but just to make it quiet, the engines pull back so they're quiet. And at show center, which you've pre-briefed some sort of ground reference plane, accelerate the aircraft, again turn away from the airfield to get offset, so away from the crowd.

This is configuring for your low-speed pass. So this one you put up the slats, flaps, gear and you basically go to approach speed. So your approach speed configuration, turn back around, again descending. So you've climbed up to 1000 each time you turn around. Descend down 500 feet above the ground, pass the crowd again, show center, you turn it outbound away from the crowd. This one you are cleaning up to half flaps, so the rear will come up for the – it's a 360 degree turn at show center. It's just basically to give them, I think, a photo opportunity to be honest, for people. So you come back around to this again, at 500 feet above the ground. At the show center you 360 - 360 degree turn or a pivot, and you just perform a little circle there for everyone to see. And then that's the last maneuver before your landing. So you fly outbound, configure as you need for landing. And then to do the assault, and that's where you actually land

on the runway, full mass rigging, and then also use thresh reversers. On this, you leave the thresh reversers out, you have a loadmaster and the troop door to help you call out there there's any sort of unsafe condition. You begin, you let the aircraft back. I don't remember the airspeed but it (inaudible) before, then you stop at that point.

- 32Q. So if I may, just to make sure I understand. Maximum power, brake release and I'm only going to go up to the initial turn, if I may?
  - 32A. Yes, sir.
- 33Q. You said that you would what would you normally rotate to at rotation speed? What deck angle? What pitch?
- 33A. Sir, I'm trying to remember. Sir, I really don't recall. I don't want to say something that could be wrong. We would review it before.
  - 34Q. Did you look for a speed?
  - 34A. I'm trying to remember. Sir, I was the copilot.
  - 35Q. And that's okay if you don't recall.
- 35A. It wasn't a speed, it was an angle, because they would rotate and maybe begin to nose over, or push the nose over, and there was no lesson that we would watch, that that was the other if we didn't get the nose up high enough, it would begin to push over. I want to say, if memory serves me correctly, I believe 25 degrees nose high.
- 36Q. All right. And then you would climb up to 1500 degrees A -- or 1500 feet altitude above ground.
  - 36A. Yes, sir. That's one I did not remember until I reviewed the manual.
- 37Q. And then you would take whatever that heading was and turn 80 degrees offset, and then time outbound, and then start a 260 degree turn back inbound for your high-speed pass?
- 37A. Yes, sir. I don't remember if it was exact if it was 80 degrees. I know there is an 8260 in the profile, I just don't remember if it was that specific turn. One of them is, but if (inaudible.)
  - 38Q. During that 8260 --
  - 38A. Yes, sir.
- 39Q. -- degree maneuver, how is the aircraft typically de-configured? When would you de-configure that airplane? What I mean by de-configure, I mean retract the gear, retract the flaps, retract the slats, and when would you do that?
- 39A. Yes, sir. We pre-brief that it was clean up on speed, which means the copilot, and I would verbalize it and I'd say, "positive rate gear, up." And on my own, I wouldn't wait for the pilot necessarily, I'd pull the gear up, as the copilot. As we're going out, as soon as we get to flap retract speed, I'd say, "flaps up." I'd bring the flaps up. And then again as we got to slats. Which, this was all usually on the outbound leg, slats retract, and I'd pull the slats up.

- 40Q. So you're saying on outbound leg, you mean that 80 degree turn away from the runway that you just took off, or is it --
  - 40A. Sir, that's more my memory. It was whenever the speed --
  - 41Q. So it was done on speed?
  - 41A. Exactly. So if we were on outbound leg, that was when we did it.
- 42Q. What was your instruction specifically regarding the bank angle during that 8260 degree maneuver?
- 42A. Sir, that's another one I have looked up since, so I've seen that it says 45 degrees. It does say that those are -- the whole profile is guidelines. So I think that was maybe I don't remember for sure because I wasn't necessarily flying. But I think our larger concern was not overflying the crowd, so I think I've seen the pilots go up to 60 degrees.
- 43Q. So your interpretation then is that the 11–246, that's procedure, or is that guideline?
- 43A. No, sir. And this is again, I'd have to review the regulation, I believe it says these basic profiles are general guidelines.
- 44Q. And so do you remember what you said 45 degrees at bank. Have you ever seen more or less in the initial turn or the turn in 260?
- 44A. Sir, I feel like I have, but it never struck me. So I'm not sure if it was just I assumed they were doing a certain angle of bank. I felt more it was what we watched. We have a, we call it the worm. We have something that shows us where we're turning.
  - 45Q. The flight check a flight pad predictor?
- 45A. Yes, sir. Yes, sir. And you'd make sure you're not overshooting where you want to be. We do in the sometimes in the secondary flight plan, we'd show an offset where our line that we needed to not cross, so we could see if the pilot was overshooting or under shooting that line. So that's why I don't remember if they were setting a bank and then I feel like more what we were at doing was we'd try 45, and then if he wasn't quite making it I'd say, "you're overshooting," and he'd use a little more bank as needed.
  - 46Q. That's on the 260 degree heading change back into the show center?
  - 46A. Yes, sir.
  - 47Q. How about the initial bank out, do you recall?
- 47A. I don't recall the initial bank being extremely aggressive. So I don't think it was 60.

- 48Q. Do you remember any instruction during your upgrade and certification about the use of the rudder?
- 48A. Sir, I don't recall specific instruction on the rudder. Well, actually I do. Yes, sir, I do. That was something that came from our initial training. And what was said was that a wing flash is very obvious to the crowd, so if you were just correcting the center line, for example, on a landing or your show line, we call it, that you could use rudder to kind of turn yourself to get onto that line. It was less obvious. It made for a cleaner (inaudible.)
- 49Q. And then how much, when you say use your rudder, was it a lot, a little, full rudder, half rudder, a tap?
  - 49A. Some I think more my answer would be enough, as much you need kind of.
- 50Q. And then going back to your use of checklists, so there was no one who really during the actual demo would initiate the checklist, is that what you were saying? I guess my question is, my question specifically is: Regarding the use of checklists, which demo crew member initiated CAW for the checklist?
  - 50A. The copilot would initiate the checklist.
  - 51Q. And were challenge response checklist items verbalized?
  - 51A. Yes, sir, they were with the safety.
- 52Q. With the safety, okay. Regarding checklists, do you recall using an aerial demonstration checklist?
  - 52A. Yes, sir.
  - 53Q. And is that an official checklist?
- 53A. No, sir. Well, actually, I don't recall. I'd have to review it. There is a note at the top, I don't remember what it says. Sir, if I remember, it was something like it involved deep pressurization, making sure we wouldn't be pressurized for the loadmaster to open the troop door, making sure I think it was like altimeter cross check with each other, just kind of going through some basic setups.

LA: If I may, sir? It's the Pilot Member.

### **Questions by Pilot Member:**

- 54Q. So when you ran the checklist, how did you run the checklist? In other words, what checklist did you verbalize that you were initiating?
- 54A. Let's see. I'm trying to recall. I know during the 360 degree maneuver at show center, that was when the approach check would be run. And it was auto, but I'd go into it on my own. It wasn't call for, but we briefed that was during the 360 you do the approach check. The safety would remind you if for some reason you weren't doing it. And then before landing checklist was the same, which was initiated as soon as the gear went down.

- 55Q. And how about prior to departure?
- 55A. All of the I would call for, I believe.
- 56Q. Do you remember which checklist you called for?
- 56A. No, sir, I don't. I mean, other than just the normal before takeoff and landing checklist. Is that what you're asking?
  - 57Q. Yes. Just which checklist was verbalized.
  - 57A. Uh-huh.

- 58Q. I mean, if I just may, just to --
- 58A. Yes, sir.
- 59Q. So was it the before takeoff checklist or was it be before takeoff aerial demonstration checklist? You see, I don't know how this particular how is that used?
- 59A. Yes, sir. I see what you're saying. I'm trying to remember again. I believe we ran both. We did the normal checklists, but then we also did the extraneous to help us with the demo for the things that I said before. But it was -- we did both of them.
- 60Q. Do you remember getting warnings or alerts from the aircraft? And if you do, what were they?
- 60A. Sir, we get the stall indication, that is often during the approach portion where if a pilot might be using the DLC, the direct lift control to help the aircraft descend, and that's something we train to just in everyday flying, that if you're holding your deck angle and you're using the direct lift control to descend, you would have to push the nose over to compensate for that. It's a, I want to say standard. It's a common training thing that you have to address with copilot's, with everybody. So that was one I know I've heard. I don't remember off the top of my head any others.
- 61Q. Now, did you ever get stall warnings in turns or oral warnings in turns, or the stick shaker?
- 61A. Sir, I'm trying to remember the exact phase that I'd hear it, because I know I've heard it. I don't remember if it was in a turn.
- 62Q. Well, then, if I may, what response would be if you heard you said okay, it occurred when we have the DLC. You would push the nose over because that would make it stop?
  - 62A. Yes, sir, to help increase the air speed for backside (inaudible.)

- 63Q. What was your assessment of MP performance? Do you know anything about his training or how he performed the air show?
- 63A. Sir, I don't know or actually, I should say I never flew with him, so I didn't have first-hand knowledge of him as a demo pilot. I saw some of the ground training, I know he was just as in IP planning, he was very, very "in the books," for lack of a better term, very motivated. Always working on the demo and trying to improve it, working on the demo team, making sure we had enough people upgrading. That was the extent of my knowledge with him and the demo team. I didn't get to I don't think I even flew with a sim with him, to be honest.
- 64Q. And then if I may, can you elaborate, when you say you're trying to improve the demo, is that it's a set profile, so can you elaborate on that?
- 64A. I'm trying to think what an example would be. Well, sir, I know for a while he and who was the previous active-duty demo pilot lead, they discussed things like, on the initial turn out, after initial takeoff -- and I'd seen do this. And he'd have the sim instructor kill his down wing basically the number one engine as he's making a left turn.
- 65Q. So when you say "kill," seemed like that it was, for some reason it had turned off? 65A. Flamed out or bird strike. But, so they'd train for EP, or emergency procedure basically, and just see if they could recover it. And once they establish that even as they're doing this banked turn with the engine now suddenly becoming inoperative, that they were able to successfully recover. So things like that, I guess that's a safety part of it. Some of it was just simply his enthusiasm. He made hats and patches for the team to wear, kind of as a pride thing. But yeah, you brought up the change in the profile. I don't think the profile is different, but it was, I mean just anything he could think of to make the experience better.
- 66Q. Part of the certification process is an interview with the squadron commander and the wing commander. What did this interview entail?
- 66A. Well, sir, my interview, and it's the only one I've been present for, the squadron commander was simply we've the squadron commander told us, "We selected you for this because you have exhibited flying skills that are worthy of an extra level of flying," I suppose, that, "We trust you to go out and make a good impression, please." So a lot of just the public affairs type aspect. And I think it was the same with the wing commander, just, you're kind of a -- speech on well, for -- actually the wing commander wanted to know a lot about our training, come to think of it. So it was a lot more interview type. I think the squadron commander was very into what we were doing day-to-day. He would show up in the initial planning room when we were getting ready to fly, so he knew the upgrade. So I think maybe that's why he didn't interview or ask. The wing commander did. He was very it was General Tinsley at the time. He wanted to know all the training we have done, "So have you all had sims?" He was very anxious to know that we'd been trained properly, and then he gave us all the speeches about making sure that we set a good example, if we go international, we're not just representing our base, we're representing the United States. And it was that sort of a thing.

- 67Q. Was anything discussed about safety?
- 67A. Well, yes, sir. The -- be safe, that you're flying aircraft, I don't want to say max performing, but basically max performing aircraft, that you're doing some extremely demanding profile, and that's why you have a safety observer onboard. Be safe. Back each other up. Make sure you train for it before you go. And that was built in, but we'd always practice before.
- 68Q. Was there -- just as a side line away from the certification process, and those questions, but was there ever a discussion, did you ever brief that if you ever got into a maneuver or there was a maneuver that you do knock off, you know, or do what you needed to do to keep safely performing the profile, but continue on? Or you know, if it didn't, if it wasn't a motor going out or anything like that, you know what I'm saying? If you (inaudible) to a warning or something like that?
- 68A. Yes, sir. Well, I'll be honest, I don't think we talked about continuing after anything. Because during our training we would, sometimes when someone was learning, but WITNESS 11 for example, if he just completely overshot a turn or something, would say, "Hey, knock it off. We're going to go out here." We had a place they'd tell us to fly to in bold. So it was "timeout," we used timeout as a, "Let's stop everything."
  - 69Q. Can you give me a definition of what timeout is?
- 69A. Timeout is just, it's a word we reserve for anyone on the crew to more or less say, "I don't like," or "I don't know what's going on." And then to the pilot flying, what that means is, "Come away from the ground. Get away." We use it in air fueling, "Get away from the tanker." Whatever the biggest threat might be, formation get away from another aircraft. And it's, anyone can use it. You know, we brief and try bring up what you object to first. Are you a little too close or too low, if no one's listening to you "timeout," and no matter what, stop what we're doing and climb away and fix the situation.

PRESIDENT: If we may, I would like to take just a short break, Allow us the time to gather our thoughts a little bit. And then when we're ready, we'll come back and get you.

WITNESS: Yes, sir.

[A recess was taken from 1709 to 1740.]

LA: It's We're back on the record. All attendees to the interview prior to the break are again present.

### **Questions by the Board President:**

70Q. Would you ever have a problem making that call during an air show? 70A. No, sir.

#### PRESIDENT:

PILOT MEMBER: Yes, sir.

## **Questions by Pilot Member:**

- 71Q. We just wanted to ask, just to build little more background. We got a little bit at the beginning, so just to clarify the background a little bit more. You mentioned that you did not fly with one of the mishap crew members, MP When did you last fly an air show practice?
  - 71A. The air show, sir, I believe was March '09, March 2009 last May --
  - 72Q. And that's the last air show?
- 72A. Yes, sir. That was last air show, any sort of practice or sim or any real involvement in it.
  - 73Q. So, that was the last air show type event that you did?
  - 73A. Yes, sir.
  - 74O. Was in '09?
  - 74A. Correct.
- 75Q. And you say that you never flew with MP Did you ever sim with him at any time?
  - 75A. No. sir.
  - 76Q. And did you ever seen any videos of any performances that you knew to be or any of the mishap crew members?
- 76A. No, sir. The only video I knew about was the one we made, that I was on initially (inaudible.)
  - 77Q. Did you ever fly or sim with any of the other mishap crew members?
  - 77A. No. sir.
- 78Q. Earlier you mentioned that, you mentioned overshooting and that that was something to avoid. Was this a major concern for the pilots flying?
- 78A. Yes, sir. It was very it was emphasized. I'm trying to say it was major is a little too strong, perhaps. It was a concern or an objective maybe. It was a, "You do not want to overshoot." Time -- we'd specifically create more time in practice flying away from the crowd for longer times, in the sim we'd experiment to make sure that we didn't overshoot. So it was kind of an objective is more what I would say.
- 79Q. And how about increasing bank angles and those types of maneuvers in order to not overshoot, was that a procedure or a method that was used to avoid overshooting?
  - 79A. It was, yes, sir.

80Q. And then you had previously mentioned in the AFI 11-246 –

LA: Excuse me, and I'm sorry, I don't mean to interrupt. But you asked a question about, was that the guideline – or I'm sorry, was it a technique – or you gave a choice?

PILOT MEMBER: Procedures.

WITNESS: Procedure.

LA: What procedure, and she said, "Yes." So I was just clarifying as to what she was saying yes to.

WITNESS: I was saying more to the method, was the word that I used.

LA: Okay. Thank you.

PILOT MEMBER: Yes, sir.

### **Questions by the Pilot Member:**

- 81Q. And you had mentioned previously also that we were talking about the profiles that we previously mentioned, and you had mentioned that they were, in your interpretation, were guidelines. And then you mentioned that in AFI 11-246, Vol 6, Chapter 3, that you believe that to be substantiated. And we'd just like to I'm going to hand you actually, AFI 11-246, Vol 6, Chapter 3. And if you could just point to us or point out to the board your interpretation of that.
- 81A. Yes, sir. It's here, page 3, here at the top of the page. It says, "The procedures in these profiles are general guidelines." It talks about mission planners may adjust, it gives some examples.
  - 82Q. Can you read the examples for us?
- 82A. Sure. "Mission planners may adjust them for cause to accommodate the requirements of a jump team or paratroopers, Static Line, HALO, etc., the requirements of the equipment, material to be airdropped, heavier CDS container delivery system, the physical requirements of the drop zone or the unique requirements of the event itself. Aircrews will not deviate from the mission planned except for safety considerations. Planning and mission execution must comply with the AFI 11-2C-17, Vol 3, and other relevant DoD, U.S. Air Force, and FAA guidelines."
- 83Q. And for clarification, do you believe that paragraph to relate to all the profiles in the AFI?
  - 83A. Yes, sir.

- 84Q. And not just the previous page, which would be page 2?
- 84A. Of the airdrop section?
- 85Q. Yes.
- 85A. No, sir. It's not necessarily broken out, I believe that was at the end of all the profiles.
  - 86Q. You believe it applies to the entire regulation?
  - 86A. Yes, sir.
- 87Q. And if you could, if you could go back to the front for us, I'll have you go back to I think we're on page 1.
  - 87A. Yes, sir.
- 88Q. And if you could just read the first sentence in the very first paragraph for us. Great. Yes.
- 88A. All right. "General instructions. Aircrews from all MAJCOM's will adhere to the flying procedures and Profiles 1 through 4. Profiles 1, 2 and 3 are demonstrations of aircraft high-performance maneuvering."
- 89Q. And that was just to clarify the record, just to establish that in the record. So thank you for doing that. Another area that we had previously visited was stall warnings. And you had previously mentioned that one area that you have seen stall warnings before was during the approach or the final approach phase.
  - 89A. Yes, sir.
  - 90Q. Is that accurate?
  - 90A. It is.
- 91Q. Were there other times when you witnessed stall warnings, specifically, occurring?
- 91A. Sir, I don't remember I don't remember if it was any specific time, because it's been so long that I've flown, I just don't know remember exactly when.
- 92Q. I understand. So you don't know where in the profile in particular you heard them. Do you remember how long they occurred?
- 92A. Sir, not for an extended period of time. More it was sort of, we'd say, "In and out," of the stall warning. You'd hear it, someone would say, "push the nose over," or a correction would be made, basically, to stop it. And then perhaps it would come back, depending on the maneuver.

# **Questions by the Board President:**

93Q. So just to clarify then, when you say, "In and out," so if you heard it, someone would make a correction to fix that immediately?

93A. Yes, sir.

### **Questions by the Pilot Member:**

94Q. And lastly, we'll just revisit the check list usage a little bit. We had mentioned that -- we had talked about prior to takeoff and then we talked about the checklist that you run after takeoff.

94A. Yes, sir.

95Q. We also had mentioned that one of the checklists that was used was the aerial demonstration checklist.

95A. Yes, sir.

- 96Q. Was that something that was briefed prior to the flight, which checklist you would use and when you would use it?
- 96A. Sir, what I think you're asking is if we would run standard checklists? Is that what you mean?
  - 970. Sure, if you want to elaborate on that.
- 97A. We did. We'd use whatever was applicable. So for example, on a short sortie we might say no need for after takeoff cruise decent, we'll go straight into approach check. So I'm sorry, it would be cruise and decent. So we'd clean up, confirm visually that the aircraft was clean. So again, that was running it, but not verbalizing all the steps necessarily. So for approach check, we'd brief, "Let's do it at this point." So a good time for the copilot to kind of go heads down, or which is excuse me -- be looking in the aircraft let's say during that 360 degree maneuver. And then also before landing checklists, as soon as the gear comes down you can initiate that. So that was briefed.
- 98Q. So can you explain then, maybe how you utilized the air show demonstration checklist specifically, then? And I can hand you this as a reference. And for the record, this is the air show checklist. And on top, for the record, it says "3<sup>rd</sup> Wing Aerial Demonstration Checklist." And we'd like to submit that to you and have you take a look at it, make sure that you are familiar with that.

98A. Yes, sir.

99Q. And if you are, if you could elaborate as to how that was utilized in conjunction with the other checklists.

[Male speaker tells the witness to take her time and look up when she is done.]

- 99A. [Reviews document.] Okay. And I'm sorry, what was the specific question?
- 100Q. If you could just maybe elaborate on how that was utilized with the other checklists.
- 100A. Sir, to be honest, from when I did it, it was two different pieces of paper. This wasn't exactly the same. I recognize what's on this piece of paper. And I know at the time even, when we were using different pieces of paper, it was always printed for optimization, basically, of our use, because it's such a fast profile. So I can see that they've got, some of the steps are small because of things that we've established or briefed ahead of time. Our NAF guidance, for example, really don't check don't need to do that on a visual aerial demonstration.
- 101Q. So what is your interpretation of the small print items and then the large print items?
  - 101A. The small print ones are let me look for a second, please.
- 102Q. And again, I want to make sure that's based on your familiarity with those. If it's not, you don't have to comment on something that you're not familiar with, specifically.
- 102A. Well, sir, I'll say that the specific one I haven't seen, just like this. But when -- before when I was training, we would make small print for defensive system as required, for example, on approach check is sort of not applicable.
- 103Q. And so what would that mean? That would mean that it was something that's not run or applicable?
- 103A. You don't need to perform that. Correct. Yes, sir. But it's defense system, as required, for example, it's as required, we've established ahead of time it's not required to perform.

#### **Questions by the Board President:**

104Q. So would you use this checklist or the items, use the items on this checklist, did you all establish a different checklist because you didn't want to write in your fan fold, or?

104A. Well, sir, I have to look at the fan fold. Our fan fold has other – there is an off stop checklist for example, and it's in between some things. So this was – I mean, this should be cut and paste directly from the fan fold, but just with the checklist that we use. And for, when I was doing it, with our different checklist, it was for ease of reading, that it flowed without skipping a step or flipping pages. And I think that was with the one we used, what our objective was.

## **Questions by the Pilot Member:**

- 105Q. So again, just to clarify, so there were two checklists, then, when you so taking this one aside, when you actually performed these duties, there were two separate -- you actually carried two physically separate checklists; one was the normal technical order dash one fan fold. Is that I'll let you put it in your words.
- 105A. Sir, I can see on this page we had -- the aerial demonstration checklist was included following before takeoff, which is something we created. And then the following demonstration or I'm sorry. There is also there is following before landing.
  - 106Q. So that would be something you would run and verbalize or?
  - 106A. It was, if it was in quotations. So, I mean, gear down call completed.

LA: Well, if I may, this is

### **Questions by the Legal Advisor:**

107Q. Just to, for the record, find out what referring to – has given her a one-page document entitled, "3<sup>rd</sup> Wing Aerial Demonstration Checklist," and has had witness 26 review it. She is referring to some items that she recognizes from her fan fold, from the dash one.

107A. Yes, sir.

- 108Q. And she has pointed out the following before takeoff portion on the left side of the page, and as well as the following demonstration portion on the bottom right corner of that page. She also did indicate that other items on the one-page document also included in the dash one checklists are -- and what was that?
  - 108A. Sir, looks like the following before landing and after touchdown.
  - 109Q. Portions?
  - 109A. Correct.
  - 110Q. How about any other portions that you recognize from the dash one?
- 110A. Sir, the rest of the checklists appear to be from the dash one, the fan fold that we're issued.
- 111Q. And also just to clarify, there are the paper in front of you has different font sizes, as you can see; is that correct?
  - 111A. Yes, sir.
- 112Q. But you just said that all of this is also included in the dash one. Are the different font sized items also included in the dash one?
  - 112A. No, sir.

113Q. Also, when you were trained, you said that initially the one you had seen, there were two different documents.

113A. Yes, sir.

114Q. One, I'm assuming, and I don't want to put words in your mouth. One was the fan fold?

114A. Yes, sir.

115Q. From the dash one?

115A. The fan fold, yes, sir.

116Q. And then the other one was another list that seems to have the same information as this one page document in front of you?

116A. Yes, sir.

117Q. Just combined.

117A. Yes, sir.

LA: I just wanted to clarify.

PILOT MEMBER: Great. Thank you.

### **Questions by the Pilot Member:**

118Q. And then my last question would be: Was it common practice for most or other demonstration crews to utilize that combination or to utilize those checklists in the same manner?

118A. Sir, don't remember from McCord. But I know our initial training, that was where we actually received the initial information.

LA: I do have one follow on, sir.

PILOT MEMBER: Yes.

LA: again.

### Questions by the Legal Advisor:

119Q. When you had the two pieces of paper; one was the dash one checklist, which had some of those items, and then you had another separate piece of paper that had a list of items for aerial demonstrations?

119A. Yes, sir.

120Q. That list of aerial demonstration items, was that from a dash one?

120A. No, sir, it wasn't. They gave us from the dash one.

- 121Q. What was that list derived from, if you remember?
- 121A. Sir, I can look at some of them.
- 122Q. And you're looking at the smaller print items?
- 122A. No, sir, I'm looking at the following before takeoff portion, the following before landing, after touchdown and following demonstration portions. So I would say they're not from the dash one, but it's so, for example, the engine NIS, here's one, on before before landing. Because you know you're about to back. This, and we have told for the engine NIS on.
  - 123Q. Told?
- 123A. Of the takeoff and landing data, the numbers will tell us if we can land on the (inaudible.) So it's more of a it was a technique, but it was a technique to get you set up to do the maneuvers in the AFI 11-246, Vol 6, Chapter 3 profiles.
- 124Q. If I may, the difference between checklist items in the dash one and the technique, is there a difference?
  - 124A. Sir?
  - 125Q. What I'm asking is –
  - 125A. Is it something we would do anyway?
  - 126Q. Yes.
  - 126A. Yes, sir. We do put the NIS on for backing
  - 127Q. Right. But is that in the dash one checklist itself?
  - 127A. Yes, sir. That one, for example, is.
  - 128Q. I think I'm trying to hear what you're saying.
- 128A. Sir, maybe my point is that it's things that are in the dash one to do or going to do, it's not listed anywhere like this checklist, though.
  - 129Q. And by "this checklist," you mean the one page –
  - 129A. Sorry, following before takeoff.
  - 130Q. The one-page checklist that you have in front of you?
  - 130A. Oh, yes, sir, that also.
  - 1310. Right. It's not listed on that?
  - 131A. No, sir.

PILOT MEMBER: Okay.

PRESIDENT: All right. Just a couple more questions, if I may.

# **Questions by the Board President:**

- 132Q. During the profiles, as a copilot, you mentioned that you were watching inside, outside. Where was mostly your attention, was it inside the cockpit running checklists, was it outside, was it cross checking both? How would you characterize that?
- 132A. Sir, it's definitely most of the time outside. Now, we have a heads-up display, I can monitor the pilot's air speed, altitude and heading, those things through the heads-up display. As a guess or guesstimate I should say, maybe a third of the time inside, only for brief periods of time to cross check of winds, whatever drift you might have on the running course, the next heading we're about to fly to, to run the checklist also. But it was most of the time outside.
- 133Q. And then, just a thread to follow on, if I may. The safety observer, would they they were typically in the rack em seat?
  - 133A. Sir, we like to put them in the lacken seat, it's easier to view the gear.
  - 134Q. And then lacken means?
  - 134A. Oh, lefty, additional crewmember seat.
- 135Q. And so then they would slide toward the middle or how would they where would they sit?
- 135A. Sir, I'm trying to remember. I didn't fly as a safety observer on in the actual demo. I've upgraded to it, but the sim is all you're required for that. Sir, I believe they just slid over towards the middle. I know it's the left side because I have (inaudible) there at them, when I flew. I don't think that was notated.
- 136Q. All right. You mentioned that you flew in the New Zealand and London air show?
  - 136A. London, Ontario, Canada.
  - 137Q. London, Ontario, okay.
  - 137A. Yes, sir.
  - 138Q. And Canada.
  - 138A. A little different.
  - 139Q. Were there any changes to the profiles you flew?
  - 139A. No, sir.
  - 140Q. So still standardized based off of the regulation?
  - 140A. Yes, sir.
- 141Q. And then when you talked about Profile 3 during the 80/260 maneuver and the initial climb out, where would you typically, normally, clean up the aircraft?
  - 141A. Sir, are you asking on the outbound leg or the turn, is that your question?

142Q. Right, exactly.

142A. Sir, my memory is that it was when the air speed became – there is a minimum slat retract speed, and it was, I believe it was usually on the outbound leg, still level.

143Q. So you made the turn from the 80 degrees off of that initial heading, and then outbound as you were timing?

143A. Yes, sir. So level – I will say we did 1000 feet, as I said, I've reviewed the regulation, but we did fly 1000 feet for takeoff.

144Q. So, did you fly at 1000 feet altitude above the ground, or did you go to 1500 feet altitude above ground?

144A. Sir, my memory is that we were trained to 1000 feet. And it was addressed that it said 1500. I asked, sir, I don't know why. But we were – the initial training, proceed to 1000 feet as the altitude.

145Q. So your interpretation is that the regulation stated 1500, but you were trained to 1000?

145A. Yes, sir.

146Q. And do you know why you were trained to 1000?

146A. No, sir, I don't.

PRESIDENT: Anything else,

PILOT MEMBER: No. sir.

[Negative response from other members.]

PRESIDENT: Okay. Are there any other matters that we haven't covered that you believe are important to this investigation?

WITNESS: No, sir.

PRESIDENT: I do have one other question, if I may, just to follow on.

# **Questions by the Board President:**

147Q. 1000 feet on that initial training, who trained you to that?

147A. Sir, I believe it was the initial trainer,

PRESIDENT: All right. This is part of the readout, if I may.

WITNESS: Yes, sir.

PRESIDENT: You are reminded of the official nature of this interview. You may not discuss your testimony with anyone except with my permission at any time before this report of this investigation is actually officially released to the public.

And this concludes the interview. At the time now, it is 1804 local, Alaska time.

### **V27. AIB INTERVIEW WITH**

## WITNESS 27

#### VERBATIM TESTIMONY OF

# WITNESS 27

PRESIDENT: Today is the 15<sup>th</sup> of September 2010. Time now is 1145 local Alaska time. My name is Brigadier General Carlton D. Everhart, II., President of the accident investigation board convened to investigate the C-17 mishap that occurred on 28 July 2010, tail number 00-0173, at Joint Base Elmendorf-Richardson, Alaska. The investigation board is in building 7309 Room 106, at Joint Base Elmendorf-Richardson, Alaska, and we are conducting a telephonic interview WITNESS 27 who is in building P3, in the second floor deliberation **LEGAL REP** room at Scott Air Force Base, Illinois. Also present with the witness is LEGAL REP with the Scott Air Force Base Legal Office. Prior to the start of this interview, positively identified the witness in accordance with AFI 51-503, Chapter 6, paragraph 6.7. Persons present here in this interview are myself, Brigadier General Carlton D. Everhart, II, the board president; the pilot member; the legal advisor; the maintenance officer advisor; the the maintenance enlisted advisor; and medical advisor; the court reporter.

This investigation, conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 91-204. The purpose of this investigation is to produce a publicly releasable report on the facts and circumstances surrounding the accident and to gather and to preserve evidence for the use in claims, litigation, disciplinary actions, and adverse administrative proceedings, and for all other purposes. A safety investigation was previously conducted on the accident. Any testimony you may have given before the safety investigation board will be kept confidential, if you were so advised, and can be used only for accident prevention purposes. The board does not have access to any confidential testimony you may have given before the safety investigation board. Your sworn testimony to us may be used for any proper purpose. Additionally, your testimony can be released to the public.

WIT 27 do you understand the difference between any testimony you may have given before the safety investigation board and your testimony to the accident investigation board?

WITNESS: Yes, sir, I do.

PRESIDENT: WIT 27 do you consent to having this interview recorded?

WITNESS: Yes, sir, I do.

PRESIDENT: Your testimony in this investigation will be under oath. At this time, LEGAL REP will administer -- will you please administer the oath to the witness?

[The witness was duly sworn by LEGAL REP]

LEGAL REP: Sir, the witness has been sworn.

PRESIDENT: Thank you, LEGAL REP for your service. You may be excused. And then WIT 27 if you would, just to clarify, once LEGAL REP has left the room.

WITNESS: Yes, yes, sir, he has left the room.

### **Questions by the Board President:**

- 1Q. Will you please state your full name and rank?
- 1A. WITNESS 27 United States Air Force.
- 2Q. And how long have you served in the Air Force?
- 2A. I was commissioned in 1991, so I guess that'd be about 19 years.
- 3Q. And what is your unit of assignment and location?
- 3A. I'm assigned currently to Scott Air Force Base in United States TransCom, JDPAC.
  - 4Q. And how long have you been with that unit?
  - 4A. Thirty-two days.
  - 5O. And then your job title?
  - 5A. I'm the Chief of the Operations Support Division.
- 6Q. And what was your duty title while assigned at Joint Base Elmendorf-Richardson, and from this point forward, we'll just refer to the base as Elmendorf Air Force Base.
  - 6A. I was the Commander of the 517<sup>th</sup> Airlift Squadron.
  - 7Q. Were you also the Director of Operations for the 517<sup>th</sup>?
- 7A. Prior to the Commander, I was the Director of Operations for the 517<sup>th</sup> in 2007 and 2009.
- 8Q. Please describe your duties and responsibilities as the Commander of the 517<sup>th</sup> Airlift Squadron.
- 8A. As commander of the squadron, I'm responsible for the mission and the people of the 517<sup>th</sup>.
- 9Q. Prior to this, you made a non-privileged statement to the safety board, it was transcribed and is now part of Tab R. Have you had a chance to review it?
  - 9A. Yes, sir.

- 10Q. That statement was not taken under oath. Do you want to adopt that statement as part of your testimony today?
- 10A. Yes, sir, I do, and I'd like to change two words, because they were transcribed incorrectly.
  - 11Q. Please do.
- 11A. Okay, on page Romeo 26, the second paragraph that I speak, on line four, the word as written is "op-ter," o-p-t-e-r. It should be "op-dir," o-p-d-i-r, which means Operational Direction. And the other requested change is on Romeo 30.
  - 12Q. Okay.
- 12A. The sixth statement from the top that I made, which begins with "check rides," line three. Instead of "So really we checked the ASAV," I said "So really we shacked," which is a term meaning we did well. S-H-A-C-K-E-D. Otherwise, there appear to be no errors in transcription.
- 13Q. Okay, thank you. And as we go through this, we understand that there may be some other clarifications, and then we'll take that up at a time prior to the closure of this interview.
- 13A. Oh, sir. If you wouldn't mind, the gentleman that's helping me needs to run to an emergency. I need to give him this piece of paper so he can shred it. Could you pause for 30 seconds.

LA: And this is The piece of paper, you mean the prior SIB statement that you gave, the written form?

WITNESS: That is correct.

LA: That we provided to you for review?

WITNESS: Yes, because he can't leave until he's shredded it.

LA: Understood.

PRESIDENT: Yeah, please.

(The interview paused momentarily.)

WITNESS: Okay, I'm back, sir, and ready.

# **Continue questions by the Board President:**

- 14Q. All right, and then could you -- we were talking about your duties and responsibilities. Can you give me the dates of, again, for the record, that when you were DO, Director of Operations, and the dates of when you were Commander of the 517<sup>th</sup>?
- 14A. Yes, sir. I became the DO on the date of the change of command from Gary Gottschall to WITNESS 23 which was in April of 2007. I forget the exact date.
  - 15Q. Okay, that's fine.
- 15A. And I have been at the base since the end of December 2006, preparing for that role. I took command of the 517<sup>th</sup> Airlift Squadron on 13 February 2009, and I gave up command on the 6<sup>th</sup> of August 2010.
  - 16Q. Okay. When did the first C-17s arrive at Elmendorf?
  - 16A. Sir, they arrived on 12 June 2007, two aircraft, tail 169 and 172.
  - 17Q. Are you familiar with the C-17 aerial demonstration program at Elmendorf?
  - 17A. Yes, sir.
  - 18Q. How did it start?
  - 18A. It started as a requirement to prepare for the Elmendorf air show in 2008.
  - 19Q. And who was in charge of standing up the demo program?
- 19A. The squadron the responsible party to stand-up the demo program, and the squadron commander would be the one that ensured that we stood-up that program.
  - 20Q. And what was your involvement in the start-up of the demo program?
- 20A. My involvement was to discuss who were the right people to start-up that program, with the commander.
- 21Q. And when you say "who are the right people," what is your definition of "right people?"
  - 21A. Highly experienced and mature aviators.
  - 22Q. And again, when you say "highly experienced," again, what do you mean by that?
- 22A. What that typically would mean is they'd likely be an instructor or evaluator, or a highly experienced aircraft commander. Or I guess you might have someone who is little less experienced, but if they showed great maturity, they might be someone who is on there. Someone who you trust.
- 23Q. Okay. You talked about your duties as the 517<sup>th</sup> Squadron Commander; can you tell us about the 249<sup>th</sup> Airlift Squadron?
- 23A. Let's see, broad question. I can tell you when I think of the 249<sup>th</sup> Squadron, I think of a partner in every 517<sup>th</sup> operational action, an equal partner in many cases where they're

capable. It is a total force -- I mean it is an Air National Guard squadron that comprises about ten full time and somewhere around 70 part-time guardsmen. They're mostly an air/land squadron with designs to be an air/land air drop squadron, like the 517<sup>th</sup>.

- 24Q. And then, just for the record, air/land means what?
- 24A. It means that they don't perform the air drop mission.
- 25Q. Okay.
- 25A. I think positive thoughts whenever I think of the 249<sup>th</sup>. An instructor in the 249<sup>th</sup> or an evaluator in the 249<sup>th</sup>, I consider equal to any in the 517<sup>th</sup> squadron, specifically, WITNESS 22 and myself, and our predecessors, WITNESS 23 and WITNESS 30 made great effort at streamlining our processes so they were the same, if not very similar, and that we did everything close to each other, if not at that the same time to lay the environment that we would function as one operation.
- 26Q. Okay. Is the demo program integrated -- and I'm talking about the C-17 demo program -- is it integrated between the 249<sup>th</sup> and the 517<sup>th</sup>?
  - 26A. Yes.
  - 27Q. How is it?
- 27A. It's integrated in that the team members fly mixed crews. There's one Elmendorf team comprised of a C-17 cadre, and which squadron they come from is less relevant than their experience and maturity.
  - 28Q. And then you say "fly as mixed crews," what does that mean?
- 28A. That means that it is normal to not distinguish between which squadron a person is from, even if the mission itself might be a guard mission or an active mission. The crew members on board are crew members, not from the specific squadron. And that would transcribe to any action that we do, mission or training oriented, where an instructor for a ground course didn't matter what patch they might be wearing, they were instructing the C-17 operation, or providing resources to the C-17 operation.
- 29Q. Who had oversight of the demo program once it was established and the two units were integrated?
- 29A. The primary oversight was by people that were in stan/eval and that's driven mainly because they were the experience on the demo team, and they insured that our training was accomplished and our paperwork required to get those crews certified.
  - 30Q. Do you recall who those members were as far as the stan/eval?
- 30A. At the time of the crash, it would have been WITNESS 26 and MP It could have possible have been LT COL BB but I think he didn't do the work. I think just primarily MP did the work for the guard.

- 31Q. All right, and when you say "do the work for the guard," what does that mean?
- 31A. Insure that we had any paperwork required accomplished, and the training was accomplished such that we were prepared for each air show.
- 32Q. Okay. Now, I just want to go a little deeper if I may. You said that the primary responsibility for the program is the five -- or the Third Wing; is that correct?
- 32A. No, the responsibility of the program would be the squadron commander, and the executors of that would be stan/eval.
  - 33Q. Okay, which squadron commander?
  - 33A. It would be both of us.
- 34Q. Okay. All right, so the fact that wouldn't be abnormal; is that what you're saying?
  - 34A. That's correct.
- 35Q. Okay. I know you were -- as previously stated, you're the Squadron Commander for the 517<sup>th</sup>, were there any unwritten responsibilities, or written responsibilities, to the 249<sup>th</sup> Airlift Squadron?
- 35A. I'm not aware of any written operational directions given to the 249<sup>th</sup> squadron or any particular memorandum of understanding or agreement...
  - 36O. Okay.
  - 36A. ...relating to what duties they would perform and what duties we would perform.
  - 37Q. Okay. Going back to the demo air crews, how did you certify the demo air crews?
- 37A. I did not certify the demo air crews. I certified the crew members, when they became aircraft commanders and instructors, but the demo certification process required the NAF commander to certify them, and not the squadron commander.
  - 38Q. What was your role in that process then?
- 38A. To ensure that I provided qualified crew members, and scheduled aircraft to do that mission.
- 39Q. Okay, and then did you actually talk to the crew members during that -- as that certification process was happening? And what I mean by that, are there certain steps that you would have a conversation, and then it would proceed to the next level, and they would have a conversation?
  - 39A. No, not regarding the certification process.
  - 40Q. Then when did you talk to the crew members?
- 40A. I talked to the crew members in my interaction with them as instructors and crew members. I talked to them with regard to ensuring that they got the necessary practices done. Never in a formal setting, just to ensure that they were getting that mission accomplished.

- 41Q. Okay. Was there a certification board then, and if there was, was minutes accomplished?
- 41A. No, sir, there's no certification board at the squadron level for the demo crew. And when we certify crew members as instructors or aircraft commanders, we did not do minutes during that time, unless stan/eval recorded it. We did sign a form that indicated they had been certified. That's a standard Air Force form.
  - 42Q. Okay, and when you say "we," who was that?
- 42A. It comprised of myself, stan/eval, safety, usually the DO, scheduling, but again, that wasn't for a demo crew, that was for their crew positions.
- 43Q. Okay. Who were the original demo air crew members chosen to be the first to go through the demo program?
- 43A. I think -- my memory is a little thin here, but MAJ B MAJ W. I don't recall the loadmasters, nor the guard members.

  was early in the program. WITNESS 13 I think he was early in the program. But the first original crew from 2008, I can't tell you specifically who they were, other than that was the -- those were a populate -- that was a population that I just gave you, and I don't know that that's all of them.
  - 44Q. Do you recall who was part of that initial demo crew from the 249<sup>th</sup>?
- 44A. I seem to remember we had some difficulty getting -- I think we had one guard crew member and the problem was, we didn't have a lot of guard experience then, but we needed it to be a mixed crew, because that was one of our continuous goals, and so we did have a guard member on that 2008 crew, but I'm not remembering if it was MP or someone else.
  - 45Q. Okay.
  - 45A. I think the right person to ask there would be MAJ W or MAJ B.
- 46Q. All right. Talking about those original crew members that you just gave me their names, how were they chosen?
- 46A. I think they were looked at first because of the positions they were in as evaluators, and then considering the maturity that they would be the right candidates to go become a demo team. I recall conversations with "What do you think about MAJ B," or "What do you think about MAJ W," and I'd give the thumbs-up at the DO and I don't recall ever disagreeing with a particular person. They were all reasonable selections.
  - 47Q. Did you interview those candidates?
  - 47A. I did not interview those candidates.

- 48Q. During the course of the upgrade, did you receive any feedback on their performance?
- 48A. I don't remember a specific. There was certainly no formal time when I received feedback, but I remember -- I remember the process and the time it took to upgrade and recalling that the practices went -- well, or were not accomplished for whatever reason. So I followed the practices, but not the performance of how they did.
  - 49Q. Do you remember who provided that feedback to you?
  - 49A. It was usually one of the crew members. I'd ask him how it went after a flight.
- 50Q. Okay. Do you remember feedback that was given about MP 50A. I don't remember any feedback provided specifically about MP Not pre-crash. Not pre-investigation. And since then, I've talked to a lot of pilots in trying to sort this all out myself. But I never remember indication of MP performance.
- 51Q. Do you know if WITNESS 28 I believe that was your Director of Operations for the 517<sup>th</sup>, did he receive any feedback on MP
- 51A. Sir, I've not spoken to witness 28 about that topic. Though I have considered doing so, because I want to know, but I have not asked him if he received that feedback and he did not give me any feedback about that -- MP or any other demo team member.
- 52Q. You said that you talked to lots of pilots about the performance and things like that, how it went. What did they say?
- 52A. Usually, it went well. No details, and I didn't drill in for details. I never got any indication that there was any limits exceeded or unreasonable behavior by the pilots. I'd say I just got positive, "It's going good, it's going well," which I'll begin to speculate if I think more about this.
- 53Q. Okay, and there again, you also talked about -- you said you had talked to lots of pilots about the mishap, what did they say?
- 53A. What I have -- I have gotten the sense in that, and where this information is coming from, I don't know, but I have gotten the sense on what the cause of the crash was, and that leads me to believe that the pilot flying, presumably MP was performing the maneuvers in a low energy state, and possibly doing things that got him in that state, and that surprises me that the would get himself in that position because of the quality aviator and mature officer that he was.
- 54Q. Now, when you said, "got himself into a low energy state," what are you hearing how specifically that occurred?
- 54A. I'm hearing that he over-rotated on takeoff, did not accelerate long enough on the first outbound leg, and accelerated to slat and track speed late in the profile and retracted slats, and lost control of the aircraft after hearing the stall warning for many seconds, and what seems to me unreasonable is that once the stall warning goes off, that he would not have rolled out, or

changed his power setting, or put the slats back out, or something to recover from that. To tolerate a stall warning in progress, does not seem reasonable, and certainly not normal for MP or anyone else.

- 55Q. Who was it that you were talking to?
- 55A. That -- that conversation has come from talking to two people, WITNESS 19 and WITNESS 11
  - 56Q. Do you recall when?
- 56A. I spoke with WITNESS 19 on ... Monday or Tuesday this week, and WITNESS 11 this morning. I called Brett to find out the AFI number for the demo profile, so I could look at it again, and he had told me that he'd gotten some sense of what may have happened because we had also talked approximately two or three weeks ago where -- maybe it was three weeks -- actually, it was 32-plus days ago that I talked to WITNESS 11 when his theory was that there was control flight into terrain, and so since then, he had gotten a different opinion that perhaps they'd been tolerating the stall warning for many seconds.
  - 57Q. Do you know how he might have gotten that opinion?
- 57A. I don't recall. I'm trying to think of how that conversation went. I would conjecture that that opinion is from talking with either the AIB, the SIB or other people, but I don't remember what he attributed it to. The main thing was, is that we were talking about the control -- I brought up control flight into terrain because that's what we had talked about before, and he said it might not have been that.
- 58Q. Okay. What I'd like to do there, WIT 27 is just take a break for a minute so we can collect some thoughts, and then get right back in touch with you.
  - 58A. All right, sir.

(The interview paused momentarily at 1216 hours.) (The interview resumed at 1248 hours.)

- LA: And this is Major we're back on the record. All attendees present at the interview prior to the break are again present, to include WIT 27 Also, I want to make one correction for the record, and that is the date of today's interview is actually the 18<sup>th</sup> of September 2010. I think there was a misprint in the script and I apologize for that, sir.
- 59Q. WIT 27 one of the questions that I'd like to follow-up with is, did you ever fly a demonstration profile or simulator as an observer or as another crew position, air crew position?
- 59A. Sir, I flew in 2002 time frame for the Altus air show as a safety pilot, and the practices associated with that; at Elmendorf for the 2008 air show I observed practices and the performance leading up to that; and for the 2000 [sic] air show demonstration I did not observe any practices.

- 60Q. Okay, did you ever fly a demonstration profile with MP as an observer or additional crew member, and then how about, MSO and MCP
- 60A. I did not fly in a demonstration performance with those three pilots, or either one of them individually.
- 61Q. We just want to clarify the for the record some of the questions we asked you about the process as far as sending paperwork up for people who, at the squadron level, who were qualified to fly in the aerial demonstration profile. What was the mechanism that the squadron used, and if you recall, what was sent up?
- 61A. I do not recall what was sent up, but the proper mechanism is the demo team lead would do required documentation which ultimately would land at the NAF for certification. I do not recall reviewing or signing. However, it is entirely possible that I was brought that required documentation to sign and verify that that is a crew member that I wished to enter into the demo training program. But I cannot tell you that I remember signing a specific document.
- 62Q. And then for the mishap crew, who was the demo lead that would have provided that documentation?
  - 62A. MP for this mishap crew.
- 63Q. All right, and then just for one clarification, would that be for both active duty and the guard, that paperwork? Or would it be because of the way the squadrons were integrated, or would you do separate?
- 63A. It would be together, and nothing formal establishes that it would be together except we do everything in those squadrons together.
- 64Q. Okay. And then so with MP bringing the paperwork to you, did stan/eval -- in that capacity, was stan/eval bringing the paperwork to you?
- 64A. I don't recall, and I don't recall actually seeing the paperwork except the night before, and we were providing additional documentation the night before than what had previously been sent up. The required documents, WITNESS 26 explained to me, had already been provided to the NAF and on the 27<sup>th</sup> of July we were being asked for more detailed information about the crew members, and so MP WITNESS 26 and myself, and
- **MLM** as well, and then some of the SELOs were putting that together. I was doing little work. I was mostly insuring that it got done.
- 65Q. Okay, and then if I recall, SELO stands for Standardization Evaluation Liaison Officer; is that what you're referring to?
- 65A. Yes, sir. Yes, sir, my apologies. I can't recall which standardization liaison officer was there, but there was at least one.
- 66Q. Okay. In the statement that you adopted on page R-30, you were in a conversation with CAPT H and you replied, the conversation revolved around MP reputation within the squadron, and then you specifically said, "But he liked getting into the weeds of how the aircraft worked. I remember a couple of times, especially on takeoff and

landing where he and I would kind of argue because that was my pet peeve, too." Can you elaborate, please, on what you meant by "getting into the weeds?"

- 66A. Yes, sir. I would characterize MP as a very precise, academic and aviator, and I'm not sure if it was because of his job previously as a sim instructor, or if that's what made him a good sim instructor, but he wanted to understand every electron that went through that aircraft and what it meant, and what it could do, and how to employ it. And he led many of our discussions at many of instructor training periods where all the pilots would gather and MP would lead a systems discussion, or a mission related instructional period, and he would get very deep into how the mission computer or the systems of the aircraft would work, and like any instructor, occasionally I thought he was incorrect, and I remember once, very clearly, and the other is vague, it's from a couple years back, and what I was trying to articulate in my previous SIB testimony was that he handled disagreement very professionally and articulated that he might be wrong, and he'll go figure it out and come back to the group, which he did.
- 67Q. Well, let me ask you, when he would go figure it out, would there be any other persons who would verify that data was correct, wrong, et cetera?
- 67A. No, it was not a formal process. It was more like, "Yeah, and he'd let the squadron pilots know via email.
  - 68Q. Okay --
- 68A. Or -- or, yeah, just the two times that we're talking about I was right, but I think, to me, that is a good representation of a mature officer that can teach very well and when he finds he's wrong, ensure that all the damage he may have done by teaching it wrong is undone.
- 69Q. Okay. And then just a couple more questions. Did you see the mishap air crew the day of the accident?
  - 69A. Yes, sir.
  - 70Q. And could you elaborate on that, please?
- 70A. Sir, I was leaving the squadron to join my wife and kids, who had arrived 18 hours prior, and I was entering the car and something occurred to me, and I don't know what it was, but I no it's not very objective, but I think it was God, and he said, "Hey, go say good-bye to the demo crew," and so I ran back up -- told my wife I need to say good-bye to them, and I went up to the briefing room where the four of them were briefing, very intently. It's an open briefing room; I assume you've seen it, near the operations desk. The door was open, and I interrupted them. I did not listen in before I interrupted them because I was in a hurry to get with my family. And I spoke to them versus them speaking to me. I think I said, "You guys ready? Make sure you debrief this very well, good luck, and I'm proud of you," and the DO, WITNESS 28 joined me during that very short sentence. I can't recall if he said anything. I don't think he did. Actually, he did. He joined me and said, about half-way through my blurb, "Hey,

  WITNESS 16 not coming anymore," because

  WITNESS 16 could not fly, and

then we called it a day. And I said, "All right, guys, I'm proud of you," and I left. And that was approximately 1630 of the day of the mishap.

- 71Q. Do you remember why witness 16 couldn't fly?
- 71A. Yes, sir. Again, I know it's not objective, but I'd like people that read this in the future to know that the Lord was looking out for these guys as much as he could. There was an F-22 that took the barrier. If a fighter leadership was available in the Ops Group, could have flown with that C-17, but the problem was his deputy was the one that took the barrier, and that diverted some F-22s, and so the only person available who was an F-22 pilot was
- 72Q. Okay, and then going back, when you saw the crew, when you left, how did they look to you when you left them?
- 72A. I remember their faces very clearly. Very happy, smiling. They were leaned over, much as I am right now on this desk, because they had been talking intently about their pre-brief, and it was kind of like, "Okay, you're interrupting us, but we're happy to hear you give me [sic] the thumbs-up and now WIT 27 I'd like you to let us get back to pre-briefing." So it was a positive look on all of their faces.
  - 73Q. And then just to clarify, you didn't hear any of the pre-briefing, correct?
- 73A. No, sir. I interrupted them, was in a hurry and I didn't sit down to join them as they closed out their pre-brief.

### **Questions by the Pilot Member:**

- 74Q. Sir, it's the pilot member. Were you present for any of the other demonstration briefings, whether that be practice or simulator briefings, prior to the mishap day?

  74A. No. I was not --
  - 75Q. How about mission planning?
- 75A. Not for that purpose, and I don't recall specifically, though we didn't make it a secret when people were mission planning, so I have heard pieces of mission briefs, but I have never audited or sat through or flown on that crew's or any other Elmendorf crew's mission.
- 76Q. Okay, the last question is: there was a mass briefing in the auditorium during the first two weeks of July; were you present for that? It was for aerial demonstrations upgrade.
  - 76A. What day was it?
  - 77Q. It would have been --
- 77A. I'm sorry, I don't recall, but it would help me if I knew the date because I was permissive TDY until ... I think 1 or 2 July, and then of course, it's the July Fourth holiday, and then I had a couple weeks -- I think was gone, so ...

78Q. Okay, sir, I think -- I believe it to be after the Fourth of July, but the briefing was given for aerial demonstration upgrade, and it was kind of a mass briefing, if you will, where most of the upgrading members were present, and it was conducted by MP If that helps.

78A. No, I was not at that.

79Q. Okay.

79A. I would have remembered MP briefing.

80Q. Okay.

80A. Thank you for helping me.

PRESIDENT: Okay, are there any other matters that we haven't covered that you believe may be important to our investigation?

WITNESS: No, sir.

PRESIDENT: As a reminder, you are reminded of the official nature of this interview. You may not discuss with anyone, and I repeat, may not discuss with anyone without my specific permission, at any time before this report -- this investigation is officially released. Do you understand?

WITNESS: Yes, sir.

PRESIDENT: This concludes the interview at this time. The time now is 1303 local Alaska time.

### **V28. AIB INTERVIEW WITH**

# WITNESS 28

### VERBATIM TESTIMONY OF

# WITNESS 28

PRESIDENT: My name is Brigadier General Carlton D. Everhart, II. We are investigating the C-17 accident that occurred on 28 July 2010 at Joint Base Elmendorf-Richardson, Alaska. This investigation, conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 91-204. The purpose of this investigation is to produce a publicly releasable report on the facts and circumstances surrounding this accident and to gather and preserve evidence for use in claims, litigation, disciplinary actions, and adverse administrative proceedings, and for all other purposes. A safety investigation was previously conducted on the accident. Any testimony you gave before the safety investigation board will be kept confidential, if you were so advised, and can be used only for accident prevention purposes. This board does not have access to any confidential testimony you gave before the safety investigation board. Your sworn testimony to us may be used for any proper purpose. Additionally, your testimony can be released to the public. Do you understand the difference between your testimony before the safety board and this accident board?

WITNESS: Yes, sir.

PRESIDENT: Your testimony in this investigation will be under oath. At this time, I will administer the oath. Please raise your right hand.

[The witness did as directed.]

PRESIDENT: Do you solemnly swear that the testimony you are about to give in the matter now under investigation shall be the truth, the whole truth, and nothing but the truth, so help you God?

WITNESS: Yes, sir.

PRESIDENT: Today is the 23rd of September 2010. This time is now 1050 local, Alaska time. This interview is being conducted in building 7309, room 105, Joint Base Elmendorf-Richardson, Alaska. The persons present are:

The witness,

WITNESS 28

Pilot Member;
Legal Advisor;
, Maintenance Officer;
Maintenance Member;
Court Reporter; and,

me, [Brigadier General Carlton D. Everhart, II, Board President]

PRESIDENT: The witness has been sworn.

LEGAL: Sir, just to clarify the record, it's 0950 for local, Alaska time.

PRESIDENT: Yes, thank you.

## **Questions by the Board President:**

- 1Q. Please state your full name and rank.
- 1A. WITNESS 28
- 2Q. How long have you served in the Air Force?
- 2A. 17 1/2 years.
- 3Q. What is your unit of assignment and location?
- 3A. Currently 517th Airlift Squadron, Elmendorf Air Force Base, Alaska.
- 4Q. How long have you been with this unit?
- 4A. 15 months.
- 5Q. What is your job title?
- 5A. Currently, Squadron Commander of the 517th.
- 6Q. How long have you been doing this job?
- 6A. Change of command was 6 August 2010.
- 70. What was your job prior to the change of command?
- 7A. Director of Operations for the 517th.
- 8Q. For the same unit?
- 8A. Yes sir.
- 9Q. You stated, for the record, you were the commander of the 517th Airlift Squadron?
  - 9A. Yes sir.
- 10Q. From now on, we will refer to Joint Base Elmendorf-Richardson, Alaska as Elmendorf Air Force Base. Please describe your duties and responsibilities as the commander of the 517th Airlift Squadron.
- 10A. Taking care of the people, taking care of the mission whether it be training and equipping, operating and executing, O&M hours or TWCF hours--I'm sorry, that's the training hours for operations and maintenance or the transportation working capital fund which is the C-17 version of flying the mission away from home station whether it be around the world or just down to the lower 48.

- 11Q. Tells about the 517th Airlift Squadron.
- 11A. Very tight-knit squadron. This is the first time I have been in an airlift squadron that has total force integration. Didn't have that in the 7 years I was at Charleston. The 517th is much different from what I have experienced at Charleston itself in that we are deploying to the expeditionary airlift squadrons over in the CENTCOM AOR. A lot of what we do is in support of Pacific Command and Pacific Air Forces and a lot of what we do is in a different context here in the environment of being a composite wing meaning fighters on the same base. You have combat air forces and mobility are forces on the same base which I have experienced before when I was a maintenance officer at Mountain Home back when they had the composite wing there under the 366th Wing, but they had since dissolved that one and this is the closest thing to that that I've experienced, so the 517th is just a single active-duty airlift squadron up here at Elmendorf and much more tight knit than anything I've experienced in a flying world.
  - 12Q. You mentioned the acronym AOR. What is that?
  - 12A. Area of responsibility, sir.
- 13Q. What is your relationship--you said total force integration. What is your relationship with the 249th?
- 13A. Outstanding. We have talked over the past year that I have been here that our total force and integration with the 249th is better than anything we have heard of or seen before. We fly blended crews together all the time whether it be on training missions or operational missions. We do safety days together, training days together, ground and flight training. It is all blended so they are welcome to jump on any flights that they have and they open seats to us to do the same.
  - 14Q. When you say open seats to you, that means?
- 14A. When a mission comes down through the operational support squadron, there will be an offer to the 249th to take the mission kind of similar to what Charleston used to have where they would offer a mission to the reserves first. Since those guys have more control, they had the funding where they could fly and if they accept the mission you will see a note back saying the 249th accepts this mission, however, two seats are open for the 517th to fly with us.
  - 15O. For aircrew members?
- 15A. Yes sir. For aircrew members. So, it could be a pilot. It could be a loadmaster, either one. It is very rare that we walk out the door with just Firebird patches on for the 517th, all crew, or the Turn patches with the 249th. Almost every single time the crew steps, it's a blended crew for total force.
  - 16Q. When you say Firebird, that is like your unit mascot?
  - 16A. Yes, sir. That's the 517th.
  - 17Q. You have a representation on your patch?
  - 17A. Yes, sir. That is correct.

- 18Q. Do you have responsibilities, or what are your responsibilities to the 249th?
- 18A. Responsibilities to the 249th, we have several offices in the squadron that are integrated. The Guard has said they don't want to integrate in certain offices, and other offices they have integrated. My responsibility to them is none other than being charged with total force integration. If the Air Force wants us to do it, then I will try to make it happen as best as possible. I do get together every Wednesday at 1130 with the 249th Commander and DO as well as—Director of operations, as well as my Director of Operations now and we sit down and talk total force integration issues. It can be everything from the inside of the house to the operations side to facilities to executing the mission.
  - 19Q. You said there are some offices they did not want to integrate?
  - 19A. Yes sir.
  - 20Q. Can you elaborate?
- 20A. Our scheduling offices are not one of those integrated in the fact that my schedulers do not schedule their people. They do not reach out and grab a Guardsman and put them on a flight. However, they are sitting in the same office and we have gone to using virtual software similar to what they use so we can see everybody on the board. Those kinds of things. So, that, to me, is not fully integrated.
- 21Q. When you say see it right on the board, you mean the scheduling board so everybody is on the same sheet of music?
- 21A. Yes sir. The way I grew up, we used to do dry erase boards and writing names on the board. Now it is gone to electronics and a computer system called Patriot Excalibur and they display that on the wall. It is almost like looking at a Windows type product is what you are looking at for scheduling.
  - 22Q. Are you familiar with the C-17 aerial demonstration program at Elmendorf?
  - 22A. Yes sir.
- 23Q. Did you have any--when you say you are familiar, what do you mean by that? What you know about it?
- 23A. I know--as my role as the Director of Operations at the time of the accident, my role was to set aside sorties for those guys to fly up, work with the operational support squadron to get the right times for them to fly as well as to make sure that some of the behind-the-scenes work as far as Notices to Airman at the airfield, so every other unit or outside agency knew that we were going to practice, that those were published, and just making sure that the crew's orders were correct and we had performed what we call our go-no-go process which we would do for any training sortie or a mission where we checked currencies and they are ready to step.
- 24Q. Did you happen to have any involvement in the start up of the demo program itself, the aerial demonstration program?
  - 24A. No, sir.

- 25Q. The demo program is integrated between the 517th and the 249th, correct?
- 25A. Yes sir.
- 26Q. How's that integrated?
- 26A. Its integrated in that we have a list of folks from both the Guard and the active-duty that are all approved through the Wing Commander to the Numbered Air Force Commander and certified to accomplish the C-17 demo. So, whenever we go--when there is a request for a demonstration to occur, we can pull from that list to form the crew.
- 27Q. You mentioned the certification process. What is your role--what was your role as a DO and your current role as a commander in that certification process. By DO, I mean Director of Operations.
- 27A. Did not have a role as the Director of Operations with the certification process. As the Commander, I have not certified anyone with the demo program yet, but as I understand it, going through and making sure we have the right folks on the team with the experience to execute the profile, folks that are top of the line folks from the squadron to be able to execute the profile on request.
- 28Q. How do you determine then if someone is capable of performing that program? What gives you that idea?
- 28A. We go back in and look at the training management software. I don't know that's the exact terminology. We call it TMS. There are write ups in there from folks ever since they came into the C-17. We go back and review their training, what the write-ups were from previous instructor pilots on how they have done, what the progress has been, if they had any areas for improvement. They are all supposed to be objective comments in the training software that we can look at and see exactly how they did during their upgrades at Altus, where our formal schooling is for the airplane. We can view all that and that's all there in that database for us to go back and do some research on how these folks have been doing even if they weren't in our unit before.
- 29Q. You mentioned that as a DO you did not have any involvement in the start up of the demo program. Did you have any involvement in the selection process for the people in the start of the demo program, in the initial startup?
- 29A. Sir, the only thing I would have had a role in was if I was asked for my opinion on one of the pilots.
  - 30Q. Do remember that question being asked to you, what your opinion was on a pilot?
  - 30A. No. sir.

- 31Q. Once in the process, in the demo certification process, once training is complete and now you have the paperwork, what happens then?
- 31A. Just from reading the instructions on what I'm supposed to do as a commander, again, having not done this before, that letter goes up through the Wing Commander and the folks that have accomplished the simulators--the ground training, the simulators and the flights. The Wing Commander approves that and it heads, in this case, to our Numbered Air Force Commander for final approver and certification. There is an interview process, as I understand it, for the pilots themselves that go and speak to the Wing Commander as well as the Numbered Air Force Commander for that final approval.

# **Questions by the Legal Advisor:**

- 32Q. I just wanted to clarify since we have a couple Wings here at Elmendorf. Which Wing are you talking about?
  - 32A. Third Wing Commander.

## **Questions by the Board President:**

- 33Q. Do you know if anything is afforded to the Operations Group during the certification process?
- 33A. I cannot remember the 3rd Operations Group Commander being on the letter, but any of the information that goes to the 3rd Wing Commander, sir, it would normally go through the Operations Group Commander. We would not bypass his office to go direct to there.
- 34Q. Did you ever fly demonstration profiles in the simulator as an observer or any other crewmember?
  - 34A. No, sir. I've never been in a simulator or the airplane for a demo.
- 35Q. So, just for clarification purposes then, you never flew a demonstration profile or anything like that with MP either as an observer or in any other aircrew position?
  - 35A. No. sir.

36Q. How about MSO

36A. No, sir.

37O. How about MCP

37A. No, sir.

38Q. Have you ever attended any aerial demonstration briefs, to include upgrade briefs or mission briefs prior to stepping out to be a point to go fly a profile and demonstration practice or anything like that?

38A. No, sir.

- 39Q. Do you remember feedback that was given about MP in regards to the aerial demonstration program?
  - 39A. No, sir.
- 40Q. Then I think you have already answered this, but I just want to re-clarify. Did you have any involvement in the original demo air crewmembers?
  - 40A. No, sir.
- 41Q. During your tenure as the Director of Operations, do you remember if your commander, WITNESS 27 at that time, received any feedback on MP
  - 41A. No, sir. Not that I know of.

# **Questions by the Legal Advisor:**

- 42Q. When you asked--when the General asked the question he mentioned WITNESS 27 but it was WITNESS 27 Is that correct?
  - 42A. Yes. That's correct.

## **Questions by the Board President:**

- 43Q. Who has oversight for the demo program?
- 43A. The commander in each squadron.
- 44Q. The commander in each squadron?
- 44A. Yes sir.
- 45Q. How about the administration? Do they have the administrative oversight also for the program?
  - 45A. Yes sir. It is a commander's program.
- 46Q. Can you tell me who was the Standardization and Evaluation Chief of the C-17 and the Operations Group at the time of the initial certification?
  - 46A. Initial certification--when the program was stood up?
  - 47Q. Original standup and original crews.
- 47A. The chief of standing out prior to WITNESS 26 was CAPT BA who has since been permanently change of station down to Altus Air Force Base, and that is where he is at now.
  - 48Q. Was he with the squadron or was he with the Operations Group?
  - 48A. He was with the squadron.

- 49Q. Do you recall who it was for the operations group?
- 49A. The overall Chief of Stan Eval for the Group, I cannot remember his name. He was an F-22 pilot.
- 50Q. How about the C-17 Standardization and Evaluation pilot for the Operations Group?
- 50A. Our chief of Stan Eval--Standardization and Evaluation for the Group is MAJ B, and I forgot, sir, the exact time that she took over or who was there before her, but that is where she has been ever since I have been up here at Elmendorf Air Force Base.
- 51Q. We learned there was a time when you watched an aerial demonstration flight with during a lunchtime period. Do you remember this?
  - 51A. Yes sir.
- 52Q. Can you tell us about that? Can you tell us about the flight, what your impressions were, and those types of things?
- 52A. I've seen the aerial demonstration many times. It is always impressive to see the airplane fly during the demonstration and I don't think any of my comments to were any different than what I normally would say when I see the demonstration. If you see an airplane with a 170 foot wingspan flying around the pattern, it's impressive. There was nothing different about what I had seen before that day.
- 53Q. When you say you have seen it many times before, where have you seen it before?
- 53A. Charleston--Charleston Air Force Base in South Carolina where I was stationed for 7 years.
- 54Q. Did you see a difference in the way that profile was--that lunchtime profile that you saw, did you see a difference in the way that profile was flown versus what you had seen at Charleston?
- 54A. The only difference I saw in the profile was normally at Charleston during the final landing they would land, do what we would call a rubber band which means you wouldn't even put your feet on the brakes and we used to do this in special operations, you put the engines in reverse thrust, back the airplane up and turn it 90 degrees to face the crowd at show center. They did not do that on the practice day. They just landed and stopped.
- 55Q. Did you see a difference on the practice day here at Elmendorf? Did you see a difference in the bank angles----
  - 55A. No, sir.
  - 56Q. ----than what you had seen that you remember at Charleston?
  - 56A. No, sir. Nothing was noticeably different to me.

- 57Q. Do you think that profile here was flown as far as the maneuvers themselves? Were they--how do you think they were flown?
- 57A. Nothing looked out of the ordinary to me. Again, anytime I see the airplane flying in the pattern and it is up close, it looks like a big airplane flying tight turns in the demo profile. It didn't look anything out of the ordinary or different to me that day, sir.
- 58Q. What is your definition when you said tight turns? What is your definition of tight turns? What does that mean?
- 58A. During the demo profile you are going to perform an 80 degree turn off the runway with a 260 degree turn back to the runway. When you're performing these sorts of maneuvers in close to the airfield, that's a tight turn to me.

President: I would like to take a break right now and let you go to the break room. We'll call you right back in as soon as we are ready then finish up the interview.

[The board recessed at 1010, 23 September 2010.]

[The board reconvened at 1019, 20 3 September 2010.]

Legal: All the attendees to the interview prior to the break are again present, to include

## **Questions by the Board President:**

59Q. WITNESS 28 are there any other matters that we have not covered that you would like to say a thing about to possibly aid us in our investigation?

59A. The only other thing I was going to tell you, sir, is I have personally flown with MCP once on a mission--overseas mission, and once on a local flight. My impression of him, like we talked about earlier, going back to training records and knowing how people fly just from other people's objective inputs was he was a very conservative guy in the airplane and my example to you would be on our local we had what we call an exceptional restart. He had never seen one of those before, and basically what happens is all the computer screens blank out momentarily. Nothing happens as far as the airplane flying other than the automation kicking off--going away. You are manually flying the airplane and he had ever seen that before. It was a good experience for him, but I was the one in the seat. He was sitting behind me in the left additional crewmember seat and we got a good chance to explain that sort of thing and he grew up a little bit in the airplane that day, but he was surprised by that. On the mission itself that we flew, again, very conservative guy. Conservative guy about assessing the weather, the fuel requirements and whatnot. That was my assessment of him. Did not have much exposure to

MSO or MLM Had a little bit of exposure with MP He was always a very meticulous guy on how he went about doing its work and he worked in the Standardization and Evaluation office in the squadron and everything he did was to the "T" from the work that I saw from him. If that helps, that was my assessment on the two guys that I knew more about than the others.

# **Questions by the Legal Advisor:**

- 60Q. When you described MP as a meticulous guy, can you give me an example of what you mean by meticulous?
- 60A. Just some of the products that I did see with the certification process for the crews, whether it be letters or the training documentation and whatnot, it was solid. There was nothing left out of what he documented on the profiles that they flown in the simulator or in the airplane or during the ground training.
- 61Q. When you say documentation, certifications for the aerial demonstration program?
  - 61A. Yes.
  - 62Q. Or was it in all respects?
- 62A. Well, the entire certification process whether it be the ground training, sim training, or the flight itself.

## **Questions by the Board President:**

- 63Q. So MP ran that program. Is that correct?
- 63A. Yes sir. He was the lead on that program as far as assembly and the crews and the certification process
  - 64Q. Anything else?
  - 64A. No, sir.

President: You are reminded of the official nature of this interview. You may not discuss your testimony with anyone without my permission at any time before the report of this investigation is officially released to the public.

This concludes the interview. The time is now 1022 local, Alaska time.

### **V29. AIB INTERVIEW WITH**

## WITNESS 29

### VERBATIM TESTIMONY OF

# WITNESS 29

PRESIDENT: My name is Brigadier General Carlton D. Everhart, II. We are investigating the C-17 accident that occurred on 28 July 2010, at Joint Base Elmendorf-Richardson, Alaska. This investigation, conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 91-204. The purpose of this investigation is to produce a publicly releasable report on the facts and circumstances surrounding the accident and to gather and preserve evidence for the use in claims, litigation, disciplinary actions, and adverse administrative proceedings, and for all other purposes. A safety investigation was previously conducted on the accident. You did not provide testimony or a statement to the safety investigation. Your sworn testimony to us may be used for any proper purpose. Additionally, your testimony can be released to the public. Do you understand how your testimony before this board may be used?

WITNESS: Yes, sir, I do.

PRESIDENT: Your testimony in this investigation will be under oath. At this time, I will administer the oath. Please stand and raise your right hand.

[The witness did as directed.]

PRESIDENT: Do you solemnly swear that the testimony you are about to give in the matter now under investigation shall be the truth, the whole truth, and nothing but the truth, so help you God?

WITNESS: I do.

PRESIDENT: Today is 24 September 2010. The time now is 0914 local Alaska time. This interview is being conducted in Building 7309, Room 106, Joint Base Elmendorf-Richardson, Alaska. The persons present are:

The witness, WITNESS 29

Myself, Brigadier General Carlton D. Everhart, II, Board President;

Legal Advisor; and

Court Reporter.

PRESIDENT: The witness has been sworn.

# **Questions by the Board President:**

- 1Q. Please state your full name and rank.
- 1A. WITNESS 29
- 2Q. How long did you serve in the Air Force?
- 2A. 20 years, 6 months.
- 3Q. What is your unit of assignment and location?
- 3A. Third Operations Groups, Joint Base Elmendorf-Richardson, 3d Wind.
- 4Q. How long have you been with this unit?
- 4A. Since June 2009.
- 5Q. What is your job title?
- 5A. I am the Third Operations Group Deputy.
- 6Q. How long have you been doing that job?
- 6A. Since June 2009.
- 7Q. Please describe your duties and responsibilities as the Third Operations Group Deputy Commander?
- 7A. I am the advisor to WITNESS 16 who is the Third Operations Group Commander. I assist him in his daily execution of the mission in performance of the Third Operations Group flying operations; act as the Third Operations Group Commander in the absence of him or COLS, who is the other Third Operations Groups Deputy, and advise him on any flying matters that he may require assistance in.
  - 8Q. What is you C-17 background?
- 8A. My C-17 background started in June 1995 at Charleston AFB, South Carolina. I have approximately 3000 hours of flight time in the C-17. My assignments range from 4 ½ years at Charleston, where I finished a tour as the assistant chief of stand eval, 14<sup>th</sup> Airlift Squadron. I had 3 years of experience at Altus AFB, Oklahoma, from 1999 until 2002. I flew and was attached with Charleston ,14th Airlift Squadron, while I was on the Air Mobility Command staff, from 2003 until 2006. I was the weapons instructor course director of operations at Maguire AFB, New Jersey, with the 57th Weapons Squadron. I am now the Third Operations Group Commander, currently evaluator qualified -- in air land. I am an air drop pilot here at Elmendorf.
  - 9Q. You mentioned Altus, Oklahoma. What was that?
- 9A. That is the C-17 school house where they teach the initial qualifications for crewmembers going through C-17 training.

- 10Q. As the Third Operations Group Deputy Commander, what was your interaction with the 249<sup>th</sup> and the 517<sup>th</sup> Airlift Squadrons?
- 10A. I fly attached to the 517<sup>th</sup> Airlift Squadron approximately 3 to 4 times a month on local training sorties and on occasional off-station missions that could last up to a week or 10 days, typically not more than 10 days. The interaction I have with the 249<sup>th</sup> would be -- or has been interaction with them in the squadron building, itself, and occasionally flying on mixed crews.
- 11Q. Can you explain what is meant by attached -- when you say I fly attached wit that unit, what does that mean?
- 11A. The 517<sup>th</sup> Airlift Squadron consists of C-17 crewmembers. There are also C-17 crewmembers that are not assigned to the 517<sup>th</sup> Airlift Squadron that are qualified in the C-17 and they will go fly with the 517<sup>th</sup> to augment their crew force and their capabilities.
  - 12Q. What is your C-17 aerial demonstration program background?
- 12A. I was a C-17 demonstration instructor pilot with the 14<sup>th</sup> Airlift Squadron for approximately 2 years, from 1997 timeframe until I PCS'd in 1999.
  - 13Q. Are you familiar with the C-17 aerial demonstration program here at Elmendorf?
  - 13A. Yes, sir, I am.

PRESIDENT: For the record, Joint Base Elmendorf-Richardson will be from now on known as Elmendorf AFB.

- 14Q. There were several air crewmembers, around ten, who were certified after 2009. Did you have a role in the aerial demonstration program certification at that time?
  - 14A. Yes, sir, and informal role.
  - 15Q. What was that informal role?
  - 15A. I would look at the certifying crewmembers -- put a sanity check on it and advise on any concerns or issues I had, which I had none.
  - 16Q. When you say "look at crewmembers," what did that entail?
- 16A. The 517<sup>th</sup> -- and the 249<sup>th</sup>, for the matter -- would come with a list of people that they wanted to certify for the aerial demonstration program. I would see that list of names, review their records, and then raise any concerns I had to which I had none. I do not think I ever saw the 249<sup>th</sup> squadron's list of crewmembers. However, I did see the 517<sup>th</sup> list of crewmembers.

- 17Q. You were talking about reviewing the records. What type of materials did you review?
- 17A. It was mostly what their crew qualification was, what they were going to be doing in the certification program. When I say "crew qualification," that means basic aircraft commander, co-pilot, instructor pilot, or evaluator, total time in the aircraft -- have a discussion with the 517<sup>th</sup> Squadron Commander, WIT 27 or the operations officer,

with the structure with them what the qualifications were and why they were choosing the people that they choice to upgrade to demo qualification.

- 18Q. For the record, WIT 27 and those positions at that timeframe we discussed in July 2009?
  - 18A. Yes, sir. They have been in that position since I have been here.
- 19Q. Once you reviewed those packages, that material, what did you do with it? What was the next step in the process?
- 19A. I was not a formal piece of the process. But if I had concerns with who was going forward, I would raise a concern to

  WITNESS 16 As I stated earlier, I had no concerns with the people they were putting forward at the time. If I did have any concerns, I would have discussed it with

  WIT 27 or

  WITNESS 28 previously. If I may add one more thing?

  There were occasions, or an occasion I can think of where there was a demonstration crew performing demonstrations somewhere in the pacific. I cannot remember if it was Korea or Singapore. They needed to break the hard crew that had been set up due to other commitments that one of the crewmembers had. They sent a request to me to substitute one of those crewmembers with another highly experienced crewmember; and I agreed to that switch and recommended it to
- 20Q. You talked about your inputs to the Third Operations Group Commander. Were there any inputs that you, specifically, provided to the 3d Wing Commadner?
  - 20A. No, sir.
- 21Q. Did you receive feedback on the performance of aircrews performing aerial demonstrations?
  - 21A. No, sir.
- 22Q. Did you ever receive feedback regarding MP performance: flying or teaching an aerial demonstration program?
  - 22A. No. sir.
- 23Q. Did you ever fly on any demonstration flights or sims during your time here at Elmendorf?
  - 23A. No, sir.

- 24Q. Did you ever attend any demo planning or mission briefs during your time here at Elmendorf?
  - 24A. No, sir.
- 25Q. Did you ever observe aerial demonstration practices or flights while here at Elmendorf?
  - 25A. Yes, sir. Informally.
  - 26Q. What was your impression?
- 26A. I don't think I had an impression at the time. It looked like the standard demo profile, the week prior or 10 days prior, I knew that they were doing several demonstration pilot upgrades, so I watched those on occasion from the ground, just to observe to see if there was anything that seemed unusual to me. There did not seem to be anything unusual going on there.

[The board took a recess.]

# **Questions by the President:**

- 27Q. Have you ever flown with MP
- 27A. I can't quite remember. I think I may have flown with him once during Operations Enduring Freedom when I took a crew from Altus AFB to augment the airdrop operations that were going on over Afghanistan. We had to have somebody who was familiar with the operation onboard the aircraft before they would let the Altus crew go in unsupervised. Essentially, he was what we would call the seeing eye pilot, to talk us through the procedures. That is my only recollection of ever flying with MP He was not actually at the controls. I am not positive, but when I showed up last summer, he and I had talked and we thought that we had flown together in that operation.
  - 28Q. And your impression at that time?
  - 28A. At the time that I flew with him?
  - 29Q. [Affirmative response.]
- 29A. He was very professional. Everybody was very focus on the mission at hand. It was a new dynamic mission with high the altitude airdrops that were going on, something that had not been done before in a C-17, and he was selected to guide us through the new combat procedures that we were implementing in Afghanistan. He seemed very sharp at the time.

| - | Have you ever flown with No, sir.  | MSO |
|---|------------------------------------|-----|
| _ | Have you ever flown with Yes, sir. | MCP |

- 32Q. Can you tell me when and how many times, and your impression?
- 32A. I only remember one time flying with MCP It was during an Red Flag.
- 33Q. "Red Flag" is what?
- 33A. Red Flag, Alaska, which is quarterly large force exercise, usually with aircraft from several units from the Air Force, sometimes even international. I cannot remember what the case was this time. I think it was a year ago. I think it was the one last fall, because I do remember some snow on the ground to the north. He was the co-pilot at the time. There was another aircraft commander onboard and I was the third pilot -- looking for threats, recording threats calls, providing general situational awareness to the crew. It was a successful mission and he seemed extremely confident to me at the time. I don't think he actually flew the aircraft. I think he was acting as the pilot not flying. But the radio calls were crisps. His situational awareness was good. And he seemed very professional.

## **Question by the Legal Advisor:**

- 34Q. A couple of clarifying questions. When you said you were the third pilot coording, do you mean coordinating?
- 34A. The third pilot, yes, coordinating the threat calls. In other words, I would on headset. If the AWACS -- the aircraft warning control system aircraft -- or another fighter aircraft would call a potential threat to us saying somebody is coming to try to shoot you down or they knew of a threat on the ground that we needed to avoid, I would be the person who would copy that information down, plot it on a map, and determine if it was something that we needed to avoid, or if we were okay in our current course, and provide general route, awareness, and threat. In other words, when we are flying in low level environment, I would advise them of what was coming up, what type of terrain was ahead, what type of threats were ahead, what type of radio calls we needed to make, things of that nature.

## **Questions by the President:**

- 35Q. And that is not to literally shoot you down, that is part of the exercise process?
- 35A. Exercise, exactly right.

### **Questions by the Legal Advisor:**

- 36Q. As the third pilot onboard, were you sitting in one of the additional crewmember's seats?
- 36A. Yes, I was. I would occasionally move back and forth between the seats to scan out of one side of the aircraft or another, depending on what the situation was.
  - 37Q. Moving between the seats, you mean moving between the right and the left?37A. The right and the left -- ACM -- additional crewmember seat.

38Q. RACM and LACM?

38A. That is correct.

39Q. Is there anything else you would like to add to aid us in our investigation?

39A. I would say while not part of the formal process for the demo selection, I am familiar with most of the pilots in the 517th and 249th and as the names would--due come forward for any type of certification, upgrade, anything that requires an Operations Group Commander's attention, my interaction with the squadron and the routine flying I do with them aids me in understanding what their qualifications are, what their competencies are. If I think they are the right person to continue with the upgrade or be selected for some type of special qualifications, while it is not in writing, my attachment to that squadron, my familiarity with the folks that fly down there, I feel like I have a good understanding of the qualifications and competencies of most of the pilots here in the 517th, if that helps.

President: You are reminded of the official nature of this interview. You may not discuss your testimony with anyone without my permission at any time before the report of this investigation is officially released to the public. This concludes the interview.

The time now is 0941 local, Alaska time.

### V30. AIB INTERVIEW WITH

# WITNESS 30

### VERBATIM TESTIMONY OF

# WITNESS 30

PRESIDENT: My name is Brigadier General Carlton D. Everhart II, and we are investigating the C-17 accident that occurred on 28 July 2010 at Joint Base Elmendorf-Richardson, Alaska. This investigation is conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 91-204. The purpose of this investigation is to produce a publicly releasable report on the facts and circumstances surrounding the accident and to gather and to preserve evidence for the use in claims, litigation, disciplinary actions, and adverse administrative proceedings, and for all other purposes. A safety investigation was previously conducted on the accident. Any testimony you gave before the safety investigation board will be kept confidential, if you were so advised, and can be used only for accident prevention purposes. This board does not have access to any confidential testimony that you gave before the safety investigation board. Your sworn testimony to us may be used for any proper purpose. Additionally, your testimony can be released to the public. Do you understand the difference between your testimony before the safety investigation board and this accident board?

WITNESS: Yes, sir.

PRESIDENT: Your testimony in this investigation will be under oath, and at this time, I will administer the oath. Please stand and raise your right hand.

[The witness did as directed.]

PRESIDENT: Do you solemnly swear that the testimony you're about to give in the matter now under investigation shall be the truth, the whole truth, and nothing but the truth, so help you God?

WITNESS: I do.

PRESIDENT: Please be seated.

[The witness did as directed.]

PRESIDENT: Today is the 20<sup>th</sup> of September -- or excuse me -- today is the 22<sup>nd</sup> of September 2010. Time now 1050 local Alaska time. This interview is being conducted in building 7309, Room 106, Joint Base Elmendorf-Richardson, Alaska. The persons present are the witness,

WITNESS 30 myself, Brigadier General Carlton D. Everhart, II, the board president; the pilot member; the legal advisor;

the maintenance officer advisor;

, the medical advisor;

the maintenance enlisted advisor; and

the court reporter.

The witness has been sworn.

# **Questions by the Board President:**

- 1Q. Please state your full name and rank.
- 1A. WITNESS 30

(The maintenance advisor noted the Board President misspoke in referring to him as a corrected the record.)

- 2Q. How long have you served in the Air Force?
- 2A. Thirty-two years.
- 3Q. And what is your unit of assignment and location?
- 3A. The 176<sup>th</sup> Operations Group at Kulis Air National Guard Base, Alaska.
- 4Q. And how long have you been with that unit?
- 4A. I've been the Operations Group Commander for 15 months.
- 5Q. And Operations Group Commander is your job title?
- 5A. Yes, sir.
- 6Q. Please describe your duties as the 176<sup>th</sup> Operations Group Commander.
- 6A. I oversee seven operational squadrons, three rescue squadrons, and air control squadron, a tactical airlift squadron, C-130s, and a C-17 flying squadron. And five of those are GSUs -- geographically separated units from the base, and I have a balancing act of critical resources that I have to spread out and share so that all units can meet their training requirements.
- 7Q. And what was your job title from July of 2007 until now? Or prior to becoming the Operations Group Commander?
- 7A. July of 2007, I was still the 210<sup>th</sup> Rescue Squadron's Director of Operations, flying HH-60s, as well as the C-17 Program Integration Officer for this new squadron that we're standing up. So kind of dual-hatted. And I remained the helicopter director of operations until going off to Altus for training, and then I relinquished that job and came back here at the Program Integration Officer for -- probably until half-year 2008 when we finally got a unit

manning document for the new squadron, and it became designated as a squadron, but it didn't actually receive federal recognition until -- into 2009.

- 8Q. Okay. In June of 2008, then, roughly the middle of the year as you say, did you become the squadron commander?
- 8A. Well, I was still the Program Integration Officer. I was called the squadron commander, but officially we couldn't have a squadron commander without a squadron that didn't exist. So I served in the same capacity as an equal with WITNESS 23 for the purpose of standing up the squadron.
  - 9Q. Are you familiar with the C-17 aerial demonstration program at Elmendorf?
- 9A. Only on the periphery. I was not directly involved in putting that program together. It was a Third Wing program.
- 10Q. Do you know who had oversight of the demo program once it was established, and the two units -- the 249th or the unit that became the 249<sup>th</sup> and then the Guard -- the 517<sup>th</sup> Squadron?
- 10A. It's my understanding the Third Operations Group had oversight of the program; we simply provided bodies to it, and that program was -- that program had direct oversight from the Third OG, Operations Group Commander, through the Third Wing Commander for certification up to the PACAF commander.
- 11Q. So stan/eval's role then was -- what was stan/eval's role as you understand it in this demonstration program?
- 11A. I am really not sure what their role was. When we first provided bodies to that program, my understanding was this was a certification process and it was more in training's lane than stan/eval's.
  - 12Q. When you say "training lane," who provided the training to the crews?
- 12A. The -- as a Third Wing program, it was the Third Wing that developed the training program to meet whatever profile they were going to designate as their standard profile, and so that training was conducted, simulator and flight training, through the 517th.
- 13Q. How did -- talking about your experiences as the 176<sup>th</sup> Operations Group Commander, how did you integrate the program, besides, was there any more than just providing bodies that you integrated with the Third Operations Group and then the 176<sup>th</sup> Operations Group?
  - 13A. As far as the demonstration program?
  - 14Q. The demonstration program itself.
- 14A. That was not integrated at all. That was -- when it first started up, the Third Wing was interested in making that have a TFI flavor to it, which was the reason we provided bodies. But the program itself was wholly an active duty program.

- 15Q. And TFI flavor, you mean total force integration?
- 15A. Total force integration; I'm sorry, yes.
- 16Q. And that's where it came in that you provided the personnel?
- 16A. Yes.
- 17Q. All right. And then who were those personnel that you provided for the demonstration program?
- 17A. At the time they were putting it together, I had -- we, the Air National Guard entity, had only one person I was comfortable allowing to go into that program, and that was
- MP He came to us as a fully qualified IP, instructor pilot, and he was the only one that met the criteria.
- 18Q. And then when you say made you comfortable, please describe that. Why did he make you comfortable?
- 18A. The comment wasn't really in reference to MP That was my own personal feeling towards aerial demonstrations and air shows. I was not a fan of it. I personally did not want anything to do with it, having witnessed two Class A mishaps before, and lost a couple of boom operators. I didn't feel comfortable with having an aerial demonstration program with a big airplane, but that was a personal issue with me and I did not want to deny anybody an opportunity. This was an established program that had been successful up until that point, and so I wasn't going to deny anybody an opportunity to do it. So when I say that I was comfortable with MP being involved in that program, it's because there was an established program with a scripted profile that they were not allowed to vary from, and a training program associated with it, and that's the only reason I was comfortable being involved in it.
- 19Q. Okay. How did you come about choosing MP Did he come to you, did you make an announcement in the squadron? How did that work?
  - 19A. With regard to the demonstration program or the unit?
  - 20Q. To the demonstration program.
- 20A. Actually, it was -- we discussed -- MP expressed an interest in it when it was first brought up, and we had discussed it inside of the Air National Guard leadership about getting involved in something like that, and we agreed that MP -- if we were going to do it, that MP was the only one that we would be comfortable allowing to do that.
  - 21Q. And there again, comfortable because of his?
- 21A. His experience, his experience as an instructor pilot. He came to us from active duty. He actually came highly recommended and had served as a simulator instructor here at Boeing for a year prior to us gaining him full time. He was very smart with the airplane, very knowledgeable.

- 22Q. When the training -- you said that they went through ground training, I believe, and then simulator training and then flight training. When crew members are complete with their certification or with their training, when their training is complete, what happens next? What is the process?
- 22A. I can only give you my understanding. Again, it wasn't -- nobody in the Air National Guard had direct oversight of the program. I do know that there was a process for briefing the wing commander and being certified by the PACAF commander to do, and I believe that process was by air show. So it wasn't a blanket approval to go off doing multiple air shows. Yeah, I don't want to confuse the issue. That's my understanding of the process post-training.
- 23Q. All right. And then, going back to your selection of candidates, were there interviews given to MP to be a candidate, or then subsequent people asked that as far as the National Guard goes, did you all happen to interview those people, or what was that process? You know, because you said, this is the initial guy, we've talked about it, we're going to pick him. Obviously, I think he's -- I would have talked to him. I don't know, I don't want to put words in your mouth.
- 23A. We did. We discussed it. I shared with him my feelings and concerns about aerial demonstration in big airplanes and he understood. We always emphasized that this is --
- MP was very rule oriented, so he got it, that there was to be no deviation or anything, and safety was always job one, but as far as subsequent crew members and such, as the Program Integration Officer, I spent more time going back and forth to Washington or to the National Guard Bureau working the standup of the squadron, and I know that when other people expressed interest in being involved in that, that there was discussion with my director of operations who was

  WITNESS 22 So there wasn't just -- people didn't just get signed up for it out of the blue there. We required them to be pretty experienced.
  - 24Q. And then for the record, you said rule oriented?
- 24A. He was a stickler -- from my observation, he was a stickler for following AFI guidance for not varying out of -- for the lack of a better term, more AFI guidance in the operation of the airplane. I mean, he was very much about following the rules.
- 25Q. Okay. Did you ever review any of the materials and part of the certification process, saying that it was complete and you know, you give your blessing that it can go forth as far as the actual certification processing goes?
  - 25A. Not their actual -- if you're referring to training records --
  - 26O. Right.
- 26A. -- for them? I did not review outside of the scope of the normal TMS review that shows up in the Boeing training system.
- 27Q. And then did you ever receive any feedback on how the aircrews were performing in their upgrade training for aerial demonstrations?
  - 27A. No, I didn't.

- 28Q. Did you ever receive any feedback regarding MP performance or teaching in the aerial demonstration program? Either as a squadron commander or as a group commander?
- 28A. I only recall one feedback, back when WITNESS 23 was still here, that he gave me a thumbs-up after the first thing that all of our folks, that included the active duty and
- MP that they did a really good job at the first air show that they did. I believe that was the spring of 2008.
- 29Q. There were several air crew members, approximately ten, that were certified after 2009; what was your role, if any, in that demonstration certification process?
  - 29A. I had no role in the certification process.
- 30Q. Okay. Did you ever fly on any of the demonstration flights, or participate in any of the sims, or any part of the training at all?
  - 30A. No.
  - 31Q. Did you ever attend any demo planning, briefs or mission briefs?
- 31A. Actually, my intent was to attend some of those, but every single time an air show came around, they were prepping, I was either TDY or unable to make it due to other commitments.
- 32Q. Okay. Earlier you were describing the initial candidates for the aerial demonstration program, MP and you said he came to you highly recommended? 32A. Yes.
  - 33Q. Who provided you with that recommendation? What did they say?
- 33A. Well, it was WITNESS 22 that talked with the folks from where he came from on active duty, and the simulator folks here at Boeing just were very happy with his performance over there. What they really were grateful with MP is when he came up here to take that simulator job, we were already trying to hire him and he pushed us off for an entire year because he had committed to them for a year. They were brand new here, too. He said he would come up here and work with them for a year before doing anything else, and he kept that promise to them.

## **Questions by the Medical Advisor:**

- 34Q. Sir, this is . You said he came up here for a year; was he traditional guard at that point during that year?
- 34A. Part way through that year, we hired him on as a drill status guardsman, and then after he left the simulator, we hired him as a full time.
- PRESIDENT: Okay, WITNESS 30 if we could, we'll just take a quick break and then we'll call you back in and then we'll finish up.

[The board recessed at 1108, 20 September 2010.)

[The boar reconvened at 1117, 20 September 2010.]

Legal: Yeah, this is are again present, to include

All attendees present at the interview prior to the break witness 30

### **Questions by the Board President:**

- 35Q. WITNESS 30 earlier in your testimony you said that MP could be described as a stickler to the rules?
  - 35A. Yes.
  - 36Q. What gave you that impression?
- 36A. He -- well, my interface with him, his, if you can remember back in UPT, the kind of ground evals that you would get, he was very much about digging right down into the weeds about every single issue. Not just why an answer was what it was, but where it came from. And he was very procedurally oriented. He would -- one of the times that I flew with him -- as an example -- for an air refueling sortie, would not close on the tanker until all the checklists were done, and in sequence, and all the right responses were made. He was very, very good at teaching younger folks.
  - 37Q. How many times did you happen to fly with him?
  - 37A. Honestly, I think it was probably only four times.
  - 38Q. And your impression when you flew with him then was the same?
  - 38A. Yes. A very good pilot.
- 39Q. Previously we talked about the candidates for the aerial demonstration program. Did anyone else express interest in being a part of that program?
- 39A. I had a couple of people come to me about that, and between myself and WITNESS 22 denied their -- denied them entering the program until they got some more experience. So there was a great deal of interest. I mean, obviously, the program got to follow the Thunderbirds around the Pacific and go to India, and all of those kinds of things. So there was a lot of interest in being part of the program, but we did limit it.
- 40Q. Okay, and then how many folks did you have to choose from totally for the aerial demonstration program?
  - 40A. Well, you mean at the beginning or during --
  - 41Q. Uh huh, at the very beginning.
- 41A. At the very beginning, it was really only MP that I recall. He was the one with -- when we hired him, he obviously had the most C-17 experience in our program.

- 42Q. Yeah, but just for clarification, I mean, for as far as the population of your squadron, that you could have chosen from.
- 42A. I think when we hired MP we only had eight people. We were still at the very beginning of the standup. He was our first hire from outside of Alaska.
  - 43Q. All right. When you flew with MP when was that?
- 43A. Without reviewing flight records, I'd have to say probably the fall of 2009 was the last time I flew with him.
- 44Q. All right. Did you ever see a demo from the ground, or a video of the aerial demonstration?
  - 44A. Actually, no, I've never seen it actually accomplished.
  - 45Q. Okay.
  - 45A. The one air show they did here, I was TDY during the air show.

#### PRESIDENT:

Questions by the Legal Advisor:

- 46Q. Thank you, sir. Just had one follow-up question to the General's question. You mentioned that you thought -- or you flew with MP maybe about four times?
  - 46A. Yes.
  - 47Q. Give or take, without reviewing records --
  - 47A. Yes, right.
  - 48Q. -- or anything. And the last flight was in 2009, sometime in the fall of 2009?
  - 48A. I believe so, yes.
- 49Q. Was there -- when was the first of those four? I mean, if you can give me a date range or a year range.
- 49A. It would have to be the fall of 2007 when we first got airplanes here in the program.
- 50Q. So would I be correct in saying that you flew with him approximately four times, give or take, between fall of 2007 to fall of 2009?
  - 50A. Yes.
  - 51O. In the C-17?
  - 51A. Uh huh.

PRESIDENT: Is there anything else, matters of importance that you think may help us in our investigation?

WITNESS: No, not in your investigation.

PRESIDENT: Okay. You are reminded of the official nature of this interview. You may not discuss your testimony with anyone without my permission, or at any time before the investigation is officially released to the public. This concludes the interview.

The time now is 1123 local Alaska time.

# V31. AIB STATEMENT FROM WITNESS 31

# STATEMENT OF WITNESS 31

I, WITNESS 31 , of the 249th Airlift Squadron at Joint Base Elmendorf-Richardson, Alaska, hereby state I understand the difference between the nature of an accident investigation board (AIB) under AFI 51-503 and a safety investigation board (SIB) under AFI 91-204. An AIB is a legal investigation convened to inquire into the facts surrounding aircraft or aerospace accidents, to prepare a publicly-releasable report, and to gather and preserve all available evidence for use in litigation, disciplinary actions, administrative proceedings, and for other purposes. I understand the difference between an AIB and SIB. I understand that this statement may be used for any purpose and can be released to the public.

On July 28, 2010 I saw MP and MSO in the briefing room sometime after 1500 in the briefing room. I recall they were discussing a plan of how to move MP shed from his neighbor's property over onto his. I had gone into the briefing room to ask one of them a question but before I could interrupt them I had decided that the matter I was going to discuss (of which to this day I cannot remember) could wait. It was just MP and MSO in the room. I can only speculate that they were waiting on the rest of the crew to brief their sortie for the day.

WITNESS 31 USAF

Signed and sworn before me this 27 day of September 2010.

CARLTON D. EVERHART II, Brig Gen, USAF President, Accident Investigation Board

#### **V32. COCKPIT VOICE RECORDER**

Previous Crew - I've been told--I figure you want to go off 24. The winds are calm and I got 6 in the landing. I got it this time with Homer. I don't know what you [expletive] high-speed guys do other than that.

MCP - Yeah, we got all kinds of crazy magic. I got it all, dude.

Previous Crew - Just do the ops stop checklist.

MCP - What step you on?

Previous Crew - I think, like 17 or something. I don't know. I just said get out and get in. Yeah, you're up to 17, clear to taxi.

MCP - Huh?

[Inaudible voices from outside aircraft.]

MCP - All right, dude. Thank you.

Previous Crew - All right, man. Have fun. I am outta here.

MLM - Test, one, two.

MCP - Loud and clear.

MLM - Thank you.

[Unknown voices from outside aircraft.]

Unknown 1 - I told them to take the 781 and you're going to do the extract.

Unknown 2 - [Inaudible.]

Unknown 1 - Yeah, they were going to leave it out here and I'm no, no, no, no.

MLM - All right, let me get my [expletive] in one sock, brother. All right. I need about 5 minutes and I will be ready to go.

MCP - Roger that, load.

Unknown 1 - Oh, okay. You sent it to M or MP

MCP - What are they calling it?

Unknown 2 - 4300.

Recorded Advisory- Elmendorf Air Force Base, information kilo. Weather at 0055 Zulu, wind calm, visibility 10, ceiling 2300 overcast, temperature 13, dew point 9, altimeter 3004, pressure altitude plus 102, runway 6----

MCP - If we just standby, huh?

MP - Can you get a hold of weather? Kind of talk to them and see if----

MCP - Just call [expletive] tower, dude, and tell them to give us an update. What do you think?

MP - Probably need to call weather. Tower is just going to be like, uh.

MCP - Weather doesn't have anything to do with the current observation, do they?

MP - True.

MCP - You know what I mean? That's the tower calling it. Weather is going to give you----

MP - Yeah, yeah. Work your magic and see what you can come up with.

MCP - Is that right or wrong, though, dude? All the [expletive] comes off the [expletive] at-maybe not, dude. It might be weather. Let's call them. Hey, I'm off headset, brother.

MP - All right.

MLM - Load is going to be off for a minute in the back.

MCP - I'm delegating to the Major, dude. All right, you want me to get the secondary?

MP - Yes, please.

MCP - You already built the custom runway?

MP - Yeah.

MCP - What did you put it in as?

MP - Seven and 23. That's not right.

MSO - That's [expletive] up.

MCP - What's that, bud?

MSO - I don't know, the line. You got a phone number?

MCP - , ask for base weather.

MSO - Is this the operator?

MCP - Yes. You know what, it was actually MAJ N MAJ N just gave a pie rep of 2300.

MP - [Laughs.]

MP - 480.

[Buzz.]

AIRCRAFT - Stabilizer motion.

[Laughter.]

MCP - Close it back up.

MSO - I don't know why you guys are laughing. That's a legitimate question.

- MCP Absolutely.
- MSO And he says he will do it. He says if we go up there and do a weather check and we see 2500, we can give that pie rep and they will change their report. However, right now they are calling it 2400.
- MP [Expletive.] 100 feet, really?
- MSO Yeah. So, the way I see it, the options are we can [expletive] sit here with our thumbs up our [expletive] for a while and hope it comes up. He thinks it won't come up for a while. Or, we can go do a weather check and make a pie rep for 2500 if it is somewhat close, or that's it. We may be sitting here for a while.
- MP [Expletive] that. We are going to go look.
- MSO All right.
- MP Let's do the ops stop check. The question is, are we going to look at the same time we do the show?
- MSO That we do the what?
- MP That we do the show.
- MSO I don't think that is a good idea.
- MP [Laughs.]
- MSO I like it, I like where your head is at, but we gotta fly. You're the one who looked it up. If you wouldn't have looked up the [expletive] weather requirement we would be fine. What do we really need? We need a thousand foot [expletive] ceiling, 1500, 500 foot below that, VFR 1000 feet.
- MCP Where the [expletive] am I going? Ops stop. All right.
- MSO Projector has really low specs compared to the new [expletive]. 1100 lumens.
- MP Yeah.
- MSO 2500-1 contrast ratio. \$7,000 MSRP in 2005.
- MCP Just wait and we can update the weigh and CG.
- MLM You shouldn't need to. Ops stop. There's no cargo.
- MCP IRU alignment, mission computer data. Present position, flight plan and TOL.
- MP Alta.
- MCP All looks good. Check co-pilot.

MP - Pilot.

MCP - Toga man?

MP - Engaged.

MCP - Trust ring is max. Flap index is set 76. Stabilizer, rudder, and aileron trim are at .6 down 00, co-pilot.

MP - Pilot.

MCP - Altimeters 3004. I've got 230 on 2. Sitkoba.

MP - 2004 showing 250.

MCP - Roger that. Skis off. Environmental panel is set.

MP - Roger.

MCP - Propane switch lights are coming on. Spoiler switch is armed. Radar, we will leave off.

Defensive system not required. TAUS is--we will get that here in our next checklist.

MSO - I'm off headset for a minute. I need to make a call to the guy doing the video.

MCP - Okay. Flap is checked with the----

MP - We need to change some of that TAUS input stuff.

MSO - All right. Call that bottom number right there. Tell them our first take-off is not the air show. It's the combat camera guy. He is going to be videoing us.

MP - 27-376.

MSO - Just let him know what is going on.

MCP - Flaps checked with the park brake. Landing and taxi light. 700, 300 weight one in there.

MP - It should be off and that could be probably 400.

MCP - Roger. Flaps, check, co-pilot.

MP - Pilot.

MCP - Loadmaster report?

MLM - Check complete.

MCP - Ops stop checklist is complete. All right, crew, switching checklists. We are in the air show checklist now.

MP - Actually, we are just going to go up, take a look at the ceiling real quick, and hopefully if we can get the ceiling we will call in the pie rep and land and start all over.

MCP - Okay. Yup. Land opposite direction for the 180 with no thrust reversers.

MP - Yup.

MCP - Did you get the----

MP - So you can put probably land data for runway 23 in there.

MCP - Roder. Did you select 2 engine max?

MP - What's that?

MCP - Did you select 2 engine max?

MP - Don't worry about it.

MCP - Okay.

MP - We can get the majority of that once we are back on the ground.

MCP - All right. Cool.

MP - Have it programmed?

MCP - You got it, buddy.

MP - Ground, Sitka 43.

Ground - Sitka 53 [said in context] heavy, good evening, Elmendorf ground.

MP - 53?

MCP - 43.

MP - Sitka 43. We are ready to taxi. I would like to probably take off on runway 24. We would like to just basically go do a weather check and get an idea how high the clouds are.

Ground - All right. Copy all, sir. So you're just going to go out on a local VFR?

MP - Affirmative. We are just going to orbit up over the field, take a look at the clouds and land.

Ground - Copy all, sir, and verify you are the C-17 right around spot 19, 20 area?

MP - We are over on delta.

Ground - All right. Copy all, sir. Taxi up and hold short on runway 24 delta.

MP - Up 2 and hold short 24 at delta, Sitka 43. All right, here we go.

MCP - All right, man.

MP - He onboard, MSO

MSO - Positive comms with the camera dude.

MP - You are ready to go in the back, right, load?

MLM - Roger.

MP - And you're clear on the plan?

MLM - Yup.

MP - Okay.

MCP - Hey, MSO help me out. Let's get a sanity check of this overhead panel. What do we have on gas?

MP - 65. It checks.

MCP - All right, man. My needle is to the right, my balls are to the left. Got a 115, 115, looking good. Everything is swinging.

MP - All right. That should be lineup check, correct?

MCP - Let's do a before take-off checklist.

MP - We did the ops stop, right?

MCP - Yeah, I guess. That's fine. We can do that. We will do a lineup check. I said I was going to exit that and go to this. That's what [expletive] me up.

MP - I got ya.

MCP - All right, crew, standing by on the lineup.

MP - Inboards going to reverse. Hey, your radios----actually, you want the takeoff that way you can get one?

MCP - Yeah, that's fine.

Ground - Sitka 42 heavy, contact tower.

MCP - Switch.

MSO - Blue Angels. Wow, impressive. [expletive].

MCP - All right, dude.

MP - All right, whenever you are ready.

MCP - Co-pilot is ready to drive.

MP - Co-pilot--aircraft pilot's radios.

MCP - All right, crew attention to brief.

MP - Tower, Sitka 43 is ready to go for runway 24.

Tower - Sitka 43, roger. Hold short runway 24 for inbound traffic, runway 6.

MP - Copy. Holding short, 24, Sitka 43.

MCP - It will be a max power takeoff on the right hand. Seeing anything prior to go we'll abort. Anything after that, take the aircraft airborne and handle that in airborne emergency. We will plan on vectors back around for either 24 or 6 as appropriate. 2400 foot ceiling is

what we are anticipating. We will just pull a VFR closed so it will be right close to 24. We do have the barriers up so I've got to land past those.

MP - Oh, what the hell? Barrier 2 is up.

MCP - Yeah, that [expletive] needs to be gone.

MP - Yeah. Tower, Sitka 43.

MCP - Who coordinated all this?

Tower -Sitka 43, what's the request?

MP - Yeah, looks like barrier 2 is up. We will need that down for the performance.

Tower - Roger that.

MP - Just so you have a heads up, we are just taking off to do a weather check and then we will be landing for the performance. If they can take it down after we are airborne, that would work great.

Tower - Roger.

MCP - Next time you talk to them, can you let them know too it looks like number 3 is maybe just a little bit out of place there, like 3 had pulled just a little bit too far forward.

[Laughter.]

MCP - It could just be the angle of that.

MP – [Laughs.]

 $MCP-{}^{[expletive]}$ 

MP - Actually, we need to make that radio call at some point.

[Beep.]

MP - Roger, seg 1. 1, shutting it off.

MCP - Is that [expletive] us up with the anti-ice?

MP - Tower, if you could go ahead and advise Blue Angels that number 3 is out of position.

[Laughter.]

MP - Number 3 looks [inaudible]. Too far forward. You might want to take care of that before the show.

MCP - We can wait and [inaudible].

[Laughter.]

MSO - No kidding.

MCP - What's the status on barrier 3 there? That [expletive] needs to come down too.

MP - Three is fine.

MCP - No, dude. This is show center right here.

MP - Yeah. We rotate right there. We will rotate at barrier two.

MSO - A couple of those we did last time, man, after that sling shot--I guess we're not sling shooting today.

MCP - Yeah, it----

Tower- 1709 is able to fly slowest practical airspeed on final for a heavy C-17 departing runway 24, northbound, VFR.

Unknown 3 - Verify and if able, turn right at that taxiway. Contact ground when off.

Tower - Sitka 42 heavy, wind 2--correction, 250 at 6, runway 24 clear for takeoff with a right turn out. Traffic is a C-130, 8 mile final on runway 6.

MP - Traffic is in sight. Clear for take off, Sitka 43

MCP - Dude, he's on a [expletive] 8 mile final.

MP - Someone is about to get smacked in the tower. Let's make it quick. Taxi back to there.

MCP - Okay, crew. Let's do a lineup check.

MP - [Inaudible] one half. Index, 76. Co-pilot?

MCP - Co-pilot.

MP - Lineup checklist completed and TOGA. 22 knots right now.

MCP - Max power. Rolling, crew.

MP - Gotta go. Our airspeed is alive.

MCP - Roger.

MP - 80.

MCP - Clamp.

MP - Rotate. Positive 8.

MCP - Gear up.

MP - Gear up.

[Beep.]

MP - Tank not inert. And, let's start the turn. Tower, Sitka 43 is in the turn and non stand, we would like to climb up and take a look at how high the weather is here.

Tower - Roger that. You're going to stay within my airspace, yes?

- MP Affirmative. Plan to go up to--we need to check and see if we can get 2500 feet.
- Tower Roger that. Just maintain at or below 3000, please.
- MP Wilco, at or below 3000 and that's it for Sitka 43. Let's see what we got.
- Tower- 1709, winds 250 at 50, runway 6. Clear to land, caution [inaudible] C-17 departed runway 24.
- MCP I say let's go out there and hit this and potentially go out there to Goose. You want to, or do you just want to come in and land?
- MP I just want to see what we got here [inaudible].
- MSO Yeah, I think we need to check the weather and land before we waste all our [expletive] gas.
- MP Yeah, absolutely. 2500 right there. Hold back.
- MSO Actually, come up a little back. Go up and see where you [expletive] hit it.
- MCP 26.
- MP 27-ish. Get back down to 25.
- MCP Hold on. We got to get this back end area. We just got layers back here. It's going to be a--let's do a full flap from the right seat in accordance with the Dash 1. No questions, crew brief complete. Let's go on speed. Check. Let's go gear down.
- MP Gear down.
- Tower [Inaudible] proceed inbound for runway 6. Traffic is a heavy C-17 inside our airspace doing a weather check. He is going to be the demo for the C-17 later this evening.
- MP Tower, confirm with Sitka the area is cold.
- Tower Affirm.
- MP We are going to make a left 360 here and land on 24.
- Tower Roger that, sir. That cable is still up and operational.
- MP Copy that. We'll land past the barrier and taxi clear while we wait for it to be cleared off, if able.
- Tower Roger that. We do have barrier maintenance in route to get that taken down for you. Standby one second. Coast Guard 1709 if able, right----[inaudible].
- MP All right, crew. Let's do an approach check.
- MCP Okay. Approach mode.

Tower - Sitka 43, that shouldn't be a problem. Traffic you're following, however, it is a B-20 over Goose Bay approximately your 10 to 11 o'clock at 2700 feet, inbound for a right base to runway 6. He will be following you.

MP - [Inaudible] for traffic. Confirm their landing runway.

Tower - They are landing runway 6. I will let you land runway 24. Just once he is down, we will get you inbound for runway 24. You can continue to circle current location.

MP - Copy, wilco.

MCP - Okay. We are good to go.

MP - Sweet. Approach checks. Let me double check that and make sure. Yup. Full flaps. Check co-pilot or pilot, rather.

MCP - 75 now. Post check, co-pilot.

MP - Full flap, no brakes, all reverser. Just past barrier 2 more than likely.

MCP - You got it. What's the runway available there, bud?

MP - In between them. It's about 5500.

MCP - Okay.

MP - Gear is already down, so.

MCP - Are we happy with 2500?

MSO - [expletive] yeah, we're happy with 25.

MCP - Gear is down, co-pilot.

MSO - Maybe half that.

MCP - [Inaudible], pilot.

MCP - Co-pilot.

MP - Loadmaster, approach check.

MLM - Check complete.

MP - Approach check completed. Let's go down to 1200.

MCP - That's where I'm down to now. [Inaudible checklist], co-pilot.

MP - [Inaudible repeat of checklist], co-pilot--uh, pilot.

MCP - Co-pilot.

MP - Gear's down, pilot.

MCP - Co-pilot.

MP - [Inaudible] search is on. Loadmaster report?

MLM - Check complete.

MP - Check complete.

Tower - Wind 340 at 3, runway 6----

MCP - Can we 17 for patterns or 12?

MP - 12.

MSO - 17 for overhead.

MP - 17 is for overhead.

MCP - That's what I'm thinking.

Tower - Sitka 43 heavy, continue in that turn and just line up for your base to come out of that turn to runway 24. Traffic you're following is the B-20 now 1 1/2 mile final--correction, 1/2 mile final runway 3.

MP - Traffic is in sight. We will probably continue opposite direction here and then enter into a downward for a right base, runway 24. Sitka 43. We are also descending to 1200.

Tower - Sitka 43, roger. Cable 1 and 2 are both up and operational. First one is 1780 feet from the approach end.

MLM - This is the standard landing report, right?

MP - Copy.

MP - Affirmative.

MCP - Correct.

MSO - You just said 24. Is it 24 we are going to?

MCP - We are. Yeah. Entering a downwind.

MP - You are good to turn. I think he is on the ground. SOA, over.

MCP - Good call.

Tower - [Inaudible] Roger that.

MCP - Got a lot of guys comin' in our [expletive] pattern that we are supposed to have. You know what?

MSO - Yup.

MCP - Are we cleared and hot? Where is this dude at?

MP - I'd just make the turn.

MSO - I thought he said you were clear to enter base, right?

MP - Yeah.

MCP - Clear right. Coming to base.

MP - Sitka 43 at base.

Tower - Sitka 43 heavy, wind 260 at 4, runway 24, cleared to land.

MP - Cleared to land, Sitka 43.

MCP - Clear to land, looking for the barrier. It's going to be just past. Let's do a sanity check on the runway here.

MP - You got the boxes in sight there?

MCP - Yeah.

MP - Two sets of boxes.

MCP - All right, bro-hama. Speed is checking. Let's go flaps full.

MP - Flaps full.

MP - ATT is set. Runway is clear. Clear to land. Config page.

MCP - Thank you.

MSO - Is anybody working on that [expletive] cable yet?

MP - No. They said they were in route.

MP - Right there is brick one.

MSO - Height good, safe. Check.

MP - Looks like there is a truck sitting there. They are ready to de-rig. 300 feet.

AIRCRAFT - Minimum.

MP - Stable.

MCP - No brakes, crew. No brakes.

AIRCRAFT - Fifty.

MP - Fifty feet. Little less, I know. [Inaudible]

MCP - Taking it to the end.

MP - Yup.

[Engines.]

MP - Tower, Sitka 43. Like to 180 at the end and from there wait for the barrier to be down.

Tower - Sitka 43, just taxi to the end and exit at Alpha North. I've got 2 more aircraft inbound.

One 8 miles final, the other approximately 13 to fly off on final.

MCP - We'll just clear here and do the [expletive] dance.

MP - Copy. We'll exit north at alpha. Sitka 43.

MCP - Alright I've got the flaps and slats, let's do an after landing.

MP - Alright.

MP - And uh we'll do a, I don't know, full stop taxi back.

MCP - Yeah that'll work too.

[Beep.]

MP - Slat disagree. Transient.

MCP - Clear right crew.

Tower - Elmendorf Tower Raider 46 eight mile final on the ILS runway 6, three unlocked.

Tower - Raider 46, wind 260 at 4, runway 6 clear to land, your landing is over a raised cable 1780 feet from the approach end.

MSO - Did that NOTAM not make it in?

Tower - Raider 46 clear to land, runway 6.

MP - I specifically called 'em and give them the data on it, oh I guess----

MCP - We're down here to the----

MP - Oh, hang on, let's wait here and talk to tower.

MP - Tower Sitka 43 would like to taxi down to Bravo and hold short there.

Tower - Sitka 43 contact ground.

MP - [Expletive]

MP - Ground Sitka 43 has cleared the active at Alpha would like to taxi to Bravo and hold short.

Ground - Sitka 43 heavy Elmendorf ground approved as requested.

MP - Sitka 43.

MCP - Rollin crew.

MCP - Dude, you know what, I'm glad we didn't [expletive] have  $^{\text{WITNESS } 16}$  with us.

MSO - No [expletive].

MP - Yeah.

MP - Well, we haven't done anything.

MCP - No, I just mean because it's just been such a cluster [expletive].

MP - Yeah.

- MLM Hey, we're going to be switching sides back and forth aren't we?
- MP I hear you like to switch sides.
- MLM Yeah, front, back, front, back. Hey ah, which side is the audience going to be on?
- MP They're going to be on the number four engine.
- MCP Number four will be the critical side.
- MLM Okay, so I need to be on the other side of the airplane?
- MP No, yeah you need to be on the number four side.
- MLM Okie dokie.
- MCP Hey bro, do you want to ask if we can pull into here?
- MP Why?
- MCP Kind of like we did the other day? Until these [expletive] have everything set up, and all their arrivals are in. Because depending on where we're parking those guys, we block that taxi way.
- MP That might not be a bad idea. I'm hoping they have it pretty much down by the time we get there if we taxi slow, and just yeah minimize brakes on the taxi.
- MSO Is that secondary FAF, is that overlaying or does that need to be fixed?
- MP I'm working on that right now.
- MSO Oh you're working on that, okay.
- MP I'm doing the co-pilots [expletive] job is what I'm doing.
- MSO- This is tactical, this is tactical. Hey MP does \$1,000 to about to \$1,400 sound about right for that screen for a new.
- MP No.
- MSO Oh, ok.
- MSO Well that's what they're--the delight----
- MP Well it is pretty big.
- MSO Delight snap screens about that size, anywhere from \$1000 to \$1400 on Amazon and different spots.
- MP For that size, yeah maybe, it is a pretty big screen.
- MSO Screens, they don't really get [expletive] up unless they deliberately get [expletive] up, right?

MP - True statement.

MSO - So, wonder what I should offer him, he's just trying to get rid of, he told me that, he goes, I said how much you asking for and he said----

Tower - Calling ground 21A coming in completely unreadable.

MSO - He said, well I didn't really put a price on it I don't think, and I said I don't know I'm on the phone that I was looking at it on, and he said I don't know, I'm just trying to get rid of it, those were his exact words.

Tower - Calling 21A still coming in extremely unreadable.

MP - Good words.

MSO - So what does that say for you to price?

MP - Five, 400 maybe, probably go less than that. Hell.

MCP - Is this the Russian open skies flight that they still haven't gotten the FAA clearance form for us to fly tomorrow, or, uh, Friday

MP - Huh?

MCP - The [expletive] ruskies are here.

MP - What do you know? We'll show them.

MCP - So, we're holding for two dudes, right?

MP - Uh yeah.

MCP - Hercules and somebody else? Hercules...Hercules...

MSO - Alright, well we got a minute Uh just got one thing for ya there, co-pilot. When you push the power up, I would be very [expletive] careful about what you did, because they were almost at idle and you pushed them all the way up.

MCP - What are you talking about?

MSO - Point on the takeoff.

MP - Yeah.

MCP – Okay.

MCP - Oh, you get the spool up?

MSO - And so what we ended up having was one was here, two was down here, three was here, and four was here.

MCP - Yup.

MSO - If these two would have been reversed, we would have been [expletive].

- MP You would have felt that.
- MCP You get the moment, as opposed to pushing a 1.15.
- MSO Yeah.
- MCP Yeah, trackin'.
- MSO Yeah, I mean because they take a while to spool up, but when they go they [expletive] go.
- MCP No, that's a good feedback.
- MCP [Expletive], I hate it when MSO has legit [expletive].
- MP Doesn't happen often. Alright, mission computer data is checked for the pilot and the [inaudible]. I'll take it, you take the rest
- MCP Alright man you got inboards. Pilot has the aircraft.
- MP Hopefully they're able to get some of that crap----
- AIRCRAFT- Stabilizer motion.
- MP Down while they're waiting, I bet they can't.
- MSO Next time, don't call me MSO I'm RACM.
- MP [Laughs.]
- MCP Well, Blue Angels sure can't count. 1, 2, 3, 7, 5, 6. That's what the critique is going to be.
- MP That's the radio call.
- MCP And then they put 4 on the end, what the [expletive]?
- MP Be advised, it appears the Blue Angels cannot count.
- MSO Be advised the Blue Angels are out of order.
- MCP There's a P3.
- MSO Awww man lets [expletive] hump this monkey.
- MP What did you tell the camera dude?
- MSO I told him the first take off would be a weather check and then the next time he saw us go we'd be, well I'll call him again, just let him know we're good, we're legit, too legit to quit.
- MCP Is this a curtsey?
- MP Say again?
- MCP Is this a curtsey, a bow?
- MP Negative.

- MCP Aww this guy is doing a 180. Hopefully he's going down here. All right, I got the radios again.
- MP Yes you do.
- MCP You talking to him on victor or uniform.
- MP Uh victor, cause I couldn't hear these other guys coming in.
- MSO No fighters on frequency, supposed to be on victor I think.
- MP Yeah. Love, love
- MCP Tower Sitka 43 is checking in with you, holding short 24 at Bravo, we'll be waiting for barrier two to come on down.
- MSO Is that thing still up?
- MP Looks like it, I think they're waiting for the Herc to go over it and then they're going to drop it.
- MSO I'm going to go take a quick pee.
- MCP How much gas we got?
- MP Uh, 61K left we'll be fine, an hour and a half of flying, we'll probably burn 30. Probably land with 20.
- MLM Are we going to be here for a sec?
- MP Yes, we will.
- MLM I'm going to do a right troop door check.
- MP Copy.
- MLM Just to make sure it doesn't get hung up like WITNESS 5 kept saying.
- MP You're cleared to open; he's the only person that's ever had that problem by the way.
- MCP Tower Sitka 43.

[Beep.]

- MP Troop door.
- Tower Sitka 43, Tower.
- MCP Yes sir, just wanted to make sure you guys copied, we're holding short 24 at bravo for the barrier.
- Tower Affirm and I have the barrier maintenance crew out there right now pulling down your cable for you.
- MCP No worries.

MLM - Door checks good.

MP - QB? Is that Quebec?

MCP - QB?

MP - No, that's Marines

MLM - Yeah, it used to be El Toro, I think, now its Miramar. Is it on a Herc?

MP - Yep

MSO - Hey, Trigger, I just want to say you look good in your helmet.

MLM - Yeah, it's starting to bring me--give me flashbacks of my Herc days. At least I'm not wearing goggles.

MP - Make sure were good on the checklist once that sucker is down.

MCP - I'm going to leave TCAS on since there are other airplanes out here.

MP - Okay, I like that.

MCP - TA/RA.

MSO - TA/RA

MCP - Were going to BA, set zero.

MP - Uh, yeah good call.

MSO - BA.

MCP - 29.79?

MP - I've got 29.82. How about 81, nope 80...nope 79 there it is

MP - 29.79 set.

MCP - Co-pilot. Alright, following before takeoff demo checklist is complete. We're standing by on the line up checklist, crew.

MSO - Alright, so how much--how much room do I need on the sides of the screen to be open, if any?

MP - What do you mean?

MSO - In other words if I put the screen up, do I need the sides of the screen to have any opening whatsoever?

MP - Like between the sides of the screen and the wall?

MSO – Yes.

MP - No, you do not.

MSO - Like, not an opening, but does there need to be a border there of any kind?

MP - No, not really. However, keep in mind the best screen--sitting position is one and a half screen lengths from the screen, so the larger the screen the deeper the room you'll need.

MSO - Right.

MP - To have decent viewing of it.

MSO - Right, assuming that means you use the whole width of the screen.

MP - True, but if you don't use the whole width of the screen then it will look like crap.

MSO - Yeah, okay.

MCP - 1..2..3..7..5..6..4.

MSO - So the width is 10, so I need 15 feet from the screen.

MP – Right.

MLM - Why don't you just paint the wall white or hang a sheet, save yourself fifteen hundred bucks?

MSO - I don't know. Why don't I do that?

MP - It kills the image quality.

MSO - Yeah, it kills the image quality.

MLM - Don't we have any of those old whiteboards lying around you could use?

MCP - You'll get a glare off the whiteboard.

[Laughing]

MP - Can't have glare, what the hell?

MLM - Dude, I still have a regular DVD and a 19...what '99 tv, so.

MCP - How can you watch [expletive] on that and still respect yourself?

MLM - I can on my MAC.

MP - Good point.

MLM - And on my I-phone.

MSO - Okay, so this thing says, let's see here----

MP - I think the barrier is off the runway now.

MSO - All right, he put in the ad on the screen; he said it is gray or deeper black.

MP - That's what you want.

MSO - Okay.

MP - It's not really gray, if you look at it, it still looks white.

MSO - It looks white in the picture.

MP - Right, mine is gray.

MP - All right, here he goes.

MSO - So if I bought that one, mine would be bigger?

MP - Do you have to buy something to make yours bigger, MSO Is that what you're saying?

MSO - Hey, if I'm happy with it that's all that matters.

[Laughing.]

MLM - I just and it

MSO - All right, talk about your imagination, MLM

[Laughing.]

MP - You too.

[Laughing.]

MLM - All it does is

[Laughing.]

MLM – Hey, I'm proud to be

[Laughing.]

MP - All right, so we need to confirm no inbounds, and then we'll have the air space for 10.

MCP - Got it. Did you get the three hundred approved?

MP - Huh?

MCP - Did you get the three hundred approved?

MP - What do you mean, three hundred?

MSO - Don't ask, don't tell.

MP - I think I saw that in a survey somewhere.

MSO - It's certified, certified for the approved maneuvers we're about to do.

MCP - That was funny, the last time we did it, you know, we rolled in and somebody was like, how fast you guys do that? We all looked at each other and were like two-fifty.

[Laughing.]

MCP - It's like we never even missed a beat.

MSO - You don't have a hair on your [expletive] if you don't hit two hundred feet today, MP

[Laughing.]

MCP - Yeah, each time we [expletive] land.

[Laughing.]

- MP Alight, so looks like they're done. Lets prep tower, tell them were still ready to go as soon as they don't have any inbounds.
- MCP And tower, heads up for Sitka 42. Sir, were going need the air space completely cleared out for probably about ten minutes. So, looks like the barrier guys are done. If you guys don't have any inbounds we're ready to go.
- Tower And Sitka 43 heavy, I do have an inbound we got a BE-20 approximately twenty-five miles to fly for a TACAN visual to 6. I can get you airborne and get you over Goose Bay, and then once he's down bring you inbound if that will work for you?
- MP Nope, nope.
- MSO Twenty five miles I got a BE-20.
- MCP -I got it.
- MCP Alright, sir that's not going to work for us. We need to do the full profile or nothing.

  Can you check for us and verify that the NOTAM made it in there?
- Tower The NOTAM did make it in there. We have it for you. We were just told to work in between your profiles for inbounds and out bounds. I didn't know if you wanted, basically your profiles going to start on takeoff and then you're going to run through your sequence. Is that accurate?
- MP Yep.
- MCP That is accurate, yup. We're going to--for takeoff we'll do--probably about three passes and we're going to land. We're going to have to go to goose in between to cool the gear, but we'll let you know when we're going out and when the profile is done.
- Tower Roger that, after this BE-20 comes inbound, I don't have any proposals for a little while. Would it be all right if we just waited for him to get down?
- MP Well what's the time, how much time does he need? Is he ten minutes out or is he?
- MCP Twenty five minutes on the TACAN circle.
- MP Twenty five minutes or miles?
- MSO Twenty five miles out and then he starts to circle.
- MP Yeah, so.
- MSO He's going to be forty [expletive] miles.
- MCP That's fine, sir, for Sitka 43. We'll wait for this one and then once the air space is cleared out, we'll go.

Tower - Roger that, thank you sir.

MP- That's what the [expletive] NOTAM's for, to kick them out.

MSO - I mean he can hold on the [expletive] TACAN.

MP - Yeah.

MSO - Jesus.

MCP - The only reason I said that is because it might be one of our guys. It's probably one of the north guys.

MSO - A BE-20?

MCP - Yeah, it's King Air, right?

MP - No.

MCP - What's a BE-20?

MP - No.

MSO - It's a Beech Craft.

MP - Yeah it's not a C-12. I don't think it is. BE-20.

MCP - [Expletive] it, we'll get it here.

MSO - Google it

MCP - [Laughing]. Dude how awesome would it be if we had

I'm going to the other end of the spectrum, so right now.

MP - Right here, it would be awesome.

MCP - All of a sudden he sees our world.

MP - Uh huh.

MCP - We got a NOTAM published were trying to do the air show.

MP - And were waiting on a BE-20 on a twenty five mile TACAN.

MCP - Doin' practice approaches.

MSO - It's a King Air.

MLM - Hey MP

MP - Yep?

MLM - MAJ N texted me that they did 1.7 total flying with nine total landings, so we got to put those in the forms.

MP - Ah, he didn't do it? Slacker.

MLM - No, because he didn't know how much what his total flying time and stuff was.

MP - Okay, we'll write it in dude. You know where all that goes.

MCP - Yeah.

MP - Alright.

MLM - I'll do all of that crap after we take off.

MP - Well we've got ten minutes so, plus five minutes.

MLM - Well then I got to take the harness off, and then I got to put it back on.

MP - Oh yeah, yeah, you're way back there, never mind.

[Laughing.]

MP - You're scared of a little work, it's all good, I understand.

MLM - Crap, speaking of which, what was our first take off and landing?

MP - We did one of those?

MLM - Well you can get a dual AFTP.

MP - Yeah, I think so, we took off at 5:30 I think, and we landed at about 5:12, would you say, about 12 minutes?

MCP - Yeah that was definitely what time it was.

MP - I'm pretty sure that's what it was.

MLM - All righty.

MSO - Have you seen the new--have you seen the new track pad that Apple released?

MCP - What is it?

MSO - Track pad. You know, how you like, how your laptop, the Mac Book has a Track Pad on it?

MCP - Okay.

MSO - Well they released a new wireless track pad for like if you have a desktop computer.

MCP - No [expletive], huh.

MSO - It's actually the same track pad except it's bigger, pretty sweet.

MP - That is pretty cool.

MSO - So you can get a little wireless keyboard, little wireless track pad and then the only thing you need is to machine something.

MP - Is to what?

MSO - To like invent something that would hold those two items together in one.

MP - So it's like----

MLM - Duct tape and cardboard.

MP - So it's like a laptop?

[Laughing.]

MSO - Like what I've got at my house where you get a----

MP - Oh yeah.

MSO - Where you get like a--or--downstairs in a theatre or whatever you hook a Mac mini up to that thing.

MP - Hell yeah.

MSO - New track pad, see?

MP - Sweet.

MCP - That's cool.

MSO - Conveniently priced at \$69.

MP - They're still five minutes out.

MSO - Yup, [expletive] King Airs are not [expletive] fast, should have had them [expletive] turn and hold.

MCP - They got kicked out of the dissimilar formation for----

MP - Being too slow.

MCP - For being too [expletive] slow.

MLM - Hey, can I ask a favor?

MP - You can ask.

MLM - Can you guys keep track of the gears cycles?

MCP - It's ten, MLM

MLM - During the demo?

MCP - Yeah, absolutely. I will.

MCP - 1.

MLM - Yeah I already got that one.

MCP - 2...3.

[Laughing.]

MLM - So, it's just 10?

MCP - I'll let you know at the end. Now what constitutes a cycle, up? Or up and down? Is up and down one, or is up and down two?

MLM - Every time you put it down, that's the gear cycle.

Tower - [Inaudible] 8 miles on the TACAN runway 16 to circle to runway 6 [inaudible].

MCP - That's agreeable.

MSO - 8 miles out, and he's circling.

Tower - Northwest 7 approved as requested. Report gear down. Wind 240 at 5. Runway 6 clear to land.

NORTHWEST 7 - Northwest 7 is gear down. Clear to land runway 6.

MCP - Might have DV's on board or something.

MSO - DV's and he's doing a TACAN?

MP - I doubt it.

MCP - Oh yeah. What you got going on there, buddy?

MP - I really won't discuss that until after the air show.

MCP - Rhymes with itches?

MP - [Laughing.] I will say its MSO fault

MLM - What'd you do?

MP - It'll make for a humorous story, I'm sure.

MCP - You got to just tell us now.

MP - So, uh.

MCP - Doesn't look like it hurts to touch. It's obviously cutting some kind of a wound. You got stitches didn't you?

MP - Oh no. No it's to cut down on mobility. So, I got roped into going out the other night because MSO kept giving me [expletive].

MCP - [Laughing.]

MSO - Oh no you didn't.

MP - Dude, you gotta go out. You gotta go out. You gotta go out.

- MSO Hey, I'm going to try that number one SOV.
- MCP Give it a whack and try to turn it on there.
- MP So I finally said alright [expletive] it I'll go out, and Thursday what happens with MSO within five minutes he gets booted out of the bar for being too drunk and I'm sitting there on my own. Actually, I was with the rest of the guys at the wedding-with the wedding party because it was the brother in laws.
- MSO –Aww, they're commencing the circle.
- MP It was his brother in law's bachelor party. So, of course what are we gonna do is ride the bull.

[Laughing.]

[Beep.]

- MCP What was her name?
- MP I was riding the [expletive] out of that bull, and environmental, shutting it off again.

  Underhand, and moved forward and twisted like this caught myself with the thumb, heard a crack over the music, over the music.
- MSO Ohhhh, ow.
- MCP It, doesn't look all that swollen though.
- MSO Does it rhyme with choke?
- MP Yeah, it does.
- MSO Oh. You gonna get a cast on it?
- MP Haven't decided yet.
- MSO You [expletive], why would you do [expletive] like that?

[Laughing.]

- MCP Didn't you mess this one up last time from snowmobiling? You messed up----
- MP No, this finger was broke last air show I did. My other hand is still sore from [inaudible] it on MSO
- MCP Dude, is that [expletive] coming down or is it me? Watch these freaks come in and steal it.
- MP That's a good call. Let's do a PIREP of 2300.
- MCP I'd like to give a PIREP of 2300. That's what I would've done.

[Laughing.]

MCP - If I was being a [expletive], be like all right [expletive], you don't want me to circle.

MP - [Laughing.]

MCP - It'd be funny too. I'd do it on like uniform or something like that so you guys--I know you guys could still hear me.

MP - [Laughing.]

MCP - But, I wasn't really calling it in. That'd be funny.

MP - What approach did they [expletive] do?

MCP - TACAN circle.

MSO - TACAN to 16 circle.

MP - I didn't think the TACAN was so long.

MSO - Yup, we would have had one down. I'm just saying.

MP - Yes, sir. We would have.

Tower - Northwest 7 if able left turn at delta, contact ground when off.

NORTHWEST 7 - Northwest 7 left turn at delta wilco thanks.

MCP - Yeah, he's a good dude. Alright, MLM you ready to go?

MLM - Rodger.

Tower - Sitka 43 heavy position and hold runway 6.

MCP - Onto hold runway six. Sir, we would like to taxi up some.

Tower - Like to taxi? What was that?

MP - Ah don't, just disregard, he doesn't care. It's our [expletive] field. We'll do what we want

MCP - Ah, disregard. I was just going to let you know were taxiing out, but I guess we pretty much have the air space so.

Tower - Affirm.

MSO - Blue Angels, 1...2...3...7...5...6...4

MP - [Laughing]. What time is it?

MSO - Game time.

MP - Damn right.

[Laughing.]

MP - What the [expletive]?

MCP - All right, crew. Slats are extended. Flaps are one half. Index 75 for the co-pilot.

MP - Safety, I'll be safety.

Tower - Sitka 43 heavy your discretion wind 240 at 4, runway 6, clear for takeoff.

MSO - That's your call on the takeoff, try to piss me off, I know what I'm doing here.

Tower - The space is yours, so advise when ready to land.

MP - Roger cleared for takeoff runway 6 Sitka 43.

MCP - Spoiler switch is armed, anti ice is off, TOGA mode hey how is this going to [expletive] with us while we're doing the profile with the icing on there?

MP - It'll be fine, I'll just minimize the use of number one.

MCP - All right, so.

MP - This is lovely.

MSO - As soon as you push 'em up I'll try it, if you want?

MCP - Hydraulic reservoir temperatures are checked, exterior lights are set, IFF we are squawking, line up checklist is complete.

MP - 15 seconds.

MCP - Want to fix you're wiper real quick?

MP - It won't, it'll be alright. It will fix itself when we're airborne.

MCP - Alright, 5...4...3...2...1 brakes, release.

MSO - Hack the clock if you want.

MCP - Air speeds alive. 80 Knots. Go. Rotate.

MSO - Gear, gear, gear, gear.

[Beep.]

MCP - Tank not inert, crew. Very nice, brother. Thirty to your heading...10.

MSO - Thousand 1...thousand 2...thousand 3...thousand 4...5...6...7...turn.

[Buzz, buzz, buzz.]

AIRCRAFT - Stall.

MCP - Acknowledged, crew.

Aircraft - Stall.

MCP - Temperature, altitude, lookin' good.

AIRCRAFT - Stall, stall.

MCP – Not so tight, brother.

MSO - Bank. Watch your bank, watch your bank.

AIRCRAFT - Stall. Sink rate.

MSO - Quick, grab it.

AIRCRAFT - Sink rate, sink rate.

MSO - Max power.

MCP - Oh my God.

MSO - Max power.

MP- Oh [explicative].

[Double alarm.]

### Y1. INITIAL CONVENING ORDER, 4 AUG 2010

### DEPARTMENT OF THE AIR FORCE PACIFIC AIR FORCES

AUG 0 4 2010

### MEMORANDUM FOR BRIG GEN CARLTON D. EVERHART II

FROM: PACAF/CC

SUBJECT: SUBJECT: Convening of AFI 51-503 Accident Investigation Board (AIB); Class A Mishap, C-17A, T/N 00-00173, 28 Jul 10, 3 WG, Elmendorf, Alaska

- 1. An Aircraft Accident Investigation Board (AIB) is hereby convened under the provisions of AFI 51-503 to investigate the subject mishap. This appointment letter is your authority to interview witnesses, take sworn testimony, and review all documents, files, recordings, and wreckage relevant to the investigation. Upon receipt of Part 1 of the Safety Investigation Board (SIB) report, you shall be relieved of all other duties until the AIB investigation is complete; and AIB tasks shall remain your primary duty until the report is approved.
- The following personnel are detailed to serve on the AIB:

President: Brig Gen Carlton D. Everhart II 618 TACC/CV
Legal Advisor: AFLOA/JACC
Recorder: AFLOA/JACC

- 3. The investigation will be conducted IAW the provisions of AFI 51-503. Your legal advisor is required to be present during all witness interviews, and must also review all evidence, documents, transcripts and statements prior to inclusion in the AIB report. The AIB report must include an Executive Summary, Summary of Facts, and Statement of Opinion as required by AFI 51-503. All witnesses, documents, records, and other evidence within control of the Air Force will be made available to you, other than privileged safety information. All witnesses who testify must do so under oath or affirmation. The AIB report will be releasable to the public and may not contain any privileged safety or Privacy Act-protected information.
- 4. Board Administration: PACAF/JA is delegated authority to detail additional members or substitute members, if needed. The legal advisor and recorder must remain detailed to the board until final completion of the report. Other members may be released early, as the AIB President deems appropriate.
- 5. The AIB President's Statement of Opinion must be supported by clear and convincing evidence contained in the AIB report. The legal advisor will assist in evaluating evidence. Do not include recommendations for corrective or disciplinary action in the report. Board members are not authorized to disclose findings or opinions, except to members of my staff, prior to my approval of the AIB report.

- 6. Travel and Funding: Travel orders should be cut locally using "10 JA AIB" label in DTS. Additionally, variations in travel should be authorized. All travel costs for witness interviews outside the Elmendorf AFB area should be coordinated with PACAF/JA in advance.
- 7. Logistics and POCs: A host installation liaison will be appointed to assist with arranging billeting, vehicles, facilities, administrative support, reproduction services and access to witnesses. Make contact with the host installation liaison officer through the office of the Host Installation Commander.
- 8. Your investigation and AIB report should be completed within 30 days of receipt of the completed Part I SIB report. Submit any requests for extensions, additional advisors, or other matters to PACAF/JA. Submit your final report to PACAF/JA, and they will forward it to me for approval. Your PACAF/JA points of contact are Lt Col and TSgt

### **Y2.** AMENDMENT CONVENING ORDER, 12 AUG 2010

### DEPARTMENT OF THE AIR FORCE PACIFIC AIR FORCES

MEMORANDUM FOR

AUG 1.2 2010

FROM: HQ PACAF/JA

SUBJECT: Convening of AFI 51-503 Accident Investigation Board (AIB); Class A Mishap, C-17A, T/N 00-00173, 28 Jul 10, 3 WG, Elmendorf, Alaska

- I. An AIB is hereby convened under the provisions of AFI 51-503 to investigate the subject mishap. By this letter, you are hereby detailed as AIB members pursuant to authority delegated to me in AFI 51-503 and the PACAF Supplement. This appointment letter is your authority to assist the AIB President, Brig Gen Carlton D. Everhart II. The AIB will interview witnesses, take sworn testimony, and review all documents, files, recordings and wreckage relevant to the investigation. Upon receipt of this memo and direction from the AIB President to assemble, you are relieved of all other duties until the AIB is completed or you are relieved by the AIB President.
- 2. With your appointment to the board, the AIB now consists of the following personnel:

President: Brig Gen Carlton D. Everhart II 618 TACC/CV
Legal Advisor: AFLOA/JACC
Medical Advisor: 178 MDG/SGP
Pilot Advisor: 15 WG
Maintenance Advisor: 172 AW/MXG
Recorder: AFLOA/JACC

- 3. The investigation will be conducted IAW the provisions of AFI 51-503. Your legal advisor is required to be present during all witness interviews, and must also review all evidence, documents, transcripts and statements prior to inclusion in the AIB report. All witnesses who testify must do so under oath or affirmation. The AIB report will be releasable to the public and may not contain any privileged safety or Privacy Act-protected information.
- 4. Board Administration: PACAF/JA is delegated authority to detail additional members or substitute members, if needed. The legal advisor and recorder must remain detailed to the board until final completion of the report. Other members may be released early, as the AIB President deems appropriate.
- 5. The AIB President's Statement of Opinion must be supported by clear and convincing evidence contained in the AIB report. The legal advisor will assist in evaluating evidence. Do not include recommendations for corrective or disciplinary action in the report. Board members

are not authorized to disclose findings or opinions, except to members of my staff, prior to COMPACAF's approval of the AIB report.

- 6. Travel and Funding: Travel orders should be cut locally using "10 JA AIB" label in DTS. Additionally, variations in travel should be authorized. All travel costs for witness interviews outside the Elmendorf AFB area should be coordinated with PACAF/JA in advance.
- 7. Logistics and POCs: A host installation liaison will be appointed to assist with arranging billeting, vehicles, facilities, administrative support, reproduction services, and access to witnesses. Make contact with the host installation liaison officer through the office of the Host Installation Commander.
- 8. Your investigation should be completed within 30 days of the AIB President's receipt of the completed Part I, SIB report. Submit any requests for extensions, additional advisors, or other matters to PACAF/JA. Submit your final report through our office and we will forward it to COMPACAF for approval. Your PACAF/JA points of contact are Lt Col ).

Subject: Airshow Team Schedule

All,

This is the tentative schedule for your airshow upgrade program. Ground training starts on 29 Jun. Loadmasters will be released early, but please pay particular attention to the flying schedule. We need an instructor for the first flight and then we need to ensure LM coverage for the rest of the flights. Anyone not upgrading is not required to attend ground training, but it is encouraged as we could all use the refresher. Please make every effort to attend this training. If you have questions or concerns, please see me.

MP

## 3WG Aerial Demonstration Checklist (1c-17a-1cl-1-1 REV 34)

Aerial demonstration profiles are inherently technique-oriented. This checklist is an aid to the profile and may be modified to suit the situation and the desires of the aircraft commander. It is intended to minimize CAWS alerts and extraneous switchology while airborne.

4. Radar — "AS REQUIRED" (PM)
5. Defensive System — As Required (PM)
6. SKE FCl's — "AS REQUIRED" (PM) Spoilers Switch — "ARM" (PM) Flight Instruments — "CHECKED" (PM, PF) Brakes, Steering — "CHECKED" (PM, PF)

| 16. GO/NO-GO VERIFICATION:  I certify go/no-go checks were accomplished for aircrew members listed below. As a minimum, flight physical, physical availability, physiological training, emergency egress, local area survival, current ASC, (AO effective date/term date), ACFT AOs, FCIF card, and any other grounding events were checked. Individuals non-current for aircrew training or aircrew qualification have appropriate remarks codes assigned and an instructor is on-board for their specialty. Reserve personnel not on extended duty are subject to the provisions of the uniform code of military justice, while performing this duty.  1COX2 Initials:  Aircraft Commander Review:  IF CHANGES TO ORIGINAL CREW MEMBERS: I certify the above go/no-go checks were performed for aircrew member (s) added: |                       |                      |                        |                   |         |             |                            |                    |                 |                                         |  |

#### **BB1. C-17 RELEASABLE TECHNICAL DATA**

#### C-17 Technical Data Authorized for Public Release (Reviewed and Approved by ASC/WLME)

- 1. The C-17A includes a Stall Warning System which provides stick shaker and aural "STALL" alerts to the pilots. This system is continuously active and provides stall warning to the pilot when flight conditions approach a predetermined speed range, which is a function of a combination of flight conditions and aircraft configuration. In the event of invalid aircraft angle of attack (AOA) and/or aircraft configuration signals, a warning message will be displayed in the cockpit when stall warning is not fully functional. Reference: TO 1C-17A-1, Paragraph 1-1128.
- 2. The aircraft also has a deep stall protection system called the Angle of Attack Limiter System (ALS). The purpose of the ALS is to preclude the aircraft from attaining AOA attitudes that could result in a deep stall from which the aircraft is not recoverable. AOA limiting is available throughout the flight envelope. The ALS is active when the electronic flight control system is operational. ALS operates by limiting commanded nose up elevator position. A warning message will be displayed in the cockpit when the ALS is not fully functional. Reference: T.O. 1C-17A-1, Paragraph 1-1130.
- 3. Minimum climb-out speed is the minimum speed recommended for three-engine obstacle clearance. Reference: TO 1C-17A-1-1, Paragraph 3-32.
- 4. The C-17 flight manual limits bank angle to 60 degrees in level flight during an abrupt maneuver. Reference: TO 1C-17A-1, Paragraph 5-59.

# BB2. AIR FORCE INSTRUCTION 11-246, VOLUME 6, 20 APRIL 2004 (STANDARD PROFILES)

Distribution: F

This instruction implements guidance in AFPD 11-2, Flight Rules And Procedures, and AFI 11-209, Air Force Aerial Events. It provides guidance and procedures in performing specified aircraft capabilities demonstrations using specific Air Force model, design, series (MDS) aircraft. It designates Air Mobility Command as lead command for aircraft capabilities demonstrations applicable to C-5, C-9, C-12, C-17, C-20, C-21, C-22, C-32, C-37, C-38, C-130, C-141, E-4, KC-10, KC-135, C-135, NKC-135, UH-1N, and VC-25 aircraft. For the purpose of this instruction, the Air National Guard is functionally considered to be a major command (MAJCOM). MAJCOMs, field operating agencies (FOA) and direct reporting units (DRU) may supplement this instruction. Forward one copy to HQ AMC/A33 and HQ USAF/XOOO after publication. See Attachment 1 for a glossary of references and supporting information. Ensure all records created by this AFI are maintained and disposed of IAW AFMAN 37-139, "Records Disposition Schedule."

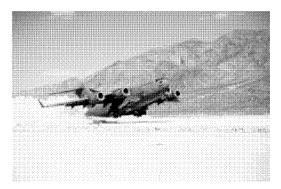

#### SUMMARY OF REVISIONS

IC 2004-1 accomplishes the following: 1) Corrects the AMC web site address; 2) Clarifies Flyover and Aerial Review concepts; 3) Expands the definition of Aircraft Capabilities Demonstration; 4) Explains the process for changing or creating new Standard Profiles; 4) Modifies the Standard Profiles for the C-17 and C-130, adding formation airdrops; 5) Modifies the UH-1N Standard profiles, adding formation and AIE procedures (authorizes insertion/extraction of personnel); 6) Expands options for "Critique and Review Process;" 7) Adds Table A-1 to the Terms section of Attachment 1; 8) Adds selected Terms to Attachment 1; and, 9) Updates the Standard Profiles on the AMC web site to reflect these changes. See the last attachment of the publication, IC 04-1, for the complete IC. NOTE: A VERTICAL BAR IN THE LEFT MARGIN IDENTIFIES TEXT CHANGED BY IC 2004-1.

#### Chapter 3

#### STANDARD PROFILES

- 3.1. The Standard Profiles for the C/KC/NKC-135, C-141, C-130, C-17 and UH-1N aircraft are at the AMC web site (A330 home page). Click on the desired MDS aircraft to view a specific standard profile. The profiles are based on the aircraft capabilities demonstrations listed in paragraph 1.4., having been compiled from basic flying maneuvers common to the MDS selected. The profiles by MDS are summarized here.
- **3.2.** KC-135 Stratotanker (Includes C-135 and NKC-135). Profile 1 is an aircraft capabilities demonstration of approximately seven minutes duration. It begins with a take off to a VFR closed pattern followed by high-speed and low-speed passes and ends with a full stop at the same airfield.
- **3.3.** <u>C-141 Starlifter.</u> Profile 1 is an aircraft capabilities demonstration that starts with the C-141 already airborne. The aircraft capabilities demonstrated follow in this sequence: personnel airdrop; airdrop escape; VFR overhead pattern; and, finally a full stop landing. Profile 2 is an aircraft capabilities demonstration that begins with a C-141 on the airfield. The aircraft capabilities demonstrated follow in this sequence: take off; spiral-up tactical departure; overhead VFR pattern; and, full stop recovery at the same airfield.
- 3.4. C-130 Hercules. Profile 1 is an aircraft capabilities demonstration (airdrop) flown by a single-ship C-130 or a C-130 formation. A C-130 formation may contain multiple elements involving a number of aircraft up to the limits authorized by DoD, USAF and AMC guidance. Mission planners may use any combination of C-130 single-ships and formations to airdrop heavy equipment (HE), Container Delivery System (CDS) supply containers and personnel—all as part of the same capabilities demonstration—to present the full range of C-130 delivery capabilities. The aircraft capabilities demonstrated include: Personnel airdrop (HALO / Static Line); Equipment airdrop (heavy equipment / CDS); Random steep or shallow approach; Assault landing; Backing demonstration (optional ERO or upload); and, Assault takeoff (maximum effort takeoff). Profile 2 is an aircraft capabilities demonstration that starts with an assault takeoff (maximum effort takeoff) and includes the following: Random shallow or steep approach; Assault landing; Backing demonstration (optional ERO or upload); and, Optional assault takeoff (maximum effort takeoff). Profile 3 is an aircraft capabilities demonstration starting with a C-130 already airborne and includes the following: Random shallow or steep approach; Assault landing; Backing demonstration (optional ERO or upload); and, Optional assault takeoff (maximum effort takeoff).
- 3.5. C-17 Globemaster. Profiles 1, 2, and 3 are aircraft capabilities demonstrations involving the performance maneuvering of the aircraft in a runway environment, each with a different duration: 6, 10, and, 12 minutes, respectively. Profile 4 depicts three separate aircraft capabilities demonstrations—basic airdrop, overhead pattern to a simulated short-field landing (optional backing demonstration and ERO/upload), and, an assault takeoff (maximum effort takeoff). The airdrop demonstration is flown by a single-ship C-17 or a C-17 formation. A C-17 formation may contain multiple elements involving a number of aircraft up to the limits authorized by DoD, USAF and AMC guidance. Mission planners may use any combination of C-17 single-ships and formations to airdrop heavy equipment (HE), Container Delivery System (CDS) supply containers and personnel—all as part of the same capabilities demonstration—to present the full range of C-17 delivery capabilities.

# C-17 Standard Profiles 1 Thru 4

**General Instructions:** Aircrews from all MAJCOMs will adhere to the flying procedures in Profiles 1 through 4. Profiles 1, 2 and 3 are demonstrations of Aircraft High Performance Maneuvering.

<u>Profile 3 Synopsis</u>: This 12-minute profile is an aircraft capabilities demonstration consisting of a takeoff followed by a maximum performance climb (max performance climb angle) to 1,500° AGL. The C-17 then executes a 45° bank angle 80°/260° reversal turn descending to 500° AGL, aligning with the runway to perform a high-speed pass. Once past show center, the C-17 executes a 50° teardrop turn and reversal while climbing to 1,000° AGL. The aircraft is configured for landing with slats/full flaps and gear. The C-17 descends to 500° AGL for a slow-speed pass. At show center, the aircrew advances

the power setting to MAX and reconfigures the aircraft (gear/slats/half flaps). The aircraft performs a 50° teardrop turn while climbing to 1,000' AGL and then descends to 500' AGL for the third pass, once again aligned with the runway. At show center, the aircraft demonstrates a low-speed 360° turn. At the end of the turn, the aircraft continues down the runway and uses a 45° teardrop reversal climb to 1,000' AGL, setting up for a full-stop assault landing. The aircraft stops at show center and demonstrates a backing maneuver but does not do any turning while backing. After backing up an adequate distance (no turns), the aircraft executes a forward turn toward the crowd. This is followed by a turn to exit the runway. Approximate duration: 12 minutes.

The third demonstration depicted is the Assault Takeoff (Maximum Effort Takeoff). In this illustration, the assault takeoff follows the backing demonstration. The C-17 climbs with  $\frac{1}{2}$  flaps at maximum power, holding airspeed at or above Vmco to 5,000' AGL.

The procedures in these profiles are general guidelines. Mission planners may adjust them, for cause, to accommodate the requirements of the jump team or paratroopers (static line, HALO, etc.), the requirements of the equipment (material) to be airdropped (HE or CDS), the physical requirements of the drop zone or the unique requirements of the event, itself. Aircrews will not deviate from the mission plan except for safety considerations. Planning and mission execution must comply with AFI 11-2C-17, Vol 3, and other relevant DoD, USAF and FAA guidance.

**Narration for the C-17 Standard Profile 3 (12-Minute Demonstration):** The following narrative is illustrative only—the narrator should edit it as needed to suit the venue for the event, the supporting C-17 unit, the mission plan for C-17 participation (scenario), and the audience.

Introduction – 45 Seconds Prior To Engine Run-Up For Takeoff: Good (morning / afternoon) ladies and gentlemen. I'm (Rank/Name) from the Air Force's (Wing) at (Base) Air Force Base, (State). It's my pleasure this afternoon to describe for you today's flight demonstration by America's newest airlifter, the Boeing C-17 Globemaster III – the aircraft that ensures rapid global mobility for America.

The aircraft will takeoff performing a maximum angle climb, demonstrating its impressive power and the ability to depart an airport where enemy resistance is suspected. With a departure climb angle just over 25° nose up, the aircraft will reach over 1,500 feet before crossing the departure end of the runway.

**After Takeoff:** The pilots for today's demonstration are (Rank/Name) and (Rank/Name). The loadmaster is (Rank/Name). This crew has a combined total of over (XX) thousand flying hours in various aircraft including (i.e., the C-5 Galaxy, C-141 Starlifter, C-130 Hercules, KC-10 Extender, KC-135 Stratotanker, B-52 Stratofortress, T-1 Jayhawk, T-38 Talon and T-37 Tweet).

**As Jet Begins 80°/260° Maneuver:** The C-17's first pass today will be a high-speed pass. After completing a teardrop maneuver to align with the runway, the crew will accelerate to 250 / 300 Knots [460 / 550 kilometers per hour] demonstrating the rapid strategic capability of the airplane.

The C-17 design includes 1) a modern computerized glass cockpit, 2) heads-up displays at both pilot stations, and 3) advanced cargo handling system – allowing it to operate with a crew half the size of current aircraft. Only three crewmembers are required to fly the C-17. The aircraft's advanced design allows it to accomplish its entire mission with this minimum crew.

**As Aircraft Approaches Show Center:** Notice how quiet the C-17 is while passing show center. This gives the Globemaster a tactical advantage while flying low over hostile territory and is also environmentally friendly.

**As Aircraft Begins 50° Teardrop:** The C-17 provides a direct delivery capability that combines the intercontinental cargo carrying capabilities of large aircraft, such as the C-5 Galaxy and C-141 Starlifter, with the short runway capability of the much smaller C-130 Hercules. It can routinely land on runways only 3,000 feet [1,000 meters] long.

Four Pratt and Whitney F-117 engines power the C-17. These are the same engines used on the Boeing 757. Each engine delivers over 40,000 pounds of thrust. This amount of thrust allows the Globemaster III to carry over 170,000 pounds [75,000 kilograms] of cargo. The Range of the C-17 with this amount of cargo is 2,400 nautical miles [4,000 kilometers]. However, the C-17 can reach anywhere in the world, nonstop, using its air refueling capability.

**Wings Level Inbound:** As the aircraft passes, please notice the wing leading edge slats and large, powered-lift wing flaps. These devices change the shape of the C-17 wing, and are the key to its low final approach speed enabling this aircraft to land and stop in short distances.

**On Go Around:** The aircraft is now performing a go around maneuver using maximum power to demonstrate its ability to depart an airport where enemy resistance is suspected.

**As Aircraft Begins 50° Teardrop Maneuver:** The C-17 will now maneuver to show its ability to fly at slow speeds and demonstrate its advanced aerodynamics in action. The aircraft is performing a series of steep bank turns to maneuver for a low-speed pass and circle over the airfield.

**Wings Level Inbound:** And in case you're wondering how big it is, the wingspan (tip to tip) is about half the length of a football [soccer] field, the tail is over 5 stories tall. Empty the C-17 weighs almost 280 thousand pounds [127 thousand kilograms]. But with maximum cargo and fuel loaded, that gross weight rises to over a half a million pounds [266 thousand kilograms]. Notice the up-turned wing tips or winglets – these decrease aerodynamic drag and increase fuel economy. To give you a better idea of the aircraft's overall size, those winglets are over 9 feet [3 meters] tall!

After Jet Completes First 90° Of The 360° Turn: The aircraft is extremely agile at both high and low speeds making it easy to operate in any tactical situation including the combat delivery capability of paratrooper or heavy equipment airdrop.

8

**During The Last 90° of 360° Turn:** The C-17 uses a quadruple redundant fly-by-wire system to run its flight controls. The fly-by-wire system means the aircraft's flight controls are electronically operated by inputs from the control sticks. There are four separate fight control computers, each of which can manage the entire system by itself. The computers continuously monitor the flight controls and each other. If there are any problems they automatically work around the disabled system. In addition to these features, the C-17 still has a mechanical back up.

As Aircraft Begins 45° Teardrop: The aircraft is maneuvering to demonstrate a full flap approach to a simulated short field runway. This short field capability allows the C-17 Globemaster III to land at over 6,000 more airfields worldwide than currently available to the C-141 Starlifter, C-5 Galaxy, and commercial wide-body aircraft. In fact, during the NATO peacekeeping mission to Bosnia, C-17 crews airlifted nearly one-half of the total cargo in only one-fourth of the missions while boasting and impressive 96% reliability rate.

The C-17 you see today weighs almost 400 thousand pounds [200 thousand kilograms]. On final, its speed is approximately 120 miles [200 kilometers] per hour.

**As Aircraft Turns Final:** Approaching the end of the runway, the crew is simulating arrival to an airfield with hostile forces nearby. This approach tactic can also be used from very high altitude to avoid enemy fire.

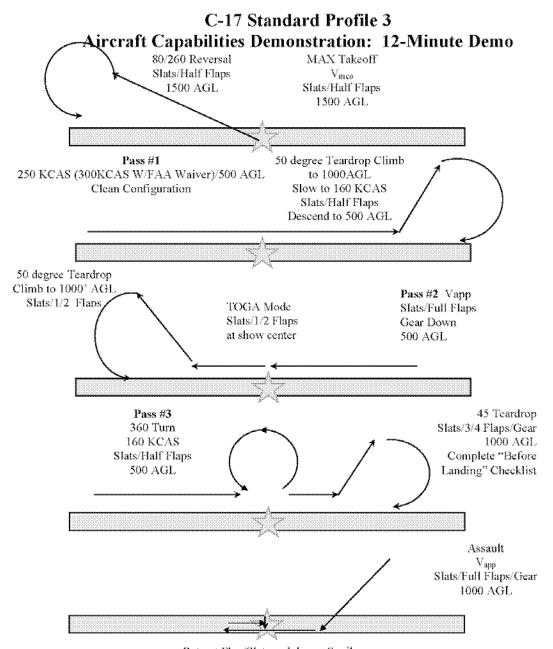

The C-17 made its inaugural flight in September 1991. Since then the C-17 set over 20 world records—including payload-to-altitude and time-to-climb records. McDonnell Douglas (now, Boeing) delivered the first operational C-17 to Charleston Air Force base in June of 1993.

When Touchdown Is Assured (Otherwise Go To Go-Around Filler Material): Now the crew will demonstrate the very short landing distance of the C-17.

While Backing, But Out Of MAX Reverse: The aircraft is demonstrating a capability limited to a very few aircraft – the ability to routinely back under its own power. Ground maneuverability is extremely important when space is limited for off-load operations on a day-to-day basis.

**As Aircraft Taxis Clear:** All the maneuvers you have seen here today are representative of those flown by our operational aircrews everyday, as they provide the highly responsive and flexible airlift capability for America...

Ladies and Gentlemen, this concludes today's demonstration of the C-17 Globemaster III and just some of its unique capabilities. On behalf of the men and women of the United States Air Force, (insert appropriate MAJCOM), and XX AFB, we thank you for being with us today. We hope you enjoyed this brief look at the C-17 Globemaster III, the United States Air Force's core airlifter and work horse, providing rapid global mobility for America – today, tomorrow, and throughout the  $21^{\rm st}$  Century.

Retract Flap/Slats and dearm Spoilers
Straight Backing ONLY, then forward turn to face the crowd. Then turn to exit runway.

# BB3. HQ AMC/A3V INTERPRETATION OF AFI 11-246, VOL , C-17 STANDARD PROFILES PG 3, PARA 1

# DEPARTMENT OF THE AIR FORCE HEADQUARTERS AIR MOBILITY COMMAND

22 Sep 2010

MEMORANDUM FOR C-17A, T/N 00-0173, 28 JUL ACCIDENT INVESTIGATION BOARD

FROM: HQ AMC/A3V 402 Scott Drive Unit 3A1 Scott AFB, IL 62225

SUBJECT: Interpretation of AFI 11-246, Vol. 6, C-17 Standard Profiles Pg. 3, para 1.

- 1. This letter establishes HQ AMC/A3V interpretation of AFI 11-246, Vol. 6, C-17 Standard Profiles Pg. 3, para 1. Brig Gen Everhart, the board president for the 28 July C-17 mishap at Joint Base Elmendorf-Richardson, Alaska, requested AMC/A3V interpretation to support the investigation.
- 2. The paragraph in question states the following:

"The procedures in these profiles are general guidelines. Mission planners may adjust them, for cause, to accommodate the requirements of the jump team or paratroopers (static line, HALO, etc.), the requirements of the equipment (material) to be airdropped (HE or CDS), the physical requirements of the drop zone or the unique requirements of the event, itself. Aircrews will not deviate from the mission plan except for safety considerations. Planning and mission execution must comply with AFI 11-2C-17, Vol 3, and other relevant DoD, USAF and FAA guidance."

3. The guidance in this paragraph is poorly written and in future revisions should be clarified to state that its provisions apply to all four profiles and not only to Profile Four. The second sentence of the paragraph begins with examples which apply only to profile four, leading the reader to conclude the "general guidelines" statemement in the first sentence may only apply to profile four. However, the first sentence states "these profiles", and the second sentence concludes with "or the unique requirements of the event". Using the plural form of profile(s) and a broad example ("event") leads to the conclusion that the paragraph applies to all the profiles, not just the airdrop profile. Regardless, it is clear that crews flying demonstration profiles are to follow the mission plan as described, deviating only for safety considerations. Additionally, as stated in AFI 11-246, Vol. 6, C-17 Standard Profiles page 1, para.1, profiles 1-4 should be regarded as procedure, and should be planned in accordance with each profile's textual and graphical depiction.

UNRIVALED GLOBAL REACH FOR AMERICA... ALWAYS!

#### **BB4. DOD HFACS GUIDE**

#### DoD HFACS

# Department of Defense Human Factors Analysis and Classification System A mishap investigation and data analysis tool

#### **Executive Summary**

This Department of Defense Human Factors (DoD HF) Guide explains procedures for investigating and reporting all DoD mishaps. It supports DoDI 6055.7, Accident Investigation, Reporting, and Record Keeping. The DODI directs DOD components to "Establish procedures to provide for the cross-feed of human error data using a common human error categorization system that involves human factors taxonomy accepted among the DoD Components and U.S. Coast Guard." It is intended for use by all persons who investigate, report and analyze DoD mishaps, and is particularly tailored to the needs of persons assigned to Interim Safety Boards and formal Safety Investigation Boards following all Classes of mishaps. There are myriad potential human factors, all of which need to be assessed for relevancy during a mishap investigation. No investigator, flight surgeon, physiologist, human factors consultant or aviation psychologist can be expected to be fully familiar with all potential human factors

When using this human factors model, the investigator should consider applying the model to three distinct areas of consideration: environmental, individual and the event or mishap. The mishap crew, operator, or team reacts to the environment to which they are exposed. The environmental factors cover not only the physical environment to which the individual members are exposed, but also the organizational and supervisory environments and specific physical and technological preconditions. The individual factors cover acts, precondition and supervision factors. The mishap factors can cross all four tiers of the model. The investigator can apply this model by entering at any tier that is specifically related to environmental, individual or mishap factors discovered during the analysis. This model can be used as either a primary or secondary tool to investigate both active and latent failures. Our model is designed to present a systematic, multidimensional approach to error analysis. This human factors model covers human error from three perspectives:

- Cognitive Viewpoint and Human System Interaction and Integration
- Human-to-Human Interaction
- Sociocultural and Organization

When using our DoD HF Taxonomy for either primary investigation or secondary analysis, we must assume error can mean several things:

- Error as the failure itself. For example: The operator's decision was an error (decision, perceptual, or skill-based errors).
- Error as the cause of failure. For example: This event was due to human error (failure to provide guidance).
- Error as a process or, more specifically, as a departure from some kind of standard (exceptional, routine, intentional or unintentional).

A reasonable synthesis of these assumptions, as suggested by Senders and Moray (1991), is the following: Human error occurs when human action is performed that was either (1) not intended by the actor, (2) not desired according to some specified set of rules or by some external observer, or (3) contributed to the task or system "going outside its acceptable limits."

This DoD Guide starts with a brief history of the development of the DoD HFACS, followed by an introduction and description of the human factor and human performance application of this model. The Guide concludes with a high-level structural overview of the taxonomy and definitions.

#### History

The Secretary of Defense published a memorandum 19 May 2003 stating, "World-class organizations do not tolerate preventable accidents. Our accident rates have increased recently, and we need to turn this situation around. I

challenge all of you to reduce the number of mishaps and accident rates by at least 50% in the next two years." These goals are achievable, and will directly increase our operational readiness. We owe no less to the men and women who defend our Nation." This memorandum resulted in the creation of the DOD Safety Oversight Committee to provide guidance to the DOD and individual services on best practices and methods to accomplish this mandate. The Secretary of Defense established the Defense Safety Oversight Council to:

- > Review accident and incident trends, ongoing safety initiatives, private sector and other governmental agency best practices, and to make recommendations to the Secretary of Defense for safety improvement policies, programs, and investments.
- Assess, review and advise on improving all aspects of the coordination, relevance, efficiency, efficacy, timeliness and viability of existing DoD-wide safety and injury prevention information management systems.
- Promote the development and implementation of safety initiatives, including Systems Safety for Acquisitions and operations, to improve mission success as well as preserve human and physical resources throughout DoD.
- Coordinate with other federal agencies and industry leaders, to facilitate communication, coordination, and integration of best practices into DoD planning, development and implementation of initiatives and programs that support research to improve human performance, safety education standards/procedures, and equipment.

The Aviation Safety Improvement Task Force (ASI-TF) was established to meet these DOD requirements. The ASI-TF subsequently established the Human Factors Working Group with a charter to identify data-driven, benefit-focused, human-factor and human-performance safety strategies designed to identify hazards, mitigate risk and reduce aviation mishaps inherent in aircraft operations throughout DoD. The ASI-TF chair directed the HFWG to accomplish the following tasks:

- Promote common Human Factors Analysis and Classification System for DoD-wide implementation
- Recommend standardization of human factor and human performance terminology
- Provide human factors subject matter experts to all ASI-TF working groups, and hazard identification and intervention analysis teams
- ▶ Identify and analyze top human factor and human performance mishap focus areas
- > Identify, catalog and recommend approaches to improve organizational/cultural assessments

This guide is produced to meet the first two tasks of the Human Factors Working Group. The guide was initially developed to investigate aviation mishaps, and therefore uses an aviation-centric language. During production the authors have attempted to modify definitions to ensure the tool can be used in the investigation of multiple types of events. This guide was developed based on the evolution of the works produced by Jens Rasmussen, James Reason as well as Douglas Wiegmann and Scott Shappell. As this dynamic document evolves, we plan to ensure that it can be seamlessly applied across all services, and will be used to investigate aviation, ground, weapons, afloat, space and off-duty mishaps and events.

#### Introduction

Mishap or event investigation can be extremely difficult, time-consuming and stressful, but it can also be rewarding when we recognize that the contributions we make will improve safety. A thorough mishap investigation is absolutely necessary to determine the cascading events causal to a mishap, and to recommend corrective actions to prevent recurrence. This guide provides the accident investigator with a proven template that aids in organizing the investigation while providing a detailed analysis of human error for on-scene investigation and post-hoc mishap data analysis, revealing previously unidentified human-error trends and hazards.

Human error continues to plague both military and civilian mishaps. Analysis indicates that human error is identified as a causal factor in 80 to 90 percent of mishaps, and is present but not causal in another 50 to 60 percent of all mishaps, and is therefore the single greatest mishap hazard. Yet, simply writing off mishaps to "operator error" is a simplistic, if not naïve, approach to mishap causation and hazard identification. Further, it is well established that mishaps are rarely attributed to a single cause, or in most instances, even a single individual. Rather, mishaps are the end result of myriad latent failures or conditions that precede active failures (Shappell in "The Naval Flight Surgeon's Pocket Reference to Aircraft Mishap Investigation"). The goal of a mishap or event

investigation is to identify these failures and conditions in order to understand why the mishap occurred and how it might be prevented from happening again.

This reference is an adjunct to formal instructions that govern mishap investigation and is not meant to supplant the other references that address service-specific guidance for mishap investigation. Use this guide as a ready reference in the field to ensure that your data retrieval is complete and that you preserve perishable evidence. This guide is also designed to ensure uniformity of inter-service human factors definitions and data driven analysis.

#### Description

This guide is designed for use as a comprehensive event/mishap, human error investigation, data identification, analysis and classification tool. It is designed for use by all members of an investigation board in order to accurately capture and recreate the complex layers of human error in context with the individual, environment, team and mishap or event.

In the past, investigators have thrown human factors analysis to the medical investigator and have asked him or her to do this work on their own. This practice has sometimes produced human error analyses that differed considerably from the boards' investigation and findings of fact. Integrating human factors analysis into all aspects of the investigation will result in a much more coherent final product.

As described by Reason (1990), active failures are the actions or inactions of operators that are believed to cause the mishap. Traditionally referred to as "error", they are the last "acts" committed by individuals, often with immediate and tragic consequences. For example, an aviator forgetting to lower the landing gear before touch down or showing off through a box canyon will yield relatively immediate, and potentially grave, consequences. In contrast, latent failures or conditions are errors that exist within the organization or elsewhere in the supervisory chain of command that effect the tragic sequence of events characteristic of a mishap. For example, it is not difficult to understand how tasking crews or teams at the expense of quality crew rest can lead to fatigue and ultimately errors (active failures) in the cockpit. Viewed from this perspective then, the actions of individuals are the end result of a chain of factors originating in other parts (often the upper echelons) of the organization. The problem is that these latent failures or conditions may lie dormant or undetected for some period of time prior to their manifestation as a mishap.

The question for mishap investigators and analysts alike is how to identify and mitigate these active and latent failures or conditions. One approach is the "Domino Theory" which promotes the idea that, like dominoes stacked in sequence, mishaps are the end result of a series of errors made throughout the chain of command.

A "modernized" version of the domino theory is Reason's "Swiss Cheese" model that describes the levels at which active failures and latent failures/conditions may occur within complex operations (see Figure 1). Working backward from the mishap, the first level of Reason's model depicts those *Unsafe Acts of Operators* (operator, maintainers, facility personnel, etc.) that lead to a mishap. Traditionally, this is where most mishap investigations have focused their examination of human error, and consequently where most causal factors are uncovered. After all, it is typically the actions or inactions of individuals that can be directly linked to the mishap. Still, to stop the investigation here only uncovers part of the story.

What makes Reason's model particularly useful in mishap investigation is that it forces investigators to address latent failures and conditions within the causal sequence of events. For instance, latent failures or conditions such as fatigue, complacency, illness, and the physical/technological environment all affect performance but can be overlooked by investigators with even the best of intentions. These particular latent failures and conditions are described within the context of Reason's model as *Preconditions for Unsafe Acts*. Likewise, *Supervision* can promote unsafe conditions of operators and ultimately unsafe acts will occur. For example, if an Operations Officer were to pair a below average team leader with a very junior/inexperienced crew, the result is increased risk of mission failure. Regardless, whenever a mishap does occur, the crew naturally bears a part of the responsibility and accountability. However, latent failures or conditions at the supervisory level are often equally responsible for poor hazard analysis and subsequent increased mission risk, and may ultimately cause the mishap. In this particular example, the crew was set up for the opportunity for failure.

3 of 12

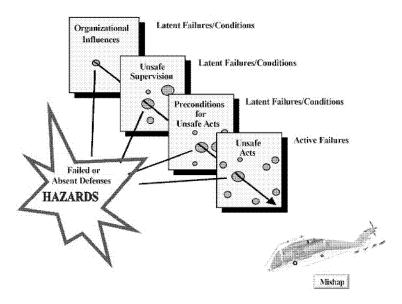

Figure 1. The "Swiss Cheese" Model (adapted from Reason, 1990)

Reason's model does not stop at supervision; it also considers *Organizational Influences* that can impact performance at all levels. For instance, in times of fiscal constraints, funding may be short and may lead to limited training opportunities. Supervisors are sometimes pressed to task "non-proficient" crews with complex missions. Not surprisingly, unintended and unrecognized errors may appear, and mission performance will consequently suffer. As such, hazards and risks at all levels must be addressed if any mishap investigation process is going to be effective.

The investigation process then endeavors to detect and identify the "holes (hazards) in the cheese" (see Figure 1). So how do we identify these hazards? Aren't they really too numerous to define? After all, every mishap is unique, so the hazards will always be different for each mishap ... right? Well, it turns out that each mishap is not unique from its predecessors. In fact, most mishaps have very similar causes. They are due to the same holes in the cheese, so to speak. The hazards identified in each new mishap are not unique to that mishap. Therefore, if you know what these system failures/hazards or "holes" are, you can better identify their roles in mishaps -- or better yet, detect their presence and develop a risk mitigation strategy correcting them before a mishap occurs.

#### Department of Defense (DoD) Human Factors Analysis and Classification System

Drawing upon Reason's (1990) and Wiegmann and Shappell's (2003) concept of active failures and latent failures/conditions, a new DoD taxonomy was developed to identify hazards and risks called the DoD Human Factors Analysis and Classification System. DOD-HFACS describes four main tiers of failures/conditions: 1) Acts, 2) Preconditions, 3) Supervision, and 4) Organizational Influences (Figure 2). A brief description of the major tiers with associated categories and sub-categories follows, beginning with the tier most closely tied to the mishap.

Attachment 1 is the in-depth reference document, and contains all the currently accepted definitions for the subcodes that fall within the 4 major tiers of human error. This document is subject to review and update every 6 months by the Human Factors Working Group of the Joint Services Safety Chiefs. For comments please contact the Command Flight Surgeon of the Naval Safety Center.

4 of 12

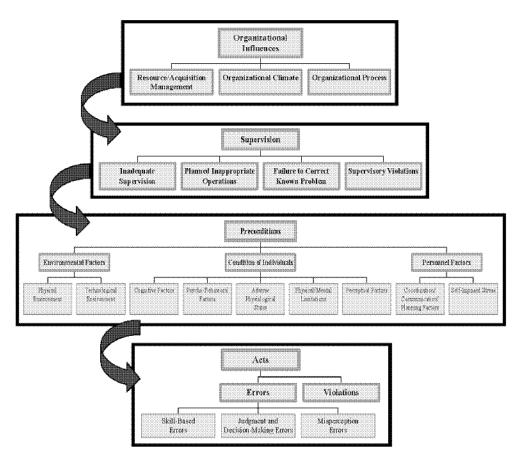

Figure 2. DOD HFACS Model

Note In the electronic version of this document each of the HFACS Model
boxes are hyper-linked to more in-depth descriptions

#### 1. Acts

Acts are those factors that are most closely tied to the mishap, and can be described as active failures or actions committed by the operator that result in human error or unsafe situation. We have identified these active failures or actions as *Errors and Violations* (see Figure 3).

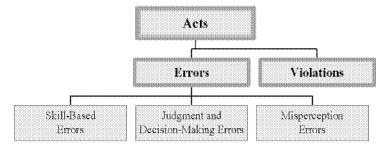

Figure 3. Categories of Acts of Operators

Errors: Errors are factors in a mishap when mental or physical activities of the operator fail to achieve their intended outcome as a result of skill-based, perceptual, or judgment and decision making errors, leading to an unsafe situation. Errors are unintended. We classified Errors into three types: Skill-Based, Judgment and Decision Making, and Misperception Errors. Using this error analysis process, the investigator must first determine if an individual or team committed an active failure. If so, the investigator must then decide if an error or violation occurred. Once this is done, the investigator can further define the error.

**Skill-based Errors**: Skill based errors are factors in a mishap when errors occur in the operator's execution of a routine, highly practiced task relating to procedure, training or proficiency and result in an unsafe a situation. Skill-based Errors are unintended behaviors. (Table 1)

**Judgment and Decision Making Errors**: Judgment and Decision making errors are factors in a mishap when behavior or actions of the individual proceed as intended yet the chosen plan proves inadequate to achieve the desired end-state and results in an unsafe situation (Table 1).

Misperception Errors: Misperception errors are factors in a mishap when misperception of an object, threat or situation (such as visual, auditory, proprioceptive, or vestibular illusions, cognitive or attention failures) results in human error (Table 1).

Violations: Violations are factors in a mishap when the actions of the operator represent willful disregard for rules and instructions and lead to an unsafe situation. Unlike errors, violations are deliberate. (Table 1)

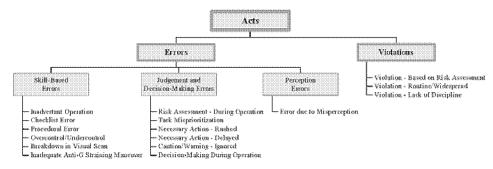

Table 1 Acts

#### 2. Preconditions

Preconditions are factors in a mishap if active and/or latent preconditions such as conditions of the operators, environmental or personnel factors affect practices, conditions or actions of individuals and result in human error or an unsafe situation (Figure 4). In this error analysis model preconditions include Environmental Factors, Condition of the Individuals and Personnel Factors.

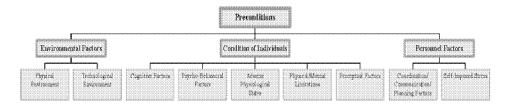

Figure 4. Categories of Preconditions for Unsafe Acts

**Environmental Factors**: Environmental factors are factors in a mishap if *physical* or *technological* factors affect practices, conditions and actions of individual and result in human error or an unsafe situation. Environmental factors include:

**Physical Environment**: Physical environment are factors in a mishap if environmental phenomena such as weather, climate, white-out or dust-out conditions affect the actions of individuals and result in human error or an unsafe situation. (Table 2)

**Technological Environment**: Technological environment are factors in a mishap when cockpit/vehicle/workspace design factors or automation affect the actions of individuals and result in human error or an unsafe situation. (Table 2)

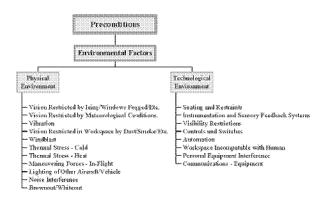

Table 2. Environmental Factors

Condition of the Individual: Condition of the individual are factors in a mishap if cognitive, psycho-behavioral, adverse physical state, or physical/mental limitations affect practices, conditions or actions of individuals and result in human error or an unsafe situation. Condition of the Individuals include:

Cognitive Factors: Cognitive factors are factors in a mishap if cognitive or attention management conditions affect the perception or performance of individuals and result in human error or an unsafe situation. (Table 3)

Psycho-Behavioral Factors: Psycho-Behavioral factors are factors when an individual's personality traits, psychosocial problems, psychological disorders or inappropriate motivation creates an unsafe situation. (Table 3)

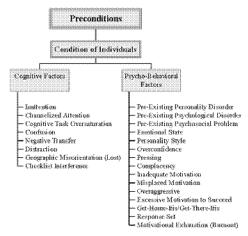

Table 3. Conditions of the individual (part 1)

Adverse Physiological States: Adverse physiological states are factors when an individual experiences a physiologic event that compromises human performance and this decreases performance resulting in an unsafe situation. (Table 4)

Physical/Mental Limitations: Physical/mental limitations are factors in a mishap when an individual lacks the physical or mental capabilities to cope with a situation, and this insufficiency causes an unsafe situation. This often, but not always, indicates an individual who does not possess the physical or mental capabilities expected in order to perform the required duties safely. (Table 4)

Perceptual Factors: Perceptual factors are factors in a mishap when misperception of an object, threat or situation (visual, auditory, proprioceptive, or vestibular conditions) creates an unsafe situation. If investigators identify spatial disorientation (SD) in a mishap the preceding causal illusion should also be identified. Vice versa, if an illusion is identified as a factor in a mishap then the investigator should identify the resultant type of SD. (Table 4)

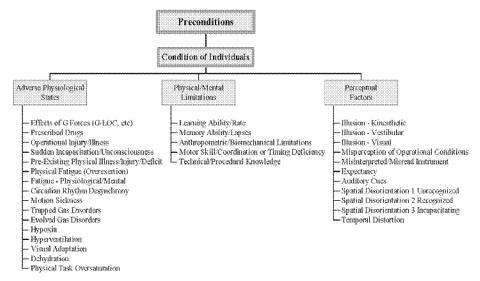

Table 4. Conditions of the individual (part 2)

**Personnel Factors:** Personnel factors are factors in a mishap if self-imposed stressors or crew resource management affects practices, conditions or actions of individuals, and result in human error or an unsafe situation. Personnel factors include:

Coordination / Communication / Planning: Coordination / communication / planning are factors in a mishap where interactions among individuals, crews, and teams involved with the preparation and execution of a mission that resulted in human error or an unsafe situation

Self-Imposed Stress: Self-imposed stress are factors in a mishap if the operator demonstrates disregard for rules and instructions that govern the individuals readiness to perform, or exhibits poor judgment when it comes to readiness and results in human error or an unsafe situation. These are often violations of established rules that are in place to protect people from themselves and a subsequent unsafe condition. One example of self-imposed stress is drinking alcohol prior to operating a motor vehicle.

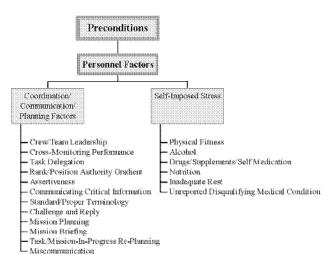

Table 5. Personnel Factors

#### 3. Supervision

The Human Factors Working Group has determined that a mishap event can often be traced back to the supervisory chain of command. As such, there are four major categories of Unsafe Supervision: *Inadequate Supervision*, *Planned Inappropriate Operations*, Failed to Correct a Known Problem, and Supervisory Violations (see Figure 5).

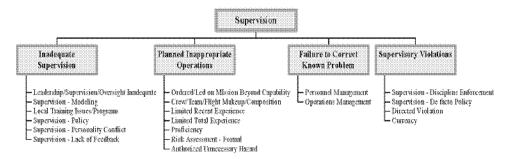

Figure 5 / Table 6. Categories of Unsafe Supervision

Inadequate Supervision: The role of supervisors is to provide their personnel with the opportunity to succeed. To do this, supervisors must provide guidance, training opportunities, leadership, motivation, and the proper role model, regardless of their supervisory level. Unfortunately, this is not always the case. It is easy to imagine a situation where adequate CRM training was not provided to an operator or team member. Conceivably, the operator's coordination skills would be compromised, and if put into a non-routine situation (e.g., emergency), would be at risk for errors that might lead to a mishap. Therefore, the category Inadequate Supervision accounts for those times when supervision proves inappropriate, improper, or may not occur at all (see Table 6). Inadequate Supervision is a factor in a mishap when supervision proves inappropriate or improper and fails to identify a hazard, recognize and control risk, provide guidance, training and/or oversight and results in human error or an unsafe situation.

10 of 12

Planned Inappropriate Operations: Occasionally, the operational tempo or schedule is planned such that individuals are put at unacceptable risk, crew rest is jeopardized, and ultimately performance is adversely affected. Such Planned Inappropriate Operations, though arguably unavoidable during emergency situations, are not acceptable during normal operations. Included in this category are issues of crew pairing and improper manning. For example, it is not surprising to anyone that problems can arise when two individuals with marginal skills are paired together. During a period of downsizing and/or increased levels of operational commitment, it is often more difficult to manage crews. However, pairing weak or inexperienced operators together on the most difficult missions may not be prudent (see Table 6). Planned Inappropriate Operations is a factor in a mishap when supervision fails to adequately assess the hazards associated with an operation and allows for unnecessary risk. It is also a factor when supervision allows non-proficient or inexperienced personnel to attempt missions beyond their capability or when crew or flight makeup is inappropriate for the task or mission.

Failure to Correct a Known Problem: Failed to Correct a Known Problem refers to those instances when deficiencies among individuals, equipment, training or other related safety areas are "known" to the supervisor, yet are allowed to continue uncorrected. For example, the failure to consistently correct or discipline inappropriate behavior certainly fosters an unsafe atmosphere and poor command climate (see Table 6). Failure to Correct Known Problem is a factor in a mishap when supervision fails to correct known deficiencies in documents, processes or procedures, or fails to correct inappropriate or unsafe actions of individuals, and this lack of supervisory action creates an unsafe situation.

Supervisory Violations: Supervisory Violations, on the other hand, are reserved for those instances when supervisors willfully disregard existing rules and regulations. For instance, permitting an individual to operate an aircraft without current qualifications is a flagrant violation that invariably sets the stage for the tragic sequence of events that predictably follow (see Table 6). Supervisory Violations is a factor in a mishap when supervision, while managing organizational assets, willfully disregards instructions, guidance, rules, or operating instructions and this lack of supervisory responsibility creates an unsafe situation.

#### 4. Organizational Influences

Fallible decisions of upper-level management directly effect supervisory practices, as well as the conditions and actions of operators. These latent conditions generally involve issues related to Resource/Acquisition Management, Organizational Climate, and Organizational Processes (see Figure 6). Organizational Influences are factors in a mishap if the communications, actions, omissions or policies of upper-level management directly or indirectly affect supervisory practices, conditions or actions of the operator(s) and result in system failure, human error or an unsafe situation.

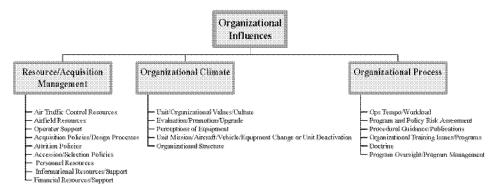

Figure 6 / Table 7. Categories of Organizational Influences

11 of 12

Resource / Acquisition Management: This category refers to the management, allocation, and maintenance of organizational resources—human, monetary, and equipment/facilities. The term "human" refers to the management of operators, staff, and maintenance personnel. Issues that directly influence safety include selection (including background checks), training, and staffing/manning. "Monetary" issues refer to the management of nonhuman resources, primarily monetary resources. For example, excessive cost cutting and lack of funding for proper equipment have adverse effects on operator performance and safety. Finally, "equipment/facilities" refers to issues related to equipment design, including the purchasing of unsuitable equipment, inadequate design of workspaces, and failures to correct known design flaws. Management should ensure that human-factors engineering principles are known and utilized and that existing specifications for equipment and workspace design are identified and met (see Table 7). Resource / Acquisition Management is a factor in a mishap if resource management and/or acquisition processes or policies, directly or indirectly, influence system safety and results in poor error management or creates an unsafe situation.

Organizational Climate: Organizational Climate refers to a broad class of organizational variables that influence worker performance. It can be defined as the situational consistencies in the organization's treatment of individuals. In general, Organizational Climate is the prevailing atmosphere or environment within the organization. Within the present classification system, climate is broken down into three categories--structure, policies, and culture. The term 'structure" refers to the formal component of the organization. The "form and shape" of an organization are reflected in the chain-of-command, delegation of authority and responsibility, communication channels, and formal accountability for actions. Organizations with maladaptive structures (i.e., those that do not optimally match to their operational environment or are unwilling to change) will be more prone to mishaps. "Policies" refer to a course or method of action that guides present and future decisions. Policies may refer to hiring and firing, promotion, retention, raises, sick leave, drugs and alcohol, overtime, accident investigations, use of safety equipment, etc. When these policies are ill-defined, adversarial, or conflicting, safety may be reduced. Finally, "culture" refers to the unspoken or unofficial rules, values, attitudes, beliefs, and customs of an organization ("The way things really get done around here."). Other issues related to culture include organizational justice, psychological contracts, organizational citizenship behavior, esprit de corps, and union/management relations. All these issues affect attitudes about safety and the value of a safe working environment (see Table 7). Organizational Climate is a factor in a mishap if organizational variables including environment, structure, policies, and culture influence individual actions and results in human error or an unsafe situation.

Organizational Processes: This category refers to the formal process by which "things get done" in the organization. It is subdivided into three broad categoriess—operations, procedures, and oversight. The term "operations" refers to the characteristics or conditions of work that have been established by management. These characteristics include operational tempo, time pressures, production quotas, incentive systems, and schedules. When set up inappropriately, these working conditions can be detrimental to safety. "Procedures" are the official or formal procedures as to how the job is to be done. Examples include performance standards, objectives, documentation, and instructions about procedures. All of these, if inadequate, can negatively impact employee supervision, performance, and safety. Finally, "oversight" refers to monitoring and checking of resources, climate, and processes to ensure a safe and productive work environment. Issues here relate to organizational self-study, risk management, and the establishment and use of safety programs (see Table 7). Organizational Processes is a factor in a mishap if organizational processes such as operations, procedures, operational risk management and oversight negatively influence individual, supervisory, and/or organizational performance and results in unrecognized hazards and/or uncontrolled risk and leads to human error or an unsafe situation.

#### DOD HFACS

Quick user instruction and in-depth Nanocodes (definitions)

#### **HFACS Quick Users Guide**

After any event investigators must gather human factors evidence. One method to do this is to start with the event outcome and create a time line documenting each step that leads up to the event. As you probe backwards determine whether a material (a part failed) event occurred or an individual committed or failed to commit an act the resulted in the outcome event.

At each step the investigator must document who committed the act then utilize the taxonomy to further classify the act. Once the investigator has identified the nanocode that reflects the act he/she must dig deeper.

The next step is to look evaluate the preconditions that resulted in the unsafe act. A method that may help evaluating preconditions is to review each of the categories and sub categories in this tier of HFACS and rule in or eliminate the various preconditions that lead to the act. Once the investigator has fully devolved into the preconditions and has recorded all preconditions for the act the focus must move on to supervisory and subsequent organizational issues that contributed to the precondition.

I recommend that for each nanocode chosen the investigator write a short narrative discussing the nanocode

Conduct an evaluation of each item in the time line. This should give the investigator a thorough human factors picture of all the events that lead up to the mishap.

# **DoD HFACS Nanocodes**

#### Acts

Are those factors that are most closely tied to the mishap, and can be described as active failures or actions committed by the operator that result in human error or unsafe situation.

#### Errors (AExxx)

Are factors in a mishap when mental or physical activities of the operator fail to achieve their intended outcome as a result of skill-based, perceptual, or judgment and decision making errors leading to an unsafe situation. Errors are unintended.

#### Skill-Based Errors (AE1xx)

Are factors in a mishap when errors occur in the operator's execution of a routine, highly practiced task relating to procedure, training or proficiency and result in an unsafe a situation.

#### **AE101 Inadvertent Operation**

Inadvertent Operation is a factor when individual's movements inadvertently activate or deactivate equipment, controls or switches when there is no intent to operate the control or device. This action may be noticed or unnoticed by the individual.

#### **AE102 Checklist Error**

Checklist Error is a factor when the individual, either through an act of commission or omission makes a checklist error or fails to run an appropriate checklist and this failure results in an unsafe situation.

#### **AE103 Procedural Error**

Procedural Error is a factor when a procedure is accomplished in the wrong sequence or using the wrong technique or when the wrong control or switch is used. This also captures errors in navigation, calculation or operation of automated systems.

#### **AE104 Overcontrol/ Undercontrol**

Overcontrol/Undercontrol is a factor when an individual responds inappropriately to conditions by either overcontroling or undercontroling the aircraft/vehicle/system. The error may be a result of preconditions or a temporary failure of coordination.

#### AE105 Breakdown in Visual Scan

Breakdown in Visual Scan is a factor when the individual fails to effectively execute learned / practiced internal or external visual scan patterns leading to unsafe situation.

#### **AE106 Inadequate Anti-G Straining Maneuver**

Inadequate Anti-G Straining Maneuver is a factor when the individuals AGSM is improper, inadequate, poorly timed or non-existent and this leads to adverse neurocirculatory effects.

#### Judgment and Decision-Making Errors (AE2xx)

Are factors in a mishap when behavior or actions of the individual proceed as intended yet the chosen plan proves inadequate to achieve the desired end-state and results in an unsafe situation.

#### AE201 Risk Assessment - During Operation

Risk Assessment – During Operation is a factor when the individual fails to adequately evaluate the risks associated with a particular course of action and this faulty evaluation leads to inappropriate decision and subsequent unsafe situation. This failure occurs in real-time when formal risk-assessment procedures are not possible.

#### **AE202 Task Misprioritization**

Task Misprioritization is a factor when the individual does not organize, based on accepted prioritization techniques, the tasks needed to manage the immediate situation.

#### AE203 Necessary Action - Rushed

Necessary Action – Rushed is a factor when the individual takes the necessary action as dictated by the situation but performs these actions too quickly and the rush in taking action leads to an unsafe situation.

#### AE204 Necessary Action - Delayed

Necessary Action – Delayed is a factor when the individual selects a course of action but elects to delay execution of the actions and the delay leads to an unsafe situation.

#### AE205 Caution/Warning - Ignored

Caution/Warning – Ignored is a factor when a caution or warning is perceived and understood by the individual but is ignored by the individual leading to an unsafe situation.

#### **AE206 Decision-Making During Operation**

Decision-Making During Operation is a factor when the individual through faulty logic selects the wrong course of action in a time-constrained environment.

#### Perception Errors (AE3xx)

Are factors in a mishap when misperception of an object, threat or situation, (such as visual, auditory, proprioceptive, or vestibular illusions, cognitive or attention failures, etc), results in human error.

#### **AE301 Error due to Misperception**

Error due to Misperception is a factor when an individual acts or fails to act based on an illusion; misperception or disorientation state and this act or failure to act creates an unsafe situation.

## **Violations (AVxxx)**

Are factors in a mishap when the actions of the operator represent willful disregard for rules and instructions and lead to an unsafe situation. Violations are deliberate.

#### AV001 Violation - Based on Risk Assessment

Violation- Based on Risk Assessment is a factor when the consequences/risk of violating published procedures was recognized, consciously assessed and honestly determined by the individual, crew or team to be the best course of action. Routine "work-arounds" and unofficial procedures that are accepted by the community as necessary for operations are also captured under this code.

#### AV002 Violation - Routine/Widespread

Violation - Routine/Widespread is a factor when a procedure or policy violation is systemic in a unit/setting and not based on a risk assessment for a specific situation. It needlessly commits the individual, team, or crew to an unsafe course-of-action. These violations may have leadership sanction and may not routinely result in disciplinary/administrative action. Habitual violations of a single individual or small group of individuals within a unit can constitute a routine/widespread violation if the violation was not routinely disciplined or was condoned by supervisors. These violations may also be referred to as "Routine Violations."

#### AV003 Violation - Lack of Discipline

Violation - Lack of Discipline is a factor when an individual, crew or team intentionally violates procedures or policies without cause or need. These violations are unusual or isolated to specific individuals rather than larger groups. There is no evidence of these violations being condoned by leadership. These violations may also be referred to as "exceptional violations." (NOTE: These violations may also carry UCMJ consequences. Boards should consult the Judge Advocate of the convening authority.)

### **Preconditions**

Are factors in a mishap if active and/or latent preconditions such as conditions of the operators, environmental or personnel factors affect practices, conditions or actions of individuals and result in human error or an unsafe situation.

# **Environmental Factors (PExxx)**

Are factors in a mishap if *physical* or *technological* factors affect practices, conditions and actions of individual and result in human error or an unsafe situation.

#### Physical Environment (PE1xx)

Are factors in a mishap if environmental phenomena such as weather, climate, white out or brown out conditions affect the actions of individuals and result in human error or an unsafe situation.

#### PE101 Vision Restricted by Icing/Windows Fogged/Etc

Vision Restricted by Icing/Windows Fogged/Etc is a factor when it is determined by the investigator that icing or fogging of the windshield/windscreen or canopy restricted the vision of the individual to a point where normal duties were affected.

#### PE102 Vision Restricted by Meteorological Conditions

Vision Restricted by Meteorological Conditions is a factor when weather, haze, or darkness restricted the vision of the individual to a point where normal duties were affected.

#### PE103 Vibration

Vibration is a factor when the intensity or duration of the vibration is sufficient to cause impairment of vision or adversely effect the perception of orientation.

#### PE104 Vision Restricted in Workspace by Dust/Smoke/Etc.

Vision restricted in workspace by dust/smoke/etc. is a factor when dust, smoke, etc. inside the cockpit, vehicle or workstation restricted the vision of the individual to a point where normal duties were affected.

#### PE105 Windblast

Windblast is a factor when the individual's ability to perform required duties is degraded during or after exposure to a windblast situation.

#### PE106 Thermal Stress - Cold

Thermal Stress - Cold is a factor when the individual is exposed to cold resulting in compromised function.

#### PE107 Thermal Stress – Heat

Thermal Stress – Heat is a factor when the individual is exposed to heat resulting in compromised function.

#### PE108 Maneuvering Forces - In-Flight

Maneuvering Forces – In-Flight is a factor when acceleration forces of longer than one second cause injury, prevent or interfere with the performance of normal duties. Do not use this code to capture G-induced loss of consciousness

#### PE109 Lighting of Other Aircraft/Vehicle

Lighting of Other Aircraft/Vehicle is a factor when the absence, pattern, intensity or location of the lighting of other aircraft/vehicle prevents or interferes with safe task accomplishment.

#### PE110 Noise Interference

Noise Interference is a factor when any sound not directly related to information needed for task accomplishment interferes with the individual's ability to perform that task.

#### PE111 Brownout/Whiteout

Brownout/Whiteout is a factor when dust, snow, water, ash or other particulates in the environment are disturbed by the aircraft, vehicle or person and cause a restriction of vision to a point where normal duties are affected

#### Technological Environment (PE2xx)

Are factors in a mishap when cockpit / vehicle / control station / workspace design factors or automation affect the actions of individuals and result in human error or an unsafe situation.

#### PE201 Seating and Restraints

Seating and Restraints is a factor when the design of the seat or restraint system, the ejection system, seat comfort or poor impact-protection qualities of the seat create an unsafe situation.

## PE202 Instrumentation and Sensory Feedback Systems

Instrumentation and Sensory Feedback Systems is a factor when instrument factors such as design, reliability, lighting, location, symbology or size are inadequate and create an unsafe situation. This includes NVDs, HUD, off-bore-site and helmet-mounted display systems and inadequacies in auditory or tactile situational awareness or warning systems such as aural voice warnings or stick shakers.

#### PE203 Visibility Restrictions

Visibility Restrictions is a factor when the lighting system, windshield / windscreen / canopy design, or other obstructions prevent necessary visibility and create an unsafe situation. This includes glare or reflections on the canopy / windscreen / windshield. Visibility restrictions due to weather or environmental conditions are captured under PE101 or PE102.

#### **PE204 Controls and Switches**

Controls and Switches is a factor when the location, shape, size, design, reliability, lighting or other aspect of a control or switch is inadequate and this leads to an unsafe situation.

#### PE205 Automation

Automation is a factor when the design, function, reliability, use guidance, symbology, logic or other aspect of automated systems creates an unsafe situation.

#### PE206 Workspace Incompatible with Human

Workspace Incompatible with Human is a factor when the workspace is incompatible with the mission requirements and mission safety for this individual.

#### PE207 Personal Equipment Interference

Personal Equipment Interference is a factor when the individual's personal equipment interferes with normal duties or safety.

#### PE208 Communications - Equipment

Communications - Equipment is a factor when comm. equipment is inadequate or unavailable to support mission demands. (i.e. aircraft/vehicle with no intercom) This includes electronically or physically blocked transmissions. Communications can be voice, data or multi-sensory.

# **Condition of Individuals (PCxxx)**

Are factors in a mishap if cognitive, psycho-behavioral, adverse physical state, or physical/mental limitations affect practices, conditions or actions of individuals and result in human error or an unsafe situation.

# Cognitive Factors (PC1xx)

Are factors in a mishap if cognitive or attention management conditions affect the perception or performance of individuals and result in human error or an unsafe situation.

#### PC101 Inattention

Inattention is a factor when the individual has a state of reduced conscious attention due to a sense of security, self-confidence, boredom or a perceived absence of threat from the environment which degrades crew performance. (This may often be a result of highly repetitive tasks. Lack of a state of alertness or readiness to process immediately available information.)

# **PC102 Channelized Attention**

Channelized Attention is a factor when the individual is focusing all conscious attention on a limited number of environmental cues to the exclusion of others of a subjectively equal or higher or more immediate priority, leading to an unsafe situation. May be described as a tight focus of attention that leads to the exclusion of comprehensive situational information.

DOD HFACS Attachment 1 11 January 05

#### **PC103 Cognitive Task Oversaturation**

Cognitive Task Oversaturation is a factor when the quantity of information an individual must process exceeds their cognitive or mental resources in the amount of time available to process the information.

#### **PC104 Confusion**

Confusion is a factor when the individual is unable to maintain a cohesive and orderly awareness of events and required actions and experiences a state characterized by bewilderment, lack of clear thinking, or (sometimes) perceptual disorientation.

#### **PC105 Negative Transfer**

Negative Transfer is a factor when the individual reverts to a highly learned behavior used in a previous system or situation and that response is inappropriate or degrades mission performance.

#### PC106 Distraction

Distraction is a factor when the individual has an interruption of attention and/or inappropriate redirection of attention by an environmental cue or mental process that degrades performance.

#### PC107 Geographic Misorientation (Lost)

Geographic Misorientation (Lost) is a factor when the individual is at a latitude and/or longitude different from where he believes he is or at a lat/long unknown to the individual and this creates an unsafe situation.

#### **PC108 Checklist Interference**

Checklist Interference is a factor when an individual is performing a highly automated/learned task and is distracted by anther cue/event that results in the interruption and subsequent failure to complete the original task or results in skipping steps in the original task.

## Psycho-Behavioral Factors (PC2xx)

Are factors when an individual's personality traits, psychosocial problems, psychological disorders or inappropriate motivation creates an unsafe situation.

# PC201 Pre-Existing Personality Disorder

Pre-existing Personality Disorder is a factor when a qualified professional determines the individual met Diagnostic and Statistical Manual criteria for a personality disorder.

# PC202 Pre-Existing Psychological Disorder

Pre-existing Psychological Disorder is a factor when a qualified professional determines the individual met Diagnostic and Statistical Manual criteria for a psychological disorder.

#### PC203 Pre-Existing Psychosocial Problem

Pre-existing Psychosocial Problem is a factor when a qualified professional determines the individual met Diagnostic and Statistical Manual criteria for a psychosocial problem.

#### **PC204 Emotional State**

Emotional State is a factor when the individual is under the influence of a strong positive or negative emotion and that emotion interferes with duties.

#### PC205 Personality Style

Personality style is a factor when the individual's personal interaction with others creates an unsafe situation. Examples are authoritarian, over-conservative, impulsive, invulnerable, submissive or other personality traits that result in degraded crew performance.

#### PC206 Overconfidence

Overconfidence is a factor when the individual overvalues or overestimates personal capability, the capability of others or the capability of aircraft/vehicles or equipment and this creates an unsafe situation.

#### PC207 Pressing

Pressing is a factor when the individual knowingly commits to a course of action that presses them and/or their equipment beyond reasonable limits.

#### **PC208 Complacency**

Complacency is a factor when the individual's state of reduced conscious attention due to an attitude of overconfidence, undermotivation or the sense that others "have the situation under control" leads to an unsafe situation.

# PC209 Inadequate Motivation

Motivation – Inadequate is a factor when the individual's motivation to accomplish a task or mission is weak or indecisive.

# PC210 Misplaced Motivation

Misplaced Motivation is a factor when an individual or unit replaces the primary goal of a mission with a personal goal.

# PC211 Overaggressive

Overaggressive is a factor when an individual or crew is excessive in the manner in which they conduct a mission.

#### PC212 Excessive Motivation to Succeed

Motivation to Succeed – Excessive is a factor when the individual is preoccupied with success to the exclusion of other mission factors leading to an unsafe situation.

DOD HFACS Attachment 1 11 January 05

#### PC213 Get-Home-Itis/Get-There-Itis

Get-Home-Itis/Get-There-Itis is a factor when an individual or crew is motivated to complete a mission or reach a destination for personal reasons, thereby short cutting necessary procedures or exercising poor judgment, leading to an unsafe situation.

#### PC214 Response Set

Response set is a factor when the individual has a cognitive or mental framework of expectations that predispose them to a certain *course of action* regardless of other cues.

#### **PC215** Motivational Exhaustion (Burnout)

Motivational Exhaustion (Burnout) is a factor when the individual has the type of exhaustion associated with the wearing effects of high operations and personal tempo where their operational requirements impinge on their ability to satisfy their personal requirements and leads to degraded cognitive or operational capability.

# Adverse Physiological States (PC3xx)

Are factors when an individual experiences a physiologic event that compromises human performance and this decreases performance and results in an unsafe situation.

#### PC301 Effects of G Forces (G-LOC, etc)

Effects of G Forces (G-LOC, etc) is a factor when the individual experiences G-induced loss of consciousness (GLOC), greyout, blackout or other neuro-circulatory affects of sustained acceleration forces.

#### **PC302 Prescribed Drugs**

Prescribed Drugs is a factor when the individual uses a prescribed drug with measurable effect interfering with performance.

# PC303 Operational Injury/Illness

Operational Injury/Illness is a factor when an injury is sustained or illness develops from the operational environment or *during* the mission and this injury or illness results in an unsafe situation. This includes toxic exposure. Details of injury, illness or toxic exposure should be captured in the medical investigation. Do not use this code to capture injury or illness that does not cause an unsafe situation or contribute to the mishap sequence.

# PC304 Sudden Incapacitation/Unconsciousness

Sudden Incapacitation/Unconsciousness is a factor when the individual has an abrupt loss of functional capacity / conscious awareness. (NOT GLOC) Capture medical causes for the incapacitation in the AFSAS medical module.

# PC305 Pre-Existing Physical Illness/Injury/Deficit

Pre-Existing Physical Illness/Injury/Deficit is a factor when a physical illness, injury or deficit that existed at the time the individual boarded the aircraft or began the mission/task causes an unsafe situation. This includes situations where wavered physical defects contribute to an unsafe situation and situations where vision deficit or loss of prosthetic devices during the mission cause an unsafe situation. An individual must board

the aircraft or begin the mission/task with prior knowledge of illness/injury/deficit otherwise mark and rate PC303. Details of injury, illness or deficit should be captured in the medical investigation. Do not use this code to capture injury or illness that does not cause an unsafe situation or contribute to the mishap sequence. (i.e. medevac patient whose condition deteriorates during flight).

#### PC306 Physical Fatigue (Overexertion)

Physical Fatigue (Overexertion) is a factor when the individual's diminished physical capability is due to overuse (time/relative load) and it degrades task performance. (The effects of prolonged physical activity, or the effects of brief but relatively extreme physical activity, either of which taxes a person's physical endurance or strength beyond the individual's normal limits.)

#### PC307 Fatigue - Physiological/Mental

Fatigue - Physiological/Mental is a factor when the individual's diminished physical or mental capability is due to an inadequate recovery, as a result of restricted or shortened sleep or physical or mental activity during prolonged wakefulness. Fatigue may additionally be described as acute, cumulative or chronic.

#### PC308 Circadian Rhythm Desynchrony

Circadian Rhythm Desynchrony is a factor when the individual's normal, 24-hour rhythmic biological cycle (circadian rhythm) is disturbed and it degrades task performance. This is caused typically by night work or rapid movement (such as one time zone per hour) across several time zones. Referred to as "shift lag" and "jet lag." (Time in the new time zone will lead to adaptation and recovery; the amount of time depends on the number of time zones crossed and the direction of travel. Recovery from shift lag may never occur.)

#### **PC309 Motion Sickness**

Motion Sickness is a factor when the symptoms of motion sickness impair normal performance. Motion sickness symptoms include nausea, sweating, flushing, vertigo, headache, stomach awareness, malaise, and vomiting.

#### PC310 Trapped Gas Disorders

Trapped Gas Disorders are a factor when gasses in the middle ear, sinuses, teeth, or intestinal tract expand or contract on ascent or descent causing an unsafe situation. Also capture alternobaric vertigo under this code. If the alternobaric vertigo induces spatial disorientation you must mark and rate PC508, PC509 or PC510.

## PC311 Evolved Gas Disorders

Evolved gas disorders are a factor when inert-gas evolves in the blood causing an unsafe situation. This includes, chokes, CNS, bends or parasthesias or other conditions caused by inert-gas evolution.

DOD HFACS Attachment 1 11 January 05

# PC312 Hypoxia

Hypoxia is a factor when the individual has insufficient oxygen supply to the body sufficient to cause an impairment of function.

#### **PC313 Hyperventilation**

Hyperventilation is a factor when the effect of ventilating above the physiological demands of the body causes the individual's performance capabilities to be degraded.

#### **PC314 Visual Adaptation**

Visual Adaptation is a factor when the normal human limitation of dark-adaptation rate affects safety, for example, when transitioning between aided and unaided night vision.

#### PC315 Dehydration

Dehydration is a factor when the performance of the operator is degraded due to dehydration as a result of excessive fluid losses due to heat stress or due to insufficient fluid intake.

#### **PC316 Physical Task Oversaturation**

Physical Task Oversaturation is a factor when the number or complexity of manual tasks in a compressed time period exceeds an individual's capacity to perform.

# Physical/Mental Limitations (PC4xx)

Are factors in a mishap when an individual, temporarily or permanently lacks the physical or mental capabilities to cope with a situation and this insufficiency causes an unsafe situation.

# PC401 Learning Ability/Rate

Learning Ability – Rate is a factor when the individual's relative efficiency with which new information is acquired, and relatively permanent adjustments made in behavior or thinking, are not consistent with mission demands.

# PC402 Memory Ability/Lapses

Memory Ability/Lapses is a factor when the individual is unable or has lapses in the ability to recall past experience needed for safe mission completion. (Experience includes any information a person receives through any means, any cognitive functions he or she performed on that information, and any response he or she made as a result of it.)

# PC403 Anthropometric/Biomechanical Limitations

Anthropometric/Biomechanical limitations are a factor when the size, strength, dexterity, mobility or other biomechanical limitations of an individual creates an unsafe situation. It must be expected that the average individual qualified for that duty position could accomplish the task in question.

# PC404 Motor Skill/Coordination or Timing Deficiency

Motor Skill/Coordination or Timing Deficiency is a factor when the individual lacks the required psychomotor skills, coordination or timing skills necessary to accomplish the task attempted.

#### PC405 Technical/Procedural Knowledge

Technical/Procedural Knowledge is a factor when an individual was adequately exposed to the information needed to perform the mission element but did not absorb it. Lack of knowledge implies no deficiency in the training program, but rather the failure of the individual to absorb or retain the information. (Exposure to information at a point in the past does not imply "knowledge" of it.)

# Perceptual Factors (PC5xx)

Are factors in a mishap when misperception of an object, threat or situation, (visual, auditory, proprioceptive, or vestibular conditions) creates an unsafe situation

# PC501 Illusion - Kinesthetic

Illusion – Kinesthetic is a factor when somatosensory stimuli of the ligaments, muscles, or joints cause the individual to have an erroneous perception of orientation, motion or acceleration leading to degraded performance. (If this illusion leads to spatial disorientation you must mark and rate PC508, PC509 or PC510.)

#### PC502 Illusion - Vestibular

Illusion – Vestibular is a factor when stimuli acting on the semicircular ducts or otolith organs of the vestibular apparatus cause the individual to have an erroneous perception of orientation, motion or acceleration leading to degraded performance. (If this illusion leads to spatial disorientation you must mark and rate PC508, PC509 or PC510.)

#### PC503 Illusion - Visual

Illusion – Visual is a factor when visual stimuli result in an erroneous perception of orientation, motion or acceleration, leading to degraded performance. (If this illusion leads to spatial disorientation you must mark and rate PC508, PC509 or PC510.)

# **PC504 Misperception of Operational Conditions**

Misperception of Operational Conditions is a factor when an individual misperceives or misjudges altitude, separation, speed, closure rate, road/sea conditions, aircraft/vehicle location within the performance envelope or other operational conditions and this leads to an unsafe situation.

# PC505 Misinterpreted/Misread Instrument

Misinterpreted/Misread Instrument is a factor when the individual is presented with a correct instrument reading but its significance is not recognized, it is misread or is misinterpreted.

# PC506 Expectancy

Expectancy is a factor when the individual's expects to perceive a certain reality and those expectations are strong enough to create a *false perception* of the expectation.

#### **PC507 Auditory Cues**

Auditory Cues is a factor when the auditory inputs are correctly interpreted but are misleading or disorienting. Also when the inputs are incorrectly interpreted and cause an impairment of normal performance.

## PC508 Spatial Disorientation (Type 1) Unrecognized

Spatial Disorientation is a failure to correctly sense a position, motion or attitude of the aircraft or of oneself within the fixed coordinate system provided by the surface of the earth and the gravitational vertical. Spatial Disorientation (Type 1) Unrecognized is a factor when a person's cognitive awareness of one or more of the following varies from reality: attitude; position; velocity; direction of motion or acceleration. Proper control inputs are not made because the need is unknown.

#### PC509 Spatial Disorientation (Type 2) Recognized

Spatial Disorientation is a failure to correctly sense a position, motion or attitude of the aircraft or of oneself within the fixed coordinate system provided by the surface of the earth and the gravitational vertical. Spatial Disorientation (Type 2) is a factor when recognized perceptual confusion is induced through one or more of the following senses: visual; vestibular; auditory; tactile; proprioception or kinesthetic. Proper control inputs are still possible.

# PC510 Spatial Disorientation (Type 3) Incapacitating

Spatial Disorientation is a failure to correctly sense a position, motion or attitude of the aircraft or of oneself within the fixed coordinate system provided by the surface of the earth and the gravitational vertical. Spatial Disorientation (Type 3) Incapacitating is a factor when an individual is unable to make proper control inputs for safe operation of the aircraft or system due to a conflict (often extreme) between the sensory systems identified in type 2

#### **PC511 Temporal Distortion**

Temporal Distortion is a factor when the individual experiences a compression or expansion of time relative to reality leading to an unsafe situation. (Often associated with a "fight or flight" response.)

# **Personnel Factors (PPxxx)**

Are factors in a mishap if self imposed stressors or crew resource management affect practices, conditions or actions of individuals and result in human error or an unsafe situation.

#### Coordination/Communication/Planning Factors(PP1xx)

Refer to interactions among individuals, crews, and teams involved with the preparation and execution of a mission that resulted in human error or an unsafe situation.

#### PP101 Crew/Team Leadership

Crew/Team Leadership is a factor when the crew/team leadership techniques failed to facilitate a proper crew climate, to include establishing and maintaining an accurate and shared understanding of the evolving mission and plan on the part of all crew or team members.

#### **PP102 Cross-Monitoring Performance**

Cross-monitoring performance is a factor when crew or team members failed to monitor, assist or back-up each other's actions and decisions.

#### **PP103 Task Delegation**

Task delegation is a factor when the crew or team members failed to actively manage the distribution of mission tasks to prevent the overloading of any crewmember.

#### PP104 Rank/Position Authority Gradient

Rank/position authority gradient is a factor when the differences in rank of the team, crew or flight caused the mission performance capabilities to be degraded. Also conditions where formal or informal authority gradient is too steep or too flat across a crew, team or flight and this condition degrades collective or individual performance.

#### **PP105** Assertiveness

Assertiveness is a factor when individuals failed to state critical information or solutions with appropriate persistence.

# **PP106 Communicating Critical Information**

Communicating critical information is a factor when known critical information was not provided to appropriate individuals in an accurate or timely manner.

# PP107 Standard/Proper Terminology

Standard/proper terminology is a factor when clear and concise terms, phrases hand signals, etc per service standards and training were not used.

#### **PP108 Challenge and Reply**

Challenge and reply is a factor when communications did not include supportive feedback or acknowledgement to ensure that personnel correctly understand announcements or directives.

#### **PP109 Mission Planning**

Mission planning is a factor when an individual, crew or team failed to complete all preparatory tasks associated with planning the mission, resulting in an unsafe situation. Planning tasks include information collection and analysis, coordinating activities within the crew or team and with appropriate external agencies, contingency planning, and risk assessment.

#### **PP110 Mission Briefing**

Mission briefing is a factor when information and instructions provided to individuals, crews, or teams were insufficient, or participants failed to discuss contingencies and strategies to cope with contingencies.

#### PP111 Task/Mission-In-Progress Re-Planning

Task/mission-in-progress re-planning is a factor when crew or team members fail to adequately reassess changes in their dynamic environment during mission execution and change their mission plan accordingly to ensure adequate management of risk.

#### **PP112 Miscommunication**

Miscommunication is a factor when correctly communicated information is misunderstood, misinterpreted, or disregarded.

# Self-Imposed Stress (PP2xx)

Is a factor in a mishap if the operator demonstrates disregard for rules and instructions that govern the individuals readiness to perform, or exhibits poor judgment when it comes to readiness and results in human error or an unsafe situation.

#### **PP201 Physical Fitness**

Physical Fitness is a factor when the relative physical state of the individual, in terms of a regular rigorous exercise program or a physically active lifestyle, is not adequate to support mission demands.

#### PP202 Alcohol

Alcohol is a factor when the acute or residual effects of alcohol impaired performance or created an unsafe situation.

# PP203 Drugs/Supplements/Self medication

Drugs/Supplements/Self-medication is a factor when the individual takes any drug, other than prescribed, that interferes with performance. This includes nicotine or caffeine in sufficient quantities to cause impairment of normal function. This also includes any chemical compound taken for purposes of prevention of disease, treatment of disease, weight management, mood alteration, birth control or sleep management, etc. The effects may be direct or residual. Alcohol is captured under PP206.

# **PP204 Nutrition**

Nutrition is a factor when the individual's nutritional state or poor dietary practices are inadequate to fuel the brain and body functions resulting in degraded performance

# PP205 Inadequate Rest

Inadequate rest is a factor when the opportunity for rest was provided but the individual failed to take the opportunity to rest.

# PP206 Unreported Disqualifying Medical Condition

Unreported Disqualifying Medical Condition is a factor when the operator intentionally operates/flies with a known disqualifying medical condition that results in an unsafe situation.

# **Supervision**

Is a factor in a mishap if the methods, decisions or policies of the supervisory chain of command directly affect practices, conditions, or actions of individual and result in human error or an unsafe situation.

# **Inadequate Supervision (SIxxx)**

Is a factor in a mishap when supervision proves inappropriate or improper and fails to identify hazard, recognize and control risk, provide guidance, training and/or oversight and results in human error or an unsafe situation.

# SI001 Leadership/Supervision/Oversight Inadequate

Leadership/Supervision/Oversight Inadequate is a factor when the availability, competency, quality or timeliness of leadership, supervision or oversight does not meet task demands and creates an unsafe situation. Inappropriate supervisory pressures are also captured under this code.

#### SI002 Supervision – Modeling

Supervision – Modeling is a factor when the individual's learning is influenced by the behavior of peers and supervisors and when that learning manifests itself in actions that are either inappropriate to the individual's skill level or violate standard procedures and lead to an unsafe situation.

#### SI003 Local Training Issues/Programs

Local Training Issues/Programs are a factor when one-time or recurrent training programs, upgrade programs, transition programs or any other local training is inadequate or unavailable (etc) and this creates an unsafe situation. (Note: the failure of an individual to absorb the training material in an adequate training program does not indicate a training program problem. Capture these factors under PC401 "Learning ability/rate" or PC405 "Technical/Procedural Knowledge." The failure of an individual to recall learned information under stress or while fatigued despite attending an adequate training program does not indicate a training program problem. Capture these factors under PC402 "Memory/ Ability lapses" or other cognitive factors such as PC104 "Confusion," PC106 "Distraction," PC105 "Negative Transfer," etc.)

## SI004 Supervision - Policy

Supervision – Policy is a factor when policy or guidance or lack of a policy or guidance leads to an unsafe situation.

# SI005 Supervision – Personality Conflict

Supervision – Personality Conflict is a factor when a supervisor and individual member experience a "personality conflict" that leads to a dangerous error in judgment / action.

DOD HFACS Attachment 1 11 January 05

# SI006 Supervision - Lack of Feedback

Supervision – Lack of Feedback is a factor when information critical to a potential safety issue had been provided to supervisory or management personnel without feedback to the source (failure to close the loop).

# Planned Inappropriate Operations (SPxxx)

Is a factor in a mishap when supervision fails to adequately assess the hazards associated with an operation and allows for unnecessary risk. It is also a factor when supervision allows non-proficient or inexperienced personnel to attempt missions beyond their capability or when crew or flight makeup is inappropriate for the task or mission.

#### SP001 Ordered/Led on Mission Beyond Capability

Ordered/Led on Mission Beyond Capability is a factor when supervisor / management directs personnel to undertake a mission beyond their skill level or beyond the capabilities of their equipment.

#### SP002 Crew/Team/Flight Makeup/Composition

Crew/Team/Flight Makeup/Composition is a factor when, in the opinion of the investigator, the makeup of the crew or of the flight should have reasonably raised obvious safety concerns in the minds of crewmembers involved in the mission, or in any other individual directly related to the scheduling of this mission.

#### **SP003 Limited Recent Experience**

Limited Recent Experience is a factor when the supervisor selects an individual who's experience for either a specific maneuver, event or scenario is not sufficiently current to permit safe mission execution.

#### **SP004 Limited Total Experience**

Limited Total Experience is a factor when a supervisor selects an individual who's individual has performed a maneuver, or participated in a specific scenario, infrequently or rarely.

#### SP005 Proficiency

Proficiency is a factor when and individual is not proficient in a task, mission or event.

#### SP006 Risk Assessment - Formal

Risk Assessment – Formal is a factor when supervision does not adequately evaluate the risks associated with a mission or when pre-mission risk assessment tools or risk assessment programs are inadequate.

#### SP007 Authorized Unnecessary Hazard

DOD HFACS Attachment 1 11 January 05

Authorized Unnecessary Hazard is a factor when supervision authorizes a mission or mission element that is unnecessarily hazardous without sufficient cause or need. Includes intentionally scheduling personnel for mission or operation that they are not qualified to perform.

# Failure to Correct Known Problem (SFxxx)

Is a factor in a mishap when supervision fails to correct known deficiencies in documents, processes or procedures, or fails to correct inappropriate or unsafe actions of individuals, and this lack of supervisory action creates an unsafe situation.

#### SF001 - Personnel Management

Personnel management is a factor when a supervisor fails to identify an operator or aviator who exhibits recognizable risky behaviors or unsafe tendencies or fails to institute remedial actions when an individual is identified with risky behaviors or unsafe tendencies.

#### SF002 - Operations Management

Operations management is a factor when a supervisor fails to correct known hazardous practices, conditions or guidance that allows for hazardous practices within the scope of his/her command

# **Supervisory Violations (SVxxx)**

Is a factor in a mishap when supervision while managing organizational assets willfully disregards instructions, guidance, rules, or operating instructions and this lack of supervisory responsibility creates an unsafe situation.

# SV001 Supervision - Discipline Enforcement (Supervisory act of omission)

Supervision – Discipline Enforcement is a factor when unit (organizational) and operating rules have not been enforced by the normally constituted authority.

#### SV002 Supervision – Defacto Policy

Supervision – Defacto Policy is a factor when unwritten or "unofficial" policy perceived and followed by the individual, which has not been formally established by the properly constituted authority, leads to an unsafe situation.

#### **SV003 Directed Violation**

Directed Violation is a factor when a supervisor directs a subordinate to violate existing regulations, instructions or technical guidance.

#### **SV004 Currency**

Currency is a factor when an individual has not met the general training requirements for his job/weapon system and is considered "non-current" and supervision/leadership inappropriately allows the individual to perform the mission element for which the individual is non-current.

DOD HFACS Attachment 1 11 January 05

# **Organizational Influences**

Are factors in a mishap if the communications, actions, omissions or policies of upper-level management directly or indirectly affect supervisory practices, conditions or actions of the operator(s) and result in system failure, human error or an unsafe situation.

# Resource/Acquisition Management (ORxxx)

Is a factor in a mishap if resource management and/or acquisition processes or policies, directly or indirectly, influence system safety and results in poor error management or creates an unsafe situation.

#### **OR001 Air Traffic Control Resources**

Air Traffic Control Resources is a factor when inadequate monitoring of airspace, enroute nav-aids or language barriers in air traffic controllers cause an unsafe situation. Note: If the unsafe acts of an individual air traffic controller are determined to be a factor in a mishap then the controller must be added and investigated as a mishap person.

#### **OR002 Airfield Resources**

Airfield Resources are a factor when runways, taxiways, ramps, terminal ATC resources or nav-aids, lighting systems, SOF/RSU resources or the environment surrounding the airfield are inadequate or unsafe. If the airfield or environment created a visual illusion that contributed to the mishap sequence you must also mark and rate PC503 "Illusion - Visual."

# **OR003 Operator Support**

Operator Support is a factor when support facilities (dining, exercise, quarters, medical care, etc) or opportunity for recreation or rest are not available or adequate and this creates an unsafe situation. This includes situations where leave is not taken for reasons other than the individual's choice.

# OR004 Acquisition Policies/Design Processes

Acquisition Policies/Design Processes is a factor when the processes through which aircraft, vehicle, equipment or logistical support are acquired allows inadequacies or when design deficiencies allow inadequacies in the acquisition and the inadequacies create an unsafe situation.

#### **OR005 Attrition Policies**

Attrition Policies is a factor when the process through which equipment is removed from service is inadequate and this inadequacy creates an unsafe situation.

# **OR006 Accession/Selection Policies**

Accession/Selection Policies is a factor when the process through which individuals are screened, brought into the service or placed into specialties is inadequate and creates an unsafe situation.

DOD HFACS Attachment 1 11 January 05

#### **OR007 Personnel Resources**

Personnel Resources is a factor when the process through which manning, staffing or personnel placement or manning resource allocations are inadequate for mission demands and the inadequacy causes an unsafe situation.

#### **OR008 Informational Resources/Support**

Informational Resources/Support is a factor when weather, intelligence, operational planning material or other information necessary for safe operations planning are not available.

#### **OR009 Financial Resources/Support**

Financial Resources/Support is a factor when an organization or operation does not receive the financial resources to complete its assigned mission and this deficiency creates an unsafe situation.

# **Organizational Climate (OCxxx)**

Is a factor in a mishap if organizational variables including environment, structure, policies, and culture influence individual actions and results in human error or an unsafe situation.

#### OC001 Unit/Organizational Values/Culture

Unit/Organizational Values/Culture is a factor when explicit/implicit actions, statements or attitudes of unit leadership set unit/organizational values (culture) that allow an environment where unsafe mission demands or pressures exist.

#### OC002 Evaluation/Promotion/Upgrade

Evaluation/Promotion/Upgrade is a factor when an individual perceives that their performance on a task will inappropriately impact an evaluation, promotion or opportunity for upgrade and this pressure creates an unsafe situation. Other inappropriate supervisory pressures are captured under SI001 Supervision – Inadequate.

# **OC003 Perceptions of Equipment**

Perceptions of Equipment is a factor when over or under confidence in an aircraft, vehicle, device, system or any other equipment creates an unsafe situation.

# ${\bf OC004\ Unit\ Mission/Aircraft/Vehicle/Equipment\ Change\ or\ Unit\ Deactivation}$

Unit Mission/Aircraft/Vehicle/Equipment Change or Unit Deactivation is a factor when the process of changing missions/aircraft/vehicle/equipment or an impending unit deactivation creates an unsafe situation.

# OC005 Organizational Structure

Organizational Structure is a factor when the chain of command of an individual or structure of an organization is confusing, non-standard or inadequate and this creates an unsafe situation.

DOD HFACS Attachment 1 11 January 05

# **Organizational Processes (OPxxx)**

Is a factor in a mishap if organizational processes such as operations, procedures, operational risk management and oversight negatively influence individual, supervisory, and/or organizational performance and results in unrecognized hazards and/or uncontrolled risk and leads to human error or an unsafe situation.

# OP001 Ops Tempo/Workload

Ops Tempo/Workload is a factor when the pace of deployments, workload, additional duties, off-duty education, PME, or other workload-inducing condition of an individual or unit creates an unsafe situation.

#### **OP002 Program and Policy Risk Assessment**

Program and Policy Risk Assessment is a factor when the potential risks of a large program, operation, acquisition or process are not adequately assessed and this inadequacy leads to an unsafe situation.

#### **OP003 Procedural Guidance/Publications**

Procedural Guidance/Publications is a factor when written direction, checklists, graphic depictions, tables, charts or other published guidance is inadequate, misleading or inappropriate and this creates an unsafe situation.

# OP004 Organizational Training Issues/Programs

Organizational Training Issues/Programs are a factor when one-time or initial training programs, upgrade programs, transition programs or other training that is conducted outside the local unit is inadequate or unavailable (etc) and this creates an unsafe situation. (Note: the failure of an individual to absorb the training material in an adequate training program does not indicate a training program problem. Capture these factors under PC401 "Learning Ability/Rate" or PC405 "Technical/Procedural Knowledge." The failure of an individual to recall learned information under stress or while fatigued despite attending an adequate training program does not indicate a training program problem. Capture these factors under PC402 "Memory/ Ability lapses" or other cognitive factors such as PC104 "Confusion," PC106 "Distraction," PC105 "Negative Transfer" or one of the forms of Fatigue, etc.)

# **OP005 Doctrine**

Doctrine is a factor when the doctrine, philosophy or concept of operations in an organization is flawed or accepts unnecessary risk and this flaw or risk acceptance leads to an unsafe situation or uncontrolled hazard.

# OP006 Program Oversight/Program Management

Program Oversight/Program Management is a factor when programs are implemented without sufficient support, oversight or planning and this leads to an unsafe situation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | N BUILD                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |        |
|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |        |

# Boeing Technical Analysis of SFDR Data

Mishap Aircraft: C-17A, Serial Number 00-0173

Mishap Date: 28 July 2010

# Background

Boeing was tasked by the C-17 00-0173 Accident Investigation Board (AIB) to provide engineering, technical, and supplier support to the investigation of the mishap at Elmendorf AFB on 28 July 2010. Boeing provided the following support:

Engineering - Boeing engineers, primarily out of Long Beach and Field Services (Boeing Elmendorf and Dover AFBs) responded to technical questions and provided the following analysis of the Standard Flight Data Recorder (SFDR) information provided.

Supplier Support: Boeing Engineering requested GE Aviation to review SFDR decoder  $\log$  to analyze errors.

# Scope

This document provides a factual summary to support the accident investigation into the mishap of aircraft 00-0173 on 28 July 2010. Team developed the attached plots and timeline summary based on the SFDR data provided.

Attachment A provides verification that the recovered Line Replaceable Units (LRU) were functioning properly at the time of the mishap.

The information in this report does not contain any Boeing proprietary information.

# Observations

#### Takeoff Planning (TOLD) Data Summary

Takeoff data are calculated based on gross weight and pressure altitude recorded at takeoff brake release from the SFDR data, plus temperature and wind data as reported by the tower.

Elmendorf AFB - Runway 06

Runway Length: 10,000 ft Runway Slope: +0.3%

Tower Reported Altimeter Setting (QNH): 30.04 in Hg

Pilot Altimeter Setting: 29.834 in Hg (resulting in display baro-altitude of zero ft, see Attachment B for

detailed explanation) Field Elevation: 174 ft

Pressure Altitude: 80 ft (at ground roll start)

Temperature: 13°C Wind: from 240 at 4 knots

Takeoff Gross Weight: 344,960 lbs

Rotation Speed: 103 knots calibrated airspeed (KCAS)

Minimum Climbout Speed: 133 KCAS Minimum Flap Retract Speed: 150 KCAS Minimum Slat Retract Speed: 193 KCAS

Minimum Maneuver Speed: 193 KCAS (clean configuration)

# Time-History from SFDR data

The events during the flight are presented chronologically with notes describing the condition of the aircraft and the actions taken by the crew. Key parameters are listed for each event.

- Delta Time: Time referenced from the SFDR time of 87403.938 sec which is approximately GMT 02:21:31
- Speed (KIAS): Knots indicated airspeed (KIAS) which does not include position error corrections
- Pressure Alt (ft): Pressure Altitude corrected for position error
- Local AOA (deg): Local Vane Corrected Angle of Attack (AOA) is the average of the three local vane pairs' angle of attack corrected for sideslip effects.
- Pitch Attitude (deg): Inertial Reference Unit (IRU) derived Pitch Attitude
- Roll Attitude (deg): IRU derived Roll Attitude.

SFDR time history plots of flight and aircraft parameters are presented in Attachment C, Figures 1 – 4. Figure 5 includes calculated parameters and smoothed SFDR parameters. These figures are the basis for the following timeline event descriptions. Attachment D is a description of the SFDR parameters used to create figures in Attachment C.

#### **Event: Brake Release**

| Delta Time | Speed  | Pressure Alt | Local AOA | Pitch Attitude | Roll Attitude |
|------------|--------|--------------|-----------|----------------|---------------|
| (sec)      | (KIAS) | (ft)         | (deg)     | (deg)          | (deg)         |
| 2.38       | 0      | 80           | 2.5       | 1.1            |               |

Maximum Thrust was set for takeoff and was maintained throughout the flight with the
exception that the throttles were retarded and immediately advanced back to Maximum
Thrust at Delta Time 64.45 seconds.

#### **Event: Rotation**

| Delta Time | Speed  | Pressure Alt | Local AOA | Pitch Attitude | Roll Attitude |
|------------|--------|--------------|-----------|----------------|---------------|
| (sec)      | (KIAS) | (ft)         | (deg)     | (deg)          | (deg)         |
| 17.50      | 115    | 88           | 0.2       | 0.0            |               |

• Calculated pitch rotation rate = 7 degrees per second

#### **Event: Liftoff and Climbout**

| Delta Time | Speed  | Pressure Alt | Local AOA | Pitch Attitude | Roll Attitude |
|------------|--------|--------------|-----------|----------------|---------------|
| (sec)      | (KIAS) | (ft)         | (deg)     | (deg)          | (deg)         |
| 21.13      | 128    | 88           | 17.8      | 19.3           | 1.8           |

- Calculated airspeed = 128 KCAS
- Calculated fuselage AOA = 12.0 deg
- · Decelerates during climb
- Pitch attitude reaches a maximum of 40 degs
- An anomaly in indicated airspeed occurs near the time of maximum pitch, most likely due to wake from the nose landing gear door transition
- Master caution annunciates shortly thereafter ("TANK NOT INERT")
- Minimum speed reached during climb = 107 KCAS
- V<sub>MCO</sub> = 133 KCAS

# Calibrated Airspeed Calculation Description

The SFDR data stream records indicated airspeed which is not corrected for position errors typically present at the 4 pitot-static probe locations on the aircraft. The position errors are caused by the pressure field created by the aircraft, and vary as a function of aircraft flight condition and flap position. During the original C-17 flight test program, air data calibration tests were conducted to define the corrections to be applied to the measured static pressure and total pressure for each pitot-static system to accurately account for position error. These corrections were implemented in the ATD Data Computer (ADC) software which outputs calibrated air data parameters for display to the flight crew at all times, e.g., calibrated airspeed, pressure altitude, true Mach number, and true airspeed. Analysis of the SFDR data required calculations to obtain the calibrated air data parameters noted above, in accordance with the software algorithms defined in the ADC software.

#### Fuselage Angle of Attack Calculation Description

There are six Angle-of-Attack (AOA) vanes on a C-17A aircraft. Each AOA vane measures a local AOA. The local AOA values measured by each of the six AOA vanes are used to compute the Fuselage Angle of Attack (FUAOA). In addition to the local AOA measured by each of the six AOA vanes, the computation of FUAOA is a function of roll rate, pitch rate, flap position, and true Mach number. The local AOA recorded by the SFDR includes the corrections for sideslip and roll rate. The SFDR does not record fuselage AOA; therefore, fuselage AOA is calculated using local AOA, true airspeed, true Mach number, pitch rate, and flap position. The calculation is consistent with the Flight Control Computer (FCC) computation of fuselage AOA.

# **Event: Landing Gear Up & Locked**

| Delta Time | Speed  | Pressure Alt | Local AOA | Pitch Attitude | Roll Attitude |
|------------|--------|--------------|-----------|----------------|---------------|
| (sec)      | (KIAS) | (ft)         | (deg)     | (deg)          | (deg)         |
| 31.20      | 111    | 856          | 9.5       | 24.1           | 2.8           |

- Calculated airspeed = 107 KCAS
- Calculated fuselage AOA = 6.2 deg

# **Event: Initiates Left Turn**

| Delta Time | Speed  | Pressure Alt | Local AOA | Pitch Attitude | Roll Attitude |
|------------|--------|--------------|-----------|----------------|---------------|
| (sec)      | (KIAS) | (ft)         | (deg)     | (deg)          | (deg)         |
| 32.51      | 111    | 904          | 13.0      | 24.1           |               |

- Calculated airspeed = 108 KCAS
- Calculated fuselage AOA = 8.5 deg
- Rolls from wings level to a maximum of 58 deg left wing down (LWD)
- Average roll rate = 15 deg/sec
- V<sub>MMA</sub> = 138 KCAS for flaps ½ slats extended

#### **Event: Max Left Roll Attitude**

| Delta Time | Speed  | Pressure Alt | Local AOA | Pitch Attitude | Roll Attitude |
|------------|--------|--------------|-----------|----------------|---------------|
| (sec)      | (KIAS) | (ft)         | (deg)     | (deg)          | (deg)         |
| 36.07      | 111    | 1016         | 16.0      | 15.5           | -57.7         |

- Calculated airspeed = 115 KCAS
- Calculated fuselage AOA = 9.5 deg
- Vertical acceleration (Nz) increases to 1.5g
- Accelerates during turn

# **Event: Initiates Return to Wings Level**

| Delta Time | Speed  | Pressure Alt | Local AOA | Pitch Attitude | Roll Attitude |
|------------|--------|--------------|-----------|----------------|---------------|
| (sec)      | (KIAS) | (ft)         | (deg)     | (deg)          | (deg)         |
| 43.57      | 142    | 984          | 17.0      | 6.5            |               |

- Calculated airspeed = 144 KCAS
- Calculated fuselage AOA = 10.0 deg
- Rolls back from LWD to wings level
- Average roll rate = 20 deg/sec

# Event: Moves Flap/Slat Handle to 0/EXT

| Delta Time | Speed  | Pressure Alt | Local AOA | Pitch Attitude | Roll Attitude |
|------------|--------|--------------|-----------|----------------|---------------|
| (sec)      | (KIAS) | (ft)         | (deg)     | (deg)          | (deg)         |
| 45.32      | 150    | 936          | 17.0      | 7.2            |               |

- Calculated airspeed = 151 KCAS
- Calculated fuselage AOA = 9.6 deg
- V<sub>MFR</sub> = 150 KCAS

#### **Event: Initiates Wings Level Acceleration**

| Delta Time | Speed  | Pressure Alt | Local AOA | Pitch Attitude | Roll Attitude |
|------------|--------|--------------|-----------|----------------|---------------|
| (sec)      | (KIAS) | (ft)         | (deg)     | (deg)          | (deg)         |
| 46.07      | 155    | 936          | 14.2      | 7.2            | 1.1           |

- Calculated airspeed = 154 KCAS
- Calculated fuselage AOA = 8.5 deg
- Accelerates at approximately 4 knots/sec
- Constant altitude

# **Event: Flap Retract Begins**

| Delta Time | Speed  | Pressure Alt | Local AOA | Pitch Attitude | Roll Attitude |
|------------|--------|--------------|-----------|----------------|---------------|
| (sec)      | (KIAS) | (ft)         | (deg)     | (deg)          | (deg)         |
| 46.32      | 155    | 936          | 14.2      | 7.2            | 1.1           |

- Calculated airspeed = 155 KCAS
- Calculated fuselage AOA = 8.0 deg
- Flaps begin retracting: current average flap 19 deg

# Event: Moves Flap/Slat Handle to UP/RET

| Delta Time | Speed  | Pressure Alt | Local AOA | Pitch Attitude | Roll Attitude |
|------------|--------|--------------|-----------|----------------|---------------|
| (sec)      | (KIAS) | (ft)         | (deg)     | (deg)          | (deg)         |
| 53.31      | 188    | 888          | 8.2       | 8.3            | 1.4           |

- Calculated airspeed = 188 KCAS
- Calculated fuselage AOA = 6.3 deg
- Pilot commands A/C nose right rudder pedal force
- · Pilot commands right wing down roll
- $V_{MSR} = 193 \text{ KCAS}$

# **Event: Initiates Right Turn**

| Delta Time | Speed  | Pressure Alt | Local AOA | Pitch Attitude | Roll Attitude |
|------------|--------|--------------|-----------|----------------|---------------|
| (sec)      | (KIAS) | (ft)         | (deg)     | (deg)          | (deg)         |
| 53.50      | 188    | 888          | 8.2       | 9.0            |               |

- Calculated airspeed = 189 KCAS
- Calculated fuselage AOA = 6.5 deg
- Average roll rate = 24 deg/sec
- Current average flap: 2.25 deg

See stability and control assessment presented in Attachment E.

# **Event: Flap Retract Complete**

| Delta Time | Speed  | Pressure Alt | Local AOA | Pitch Attitude | Roll Attitude |
|------------|--------|--------------|-----------|----------------|---------------|
| (sec)      | (KIAS) | (ft)         | (deg)     | (deg)          | (deg)         |
| 54.12      | 188    | 888          | 8.3       | 6.7            |               |

- Calculated airspeed = 191 KCAS
- Calculated fuselage AOA = 7.1 deg
- Current average flap: 0 deg
- Slats still extended

# Event: Pilot Holds Roll Attitude: Approximate 60 deg Right Wing Down (RWD)

| Delta Time | Speed  | Pressure Alt | Local AOA | Pitch Attitude | Roll Attitude |
|------------|--------|--------------|-----------|----------------|---------------|
| (sec)      | (KIAS) | (ft)         | (deg)     | (deg)          | (deg)         |
| 56.06      | 194    | 888          | 18.5      | 6.5            |               |

- Calculated airspeed = 197 KCAS
- Calculated fuselage AOA = 11.0 deg
- Holding steady speed and altitude during roll
  - aircraft is no longer accelerating or climbing, even though engine thrust has not changed
  - aircraft has no excess energy
- Full A/C nose right rudder pedal force
- Vertical Acceleration (Nz) at approximately 2 g's
- Stall roll limit displayed on heads up display (HUD): 60 deg (0/EXT), 57 deg (UP/RET)

#### **Event: Slats Retract Begins**

| Delta Time | Speed  | Pressure Alt | Local AOA | Pitch Attitude | Roll Attitude |
|------------|--------|--------------|-----------|----------------|---------------|
| (sec)      | (KIAS) | (ft)         | (deg)     | (deg)          | (deg)         |
| 57.19      | 194    | 888          | 20.5      | 4.9            | 52.4          |

- Calculated airspeed = 199 KCAS
- Calculated fuselage AOA = 11.9 deg
- Holding steady speed and altitude during roll
- Full A/C nose right rudder
- · Yaw damper is active to eliminate yaw rate
  - Only the lower rudder provides yaw damping below 15 deg of fuselage AOA and both rudders provide yaw damping above 17 deg
  - Yaw damping indicates that the fuselage AOA is at or below 15 deg

# **Event: Stall Warning Activates**

| Delta Time | Speed  | Pressure Alt | Local AOA | Pitch Attitude | Roll Attitude |
|------------|--------|--------------|-----------|----------------|---------------|
| (sec)      | (KIAS) | (ft)         | (deg)     | (deg)          | (deg)         |
| 57.45      | 194    | 888          | 20.5      | 4.9            |               |

- Calculated airspeed = 199 KCAS
- Calculated fuselage AOA = 11.4 deg
- Stall warning is active after first slat starts to retract
- Stall warning is based on UP/RET Aircraft/Propulsion Data Management Computer (APDMC) stall warning activation logic
- Aural stall annunciation ("STALL") comes on and remains on for eight seconds and then is
  overridden by the ground proximity sink rate annunciation ("SINK RATE") and subsequent first
  portion of the ground proximity terrain, fly up annunciation ("WHOOP, WHOOP")
- Stick shaker commences simultaneously with aural stall warning and continues for the remainder of the SFDR data
- Full A/C nose right rudder pedal force
- Pilot maintains A/C nose up control stick force
- Pilot allows roll attitude to continue increasing despite stall warning annunciation

# **Event: Pilot Applies LWD Control Stick to Control Bank**

| Delta Time | Speed  | Pressure Alt | Local AOA | Pitch Attitude | Roll Attitude |
|------------|--------|--------------|-----------|----------------|---------------|
| (sec)      | (KIAS) | (ft)         | (deg)     | (deg)          | (deg)         |
| 58.20      | 194    | 888          | 17.0      | 3.2            | 55.5          |

- Calculated airspeed = 199 KCAS
- Calculated fuselage AOA = 9.6 deg
- Cross controls commanded: LWD control stick with A/C nose right pedal
- Pilot maintains A/C nose up control stick force

Note: A/C was controllable as evidenced by the pilot's ability to control to  $\sim 60$  deg roll attitude

# **Event: AOA Limiter System (ALS) Activates**

| Delta Time | Speed  | Pressure Alt | Local AOA | Pitch Attitude | Roll Attitude |
|------------|--------|--------------|-----------|----------------|---------------|
| (sec)      | (KIAS) | (ft)         | (deg)     | (deg)          | (deg)         |
| 61.63      | 198    | 888          | 20.8      | 0              |               |

- Calculated airspeed = 200 KCAS
- Calculated fuselage AOA = 12.4 deg
- ALS activates approximately 3.5 sec after 5 of the 8 slats indicate not extended
- Pilot continues cross controls commands: LWD control stick with A/C nose right pedal
- Full A/C nose right rudder pedal force
- · Pilot maintains A/C nose up control stick force
- · Slat retraction continues

# **Event: Aircraft Stalls**

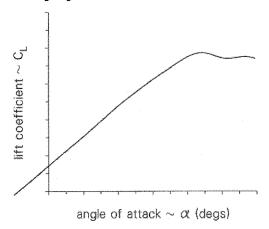

| Delta Time | Speed  | Pressure Alt | Local AOA | Pitch Attitude | Roll Attitude |
|------------|--------|--------------|-----------|----------------|---------------|
| (sec)      | (KIAS) | (ft)         | (deg)     | (deg)          | (deg)         |
| 61.75      | 198    | 888          | 20.8      | 0              |               |

- Calculated airspeed = 200 KCAS
- Calculated fuselage AOA = 12.5 deg
- Aircraft enters stall as defined by conventional stall criteria (g break, loss of control about a single axis, AOA effects, or excessive sink rate)
  - Vertical acceleration (NZ) peaks at 2.42 g's and subsequently decreases, while AOA continues to increase
  - o RWD roll rate increases to approximately 8 deg/sec
  - $\circ\quad$  Fuselage AOA increases at a rate of approximately 1 deg/sec
  - Pitch begins decreasing
- Pilot goes to full LWD control stick force
- Pilot changes rudder pedal force from full A/C nose right to A/C nose left
- Pilot maintains A/C nose up control stick force

**Stall Onset** - During slat retraction, while executing a 2.4 g, 63 deg right turn with full nose right rudder, the aircraft stalled. The calculated fuselage angle of attack of the aircraft at this time is 12.5 degrees. The flight test derived wings level stall angle of attack is approximately 24 degrees for the 0/EXT configuration, and approximately 14 degrees for UP/RET.

Attachment C, Figure 5 presents a comparison between the aircraft calculated calibrated airspeed and the flight manual calculated stall speed derived from the SFDR vertical acceleration, NZ (g), and estimated slat effectiveness. At the initiation of the right turn there is approximately knots stall speed margin. As the aircraft reaches a 60 degree bank, this margin has been reduced to approximately knots. With the slats retracting, the stall warning activates. As the slats retract over the next 4.5 seconds and the vertical acceleration increases to 2.4 g's (63 deg bank) the aircraft stall speed margin has been eliminated and the aircraft stalls. At the time of decreasing airspeed and increasing AOA, the calculated stall speed is KCAS; CCAS above the aircraft speed. This analysis does not include the effect of sideslip on stall speed. Insufficient data exists to compute sideslip effect on stall speed given the large bank angle and cross-control configuration of the aircraft, however sideslip would increase stall speed.

The nature of a powered-lift airplane, such as the C-17, is such that a wing stall does not produce an abrupt break in lift. At stall, there is a gentle round-over of the lift curve and not a sharp drop-off of the lift as shown in the following diagram:

# **Event: Outboard Slat Retract Complete**

| Delta Time | Speed  | Pressure Alt | Local AOA | Pitch Attitude | Roll Attitude |
|------------|--------|--------------|-----------|----------------|---------------|
| (sec)      | (KIAS) | (ft)         | (deg)     | (deg)          | (deg)         |
| 63.20      | 191    | 840          | 25.8      | -3.3           | 70.7          |

- Calculated airspeed = 197 KCAS
- Calculated fuselage AOA = 15.5 deg
- ALS is reducing the A/C nose up elevator deflection
- Final commanded A/C nose left rudder pedal force is reached
- Pilot reaches maximum LWD control stick force
- · RWD roll rate decreases but RWD roll attitude continues to increase
- AOA continues to increase
- Pitch continues to decrease
- Altitude is decreasing
- · Decreasing airspeed is consistent with increasing AOA after stall

# **Event: Aircrew Initiates a Momentary Throttle Reduction**

| Delta Time<br>(sec) | Speed<br>(KIAS) | Pressure Alt<br>(ft) | Local AOA<br>(deg) | Pitch Attitude<br>(deg) | Roll Attitude<br>(deg) |   |
|---------------------|-----------------|----------------------|--------------------|-------------------------|------------------------|---|
| 64.45               | 182             | 800                  | 30.0               | -7.2                    | 78.8                   | l |

- Calculated airspeed = 189 KCAS
- Calculated fuselage AOA = 17.4 deg
- Negligible effect on thrust
- Total event approximately 1 sec

# **Event: Slat Retract Complete**

| Delta Time | Speed  | Pressure Alt | Local AOA | Pitch Attitude | Roll Attitude |
|------------|--------|--------------|-----------|----------------|---------------|
| (sec)      | (KIAS) | (ft)         | (deg)     | (deg)          | (deg)         |
| 65.20      | 175    | 736          | 31.0      | -12.1          | 80.5          |

- Calculated airspeed = 185 KCAS
- Calculated fuselage AOA = 18.1 deg
- RWD roll rate and AOA rate have been arrested
- Pitch continues to decrease
- Altitude continues to decrease

# Event: GPWS Sink Rate (Mode 1) Initiates

| Delta Time | Speed  | Pressure Alt | Local AOA | Pitch Attitude | Roll Attitude |
|------------|--------|--------------|-----------|----------------|---------------|
| (sec)      | (KIAS) | (ft)         | (deg)     | (deg)          | (deg)         |
| 65.63      | 175    | 736          | 32.0      | -14.4          | 82.6          |

- Calculated airspeed = 183 KCAS
- Calculated fuselage AOA = 18.7 deg
- Sink rate (pressure altitude) = -3300 FPM
- Stick shaker (stall warning) remains active
- Copilot applies A/C nose up and LWD control stick force inputs, consistent with the pilot inputs

#### **Event: A/C Response to Aircrew and ALS Commands**

| Delta Time | Speed  | Pressure Alt | Local AOA | Pitch Attitude | Roll Attitude |
|------------|--------|--------------|-----------|----------------|---------------|
| (sec)      | (KIAS) | (ft)         | (deg)     | (deg)          | (deg)         |
| 67.00      | 175    | 640          | 32.0      | -18.5          |               |

- Calculated airspeed = 181 KCAS
- Calculated fuselage AOA = 19.2 deg
- Pitch stabilized
- AOA stabilized
- Roll rate reverses to 5 deg/sec LWD
- Both pilots continue to apply LWD control stick force
- · Pilot nose up control stick force decreases, while copilot nose up control stick force increases

Note: The stabilization of pitch, AOA and roll rate indicates that the aircraft is responding to pilot and ALS inputs.

#### **Event: End of SFDR Data Stream**

| Delta Time | Speed  | Pressure Alt | Local AOA | Pitch Attitude | Roll Attitude |
|------------|--------|--------------|-----------|----------------|---------------|
| (sec)      | (KIAS) | (ft)         | (deg)     | (deg)          | (deg)         |
| 69.30      | 175    | 304          | 32.0      | -16.9          | 63.6          |

- Calculated airspeed = 184 KCAS
- Calculated fuselage AOA = 19.6 deg

# Conclusion

Based on a thorough analysis of SFDR data the Boeing technical team reached the following conclusion:

The aircraft systems responded as expected to aircrew inputs throughout the flight. The aircrew configured the aircraft into a stall condition by transitioning the slats from extended to retracted position at the initiation of the right bank turn. Pilot delayed in responding to the stall warning. This resulted in the aircraft stalling at the large bank angle while the slats were retracting. Although the aircraft responded to aircrew and ALS commands, sufficient altitude was not available to recover from the stall condition.

#### Attachment A

# Analysis of data from recovered Line Replaceable Units (LRUs)

After the mishap USAF recovered 1 Air Data Computer (ADC), 1 Aircraft/Propulsion Data Management Computer (A/PDMC), 1 Core Integrated Processor (CIP), 2 Flight Control Computers (FCC), 1 Spoiler Control/Electronic Flap Computer (SC/EFC), the Standard Flight Data Recorder (SFDR) system's Crash Survivable Memory Unit (CSMU) LRU and 1 Warning and Caution Computer (WCC). These LRUs were sent to their respective manufacturers for download of the Non-volatile Random Access Memory (NVRAM). A summary of the NVRAM for each of the LRUs is provided below.

#### Air Data Computer (ADC)

The modernized ADC, Part Number 4090200-901, is capable of storing fault data for the current flight and four previous flight legs. Once five flight legs have been reached, the initiation of a new flight leg will overwrite the oldest flight leg and the data contained in that flight leg will no longer be available for retrieval. When a fault occurs the ADC will store pertinent data to aid in fault isolation of LRU/aircraft issues. Each ADC will store the following data per occurrence:

- Flight Leg No.
- Fault ID
- Fault Count
- PBIT 1
- PBIT 2
- DV1
- DV2
- Ps (in Hg)
- Pt (mB)
- Baro Set
- TAT
- GMT GMT Valid

Each ADC contains two independent air data modules capable of computing air data. Each air data module stores the last five flight legs. ADC Serial Number 32083773, was received and NVRAM from each of the air data modules was downloaded in accordance with Honeywell Engineering Specification EB409337. No fault codes/engineering information was present in either of the LRUs two air data modules for the last five flight legs. Since there were no faults in the previous five legs, no engineering parameters were stored in the unit for the mishap. These result along with the SFDR

#### Aircraft/Propulsion Data Management Computer (A/PDMC)

data are indications that this ADC was functioning within acceptable operating limits.

The legacy APDMC, Part Number 17B1U6005-547, is capable of storing 256 12 bit words, approximately 20 seconds, in fault history. Fault history is retrieved on a "first in last out" basis (i.e. current faults are stored at the end of the 256 word memory. In addition to fault history, aircraft parameter data is stored in the Electrically Erasable Programmable Read-Only Memory (EEPROM), address range x3A000 to x3E27F.

Serial number 97010788 was received at Hamilton Sundstrand with damage to the chassis and power supply that prevented the LRU from being powered. The I/O Processor CCA, which appeared undamaged, was removed and installed in a lab LRU. The LRU completed checkout and the NVRAM was downloaded. The NVRAM has been forwarded to the APDMC Software Engineer for a complete

Page Attachment A - 1

analysis. The analysis is expected to be completed by October 01, 2010. The EEPROM data was requested from Hamilton Sundstrand and analysis will require three to four days after receipt. From observing the FDR data it appears that the No. 2 APDMC was functioning normally, since all of the data recorded by the SFDR is calculated or transmitted through APDMC 2. In the SFDR data we able to see that APDMC 1 output Stall Warning to APDMC 2 as an indication that APDMC 1 was functional.

#### Core Integrated Processor (CIP)

The downloaded flash memory is typically used to extract the event logs which provide information related to CIP restarts and is used to trouble shoot anomalies. The NVRAM provided is not in the usual format for analysis and will need additional processing. The CIP is being shipped to the Avionics Integration Support Facility (AISF) Lab to support data collection and analysis. Using available data the Software Engineers estimate one week to complete their analysis. From the SFDR data and CVR audio there were no indications of a CIP degraded mode or loss of mission computer function.

#### Flight Control Computer (FCC) / Spoiler Control/Electronic Flap Computer (SC/EFC)

The FCC Fault History and Pre-flight Built in Test (PFBIT) data did not contain any faults.

SC/EFC Fault History data did not contain any faults. SC/EFC Hydraulic PFBIT contained a BLIN code CD5 (Flap Fail Lamp FCS Panel lamp Failure) fault. This fault was most likely caused by one bad light bulb in the Flap Fail light of the FCS Actuator Panel.

#### Standard Flight Data Recorder (SFDR)

Data was decoded using GE Aviation's Integrated Ground Software (IGS). Errors detected during decoding were associated with an unclosed file associated with loss of power. GE Aviation confirmed that all available data was extracted and available for analysis.

Analysis of the SFDR time history tables, used to reconstruct a timeline of the mishap, found no missing or invalid data; indicating all of the systems sending data to the SFDR were functioning normally.

# Warning and Caution Computer (WCC)

The WCC contains 32Kbytes of NVRAM for the storage of BIT detected faults during power on built in test (POBIT), initiated built in test (IBIT) and periodic built in test (PBIT). The NVRAM is time stamped with GMT or the WCC's Elapsed Time Indicator (ETI) value if GMT is not available.

The NVRAM was downloaded from the LRU and provided to Boeing for analysis.

Preliminary Analysis shows flight leg no. 3 is the current flight leg. Several faults were indicated in the NVRAM. WAP, HCU2, ADS, OBG2 FDR and ECS2 were faulted one time at 2:22 GMT. ECS1 showed 3 faults. However, ECS1 type faults (environmental systems) would not be a contributor to the mishap.

As there are no faults prior to 2:22 GMT and the mishap occurred at 2:22 GMT, it appears as though the WCC was functioning properly up to that time. Additionally, the WCC is the bus controller for the Warning and Caution System (WACS) bus. The APDMC and SFDR are remote terminals on the WASC bus, since these LRUs were operating normally, this would also imply that the WCC was functioning normally.

Page Attachment A - 2

# Attachment B

# P-73 AIB Pressure Altitude versus Baro-Corrected Altitude

The aircraft landed from the previous flight with a Baro Correction of 30.047 in-Hg.

The tower reported Baro Correction was 30.04 in-Hg.

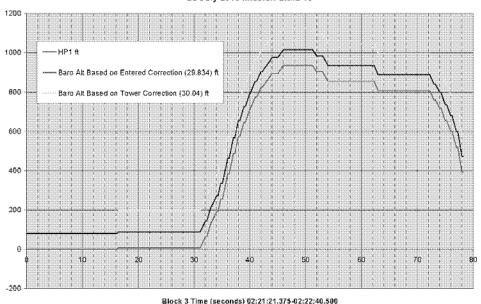

For the incident flight, the SFDR recorded Baro Correction was 29.834 in-Hg throughout the flight.

The Baro-Corrected altitude computed by the ADC during the ground roll, with a Baro Correction (BC) of 29.834 in-Hg and Pressure Altitude (HP) of 80 feet, would be approximately zero feet. Therefore, the Baro-Altitude displayed in the HUD/PFD would be approximately zero feet when the brakes were released.

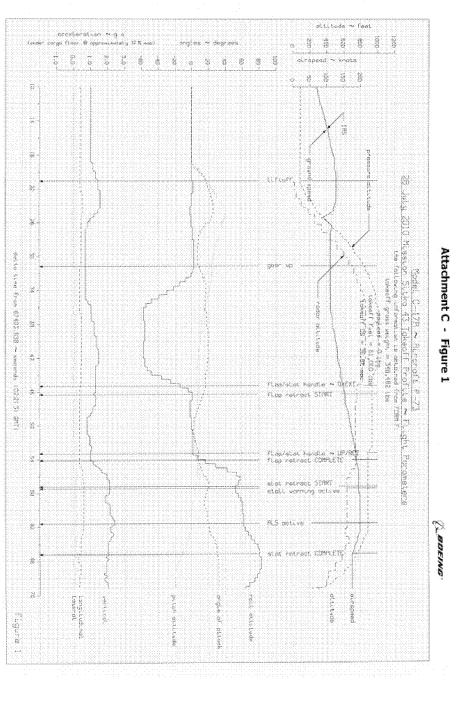

The SFDR Mishap Data does not record Baro-Corrected Altitude. Baro-Corrected altitude was computed using the SFDR Baro Correction (BC) and Pressure Altitude (HP1).

The plot below shows the Pressure Altitude (HP1) recorded by the SFDR, along with the Baro-Corrected Altitude based on the Baro-Correction set in the aircraft (29.834 in-Hg) and the Baro-Corrected Altitude based on the Baro-Correction reported by the tower (30.04 in-Hg)

### Stability and Control Assessment of the SFDR Data

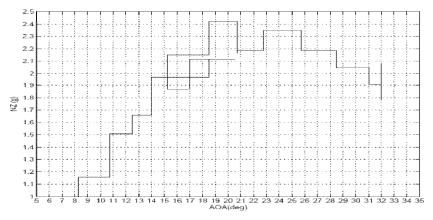

### Overview:

Beginning at 53.5 seconds, a roll rate of approximately 20 degrees/sec was applied to achieve a 60 degree bank angle. Rudder pedal input was applied concurrently in the same direction as the desired roll, and occurred in two major steps.

- A 20 pound Aircraft-Nose-Right (ANR) input was initially applied. The upper rudder goes from 2 degrees Aircraft-Nose-Left (ANL) to -2 degrees ANR. The lower rudder shows apparent Yaw Damper response.
- Subsequently, and from about 55 to 62 seconds, the ANR rudder input is much more significant, yielding around -15 degrees of rudder, which slowly ramps out.

That significant pedal input (ANR) appears to gradually increase the roll attitude (Roll rate due to sideslip effects). For most of the larger rudder pedal force (ANR), the roll control stick input is actually in the *apposite* direction (Left-Wing-Down; LWD), resulting in an alarming cross-controls situation while at a high angle-of-attack and a large bank angle (unlike a steady-heading sideslip, where bank angles are much lower).

By this time (about 62 seconds), the data indicate that the aircraft has stalled. The following chart compares the vertical load factor (Nz) to the local angle of attack (AOA), showing that the latter continues to increase while the former holds fairly steady and then drops somewhat. This confirms that the aircraft entered a stall condition (post-stall lift curve) during the right turn. This chart plots SFDR data from time 54 seconds onwards, corresponding to the flaps retracted/slats retracting portion of the event.

At approximately 62.5 seconds, both airspeed and altitude begin decreasing. At the same time, roll rate builds up in the Right-Wing-Down (RWD) direction, increasing the already-high RWD bank angle. Pitch falls as roll builds up. The pilot reacts to this increase in roll with significant LWD control stick, deploying the left wing spoilers to near maximum. As the altitude decreases, alpha continues increasing, as expected. Vertical acceleration, though, as previously noted, stays fairly constant confirming the aircraft has stalled. The pilot then removes the large ANR pedal input and instead makes an ANL input in an apparent attempt to get out of the right turn, but runs out of altitude.

### Attachment E

### **Chronological Account:**

- 1. Thrust was greater than "thrust for level flight" for most of the event (i.e. there was excess energy available) since the airspeed and/or altitude generally increased until the final right turn was well established.
- 2. Bank angle above 60 deg was reached in the final right turn, thus reducing the margin to stall.
- 3. For the right turn, what looks like an unusual and large rudder pedal input was made during the turn. Such aggressive and large inputs are typical of trying to "kick" the aircraft into the bank/turn more rapidly than roll control stick alone would achieve.
- 4. While the bank angle appeared to be beyond the target value, additional rudder pedal input was made. The SFDR data show that the pilot then commanded opposite (cross-control) roll control stick input. The roll attitude stabilized (low roll rate) to a bank angle that was higher than the target.
- 5. Some sideslip angle resulted from this configuration/condition (SFDR Ny > 0 g's), likely further increasing aircraft drag.
- 6. During the right turn, the previous "excess energy" from the engines has dissipated (airspeed and altitude are now constant, EPR hasn't changed significantly). The flaps are retracted while the slats are still deployed, which would have resulted in less drag than before (i.e. with ½ flaps when the aircraft showed excess energy), except that now the aircraft was facing additional drag due to high-alpha, cross-control (spoiler + sideslip), and possibly rudder drag. The aircraft is on the verge of stalling. It looks like it is flying in the roundover/separation region of the lift-alpha curve, if it hasn't already stalled. The wings are still producing some lift, however, since vertical acceleration hasn't dropped appreciably.
- 7. As the slats continue to retract as commanded, the SFDR shows a negative energy situation. Airspeed and altitude both drop leading to an increase in alpha without a corresponding increase in Nz. This is indicative of post-stall operation. Drag has likely increased further.
- 8. In this post-stall condition (>62 seconds) roll rate builds up to several degrees per second (approx 10 deg/sec) from the existing already-high bank angle (approx 60 deg). At such regions of high-alpha/post-stall, lateral (and pitch) control effectiveness diminishes. Rudder input is still in the RWD direction at this point. Because the rudder probably loses less effectiveness than the spoilers, the rudder is "winning" in the cross-control battle to roll the aircraft. Meanwhile pitch attitude is dropping as expected if roll builds up with no increased pitch control inputs and/or reduced pitch control effectiveness.
- 9. The pilot then abruptly reverses pedal input (ANR to ANL) and commands full LWD control stick. However, the high RWD roll rate takes time to reverse. Given the stall, the lateral controls' effectiveness is limited and the LWD input generates a smaller-than-normal negative roll acceleration. As the roll attitude stabilizes and then starts to reverse toward wings level, pitch attitude stabilizes.
- 10. Aircraft runs out of altitude before the LWD roll rate can significantly build up and reduce the extreme roll attitude

### Dispositions

Material meets specification requirements with respect to the test(s) conducted. GC is typical for a JP-8 type fuel. Report amended to add GC comment.

### Dispositions:

For information purposes only.

Sample had a high percentage of particulates. The GCMS of the filtered sample was that of a typical JP-8 type fuel. SEM/XRF analysis showed that the particulates are composed primarily of oxygen, aluminum, and silicon, with minor amounts of iron, chromium, and zinc. They are most likely clay particles. The particle size ranged from 10-400 micrometers.

| To:<br>Subject: RE:                      | Hydraulic Fluid Analysis                                                   |

After reviewing the laboratory report for the C-17 00-0173 hydraulic fluid sample, I've concluded that the results are fairly typical for a sample of in-service fluid, particularly for one from a hydraulic system that had been open to the air for some length of time.

The acid number requirement for new MIL-PRF-83282 fluid is 0.10 maximum rather than 0.20, but the measured result of 0.22 is not unusual for in-service fluids. Viscosity @ -54 degrees C is not required for MIL-PRF-83282. The viscosity requirements @ -40, +40, and +100 degrees C are actually 2200 max, 14 min, and 3.45 min, respectively, so all of the measured viscosities are either within or very close to the spec limits. Lastly, the measured water content at 470 ppm is considerably highter than our on-aircraft limit of 300 ppm given in OATP 17T0C3601, but this may be attributed to the system's exposure to atmospheric moisture or liquid water as a result of the incident.

Please let me know if you have any other questions.

Thanks.

### Dispositions:

Coordinated with

For information purposes only.

GC was that of a typical MIL-PRF-83282 for both bottle "A" and "B".

The stated limits in this report are for new unused fluid and are provided for reference purpose only. The condition of the fluid and how the sample was taken will affect the test results.

<sup>\*\*</sup> Date as provided by customer

Continuing with yesterday's email, the following additional information is provided for your consideration:

Per SAE AIR 810C, the MIL-PRF-83282 new fluid requirements and in-service limits for for the fluid properties tested in the subject lab report are as follows: **Acid Number** (mg KOH/g): New Fluid Reqmt: 0.10 max. In-Service Limit: 0.30 max.

Pour Point (deg C): New Fluid Reqmt: -55 max. In-Service Limit: none recommended

Water (ppm): New Fluid Reqmt: 100 max. In-Service Limit: 300 max.

Viscosity (cSt): -40 deg C New Fluid Requirement: 2200 max. In-Service Limit: none recommended 40 deg C New Fluid Requirement: 14.0 min. In-Service Limit: +10%, -15% (or 15.4 to 11.9) 100 deg C New Fluid Requirement: 3.5 min. In-Service Limit: none recommended

Based on these values, the pass/fail status of the fluid samples is as follows:

**Acid Number:** The 0.22 mg KOH/g result exceeds the new fluid requirement, but does meet the in-service limit.

Pour Point: The -72 deg C result meets the new fluid requirement.

**Water:** The 470 ppm result exceeds the new fluid requirement, as well as the in-service limit (by 170 ppm). Exposure to elevated temperatures during a fire would tend boil out any water that may initially be in the hydraulic fluid. Afterwards however, the hygroscopic nature of the MIL-PRF-83282 fluid, coupled with the fluid's exposure to the elements (i.e., not contained within a closed system after the incident), may explain the fluid's higher than recommended water content in the as-tested condition.

Viscosity: At -40 deg C, the 1968 cSt result meets the new fluid requirement.

At 40 deg C, the 13.9 cSt result nearly meets the new fluid requirement, and does meet the in-service limit.

At 100 deg C, the 3.50 cSt result meets the new fluid requirement.

Regards,

Mechanical Fluid Systems C-17 Aircraft Systems Boeing Defense, Space & Security With regard to the attached fluid test report, the following observations are provided:

- The Min/Max values that are listed for the tested fluid parameters are for hydraulic oil per MIL-PRF-5606. This is consistent with the entries provided in report's "Product:" and "Specification:" headers which state "... Petroleum Base" and "MIL-PRF-5606H (3)", respectively. However, the C-17A hydraulic systems use a synthetic hydrocarbon base fluid per MIL-PRF-83282. The Gas Chromatography results in the "Dispositions:" section of the report bear this out. As such, the Min/Max values for the MIL-PRF-83282 fluid will be different than those listed in this report.
- The Min/Max values that are listed are for "...new unused fluid". However, it
  would be more appropriate to compare the measured values against In-Service
  Limits when assessing the operating condition of the hydraulic fluid.
- Both of the above two issues will affect the pass/fail status of the measured fluid properties.
- In-Service Limits for MIL-PRF-83282 fluid properties can be found in the attached SAE Aerospace Information Report (see Table 2 on page 5 for new fluid properties, and Table 3A on page 11 for In-Service Limits).

Lastly, for any in-depth technical questions related to issues of fluid chemistry, you may want to involve one of the following experts:

Boeing, C-17 Materials and Process Engineering Oils, Lubricants and Hydraulic Fluids cognizant engineer

USAF, AFRL (retired)
Senior Materials Engineer
at Univ. of Dayton Research Institute

### Dispositions:

For information purposes only.

Sample had a high percentage of particulates. The GCMS of the filtered sample was that of a typical JP-8 type fuel. SEM/XRF analysis showed that the particulates are composed primarily of oxygen, aluminum, and silicon, with minor amounts of iron, chromium, and zinc. They are most likely clay particles. The particle size ranged from 10-400 micrometers.

## HYDRAULIC FLUID SAMPLE LOG

### CC6. BAE SYSTEMS ANALYSIS

 From:

 To:

 Subject:
 Elmendorf Units

 Date:
 Monday, September 20, 2010 6:28:47 AM

.

BAE Systems received four LRUs from the Elmendorf crash. These units are Flight Control Computers (FCCs) serial numbers 00H0434 and 96H0209, Spoiler Control Electronic Flap Computer (SCEFC) serial number 00J0259, and Core Integrated Processor (CIP) serial number 06D0533.

FCC 434, SCEFC 259 and CIP 0533 came in with their factory seal intact, and the SRUs in the LRUs matched the shipped configuration.

FCC 209 was returned in 2000 for an upgrade from a G14 to a G201 configuration. Since that time, the factory seal was broken on FCC 209, and the PS2 module was replaced in the field since the shipment in 2000. The unit originally shipped with SN 96G1203 PS2. It was received with SN 94B1101 in the PS2 slot. At some point I-Level repair of the unit was performed which BAE Systems does not receive records for.

Each of these unit's external chassis was damaged so no attempt to test the units at the LRU level was made. The units were opened and inspected. The inspection of the SRUs found all SRUs to be in a condition consistent with other field return units.

The IOP CPUs from the FCCs and SCEFC were removed and placed in a slave FCC and SCEFC so that the NVM data could be retrieved and decoded. There were no issues retrieving the NVM data. The NVM data was consistent with other working unit's NVM data on other LRUs returned from the field

The CIP IOP, CPM, IOM and AIM were removed and placed in a slave CIP allowing the NVM data to be retrieved and decoded. The fault history was also retrieved from the IOP. There were no issues retrieving the NVM or fault history data. The NVM data was consistent with other working unit's NVM data on other LRUs returned from the field.
