TRANSCRIBED INTERVIEW INTERVIEWERS: LT COL (SIB/PM), CAPT

(SIB/IO), LT COL

(SIB/PM), CAPT (SIB/HF)
INTERVIEWEE: WITNESS 3

**ROLE: 517 AS, DEMO PILOT** 

**DATE: 5 Aug 2010** 

LOCATION: ELMENDORF AFB, ALASKA, HANGAR 5

Capt. - "Today's date is August 5<sup>th</sup> and the time is 1354, and this is an interview with Maj WITNESS 3 and I am Capt. human factors members "

Lt Col – "I'm Lt investigating officer"

Lt Col – "As well as Lt Col

Lt Col We'' get with the questions and some of these may just be basic which we may already know the answer to but just to have it on the record. Have you ever been certified as an air show demo pilot "

#### WITNESS 3 -"yes"

Lt Col — "what crew position were you certified in? Safety observer, co-pilot, pilot?"

j WITNESS 3 "Pilot flying and then co-pilot and observer, so I've done all three of those"

Lt Col — "Ok and you have physically flown in all three of those positions?"

WITNESS 3 "Yes, sir"

Lt Col - "Ok, when you were certified were you certified as a hard crew?"

j<sup>WITNESS 3</sup> – "Yes, yes I was last year"

Lt Col - "Ok what, who were those other crew members?"

WITNESS 3 - "Hard crew was MP MSO do you need the whole names or?"

Lt Col - "Just that's fine"

witness 3 - "Ok MP MSO I was swapping out with MP as the pilot, we changed duties as pilot and mission commander to allow the crew rest, I worked with this one co-pilot all the time and WITNESS 8 now was our Load Master"

Lt Col - "Ok, Does the Demo AC always sit in the left seat"

WITNESS 3 - "Yes"

Lt Col - "Ok, Who was your instructor during your upgrade process?" Or did you have multiple instructors?"

WITNESS 3 – "My only instructor was MP

Lt Col — "Okay, do you know if the upgrade program that was used was derived from AMC, PACAF, locally?"

WITNESS 3 - "It was\_\_?\_246\_ I think that's the right, and then techniques were thrown in of course in between the procedure, but yeah it was, we had a whole program and if we have a copy of it somewhere you guys can have all the files, it's all packaged."

Lt Col - Right, we'll get that, what were the steps involved in your upgrade process? That you can remember, I mean like we said we do have the programs just as far as you can remember.

WITNESS 3 - Ground School we talked about the checklist variations, and how the crew member actually works, because the pilot flying doesn't really do any challenge/responses with the co-pilot and safety, we talked about how to program the jet with the box in the jet because you don't want to use the standard runway because it could be several degrees off and that's critical for a precise air show so we talked about that. We talked about how to correct when you make a turn you make an outbound heading for a few seconds and then come back in and techniques that we would use to correct for cross wings, head wings, tail wings, if show center was off center from the runway center line that type of thing"

Lt Col - Okay

WITNESS 3 - "And I'm sorry... In reference to ground training when we did the SIM and we did an EP we demonstrated, and then we would fly for SIM and they did record the SIM stuff I doubt very much that, that was kept anywhere that they ... I think I viewed the profile two or three times we all practiced. See there's four profiles in the 246 to qualify we have practiced profiles two and three. One is designed for coming in from an out base during the show landing, backing up, taking off again and going away that's profile two. Profile three is the one that was most common when you take off from the air show base leave show, come back and land and backup and depart the runway, so we practiced both of those in SIM three times and then there were three of us going through the upgrade process three pilots, and so we all three of us went through that a few times and then we went out, I had two full flights where I got to practice it for about twice each time plus a bunch of others and then I got the certification and then I viewed several shows last week."

Lt Col - "Okay, That was going to be my next question, is have you ever flown a C-17 Demo in the air show"

WITNESS 3 - "Yes, several"

Lt Col - "Okay, Which profile did you fly?"

WITNESS 3 – "Number three every time"

Lt Col - Okay, Tell me as much as you can remember about how you fly your profiles, such as air speeds, configuration...bank angles, altitudes if you want you can use the board but for the purpose of the recorder you know.

WITNESS 3 - "Yeah well"

Lt Col - "Explain something, but exactly but so just I know you don't have them straight in front of you"

WITNESS 3 - "Right, right"

Lt Col – "So this isn't a test on how much you can remember"

WITNESS 3 - \*Laughs\*

Lt Col — "But yeah, air speeds, configuration, to bank angles, altitude from break release to stop"

WITNESS 3 — "Okay, we would, well generally an air show had timing on it so we would do a countdown with the announcer in charge of the air show. Countdown...5-4-3-2-1 it was pretty common technique sometimes you could coordinate something different. Break release it was always an act prior to take-off and we rolled down the run way

and we it was technique based on really what the temperature was we flew anywhere from very cold islands in Japan (area can't hear) and we also flew in Thailand and calm quarters so the way you handled the jet was significantly different in each one. So generally we would delay rotate 10 Knots past go speed or rotate speed we never took off the split marker(Mumbles something here, can't hear) and then well depending on what kind of performance you had you could get 30-40° sometimes and 1,500Ft was your altitude you were supposed to be at for the take-off rotation. So based on the performance of the aircraft you kind of had to make an audit of what you did, about 800-900ft you would need to start pushing it over it was kind of like the wing over but not really but you would unload the aircraft and actually push it forwards slightly and you never go negative you have a .5 or .8 G at that point when your pushing it over and then (mumbles something) and a lot of it 45°-65° at bank and we put full rudder (mumbles something)"

#### Lt Col - "All the way to the stop?"

WITNESS 3 - "Yeah, the tech controls kind of take care of the jet on this thing, we're requesting that our computers give it to us, so we do that and if it's really not performing well sometimes (something) weather will get it started and to get the nose coming down because you don't want to do a big bank with the nose up in the air and then generally the first turn is about 80° and we're doing that to gain spacing because you're going to clean up and accelerate and make a steep turn around and do a high speed pass for your (mumbles something) so that's essentially it, time varied on acceleration if it was hot outside it would take several seconds several meaning like eight seconds sometimes, to get enough acceleration you would bring it back over and bank it over to the other side 60° was standard but we always shot for 60° and we would start the bank and then after the aircraft would settle down we would assess whether our turn was ahead or behind where the center line should be. If it was ahead then we would continue to accelerate so leave an hour max, continue to accelerate around and if it was still too tight for center line we would try to sneak out a little bit of (Don't know what he says) try not to show the crowd that we just came back to 45° if it was too far around we would have two choices and it was all based on performance of the jet we would either pull some power back and try to hold it at 270 Knots/280 Knots as opposed to keep accelerating 310 or 340 or whatever the air show said was okay and if that still didn't have enough then we would try to use a little inside rudder because that helps a little bit. Blast down, Show center 5-4-3-2-1 Hack and we'd give it a couple seconds and then we'd turn into the next profile which was pitching out and, I'm sorry there was a descent also involved with that because you're supposed to cross the center at 1,000ft so on takeoff were up around 1,500 and I say around because were more worried about...

#### MVI 0501; (Part 2/3)

Lt Col We had to change audio recording devices. We left on the other one talking about the demo profile. Please continue where you left off.

WITNESS 3 - So after coming around for the high speed pass we descend to 1000 feet cross show center and then pitch out and it's not really a climbing turn it's just a 30 or 40 degree turn to take spacing as we decelerate and configure for the slow speed pass. One of the few commands that a flying pilot gives is when to roll final flaps, it's technique that does its kind of how we work it because of how you did your timing, your spacing, that type of thing. So come in 500 feet pass fully configured, full flaps, gear hanging and once we are safe and leveled and so for then we go Vmma -10 which is perfectly safe in this airplane. Go on to show center same type of thing, countdown to show center, and apply full power, and after the jet is beyond Vmma; we start cleaning up, then it's again another turn, out away from the show crowd. Having trouble remembering, then we're accelerating back around, and setting up for an 160 knot and a 360 degree turn, so we pitch out and take spacing again somewhere around 45 degrees, accelerate to 160 knots, and the pilot is doing flying and the safety and the co pilot at that point are beginning to initiate the approach checklist to prepare for the segment following. So taking spacing and coming back around 160 knots right up show center line. At show center it's a 360 degree turn at show center depending on the winds the air density and so forth sometimes we do 60 degrees right off bat, sometimes it's like a circling maneuver, sometimes we use 40 or 50 and increase to 60 or vice versa, and sometimes we use rudder; it depends on what you need. The big safety concern is not going over show center line, it's very important, Every now and then we use auto throttles one of the techniques is to use auto throttles 160 knots it works like a champ and takes a tremendous load off of the pilot flying. Sometimes it will kick off, most of the pilots tell the co-pilot if it kicks off just hit it again, arm it again, engage it again. Some guys will just hand fly it, it's a technique. So anyway, 360 and pitch out again to take spacing for the landing, it's a level of 1000' AGL turn back around and it's an assault but not to an assault zone and

generally we try to pick a point during the practice prior to the air show; pick a point where we will land prior to show center so that we kind of roll through while we are max braking then we back up at speed, so we do a max effort landing, leave the engines in max reverse until the aircraft has stopped, then it starts backing again, a technique is we call "feet on the floor" to make sure we don't do anything stupid with the brake pedals, we back up using a center line of the runway and by the time we're stopped, the loadmaster has the show side door open, troop door open and we back up and it depends on what's going on the weather, where show center is, if you landed long or short that type of thing, sometimes we get up to 30 knots usually its about 20 knots backing up in a straight line and once we get our momentum going back we just want to leave it max, we don't want to risk compressor stalls so once we get to about the speed we want we bring it back to about half power reverse and just continue back for 1000 feet of whatever it is for the setup for the show, and sometimes you want to go beyond the taxi way, bring it out of reverse, pull forward slightly and it just exit there before show center again, that type of thing. So that's what terminates the show is finishing the high speed back taxi and pulling forward to the center main gear again and then exiting the air field.

Lt Col So what is your opinion on the manual use of the rudder on a large aircraft like a C-17?

WITNESS 3 I think we do it all the time on cross wind landings so I don't think it's an unusual occurrence at all.

Lt Col What other times have you used it in a plane other than cross wind landings? I see you mentioned some for the profile.

WITNESS <sup>3</sup> I have used it in the C-130 as well and I have talked to other guys but sometimes in the pattern especially overheads if you get into a 45 degree bank turn 30/60, it doesn't really matter, that technique can be used to bring the nose up or down verses rolling out of bank and trying to adjust cause that actually G's up the airplane quite a bit if you roll in and you didn't pull the nose up hard enough for a 60 and 2 turn it's a significantly less stress on the airplane to bring the nose back up where it needs to be with a little bit of uphill rudder or downhill if you are climbing then it does to roll out and start reefing on the ....very very heavy airplane.

Lt Col How much rudder do you typically use during turns when you are flying the C-17 demo profile?

WITNESS 3 I have used everything from no rudder to full foot on the floor

Lt Col Ok. So was that the way you were trained to fly or have you added any of your own techniques to the profile? I know you have C-130 background to so.

WITNESS 3 Yeah, I generally try to get a nice turn, I'll lead with the rudder but I won't put full rudder in, its gets the airplane turning faster, it initiates the turn faster, I should say. But I do not fly the demo with full rudder because I need the rudder to correct for anything like I was 10 knots too high, or my turning radius was too high, or if we are in a 360 degree turn at a 160 degree knots and the nose started to drop so I needed to use uphill rudder to bring the nose back up rather than roll out to 30 degrees and pull the nose up and now I am going over show center, that type of thing.

Lt Col As far as when MP was training you, did he train you to use full rudder or show you to use full rudder at all during turns?

WITNESS 3 He showed me how to use it but he said it's up to you; it's your comfort level.

Lt Col Have you ever been taught by anyone else to use full rudder in a C-17 other than the demo?

WITNESS 3 Just on landings

Lt Col OK

 $^{\text{WITNESS 3}}$  Up here it's not uncommon up at Allen for an assault landing, it's on the floor , we land at 30 knots cross wind so you bet

Lt Col — I know in the simulator we use it for engine out, we have to use full rudder a lot of times

WITNESS 3 Sure Sure

Lt Col What techniques were you taught during your upgrade process that were something different that you either liked or disliked, if you can think of any?

WITNESS 3 The high deck angle for the takeoff was new to me but after I saw the airplane could do just fine it was quite comfortable. It was new and different but flies like a dream really

Lt Col Anything else?

WITNESS 3 Not really I mean you could do an overhead at 60 degrees at bank it's no longer a procedure to do that but it used to be. I can't really think of anything else, just basically putting our basic skills to use the assault, the steep turn, max effort take off, true finding it putting it all together back to back

Lt Col Have you ever had the stick shaker or stall annunciation activate during an air show profile demo that you have flown or someone else might have flown?

WITNESS 3 You bet

Lt Col OK

Lt Col What were you doing at the time with the aircraft when the stick shaker activated?

WITNESS 3 It varied. Sometimes you would get it in the 360 degree turn, umm, where else do you get it? I don't ever remember getting it on rotate, if you don't have your speed high enough before you start your turn for the high speed pass you can get it because you are asking a lot from the jet , you're asking for it to keep a 16 and 2 bank and accelerate, so you can get that

Lt Col And you are cleaning up the aircraft at that same time?

WITNESS 3 Yes you are just changing configurations a lot, your deck angle, there's a lot going on and it never got mushy or anything. I was at Long Beach, I've challenged this airplane a lot more than the air show does. I never it seemed like it was a transitory type stick shaker rather than a pending stall kind of warning.

Lt Col When you wouldn't get into the stick shaker, how long if you can remember or guess at, how long would you have the stick shaker stay activated, like for how many times would hear a "stall stall"?

WITNESS 3 Well that's a tough one.

Lt Col Would it last just a couple seconds? 5 seconds?

WITNESS 3 Yeah, maybe 2 or 3 iterations. 'Cause we would try to correct for it of course right away and it varied you know maybe we would take out some rudder, maybe we would cob in some more power, depending on where you were on the profile and what you were getting. We never got it, I never got it or don't recall getting it at a low energy state, it always seemed like it was an accelerated stall warning

Lt Col OK

Lt Col So what is your personal opinion of the demo profiles? Are they adequate, too aggressive? Have you ever felt uncomfortable or unsafe with any of them and the way they are set up right now?

WITNESS 3 No. It's pretty basic. I think a lot relies on technique. I have seen some demos that look like radar patterns; I've seen the audience get their binoculars out because the airplane is so far away. I've seen others that

were fabulous and not just here U-2 type stuff from some of the other guys, really nice and tight, such it's a huge spectrum; so much technique involved

Lt Col Ok. As far as technique, you talk about technique involved, what technique have you seen....

Music plays and interrupts session..female voice comes on recording says we need to stop session in like 30 seconds

Lt Col OK let's stop it

Female voice says ending recording 2

#### #3 track on Sony Recorder; (Part 3/3)

Lt Col — "Alright this is a continuation of the interview with WITNESS 3 this is part 3 and this is Lt Col asking the questions, last question I have is are there any areas that you want to discuss, we went through a couple questions and is there anything that you want to add, discuss with us that you may feel that has any bearing on this incident."

WITNESS 3 – "Yeah maybe one point, you know we all wondering what happened, last year when we did the demo we were always trying to get better and better, more crisp, and I managed to get the airplane. We felt buffet on the fuselage at one point and we really don't know how we got there because you know we're taught that the systems would not allow that because it's an electric jet, but I managed to find it, the way we got into it was this, I'm telling you this because it may have something to do with it I don't know. It was me flying and it was the initial take off and it was not extreme weather in any form or fashion; light cross wind and we took off as I described earlier; a steep climate, roll left and lower the nose and accelerate, come back around, while we were coming back around we had tried to make it a little tighter a little tighter so we kept cutting the amount of time that we would accelerate out because we needed just a certain amount of time to be able to hit show center at 310 Knots so we decided we could cut a couple of seconds or something like that. So anyhow as I rolled right to accelerate in it seemed like the jet (we were still at max power) seemed like the jet would not accelerate anymore we were basically stuck at about 250 knots and because of the cut timing we were tighter than normal, so I did use inside rudder I didn't use all of it I used some of it and when using flight control systems you don't get all of it anyways, you can put your foot to the floor and it only gives you a certain percentage of it based on the aerodynamics at the time. So, but at some point we got I got a little bit of a stick shaker and immediately we got buffet almost as though we went through the stick shaker and I hadn't made any abrupt movements to get there so my first inclination is okay I think we're getting near truly near a stall. So I let the rudder out (Slowly not abruptly) and it seemed to correct itself right away, so I tried to accelerate another 10 or 15 Knots and re-engage pushing the rudder back in to keep it tight trying to keep from going over show center and we got the same thing again and mind you we were not in a level turn we were in a descending turn and the thing just wouldn't accelerate out so after the second time I let the rudder out again to center with no rudder in it I said "crew were going to go past show center on this one and I'm not going to keep pulling". We ultimately crossed show center, I don't know about a wingspan across show center and maybe 280 Knots seems like we kind of stuck around 250 Knots and it wouldn't accelerate out. But yeah we thought, we all sat down afterwards and discussed what exactly happened, obviously not the same thing that happened here because I think both those guys are probably better sticks then I am but we got into something we never thought could have happened on a C-17 and we got back out of it, I mean I put us in there twice and got us out twice, but I don't know, we don't know what happened, no clue. It was the last demo of the season we talked about it, we discussed what we did we thought well I don't think we can do anything differently except maybe not let ourselves drop below 250 Knots but in hindsight I don't think that's a good plan because 250 Knots based on what? Temperature, Altitude? You know the demo two usually goes down to India. They had to accelerate for twenty seconds before they can start turning. So anyway that might steer you guys in another direction I don't know but, it was something that I had not heard of from anyone before. I've flown this thing in a deep stall at the test facility and at the production facility under the tutelage of the test guys from Boeing but I've never seen a buffet, I've never felt a buffet in a C-17 before so that was new. So that's about all I can throw out that I've experienced in it."

Lt Col - "Okay, Do you have any suggestions of anybody else that we might want to interview? I have a couple names already but if you can give us some names of other pilots that have flown with MP that he has trained."

WITNESS 3 — "Okay, there's another guard guy who's a very experienced pilot and a demo pilot he's been that way for a couple years, WITNESS 25 I would recommend speaking with him and then the two new pilots who are still alive are "WITNESS 15 female, WITNESS 15 and WITNESS 18 was the other two their IPs they came to us recently and we you know they're both experienced air job instructor pilot, you know that kind of thing so we chose to put them into the program as well. So they were both trained up, they were going to perform in other portions of the air show but not the aerial demo they were going to do the air drop and the dissimilar formation and that kind of stuff. So I would speak with them, load masters the one that flew for me last year was not involved in it this year so we call him "WITNESS 5" (WITNESS 5") he was training, he was actually supposed to be on the jet but he didn't have a crew duty day for it so tread lightly when you talk to him because he's really shaken. MLM and to be honest with you I can't remember anyone else but I highly recommend WITNESS 25 and either "WITNESS 15" or "WITNESS 15" or both."

Lt Col – "Do you know if MP ever talked about the guy who trained him?"

WITNESS 3 – "No I never heard him talk about it."

Lt Col - "Okay"

WITNESS 3 — "The only reason they trained me is because the guys we had qualified initially for the air show two years ago were all PCSing out and I recognized that and went to the DO and said we need somebody trained up who's going to be here so we can bridge the gap for the active duty and he said "fine, you're training up" so you know it has to be an IP experienced and so forth so I trained up last year to bridge the gap and I didn't end up training him anyway and it ended up being MP

Lt Col — "Okay, Sorry I lied I do have one more question I just thought of something when you mentioned about the ground training did you and MP ever go over any charts, G charts, G Limit Charts, Speed, Bank angle charts, anything like that."

WITNESS 3 — "No, He taught us by demoing it and we did ground talking about where to turn and what headings and so forth and then he demoed it and talked us through it the first time rather than using the charts. And the airplane talks to you"

Lt Col - "Okay"

Capt "Well sir, as you know I'm not a pilot, I'm the human factors person but this has been great to hear that side, and so for the rest of this we'll just transition just a few human factors more related questions and then talk more about MP kind of individually, get into how well you know him and what not, but first of all while we're still talking about the air show mentality this is more for you to just to help me learn what you guys are thinking prior to an air show. If you can just list two or three, what are the, you know clues that kind of go off, we have the whole list of attention management you know the kind of CRM the channelized attention, task saturation, you know all those kind of things you know if there's anything that really flags before an air show."

WITNESS 3 – "Gosh, before an air show?"

Capt — "Or the practice, you know something that's different, out of the ordinary that you say "hey I need to pay attention to this because of this"...

Maj<sup>WITNESS 3</sup> – "If you haven't done it in a while, you really need to shake the rust off because it comes at you pretty quickly, and if you've done it the regulations say you can't do the air show if you haven't done it in the past seven days, if you haven't practiced it in the past seven days, but right now if I tried it since not having flown since last geez October, yeah I'd be all over the place the first time, I would certainly do it in the simulator a couple times, so it's a short it's a very short profile the book says twelve minutes not true, even without touching the rudder you can do it in ten minutes easily it's just you know it's not that long of a profile it's not that complicated there's very few maneuvers involved with it, nah I can't think of any human factors that would overwhelm somebody "

Capt — "Is there any different CRM techniques that you use during those profiles"

WITNESS 3 — "Yeah, typically the challenge and response with the checklist is the person reading the checklist is the pilot not flying, and the person responding to it above a position is generally the pilot flying and sometimes there's something with the pilot not flying will make the challenge and respond to it and then the pilot has to make a response as well. The pilot flying is completely removed from it because of the challenges of the quick profile and it's the safety observer... it's not really observer, that's not the right term...it's the safety and the co-pilot are the two people who are doing the challenge and response and the pilot's listening, you know he's waiting for the gear down and so forth but he's not... he or she is not involved with the challenge and response. They're responsible for air speeds and that's the safety's... that's why I guess they make the profile, but my guess is that's why the safety's there to take the load off the pilot and the distractions away from the pilot"

Capt — "Okay, and as far as just in the squadron and the week before the air show and what not, what's the kind of talk, you know are people talking about the air show are they excited? Nervous? You know anything?"

WITNESS 3 — "No not nervous, loathing is probably more than anything else, you know we had a lot of work to do getting pulled in all directions all your job duties, EPR'S, OPR's all that garbage plus all the extra duties of air show stuff. As an example MCP I was in his office with all of the other flight commanders in the squadron trying to hack out who we could send to fill a mission and we spent an hour and a half scrubbing everybody in the squadron, everybody was attached just trying to find three people to go fly or four people to go fly a basic crew a combat basic crew to go fly something. So we just had so many things going on his case in particular, he did not get a second of thought would be my guess to the air show demo practice until he said "okay, sir I got to go I got to go prepare for this" and then he stepped away and they were briefing ten minutes later, so yeah it's just nonstop here it's PACAF \*laughs\* unfortunately"

Capt — "And to go with that, the load master are you aware that he was supposed to leave to go to Germany I believe the next day and wasn't going to be at the air show. Did you know that?"

WITNESS 3 —" I didn't know that, what I had heard was that, oh yeah MLM yes I did know that he was on the crew that we were trying to build, we couldn't get another pilot, he and ( ?) was the other load master I believe (?) so but yeah he was supposed to go to Germany the next day."

Capt – "So you said he filled in because of crew rest for another?

WITNESS 3 – "WITNESS 5 was supposed to fly but he had to come in early for some reason and he didn't have a crew day to fly until the end of practice, so they pulled him off."

Capt – "Anything else on the "before the air show "stuff?"

Lt Col — "No, one of the things that you brought up was the crew for the air show demo, in a sense of were they a hard crew by chance, or are their provisions when obviously the hard crew cannot perform together as a hard crew, what provisions do you have in place to"

WITNESS 3 — "That's why we trained a couple of extras. Its... look as it as an alternate, you know you train two pilots because a pilot being an instructor pilot, once he's qualified on the left seat he can perform duties in any of the other front end of the airplane duties, so he in respect is an alternate for the co-pilot and the safety position but only another instructor pilot has been qualified in the left seat can be the guy flying, so we train up our hard crew with a spare pilot and a spare load master usually. Since the program's been here... well, to my knowledge since I've been in the program that's how we did it, and that's why we traveled last year with the same thing. If I went DNIF, the show could continue if MP went DNIF the show could continue same with the safety or co-pilot, either of us could jump into the other seats to complete that."

Capt — "Okay and then just a little general peer-assessment for basis or just strictly work relationship?" MP how friendly on a friend

WITNESS 3 – "I didn't go out, you know hang out with him we were friendly, I was actually in the process of trying to give him my hot tub, believe it so yeah were friends but mostly co-workers"

Capt – "Okay, and did you fly with him often?"

WITNESS 3 – "No, very seldom the last time I flew with him was the air show demos last fall"

Capt — "Okay, and just the general assessment of his flying you know his personality as aggressive, conservative, very meticulous?"

WITNESS 3 — "No, he flies aggressively during the air show practice, he never made me nervous when he was showing me stuff. The rest of the time he flies like an airline pilot really, it's kind of how you fly a C-17, and so no, he's not a traditionally aggressive guy in everything he does, not by a long shot."

Capt — "And had you been talking to him in the couple of weeks beforehand at all? Okay, have you seen any significant changes in his life at all, family, financial, legal?"

WITNESS 3 – "No, well we never addressed that type of thing; I would always come to him because he was designated as "Mr. Air show". Then we sort of gave him "ownus." We the 517<sup>th</sup> gave him "ownus" of training our people, because too many people trying to obtain, there were too many hands in the pot. So I just made sure he had a plan and Col with made sure he had a plan and he told Col what the plan was and who was going to fly when and that was pretty much it. I never had conversations about him, except trying to give him my hot tub, he said he was really busy and that I should try to sell it because he's too busy right now and maybe next week if I hadn't sold it, that was about it."

Capt — "Do you think pretty similar attitudes from the rest of the squadron as far as towards him, you used the "Mr. Airshow" any other general kind of you know?"

WITNESS 3 — "From the other people?"

Capt – "Yeah"

WITNESS 3 — "The other people on the crew you're asking?"

Capt — "Oh sorry, first I'll ask the other squadron members, like their perspective of him?"

WITNESS <sup>3</sup> – "Yeah, he was seen as the authority on the air show training, yes I would say that is a general consensus"

Capt - "And his personality around the squadron, similar, laid back?"

 $^{\text{WITNESS 3}}$  – "Yeah, no he didn't wear that on his shoulder or anything, he was very easy going, laid back, and humble"

Capt - "Not a history of bending the rules or anything like that?"

WITNESS 3 – "No, no not at all he's Mr. Stan/Eval"

Capt - "I will ask you about the other crew too, just a kind of a general perspective on their personalities I guess MSO first."

WITNESS 3 — "Really good pilot, way better hands than I have for sure, came from F-16s understands Aerodynamics a lot in fact we had a discussion about the thing I encountered and we talked about using the rudder lead and lag and all kinds of cool things you can do with an airplane, so he understood that stuff really well. He just upgraded to IP recently which is why he upgraded to the left seat, aside from the standard office stuff he was in charge of their scheduling, he was the focal point of the one voice for the flyers for both squadrons to the simulator people. There was a little friction there but it's been that way for a year, I would say nothing out of the ordinary I don't know of any family problems."

Capt - "Okay, and then MCP

WITNESS 3 — "He was stressed, absolutely. He had a lot going on, he had health problems he's on a Cat II health waiver, he had gotten on top of it but it stills a challenge for him. You know he's always having trouble with his PT test although he knocked it out of the park on the last one but he really struggled getting to there. He just really worked hard he's an Ops Flight Commander and we were short on people because we kept flushing the system we kept getting volunteered for everything. And yeah he was stressed out."

Capt - "And then MLM

WITNESS 3 — "I don't know that I've ever seen him stressed out; he's a pretty level-headed guy. He's excitable but I wouldn't say stressed. I saw him in passing and we talked about the trip he's going on and I said I wish I was on it with him and that was about it."

Capt - "And then how about just general morale, and we'll start with the 517<sup>th</sup>"

WITNESS 3 – "It's pretty good, I think."

Capt - "Like Ops tempo, and"

WITNESS 3 — "way too high, mostly I wouldn't say necessarily the flying, it was all the other stuff, the people getting volunteered for whatever, MC12's or office stuff you know "we need a POC for this, we need a POC for that" and they had absolutely not been given the time to go do things. I do know that some of the crew went over to the simulator to practice a day or two prior to the flight. It was just like having conversations over their shoulder as they were running out of the squadron trying to finish things up to go do that, that type of pressure, just non-stop, non-relenting"

Capt - "Guard side similar, better, worse?"

WITNESS 3—"No, the guard side was pretty healthy I think. They have a better shield then we do because they're guard, but I didn't see as much stress. I know MP was a little overwhelmed mostly because just all the pieces of the puzzle of the air show and last minute, you didn't really know when they were doing the demo until the day before or something like that, the day before the practice, because the official schedule hadn't come out, there's a lot of unknowns and they were just doing the best they could until they had something solid to hang their head on. So and it's a lot of work you know getting everything just right, trying to schedule when the practice can be, making sure that the weather's going to be okay, and if it's not going to be okay then do we have an alternate day? What happens if we don't have it within seven days of the air show? That kind of thing that was the kind of stress that he was dealing with, because the weather was quite poor, up until that day it was nice that day."

Capt - "And how about between the guard and active duty."

 $^{\text{WITNESS 3}}$  – "Oh, we're awesome. Honestly, we have such a tight relationship, even before this happened we mix well. They evaluate us, we evaluate them, we go out together, just little groups of people, and it's a real healthy relationship."

Capt - "Okay and then just general attitudes toward supervision, any glaring issues there?"

WITNESS 3 — "We were ready for a new squadron commander"

Capt "Okay"

Lt Col — "Just something I was thinking of asking, prior to them doing their demo was there any comments, probably mostly joking I'm assuming, maybe, within the squadron of "hey make sure you go, you know make it look good, make it look tight, was their anything like that were there a lot of people that were going to be out watching it from the squadron, do you know of?"

WITNESS 3 - "No not really"

Lt Col - "Ok"

WITNESS 3 - "It kind of, actually there was a little concern that they wouldn't get up that day, because the plane they had initially been set up against had an OBIGS failure I think I forget what it was. But I was top three at the time so the pro-super came down to me and said "hey we know that the air show demo practice is the highest priority today because they have the seven day window" I had to explain it to them. And I said okay lets switch it up, let's make sure the engine running crew change goes to these guys instead of to another training line. And we got, I called the command post and asked them to have them call back to me to top three I told them what the new plan was and that they were going to do an ERCC. The demo crew and we talked about how much gas they had on board and we asked them to burn down what gas they could, they said "okay were going to go to Kenai and fly around" It's a local airfield out here city airfield. So it was Nealy aircraft commander, and he said "No problem, we can do that." In fact, he flew around with his gear down most of the time to make sure that he burned enough gas. And he told me he was so proud he landed with about 65,000 pounds of gas which is exactly what MP wanted for his setup for the jet that he was going to use that was now broken, that's what he had requested. So Nealy landed with that and, because you don't want to be too heavy it throws all your parameters off when you're practicing. So anyway it seemed like it was all lining up, there were no reports of that airplane flying poorly or anything like that it just, engine running crew change was planned for 5pm, and they were supposed to be on Delta at 5pm taxiway Delta to do the swap. They would swap out and the planned take off was 5:30pm I truly don't know what time they took off, but it must have been a little early because they had done part of the profile before they had crashed."

Lt Col - "Okay"

Capt "Okay, yup that's about all, very helpful. Unless you have anything else for us, sir?"

WITNESS 3 – "Let me know if you have any other questions."

Capt "Okay, this concludes our investigation. This is a non-privileged final investigation and it is on the 5<sup>t</sup> of August and ending at 1624."

TRANSCRIBED INTERVIEW

INTERVIEWERS: LT COL (SIB/IO), LT COL

(SIB/PM), CAPT (SIB/HF) INTERVIEWEE: WITNESS 26

**ROLE:** 517 AS, Stan/Eval

**DATE: 6 Aug 2010** 

LOCATION: ELMENDORF AFB, ALASKA, HANGAR 5

Capt - "Alright today is August 6<sup>th</sup>, 2010 and this is a non-privileged interview. The members

present are Capt

Lt Col - "Lt Col Investigating officer"

Lt Col - "Lt Col Pilot board member"

Capt – "This is starting at 1753"

WITNESS 26 – "Alright I'm WITNESS 26 from the 517<sup>th</sup> AS"

Lt Col - "Okay we'll start a sking questions, as I ask these we won't interrupt, I won't be kind of agreeing with you and talk and just try to not pull your train of thought, so I'll just be kind of staring at you the whole time. So don't feel like I'm wanting you to say more, but when you're done just say that's it and we'll go to the next questions, we may have other questions in there at the same time. Have you ever been certified as an air show demo pilot?

WITNESS 26 - "Demo co-pilot, yes"

Lt Col – "Demo co-pilot? Okay, that was the next question. Were you certified as a hard crew?"

WITNESS 26 — "We did a...basically a hard crew I flew in the air show two years ago so in June or July of 08 and the paper, the document that went up to the 11 AF I believe it was more than just a hard crew of five, but it was a really hard crew. (Mumbles something)"

Lt Col —"Okay, does the demo AC always sit in the left seat?"

WITNESS 26 - "Yes"

Lt Col —"Okay, what was your instructor or who was your instructor during your upgrade process, or did you have multiple instructors? And this is from the ground side up through the flying side."

WITNESS 26 — "It was actually kind of multiple, it was the summer probably spring of 08; WIT 12 from Hickam came up and trained a group of us to include WITNESS 11 who wound up being the primary instructor at the time. I don't remember if MP was in that group, I don't think so but so WIT 12 was probably the initial one, he did the ground training with all of us. I've been a safety observer at McChord so I had the training we just basically restarted over with everything to get (?). And then we went and flew with with also up at (?) Airfield did some training up there, and once he actually certified us we continued training with WITNESS 11 just prior to the Elmendorf air show"

Lt Col - "Okay"

WITNESS 26 – "Does that answer your whole question"

Lt Col – "Yeah, that's fine, do you know if the upgrade program was derived from AMC, PACAF?"

WITNESS 26 — "It was, yeah it used some of both. I can't remember the regs off the top of my head but yeah it was based on the AMC profiles and whatever extra PACAF used."

Lt Col – "Okay, what were the steps involved in your upgrade process?" SIMS, ground training?"

WITNESS 26 — "Yeah, it was definitely ground trained to start. We went into the SIM quite a few times, and then to the aircraft. And then before each demo that we actually did, I think the only ones that I actually flew in were this air show, the Elmendorf one, and then New Zealand. And then we'd go back into the SIMS and start again, starting with ground training again and SIMS and at least a flight before the actual show."

Lt Col — "Okay, when you did fly the demo which profile did you do you remember flying in?"

WITNESS 26 – "The twelve minute"

Lt Col — The twelve minute one?

WITNESS 26 - "Yeah"

Lt Col – "Okay"

WITNESS 26 - "And we'd practice, when we did the upgrades we would do all of them, but when it was for the specific air show we would just do...

Lt Col – "Profile three?"

WITNESS 26 - "Yeah"

Lt Col — "Okay, tell me as much as you can remember about how the profile's flown such as air speed, configuration, bank angles, altitudes?"

WITNESS 26 -"I knew I should have studied"

Capt – "It's not a test"

WITNESS 26 —"I know, so yeah it's been over a year. Let's see alright so the initial take off alright so I know its max take off, we usually did our rotation about 10 Knots, rotate the nose. You know I'm doing co-pilot duties, auto gear up. I believe, can't remember if it was 25-35° nose high, probably maybe 25. And again I'm sorry if everything's wrong as soon as they get the nose up start to p ush o ver leveling off I believe 1,500's the first altitude. From that it'd be left turn to whatever the heading is and I know we'd kind of study winds you know or whatever there's some set whatever the degrees off the runway, we'd determine those ahead of time, I don't remember how many. But the outbound timing was the one we'd adjust for winds, we had ones that were no wind but then we'd extend them and talk about it, and pre-brief. So turn outbound, fly, however, I feel like it was eight to nine seconds in the beginning, then right turn back inbound, descending to 500ft and that's for the high speed pass and cleaning up and accelerating through that. So come in through your high speed pass and then the goal with that is as soon as you come to the approach end of the runway you pull to idle to be quiet for the crowd, go through you know countdown to show center, turning away from the runway, and then again I don't remember heading. But then climb back up to 1,000, timing outbound. This is the slow pass you turn back in configure with the slow pass and then you might be at the approach minus a knot or a couple knots, we have it written."

Lt Col – "Okay, so for the fully configured pass"

WITNESS 26 — "Yeah about the approach come in show center, and then turn out and this one were getting to the half flap I think it was to do the 360 at show center and then again just turning back out to come in for the assault, you do the assault hopefully as your passing show center, and then backing up again for the crowd."

Lt Col — "Okay, on those turns, on those 80, 60 turns or when you're flying out and turning to come back in, over center line or past your show center what bank angle were you taught or do you remember kind of turning out to?"

WITNESS 26 —"I don't want to say the wrong thing, if they were doing something different it's probably correct but, I feel like it was 60° of bank"

Lt Col -"60?"

WITNESS 26 -"Yeah"

Lt Col —"Okay, what is your opinion of the manual use of the rudder on a large aircraft like the C-17? I mean do you typically use rudder at all?"

WITNESS 26 -"Normal flying or?"

Lt Col —"Normal flying in this case"

WITNESS 26 –"for crabs, for coming into landing I do"

Lt Col – "single engine in the SIM?"

WITNESS 26 -"Sure, yeah that sort of stuff"

Lt Col —"Okay any other times that you would use it, low level flying maybe? Do you use a rudder at all when you're doing a break turn or something?"

WITNESS 26 - "Maybe, ridge crossing I guess, I've heard that coming off you know depending on what the tactic is (?)

Lt Col —"Okay, now thinking to the profiles have you ever seen or been briefed that rudder would be used for those turns like those 60° turns that you were talking about, were you taught to use rudder for those turns?"

WITNESS 26 - "Yes, and I know that was emphasized in the, obviously we tried to get the timing right to be outbound so you don't overshoot the crowd, but that was the main concern is that we didn't want to be crossing over the crowd, but yes I know they used rudder"

Lt Col —"Okay, have you ever been taught to use full rudder on a C-17 for anything, other than say the single engine"

WITNESS 26 — "Yeah, well if you're taxiing out of control yeah if you need it at an assault landing. I don't feel like it's been said use full rudder, maybe just understood use what you need"

Lt Col —"Okay, what techniques were you taught, were taught to you during your upgrade process, although with you being the co-pilot probably more of monitoring it"

WITNESS 26 — "Exactly, yeah and well that's what I know as the co-pilot that was sort of your job to keep the pilot steering the co-pilot should be helping them, you need a little more bank a little less bank, more rudder, if your overshooting that's a good one for center line or whatever line your shooting for. Whatever there doing to get there is fine and then safety is monitoring all that sort of stuff"

Lt Col — "Okay, have you ever had the stick shaker and stall annunciation activate during an air show demo profile that was being flown, obviously with you being a co-pilot though but have you ever had a stick shaker annunciate"

WITNESS 26 -"Yes, yes, fairly certain"

Lt Col —"Okay, was it just a quick; the two quick "stall stall" and then that's about it or did it stay all the way through a turn or, do you know roughly how long?"

WITNESS 26 —"I feel like it's in and out, I mean you hear it a lot in the show, that might just be because I haven't flown in a long time"

Lt Col –"Right"

WITNESS 26 —"It's a lot of it, but in and out and it's kind of like on the approach when you hear usually the pilot's like "we're good, or powers in" you know I felt like it was always correcting out of it although we all understood it was coming"

Lt Col —"Okay, so mostly and that was the next question what was being done with the aircraft when the stick shaker did activate, if you can remember. Was it during those 80/260 maneuvers? During the configuration, was it just while the plane was being cleaned up that you would get it? If you can remember"

WITNESS 26 —"I'm feeling like, when you turn inbound in those turns not necessarily in the clean up but I don't think we were pulling in the flaps/slats too soon I don't think it was any of that. No, because we'd clean up on speed I'd be watching that. Yeah, it was just in the as we descend sometimes they forget to descend, so you're trying to tell them you need to get down. That's mostly what I remember of it."

Lt Col —"Okay, what's your personal opinion of the demo profiles? Are the adequate, too aggressive, or have you ever felt uncomfortable or unsafe with any of them?"

WITNESS 26 — "I have not, I've never felt unsafe. I think the only two pilots I ever actually flew with in the jet were WITNESS 11 and WITNESS 13 he just PCS'd. And they were aggressive but mostly with the roll rate I guess, and it wasn't it didn't feel unsafe it was, they were max performing but stuff I've seen on low levels you know it's not...it didn't feel unsafe.

Lt Col —"Okay, are there any other topics dealing with that air show profile that you would want to say that I haven't asked at all?"

WITNESS 26 -"No, I mean it's kind of been so long for me I am kind of out of the loop on that...

Lt Col —"Okay, any other suggestions of who else we should interview, I know you already gave us those other two names?" If you think of any later you can definitely call us"

WITNESS 26 - "Okay, CaptWITNESS 8 is another one recently, did you guys get the MFR MP was the one making it...but it's a letter of our team?"

Lt Col —"Yeah, I think we have it basically.."

WITNESS 26 - "Okay, because I know I gave two copies to..."

Lt Col – "Right, the staff summary sheet..."

WITNESS 26 - "Exactly, those people are pretty recent"

Lt Col –"Okay, anything else for you?"

Lt Col – "No, not right now."

Lt Col - "Okay"

Capt - "Yeah, I just have a couple more general questions not so much about airshow profiles, but you've been in the squadron for a couple years so just your opinion on overall squadron culture, you know interaction with the guard anything you want to talk about"

WITNESS 26 — "Well, Okay I'm in the Stan/Eval shop and we just had our ASEV and we had a really good relationship, especially with MP and MLM I mean I think our shop was typically the best for the TFI we all say we were TFI but we really were. I remember there was bitterness at McChord with the whole "the reserves get the easy jobs" but I thought we were pretty good, I mean of course we hassle each other but it's I think with our offices are all kind of intermixed so it's really nice. But I think we work well together, I don't think there's any real problem with that. Like I don't think anyone would be surprised it was a TFI crew.

Capt – "How about Ops tempo?"

WITNESS 26 — "Yeah, I think it's been fine, we kind of got it easy compared to AMC right now, not much to complain about there. Nah it's I feel like the guard helps out, and you know we do our part."

Capt — "Okay, and then as far as the crew on the mishap so who would you say you're closest with? Start with that, anyone?"

WITNESS 26 — 'MCP yeah he was my husband's best friend, but also MP I mean he helped us through ASEV and he and MLM sat in that office with me."

Capt – "So you didn't fly with MP

WITNESS 26 -"No, I had not actually flown with MP I don't think ever to be honest. A lot of ground training and I think he was our SIMS instructor at one point with that."

Capt – "Okay, what was his personality like?"

WITNESS 26 —"He was so smart, really hard working. I'm trying to think, quiet but not like in a shy way just he was working really hard all the time, really motivated about the air show stuff. I had gotten that whole staff summary sheet paperwork that you guys got, he had come to me to do it and he's like "Oh, you're busy with the rest of the air show" the ground part of the air show. And he's like "I can take care of this" and he got all the hours, in twenty minutes and like all the Col's are happy because they got all their information. Yeah so, he just always had new ideas to improve; FCIFs would come out and he could write a novel on every one and he would say "oh, this should be this way", and he was really analytical in that way (trail off) he was really happy the whole time"

Capt — "So his reputation in general do you think from other people too, like people viewed him as knowledgeable?"

WITNESS 26 -"Yeah I think so, oh yeah; I heard in all of the memorials that he was one of the smartest guys on the C-17"

Capt — "Did he ever have any history of breaking rules or bending the rules or anything?"

WITNESS 26 -"No, I doubt with that guy, especially since he would catch all of the little things that the rest of us didn't. Yeah not at all"

Capt —"Okay, and then you knew<sup>MCP</sup> well, how about his personality?"

WITNESS 26 -\*laughs\* "happy, yeah there was nothing wrong with him, I didn't get to fly with him but I heard a lot of comments about what a great instructor he was, but I could see that from his personality just so positive and you would go in his office and could be complaining and I'd come out happy. Just so I think as an instructor whatever or air crew that he was just probably the same way. I heard this story that he was air re-fueling with someone and they were crazy all over the place, and he was like "I'm going to get you there; "we're going to

get you this excellent on your check ride" So that kind of a positive "you're going to do it"; But then again I don't think I've ever flown with him.

Capt –"Okay, and then same with MSO

WITNESS 26 — "Yeah MSO was the one I didn't know, just through the squadron a little bit like I would say hi but I don't know that much about him"

Capt —"Okay, ho w about the week or past two weeks before the air s how, I kno w it's busy around there. How were people's attitudes?"

WITNESS 26 — "Well I know, since I saw MLM and MP all the time they were excited about it and then actually MP had sold me that day a demo hat a demo team hat, so I know that he was all pumped he's like "here you go, you're on the team 20 bucks" \*laughs\* So yeah, they were real excited, I'm trying to think of anything. I had seen MCP and I was stressed out with my part of the ground duties and he's like "let me put your life in perspective" and he clicks on an email that's for the squadron camping trip he's like "So this is what you have to look forward to so chill out." So he was pretty relaxed, and again I didn't know MSO that well but I know MLM was always like "I just got off leave" he had been somewhere and he had a haircut that day and he was like "they screwed up, so I buzzed it" whatever he's like "time to go fly"; he just liked to fly"

Capt —"Okay, so like the stress for the air show is that in your opinion is it worth it to do air shows, is it just a pain for people?"

WITNESS 26 —"I think so, I think the hosting our air show is stressful for the ground people but the flyers I think really loved it, yeah" \*Both Laugh\*

Capt – "Okay, That's about all I have"

WITNESS 26 -"Okay"

Lt Col - "I've got a couple things. You said you were working with Frey on that letter that you had, with the demo crews. Do you know by chance if the flight involved any training, I mean were they looking at trying to get guys up to cert status or were they all cert'd; do you know by any chance?"

WITNESS 26 -"On the 28 July, that one?"

Lt Col - "Right, yeah"

WITNESS 26 — "The point of that one, well that was their crew I believe who was going to fly during the air show and they had one last training I think our ops group commander was supposed to be on it. I know what we had just identified the day before was that they needed a video for the 11 AF commander, so he organized all that too through PA. I don't think, like extra training is that what, or?"

Lt Col - "Yeah, right like if they were actually in the cert process"

WITNESS 26 —"They were done, the only thing so it was sort of a, although they had been done with all their training ground training/flying training, and been approved by MP who was the instructor, like MCP I know for example. I don't know for sure in the guard if those guys were previously upgraded. The only thing left was to be signed by the 11 AF Commander, which is why we needed the video, so it was sort of a "they were cert'd; they just needed the final here you go"

Lt Col - "Okay, so they were cert'd then"

WITNESS 26 -"Yes"

Lt Col - "Okay, were they cert'd as a hard crew?"

WITNESS 26 — "They were, yes we had a whole, I think that whole entire list was being sent in as a hard crew; that's just a PACAF rule"

Lt Col - "Okay, all the cert letters that eventually get endorsed by the 11 AF commander, do you know where all those cert letters might be, by chance?"

WITNESS 26 -"The previous ones?"

Lt Col - "Yeah, or anyone who's been cert'd or (?)"

WITNESS 26 -\*Laughs\* "I'm laughing because after our ASEV we found something that said they need to be posted in the FEF's. So we were working on getting those"

Lt Col - "Okay, Gotcha"

WITNESS 26 -\*laughs\*"That was an 'oh crap', apparently no one knows that rule; Yeah we keep; maybe you need to look at my folders. I think we've got old stuff; WITNESS 11 was the mastermind behind all this; I've got folders on my/our shared drive so."

Lt Col - "Okay, great and the other thing that was there any place or any documentation that you have who are basically has a list of people who are cert'd to fly together as a crew members as crews, hard crews?"

WITNESS 26 —Not as a small crew, but what I remember from that was a discussion trying to like how to we do that because of our Ops tempo, you know it's really hard to go all the way up to the 11 AF commander with these four people and now someone's gone. So I think what we were trying to do (because I don't think AMC has that same kind of rule) was just cert the whole letter as a hard crew and then say we'd pick and choose. Which I know is sort of, yeah I know it's...but that was our best approach at it. Here's our hard crew..of 20. We used various people for the day, so yeah we had itemized down to at least four for this show"

Lt Col - "That's all I have"

- This ends our interview at 1815.

TRANSCRIBED INTERVIEW INTERVIEWERS: LT COL

(SIB/IO), CAPT

(SIB/HF)

INTERVIEWEE: WITNESS 27

**ROLE: OUTGOING 517 AS/CC** 

**DATE: 7 AUG 2010** 

LOCATION: ELMENDORF AFB, ALASKA, HANGAR 5

Lt Col —Okay, sir. As the squadron commander how was the working relationship between you and the guard?

WIT 27 Oustanding

Lt Col Has there ever been any problems from a leadership stand point concerning the flying of mixed crews and if so were they discussed laterally with the guard leadership and yourself?

WIT 27 I will elaborate on this one. Not only has it been discussions but it's been one of our primary objectives to mix crews to the max extent possible, part of it and I say this to the benefit far more than this investigation, I think part of the success of TFI is when it is going to be mandatory. There is no such thing as a pure guard or pure active or pure reserve crew. We are way way behind where opter? should go. But we have a great cooperative effort here and I think we are well ahead of any other association in the Air Force. We have intentionally positioned all of our sub-organizations in the squadron sitting next to each other. We are not to the point yet where we want one scheduler to do everything, one training office to do everything, led by guard or active. Makes no difference to me, they sit next to each other, therefore there is a natural tendency not to recognize that WITNESS 22 and myself, we did an each of us has important objectives, and when given clear guidance by outstanding job of mixing up aircrews on missions, training, red flags, demo teams, so problems? The only problem is that we didn't do it enough. That there is a human factor, there is a human nature, when you are the scheduler that you can negotiate with guardsman verses direct, that you call your guard folks first that's the people in your squadron, same with Active Duty, you call and say I need you to fly or I need you to go do this formation with this student and so that's who you call. So until we get to a point where is one scheduler trained to deal with both, we haven't reached perfection but we did a dang good job and we always showed leadership because we think that people like General Kim should be ordering their squadron commanders to do this. When we showed the big group board that we kept as a grease board and showed how the different colored pucks were inter-mingled on every mission. One of the short straws still today is air drop and I am intentionally pontificating because I expect there will be some leaders that will listen to this and I hope they take it far beyond this investigation. With the air drop basically we as Active Duty are intentionally paying the bill for guard to have air drop here because the guard bureau does not support which is a mistake and so we have made an agreement at the squadron commander level that until we get guard bureau to recognize the importance of having that mission for the guard here the Active Duty we will be one unit doing the air drop. We have built that into our culture and we developed our call signs and Balto is a specific air drop call sign that's total force, in our local instruction where Sitka and Togo, are guard call signs active but the only real revelance it has is who which flying hour program pays for it. We routinely have instructors on Sitka and aircraft commanders in charge of missions that are guard bought and vice versa. So the only problem is that we don't do it on every mission but we do it almost.

Lt Col Ok, so that definitely answers my next question which was do the active and guard units commonly fly as mixed crews.

WIT 27 Yes

Lt Col I figured that was true. Did you ever have any lateral discussions about a guard/active mixed crew complement that centered around flying skills or capabilities of the crew members? In other words the crew makeup of intermixing the crews.

Yes. So a good way to segue away from the last question is we didn't just build a crew to make it mixed but we still it is very critical to ensure that we have the right people, they may all be from the guard, they might all be active duty, obviously air drops is the one where you often see pure active duty crew, 99 percent of the time because we only have one basic crew of guard air droppers and one of them just came from our squadron to was going to be an air dropper. MLM was going to be an air dropper as a loadmaster. I think even<sup>MLM</sup> had a school date. Ok so the crew compliment in the program as we started out guard had zero got here. I met their leadership to include experience until MP while they were learning to fly at Altus and I was requal'ing and so we spoke early on about how the challenge for the 249<sup>th</sup> is that they started from scratch but we quickly figured out the beauty of this association and we often compared ourselves to the 535<sup>th</sup> stand up of the 204<sup>th</sup> and said "thank god we didn't stand up in parallel like they did" because we think that was a big hindrance to their association. Well the Guard here depended upon our experience and so we learned early on [that] trust and confidence of the Active Duty by the Guard and they saw that WITNESS 23 and I had it as our primary objective that they would succeed. That relatively recently the 249th has achieved enough experience that it is no longer unusual to have the most experienced guy in the aircraft be from the 249<sup>th</sup>. And so only recently we were kind of high-fiving that we had done what we intended to do and what we thought might take five or six years we did it in three. Where the Guard now begin to pay back and as we are going through a major overturn of PCS right now and I know that the 535<sup>th</sup> went through this as well. We started PCSing initial 517<sup>th</sup> C-17 cadre in January and over the course of 12 months I think that we're going to move 40 out of 80 pilots on the base. And the replacements are outstanding, I mean we've made a name for ourselves. If you come here from another C-17 base already, you're on the top. But we also get pilot training folks as well still. Only recently and I were high-fiving figuratively speaking that now it's 249<sup>th</sup> instructor teaching brand new UPT student how to employ this airplane in this phenomenal training environment and we're very proud of that. I meant everything I said at that memorial, did you guys go? MP was the most experienced demo guy here and he was frickin' precise. And you know I have wrestled a lot with my own postulates, not theories, just postulates about what happened and I cannot think for a second that he was not flying that thing as precise as he should have been. It's going to be very hard for me if that was not the case because that would not be the character of him as an aviator.

Lt Col — Okay. How familiar are you with the demo certification process and to what level were you involved with it?

WIT 27 – I was involved very little here other than our Stan/Eval program honcho'd it between our joint Stan/Evals. My only familiarity with the demo program is as a safety pilot at Altus so it has been a very long time since I have gotten familiar with it. The fact is that the DO here, I was quite frustrated with PACAF that they expected us to produce a demo team during our standup. But PACAF's got its very good reasons for showing the flag and it was expected very early on that we would produce a demo team which the first commander, gave me direction that yeah, we needed to do that. We put resources toward it but as a DO you could not care less about air shows. You care about flying operationally and making these guys the best they could be. So we took that out of hide, and we went on to take out of hide demo team resources; lots of money, lots of TDY, lots of airframe time but as a DO I did not get close to the process other than to say 'Okay, you picked a crewmember, sir' and I give you the tails and you make it happen. As a squadron commander my closest to the demo team was about the same, though now I had learned over the two years as a DO the importance of it to PACAF and it does make political capital and money for us and while some times still an annoyance to get in the way of our tactical program [There is mild laughter] we put the best people that we had behind it. And we knew we had to put the best people behind it. I look back now and think I should have been much closer to it because I sit here not knowing what happened and perhaps if I were a demo pilot I would understand. It's been one of my concerns. Again, analogously speaking, we have an incoming DO who, great guy, never been a lead guy. He's done basic copilot airdrop and that's it. And there's no more tactical airdrop base than this. I picked WITNESS 28 to be the DO, or at least told leaders to pick him because of his experience and his abilities on paper. And was not that guy. And one of the things that I did as a commander was I always did it first. Whether it was the first landing on Donnelly LZ even though I didn't fly it, I was in the seat in command. The first ICDS drop on a radar site, it was required to do it first and I regret very much that becoming part of the demo team never entered my mind. Not that I would ever have had time [laughter], I mean that's got to be your focus and I know it's not realistic. And I suppose had I been a demo pilot as a kid, that would have been easier. But it's definitely a LIMFAC when the commander is not a demo team member, though I don't think it's practical. But at least then I could sit here and digest in my head what each step of the way was. I think that's the thing I'm thinking about most these days.

Lt Col — Okay. Next question, kind of around the demos. What are your thoughts or concerns with the requirement to have hard demo crews? In PACAF the requirement is hard demo crews where in AMC it's not.

WIT 27 – Yes. My perspective has been -- And I'll certainly wait... I'm always interested in, this is going to have a really great impact on me if it identifies that that's a factor. My perspective was if it's good enough for AMC it's good enough for PACAF. And the – again, this is as a DO where my visions were created – PACAF leveling the requirement where we're not funded, wanting us to pay for flying – you know in AMC you fly two hours to do a demo, here you fly twenty. Okay? So as a DO you want to spend this many resources to go show Singapore, who's probably never going to buy the airplane, what this thing can do? You want me to take it out of hide and you want to make hard crews in a squadron of eight airplanes? That's [expletive] So no, I think that is an unrealistic expectation and that frustrated me. But that didn't affect any of the demo crew creation. It's just something that as a DO, I thought "AMC's been doing this a long time". [Another individual talks, indisctinct] Yeah, too restrictive and you know, even though I suppose as a former safety pilot I thought I... I was... I was comfortable with the demo. Now, I didn't fly it, I was in the ACM seat. But I've done everything else in this airplane, I know the capabilities of the airplane. So the need for a hard crew just seemed unrealistic, and also detrimental because you learn from other people's mistakes when you train. And if all you do is learn to accept the guy's mistakes next to you because you've been flying with him for six months, it becomes suitable. But if you fly with different people, all on a demo cadre with other people, it becomes much more transparent to what could be better and what needs to improve. So again, I was very frustrated with it but that never left my office and WITNESS 23 office. And that transcended into being a commander, and other than ensuring that only the most experienced people were on the demo team I never complained about the hard crews again.

Lt Col — Okay. Was there any wing-level or higher coordination to approve a cert letter with all names on one list and not separated as hard crews? The squadron was gathering a list of all names as one.

WIT 27 – Well, we did that Tuesday night.

Lt Col — Okay, was that something that the squadron was trying to push up and get approved or was this already discussed at a higher level and now the list was being made?

WIT 27 - There's probably more history than I understand on this one. We're talking this crew, this accident, because on Tuesday, the day before the crash, the call from **EXEC** General Atkins' exec to me, said 'Hey, General Atkins wants to have all the people's names and backgrounds and experience', so you look back and you say, God was preparing us for this. I know that's not objective, but there have been a lot of things - and this is kind of one of them -this over and above requirement at the last second to know at the three-star level everything about these guys. And with the kind of, well I perceived some frustration that we had vet to produce a video because that's another requirement. And I don't remember if that's a requirement on AMC because it is in PACAF. And so we were already doing the video on Wednesday, that was the plan, and so at this last minute we're still working it at MP was total force, doing it for everybody, to produce the names and 4:30 in the afternoon. And WITNESS 26 demo team pilot – not on this crew, WITNESS 26 Chief, Stan/Eval. And I, sitting in Stan/Eval office there, [Expletive] and elbows trying to get all the information and I remember calling EXEC at like five thirty and saying "Dude, we've got holes in this data because some people are on crew rest now, or they're not available, or the data's kind of old. And I said, "We've given you all this stuff before". (EXEC) "No, I'll take care of it," just send me all you got and the general just wants a last-minute kind of good feeling." So we gave it all to him and in true fashion it was all one squadron. I just think back to how much there's no division between us in that and how MP just sat there, just crunching away, and produced it effectively, and in my name, you know, and it's seamless. And out it went, and EXEC said "got it, we're all good", and the next day we tried to produce a video.

Lt Col —Okay. And you talked earlier about the good working relationship between the Guard and Active up here but, more specifically as the active duty squadron commander for this one specifically, were you aware that all members involved in this mishap were not going to be the full airshow crew for the demo, to fly the demo?

```
^{\text{WIT 27}} – No, I was not aware of it.
```

Lt Col – Okay.

WIT 27 – Nor was I aware that they were going to be.

Lt Col – Okay.

WIT 27 – There was going to be a demo qualified team where our chiefs of Stan/Eval made sure that it was going to be a qualified team.

Lt Col — Okay. With this sortie being a Guard mission, at least they had the Guard callsign, was the active duty leadership involved in the ORM process at all?

 $^{\text{WIT 27}} - No.$ 

Lt Col - Okay.

 $^{\text{WIT 27}}$  – I was not

Capt — That's standard, that's the way it typically works?

 $^{\text{WIT}\ 27}$  – Yes. But our ORM processes are identical. I mean, they were different before but as we led up to the ORI we said "hey, you know what, we need to clean. We need to make sure we're the same." About the only things I think we have to grow on are our ORM processes is to get full access to ARMS data both ways so we can write. We can read it now, and we're consolidating it into one database and as soon as our ARMS people can serve equally, a guardsman or an active, then we're there.

Lt Col — You're talking about crew hours, and flight hours...

WIT 27 – Everything.

Lt Col – Everything.

 $^{\text{WIT 27}}$  – Yeah, everything. You walk in and hand it to Sergeant R , she's guard, it doesn't matter if I'm me or MSO It doesn't matter.

Lt Col - TFI.

 $^{\text{WIT}\,27}$  – Yeah. That's exactly right. And that has been improving. And both to WITNESS 22 and my frustration, not as fast as it should, but it's improving. But as far as a go/no-go process they're the same, and I trust, I have trusted and continue to trust the guard's process because it's just like mine.

Lt Col — Okay. Those questions were more of the leadership between you and the guard. Now the next couple questions are going to be about some of your crew members. Have you ever reviewed the video from any of the demos flown by any of the crews, or more specifically by MP at all, have you ever seen them before?

 $^{\text{WIT 27}}$  – No. I have not.

Lt Col — Okay. Have you ever flown with MP and if so how would you describe his flying abilities as a pilot, instructor or evaluator? You already touched on that somewhat.

WIT 27 — You know, I have been trying to think about this because I think that I have, but I can't remember a date or an event. MP was early on, I was there with him when he pinned on Major. Gave him a lot of trouble for that because he didn't invite me but I was there anyway [laughter]. And I just know, these guys *are* our squadron...and...so I can't tell you, "Yes, in 2008 I know I flew with him." But I *feel* it, and you know how you remember what people, you don't remember what they say but you remember how you felt?

Lt Col – Right.

WIT 27 – The guy was awesome as a pilot.

Lt Col — Did you maybe have a simulator ride with him, being an instructor, because I know he was a sim instructor.

 $^{\text{WIT 27}}$  – Oh yeah! Many times. He was one of my first sim instructors here because I was the first guy in the sim here as a pilot.

Lt Col — So if maybe you can relate some of that to maybe not having flown with him in the plane, but maybe having flown with him as him being the Boeing instructor?

WIT 27 – I absolutely know I simmed with him, that he was my Boeing instructor.

Lt Col – Okay.

WIT 27 – And very thorough, I'd say that MP was the most experienced Boeing sim instructor because the only one qualified in the airplane, you know. Ste showed up as well, and STE's here, but the only guys that have flown a *mission* mission in the airplane... And, you know, he was being worked on right away to become a guardsman so he was only in the sim maybe, I'm guessing six to nine months. It might have been a year. But yeah, I remember good things. Again, I just remember being impressed with him.

Lt Col – Okay.

Lt Col — Was that the reputation he had around the squadron for the most part?

WIT 27 — Oh yeah. And we, again everything, I mean even commander's calls, are together. And we did, as we built up to the ORI, the guard came up with kind of brown-bag lunches training sessions. And MP I suspect, was the majority of the leadership in that, to be *teaching* us. And you know, he liked to talk about systems, which I could care less about [laughter]. But he liked getting in the weeds about how the airplane worked. I remember a couple times, especially on takeoff and landing data, he and I would kind of argue because it was my pet peeve too. He was right about half the time, and I was right about the other half [laughter]. But we had fun that way. I really respected the guy as an instructor. And, like me, not perfect as an instructor but he was willing to figure it all out and was also willing to say he was wrong about something.

Lt Col — What type of work, if any - which we know he did do - did MP do for you, in the active duty squadron? I know that he's a guard guy, but what type of work did he do for you?

WIT 27 – Check rides... He gave check rides, we gave each other check rides. That's probably the majority. And then just organization, stan/eval, prepping for the ORI, and ASEV. The guard did outstanding on their ASEV with stan/eval. So really we checked the ASEV on stan/eval because of him.

Lt Col — Capt<sup>WITNESS 26</sup> said the same thing.

 $^{\text{WIT 27}}$  – Yeah, she's gonna credit him because otherwise she'd have to credit herself too [laughter]. But it's just the two of them, but MP the old guy, he's got more experience than  $^{\text{WITNESS 26}}$  ... and MLM We'll get to him. But yeah, same deal  $-^{MLM}$  is in stan/eval.

Lt Col – Okay.

 $^{\text{WIT 27}}$  – Best there is.

Lt Col — Have you ever flown with MCP and if so how would you describe his flying abilities as a pilot or an instructor?

 $^{\text{WIT 27}}$  – The best instructor as a speaker I've ever met. The best. The guy could crack any nut as far as a student. I would have *made* him go to Altus when he left here. Because you could not fly with MCP and not

learn something, and shake off some kind of bad habit. Young instructor, now, I mean he hadn't been an instructor very long, but you know as an AC you're teaching. And that guy taught. And yes I've flown with him. Good hands, good AR, probably came from being a T-6 IP and a T-1 IP, yeah. It's hard to... You love to fly with MCP And ops flight commander, we worked a lot together. The guy was such a pro. I could imitate him, but [laughter] I want to do him justice so I won't imitate him while we record. Very very positive speaker – if you've heard speaker here, MCP probably second only to him as a motivational speaker which comes with being a good instructor. I think that's what makes him...

Capt — What were his duties in the squadron?

WIT 27 – He was the operations flight commander. Had been for about six months. So you know, he's the guy who I would go remind 'make that board blue and red mixed more.' And then, MSO would be the one that would go to and say 'make that board blue and red mixed more.' They were effectively equivalents as operations flight. MSO had his own office, MSO didn't [laughter] but that's the guard for you.

Lt Col — Okay, did you ever hear any reports of MP was flying the profile at all?

WIT 27 — I did not. Wednesday night when I was with MCP spouse after the crash she did relay to me that MCP had said in the past he wished he that didn't have to be a safety pilot - which he was not in this case, but previously - because he wished he could fly the jet and be in control of it. I could relate to that, having been a safety pilot. But this is, you know, post-mortem now, even though the official word hadn't come out, we knew he was dead. And MCP spouse knew he was dead. And so that's the first time I had heard that MCP had made any statements about wanting to be on the stick. But she never said anything specific about MP or MSO or any other pilot, just the fact that the position of safety pilot kind of sucks because you're not the guy flying and if something goes wrong you can't fix it. She was looking at it with a lens to, of, "my husband is dead". And I don't know if that's what MCP was thinking when he made those kind of remarks to her. He may have been thinking, "I love to fly, kind of sucks being back here". She was speaking as kind of a premonition, that "he was telling me something". So I don't know that we can take that, just from my words, that MCP had given concerns about it. He may have been giving misgivings that he didn't get to be the flyer.

Lt Col – Okay.

with 27 — And I'll tell you. I was, I've never been anything but transparent. And MCP knew that. And MCP could tell me he thought things were wrong. And MCP would have told me if he was not comfortable. I think he would have told me that. It wasn't somebody that would have said, you know, "macho up and I'll take care of it" or "suck it up" or "I don't want to be the guy that, that is, embarrass someone else". He absolutely would have told me if something wasn't right. So I have a hard time thinking that he went in that airplane thinking that something wasn't right with that crew, or with MP or anybody. Again, I'm wanting, I'm like everybody else, I'm ready for your results on Wednesday night. But that will really shock me if that's one of them.

Lt Col — Okay. Those are all the questions I had. I wasn't going to ask any questions about the other crewmembers. If there's anything else you want to add, feel free to do so. I know she might have some other questions.

WIT 27 – Do you have more questions?

Capt – Not really.

WIT 27 – Let me tell you more. Okay?

Capt – Perfect.

 $^{\text{WIT 27}}$  – And I do talk a lot, so I'm going to use every minute [laughter]. Fifteen more minutes. And if I think I'm long, keep going. MLM I consider a very close friend. And that guy, I'm not going to eulogize, I did a

little of that on Monday and many times since. But that, that guy loved to teach. I watched him teach around the world twice, young loadmasters, he didn't want to fly with anybody but the youngest, greenest loadmaster. And he personally, he liked to fly with me. I think because we both try to outdo each other talking too much and we never had to go to sleep because we'd both sit there and talk and put everyone else to sleep [laughter]. ButMLM would have called knock it off in a second if he thought something wasn't pristine, if he thought there was any kind of breach of air discipline. That guy was a pro. And he got himself in trouble not flying, administratively more than once where he shot his mouth off because he thought something was BS. Mostly about Total Force stuff. And he and I would toe the line together if it wasn't mixed, whether it was flying or administrative or social, if it wasn't mixed it was wrong. And that doesn't always fly with some people in the guard, for whatever reason. And I keep out of it, don't even know if you guys are guard.

Lt Col – No, I'm active.

WIT 27 — Okay. And I would say the same thing if you were, because again, I'm transparent. So knowing him that well, if he had seen — and you know the guard, "MP or "MSO would come out of MLM mouth in private. Maybe. You know what? It probably wouldn't, with MLM Because that guy, that guy did not want to push the culture of first names. Which is probably one of the reasons why I think he was particularly a professional. Because even in a culture that would have allowed him to call me "WITNESS 27", he never would. He never would have called a anything but "MCP Ever. Not in private, not on a boat, not hunting, not anything. In a bar with Taliban around him, he would have called him "MCP [laughter]. Okay? Because he wouldn't take anything less. And he would have told MCP or MP or MSO "that is [Expletive] don't do that."

Lt Col — With that, had **MLM** flown with them as a crew?

ever flew. Because if this turns out to be a breach of discipline - which again, I can't imagine it, but I can't imagine a C-17 crashing either – it will be very tough to think that I did not watch every single step in this program. I knew MSO the least of the four of them but I felt like I knew him well enough to trust him with flying this. I don't think I ever flew with him, but I trust WITNESS 22 and WITNESS 22 says he's good. And Think I get on thousand hours in eighteen different airplanes, so if WITNESS 22 says he's good, he's good. I liked MSO personally, because he was willing to, well, I shouldn't say *like* this, but he was willing to say... I perceive – again, this has nothing to do necessarily with the crash, but will give you an insight on his personality – he would have been one of those guys who didn't mind having guard-only crew, active-only crews. And not that he was any kind of subversive in with the crash, but you know, he'd be the one we go to and say "you need to do this, you need to". And MSO would say "Okay. Great. I'll be the ops flight commander, you be the squadron commander." [laughter]. "My schedule." I guess the part that I get out of that is, tough guy. Doesn't have a problem saying no and doing it his own, his own way, the way he thinks is right. I'm not talking about flying an airplane, but administratively. So if he didn't think something was right, I would have thought he would have discussed it. So… I'm at a loss as to how it got to this point. And I wish you guys the best in figuring this out as fast as you can.

Capt – Well thank you.

Lt Col – Any more questions?

Capt — I think... I mean, we've already covered the unit morale. It seems high, in both squadrons. Is that a true statement?

WIT 27 – I don't think you're going to find a higher one in the Air Force.

Lt Col - You're in *Alaska* [laughter].

WIT 27 - In Alaska, and we're in one squadron, people... And again, I'm not an evangelical, but I'll tell you, God's been preparing us for this. And I don't think that there's many other squadrons that could bounce back like we're going to. Not many associations that could not even think for a second, not for a second, this had anything to do with "guard guy" or "active guy". Not for a second. So, we'll do well recovering from it. I wish I was going to be

here for it. I'm certainly willing to participate if there are any more questions that you guys have right now or in the future.

Capt – Great.

 $^{\mbox{\scriptsize WIT}~27}-I'll~\mbox{help}$  you in any way I can. As well as everyone in that squadron.

Capt – Great.

Lt Col – Okay. I'm done.

Capt — That ends the recording at 1354.

TRANSCRIBED INTERVIEW

INTERVIEWERS: LT COL (SIB/IO), MAJ (SIB/FS),

CAPT (SIB/HF) INTERVIEWEE: WITNESS 19

ROLE: 517 AS, PILOT, FRIEND OF MISHAP CO-PILOT

**DATE: 8 AUG 2010** 

LOCATION: ELMENDORF AFB, ALASKA, HOSPITAL (RADIOLOGY CONF RM)

Capt — "Great, we'll just start off with kind of your general assessment of let's just start with unit morale of the 517<sup>th</sup> and then the 249<sup>th</sup>"

"Yeah, I can't speak really intelligently on the morale of the 249<sup>th</sup>. I would say that their working relationship between the 517<sup>th</sup> and 249<sup>th</sup> has been good, especially relative to some other guard-active duty relationships. We inter-fly a lot, we, I'm a readiness flight commander. We work with the guard all the time to send mixed crews out on deployments; so I mean there's a good working relationship with the guard. The morale of the 517<sup>th</sup> you know overall I would say that it's good. I mean it's a bunch of pilots and load masters, so people are going to be complaining about something all the time, you know what I'm saying? I mean that's just the nature of the business. It's hard for me to put this squadron in perspective relative to other C-17 squadrons, I think that we probably have it; I'd say the general perception is that we have it great up here. Especially when you look at Charleston, McChord, or any AMC base and I think most of us get that and appreciate it. At the same time there's a lot going on still in this squadron, especially this time of year when a lot of folks are on leave or whatever else is going on air shows, change of commands, you name it Red Flags, DV visits I mean people were stretched thin and maxed out, okay. So having said all that you know I would say that morale was good. People were excited about this leadership change, at least all the folks that I run around with. And nothing against the old leadership but you know folks were excited about what was coming, so anyhow."

Capt — "So what's your job, and do you interact with the 249<sup>th</sup> on a daily basis or?"

with them on a daily basis, you know sometimes more than others. But I'm essentially in charge of you know deploying and re-deploying folks and we do that together a lot of times, where our hard crew that goes out and inter-flies with whoever is deployed; Mc Chord usually whichever squadron Mc Chord has deployed, so that's the biggest interaction that I've had with the 249th."

Maj — "You mentioned that this is the season for a lot of leaves and everything in this squadron, could you roughly estimate how much or what percentage or what your leave policy is and who?..."

"Yeah, leave you know pardon me if I give you a wrong number but I think the number is 10% per crew position and I know for a fact that it's maxed out and then that's not counting the folks that are taking leave in conjunction with formal training, so you know we stretched that one as far as we can and for a good reason I think but."

Capt — "What is your personal opinion on flying with guard members in the intermixing of the crews, have you had good experiences?"

"I've had all of the experiences I've had flying with the guard I've had limited experiences flying with the guard especially on the pilot side. I've flown with plenty of guard load masters and never had any issues, so you know that's all positive."

Capt — "Great, and then aside from the few grumblings here and there have you heard stuff from air crews flying with mixed guard-active duty, any issues with them?"

 $^{\text{WITNESS 19}}$  - "Honestly, not that I can recall"

Capt — "Okay we'll just generally go into the mishap crew members and then we'll, just what you know about them, how well you know them, you know personalities...

Maj – "Have you flown with them?"

Capt – "That kind of stuff, we'll just start with MP first."

MP is that he's a sharp guy, he knew the C-17, and that's about it. I don't have anything really positive or negative to say about his flying skills or anything else, you know he was a smart guy."

Capt — "Did he have a certain reputation in either your squadron, or his that you know of?"

"No, I mean you know I think the reputation that he had was you know he was a quiet guy for the most part it seemed like to me, you know, he probably wasn't to the folks that knew him better I just didn't have a lot interaction with him but the impression I had and the impression I thought others had was that he was a sharp guy."

Capt – "Okay, and then how about MSO

"I never flew with him that I knew of, you know most of what I knew about MSO was through you know, I didn't have any direct interaction with him. But MSO was obviously very good friends with MSO

Capt — "Anything else on his reputation on his personality from other people?"

"Well he was a fighter guy so there's not a whole lot of fighter guys floating around a C-17 squadron, so I think people automatically think a lot of those guys are sharp and he was a good dude, you know, so yeah, it was all positive."

Capt – "Okay, and then you know MCP the best?"

WITNESS 19 - "Yes, yeah, you know, MCP was a great friend I knew him...we were in the same pilot training class. So we go way back, and he came up to Alaska a couple years ago and I had been here maybe six months, it's close enough for government work. But we had worked together and you just kind of just picked up where you left off, you know how that goes in the military. But this past six months to a year he was a flight commander. I was a flight commander, we both like neck deep in the booster club that was like our pet project so we worked together all the time...all day every day. And MCP is you know I think that he's a lot like me he got along with everybody. But I think that we were definitely on the same wave length. He was a great leader a great officer, he had things in perspective. The people that worked for him and with him loved him. I mean all that stuff that's been said in the past week in a half it's no bull the guy was all that and then some. And you know he was a solid officer and a pilot but he was a solid dad, a solid husband, you know a good friend he was just kind of one of those dudes. My impression of him as a pilot is he was...he enjoyed flying and I don't want this to be construed the wrong way what I'm about to say okay so there needs to be clarification at some point we need to do that. But MCP could, flying wasn't his sole drive, you know what I'm saying? Like we could have both set flying down and gone in a different direction that would have been fine, now that doesn't mean we don't love it because we do and he did, but, you know, this is a guy that could probably do anything he wanted. And if something came along that was better for him personally, for his family, then he would have done it. He was a conservative flyer like I am, you know there are guys there's a couple of different personality types in the C-17 because it's a tactical airplane, or it can be a strategic and a tactical airframe. And there are folks, that really embrace the tactical standpoint and that was a huge push from leadership in the squadron a very tactical mind set, okay. And you know we need that, that's what this airplane was designed for and built for but you know I would put MCP and I in the more strategic category, you know. We enjoyed taking off, and putting the autopilot on you know waking back up when it was time to click it off and land. We didn't enjoy pushing the envelope or max performing the airplane because it just you know it wasn't our thing, and that made us uncomfortable and it made MĈP uncomfortable. And I think I probably answered your question and then some. MCP specifically related to this air show program with that in context, you know, he had verbalized that to some folks."

Capt "Who was it in particular? Was it to leadership or just friends?"

Well, to me. To me. And, you know, I think there's some other guys that you probably want to talk to that could maybe offer some more insight into that. But all I can tell you is what the conversation that MCP and I had, you know. And on Wednesday we had, you know, we had worked together all day on a lot of stuff, it was just a very busy day. And he was in my office right before he stepped, or right before he briefed. And we were talking about a lot of things, the, just all the crap that was going on. But he, he talked about this air show profile and how, you know, I think he even talked about how his, well... He talked about how it was uncomfortable because of, just, the maneuvers, you know. Not that they were... He never alluded to anything that was outside the parameters of what that airshow profile was about. It was just the nature of the profile that was uncomfortable to him. The, all the warnings, aural warnings that the airplane is giving you during that kind of profile... How he's heads-down a majority of the time running checklists, you know, and kind of at the mercy of whatever is going on because he's got his particular job to do and unfortunately that's not looking outside for a majority of the time. You know, what's tough about that conversation for me, you know, is we had talked about some of the other crap going on but that's really the last, the last thing that he said. He left my office and he came back and he's like, "you know, man? It just scares me. This thing just scares me a little bit." And he smiled at me and left. You know? That was the last thing that we talked about.

Capt — Had he mentioned earlier then, the last week or so, practicing about the air show profile?

"He had mentioned it before, you know. And I can't tell you a specific time and place, but it wasn't new news to me that day, okay? I knew that... I knew that he didn't... That he wasn't comfortable there. And that's where this gets really tough because MCP was proud to be on that air show team, and like he enjoyed what it was about and like the fact that he got to be a part of that. But... I don't know any other way to say it than there was just a significant part of that that really bothered him. And that I wasn't the only person that he told that to, you know. I know that.

Lt Col — You mentioned about the aural warnings that are going off all the time. Did he say specifically...

He did. He did say specifically during the conversation, but I... I can't, I can't tell you exactly what he said so I don't know if it's better for me to not say it or to speculate.

Lt Col — I'd rather have you say what you thought he might have said. And then we can compare that to what... [trails off]

he was conveying. And that's that you're flying the profile and you essentially get somewhat desensitized, especially to the... I remember him saying the ALS is constantly flashing in the HUD. Okay? And that, you know, you're hearing the stall warning but, you know, and this isWITNESS 19 speaking now, this airplane has a, you know, a whatever, a thirty percent stall margin, whatever it is. You know, and so, when you're, when you're flying an aggressive profile like that, and I guess you expect to, to hear that frequently, and I don't know. I'm not an air show guy, I don't, I don't fly the plane that way, you know, on locals. And yeah, I've got the, the stall warning before just like all of us have, you know, and probably frequently. But the point is that it's not, that's not a comfort zone for me, I don't operate there, I fix something if I hear that. And the impression I got from him is that that's not the case in that airshow profile. You know? And so...

Lt Col — Did he mention anything about altitudes, flying, bank angles...?

WITNESS 19 — Yeah! Yeah, he did. He talked about bank angles a lot. And I remember him saying that day in that conversation, you know, aggressive stick movements and how he just, what he alluded to, "I just want to... You know, stick my hand up there and mellow that out a little bit," you know what I'm saying? He talked about the bank angles a lot, and the proximity to the ground. And MCP had a, MCP had a, he wasn't, he didn't get, he didn't get airsick. But he was like me, man, you're yanking and banking in the pattern like that... You know, we get a little

queasy, you know? And that's the other thing that he, you know, had talked about is that, you know, once he gets done with those profiles, he's just... wasted, because his head's down the whole time, and they're just jerking that airplane all over the place. And then once again I want to clarify, he never... He never alluded to the fact that anybody was breaking any rules or doing anything that they weren't supposed to. You know, it was just the nature of what that profile was about. He did not say this to me, but I know that, I know that he has watched an air show profile, you know, up on the roof with some guys, and conveyed specifically things that made him nervous while they were watching the profile. So this is second-hand, MCP did not tell this to me, but I know that when they do the initial takeoff and bunt over and go immediately into the left turn and back into the right turn, that he talked about that was the scariest part for him because they get so slow in the left turn, they were trying to gain their speed again back in the right turn. You know, and that was, that's what I heard that he said. And that's consistent with a lot of the things that he's told me directly. And.. You know.

Capt — As your friend, and you said he was a pretty conservative flyer...

WITNESS 19 — Yes.

Capt —Did it strike you as odd that he would continue to fly this profile, and...

we do that we probably shouldn't necessarily be comfortable with. You know what I'm saying? And I definitely would say that this airshow profile was something that... There should be a certain level of concern and healthy fear flying that profile so that something like this doesn't happen, you know? And that's why I would think MCP would be a great person to, to be on a demo team because he's got a threshold, you know, he's got a very healthy threshold. Just like I would. And no, it doesn't strike me as odd because MCP you know, MCP was... and this... This might need to be clarified in the future, but MCP was always... We used to make fun of him for being spun up all the time. Not in a bad way, he was just, you know, he was constantly going a hundred miles an hour. And he, he was always anxious, you know, like especially if you had to be evaluated, or you know, and this... This might need to be clarified in the future, but MCP was always... We used to make fun of him for being spun up all the time. Not in a bad way, he was just, you know, he was constantly going a hundred miles an hour. And he, he was always anxious, you know, like especially if you had to be evaluated, or you know, was going to be on the jet that day, I remember him talking about that. You know, he was nervous about "MCP" was going to be on the jet that was MCP" That's been more pilot training. MCP always performs and excels, you know. I mean the guy, he could have gone fighters in pilot training, you know? Probably for a lot of the same reasons that are consistent with what we're talking about now. It just wasn't his personality, you know? He wasn't a tactical guy.

Maj — Can we talk about the aircrew, this demo crew? Do you remember him talking about flying with the same people all the time, how many practices he's had with them?

 $^{\text{WITNESS 19}}$  – I know it... I know that.. And see, this is, this is a little difficult for me because I know I've got some second-hand information, you know? That wasn't, you know, wasn't necessarily MCP and I talking, some of that kind of gets, you know, get my streams crossed there. But I'm pretty sure he had flown with this crew before. I don't know if it's the crew. I don't think it's the crew that he always flew with or even usually flew with. I don't know if there are hard air show crews. I know that in his office that day we had two missions drop, and I'm sure you all have been to his office. And you see those names up on the grease board where they're lined through and question marks. And we're trying to fill those two lines with who was left in the squadron, you know, and it was difficult. I mean, we had, it was like, we just had to juggle a lot of things around and make a lot of phone calls and even get squadron commanders involved. But we were jockying air show stuff around, you know. I remember MP walking by, you know, during that point in the conversation and him being asked an air show question about if, if somebody not demo qualified could ride jump seat. Okay? But the answer was no. The answer was no, you know, and he gave that answer. But I mean that's kind of the, that might give you just an idea of what was going on right that day. So I know MCP had practiced a lot. I know he had flown this thing several times, in the sim and in the jet, you know. So it wasn't his, this definitely wasn't his first time. And I don't know how many times he had flown with those guys, but the impression I have is that you might not necessarily ever fly with the same guys on that profile.

Maj – You said that MCP had a lot on his plate. Do you feel like this air show demo that day was kind of the focus for a while, or was it...?

 $^{\text{WITNESS 19}}$  – You know what....No. No, it wasn't the focus. You know? But it wasn't... That wasn't the focus of his day, you know. It was the focus at that point in his day when it rolled around, but that wasn't... He had a

hundred things going that day, you know? He had a hundred things going that week, and the week before that, you know? I mean, he was the frigging ops flight commander, you know, he was the busiest guys in the squadron. And...You know, I don't know if it's healthy or unhealthy mentality, but the fact of the matter is that, you know, for a lot of, a lot of flight commanders – me, too – that flying is not the focus day in and day out. You know, we get put on a local, we go make it happen, we mission plan, we do what we got to do to be safe. But honestly, it gets fit in between the other responsibilities that we have, at least that's how it is for me.

Lt Col — How long do you know, do you know how long he was at work before he did fly that? I mean, do you know when you guys came in that day?

```
^{\text{WITNESS 19}} – He showed up... He showed up later that day.
```

Lt Col – Okay.

 $^{\text{WITNESS 19}}$  – Probably late morning, something like that. If I had to guess, nine or ten o'clock.

Lt Col – Okay.

 $^{\mbox{\tiny WITNESS\,19}}-You$  know, probably closer to ten. But that's a wag, y'all. I mean.

Lt Col – Okay.

Capt – Okay. [to Maj ] Did you have anything else?

Maj – No, [to Lt Col Did you have anything else?

Lt Col — The only thing I have, looking from the flying standpoint again is, is if you can remember anything that he was talking about specifics. I know you mentioned the stall warnings and ALS, and he was uncomfortable kind of bank angles wise. Did he give you any specifics about bank angles that he was uncomfortable with or did he give you any degrees?

From Speculating, you know. I can't remember the number that he threw out there, but I know that... Going to sixty or past sixty, whatever it is that they do at that particular point, was definitely an uncomfortable thing for him. And I, what I think – I don't know – what I think is that, you know, if there's some point in the profile that goes past sixty degrees of bank he was very uncomfortable at that point. Or if there's a certain point in that profile that might lend itself to going beyond that number accidentally he was very uncomfortable with that point. Because he did talk about it.

Lt Col —Okay. Do you know if he talked about it with just you, or maybe supervision, or was he saying that to a lot of people.

```
^{\text{WITNESS 19}} – I think that he had said that to a few people.
```

Capt — Do you know with MP or MSO like, how much they talk about it?

WITNESS 19 - No.

Capt – You don't know?

 $^{\text{WITNESS 19}}$  – Don't have a clue.

Lt Col – How about use of the rudder at all?

WITNESS 19 - Don't know.

Lt Col — Don't know about that, okay.

Maj — WITNESS 19 is there anything else that you can think of that might possibly help us with the investigation that we didn't ask already?

WITNESS 19 — [Pause] I know that MCP was good friends with MSO And I don't know this for a fact, but I have a good idea that MCP was much more comfortable with MSO in the seat than MP And that that might be the theme that you hear somewhere else, depending on who you talk to.

Lt Col — Alright.

Maj — Okay.

Capt — Alright. This ends our interview at 1044.

TRANSCRIBED INTERVIEW

INTERVIEWERS: LT COL (SIB/IO), CAPT

(SIB/HF)

INTERVIEWEE: LT COL WITNESS 22

**ROLE: 249 AS/CC DATE: 9 AUG 2010** 

LOCATION: ELMENDORF AFB, ALASKA, HANGAR 5

Lt Col — "Okay, as the squadron commander, how was the working relationship between you and the active duty?"

WITNESS 22I would characterize the working relationship between the active duty and the Alaska National Guard as very positive; as associations go, I think we had one of the better associations. There was regular communications, in fact every Wednesday we had what we called a TFI meeting where the squadron leadership would get together and we would discuss any factors affecting the guard or active duty. That was kind of our coordination meeting and I would characterize the relationship as very good, if not outstanding."

Lt Col — "Okay, have there ever been any problems from the leadership standpoint concerning the flying of mixed crews, and if so were they discussed laterally with the active duty leadership?"

WITNESS 22There has not been issues with flying with mixed crews, in fact we frequently did it on trips and on locals there was always....of course we had guard owned and active training lines. Basically I think we worked together quite a bit to make sure everybody's needs were taken care of, making sure that we didn't have any (ADA?) violations; if we had a guard line scheduled that the main purpose was for the training of the ANG, any active duty participation was secondary to the training of the ANG members but there was not issues. When we first started out, the unit, we were light on C-17 experience and we relied heavily on the active duty experience for the first year it seems like, there was a lot of active duty IP on the ANG flights to get the experience level up. I was not aware of any problems overall with flying with mixed crews. There might have been personality conflicts but I'm not aware of it and seemed like everyone was playing nice together."

Lt Col — "Did the active and the guard units commonly fly here as mixed crews?"

WITNESS 22On local training lines we do fly together; I don't have the exact percentages, but of course that is a matter of record. We have active duty lines and guard lines and there would be some mixing depending on the training requirements and the amount of mixing is a matter of record."

Lt Col — "What type of lateral discussions about the guard and active mixed crews, or crew compliments that centered around flying skills or capabilities would you have with the active side?"

WITNESS 22 Yeah and we always watched the pairing of crews and especially the ORM and the CRM, we always made sure there was a good experience level on the crews, we tried to stack the deck in our favor."

Lt Col – "How familiar are you with the demo certification process and to what level were you involved with it, if any?"

WITNESS 22When we first looked at the demo team there was a lot of discussion about it and my boss at the time was the squadron commander, we were a detachment, we looked at it, he was ok with it but he wasn't thrilled with it, but the thing is we wanted to have a total force team, to basically highlight the positive association, the total force, you know, the relationship between the guard and the active duty and we looked at initially MP was our choice and the active duty had folks and we threw MP in to the mix and he's been doing it since day one and we were only starting to introduce a couple others, MSO and MP it was kind of his thing, as far as on the

guard side, he had done the demo multiple times so if you look at people, you know, I look back on it and I have no regrets as I knew MP was highly experienced C-17 and he was the right choice for the demo."

Lt Col — "What are your thoughts or concerns with the requirements to have hard demo crews? In PACAF, AMC doesn't have that but PACAF does"

WITNESS 22Really I can't, I know people had to be checked out I know there's like a training, there is a syllabus, and there is a SIM, and then practice in the airplane. On some of this I know there had been some...on the guard side there was only MP and MSO were the only two people as far as the pilots go and on the active duty there seems like there are more people in to it. I don't know why that is, it might be a function of 'hey OPR bullet', I don't know"

Lt Col — "As far as the cert process goes also in PACAF it's required for the demo to be videoed and reviewed before they fly the air show, have you ever watched any of the videos or seen any of the videos before?"

WITNESS 22 Actually, I haven't seen the videos. But we've watched them fly from the windows and stuff and of course when we had the air show two years ago I watched the demo. I am somewhat familiar with it but not involved with it, like I said, I am a squadron commander and I am here worrying about OPRs and travel vouchers and stuff like that. I didn't get too much into the details....I know it's basically an aggressive climb out and a couple steep bank turns and a high speed pass and the turning capabilities of the aircraft and assault landing"

Lt Col — "Was there any wing level or higher coordination to approve a cert letter with all the names on one list, and not separated as hard crews. We actually have the most recent list that went up but were you aware of that list or have you heard of that one?"

WITNESS 22On the demo team thing, I didn't get involved in it too much. I know MP had worked the details and our DO had been involved with it a lot more than I. Once again it was one of things that was more on the active duty side of the house than the guard side of the house. You know, the guard side of the house probably wouldn't have ... we wouldn't have a guard only demo team that's for sure."

Lt Col — "As the guard squadron commander were you aware that all of the members involved in the mishap were not going to be the full air show demo crew?"

WITNESS 22 hh...I thought the pilots were going to be but the loadmasters they were going to do some changing out because I thought that...my recollection was that MP was going to be the primary, MCP was going to be the co-pilot and MSO was going to be the safety pilot and then there was discussions where getting MSO getting upgraded to possibly be the pilot."

Lt Col — "As far as MLM the load master he was actually filling in for someone that day, for another load master who was in crew rest."

WITNESS 22 Yeah... LJ "

Lt Col — "Now was this, being that it was a guard mission, was the active duty leadership involved in the ORM process at all or was it mostly the guard side that would have completed the ORM?"

WITNESS 22 Well, all the paperwork would be...the guard ORM was completed because it was a guard mission. This is one of those deals where it was more fitting it in with the schedule as far as when we could do the demo here, the practice demo at, filming by PA, and so forth, so it was more a function of timing and the sortie scheduling then it was...it just happened to be...you know if it would have been 5:30 was the best time to do the sortie it would have been an active duty sortie. TFI-wise we are very close"

Lt Col — "Everything we've talked about as far as the combining of the TFI with the guard and active up here, it seems great. Is the ORM process one thing that's still being worked on as far as based on...what's the limiting factor of just having one ORM process whether its mixed crew or not, is it more the HARM or the SARM requirements?"

WITNESS 22 Actually, what's happened with that is the ORM we have discussed this and I've said "Hey, I want the..." (we've discussed this at TFI meetings and I wanted it to be seamless between the guard and active duty where we have the same paperwork, pre-departure checklists, same ORM, and what happened was, was that we gave that to the safety guys to work and Maj S is our safety officer and MAJ D was the ADO and they were working on it and they never did finish it because they had some, I won't say disagreements, but they had some obstacles, but it's kind of interesting because that one of the things I was like 'Hey, I want the ORM to be reworked so it is the same, the ORM sheet, I had done the ORM for the rescue squadron when it first came out and I thought I did a pretty good job on it and I had given examples of the ORM I had done over in the rescue squadron and I wanted to get their thoughts on making it more extensive than what we have."

Lt Col — "Have you ever flown with far as a pilot, instructor, or evaluator?"

WITNESS 22Yes, I've flown with MP as far as in the C-17, excellent C-17 pilot, we hired him and what happened was that he was originally a SIM instructor for Boeing and MP had a degree in physics and was the kind of guy who was always asking, "why does it do this?" He went beyond the book trying to figure out stuff and he was the type where he would actually call the engineers back at Boeing to figure things out. That was the person he was as far as general knowledge. As far as hands, he had excellent hands, he was always very concerned when we first started up he was worried about us older guys going through the C-40 transition and he was worried about us older guys coming out of 135s, helicopters, C-130s, he was very concerned about us and making the transition and making sure there was a positive transfer. Overall, MP was an excellent pilot and we depended on him heavily to get us... to get the squadron up and running."

Lt Col — "What type of work, if any, did MP do for the active duty squadron?"

WITNESS 22He primarily did the stan/eval functions for the guard. There was a lot of cross communication in the stan/eval office. In fact, that was one of the issues that had come up. When we first started out were running separate FCIFs and the WG/CC at the time, Gen Tinsley, wanted a single, defined, FCIF, so we went that direction. And of course, basically where the squadrons meet is squadron stan/eval and the guard is kind of interesting because they just have OGV and you don't have squadron stan/eval because of the manpower issues but we had basically...we had been fighting that fight and we said "hey, we'll have an OGV person helping with someone at the squadron level too so there's that interaction and standardization."

Lt Col – "Okay, have you ever flown with abilities?" MCP before, and if so how would you describe his flying

WITNESS 22 never had the opportunity to fly with MCP

Lt Col — "Okay, have you ever heard any reports of all, the squadron, or maybe the way it was being flown?"

WITNESS 22-"No. I'm not aware of that"

Lt Col – "That's all the questions I have for now"

Capt — "Just kind of a general as the squadron commander, when someone has a disagreement or is having issues with someone or a crew member that's flying that can't be resolved at lower levels, what is your policy as far as guard and active? Do you want the active go through their chain of command before crossing over? Do you have any comments on that?"

WITNESS 22The thing is, if anyone has any problems with anybody it's...they're welcome to do it either way...to go through the active duty channels or come to me and of course I'm probably considered the old lady in the squadron as far as...because I'm very conservative and I've been flying up here for 33 years and I've worked civilian and military aviation and I've worked with the rescue squadrons and seen plenty of aircraft accidents. I think I have a very conservative bent and I would hope that if you talk to folks on our side, they would say 'hey his one thing would be safety' "

Capt — "Just to clarify back to the ORM, did you review the ORM for this?"

WITNESS 22 Actually, I did not. I was on a trip to New Orleans. I was supposed fly with MP on Sunday to go down to New Orleans but the airplane was broke so we waited for a couple days for it to get fixed, and he dropped off the trip so that he could fly this air show demo because it was a requirement to fly (don't quote me on this)...it was a requirement to fly within seven days of the air show."

Lt Col — "Is there anything else that you maybe want to touch up on that we didn't in the questioning?"

Capt — "Anything that could help us out at all with the investigation?"

Lt Col – "Or just about the relationship between the squadron"

WITNESS 22Yeah I think the relationship was very good in the squadron, in fact MCP I was working with trying to get him to come over to the guard. MSO was trying to get MCP on the guard side once his active duty commitment was up."

Lt Col – "Anything else, sir?"

WITNESS 22 - "I think that's it"

Capt – "This ends our recording at 1555"

TRANSCRIBED INTERVIEW **INTERVIEWERS: LT COL** (SIB/IO), CAPT (SIB/HF) WITNESS 25 **INTERVIEWEE: ROLE: 249 AS, DEMO PILOT DATE: 9 AUG 2010** LOCATION: ELMENDORF AFB, ALASKA, HANGAR 5 Lt Col - Okay, first question. Have you ever been certified as an air show demo pilot?  $^{\text{WITNESS 25}}-Yes.$ - What crew position were you certified in? Safety observer, pilot, copilot...? Lt Col WITNESS 25 - Pilot. Lt Col -Were you certified as a hard crew. When you went through your certifications, do you remember, that you would fly... When you were certified, were you trained with any copilot and safety that you would be flying with? WITNESS 25 - Yes. Lt Col – Do you remember, those crew members, who it was? WITNESS 25 - Yeah, my copilot, MSO And my safety observer was going to be MP Lt Col - Does the demo aircraft commander or demo pilot always fly the demo from the left seat, from the pilot's seat?  $^{
m WITNESS~25}$  – The pilot will fly from the left seat. Lt Col - Okay. Who was your instructor during your upgrade process, or did you have multiple instructors? Going from the ground training, the sim, and then eventually to the aircraft? witness 25 – We had several instructors. We had ground training with MP and, I believe WITNESS 11 and then the flight training with... I'm pretty sure I just flew with MP Lt Col - Okay.

WITNESS  $^{25}$  – I'll have to check records on that.

Lt Col — Okay. What were the steps involved in your upgrade process? Just general, overall, that you remember as far as, uh—

WITNESS 25 — I remember being impressed it was thorough. We got the initial contact email; 'Congratulations, you've been selected, these are the regulations you need to be familiar with, read those.' And then we spent two days with ground training. So we walked through the profile, walked through the checklist, walked through the expanded section of the checklist, created products in Falcon View, talked specifically through each maneuver for most of the day. And then we went and did several simulator profiles, I don't remember how many days. At least two. On two separate days after talking about, you know, what we would do. And then we thoroughly debriefed, you know, our SIM profiles, using the tools [indistinct] ground tracking.

Lt Col – And then how many flight—

 $^{\text{WITNESS}\,25}$  – And then after the sims, we did flights. I'm certain it was more than one, and I don't remember if it was three or more. At least two, at least two flights.

Lt Col — Okay. Have you ever flown a C-17 demo at an airshow , you being the pilot?  $\frac{1}{2}$  WITNESS 25  $\frac{1}{2}$  No.

Lt Col —When you were trained in flying the profiles, as far as checklist completion goes, how were you trained to work the checklists after takeoff? As far as reconfiguring... Reconfiguration of the aircraft? Do you as the pilot call for the standard calls that we train to every day as far as 'flaps up', 'gear up', 'flaps up; slats retract' and then it was ran by the pilot monitoring? Or did you brief something to the effect of "just clean up the aircraft on speeds" and it was all done without you as the pilot knowing and it was the copilot and safety running those checklists? Or was it something in between?

WITNESS 25 — Kind of between. But I would say we briefed....I wanted to brie...pre-brief. So I would brief, you know "clean up on speeds" so I would not, so as the pilot flying, I would not be calling for it on the checklist throughout the profile.

Lt Col —Tell me as much as you can remember about how you fly, from the initial portion of the profile? So brake release, up to the start of the high-speed pass. So you brake release on the way to your 80/260 out coming back in for the high-speed pass. And this isn't a test [laughter]

 $^{\text{WITNESS}\,25}$  – Brake release is static. Take off, max power. We briefed that you would try and be gentle on the brakes so that you would pop the nose up. That's right. We then make sure that all four engines were spooled up properly, that you would have even acceleration and thrust. We would plan to do a delta-v rotate, or delay our rotation speed on the ground, so that we would know... We knew, basically by the time that we rotated, if we were above our Vmco climbout speed. Wouldn't have to accelerate at all. We would trade some of that energy for our altitude, climb out at our minimum climbout speed. If we had a few knots, we'd rotate to... Initally we were trained, MP was good about training us to stop at fifteen, just to get above ground speed and prevent tail strike, and at seventeen degrees I think it was. But then we would quickly rotate and once we get about fifteen, ten or fifteen feet above air that's no longer a factor. So then we would rotate the pitch... We wouldn't aim for a specific pitch angle, we would have no going more. I mean, above about forty-five degrees or fifty, that's pretty uncomfortable so we'd start nosing over. We would aim for, as the pilot flying I was looking at my airspeed. You could see it decay so you'd stop and you'd hold your pitch, at your min climbout airspeed, hold that for fifteen hundred feet. Well, the airspeed, not the angle, to fifteen hundred feet. And that's something you need to be aware of, the airspeed can still decay even though it's, it looks like it may initially stop so you're kind of, nosing over and leveling off, climbout to fifteen hundred feet, and then you're going to make a snappy, you know, a crisp, is a term I would use, a crisp turn to our outbound acceleration heading for the high speed pass to come back.

Lt Col — As you're talking me through this, the turn after you take off, try to touch on airspeeds and bank angles, things like that as far as you recall.

WITNESS 25 — Well, the power setting that [indistinct], we keep that at max power so as the pilot flying you're really not going to touch that power, because you still need to accelerate once you make that turn. So you're going to make, you're going to level off and then you're going to start a sharp left turn and we would aim for sixty degrees of bank — you have plenty of energy at max power at that angle, with your configuration, so your sixty degree turn, kick some left rudder in — in this case we're turning left — push the left rudder in to get the nose tracking. Then we would pitch for our outbound, our outbound heading, which was about seventy, seventy degrees or so off of runway heading. Direct from there where you're wing's level now, you're kind of, you're nosing over, you're cleaning up and your flaps and then your slats...on speed, we pre-briefed to clean up on speeds with the power still at max and we would descend from fifteen hundred AGL down to five hundred to trade some of our altitude for airspeed and energy.

#### Lt Col — On that outbound turn?

WITNESS 25 - On the outbound turn. We would start getting down to five hundred feet AGL. Hold that, hold that heading and we timed it to seven seconds outbound, where we would accelerate, clean up, and by the time we were seven seconds or so we could have, we could start our turn back around. Coming back around, you're probably not at your, you're not at your altitude yet, usually. So you're, again, you're banking it up, steep turn, 60/2 turn, sixty degrees bank, two g's. Still with the power at max. And now the trick that you're trying to measure is playing out vour turn radius. Because vou want to keep your turn tight enough so that you don't overfly the crowd and you don't overfly the runway. On the other hand it's hard to measure performance because you're changing so many variables. You're accelerating. The common mistakes there are people will underbank in that turn, and so you can use a good flight pattern. A good noodle, we call it. And measure, and see where you're, where the airplane is going to be. And it initially starts out and you're at anywhere from 180 to 230 knots at the initial turn, and it shows that you're going to be, you know, a mile or so short. But as you keep it accelerating and turning around that turn, it often times would show you're going to be off, you know, a half a mile or more wide. So, that's the trick, you know, that's the artful turn to turn round. So in that turn, you're also, got the, we're putting in a right rudder, inboard rudder now. So you've got right rudder, in order to keep level you need to cross control so you're holding back stick pressure to keep level. And then you're also putting in left aileron to keep rolling around, and that keeps the nose up and keeps your altitude level. Which I think was emphasized, I don't know, that can be a gotcha because it's easy to sink, to lose your altitude, in that turn, at that angle. So it's an awkward, an awkward body position, that you're making new muscle memory, to control that, that turn.

Lt Col — And then as far as holding that turn, pretty much the whole way until you roll back out on the center line to come in at--

WITNESS 25 — Well you hold the turn until you get to 330 knots, hold that power. We're at light weight, so you can overspeed the jet. So that's, but that's not usually something that you catch the first three or four times that you're doing the profile because you've got so much other information that you're trying to manage. So it's common that guys will overspeed the jet if we're about, you know, rolling out two miles or so before the center line and realizing "oh, I need to power back, otherwise we're going to —

(Tape ends here, continues on second side)

Capt – Continuation of Major WITNESS 25 You already mentioned high morale in the 249<sup>th</sup>, and then—

WITNESS 25 – And good morale in the 517<sup>th</sup>. I would say not as high as in the 249<sup>th</sup>, but I'd say that's structural more than any function of personalities or leadership. Just by the virtue of the fact that they see each other less often and they are in the unit for a shorter duration; people come and go.

Capt — And working relations between the two squadrons?

witness 25 – Excellent. At my level. I know the big boys get... Territorial.

Capt – Alright. What is your opinion of flying guard and active together?

WITNESS 25 — It's good, I like, I like the mix. I think there's risk in that...TFI in general. Expects... I think active duty expects guardsman and reservists to be equally capable, trained, equipped and ready as their active duty for, you know, a small percentage of the cost. And I don't think that's realistic. So there will be differences in performance, you know, between, in a blended crew, especially as time goes by.

Capt — Do you recall any specific comments people have made after a sortie with either side, with like, you flying with active, I mean good or bad comments from anyone else? Just a general overall if people like it?

 $^{\text{WITNESS}\,25}$  – Every time I fly with active duty – I fly a lot, I probably fly more than most TFI crews because I fly airdrops and I only fly airdrop with active duty. I'm the only guy in our squadron besides our one loadmaster, who's

new. So I've been flying with active duty a lot, and it's an easy fit. You know, I'm still relatively full time so that's, we're... I'd say we're at a parity in terms as crew positions. Plus I'm just a great guy, that's just me. [laughter]

Capt – For the record.

WITNESS 25 —For every guard line I've flown that we've had active duty people on board, they've been very polite, very deferential, very thankful to be on board, at least, to join us. A majority of the conversation and the working relationship, it's is all very positive. A majority of it is, "well you guys sure are doing it right." In terms of whether it's lifestyle, or whatever. But it's a very favorable, positive crew resource cockpit I think in terms of interaction. And on the basics, we're all, from what I've seen, all solid. In terms of checklists, you know, responses, and so on.

Capt — Great. And just a couple of questions on the crew themselves. I'm just going to go through each crew member quickly, and if you've flown with them, and then what's been your opinion of their flying abilities, their personality, that kind of thing. Starting with MP

WITNESS 25 — Okay. MP and I have flown... infrequently, together, because we're the same qualification roughly, and have not had too many occasions to fly together. We regularly spoke about we need to fly together because of some of the training I've been through, and we talked about on our tabletop discussions and he's been very interested in seeing some of the stuff that I'm happy to teach. I've talked about it and we've never got to do it." When we did fly, you know, in the upgrade program I was, I felt very comfortable, very aware of the flight regimes we were in, the energy we were keeping, things we were doing until we get out of the airplane.

Capt — Did anything about his personality stand out as far as being a conservative, aggressive, technical aviator? Anything , if you had to categorize him?

WITNESS 25 – He was, he was interested that we would have a good show so he wanted us to be precise, but he was kind of risk averse, a little. He was "let's not push it to far; there's no need to go crazy". But we still wanted to be precise. "Move that nose, get your bank up, you're two degrees short," you know, "on your banks, so get it right!" He was good about being, being precise.

Capt – How about MSO

WITNESS 25 - Yeah, MSO and I got to fly together a little more often, he was a copilot, qualified. But of course he had so much other flying experience. He was, he was a lot of fun to fly with. He was, he was interested in learning the full spectrum of the airplane so we did actually get to go out on several locals and we set up times to go and run through the range up at Eielson, and we do a lot of threat responses. You know, and we would talk, I would, we would really talk about aerial delivery in terms of, I would ask him questions about like, you know, bombs on so on, the profile he had flown in the Viper, about what were the stable platforms and for how long, and what, what's your energy going to be before and after, and so on. But he was interested in talking about that kind of stuff. It's probably relevant to the board, we did a sortie where, in weapons school, we'd go out to the MOA. Okay, so you have this great big cube of airspace and you measure how well the C-17 performs in climbs and in descents, and acceleration, slowdown, in turns, you know, and you can measure all that performance. And MSO was interested in going out and doing it, so we did, we had a great time doing it. He was ahead of the airplane, he understood what we were doing and he made, you know, products that showed how well the airplane performs. So he had a good understanding of the energy that the C-17 is capable of. Much more than any new, or young aircraft commander, or newly cert'd instructor pilot.

Capt – And then, MCP Have you flown with him?

WITNESS 25 — I flew, I flew a mission with MCP I don't recall flying any locals with MCP And technically, what I remember about MCP comes first not from a mission but from a ground training that we had one day. We did our normal ten and ten, you know, every day we do a tactics ten-minute kind of threat, intel scenario. And about two weeks ago we talked about, I think it was | R | ?] And he was very interested in how we defeat the threat, and wanted to talk about the 3-1 and the 3-3 responses that we have... Sorry, AFPD, 3-1 and... The threat responses we have against just a radar threat in general, and then he was really interested in understanding how the | R | ?] works, and he would ask questions about motorization of the antenna and so on, and why that was a scary threat, and

why it was so important to the folks. And then even, we'd step back and say "getting to the big picture, it's going to shoot us down, right?" "Well, yes, it probably will, unless we avoid it. "So he had that, he was interested in the whole spectrum of just learning depth of, what, you know, why. And it was on more than one occasion... Regularly he would pass me in the hall and say, "hey, I really—"Oh, you know what? We did fly at Red Flag. He would say, "Hey, I really want to come fly another red flag sortie with you. Let's do it again." Because he liked, he liked the technical aspects of the airplane. He would acknowledge, he would say that he was more cautious and just not the...as smart as the next guy on how to fly the plane in that condition, but of course he's perfectly capable. But he had an attitude of, "I want to know more. I don't know that I know what there is to know." The mission flying that we did, mostly I just remember the social interaction as opposed to the airplane flying, which was fine, of course. It was straightforward.

Capt — I forgot to ask you about MSO but did he or MCP have any kind of reputation around the squadron of their flying abilities, something that stands out?

WITNESS 25 — We would... And just, MCP was really the one who was most guardlike. In terms of his behavior and demeanor and attitude. "Why would we push, why are we going to do a low-level into combat if we can fly an ILS or something?" MCP was the most like that. MSO you know, you know, I liked to fly with him, but I suppose you have to consider the source. I liked, I feel comfortable flying the airplane, you know, with high energy states down low. No pilot should feel comfortable with a low energy state. MSO was no different. He and MP were both strong pilots.

#### Capt – Then, with MLM

witness 25 – We grieve MLM was, he was so experienced as a loadmaster he could have been a third pilot augmenting pilot. He understood the basics of the flight regime. I don't know that he....I don't specifically remember him asking me, for example, how to land the airplane. But I vaguely recall talking about how you could actually program a jet to land and stuff, he thought that was pretty neat. MLM was almost too... To the instance, every single time, just about, MLM and I would interact, he would say "Hey, just remember I want to do airdrop". Because I'm the guy that was hired to do airdrop and for some reason people think that I have a say in who goes. I don't. But he's a qualified guy in the squadron, many, especially many people, said "Hey, you may want to go to airdrop school." And MLM was very, very eager to go.

Capt — I think that's all the questions I have. Anything else ... Are there any pilots or anything else you think that might help us in the investigation, or who to talk to?

 $^{\text{WITNESS}\,25}$  – Do you need any eyewitnesses at all? I don't know if there were anybody, there are scores I'm sure of pilot-qualified guys that either watched, or...

Lt Col — We're looking mainly for people who were either trained by MP or flew with him, and the demo and profile guys which we do have just recently the demo, the guys who were just recently certified with the demo...

WITNESS 25 - On that, I would ask if the profile was altered any from what I described. I know there was discussion about changing the outbound heading, maybe seven degrees to more, just so you could have more positive turn, for example. It went around. But I don't know what ever came of it. You know, there was debate...I don't know.

Lt Col — One question I have, just going back to the piloting side, what's your opinion of switching the normal response of, pilot flying calling for configuration changes, and the pilot monitoring running those, to now having pre-briefed something like "hey, when we hit airspeeds and altitudes, etc", the pilot monitoring and the safety just running the checklist while the pilot flying just is concentrating on just the flying. As in with the checklist that was locally, that was made here.

 $^{\text{WITNESS}\,25}$  – What we liked... That just made me think of something else, I hope, I don't know [inaudible]. I'm hoping that it wasn't a missed configuration call where someone linked up and weren't supposed to. What I liked in the training was we got into where the copilot would announce what he's, or the PNF would announce what he's doing. You know, "flaps up" and then I would hit slats retract. We would brief the top speed, and [inaudible]. I

would say "on speed or earlier", right, "we have a, our min flap is one point three, V stall and slat is one point four, stall [indistinct] at forty percent", air speed margin, energy margin that you have. So it is possible to raise flaps and slats prior to the slat and [indistinct] speeds and in the HUD we would see and still be flying. You would teach that on engine out procedures, so we talked about that. That you'd raise it and call it out as you raise it, because the pilot flying, I would, you know it would usually jog my memory "hey, just look at my airspeed. Say, okay, yes." I didn't have the numbers memorized but I knew that we were at a close enough speed and accelerating on to a safe speed that by the time they were all the way retracted – flaps or slats, whatever, seven seconds, something – by the time they all retracted we were above minimum airspeed for that configuration.

Lt Col - Okay. Go ahead.

Capt – Okay? Ending the recording at 1445.

TRANSCRIBED INTERVIEW

INTERVIEWERS: LT COL (SIB/IO), CAPT

(SIB/HF)

INTERVIEWEE: WITNESS 10 ROLE: 517 AS, 3 OG/OGV, DEMO PILOT

**DATE: 9 AUG 2010** 

LOCATION: ELMENDORF AFB, ALASKA, HANGAR 5

Lt Col - "Great, we'll start with the questions. And we already know some of these from talking, but you know for the purpose of the tape. Have you ever been certified as an air show demo pilot?

WITNESS 10 - "I have"

Lt Col - "What crew position were you certified in? Safety observer, copilot, pilot?"

WITNESS 10 - "Pilot flying"

Lt Col - "Okay, were you certified as a hard crew?"

WITNESS 10 - "No"

Lt Col - "Okay, who did you go through the upgrade process with?"

WITNESS 10 — "The people that I went through it with were witness 26 (?); WITNESS 8 I believe was going through the process of the safety observer, I don't remember who else."

Lt Col - "Okay, does the demo pilot AC always sit in the left seat?"

WITNESS 10 - "Yes"

Lt Col - "Okay, who was your instructor during your upgrade process, or did you have multiple instructors?"

WITNESS 10 – "My primary instructor throughout the entire phase of the upgrade process was MP

Lt Col - "Do you know if the upgrade training was derived from AMC, or profiles, or was it just PACAF?"

WITNESS 10 - "Yeah, it was AMC"

Lt Col - "Okay, What were the steps involved in your upgrade process?"

WITNESS 10 — "The steps that I remember off the top of my head without looking at the regulations were basically ground training, a SIM phase training where we went through the profile multiple times, the flight training where we actually went out into the aircraft and flew the training. We also met with the wing commander and had a face-to-face with him with everyone that was going through the upgrade training at that time"

Lt Col - "Okay, have you ever flown a C-17 demo in an air show?"

WITNESS 10 - "I've not actually flown at a demo air show, no"

Lt Col - "Okay, When you were coming up for your training as far as checklist completion goes, who normally runs the checklist is it normally how you fly everyday where the pilot flying calls for the checklist, copilot monitoring completes it, or in this case because of the air show demo profile is it the pilot monitoring initiates it and then the safety confirms it?"

WITNESS 10 — "Yes, normally well it's a little bit different it's a very busy profile so the pilot is pretty much silent throughout the demo, the people running the checklist are basically the copilot and the safety observer. The pilot is basically just thinking ahead trying to put the aircraft in the right energy state throughout the whole profile and basically the way I flew it or what I took from it all was that basically (?) and the copilot should configure/deconfigure on speeds whether or not I call for it....(?)"

Lt Col - "Okay, so there really wasn't much interaction as far as you calling for a checklist when you're ready for the plane to be cleaned up, it's just done on speeds? Okay is that how you train in the SIM too?"

WITNESS 10 - "Yes"

Lt Col - "Okay, tell me as much as you can remember about how you fly your profiles such as air speeds, configuration, bank angles, and altitudes?"

 $^{\text{WITNESS 10}}$  – "So there are two profiles that we train to; there's a twelve minute profile and a ten minute profile. The difference between the two is basically where the aircraft starts and finishes. The twelve minute profile starts on the ground at the air show location and finishes on the ground at the air show location. The ten minute profile starts from the air or another location and comes into the air show from the air; does the profile, lands at the air show and takes off and then finishes away from the air show. So those were the two profiles that we trained. The twelve minute profile is the one that we probably do most of the time. So you start on the ground, for takeoff you basically do max power takeoff, max effort climb-out. Some of the techniques involved, because the energy state is so critical, especially for that first takeoff would be max power to hold the aircraft nose on the runway for 5 or 10 knots to have a little more air speed on the ground and then to rotate. Things that stand out in my mind is when I'm going through that as the pilot flying would be to Vmco takeoff now you're going to hit around 40° nose high is what I remember. I remember not wanting to go much past 40° nose high straight ahead; once you get 40° nose high, you hold that for a second wait till your airspeed gets back towards Vmco. The next thing you're thinking about is your climbing the air show profile is pretty much done at 500 ft; so you are going to climb up to about 1,000-1,200ft on the initial climbout doing max power, so the next big thing is getting back down to that 500ft and correcting your energy state so 40° nose high; straight ahead, then you want to make a left turn. So left 45° bank that also stands out in my head is something I heard is get that  $45^{\circ}$  bank to the left and you really need to push forward on that stick as the air craft wants to climb it wants to keep going up unless your forcibly, almost stiff-arming the aircraft. You're not going to get down to the 500ft; you are not going to build up you airspeed; you are not going to get down to 500ft which is problematic. Now you are max power this whole time through the first turn to get to your 300 knots which is your goal. So as you hit 45° bank; push down get the aircraft descending down. Probably one of the toughest things in the demonstration profile because the airplane wants to climb so much and so you get down, your timings all set up so you get to the first 80° out; roll out; usually 2-3 seconds first turn so wings level; 1-1 thousand, 2-1thousand, 3-1thousand but this time once you push the nose over you get down to 500ft. You've gained your airspeed back because you are max power; you rolled out, you should have enough air speed, your very next turn after the 45° you turn away from the runway and you are 80° off; your very next turn is the 60° turn. The thing that you are preparing for is the high speed pass. 1-1 thousand, 2-1thousand, 3-1thousand, 60 right then max power speed and the other consideration that you have during this turn is not crossing the showline and not crossing the people that are there to watch the airshow. So 60° bank turn, what I remember of this turn is a lot of times the stall warning bar is coming down a lot, the feeling of the air craft is a little bit different then the way you fly the aircraft normally. So you are feeling it, you know you got max power, you roll out if you need to, but you also got that thing in the back of your mind not to cross the showline. As you're coming around and getting lined up on show line now you should be 300 knots; bring your power back down a bit to maintain 300 knots; now you are going 300 knots down the runway and as soon as you get to the approach end, I believe this is the part, as soon as you hit the approach end you go idle for a quiet pass at 300 knots.'

Lt Col - "Okay, I'm going to stop you there for a second, back to the turn you've done your 80° offset, turning outbound 45° bank turn and then you're going to initiate you're 60° back right turn to come back in, how do you fly that 60° right bank turn; you're at max power and you're descending through this turn, are you already at 500ft at that point?"

WITNESS 10 - "Yeah, you should be down at 500ft"

Lt Col - "Okay"

- $^{\text{WITNESS 10}}$  "And then I mean some of the details you know, I previously came from a T-6 prior to this assignment, and it's full up flying there; stick-and-rudder type stuff, coordinated turns and I kind of took that. In the C-17 community feet-on-the-floor type thing and I brought that back into this just a little bit using rudder to fly a good coordinated turn."
- Lt Col "That's what I was going to ask you, that in that turn do you use rudder at all or were you taught to use rudder? MP you said you brought it? Did MP maybe teach you to use rudder to help you with that at all too"
- WITNESS 10 "Potentially, I don't remember specifically him teaching me, I think some of the things that remembering what he taught me was just specifically sticking to the 45° bank, 60° bank. That it is a turn to be concerned with."
- Lt Col "Okay, when you used the rudder for that 60° bank turn, how much rudder are you putting in, are you putting in just a little bit to maybe bring the tail around some, or have you ever gotten to the point where you've gone all the way with the full right rudder?"
- $^{\text{WITNESS 10}}$  "I don't think I've ever gone full right rudder, I've gone significant amount of rudder, to continue flying a coordinated turn"

Lt Col - "Okay"

- WITNESS 10 "Especially I just remember this one time flying during the upgrade process, coming around maybe your timing was off by a second or two and it looks like you are going to overshoot the crowd line so that's in the back of your mind "hey you can't cross the crowd line" and so you put more rudder maybe a few more degrees of bank and then maybe even max power; maybe a power push to help."
- Lt Col "Okay, Instead of going through the rest of the whole full thing, as far as concentrating on the turns on those 80/260's are you using 45-60° of bank for that or are you pretty much going to 60 on most of those?"
  - WITNESS 10 -"You need the high speed and probably 60 of bank.
- Lt Col "I know on the profile when you do your high speed pass you're going to come up for that initial turn outbound probably up to  $60^{\circ}$  and now you're going to come around for the fully configured pass on the next one and on that turn so you take your  $80^{\circ}$  out and now as you're coming back in, fully configuring in that turn, in what bank angle are you using?"
- WITNESS 10 —"You're going to decrease to 45° as you're slowing down. Anytime you're slowing down its either 60 for high speed or 45 for slow speed, so as you're slowing down 45 degrees of bank is your maximum bank angle"
- Lt Col "Okay, that's enough on that. Some next couple questions I had were about the rudder use, but we already touched on that. What other techniques were taught to you during your upgrade process, and do you like or use them separate from your own way of flying the plane...particularly anything MP taught you?"
- WITNESS 10 —"I think, a couple things in my mind since I went through the upgrade process are with MP specifically is one that he had probably been the most experienced demonstration pilot and doing air shows over the years. He was very confident and very smart about the profiles, and in terms of what he passed on basically was just a lot of the details of things, you know stick to the parameters of the demonstration. I think that's all I've got for that."
- Lt Col "Okay. Have you ever had the stick shaker and stall annunciation activate during an air show profile that you were flying or that someone else had flown during your upgrade process, can you remember the stick

shaker coming on and the stall annunciation? If so, how long were you flying with it on and what phase of flight do you remember when it does come on all the time"

WITNESS 10 - "Yeah, that's a great question" \*Laughing\*

WITNESS 10 —"It is, it is the two times on the profile that stand out to me is during the first turn, the climb straight ahead, you are trying to push over and speed up and you are going into the 60 degree bank turn and the energy state you'd be very close to the stick shaker at that point. Going through the demo profile and upgrading it became kind of a comfortable place to be I guess, so 'oh hey, you got the stick shaker a little bet'; it's like the tickle; you do things to fix it; roll out of bank, whatever. I think the other one which is very, I guess, standard in the C-17 community is the landing phase when you're full flaps, trying to come down and standard for the C-17 is you're slow now, you're full flaps, you might be high, you might need to get down, so with all those things that you've learned so your DLC and what happens is the stall bar comes down. And in the C-17 community we are just taught to push the stick forward to help the aircraft get down and to keep the airspeed and then when you reach DLC to allow the aircraft to come back to ATT the attitude that you have set. So, I think those are probably the two points in the whole profile that stand out to me the most where you would get the stick shaker."

Lt Col - "Okay, back to the first one in that first turn out, how often would it annunciate? Would you ever hear it more than those initial two, like if it says 'stall, stall' would you hear it say it again and then maybe say a third time a third set or is it just a quick in and out?"

watching others go through the profile is that while you become accustomed with the stick shaker a little bit and getting in to the stick shaker is that you always want to correct for it as well. So it's like, there's the stick shaker you want to correct for it whether it means power, bank, overfly the crowd if you have to and just deal with that later. I've never heard of anybody getting past the point where there's other indications of stall, where there's multiple stick shakers and annunciations going off or where there is a buffet or anything like that"

Lt Col - "Okay, what's your personal opinion of the demo profiles, did you feel uncomfortable or unsafe while you were flying them at any point, just from common flying? I know you've flown out in the desert a bunch, combat missions."

WITNESS 10 —"No, I think from everything that I know about it in the aircraft I think if you stick to the profile that it's a safe demonstration. I had some other thought in my head but it's gone, could you just repeat the question?"

Lt Col - "What's your personal opinion of the demo profiles? Are they adequate, too aggressive or have you ever felt uncomfortable or unsafe during any of the profiles?"

WITNESS 10 – "Yeah, I have not felt unsafe, I can see clearly how the turn we are talking about primarily is a turn of concern and I think if ... stuck to the way it's to be flown, you know, keeping the nose down not exceeding bank, fixing the stick shaker if it does occur, if those things are maintained and the discipline maintained, I think it is a safe profile. But it is also the energy status of the aircraft is so critical there that if one or more things are not maintained in the profile standards then I can see that an aircraft or a crew could get into some trouble there and some of those things are things we talked about biggest things being bank angle or not getting that airspeed back if you don't get that nose down to get the airspeed back, that could be problematic."

Lt Col - "Okay, are there any topics that you would like to discuss concerning the question that I just asked or anything else that may, that you're thinking that I didn't ask specifically concerning the flying portion. Do you like the fact of having hard demo crews? Or is there a problem with that?"

WITNESS 10 —"I think having a hard demo crew would be beneficial, because you know probably from your own experience going out on the road it takes about three days before the crew starts clicking. And this is a profile that everybody on the crew would benefit a lot from everybody clicking right off the bat. You don't want people not familiar with each other, or things being said in a twelve minute window is all you get to get it right. You don't want ambiguity up there; you don't want crews coming off the streets, basically, that could be problematic too. So back to my upgrade I said that we didn't have a hard crew but there is a handful of us going through the upgrade process

and I don't know off the top of my head if we have sent. What I remember from how the squadron handled it last fall was that they sent MP over to (?) to do airshows around the Pacific Rim; that was a hard crew, so while we don't have...we have a handful of crewmembers to choose from here at Elmendorf, when we send them out on the road we make them hard crews, is my understanding."

Lt Col - "Okay"

Capt — "Great, and I just have a few questions on the, to just kind of get a feel since we're not from the squadron, you know the morale in the squadron, the working relationship with the guard. How long have you been out of the squadron?"

WITNESS 10 - "Since November of 2009, I moved over to OGV"

Capt – "Okay, and how long have you been in the squadron before that?"

WITNESS 10 - "Since January of 2008, so a little over a year in a half"

Capt – "Okay, what's your personal opinion of the unit morale in the 517<sup>th</sup>?"

Witness 10 —"Wonderful, It's just a great place to be, the location one, people are having a great time up here, from everything that I could tell people would love coming to work and flying the mission from here. We are kind of in a unique situation or life cycle of the 517<sup>th</sup> specifically, because the 517<sup>th</sup> basically started in June or July of 2007. So what happened there was the whole squadron showed up within about three months and the thing that came from that was basically this group of people called the 517<sup>th</sup> started in the fall of 2007 and we've been together for nearly two years, and its one unit that is very close, very friendly and we just have a great group of people up here and the reason it is different is because we've been together longer than most units. Normally you move into a unit that is already switching out people, someone comes in, someone leaves, and this particularly group of people have been together for two years."

Capt – "And how about the guard side, the 249<sup>th</sup>?"

with everybody in the guard from what I can tell are people that have grown up in Alaska, they are people who want to stay in Alaska, they are people that feel lucky to fly the C-17 up here. They are very happy kind of being the anchor I guess here. We've been in the same building since we've started in terms of with the C-17, the experience of the C-17 was all in the active duty. I'd say MP was probably the most experienced C-17 pilot the 249<sup>th</sup> had. I can't think of anyone else that was full time that had more experience, maybe JBU But I have seen over the past 2, 2½ years, that the experience is shifting a little bit, and what I mean by that is, we brought a whole bunch of active duty experienced folks up here; very experienced on the active duty side and very inexperienced on the 249<sup>th</sup> side. And over the past 2½ years, you can see it from the jobs we have in the squadron, scheduling, training, things like that to flying the aircraft that the guard folks have been in the same job since we got here and now we have new LTs who are showing up and they are the new schedulers, they are new to the aircraft and you can see that shift and we can see that the wealth of experience is going to be the 249<sup>th</sup>."

Capt —"And then general working relationships you personally have with the 249th?"

WITNESS 10 —"I think it's as good as, I can't say that I've seen a lot. I haven't done inspections at other places. But I can at least tell you it's as close to one unit as you can get with two organizations."

Capt — "And what's your opinion of flying with a mixed crew?"

WITNESS 10 —"I think that we should do it more often. I don't think it's a problem at all, I think everyone's on the same page and that's why we have checklists and things that everyone is on the same page when they get in the aircraft. Just on a large scale efficiency level, we are more efficient if we just go fly"…

\*Tape cuts out\*

- "Side 2 continuation...So you knew all the crew if you can just go ahead and tell us a little bit about their flying abilities, their general reputation, starting with WITNESS 10 6 MP and I knew each other in Charleston and then we were re-united here when I got to Elmendorf, he was a SIM instructor here and I think he is very well respected. He has put his energy into flying and knowing the aircraft, knowing the system, knowing the regulations, and my understanding of him and how people think of him is very well respected, in particular with flying. I've flown with him and I've had SIMS with him going through phase, doing the demo upgrade in the SIM and in the plane. I may have flown with him one or two other times." Capt - "Anything of note as far as his flying abilities, was he conservative, aggressive, technical, did anything stand out to you?" WITNESS 10 - "No, I think he's as good as it gets, from my perspective" Capt - "Then MSO WITNESS 10 - 'MSO and I worked together when I was in the 517<sup>th</sup>. He was the lead scheduler for the 249<sup>th</sup>, we were working on project trying to revamp and rework the FY10 flying hour program for the 517<sup>th</sup> and 249<sup>th</sup>. We had not flown together but we were also acquaintances outside of work, we'd talk about personal things, I ended up enrolling in the same program and we would talk frequently about that." - "What was his reputation for flying, if any?" Capt  $^{\text{WITNESS 10}}-\text{``I would say that I don't know of any reputation}...I \text{ never really talked to anyone about his flying''}$ Capt MCP - "and Maj<sup>WITNESS 10</sup> – 'MCP and I worked professionally together. I was an ADO and he was the ops flight commander. We have never flown together so it would also be a guess if I was to say what his reputation was. I haven't heard anything good or bad." Capt - "and MLM WITNESS 10 – "He and I worked together most recently on the 3<sup>rd</sup> WG ASEV, he was basically STAN/EVAL for the 249 Loadmaster side. I was OGV trying to put all the pieces together for the 3<sup>rd</sup> WG so we worked frequently to get the FEF folders up to date and to get everything squared away for that inspection. I may have flown with him as a loadmaster, I'd have to go back and look at records, but good reputation as far as I know. I hadn't heard anything bad." Capt - "Anything else you'd like to tell us that would possibly help us with this investigation or anyone else to talk to?" WITNESS 10 — "Nothing I can think of, if anything it would just be speculation." Capt - "This ends our interview at 1234"

TRANSCRIBED INTERVIEW INTERVIEWERS: LT COL

(SIB/IO), CAPT

(SIB/HF)

INTERVIEWEE: WITNESS 21

**ROLE: 517 AS, PILOT, FRIEND OF MISHAP CO-PILOT** 

**DATE: 10 AUG 2010** 

LOCATION: ELMENDORF AFB, ALASKA, HANGAR 5

Capt "Let's start off with a basic feel of your squadron, so what is your opinion on unit morale for the 517<sup>th</sup>?"

WIT 21 "I think unit morale was and is to the extent that it can be right now; pretty solid. We were extremely busy in the month of July and a lot of people were feeling the effects of that, and all the stuff that was going on. So I would say there was perhaps a heightened feeling of stress going on. But that's the nature of the beast, so I would say unit morale was good."

Capt "How about in the 249<sup>th</sup>?"

WIT 21 "The same"

Capt "Okay, are there any working relationships with the active guard; what's your opinion, what you have seen, good or bad?"

WIT 21 "I think it's amazing, honestly, as an example I worked with MCP every day, he was very close friends with all of the 249<sup>th</sup> so often they'd come shuffling through my office, so I got to speak with most of them a lot, I joked around with them, their comm guys would help us out all the time; It's really just like one big squadron, it doesn't feel like we're two separate entities."

Capt "Okay, and what's your personal opinion on flying with mixed crews?"

WIT 21 "I've done it a little bit, and have not had a bad experience whatsoever with any of them."

Capt "Have you heard any comments of anyone else flying with mixed crews; good or bad?"

WIT 21 "Not necessarily, most of the guys in the guard have more experience flying than most of the rest of us do, so they bring a lot of experience to the table that I think a lot of our newer co-pilots, especially like to hear about, like to see, and most of them happen to be airline pilots or have been, so they have a different mindset than the tactically brought up C-17 pilots; so I think it broadens horizons."

Capt "And what would you say for your leadership and supervison, has it been a help, or hindrance for TFI?"

WIT 21 "It definitely helped. Both the commanders for both the squadrons are very interested in making it a total force integration type situation. I think they've been pushing that for a long time."

Capt "You worked with the mishap crew? I'll just kind of have you go through and we'll start off with MP and work down as far as, have you flown with him before, and what you know about either if you've flown with him, his flying abilities, and what you've heard on what his reputation is?"

WIT 21 "Yeah I flew with MP he was actually the examiner pilot on my operational mission evaluation, it was a trip that ran down through Hickam to Australia up to Japan and back. A good mission, solid guy, very, very knowledgeable about the aircraft; pretty much put me to shame when it came to that and my GK [general knowledge], but very smart guy, flew the aircraft everything went well as I would have expected it to. When I first got up here I did a couple SIMS with him before he had come back to the guard side, maybe one SIM, and I have

nothing negative to say about him whatsoever. He was a good guy; we went out with him on the town, just an all MSO I never flew with MSO I worked with him. He around good individual and a hell of a pilot. As for was the scheduler for the 249<sup>th</sup> so as Ops we oversee our scheduling guys, so we worked with him a little bit. Most of my interactions with MSO were in the office; him coming to MCP talking about fishing and hunting and all that sort of stuff. Other then knowing that he was one of the guys that got stuff done; and a solid individual in the office I can't speak to his flying abilities. MCP and I worked together every day in the Ops flight office, I had a great relationship; I spoke at both of the memorials so hopefully that will speak to the fact that the amount of respect I have for the man. I only flew with MCP once and it was about a week and a half-ish before the accident, I had been on leave the week of the accident so the week before I finished up my check ride with MCP so my job was pretty much to sit in the back and not touch the stick until I had to complete my check ride but in the mean time he was instructing some AR. I told him after the flight that I had never heard or seen somebody instruct that well; literally, he just had that presence in the cockpit we were flying with one of our brand new guys; I think it was the second ride and just the way he conveyed how to do things and the way he made it fun for everybody in the cockpit, it was just solid. I told him I could understand why he was good when he was at Columbus, because I could see how a lot of his students could like him. MLM I flew with him on a mission on one of our IO channel missions from November of 08 because it was one of my first missions. Great guy, obviously did his job very well, I have nothing negative to say about him, and then of course in the office I saw him quite a bit working in stan/eval and talking to him on a day-to-day basis. I bumped into him about a week and a half before the accident; he was out walking his dogs with his wife, I talked to him a little bit, so interactions on the outside world I have absolutely nothing negative to say about him."

Capt "You said that month of July was pretty stressful, was that everybody and I know MCP had quite a few duties; can you describe what he was in charge of."

Well<sup>MCP</sup> was the ops flight commander, so we were overseeing scheduling. We had a lot of our schedulers at Altus at the time going to training, deployed. So our scheduling shop was very busy trying to keep stuff in order with the upcoming Red Flag, and the Air Show, and all the other stuff; so scheduling was pretty tight then, so he was trying his best to oversee that as best as he could. Then he had the air show demo stuff as well, he was trying to help with change of command, he and the incoming commander were pretty close as the DO; obviously he oversaw our shop so we had a lot of communications with him and MCP really wanted to make the change of command a good thing for him, he had a lot of respect for the guy; so he was trying to plan things like changing signs for the parking spots, and working on a camping trip for the middle of August, so I would say he did have a lot on his plate but again MCP was one of those guys who seemed to be able to juggle that. In order to deflate, we would come in the office and just laugh and joke for a while, then he'd be off doing other stuff; so I would say he was a very busy man trying to get everything done and he seemed to be doing ok."

Capt "You didn't notice any signs of being overstressed; I know he's always busy and I've heard that from other people."

WIT 21 "He did relay a story to me about being pretty short and of course his wife had hurt her leg doing aerobics I guess, when she got hurt that just put more on MCP because then he would have to work all day at work and then go home and take care of the kids; he did tell me the weekend before I went on leave that he had probably said some things to MCP SPOUSE that he shouldn't have, there was that thing at home that went to just his level of stress because they had a very good relationship. They talked all the time, he felt guilty about that because it was unusual for him to do that. I think that might have spoke to his level of stress but I don't see that it impacted his work at all because he still seemed to get the same amount of stuff done. And of course we're two months ahead on the OPR's/EPR's because MCP was trying to get all that stuff in order."

Capt "Okay, and first of all you're not a demo pilot? Correct?

WIT 21 "Correct"

Capt "Are you familiar with the demo process or the profiles and to what level?"

WIT 21 "I am only because of MCP" We went up and watched the demo practice twice on the roof just because he wanted me to see how awesome it was; he thought it was a great profile, he had a great time. We also flew my first

check ride one day while they were flying a demo, so I had to kind of coordinate with MCP to see how they ran it and when they would be able to get back to the field, so he explained to me the length of the profile, what they did where they'd be so that we could coordinate with coming back in on my check ride. So I had a good idea of their certain maneuvers, and of course sitting on the roof watching it with MCP he was telling us what to expect, "watch this particular part", telling us what part to watch saying it was the cool part. That's my level of knowledge."

Capt "And when was that, that you were watching the demo?"

WIT 21 "The week before the accident, as I said I was on leave the week of the accident; so it would have been the week before I can't say whether it was Thursday or Friday, but I could certainly find that out for you. We went up and watched it two separate times, but that last time was pretty recently."

Capt "Do you remember who was flying that practice?"

WIT 21 " MP was the pilot, and then WITNESS 8 and CAPT SC were the other two crew members, WITNESS 8 was running the box and CAPT SC was the safety observer. Don't quote me on that, but I'm pretty sure that's accurate."

Capt "Do you remember any of the comments that MCP made in particular about that profile?"

WIT 21 "On the initial take off where they were pretty nose high he was commenting that it was pretty amazing, and that was possibly the scariest part of the profile; because you came up at such a low energy state, and then tried to wrap it around and have to bring it back to come over and gain speed, he did say that that was the scariest part; we were commenting on just watching it, how they were doing it."

Lt Col "Did he comment anything on bank angles, air speeds, anything that you can remember that he had talked about where he had felt uncomfortable, I know you mentioned that part, but anything with bank angles, air speeds, use of rudder, stall warnings going off?"

WIT 21 "All of that was brought up, especially with that initial take off because he said you had to bank it around so much there to get it out a certain distance, and I remember him looking at his watch timing as they were outbound saying "Oh, they're going to be tight on this turn" and then at that point you could see the back of the tail kind of swing over and he said "Look at that amount of rudder that he's kicking in there" and he said, I don't believe it was during that particular part when we were out there watching, it was a different time when he was like "yeah, you wouldn't believe all of the squawks that are going on and I'm heads-down in the box just running stuff and you are hearing all the bells and whistles going off and he said that could be a little"...I don't know his exact words so I won't say anything to put my inflection into it but he did specifically comment on the fact that there were a lot of warnings when they were flying the profile."

Lt Col "Do you remember what specific warnings he was talking about?"

WIT 21 "I don't, I know he talked about being in the shaker a lot and the "stall stall" annunciation"

Lt Col "Do you remember him saying what bank angles that he went to?"

WIT 21 "I do not, no."

Lt Col "Okay"

Capt "Did he ever say anything about the crew he flew with, any of the demo crew?"

MP was the pilot on that one and he said specifically (because I commented on how amazing it was and how aggressive they were banking) and he said "Yeah you should see MSO fly, he's even better.. he's an even better pilot". Which was surprising to me because MP knew so much about the aircraft. I don't know how that transcends into aggressiveness or ability to fly but I was surprised to hear that from MCP

Capt "Did he ever have any concerns with flying with any of the crew, or was he excited about the demo. I know he was excited to be part of the team."

WIT 21 "Yeah he never voiced any concerns about the team itself."

Lt Col "Do you know as far as, who was the hard crew that he flew with, did he always fly with one crew, was MP always his pilot and MSO his safety?"

WIT 21 "I can't answer that, I don't know. It seems like they mixed the crews quite a bit. The day that I flew my check ride I know that MCP was flying with MSO again just because I coordinated with them on coming back in, but I can't say whether or not that was all the time"

Lt Col "Okay, so MSO flew, and MCP was the co-pilot for that one?"

WIT 21 "Yes, as far as I know, because I remember speaking to bothMSO and MCP about the profile"

Lt Col "Okay"

Capt "Anything else that you think might possibly help our investigation, anything else that we haven't commented on that you would like to?"

WIT 21 "No"

Capt "This ends the interview at 0924"

TOWNS

TRANSCRIBED INTERVIEW INTERVIEWERS: LT COL

(SIB/IO), CAPT

(SIB/HF)

INTERVIEWEE: WITNESS 18

**ROLE: 517 AS, DEMO PILOT IN UPGRADE** 

**DATE: 11 AUG 2010** 

LOCATION: ELMENDORF AFB, ALASKA, HANGAR 5

Lt Col - "Have you ever been certified as an air show demo pilot?"

witness 16 — "I met with the wing commander as part of the certification and I'm not sure how far it went"

Lt Col - "Okay, so you will be certified, you're in the process you've flown, everything and been trained just not officially fully current and signed off?"

WITNESS 18 - "Right"

Lt Col - "Okay, what crew position were you certified in? Safety observer, copilot or pilot?"

WITNESS 18 —"Pilot"

Lt Col - "Were you certified as a hard crew?"

WITNESS 18 -"No"

Lt Col - "Okay, does the demo aircraft commander if you're flying the demo does the pilot always sit in the left seat?"

WITNESS 18 -"Yes"

Lt Col - "Have you ever had a time when someone from the right seat flew it, as the copilot?"

WITNESS 18 -"No"

Lt Col - "Okay, Who was your instructor during your upgrade process, or did you have multiple instructors, and this is from the ground training through the SIM to the flying of the aircraft?"

WITNESS 18 \_4 MP

Lt Col - " MP the whole time? Okay, do you know if the upgrade program was derived from AMC, PACAF, or a local combination of any?"

"It was a combination, AFI 11-246, and then there's a PACAF regulation and there was a 3<sup>rd</sup> Wing supplement; that's where most of the training was"

Lt Col - "And what were the steps in your upgrade process? Briefly"

"We had ground training with MP we went through the profiles, the regulations, we went to the SIM flew the profiles in the SIM, we had a flight we did the ten and twelve minute profiles, and then certification"

Lt Col - "Okay, Have you ever flown the profile as a safety or copilot?"

WITNESS 18 -"No"

Lt Col - "Okay, so tell me as much as you can remember about how you fly the profile such as air speed, configuration, bank angles, and altitudes, just take me through takeoff through the 80/260 outbound and as you're coming back in for the high speed pass for the twelve minute profile."

WITNESS 18 —"Okay, we would (?) for a static takeoff, release the brakes, roll down the runway, we hit Vgo, pause about just a couple seconds, then rotate for the max takeoff, climb out of Vmco; it's about 30-40° high depending on the weight. Once we got up to 30 or 40° on that initial takeoff we'd lower the nose to maintain around Vmco to about 25° and then using 45-60° of bank make a turn outbound for the 80/260 maneuver; the whole time throttles are at max, we usually got about 1,000-1,200ft on that initial climb out, push over as were turning outbound for that 80° turn still accelerating, max power, and then we would time outbound; once we hit our initial heading; probably around 7-10 seconds to get some spacing to turn back inbound, again we turn back in using about 45-60° of bank and rudder as required to not overshoot the runway, we accelerate through the turn until the PFP? basically hit the extended center line of the runway, then we'd stop our acceleration to make sure we roll out of that extended center line. And then once our turn was assured, and we'd be descending with this turn back to 500ft AGL; once our turn was assured we'd push the throttles up again to try and get as high as air speed as possible pretty much for the high speed pass, usually around 300 Knots if we can get there and then we'd come across for the high speed pass."

Lt Col - "Okay, you mentioned about in the training you went over the profiles and..do you remember what the profile says for the altitudes to fly on that first turn or the bank angles?"

witness 16 — "Yeah, the profile...I thought it said 1,200ft, might have been 15, I'd have to look at it."

Lt Col - "Any specifics?"

 $^{\text{WITNESS 1E}}$  —"I think in the 246 it says  $45^{\text{o}}$ "

Lt Col - "Okay, you mentioned that you use rudder. How much rudder did you have to use when you were flying the plane, would you use rudder initially to start the turn, would you hold it in through the turn or would you only use rudder if you needed it to help bring the plane around a little bit?"

"Personally, I was hesitant to use the rudder at first in the C-17, I haven't used it very much. But we had flown the profiles in the SIMS and saw that it kind of works. But yeah basically use the rudder as needed to not overshoot."

Lt Col - "How far off of the runway would you be (on that turn inbound) would you already be over the end of the runway, or were you maybe say a mile displaced from the runway or say maybe two?"

"I'd say a mile, I'm trying to think. Yeah when we flew it in the SIM that's kind of where we were, there was time. When I flew it in the airplane we were a little bit closer but we had extended the turn more than 80° to try and get out farther so I think when we came back in we were a little closer to the end of the runway."

Lt Col - "Okay, next question is after takeoff normal operation with the C-17 pilot flying; pilot monitoring; you take off as a pilot flying you call for a gear up after the positive rate call, pilot monitoring retracts the gear. Configurations; you get past flaps up speed, pilot normally calls for flaps up, so for all the reconfigurations. When you're flying the demo profile do you still as a pilot were you trained to still call for that, or is that now handed off to the copilot and safety observer to work? So are you initiating the re-configuration movement or is the being done without you knowing it? Is that pre-briefed to clean up on speeds?"

"We typically pre-briefed to clean up on speed, and when I was flying I would tend to say it when I saw it because we were used to that, but yeah, we would pre-brief to clean up on speeds."

Lt Col - "Okay, Have you ever been taught to use the full rudder in this profile, or how much rudder did you put in?"

witness 16 —"During upgrade we were taught to use full rudder."

- Lt Col "Okay, What techniques were taught to you during the upgrade process other than the use of the rudder that you liked, or disliked, starting with the rudder; were you comfortable using that rudder?"
- "I would say yes after we did it in SIM the first time, it was kind of weird but once you figured out that you could maintain the air speed with it, you got a little bit more comfortable. I still was hesitant just because it felt a little abnormal."
- Lt Col "Anything else other then the rudder, any other techniques? How about going back to the fact of having the safety observer run checklists and clean up on speeds, did that feel uncomfortable at all?"
- "No to be honest not really, I felt like the profile was, being new at flying it, it was a little busy for me at first so I enjoyed having another aircraft commander in the other seat and a safety observer that had competence who would back me up, I would say that I think it's good that they have that kind of role, more so than on a normal sortie."
- Lt Col "Okay, Have you ever had the stick shaker and stall annunciation activate during your air show demo profile that you had flown or that someone else had flown?"
  - witness 18 —"I don't remember getting the stick shaker"
- Lt Col "Okay, did you ever get ALS flashing, maybe?"
  - WITNESS 16 —"I really can't remember, I think we might have gotten stall, the stall annunciation"
- Lt Col "Okay, what I'm trying to ask is that is it something you normally flew with is basically what I'm getting at, when you were flying the demo?"
- "No, I mean it happened a couple times, but the times that I can remember it happening to me was because I lost my situational awareness for a second or something, I didn't have enough power in or something like that, turning back to final and I got a little slow for a second; I guess I wouldn't say it was normal."
- Lt Col "Okay, what's your personal opinion of the demo air show profiles, are they adequate, too aggressive, have you ever felt uncomfortable or unsafe while flying it?"
- "No, I didn't feel unsafe; after we did it in the SIM I felt comfortable doing it in the airplane; I thought it was just max performing the aircraft for the most part"
- Lt Col "Okay, is there anything else about the demo profile that I didn't touch on that maybe you could help us out with as far as any opinions of your own, something that you took note of that was different when you flew it from standard or normal that I may not have asked about?"
  - witness 18 —"I can't think of anything"
- Lt Col "Okay"
- Capt "Okay. Just a few questions to get an idea of the squadron, and working with the guard. So first of all let's start with the 517<sup>th</sup>, and how long have you been there?"
  - witness 18 "Since March"
- Capt "Okay, what would you say the general unit morale is in the 517<sup>th</sup>?"
- "I'd say it's pretty good, it's tighter then my last squadron. People aren't gone as much here and everybody knows everybody more here."

```
- "And how about the guard side in the 249th?"
Capt
 witness 16 —"I can't really comment on how they interact with each other"
 -"Okay, and then how about you with the guard?"
Capt
 witness 16 —"I'd say it's pretty good, I've flown with them several times since I've been here just because they have
the line, so we tend to. I'd say a lot of the times were mixed crews for training purposes, so I'd say it's a pretty good
relationship."
 -"And what's your opinion of flying with mixed crews?"
Capt
 WITNESS 16 -"I haven't had any issues so far, a lot of the guys I've flown within the guard came from Charleston or
McChord at some point so it just seemed like flying with anybody else."
Capt
 -"Okay, Anything that you've heard in your squadron from people not liking flying with the
guard?"
 WITNESS 18 -"No"
Capt
 -"Great, and just we'll talk about the people in the mishap crew. We'll start with
 MP
Have you flown with him before?"
 "I had not flown with him for the upgrade so"
 -"Okay, and what's your opinion of his flying abilities?"
Capt
 witness 16 —"I thought from what I saw, I thought he was very confident flying the airplane. Just from watching it in
the SIM to when he flew in the jet he flew it way better than me or anyone else doing it, you could tell he had the
experience doing it. I thought he was confident."
 -"Okay, to your knowledge does he have any sort of reputation around the squadron, if he's
Capt
conservative, aggressive?
 WITNESS 18 — "No, I haven't heard anything from anybody"
 MSO
Capt
 -"Okay, and how about
 "Never flown with him"
Capt
 -"Have you heard anything about his..."
 ^{\text{witness 16}} -"I heard he used to be an F-16 pilot, so he liked to fly the C-17 like an F-16 but that's all I heard; I don't
know how substantiated any of that is"
 MCP
Capt
 -"Okay, and then
 "Never flown with MCP
Capt
 MLM
 -"And
 "He was on the demo upgrade line I did with
 MP
Capt
 -"Okay, and then it was you and a couple others flying in the demo upgrade process, who else
were those members?"
```

| WITNESS 18   | WITNESS 1 | <sup>5</sup> was doing pilot | upgrade with | me and I think we were  | the only two on th   | ne flight. In the |

| upgrade, MCP | was doing | copilot upgrade, a           | and I think  | was doing safety        | upgrade; that's al   | l I can remember" |

- Lt Col "One quick question, back to the briefing for the ground training portion, when MP briefed you guys on the profiles, was he briefing from his personal notes, did he use his notebooks, or was it directly from the printed out profiles from PACAF or AMC?"
- "I would say that he was probably briefing it from his own notes, because he gave us a copy of his own notes on how to fly the profile, well, I mean he pulled out the regs and he sent them to us and we were definitely aware that we had to read them. I can't remember if he, I can't remember which one he referenced, but I do remember he had this hand written sheet on his techniques on how to fly it.
- Capt "Anything else that you think you can add to help us with the investigation or anything we haven't touched on?"
- witness 16—"No, I guess the only thing that'd I'd say; the one thing that impressed upon me with MP was how much he cared for this; I guess it kind of stood out to me a little bit; sort of how he just really liked this demo program; wanted to (trail off)."

Capt - "Okay, this ends our recording at 1425"

### T1. MP TMS REPORT

Page 1 of 3

Used 15 AW syllabus IAW PACAF CONOPS. Copies of all materials reviewed with crews and given to crews along with lessons learned from our experiences. In WST demonstrated all profiles, emphasizing use of safety pilot to respond to checklist items instead of or in conjuction with the PF after challenged by the PNF/demo copilot. Discussed AFIs involved, FAA waiver participation, weather/wind considerations and showline setback from crowdline. Used centerline of 10/28 at PABI as the showline and runway intersection as show center. WST winds off the crowd at 10 knots, PABI actual winds 8-12 knots undershooting. 6, 10 and 12 minute profiles discussed and executed. Did not complete PF certification flight due to time limitations.

Recommend: NAF/CC certify as Aerial Demonstration Safety Observer and recieve PF upgrade at earliest possibility. Should fly another 12-minute and 10-minute profile with a demo IP.

21 Mar 2005, NVG IP Upgrade Ride 1

1 Mar 05:

Profile: Assisted in planning and discussed NVG Assault training requirements IAW syllabus in conjunction with NVG airdrop currency ride. Profile included formation AR followed by NVG formation airdrop to Rainier DZ. NVG assault training accomplished at McChord AFB (Smokey LZ and NVG lighting).

Performance: All questions on NVG Assault procedures and requirement answered. Able to place aircraft in landing zone IAW requirements. Minor problem with one "depth perception"/float......corrected on next GOATs and FS. In all, conducted two GOATs and one full stop. No other issues noted.

Recommendation: Work arrivals utilizing NVGs to assault zone and conduct at minimum remaining approaches and FS to assault. (minimum 3 GOATs and one FS).

----- 21 Mar 2005, NVG IP Upgrade Ride 2

20 Mar: Flt Time: 5.0 Seat time: 1.2

PROFILE: Flight conducted in conjunction w/NVG airdrop upgrade for loadmasters. Profile planned to qualify MP and NVG assault in conjunction with NVG IP upgrade.

Conducted NVG 3/4 and full flap approaches to 14L (1000' box) at KMWH followed by additional full flap approaches to Rwy 27 NVG. Winds did not allow any landings at Cooley. Final assault training completed at Smokey LZ at McChord AFB. Random low VFR approaches to NVG 1000' and 500' box's conducted. In all, four 3/4 approaches and four full flap. Training completed with full flap, GOATs and full flap t&g to NVG landings and LZ at McChord. Two combat offloads completed training.

PERFORMANCE: No issues with 3/4 flap NVG. Learned what it was like to use NVGs in marginal weather. Understands issues of high drift situations using NVGs. Discussed and demonstrated instructor abilities to analyze and adjust training to meet upgrade requirements. Discussed issues with discrepancies in training and how to advise other students to accomplish operations safely.

Page 2 of 3

RECOMMENDATIONS: Completed requirements for NVG assault and NVG IP upgrade.

----- 04 Mar 2005, Inclusive Dates: 28Feb-4 Mar KPOB JAATT 28Feb-4 Mar

Mission Type (EAS / Local / Other): JAATT (KPOB SuperJAATT)

Hours Flown: 14.6

Fields Transited: KTCM/KPOB/Luzon LZ

### General Comments:

### MISSION PLANNING / PRE-FLIGHT DUTIES

Assisted in package development and coordination process. Only copilot on this mission. Prepared crew billeting, charts, Bakeware, mission disk, and other requirements for week long JAATT. No issues with preflight duties.

### GENERAL KNOWLEDGE / USE OF MISSION COMPUTER

Overall OK. Saw some planning/MC issues that crop up with a challenging mission. Discussed looking ahead and importance of pre-mission walk-throughs. Encountered "DEGRADED MODE†during drops and discussed probable causes. Experienced "NO DROP†for DZ aquizition. Experienced semi prepared operations for first time. General Knowledge is coming along. At point where understands basics. Continue to work into "Nitty Gritty†to better prepare for "unexpected†or be able to plan for changes.

### TAKEOFF / ASSEMBLY / CLIMBOUT / ENROUTE

No issues. Allowed him to experience issues with unprepared copilot.

### THREAT ASSESSMENT / TACTICS / LOW LEVEL

No problems as we route studied and planned missions together.

AIRDROP PROCEDURES / TECHNIQUES / TIME CONTROL

No problems with timing $\hat{a}\in M$  in changes in checklist habits that might bite him later on  $\hat{a}\in M$  ostly caused by localisms  $\hat{a}\in M$  or well and understands adjustments required to meet TOT and how to present them to pilot flying  $\hat{a}\in M$ .

### AIR REFUELING / SAAF

Conducted NVG Assault PNF duties to semi prepared LZ. As far as this crew knows, it is first planned NVG Assault to semi prepared. I think that JRTC (8th AS) did one that they were not prepared nor planned for, nor was authorized to conduct.

### DESCENT / ARRIVAL / LANDING

No problems as routes were short and preplanned

### FORMATION PROCEDURES

No formation accomplished

Page 3 of 3

### ADDITIONAL COMMENTS

Attitude is good. Needs to continue working to apply knowledge gained from books. Need to refresh procedures prior to accomplishing instead of relying on  $\hat{a}\in \infty$  priored pilot $\hat{a}\in \infty$  by the does that, then will be able to see events that would be of concern instead of it  $\hat{a}\in \infty$  sneaking up on them $\hat{a}\in \hat{a}\in \mathbb{R}$ . Keep up inquisitive nature to find out what other members of crew are doing to make airdrop safe, effective, and

CRM / Judgment / Safety: Overall Good. Was able to monitor and advise of my operations.

------ 17 Oct 2004, NVG and KTCM Orientation
Flew to observe and conduct orientation of KMWH in conjunction with NVG upgrades. Accomplished some recurrency after extended period of non-flying while PCS from KCHS.

Profile: KTCM: Monitored patterns at KTCM. Finalized with NVG ground ops (backing and combat offload). Cont to MWH for multiple NVG T&Gs. Monitored instructor conducting NVG upgrades in KMWH pattern. Mike got to fly multiple 3/4 and Full flap patterns. Assisted IP on return leg back to KTCM for instrument full stop.

### Performance:

Preflight - Excellent attitude. Good learning knowledge of local procedures and requirements. Learning the ropes here at KTCM.

Takeoff - No issues. Transitioned well.

Landing - Minor problems with getting on final profile, but corrected by time required for landing in the zone.

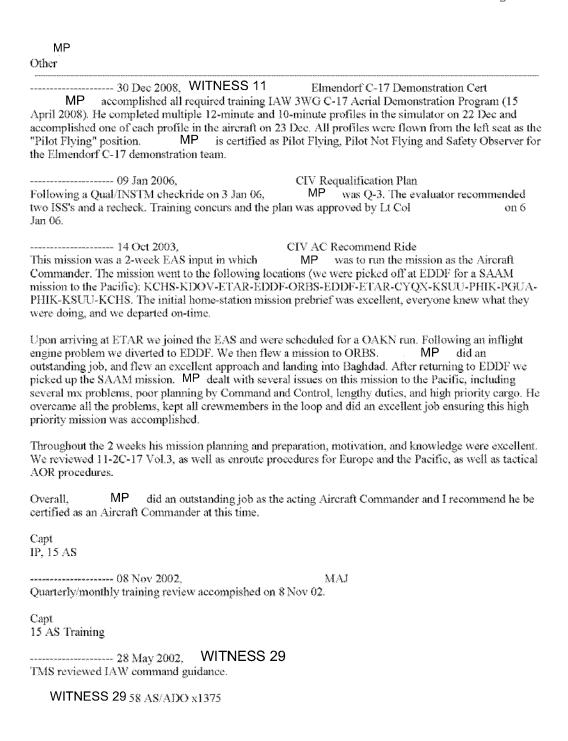

Go-Around - No issues. Able to direct PNF on duties and all procedures.

Tactical Departure - No issues.

Tactical Arrival - Finished High Tactical Arrival. Discussed benenfits and restrictions to conducting high tactical arrivals.

Recommendations: Continue working on getting items that he went Non-current for. Knock rust off. Try to fly on AR and day low-level assault trainer. Wouldn't hurt to get on another NVG ride with another instructor so that he can start building his "instructor" base......

Page 1 of 1

# T2. MCP TMS REPORT

Page 1 of 1

MCP completed airshow demonstration training as pilot not flying by accomplishing both the 10 an 12 minute profiles in the simulator and in the aircraft.

### MSO TMS REPORT T3.

#### V1. AIB TELEPHONIC INTERVIEW WITH

WITNESS 1

#### **VERBATIM TESTIMONY OF**

### WITNESS 1

PRESIDENT: My name is Brigadier General Carlton D. Everhart II. We are investigating the C-17 accident that occurred on 28 July 2010 at Joint Base Elmendorf-Richardson, Alaska. This investigation, conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 91-204. The purpose of this investigation is to produce a publicly releasable report on the facts and circumstances surrounding this accident and to gather and preserve evidence for use in claims, litigation, disciplinary actions, and adverse administrative proceedings, and for all other purposes. A safety investigation was previously conducted on the accident. Any testimony you gave before the safety investigation board will be kept confidential, if you were so advised, and can be used only for accident prevention purposes. This board does not have access to any confidential testimony you gave before the safety investigation board. Your sworn testimony to us may be used for any proper purpose. Additionally, your testimony can be released to the public. Do you understand the difference between your testimony before the safety board and this accident board?

WITNESS: I do.

PRESIDENT: Your testimony in this investigation will be under oath. At this time, I will administer the oath. Please raise your right hand.

[The witness did as directed.]

PRESIDENT: Do you solemnly swear that the testimony you are about to give in the matter now under investigation shall be the truth, the whole truth, and nothing but the truth, so help you God?

WITNESS: I do.

LEGAL: LEGAL REP

LEGAL REP Yes.

LEGAL: Were you able to view WITNESS 1 taking the oath?

LEGAL REP I was. He did take the oath, and I am able to verify his identity as WITNESS 1 by using his CAC card.

LEGAL: Thank you very much. At this time, sir, you can excuse LEGAL REP

PRESIDENT: That's good.

LEGAL: Thank you, Major--ma'am.

LEGAL REP You're welcome. Let me know if you need anything else.

LEGAL: All right.

[ LEGAL REP departed the remote interview room.]

PRESIDENT: Today is the 8<sup>th</sup> of September 2010. This time is now 1710 Zulu. This interview is being conducted telephonically. The base legal office at McChord Air Force Base has verified the identity of the witness. The AIB team, including:

Pilot Member;
Legal Advisor;
Maintenance Officer;
Flight Surgeon;
Maintenance Member;
Court Reporter; and,
I, [Brigadier General Carlton D. Everhart, II, Board President]

are in Room 105 at Building 7309, Joint Base Elmendorf-Richardson, Alaska.

The witness is at McChord Air Force Base in Building 100, Room 2078.

The witness has been sworn.

- 1Q. Please state your name and rank.
- 1A. WITNESS 1
- 2Q. How long have you served in the Air Force?
- 2A. For approximately 5 and a half years.
- 3Q. What is your unit of assignment and location?
- 3A. 62d Operations Group, Standards and Evaluation Division.
- 4Q. How long have you been with his unit?
- 4A. 14 months.
- 5Q. What is your job title?
- 5A. Deputy Chief, 62d Operations Group, Standards and Evaluation.

- 6Q. How long have you been in this particular job?
- 6A. In this job as Deputy, I have been for 14 months.
- 7Q. Okay. Can you please describe your duties and responsibilities on 28 July 2010?
- 7A. As the Deputy Chief, I am responsible for answering to the Operations Group Commanders or deputies on all matters regarding AFI interpretation, and evaluations within the Group, as well as serving as the chief pilot for our demonstration team here at McChord.

PRESIDENT: Thank you, WITNESS 1 I appreciate your time. I would like to turn this over to for his questions, if I may.

WITNESS: Certainly.

#### **Questions by the Pilot Member:**

PILOT: Good morning, WITNESS 1

WITNESS: Good morning.

- 8Q. We would like for you to start out and have you describe your aerial demonstration certification program.
- 8A. Okay. For the 62nd Operations Group we follow guidance contained within the AMC 246 Concept of Operations, or CONOPS, chapter 5 which details the pilot certification process. Going through the steps of that, we also mirror the certification process through a locally generated training guide of which all nominated members are taken through as part of their certification. From the con-ops, that begins with phase 1 and I'll say prior to actually getting to phase 1 each candidate is nominated by their respective squadron commander or the group commander. So, only those who have been given the nod by either of those people even begin the process. Phase 1, which talks about taking the candidates to become familiar with the applicable AFIs, guidances, all the AFIs that govern the aerial demonstration, they are taken through that before they begin any other training. The phase 2 process for us, for the pilots who are going to be the pilots flying as well as the co-pilots who can also be referred to as pilots monitoring per our T.O., they then go into the simulator and practice profile 3 which is the 12 minute demonstration which for the most part covers any and all maneuvers that would be covered in any of the other profiles, and except for profile 4 which is an air-ground profile.
- 9Q. When you said, "T.O.'s" that refers to technical orders and those are the technical orders that describe how to fly the aircraft?
- 9A. Yes. So they go in with--it's preferred they go in with myself or another operation--OGV or Operations Group Standards and Evaluation pilot and practice the profiles in the simulator. Then they move to a flight, a local here at McChord where again with an OGV level pilot, they fly the demonstrations here at McChord. Each candidate is given multiple opportunities to practice the profile here and once the OGV level pilot is satisfied with their performance, that's when they move to phases 3 and 4 in which the OGV pilot makes a

recommendation, by signing the training guide, to the squadron commander that they have met the standards. The squadron commander meets with each candidate through our normal review and certification board process, or RMC process, where they sit down with the squadron commander, review the training guide, and get the squadron commander's thoughts and comments on demo--on how to fly demos.

- 10Q. Okay. You mentioned that part of the phases you described as phases 1 through 4, the second phase would be the simulator phase. How many simulators do you require?
- 10A. We require only 1 simulator. Actually, that simulator can also be waived by the squadron commander.
- 11Q. Okay, so 1 is required and you mentioned that during that simulator you will fly what is called a profile. Can you explain what you mean by profile?
- 11A. The profile, the current AFI 11-246, volume 6, chapter 3, there are 4 standard profiles for the C-17 demonstration—that the C-17 can fly. Profile 3 is a capabilities demonstration which is known as our 12 minute demonstration. That one, for an air-land purpose, covers all the maneuvers that you would also fly in profiles 1 or 2.
- 12Q. Okay. When you say, "air-land" you mean that is employment of the aircraft in a capacity that delivers troops or cargo from one location to the other without dropping from the back of the aircraft?
- 12A. Yes. You are correct that the last half of the demonstration, that describes and air drop which is covered under profile 4.
- 13Q. You mentioned specifically profile 3. We would like you to talk about profile 3 and have you describe that and talk us through profile 3 specifically.
- 13A. Okay. I still had a couple more things with the certification process. Are you satisfied with what we had covered under that portion?

PILOT: Yeah, you can finish your thoughts on the certification if you like.

13A (continued). Okay. I just wanted to say after the squadron commander has met with the candidates, they sign their signature on the RMC minutes, signifying their approval which then is--they then go up to the Operations Group Commander and the Operations Group Commander's signature on both their training guide as well as the Operations Group RMC minutes then signifies the actual certification for the crew members and the C-17 no longer uses the Air Force Form 1381 in our flight evaluation folders which it used to be the record of certifications. We now process that through what is known as a Letter of X's. The Group Commander signs an Air Force Form 4324 which updates the crew member's ARMS record and that then updates the Letter of X's providing the circle of certification.

- 14Q. The ARMS record is what?
- 14A. I don't remember exactly what the definition of that acronym is.
- 15Q. Can you let me know what specifically that does?
- 15A. What that does is that updates a crew member's currency record. That signifies and loads a training table for that crewmember which in our case and our Group's case, now also loads a 2-year currency requirement for flying a demo profile to keep them what we would call as current. What do I mean by current? Meaning that they would not require a specific flight other than our mandated practice flight before taking off for a demonstration.

PRESIDENT: That's perfect WITNESS 1 Thank you.

#### **Questions by the Pilot Member:**

- 16Q. Just to summarize, so you mentioned the process starts with the nomination?
- 16A. Yes, sir.
- 17Q. It requires at least 1 simulator flight unless that is waived?
- 17A. Uh huh.
- 18Q. Then you have the actual flight training?
- 18A. Yes.
- 19Q. Then you have signatures that starts with the Squadron Commander, ends up with the Group Commander as the final approval, and then that record is maintained in ARMS as a simplified summary. Is that accurate?
  - 19A. Yes.
- 20Q. Okay. Thanks for explaining that. We would like to go back to where we were with profile 3 and have you describe that profile to us, if you can.
- 20A. The C-17, once cleared, will taxi onto the runway, and initially take off using a maximum power takeoff or what is known as our min maneuvering speed, or VMCO.
  - 21Q. Okay. Can you define the "max power" takeoff?
- 21A. A max power takeoff is pushing the throttles all the way up and getting the maximum thrust available from the engines.

[The court reporter informed the pilot member that aircraft noise appeared to distort the audio, but this was not the case.]

- 22Q. Okay. Sorry, you'll have to backtrack just a little bit due to background noise. If you can start with step 1 of profile 3.
- 22A. Okay. Once on the runway and cleared for takeoff from either the tower or the air boss, the aircrew pushes the throttles for the engines up to the max power which is the maximum amount of thrust available from the engines for the takeoff. Once reaching our rotation speed after break release, we pitched the aircraft up to climb out at our minimum climb out speed, or VMCO.
- 23Q. Okay. If you can explain the rotation, that is when takeoff occurs, through when the aircraft goes from a three point to a take off attitude?
- 23A. Yes. Our slats are extended, our flaps are at their half setting which is our normal configuration for a departure. We are climbing at--for the initial climb up to 1,500 foot AGL or above ground level. At approximately 1,000 feet we begin to bring the nose down, one, to begin to actually level off at the 1,500 feet AGL as well as to begin our acceleration to a speed faster than our VMCO.

- 24Q. WITNESS <sup>1</sup> the initial climb in degrees that you take when you rotate--or typically do you-- what normally would you see on that?
- 24A. I've seen anywhere from 20 to 30 degrees of nose high. Once reaching about approximately 1,000 feet AGL we would begin a level off maneuver to level off at 1,500 feet and begin our acceleration and then as prescribed at the preference of the aircraft commander or the pilot flying as to whether or not he will be the person directing configuration changes or it can also be delegated--or has been delegated to interaction between the safety observer which is an additional pilot in either--that would be sitting in either our left additional crewmember or right additional crewmember lack 'em or rack 'em seats which are behind the pilots-- the pilot and the copilot seat respectively.
- 25Q. When you talk about this delegation, you delegate that--is that still called for verbally by the pilot flying?
- 25A. That's what we leave up to the pilot flying. If he wants to still verbally ask for the configuration changes, or if he delegates to the safety observer to call out the configuration changes so that the pilot flying can concentrate on flying a stable profile without having to be calling those out.

- 26Q. So, WITNESS 1 when you say they are calling them out, you still will hear that inside the cockpit as you would like on a normal takeoff?
  - 26A. Yes, sir.
  - 27Q. So it's still verbally acknowledged in the cockpit?
  - 27A. Yes, sir.

### **Questions by the Pilot Member:**

- 28Q. Can you just define what you mean by configuration changes?
- 28A. Yes, sir. That would be calling for the gear to be brought up-to be retracted into the aircraft, changes to the flap settings are that the flaps are being brought up to their fully up position as well as flaps being retracted to their up and stowed position and/or extension of those three items as well.
- 29Q. When you--do you have a specific time or specific speed that you use to accomplish those configuration changes?
- 29A. A normal gear retraction is once we have established a positive climb, so that is pretty much automatic once the aircraft has departed the runway. Taking it from a--switching the flaps setting from flaps half does not take place until we are past that thousand feet and start pushover and accelerating and then we have to pass a speed known as the VMFR or minimum flap retract speed that tells us when the flaps can be brought up from the half flaps setting.
  - 30Q. Okay. You can continue to talk us through that first maneuver then.
- 30A. Once we are accelerating, we will begin an 80 degree turn away from the crowd line, or the side that the crowd is on. So, we always fly our demonstrations away from the crowd, or turns away from the crowd.
  - 31Q. When you say 80 degrees, you mean 80 degrees----
  - 31A. Of heading change.
  - 31Q (continued). ----of heading change. Okay.

- 32Q. When you said crowd line, that's an extended line basically going down the middle of the runway or show center?
  - 32A. Yes, sir.
- 33Q. How far do you think that line extends? Does it extend to field boundary or is it extended out to infinity?
- 33A. What we use and what I teach is I have it extended out for the pilot reference. I have it extended out 5 or 10 miles so it can be seen on our displays. That way, it helps the pilot and the copilot as well as safety to monitor the position of the aircraft in reference to the line because we want to treat that line as a no-fly on the opposite side.
- 34Q. So that 5 to 10 miles extended out on the visual presentation inside the airplane, is that a technique or is that a procedure?
  - 34A. That is a technique.

### **Questions by the Pilot Member:**

- 35Q. Okay. So, you mentioned--so, we were talking through the--you took us to the initial climb out and then you took us through a turn with 80 degrees of heading change.
- 35A. Eighty degrees of heading change and then depending on winds, winds always come into factor as well in flying, then a--it's called a course reversal, 260 degrees in the opposite direction of the initial turn to bring us around to the show line, heading in the opposite direction from takeoff.
  - 36Q. That's 260 degrees of heading change, correct?
- 36A. Yes, 260 degrees of heading change, and then depending upon a crew's study of terrain in the area, that will depend on when the pilot begins his descent then from the 1,500 foot AGL down to 500 feet AGL for a clean pass which means the gear is retracted, the flaps are retracted, and the slats are retracted as well. This first pass is conducted either at 250 knots of airspeed or it can also be done at 300 knots with an FAA waiver, a speed waiver for being below 10,000 feet.
- 37Q. Okay. When you are conducting the 80 degrees of heading change and the 260 degrees of heading change, what does the profile say regarding the bank angle for those turns?
- 37A. All bank angles are depicted or specified to be 45 degrees of max bank and that is in both the textual description of the profiles as well as in AFI 11-209.
  - 38Q. Okay, what does the profile say regarding the rudder use for that same turn?
  - 38A. It says no ru--my understanding is, does not specify any use of rudder.
  - 39Q. Do you have a particular technique that you use or teach?
- 39A. I teach people not to use it. If they fly the profile correctly in the way it has been designed, there should be no need for use of rudder. I have had pilots put in a little bit and I can't necessarily quantify a little versus a lot, maybe just a tap, but my technique is teaching the pilots to put both of their feet on the floor and keep their feet off the rudder pedals.
- 40Q. All right. You talked about deconfiguring the aircraft. We established what that was. Talking through the turn, the 80 degrees of heading change followed by the 260 degrees of heading change, can you describe the point during that sequence where the deconfiguring normally happens?
- 40A. The deconfiguration normally happens as the aircraft is accelerating and has passed to the min retraction speeds for the flaps and the slats. Those speeds change depending on the weight of the aircraft, but they are given to us from the mission computer as to what the speeds are.

- 41Q. Does this normally result, based on your experience, in a clean aircraft, a partially configured aircraft, partially configured meaning that maybe the slats are extended and the flaps are up, or clean aircraft meaning that the slats would be retracted and the flaps would be in the up position?
- 41A. It culminates in a clean configuration. The gear comes up first at initial takeoff. Then the flaps are retracted first. The slats are still extended. Then once we reach the slats retract speed, then the slats are retracted.

- 421Q. Let me just clarify, if I may, what I think I understand you to say. On speed, with the gear, and then about that time you make your initial 80 degree turn of heading change, that's about when you would bring on speed the flaps up. Then the way I understand what you are saying is about the time you start, or during the time that you are doing that 260 degree heading change, you would retract the slats on speed? Can you talk us through how you would do that?
- 42A. Typically because you are still at max thrust during the 80 degree heading change, the gear comes up within 100 feet of leaving the ground. The gear is up well before--is retracted well before we hit the start of the turn. The bringing up of the flaps and slats typically happens during the initial 80 degree of change because the aircraft, again, is at max thrust still and is accelerating. Usually since the aircraft is light, somewhere in the range of 320,000 pounds which is fairly light for us, those speeds come quickly. Usually by the time you have hit the 80 degree heading--80 degrees off heading and begin the turn in the opposite direction to do the 260 degrees of heading change, you are usually by that point, you are a clean aircraft.

#### [ departed the board room.]

### **Questions by the Pilot Member:**

- 43Q. You mentioned that to get into a clean configuration, you said on speed earlier, and on speed is defined as the speed that the aircraft calculates as a safe airspeed to deconfigure the aircraft, correct?
  - 43A. Correct.

- 44Q. Then again, to clarify, you said all these maneuvers are done at 45 degrees?
- 44A. Yes, sir.
- 45O. Of bank?
- 45A. Yes, sir.

### **Questions by the Pilot Member:**

- 46Q. As we continued to talk about this particular part of the profile, during this 80 degree of heading change to 260 degrees of heading change, have you noticed a propensity or have you--did you normally get any type of warnings from the aircraft during these maneuvers?

  46A. No, I do not.
- 47Q. That would include warnings such as stall warnings where the aircraft is alerting the crew that it is approaching a potential stall condition?
- 47A. I have no recollection in my experience of getting a stall warning on that turn. I will say the C-17 does have--can--during a configuration change have a momentary lag where stall bars don't necessarily change as quickly with rapid configuration changes.
  - 48Q. If we can, to define a stall, if you could define a stall for us.
- 48A. A stall is a point at which an aircraft begins to lose its aerodynamic qualities to be able to keep it in the air. The C-17 has automated warnings to calculate when the aircraft approaches those limits and orally warns the crew.
  - 49Q. Meaning they will hear it through their headset and speakers?
- 49A. Will hear it through their headset as stall, stall as long as the aircraft is maintained within that envelope that the mission computer has calculated.
- 50Q. During your experience, you have not had noticed or you cannot recollect hearing that particular warning alerting the crew. Is that correct?
  - 50A. At that point in time, no.

#### entered the board room and resumed his seat.]

- 51Q. Okay. You mentioned--we talked a little earlier about calling for the checklist and how that workload is divided inside the aircraft. Do you verbalized challenge and responses from the checklist just as you normally would, and by challenge and responses, I mean when there is a critical item and one pilot calls for it and the other confirms that it is in the position, do you run those challenge and responses just as you normally would during any other type of flight?
- 51A. Yes. Everything is verbally announced and as I said before, depending on the pilot flying, whether he wants to acknowledge those items which require a response from the pilot position or if he delegates to the safety observer to respond for him. Everything is dual, verbally enunciated.
- 52Q. Regarding checklist, do you have an approved, specific aerial demonstration checklist or do you use the standard flight manual checklist?
- 52A. Standard flight manual checklist. I know there are demonstration ones that are out there, but we do not have one in the 62d Operations Group.

- 53Q. Do you know if those other checklists are actually approved by MAJCOM?
- 53A. No, I do not.
- 54Q. By MAJCOM, I mean Major Command as in Pacific Air Forces or Air Mobility Command.
- 54A. There are none for Air Mobility Command that I am aware of. I believe the one I have seen was a technique.

#### **Questions by the Pilot Member:**

- 55Q. All right. Just to backtrack a little bit, when we described what a stall is, and we talked about the stall warning system of the aircraft, if you were to encounter that during your flight, during maneuvering, what would be your reaction to that?
- 55A. Confirming I'm in max thrust or getting the aircraft to max thrust as well as either decreasing my bank or decreasing my pitch to a level to allow the aircraft to accelerate.

#### **Questions by the Board President:**

- 56Q. So, would you actually do that during an air show profile also?
- 56A. Yes, sir.

#### **Questions by the Pilot Member:**

- 57Q. Have you, just for background, have you noticed or has anyone mentioned any unusual handling characteristics during any aspect of aerial demonstration flight?
  - 57A. No. sir.
- 58Q. The last thing, and we know that you are aerial demonstration certified, have you ever flown an actual air show?
- 58A. I have flown the modified profile 3 which began and ended in the air because the demonstrations were over water. The only part of the standard profile 3 that I have not flown for an actual air show is the full stop and the backing.
- LEGAL: I just wanted to clarify something on the record and it is actually just more for our record keeping, I just wanted to note that had departed the interview room at the time when you were discussing max thrust and during the 80 degree heading change just before we were talking about stalls and what stalls were and then re-entered the room approximately 3 minutes ago. Thank you.

  WITNESS 1 we are going to take a little break here. I'm going to put you on hold, so stay on the line.

WITNESS: Will do.

[The board recessed at 1742 Zulu, 8 September 2010.]

[The board reconvened at 1746 Zulu, 8 September 2010 with all members previously present being present.]

#### **Questions by the Board President:**

59Q. WITNESS 1 are there any other things you would like to add to help us with this investigation?

59A. All I can say is that if the profile is flown as it was designed, it doesn't exceed any standard capabilities of the aircraft.

PRESIDENT: You are reminded of the official nature of this interview. You may not discuss your testimony with anyone without my permission at any time before the report of this investigation is officially released to the public.

This concludes the interview.

[The board recessed at 1747 Zulu, 8 September 2010.]

[END OF PAGE]

#### **V2. AIB INTERVIEW WITH**

### WITNESS 2

#### VERBATIM TESTIMONY OF

### WITNESS 2

PRESIDENT: My name is Brigadier General Carlton D. Everhart II. We are investigating the C-17 accident that occurred on 28 July 2010 at Joint Base Elmendorf-Richardson, Alaska. This investigation, conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 91-204. The purpose of this investigation is to produce a publicly releasable report on the facts and circumstances surrounding this accident and to gather and preserve evidence for use in claims, litigation, disciplinary actions, and adverse administrative proceedings, and for all other purposes. A safety investigation was previously conducted on the accident. Any testimony you gave before the safety investigation board will be kept confidential, if you were so advised, and can be used only for accident prevention purposes. This board does not have access to any confidential testimony you gave before the safety investigation board. Your sworn testimony to us may be used for any proper purpose. Additionally, your testimony can be released to the public. Do you understand the difference between your testimony before the safety board and this accident board?

WITNESS: Yes, sir.

PRESIDENT: Your testimony in this investigation will be under oath. At this time, I will administer the oath. Please raise your right hand.

[The witness did as directed.]

PRESIDENT: Do you solemnly swear that the testimony you are about to give in the matter now under investigation shall be the truth, the whole truth, and nothing but the truth, so help you God?

WITNESS: Yes, sir.

PRESIDENT: Today is the 8th of September 2010. This time is now 1417 local. This interview is being conducted in building 7309, room 105, Joint Base Elmendorf-Richardson, Alaska. The persons present are:

The witness,

WITNESS 2

Pilot Member; Legal Advisor; Maintenance Officer; Maintenance Member; Court Reporter; and,

me, [Brigadier General Carlton D. Everhart II, Board President]

PRESIDENT: The witness has been sworn.

- 1Q. Please state your name and rank.
- 1A. WITNESS 2
- 2Q. How long have you served in the Air Force?
- 2A. 16 years--16 1/2 years.
- 3Q. What is your unit of assignment and location?
- 3A. 703 AMXS, Elmendorf Air Force Base, Alaska.
- 4Q. How long have you been with his unit?
- 4A. A year.
- 5Q. What is your job title?
- 5A. Maintenance production supervisor.
- 6Q. How long have you been doing this particular job?
- 6A. About 5 months now, sir.
- 7Q. If you would, would you please describe your duties and responsibilities on 28 July 2010?
- 7A. I was the swing shift production supervisor. My responsibilities are to manage production on the flight line, to include assigning jobs to specialists for any aircraft that may be broke and to the status aircraft accordingly.
  - 8Q. And you said that your years of service is about 16 1/2? Is that correct?
  - 8A. Yes, sir. December 13th will be my 17-year mark.
- 9Q. You said that your position in the maintenance organization was pro super, correct?
  - 9A. Yes, sir.
  - 10Q. Can you describe to me what a pro super is?
- 10A. A pro super manages the flight line production wise as far as--like I said, sir, when an aircraft that lands is broke, liaison personnel are assigned to fix the aircraft. I status the aircraft accordingly as far as whether it is non-mission capable, partial mission capable.
  - 11Q. That is for C-17 aircraft, correct?
  - 11A. Yes, sir.
  - 12Q. C-17 only?

12A. Yes, sir.

PRESIDENT: Thank you. I will turn this now over to

#### **Questions by the Maintenance Member:**

- 13Q. Thank you for coming. Basically, a C-17, how much experience do you have maintaining the C-17 aircraft?
- 13A. In my whole career, I spent 2 years on it while stationed at Ramstein Air Force Base, Germany. Worked the en-route there and the last year I have been here, so a total of 3 years. That Ramstein timeframe was like 2001, 2002.
- 14Q. Can you describe what you're training is that you have gone through in order to be a pro super of this aircraft?
- 14A. I went through pro-super school here on the base just recently, actually. You're just talking specifically pro super or are you talking schools I went through as a jet engine mechanic?
  - 15Q. Your total amount of training because that goes to your experience level.
- 15A. Okay. I also went to school in route to this duty assignment, at Jackson Air National Guard Base. Prior to that, when I was at Ramstein, I went through some schools as well there, through Charleston, C-17 run school, also went through another systems school there at Charleston. I believe that's it, sir, as far as I can remember.
  - 16Q. You were at work on July 28th, the day of the mishap?
  - 16A. Yes, sir.
  - 17Q. Do you remember what aircraft you signed off or were involved with on that day?
- 17A. The subject aircraft, obviously, 173. I signed the ER, exceptional release, on that aircraft the line prior to the mishap.
- 18Q. The exceptional release, can you kind of give me a brief description of what that is?
- 18A. The exceptional release, that is basically calling the aircraft air worthy as far as maintenance is concerned. I review the forms to verify that the aircraft is maintenance worthy and then I sign off the ER and inform the pilots that the ER has been signed off and it's good to fly.
  - 19Q. That wouldn't necessarily involve any maintenance yourself on the aircraft?
  - 19A. No, sir.
  - 20Q. You are just ensuring the other maintenance professionals did their job right?
  - 20A. Yes, sir.

- 21Q. In your current job, what are your current responsibilities with respect to tail number 173, the mishap aircraft?
  - 21A. On that subject day, only the ER.
  - 22Q. Only the ER?
  - 22A. Yes, sir.
  - 23Q. Had you been on shift prior to the ER, or how long had you been on shift prior?
- 23A. I had been on shift-my shift starts at 2:30. The aircraft-no, it has been a little over a month. I'm thinking it launched around 1600 so I went to the aircraft around 1500, reviewed the forms, signed off the exceptional release, and that's the interaction I had with the aircraft.
  - 24Q. So that's at 2:30 PM?
  - 24A. Yes, sir.
  - 25Q. So the ER was really the only interaction you had with it?
  - 25A. Yes, sir.
  - 26Q. Did you get a turnover of sorts from the previous shift?
- 26A. No, I did not get any turnovers as far as dayshift's pro super other than the aircraft is due to launch and I needed to go sign off the ER.
- 27Q. By turnover, I'm saying, from the previous shift pro super, did he tell you the status of that aircraft or if there had been any previous write ups on the plane?
- 27A. Yes. My turnover as far as dayshift was that aircraft had already launched out on one line. This was the second line that I was signing the ER off on and it was air worthy. There were no write ups as far as maintenance was involved. So when I came to the aircraft, I verified that.
  - 28Q. Do you know who was the pro super on duty the shift prior?
- 28A. We have 3 pro supers on day shift. It kind of varies as far as which one is actually on the line. It's usually MSGT M or MSGT W I'm not sure which one because we are all kind of in the office together as far as the turnover. It isn't specific as far as which one was on the line that day.
  - 29Q. You said you signed off on the second line for it?
  - 29A. Yes, sir.
  - 30Q. Again, can you explain what you mean by line?
- 30A. Line, there's like--a line is a flight, basically. The first line was the first flight with that aircraft. The second line was the second flight with that aircraft.

- 31Q. So, you had gotten a turnover as far as the shape the aircraft was the previous go. The status of the aircraft itself, it was--you got a turnover and they said it was?
  - 31A. Partial mission capable, maintenance.
  - 32Q. Kind of describe what that means.
- 32A. All of our aircraft, because they aren't dual role-they are dual role restricted. All of our aircraft are partial mission capable because of maintenance because it is dual role-it doesn't have dual role capability as far as air drops.
  - 33Q. So, dealing with an air drop mission, it was not capable?
  - 33A. Yes. That type of air drop mission, it wouldn't----

- 34Q. That's just because dual role is a specific configuration in the back of the airplane that will allow it to do that type of drop?
  - 34A. Yes, sir. Exactly.

#### **Questions by the Maintenance Member:**

- 35Q. So the mission that this one was going to fly, that had no bearing on it?
- 35A. Yes.

#### **Questions by the Pilot Member:**

- 36Q. Would you classify the partially mission capable as the standard across the fleet due to a known previous condition that only has to do with air drop operations?
- 36A. Yes, sir. We don't have any FMC, full mission capable, aircraft because of exactly what you're saying, sir.

#### **Questions by the Maintenance Member:**

- 37Q. Sequence of events, I guess for the day it pertains to 173, the tail number. You turned over and did the ER. After you signed the ER, can you tell me what you saw and what you did?
- 37A. I signed off the ER and that was the second line, like I said previously. Engine running crew change, "urked" into the third line which a demo team took over and we had no maintenance interaction with the aircraft. I believe it was air worthy.

- 38Q. Do you know if the crew, the earlier go during that day, had called in any maintenance or anything like that, needed to have anything checked out on it prior to the engine running crew change?
  - 38A. No. There was no call in as far as any maintenance issues.

#### **Questions by the Maintenance Member:**

- 39Q. Engine running crew change, not familiar with the standard procedures today. Did they crew change on the taxiway?
  - 39A. Yes, sir.
  - 40Q. On the ramps? You didn't martial it anywhere?
  - 40A. No, sir.
- 41Q. We already covered it, but you stated there were no maintenance related discrepancies? No problems from the first mission that day?
  - 41A. No, sir.
- 421Q. I know it was a quick turn, in other words, it wasn't on the ground very long. Do you know if any discrepancies were worked in between the missions from the first mission that morning to the second one?
- 42A. I know of none, and the forms were clean so I didn't see any other than the usual I's and E's, exhaust inspection.

#### **Questions by the Board President:**

43Q. So when you say the forms are clean, there are no hard write ups that would ground the airplane, or have to do some extensive maintenance on it? Is that what you're saying? 43A. Exactly, sir. Exactly.

#### **Questions by the Maintenance Member:**

- 44Q. There were no maintenance problems worked from previous write ups. If you are familiar with the term "red ball" maintenance, could you give me a brief description of what red ball maintenance would be?
- 44A. Red ball maintenance is a write up that needs to be worked and the maintainers have to pretty much rush out there and try to fix it before launch.
  - 45Q. There were no red ball maintenance issues, nothing called in prior to launch time?
  - 45A. No. sir.

- 46Q. Just for clarification purposes, a write up is a term I've used a couple times. That's meaning basically a discrepancy, and written up into the forms as a permanent record, and there were none on this aircraft from that first go?
  - 46A. Yes, sir.
- 47Q. I think we covered all the maintenance issues. One thing, and I'm not sure if you said it before, did you see the actual mishap? Did you watch the mishap?
  - 47A. I was actually upstairs in the production office when it happened. I was informed.
  - 48Q. So you did not see the mishap?
  - 48A. No, sir.

### **Questions by the Maintenance Officer:**

- 49Q. When the jet landed on the first go, what was the status--what would you say the status code was?
  - 49A. When it landed on the first go, that was day shift, I'm guessing it was----
  - 50Q. What was your turnover?
- 50A. My turnover was it was mission capable. It was ready to go. I just needed to sign the----
  - 510. Alpha 1?
  - 51A. Yes, sir. Alpha 1.
  - 52Q. What is Alpha 1?
  - 52A. Alpha 1 is good to fly, no write ups, no major write ups, no grounding write ups.

PRESIDENT: WITNESS 2 thank you for your time and for coming in. I would just like to ask you one more, quick question and then I will read you out of this interview.

#### **Questions by the Board President:**

- 53Q. Are there any other things you would like to add that would help us in this investigation?
  - 53A. Nothing I can think of, sir.

PRESIDENT: You are reminded of the official nature of this interview. You may not discuss your testimony with anyone without my permission at any time before the report of this investigation is officially released to the public.

This concludes the interview.

#### V3. AIB INTERVIEW WITH

### WITNESS 3

#### VERBATIM TESTIMONY OF

### WITNESS 3

PRESIDENT: My name is Brigadier General Carlton D. Everhart, II. We are investigating the C-17 accident that occurred on 28 July 2010 at Joint Base Elmendorf-Richardson, Alaska. This investigation, conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 91-204. The purpose of this investigation is to produce a publicly releasable report on the facts and circumstances surrounding the accident and to gather and preserve evidence for use in claims, litigation, disciplinary actions, and adverse administrative proceedings, and for all other purposes. A safety investigation was previously conducted on this accident. Any testimony you gave before the safety investigation board will be kept confidential, if you are so advised, and can be used only for accident prevention purposes. This board does not have access to any confidential testimony you gave before the safety investigation board. Your sworn testimony to us may be used for any proper purpose. Additionally, your testimony can be released to the public. Do you understand the differences between your testimony in the safety board and this accident board?

WITNESS: Yes, sir, I do.

PRESIDENT: Your testimony in this investigation will be under oath. At this time, I will administer the oath. Please stand and raise your right hand.

[The witness did as directed.]

PRESIDENT: Do you affirm that the testimony you are about to give in the matter now under investigation shall be the truth, the whole truth, and nothing but the truth?

WITNESS: I do.

PRESIDENT: Please be seated. Today is the 15<sup>th</sup> of September 2010. This time is now 1020 local Alaska time. This interview is being conducted in building 7309, room 106, Joint Base Elmendorf-Richardson, Alaska. The persons present are:

The witness,

WITNESS 3,

Pilot Advisor;
Legal Advisor;
Maintenance Officer Advisor
Medical Advisor;
Maintenance Advisor
Court Reporter; and,

me, [Brigadier General Carlton D. Everhart, II, Board President]

PRESIDENT: The witness has been sworn.

### **Questions by the Board President:**

- 1Q. Please state your full name and rank.
- 1A. WITNESS 3
- 2Q. How long have you served in the Air Force?
- 2A. A little over 19 years now.
- 3Q. And what is your unit of assignment and location?
- 3A. 517<sup>th</sup> Airlift Squadron in Elmendorf.
- 4Q. In Elmendorf, okay. And how long have you been with this unit?
- 4A. A little over two years, sir.
- 5Q. What is your job title?
- 5A. I'm the ADO, Assistant Operations Officer.
- 6Q. And how long have you been doing this particular job?
- 6A. Since I arrived on station.
- 7Q. Can you please describe your duties and responsibilities on 28 July 2010?
- 7A. I was the -- can I use ADO interchangeably now?
- 8Q. You can now, you bet.
- 8A. I was the ADO on duty, and my duties were keeping the squadron running in a general sense when a snag came up that wasn't able to be handled by the younger officers or enlisted. And I was also in charge of signing orders and handling any kind of prioritization if assets were limited; tails, crews went DNIF, duty not including flying, things like that. I was in charge of juggling crews and aircraft to make sure the training got done.
- 9Q. Throughout this interview, I will be asking you questions related to the information in your previous statement. I would like to ask you now if you would like to adopt your previous statement for the record?
  - 9A. Yes, sir.

#### **Questions by the Legal Advisor:**

10Q. Sorry. And let's just be clear, it's that you would like to adopt this previous statement that was in Tab R, pages R4 through R14, as part of your testimony today?

10A. I do.

- 11Q. What you have adopted and is now part of your testimony today, this means that some of the questions were based on your previous statement. Just for the record, do you understand?
  - 11A. Yes, sir.
- 12Q. And if at any time you don't understand my questions, please feel free to ask for clarification. Are you familiar with the C-17 aerial demonstration program?
  - 12A. Yes, sir, I am.
  - 13Q. Can you describe your C-17 aerial demonstration background?
- 13A. I was trained up last year. I really don't remember what month, but I was trained up with the intent to bridge the gap between our outgoing cadre of demonstration pilots for the 517th and the next wave of people that were coming in. We were the initial standup squadron, so we had a large wave of people that was leaving, and I was to bridge the gap. So I was trained up last year to be the instructor for the new group of demonstration pilots. And then I ended up being chosen to go on a road show last year with the Thunderbirds where we did multiple demonstrations all over PACAF, the Pacific Air Force theater.
  - 14Q. And who provided your training?
  - 14A. MP MP
  - 15Q. And who else trained with you?
- 15A. We had several other pilots. They were both -- two other instructor pilots that trained up with me. But once we were all qualified, I trained with a smaller -- call it a hard crew for that traveling demonstration circuit that we did.

The other two instructor pilots that trained with me were at the time

. She's now WITNESS 26 And the other one was WITNESS 10, WITNESS 10.

So the three of us trained up under MP instruction last summer.

And then, additionally, we trained up WITNESS 8 as the safety. And he did travel

with me as the safety.

And then, additionally, we trained up

with me as the safety.

And we trained up MSO as the copilot, and he was trained as hard crew with me as well.

- 16Q. Could you please describe your demonstration training?
- 16A. Yes, sir. It's been awhile. So, essentially what we did was he, sat down with the students that were going to get qualified, and we went through some ground training first and talked about the regulations that governed it. And he had some CVT -- not CVTs -- PowerPoint presentations that talked about the maneuvers and some of the limitations, some of the techniques that we could use, as well as how we would prep the jet for some of the stuff you would do on the computer. Our runways, even though they might say runway 06, for

heading 060, they are not really heading 060. They only mark them in 10 degree increments. So, for an appropriate run-in, we would have to program the jet and create a false field, or a home-built field, so that we could have an exact heading; 062 or 059, or something like that, based on whatever location.

He taught us here, so we flew simulators, and he flew in the right seat with us in the left seat, so he flew as copilot. And he could demo it. He demoed it from the right seat in the simulator, and then we would do it.

And we had recordings. The simulator instructor would record what our ground path looked like, and so you could see how initially it was all over the place. It was sort of a birds eye view of the ground path of our aircraft. And, initially, we could see how -- how our maneuvers were kind of sloppy and wavering, and not straight lines and good curves. And then as we practiced in the simulator, we got better and better. It was more consistent, and that's what we were going for.

And then after that, we would go up for a flight, and we -- depending on what the weather and the flying schedule here was, we would either train up here or we would go up to -- I did a sortie here and a sortie at Fairbanks. And I don't -- I really don't recall where the other two pilot candidates, flying pilots, flew.

So we practiced that. And we didn't practice as hard crew's in the sim at that point because he was in the copilot seat versus, say,

MSO The first time I worked with him was -- the first time I worked with MSO was on a practice demo as my copilot.

Oh, I'm sorry, I talk with my hands. My apologies.

So, some ground training, some simulation. So he demoed and then I would fly it in the sim and then we would go up and fly a sortie. We would do all of the ground training that we would normally do for any training -- local training sortie. We would come in the day prior and sit down and talk about the forecasted weather and what airfield we're going to, and then we would go up and he -- he would fly a warm-up one from -- Initially, before we got qualified, he would fly one from the right seat to demo it again in the air. And then I would fly one from the left seat.

But, once we were qualified, then he wouldn't do that. He would sit in an ACM seat, an additional crewmember seat, and I would fly left seat, MSO would fly right seat, and would fly safety. And he would sit in the right ACM seat, would. So MSO -- or

MP would sit in the left ACM seat during our practices.

And as we got closer to the show circuit, MP and I would change seats. We were supposed to have a hard crew, but we opted to take -- and I never really talked to him about this. This was my understanding of why we did it, is that we took two of us, because when you are an instructor pilot and you get qualified as a flying aircraft commander for the demo, you are qualified in all of the other positions. So I did train in each of the other seats for at least one profile in each seat, copilot and safety, so -- because he was also qualified in that respect. When we went on our circuit, we were interchangeable. I was the spare pilot for him and he was the spare pilot for me. And neither of us was -- either of us was capable of performing the duties as copilot or safety. So that's why we flew and watched the other guy.

17Q. For the record, CBT is computer-based training?

17A. Yes, sir.

- 18Q. And then when you said run-in, you mean just lining up so you can come back over the runway center line?
- 18A. Yes, sir. Well, we make the assumption that -- that our air shows are going to be done at an airfield. That was actually not the case during one of them, but we didn't fly that demo -- demonstration; the Hickam folks actually flew that one off of a beach. So there is always some kind of show center and some sort of azimuth or heading that they want you to come in so the crowd -- you're not going into the crowd or over the crowd. You are always running along in front of them. And so that's -- that's the reason we had such a critical heading.
- 19Q. You mentioned just a couple of minutes ago you said "false heading." What did you mean by -- you said, runway 060, it may be 062 or 063, or 061, but you "we'd set up a false heading." Could you describe that, please?
- 19A. Okay. When we are making our calculations for our turns, if a runway is actually five degrees off from what the runway heading says -- you know, we have these headings printed on the runways, 060, 070 -- but if the run-in heading is actually four or five degrees off -- excuse me -- it makes a difference because we don't want to be coming in at an angle where we are pointing at the crowd when we are doing our high-speed pass or our low-speed pass, or anything like that. So we want to go directly down the exact heading, the exact azimuth.
- 20Q. Okay. Good. And then once you got qualified, did you provide training for other crew members?
- 20A. No, sir, I did not. That was the intent, but the schedule did not permit me training of the new guys, so MP ended up doing it anyway.
- 21Q. In earlier testimony, you mentioned that you performed several demonstrations while you were certified as an administration pilot. Which ones were they and when, if you remember, when they occurred?
- 21A. Sorry. This is a while ago. We flew demonstrations -- I think it was number three. It was always the same one. Part of the -- Profile number three, sorry. There are four profiles in our -- and I haven't even looked at the regulations, but I think it is AFI 11- -- well, I know it is AFI 11-246, but I don't remember the other supplements that were governing this, but the four profiles that are prescribed for demonstrations. And part of our qualification required us to fly and demonstrate our capabilities in profiles number two and three. And, like I said, I haven't looked at it in quite a while because I haven't been doing any air shows this year, but number three was the profile that it's designed to take off from the place where the air show is happening, fly the demonstration, and land back at that place, as opposed to number two where you take off from somewhere else and go do an air show at a different field and then return to the initial base.
  - 22Q. So, the air shows that you have flown in then, which ones were they?
- 22A. They were overseas. It's actually kind of hard to remember. I did at least two in Seoul, Korea, and one in Osan. And I think MP did the other ones. We did some in -- I was aboard the aircraft, but not the pilot flying on all of our demos in the Pacific theater. He did Misawa Air Base, Bangkok, Thailand, and Kuala Lumpur, Malaysia.

Part of the reason he did the front end of those, I was out with the crew -- we were -- I say dragging. We were the support aircraft for the Thunderbirds. And so I had the entire mission. I was actually the aircraft commander for the whole six weeks. And Major -- we were not supposed to demonstrate until the last three weeks. Hickam Air Force Base had the first three weeks of demonstrations.

So, I was out on the road for the first three weeks, and the regulations require a demonstration team to do a practice flight seven days -- within seven days of the show. And so they, the demonstration crew, had come out having done that just recently, except me. And so that's why I went with them. And then on a practice, MP was aboard as the instructor, and then I got my seven-day window accomplished. So, I did the latter ones.

- 23Q. Again, just for the record, who were the crew members again? It was you and MP and then who else?
- 23A. Yes, sir. MSO and SSgt BE
- 24Q. Did you need to modify any of those profiles that you flew in the air shows?
- 24A. No. They were all number three. We had little modifications. We'd call them techniques based on what cross wind was going to be. Sometimes show center was not in the center of the airfield. Sometimes show center would be way down near the end of a runway. And so where we did our maneuvering had to be adjusted for that.

A runway is typically two miles long, let's say, and if the show center wasn't right at the end of the first mile, then -- if it was closer down at the beginning of one end of the runway or the other, we were a couple of miles off set because of that just for our maneuvering to line up for show center.

- 25Q. So, MP would fly a profile first. Did you actually see MP or MSO fly the profiles of the air shows you conducted in the Pacific?
  - 25A. I'm not sure I understand that one.
- 26Q. Well, did you happen to witness him fly a profile three? You said he flew in Bangkok and Kuala Lumpur.
  - 26A. Yes, sir.
  - 27Q. Did you see him fly those profiles?
  - 27A. Yes, sir. I was aboard.
  - 28Q. Okay. You were aboard?
  - 28A. Yes, sir. I was in the left ACM seat.
  - 29Q. And so you were aboard all of the time?
  - 29A. Yes, sir.

- 30Q. Can you tell us about those flights?
- 30A. They were all very good. They were all very -- profiles were not complicated. It was the external factors that were complicated, you know, the language barriers, the airspace constraints, things like that. The profiles were pretty much cut and dry. They are the same every time with the exception of correcting for -- like any other traffic pattern for an airplane, crosswinds, tailwinds, things like that, you have to adjust for.

Temperatures were significantly different in places, which affected the turning radius of the aircraft and the climb performance. You know, we were -- it was fall. It was early October in Japan, and last year it was very cold, so it was significantly cooler there. And it was very hot in Thailand. So there was quite a bit of spread in temperature.

But as far as differences in profile, we flew them the same. We would adjust how long we would time outbound for a couple of seconds or something like that, but that was it.

- 31Q. Previously, you mentioned a target altitude and when I say previously, in the statement -- of 1500 feet AG on the initial takeoff and climb out?
  - 31A. Yes, sir.
  - 32Q. Did you ever use less than 1500 feet?
- 32A. Sometimes we hit less. We never planned it. We always planned for 1500 feet AGL. But the profile came at you very quickly, and when -- at your steep angle, the deck angle, you don't want to go negative Gs on the aircraft to push over, so you start your pushover early, so you're not over aggressive on your pushover, because you can't start a turn at that deck angle. The airplane won't fly like that. So -- sorry. I started using my hands for this. I'll stop.

So, we need to lead our pushover a little bit. And we started, depending on how hot it was, we kind of had to make a guess. If we had the opportunity for a practice session, then we had a very good guess based on the trials. But somewhere around 800 feet or so, we would start our pushover. And it was still a fairly aggressive pushover. You know, you're climbing very, very quickly and you have about 700 feet.

So, we might level off at 1350 or 1400 feet, or something like that, we would miss it. But by the time we would correct that 100, 150 feet, we would already need to be in the next segment of the profile, which was a descending turn, so we would adjust the rate of descent so not to come down as quickly because we were maybe a 100 feet low or something like that.

- 33Q. But, when you did that initial climb out, you pushed over, and then you started the -- I believe it's an 80 degree turn off set?
  - 33A. Yes, sir.
- 34Q. If you were low then, would you -- was it common practice to come up to the altitude to be at that specific altitude either on that outbound 80 degree heading different leg, or would you just accept what you had?
  - 34A. If we could correct it, we would.

- 35Q. You mentioned previously that you always shot for a 60 degree bank angle. You said it was something you always shot for. What were your considerations and planning for 60 degrees of bank, and when would you use it?
- 35A. The initial turn wasn't 60. It was 45 is what we shot for. But all of the others we tried for. It's a low energy state at that point. So --

#### **Questions by the Pilot Member:**

- 36Q. For clarification, you said the initial turn, you mean the first turn after your initial climb out?
  - 36A. Right.
  - 37Q. That's the turn you're referring to, 45 degrees?
  - 37A. Right. Right.

So, you know, we've had a high deck angle and then we've pushed over, so the aircraft is still at max power and accelerating, and go to 45 degrees -- ours always ended up being to the left. It can be to the right, but show center always seemed to be that way in the winds. So, 45 degree turn to get our 80 degree offset, kind of an 80 degree to 60 course reversal, it's pretty common. Based on the winds, we might make it 70 degrees or 90 degrees, depending on what the winds were doing to us. More often than not it would be 70 or 60, not 90, adjustments, because of the direction we would be landing at the end of this thing.

- 38Q. And you're referring to the degrees of heading change and not the bank angle, correct?
  - 38A. Correct. Correct.

So they take off straight ahead, high nose, push it over, left 45 degree bank turn, and to about an 80 degrees off of the runway heading from initial takeoff, and then accelerating for a few seconds. And after that, 60 degree was the target bank angle for the rest of it except the final turn, because then you are in a low energy state again. Final turn was like any other assault final turn.

- 39Q. So to clarify, then, any time during that -- the Pacific tour, if I may, did you ever see 60 degrees of bank on that initial turn, that initial 80 degrees of bank?
- 39A. Sometimes we would get close to it, but we would come back, we would correct. Because the goal was 45 and maybe we would hit 35 or 40, maybe we would hit 55, and then come back off of it. Sixty -- I don't remember seeing 60.
- 40Q. During the demonstration, you stated that at times you would use -- you would have to use full rudder. What considerations regarding -- what are your considerations regarding the use of full rudder?
- 40A. Full rudder is asking the jet to fly in an uncoordinated status, and it changes the aerodynamics of it a little bit. It has some uses. I'm not sure how to answer that. We -- we did

use it. Full rudder was not usually used, because when you push full rudder, you don't really get full rudder anyway in this jet. It's a request of the flight control computers.

But -- so, in theory, the airplane will keep you flying no matter what you ask for as long as you are in the electronic flight control status. But rudder -- a lot of rudder would be used to lead a turn sometimes. It's a different technique. The manuals don't tell you how to fly the profile. It tells you target altitudes, and headings, and things like that, and so you have to throw pilotage in.

So, if there is a strong crosswind, and your plane isn't turning as tightly as you need it to, and you're going to go across show center, over the crowd or towards the crowd, that's a really good candidate for using a lot of rudder, because that will tighten the turn. The aircraft isn't coordinated anymore, but it will tighten the turn significantly. It's a safety concern of overflying the crowd, so we try to avoid that. So you can use it for that.

Other places we would use the rudder -- in tightening a turn, you would use the rudder in the direction of the turn. But other possibilities are if you have put yourself in a 60 degree bank turn and your nose is low, so now you are aiming at the ground a little bit, and we are just talking a few degrees. But you can use uphill rudder as well, rudder in the opposite direction of the turn to raise the nose of the aircraft, rather than trying to pull really hard at 60 degrees and increasing the G limits on the aircraft. That's another technique to actually take it easy on the jet.

- 41Q. When you do that, what does it do to the airspeed?
- 41A. It depends on a lot of factors; the temperature outside, how heavy you are, power setting. It can -- well, it certainly adds drag. It absolutely adds drag. But in a light aircraft, when you have a lot of excess power, it may not reduce the airspeed at all. It may slow your acceleration.
- 42Q. And then just to clarify, when you say -- you said a -- the amount of rudder, just to clarify, when you say you may have to use more rudder, what is more rudder or less rudder; what does that mean to you?
- 42A. Okay. The flight controls on the C-17 are coordinated. The theory is, if you are doing a nice -- nice gentle airline-type turn, the rudder will be moved for you as you move the stick. It's all done by the flight controls, by the flight control computers, to keep the aircraft coordinated, to keep all of the lift centered on the aircraft.

And if you use rudder more than the aircraft needs, if you are looking at the airplane from the outside, it kind of looks like the plane is skidding a little bit in a turn. And so more or less rudder is -- I don't know how else to describe it -- but it's kind of a feel. The aircraft -- our aircraft has a way to tell whether you need to tighten the turn or not on multifunction displays, which is why we put such a precise runway heading – you know, we know -- we know more than halfway through -- or less than halfway through the turn, a 180 degree turn, whether we are going to need to tighten up a turn or lessen the turn so that we are right over show center, as opposed to a 100 yards inside of show center or over the crowd.

So more or less rudder -- if you are at 60 degrees, you can't add any more bank. You would go beyond the technical order, the limitations of the aircraft. So the way to tighten up a turn, once you are at the limit of the bank is to add rudder in the same direction of the turn.

- 43Q. If I may, do we want to take just a quick break so we can get the door?
- 43A. Yes, sir.

[The interviewed recessed at 1048 hours, 15 September 2010, and reconvened at 1057 hours, same date, attended by all parties as listed above.]

LEGAL ADVISOR: And we are back on the record. All parties present before the interview are again present, to include WITNESS 3

- 44Q. We were talking a little bit about the use of the rudder.
- 44A. Yes, sir.
- 45Q. Just a follow-up question: Did any of others use full rudder? By others, I mean demonstration pilots.
- 45A. The only other two demonstration pilots that I flew with were during my training last year. And we were all pretty reluctant to go full out with the aggressive bank or anything. We were taking baby steps. Each time we flew, we got a little tighter, maybe a little more aggressive, because we got more comfortable with how fast it came at us. I don't know of any of -- myself, or hat used full rudder. I mean we --
  - 46Q. Would MP use full rudder?
- 46A. Some of the times he would. I don't know of him holding it in, foot on the floor, all of the way around the turn.
- 47Q. And you said that since you really didn't need it, do you know why he might have used it?
- 47A. If he used it, aside from one of the reasons that I already talked about, keeping it from going over the crowd, or correcting for crosswinds, or something like that, the only other reason would be to keep a turn tighter. If he didn't need it, it would still keep the turn tighter.
- 48Q. All right. And then a few minutes ago you stated that the electronic controls, if it was in electronic flight, that the airplane would basically allow you to fly without having to put much input or anything like that. Were you fighting -- when it's in electronic flight, are you fighting against controls, is the airplane fighting against you, or is it just trying to keep you safe?
- 48A. Oh, it's just trying to keep you safe. It's -- your movements with your feet and your hands are -- and the engine, the throttles for that matter, are requests to the series of computers, and they take a lot of data into an account, including the weight of the aircraft, atmospheric conditions, and so forth, your speed. And they keep you from -- they try to keep you from breaking the jet. They don't let you bank too quickly so you don't bend the aircraft. They try not to let you put the aircraft into a stall. They try not to let you come down at too fast of an angle, that type of thing.

### **Question by the Legal Advisor:**

- 49Q. But just for clarification, when it does that, when it tries not to let you, it's not actually taking control of the aircraft from the pilot; is that correct?
- 49A. Only during the ALS. It's a safety system, AOA limiting system. That does take control away from the pilot.
  - 50Q. Does it actually -- does it take the stick control out of your hands?
  - 50A. No, it ignores your inputs.

#### **Questions by the Board President:**

- 51Q. When you say it ignores your input, how does it do that?
- 51A. The -- your stick movements are simply requests to the computers. And if you are at too high of an angle of attack based on what the computers have calculated, and you are asking to either continue at a level altitude with not enough speed, or if you are trying to raise the nose without enough speed, it's all based on angle of attack.

If you are trying to exceed the angle of attack that the computers have deemed as safe, plus a little bit of a margin, then the flight controls will not allow you to raise the nose. In fact, they will actually allow the aircraft nose to lower a little bit to keep the aircraft flying rather than dropping out of the sky.

- 52Q. And what condition would that be in? Is that like in a stall?
- 52A. That could happen in pretty much any realm of flight. If you take off on initial takeoff and pull back really hard on the stick right away, your heads-up display, you can see the ALS -- the letters ALS in your screen, letting you know that the -- you have asked for more than the aircraft is willing to give you. So, you could either stall the aircraft or bend it by doing that. If it's a lower energy state, you could stall the aircraft. If it's a high energy state, you could bend it.
- 53Q. Would you say the aircraft is willing to give you in a -- it's trying to keep you in a safe parameter; is that correct?
- 53A. Yes, sir. Yes, sir, it is. It is decided that either you are too slow, or you are asking too much flight control deflection and you are about to hurt the aircraft by -- if they gave you everything that you just asked for with your stick movements.
- 54Q. You talked about the 45 degree angle when you made the initial 80 degree turn, that 45 degree bank angle, and then 60 degree bank angle as you executed the 260. Could you fly at less than 60 degrees bank?
- 54A. Yes, sir, you could. You could fly at a 30 degrees of bank, or 10 if you wanted to. It's all about how far away from the air field you get, the displacement that you need to compensate for the turning radius of the aircraft at that bank angle.

- 55Q. So, if I were on that initial 80 degree turn, and I'm outbound, and I'm timing, if I timed for a couple more seconds, would that allow me to go to a shallower bank?
- 55A. Yes, sir. In fact, two years ago the demonstration crew, I heard them talking about it. They actually spoke about how they had to time outbound for something like 20 seconds because they were flying the demonstration in India, and it was very hot and humid, and the aircraft simply wouldn't accelerate and it wouldn't turn like it might up here in Alaska where it's cooler.
  - 56Q. Can we talk through the cleanup portion of the initial takeoff during profile three? 56A. Yes, sir.
- 57Q. How do you do that? How do you deconfigure the airplane and deconfigure -- I mean -- what I mean, for the record, is to understand bringing the gear up, bringing the flaps up, bringing the slats up to a clean configuration?
- 57A. Okay. As soon as the pilot flying rotates, the gear comes up. Your standard calls that we train to for normal air land crew or air drop crew are not used because of the demonstration speed at which it comes. There is still the challenge and response.
  - 58Q. Now, when you say the gear comes up --
  - 58A. The landing gear handle.
- 59Q. Yes, you mean the pilot monitoring of the pilot -- or the copilot puts the gear up? It doesn't come up automatically?
- 59A. Yes, sir. Correct, yes, sir. The copilot raises the gear immediately after takeoff, and your configuration stays the same at that point. So, your flaps half, slats extended, and your gear is coming up, and then it is up during your high angle takeoff.

And then during the pushover, there are flap and slat retract speeds on your heads-up display to tell you when it's safe to retract those. And the copilot brings those up on speed, essentially. So, as the pilot flying makes the left 45 degree bank, 80 degree turn, or right-hand turn, he still has the power at max -- maximum, and the copilot cleans the aircraft up on speed. The flaps will come up first, once we pass that speed that's required for it, as indicated by the heads-up display, and then the slats will be retracted as such. Happens pretty quickly, actually, because it is such a light aircraft.

- 60Q. What would happen if you retracted below those speeds? Draw up those -- say, the flaps up below that speed that you talked about, the flap retraction speed, the minimum -- or you brought the flaps up -- or, excuse me -- the slats up prior to that minimum slat retraction speed. What would happen?
- 60A. The aircraft would be placed into a position where if you are low speed, it could be in position of where you are stalling the aircraft. And the jet would talk to you right away, and all of the -- all of the responses that you would expect from it, you know, stick shaker, the AOA limiting system, and so forth should be kicking as well.

- 61Q. Do you recall if the aircraft was usually cleaned prior to starting the 260 degree turn, or were you still cleaning it up during that turn?
- 61A. I can't think of any time that I flew it that it wasn't cleaned before we started the 260. It happens very, very quickly. Most of the time, our -- by the time we've timed out for the four seconds, or whatever it is, the slats are already up, because we are going around that turn usually 270, 280 knots, and accelerating. And those are the maximum speeds at which you want to retract the slats already. So, we are generally clean a significant amount of time before we start the 260.
- 62Q. Would you ever delay the turn to make sure the airplane was cleaned prior to starting a turn or it was just --
  - 62A. I would. But I never got to it, never while I was flying.

### **Questions by the Medical Member:**

- 63Q. If I may, sir, did the copilot just automatically put the flaps -- put the flaps up and retract the slats?
  - 63A. Yes.
- 64Q. So, how much awareness would you have as a pilot flying as to what the copilot was doing with the flaps and slats?
- 64A. You can see everything that happens on your heads-up display as you're flying. You don't have to take your eyes off of that.
- 65Q. Okay. Would the copilot verbalize that, or was that just something that you briefed on your --
- 65A. No. That's a -- it's something you brief prior. When you train as a hard crew, you do things the same way every time. And so once the techniques are blended from the different crew members, and everybody gets comfortable with each other, then you just brief it beforehand and then everything works.

Really, the only speaking that happens during the whole profile are the challenge and response between the safety and the copilot, because they are running similarly required checklists, the approach checklist and the before landing checklist, and so forth. The only time the pilot flying really speaks to is if he has to call, what I call an audible, hey, we're going to change something a little bit, or the final call for the flaps, based on, you know, the slow speed pass, or the final configuration for landing.

- 66Q. So, in your mind when you were in the demo pilot position and flying a profile, did you expect the flaps and slats of the aircraft to already be cleaned? Was it something that you would check prior to making that right turn?
  - 66A. Yes. You bet.

- 67Q. In your previous statement you mentioned flying at V Momma minus ten knots?
- 67A. Yes, sir.
- 68Q. Can you explain what that was intended to accomplish?
- 68A. During the slow speed pass, the intent of the maneuver is the go slowly in a configuration where everything -- they call it hanging out -- your gear is down, your flaps are full, and you are going slow so the crowd can see it.

V Momma is a -- we call it V Momma – it's a minimum speed for full abrupt maneuvering capability. So, straight and level, you're not asking the aircraft to do anything anywhere near that. And that's a technique that was adopted, I guess, for the air show demo that slows us down about ten more knots, and we don't make any turns like that. We always add max power and wait until we get above V Momma before we make our turnout for the next maneuver. But you are no where near stall speed during that one.

- 69Q. And who taught you that technique?
- 69A. MP did. I've seen it around here, too. Saw it a McChord.
- 70Q. Overall, regarding AFI 11-246 C-17 profile, do you regard them as guidelines or procedures.
  - 70A. They are procedures.
- 71Q. I'd like to talk to you a little bit about checklists. During the profile, which demo crew member would initiate a call for the checklist?
- 71A. That depended on what the crew decided, really. For mine, the checklist was initiated by the copilot. For instance, during our three -- coming around for the 360 degree turn at show center, my copilot would initiate the approach checklist so that it was done prior to our hitting show center, so nothing else was going on except good backups, and then the next checklist was ready to go. We weren't rushed into the before landing checklist.
- So, I really don't know how the guys training this year were doing it. It's -- that's a technique. The fact that it has to get done before you land is procedure. When it happens is technique.
- 72Q. And then we talked about the gear, the flaps, and slats. Were any other portions of those checklists challenge and response?
- 72A. Everything was challenge and response. For instance, your standard before landing checklist is a challenge and response. For the purposes of the demonstration, it was modified so that the pilot flying and the pilot monitoring were not the challenge and response. It was the copilot and the safety. But they were still challenge and response. And that's something the pilot was listening for. I was always, okay, the flaps are half, okay, I heard the gear down call, the gear is down; pilot -- sorry -- copilot, safety, that's the stuff you're listening as the pilot flying.

# **Question by the Pilot Member:**

- 73Q. What about the challenge and response on the clean-up portion where the flaps are being retracted, and the flaps are moving up and the side screen----
- 73A. For my crew, that was a standard pre-brief. As soon as we break ground and we have positive upward vector, you can raise the gear handle. As soon as we hit the speed, and once we've made our initial turn to offset 80 degrees, you are cleared to clean up on speed. And it has to be done very, very quickly, because the concern -- when I was flying it, the concern wasn't are we too slow for it; the concern is we are going to overspeed our flaps and our slats, because it accelerates so quickly.
- 74Q. And then regarding checklists, do you recall something called the aerial demonstration checklist?
  - 74A. Yes, sir.
  - 75Q. What was that?
- 75A. That was a checklist that was -- and I don't remember the exact verbiage, but the reg said it can be modified to account or accommodate for various situations. But it had some -- it was essentially our before landing checklist and our approach checklist, but it had a few other things that the copilot and the safety had to accomplish. And based on the techniques that were being used on the crew, a line might be added or moved, depending on how it was working. But it's a checklist.
  - 76Q. Is it an official checklist?
  - 76A. It is.
  - 77Q. Then it's approved by the 3rd Wing?
  - 77A. No. That one, I don't know. I don't know the answer to the final one on that one.

#### **Questions by the Board President:**

- 78Q. What would make you -- what would lead you to the conclusion that it's an approved checklist?
- 78A. The verbiage in the -- I wish I had the reg with me. But the 11-246 -- one of the regulations we actually looked at it during ground training, it said it could be modified to --

LEGAL ADVISOR: Just for the record, General Everhart has passed 11-246, Vol 6, Chapter 3. WITNESS 3 is reviewing it. And, WITNESS 3 when you're done reviewing it, just look up and let us know you're done, and we will continue then.

WITNESS: Okay. Sure. Yeah, this might take a couple of minutes.

LEGAL ADVISOR: Sir, maybe at this time we should take a break and have review the document you just handed him.

PRESIDENT: Yeah. We'll take a break at this time and allow you to review.

WITNESS: Okay, sir.

PRESIDENT: And then when you are ready, just let us know.

WITNESS: Okay. Do you have the other reg too?

[The board recessed at 1115 hours, 15 September 2010.]

[The board reconvened at 1125 hours, 15 September 2010, attended by all persons who were present before the recess, to include WITNESS 3

LEGAL ADVISOR: All persons who were present before the break, are again present, to include WITNESS 3

Prior to the break, General Everhart had provided a copy of the C-17 standard profiles, 1 through 4, AFI 11-246, Vol 6, Chapter 3. It is a 14-page document.

WITNESS 3 did you have a chance to look at this document?

WITNESS: Yeah, I thumbed through the first two or three pages of it.

LEGAL ADVISOR:Okay. And then also during the break, we handed a one-page document -- it's entitled 3WG Aerial Demonstration Checklist -- and asked him to review that.

WITNESS 3 have you had a chance to review this document?

WITNESS: Yes, I have.

LEGAL ADVISOR: And does it contain the information that you were looking for prior to the break?

WITNESS: It does. There's a note there at the top that talks about – well, I can read if you would prefer.

LEGAL ADVISOR: No, it's okay. Just that that's the note you were looking for prior to the break?

WITNESS: Yes, that gives the crew the ability to alter the checklist if required.

LEGAL ADVISOR: All right, sir. Thank you. Go ahead, General Everhart.

79Q.Continuing to question, we were talking about the demonstration checklist. When were you taught to use this document?

79A. Every time we did an aerial demonstration.

80Q.Okay. So were you taught in your initial upgrade training demonstration? 80A.Yes, sir.

81Q. And do you know where this came from? This, I mean the checklist -- the aerial demonstration checklist.

81A.No, sir, I don't.

82Q. Who approved it?

82A.I really don't know. I have no idea. There's no signature on it. It just says 3rd Wing. I really don't know.

83Q. And then, we initially talked about how it was utilized. Is there anything else you want to add, now that you have seen the documentation; is there anything else you want to add to that about how it is utilized?

83A:Not really, except -- I suppose so. The reason we have this versus our normal checklist is because we are not doing a normal air land, you know, direct delivery sortie where we are going to take off and take people in trucks somewhere and drop them off. We're not going to be at cruise for multiple hours. This is kind of a high-speed, very quick checklist, and different things need to happen; such as backing at a high-speed down the middle of a runway, and things like that. You don't do that during a normal sortie. And so this checklist keeps us from hurting ourselves or breaking the airplane while we are doing these unusual maneuvers.

84Q.All right. You stated before that during the demo profiles, you received stall warnings from the aircraft?

84A. Yes, sir.

85Q.I would like to discuss a few of those details regarding those. Which profiles did you receive stall warnings?

85A. Number three. Actually, I might have had one on profile number two, also. I flew it so seldom, I don't really recall.

### **Questions by the Pilot Member:**

86Q. You mean profile two you flew seldomly?

86A. Yes. I mean, we really only did that to qualify and then I practiced it once more before I went on the road, three weeks before the rest of the demo team joined me, just to have done it. Because we didn't really know what profiles we would be asked to perform at these other bases. It turns out it was profile number three every time.

87Q. And where in the profile would you get these warnings?

87A.Most of the time, I would get it right at the beginning after I had made the 80 degree turn and had accelerated, and the flaps and slats were up and retracted, and I would establish the sixty degree bank turn. Sometimes, I just missed 60 degrees. Sometimes, I would hit 63 or 65, and the computers would bark at me and say "stall, stall," and, of course, it would immediately correct. So, other times, every now and then, I might get that in the 360 degree turn at show center. Those are really the only two times I can recall getting that. Never during any of the slow speed maneuvering.

### **Questions by the Board President:**

88Q. You mentioned a few iterations of the stall stall. Can you estimate how long they occurred?

89A. Just a couple of seconds. It's an algorithm, and even when you test it for 800 milliseconds, it still gives you the word, "stall stall," and it kind of lasts, I don't know, maybe two seconds. So, it just runs through the algorithm whether you were coming up on a stall for a portion of a second or for a full two or three seconds, you're going to get the same amount of caution verbally from the computers.

89Q:And you get the stick shaker also?

89A:Yes. Yes, you do. That stops early though. The stick shaker, if you correct it, stops immediately. But the CAWS, the caution and warning system, the audible portion, continues. It's just an audible algorithm.

90Q. And then you also mentioned in your previous statement, you said some of these warnings were transitory, pending, and accelerated. Can you explain what you meant by these descriptions?

90A.Okay. I'm no aerodynamics expert, but when you stall an airplane, you are asking the wings -- in general, you are asking the wings to create more lift than they can in that configuration; whether it's that speed, that weight, that environment. So, most people equate a stall to something that happens at slow speed. An accelerated stall means you're going at a higher speed, normally where the aircraft would -- or the wing -- would continue flying just fine, and you've asked it to turn too sharply. You've asked it to create too much lift in an instant; not over time, but in an instant, which can happen by pulling back on the stick too fast, essentially, in layman's terms. If you put it into a turn -- and you can do it on autopilot -- and have it in a certain banked turn and punch off the autopilot and not move any of the flight controls, and then suddenly pull back on the stick and throw it into an accelerated stall. I don't know how else to describe that.

91Q.I think that's good. When you heard the stall warnings during your demonstration profile, what was the crew's response?

91A.Nothing. By the time I got the stick shaker, or, you know, the audible, I was already correcting it.

92Q.So, it's a natural pilot thing -- it's natural for the pilot to automatically correct for it? I mean, is that fair?

92A.It's a fair assessment, I think, that if the jet is telling you that -- if it's giving you a warning, you need to correct that situation. So, if it's telling you you're stalling, you need to change something. Whatever you just put in, you need to un-put.

### **Questions by the Legal Advisor:**

93Q. If I may, sir, just to clarify, your typical response to a stall enunciation during a demo profile was to what?

93A. It depends on what I had done to cause it. For instance, if I had gone into the bank and put too much bank in, the computer will yell, "stall, stall" at me right away even though I'm not pulling back on the stick too much; I just over banked it in accordance to what the computers know are the limits. So, there's one way that I could do it. And, of course, the appropriate response would be to bring it back into the standard parameters, which is 60 degrees or less.

Another opportunity for that to happen would be is if I was established comfortably in a 60 degree bank turn and accelerating around the turn, and myself or the safety or somebody on the crew might say, "Okay, we are going to need -- the turn radius that we have is not tight enough to make sure it's centered." The call might be something like, "You need to tighten it up." Seconds count, so you don't want to have a long conversation. So "tighten it up" would indicate that I either need to -- I can't add any more bank, so I could use inside rudder -- that would be, if it's a right turn, right rudder to tighten the turn up, or I need to slow my airspeed down a little bit so that I'm not continuing to have a large radius of turn.

So, if I added rudder and got the stall warning, my response to that would be to let the rudder back out. If I was in complete coordinated flight and I got stall, I would add power -- max power. If I was at max power in coordinated flight and I got stalled, well then I have to do something like put less bank in the aircraft to allow the wings to create more lift.

94Q. Thank you. And so overall, you would do something to correct the stall -- that's you----

94A.Immediate and positive response is what I would do.

### **Questions by the Board President:**

95Q. You described previously that there was a huge spectrum regarding how demonstration profiles are flown. You mentioned that some look like radar patterns and others are really nice and tight. Can you explain what you meant by that comparison?

95A. Yes, sir. Some of the turns were -- the way -- the speed at which a crew would roll into a turn can have a great effect on how crisp the demonstration looks.

For instance, if you are very gentle, as though you were flying passengers, with the stick, your initial turn to -- your initial 45 degree bank turn to 80 degrees might take a whole lot of time. It might take -- I don't know -- 30 seconds or something like that. Whereas, if the pilot flying immediately put the stick over to the stop and then once 45 degrees were hit, come back to center on the stick, the roll rate would be significantly higher than the first crew. So the aircraft

would start its turn, and, therefore, be able to finish its turn faster. And so the amount of ground that it covered would be significantly less.

Same with all the other turns. The same with the pull up -- you know, take off -- if it's a nice, easy, gradual pull, the distance traveled away from the center, show center, would be greater than if it were a rapid pullback and a steeper climb out. That kind of thing will -- it can add up to quite a bit of difference, you know; a mile or more of distance from the show center.

Other items I've seen, other crews just not use 60 degrees in a lot of their stuff. I've seen some use what looked like 30 degrees. Sometimes visibility is hazy. You know, they are calling -- prevailing visibility is acceptable, but it's hazy. Gosh, I don't know, you could go on for hours on different factors that would play into why a crew would fly it differently.

96Q. You also mentioned that you felt a buffet during the demo profiles. First, what is a buffet?

96A.A buffet is -- well, it can be caused by several different things, but it is, in technical terms, you're feeling the boundary layer separation from the air foil. What does that mean? I have no idea. It means the aircraft -- you're trying to get it to -- the wings to create more lift than they can, and you are starting to stall the air foil.

I've never felt that on this jet before. I've felt it on other aircraft. On smaller airplanes, you feel it all the time because there's no automatic systems to tell you when you're about to stall. I didn't think it was possible to feel it on this aircraft, and I don't know what caused it.

We only had it one time. And I did, essentially, all of the same reactions that I just talked about for a stick shaker or a stall warning. I did all of those very same things. And it stopped almost immediately when I made the corrections, and so we reengaged in the demo, and we got it immediately again. And so I repeated the recovery that I had initially done, and it worked again. And at that point, I was not going to reengage a third time, so I decided to -- and I made an audible -- I said, "Crew, we are going to go over show center line. I'm not going to keep trying to turn." We weren't very fast; about 250 knots, so we didn't have a huge turning radius or anything.

But I don't know what caused it, whether it was atmospheric or -- we weren't any heavier that day or anything like that. It was just -- and we couldn't figure it out. The bottom line was the aircraft wasn't performing the way we expected it to, and we accepted to go over show center versus trying to match perform it and continue in the stall regime.

97Q.So, was this during an actual air show?

97A. Yes, sir, it was; the last one of the season in Seoul, Korea.

98Q.So, if you saw anything unsafe, or felt anything unsafe during an air show, you had no problems adjusting to that to alleviate the problem?

98A.No, sir.

990.Does that make sense?

99A.Sure. It does. I think it does. We didn't practice engine-out scenarios in the aerial demo or anything like that, but when we saw something that wasn't working, we just called an audible, you know, "Okay, knock it off." If somebody felt safe (sic), "Knock it off." That's

always a "timeout" or "knock it off." Both of them work. If somebody says, "You need to tighten it up or you are going to go over show center," then we try to do that -- at least on my crew. I just happen to be the one that recognized what was happening before anybody else, so I recovered.

And we sat down afterwards -- you know, the rest of the profile went fine. Everything worked exactly as advertised; the timing was identical as the day prior, but we don't know what happened. So, we landed and we talked about it, and we still don't know what happened. We never flew another demo because that was the end of the season. I haven't flown one since just because I wasn't on the docket this year for that.

100Q. Who was with you?

100A. MSO was in -- it was my hard crew; MSO in the right seat, witness as the safety, and MP behind me in the left ACM seat, and SSgt BE as the loadmaster.

101Q.And where in the profile -- you said -- was it in that 260 -- the return?

101A.Yes, sir. The accelerating descending turn to effect down to a thousand feet AGL to show center.

And just so you understand, we did get -- I mean, the stall and the stick shaker happened with the buffet. They all happened at the same time, so the normal warning systems on the jet were working okay. It's just somehow we went right through it. I don't know what it was, you know. I don't know if it was a crosswind that was causing our vortices to hit a tail piece or something. We really don't know.

102Q.Did you happen to get ALS?

102A.No. And the jet flew fine. It responded perfectly to every input I made. We just had buffet, which is a very uncomfortable place to be.

103Q.And, then, did MP ever get a buffet like that?

103A.No. No, sir, not while I was flying with him.

104Q.And then how about the stall warning?

104A. We had those; same type of thing.

105Q.And did he try to remedy the situation by either, like you said, put max power in, or reduce the bank, or --

105A.He did. What I saw was -- he had been doing these longer -- so what I would see is he would correct it and then reattempt, and sometimes he would get it again right away. Sometimes it sounded like it was constant, but it was -- when you're listening to it, you hear "stall, stall, stall, stall, stall, stall, stall, "but when you see it, you hear, "stall, stall." And if you are looking at the flight controls, you will see the rudder comes out or bank angle lessons, and then he puts it back in again to initiate another sequence of the stall warning before the first one finished. I don't know how else to describe that without using my hands.

106Q. What would he verbalize during that, if anything?

106A.None of us ever verbalized anything. Except for the one time where I had the buffet, none of us ever verbalized. There's a lot going on and your actions are immediate, you know, you come out of bank, or less rudder, or something like that.

107Q. We would like to go back to July 27th and talk a bit about the cruise mission planning. You were the ADO on the 27th?

107A.Yes, sir.

108Q.All right. Do you know what time the crew mission planned?

108A. They -- to my knowledge, they mission planned the day before. That's how we generally do things in our squadron. It was a 249th owned sortie, so they don't always plan the day prior when it's those guys, because some of them are traditionalist. But these were all full timers, and they generally try to do procedures like the active-duty squadron does when we fly with them.

So, I really don't know, but I would have expected them to have planned the day prior and talk about it a lot, and then show up normal show time to do the normal sequence of the last minute check the weather, flight plan, how is everybody feeling, run the ORM checklist, that kind of thing.

109Q.And were all the crew members present?

109A. They were. To my knowledge, they were. I don't have the oversight of the 249th sorties. I was the top three, and I made the tail change, because the pro super came to me because we own the other tail. But I do know that MCP excused himself from a meeting we were in to go do this demo. He said, "Okay, I've got to leave now. I've got to go do the demonstration planning and meet with the rest of the crew." But I don't know all that they talked about or what planning they did aside from the paperwork.

110Q.So, you didn't actually witness the mission planning the day before. Is that correct? 110A.No. No, I did not.

111Q.But you did the day of the mishap? Was that what you were referring to when --

111A.I was not in on their mission planning the day of either. I just know that they did get together and they did the required paperwork that they have, because I'm the one that got the paperwork and cordoned it off.

112Q.All right. Top three; what is that?

112A.To my knowledge, it's a fighter term. The only reason I say that is because I've never heard of it before coming here. It implies the squadron commander, the DO, the operations officer, or the assistant operations officer. And as me being the bottom person on the three-rung ladder, it usually falls to me, unless I'm unavailable for whatever reason. So, I carry a phone, I make a lot of decisions on behalf of the operations side of the house. I don't make -- I don't have G-series orders or anything like that. I don't have the ability to command anybody or punitive authority over anybody.

113Q.And that's what G-series orders means?

113A.Yes, sir. I have operational control of the day-to-day goings on in the squadron; I guess would be the right term. I'm also the guy that is on call for any kind of emergency if our crews need to call via the airborne phone, or we call it air live. But if anybody needs anything from the squadron and they can't find it, they're supposed to call the top three phone. It's the belly button, if you will, of the squadron; 24 hours a day, seven days a week.

114Q.And then you mentioned also they came to you for a tail swap, I believe were your words?

114A.Yes, sir.

115Q.Why was the tail -- why was the aircraft changed?

115A.Their -- God, I wish I could remember the cause. I think it was an obiggs which is a -- really, not a very important system for a local flight. It's a gas generating system for protecting the wing fuel tanks from exploding from too many harmful vapors, to be short about it.

I think there's a manifold that had failed on the jet that the demonstration crew was going to fly, and they had to get that fixed. And so the pro super -- the production supervisor for maintenance came to talk to me and said -- don't quote me on -- well, you are quoting me on this -- but I really don't remember exactly what he said, but he indicated that there was problem with the aircraft that the demonstration team was lined up against, and that if I wanted to change the tail, that I could do that, because there was another tail that was flying local sorties that day that was supposed to do an engine running crew change.

So the idea of that is one crew flies it, and instead of landing and shutting down and giving it back to maintenance, and then another crew takes the jet and pre-flies it and takes off, we simply keep the engines running, the new crew comes on board and assumes responsibility and ownership of the aircraft from the old crew, and maintenance doesn't get involved. So that was the plan for the other aircraft that was operating just fine.

And -- who was it -- MAJ N was going -- he was the -- we'll call it the front end of the engine running crew change, the ERCC. So we called him and he had not yet taken off, and we told him, "Hey, when you go fly today, try to burn down a little more gas," because the characteristics of the planes change quite a bit based on how heavy the jet is. So, we wanted him to have the amount of fuel onboard about where the demonstration team had requested the now broken aircraft to be.

So, we -- MAJ N said, "No problem," and he went out and did his local sortie and came back and landed with almost exactly what the demonstration crew had wanted. And so that good flying aircraft was then handed over to the demonstration team, and the aircraft that was lined up against the team initially, they had maintenance performed on it, and the crew that was supposed to initially be on the backside of the engine running crew change had to wait with the broken jet to see if they could get it fixed in time for their training. I hope that wasn't too long.

116Q. Was there an inbound call called from Major -- 116A. Yes, sir.

117Q.Did he report the status of the aircraft on that inbound call?

117A.He didn't make it to me. Inbound calls are made to Command Post. Generally, if there's a problem with the aircraft that doesn't actually take it out of service, the pilot will just tell the other pilot what's happening; you know, "Hey, this radio is not working quite right," or something like that; all minor stuff.

118Q.So if it was minor stuff that could still fly, they would fly it, but if it was major repair stuff, what would happen then?

118A.If it was significant, then they should have called in and said, "Hey, we're" -- to Command Post they should have said, "Hey, we're alpha three, or code three," which indicates that the aircraft is no longer mission capable for its intended purpose, in which case they would have taxied to parking and shut down and gone from there.

119Q.Okay. Back to the pre-briefing, or the mission briefing: Do you know if any leadership sat in that brief at all? I know you said you were in a meeting when they went to do their briefing. Do you --

119A.No, sir, I don't. That was in the evening they were supposed to take off, so I don't even know if any of them were around. I don't recall.

PRESIDENT: Okay. And then lastly, I understand that you have a demonstration that was -- a demonstration video that was taken inside the cockpit during your previous demonstration flight. I would like for you to provide a copy of that to me if you could.

And then with that, I would like to take a break now, and then we'll let you go to the break room and then we will call you back in. We're just going to collect our thoughts here and then we will close it up with a readout and then ask you a couple more questions if we have any clarifications. Okay?

WITNESS: Okay, sir.

PRESIDENT: Great. Thank you.

[The investigation recessed at 1231 hours, 15 September 2010.]

[The board reconvened at 1231 hours, 15 September 2010, with all parties present who were present before the recess.]

LEGAL ADVISOR: All parties and members who were were present in the interview are again present, to include WITNESS 3 Go ahead, sir.

120Q. WITNESS 3 just to follow up on a few more questions that I have. We talked a lot about stalls. When you flew the profiles, they were not -- the profiles are not designed to intentionally put the aircraft in a stall. Is that correct?

120A.No, sir, they are not.

121Q.All right. And then when the stall warning comes on, what is that warning doing? 121A.It's telling the crew that you're getting near the stall regime. You're not actually in it yet. If there is a buffer -- and I don't know what that buffer is, you would have to ask Boeing that question. I'm sure it's an algorithm, and I'm sure it varies based on what realm of flight you're in, but it's a warning that you are getting close to where the wings are going to quit flying.

122Q.Okay. In general, what's the aerial demonstration demos designed to do?
122A.It's kind of two parts; one is to demonstrate the capabilities of the aircraft, what the taxpayers have bought, you know, the combat capabilities. There's a lot of -- while the demonstration is being flown, the narrator speaks a lot to those features -- capabilities -- of the aircraft, and we demonstrate some of them; the short field takeoff, the steep angle of departure, the tight turns it can do, the extreme slow flight capability, the short field landings, the ability to back. All those things are unique features to this airplane in a lot of respects. And the second part is it's a recruiting tool, for lack of a better term.

123Q.And then is that max performing the airplane? Not the recruiting tool piece, but what you just previously described.

123A.No. Parts of it are getting close to max performing it, but in all my demos, we've always had a buffer, a -- some slop between where we are and where we think that the airplane is going to start being in a realm of danger.

124Q.How about during MP demos? 124A.The same.

125Q.Okay. We referred to the aerial demonstration checklist fan fold piece of paper, and this checklist was modified from the normal check list. Why was it modified, and then who modified it?

125A. The standard aircrew checklist that we all use is intended for basic peace time or combat operations, and it's not designed for an aerial demo. So a lot of that checklist doesn't apply in that we haven't been doing three hours of practice approaches where the IRUs may have gotten out of alignment. So we really don't need to check the realignment, or we just took off at an airfield six minutes ago, so we really don't need to worry that the altimeter setting has changed in the last six minutes since we're coming back to the same place: things like that.

126Q.IRU stands for? 126A.Inertial reference unit. Sorry about that. So, a lot of what we would do on a checklist for takeoff from here and fly across an ocean and drop air jumpers or land somewhere don't really have application for when you are taking off and flying within the aerodrome for 10 minutes or something like that. They just don't apply; a lot of them. Everything that has to do with safety, like making sure your gear is down and so forth, those all are left in there.

As far as who changed it, I don't know. MP and I talked about changing a couple of them last year. I don't recall which they were. We use the standard checklist as a basis, and then it's really worrying about things like what the radar is set to, checking systems that after having not been looked at for several hours, you might want to do that on an approach checklist, but since we just took off a few minutes ago, they don't really apply, that kind of thing. I don't know. I don't even know if the one we are using this year is the one we used last year. I have no idea.

PRESIDENT: Okay. All right.

# **Questions by the Pilot Member:**

127Q.If you could, can you talk us through some of the technique -- your technique, perhaps, on how you set the altimeter setting and what altitude is displayed in each pilot's respective heads-up display?

127A.Okay. One technique, which is the standard for normal air land, or air drop, is you just set the altimeter to the airfield altimeter setting, and you take off and you fly around. The tricky part is you have to do the math in your head of how high you are AGL, above ground level. If an airfield is, let's say, 347 feet above sea level and you --and that's what it reads on the runway and you take off, if you're looking for 1500 feet AGL, you now have to do the math of adding 347 feet to all your target altitudes to make sure that you are AGL. And that's a little bit too much math for an aerial demo. It's not that complicated, but as quickly as other things come. And you do it at different fields. You know, a demo team might do a demonstration at a place that's 1241 feet one day, and four days later, it might be right at sea level; 38 feet above sea level. So it can really throw you off your game.

Another technique is to use a switch that we call the "RABA Baba". It's a radar altitude, barometric altitude switch over where the radar altimeter shows the exact vertical distance above the ground. And that's a really confusing technique because the terrain is not flat and it's a very sensitive system. So, as you fly up away from the runway, a house, building, a rolling hill, a ditch, any of those things will set it off and your altitude will be bouncing all over the place. So, it's really impossible to maintain 1500 feet AGL or 1000 feet AGL. So the technique that we have adopted is setting our --

128Q. And when you say "we," you mean the demonstration program here at the 3rd Wing?

128A:Correct. Correct.

129Q.Okay.

129A.-- is a technique that was shown to me and it seemed to work out quite well, is to check the altimeter system settings, the normal method, and then before takeoff, is set them to read zero, so that you are sitting on the ground and they read zero and then you take off, and so when you see on your heads-up display -- or the standby instruments -- you see 1500 feet, well, that is 1500 feet above the aerodrome altitude. And it doesn't jump up and down like it would for the radar version, and you don't have to do the math like you would for the current airfield altitude typesetting. And so it's a very good way to -- unless you are in an extremely mountainous area, it's a really good way to ascertain whether you are on the altitude -- your target altitude -- or not.

130Q.And you mentioned that that was a technique you used here. And who taught that technique?

130A. MP sir.

131Q:And did he employ that technique also, to your knowledge, when he flew? 131A:Yes. Yes, he did.

PRESIDENT: Well, we thank you for your time. One last question.

132Q. Are there any other matters that we haven't covered that you believe will be important to our investigation?

132A. None that I can think of, sir.

PRESIDENT: Okay. I'm going to do a readout.

You're reminded of the official nature of this interview. You may not discuss your testimony with anyone without my permission at any time before the report of the investigation is officially released to the public.

This concludes the interview. The time now is 1240, local Alaska time.

(END OF PAGE)

#### V4. AIB INTERVIEW WITH

# WITNESS 4

#### VERBATIM TESTIMONY OF

# WITNESS 4

PRESIDENT: My name is Brigadier General Carlton D. Everhart II. We are investigating the C-17 accident that occurred on 28 July 2010 at Joint Base Elmendorf-Richardson, Alaska. This investigation, conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 91-204. The purpose of this investigation is to produce a publicly releasable report on the facts and circumstances surrounding this accident and to gather and preserve evidence for use in claims, litigation, disciplinary actions, and adverse administrative proceedings, and for all other purposes. A safety investigation was previously conducted on the accident. Any testimony you gave before the safety investigation board will be kept confidential, if you were so advised, and can be used only for accident prevention purposes. This board does not have access to any confidential testimony you gave before the safety investigation board. Your sworn testimony to us may be used for any proper purpose. Additionally, your testimony can be released to the public. Do you understand the difference between your testimony before the safety board and this accident board?

WITNESS: Yes.

PRESIDENT: Your testimony in this investigation will be under oath. At this time, I will administer the oath. Please raise your right hand.

[The witness did as directed.]

PRESIDENT: Do you solemnly swear that the testimony you are about to give in the matter now under investigation shall be the truth, the whole truth, and nothing but the truth, so help you God?

WITNESS: I do.

PRESIDENT: Today is the 10 September 2010. This time is now 10537 local, Alaska time. This interview is being conducted in building 7309, room 105, Joint Base Elmendorf-Richardson, Alaska. The persons present are:

The witness,

WITNESS 4

Pilot Member;
Legal Advisor;
Medical Advisor;
Court Reporter; and,
Everbart H. Board Presider

me, [Brigadier General Carlton D. Everhart, II, Board President]

PRESIDENT: The witness has been sworn.

- 1Q. Please state your full name.
- 1A. WITNESS 4
- 2Q. How long did you serve in the Air Force, and then how long have you been with Boeing?
  - 2A. 25 years in the Air Force, 4 years with Boeing.
  - 3Q. A little bit about your background in the Air Force?
- 3A. I spent most of my career flying the C-130 in theater and operational positions or in staff positions. Two years of that, I spent flying the HC-130 search and rescue. The last 10 years of my career was up here in Alaska.
  - 4Q. How much flying time do you have?
  - 4A. About 5000 hours.
  - 5Q. How long have you been with Boeing?
  - 5A. Four years.
  - 60. In your current job right now with Boeing?
  - 6A. C-17 Aircrew Training System Instructor Pilot.
  - 7Q. And your job title?
  - 7A. Instructor pilot.
- 8Q. Can you please describe your duties and responsibilities of what you did prior to leading up to the events that happened to and 28 July 2010 and during that day also?
- 8A. We provide training in whatever media is needed, assistance and computer-based training, classroom instruction when required and then primarily in the aviation system weapons system trainer. The simulators is how we refer to that. That day in particular, it was one of those training sessions. We have scripted training scenarios that we provide specific instruction for. We observed the students, give them feedback, provide appropriate instruction, and we also are available to run training devices for times when our primary customer, the Air Force, chooses to use it for other reasons which will be known as Air Force time. That's what this was in particular, this having been an air show demonstration, its Air Force time. We are not allowed to providing instruction, but we are there to make sure the device is used properly and meets their purposes.

# **Questions by the Pilot Member:**

- 9Q. You have already spoke a little bit to your background, but can you tell us how many years you have been operating the simulator?
  - 9A. Four years.
- 10Q. Can you give an overview of your past experience with the situation that you mention such as those which would be Air Force time on July 28, 2010 and with an air crew during an aerial demonstration type of simulator event?
- 10A. First of all, ahead of time they make contact with our scheduler and tell them it is a tour for example, or they are coming over to do a specific event. In this case, we knew it was entered as an air show demonstration and had an idea of what to expect. When they arrived,
- MP had previously been-- MP working with us he is a contractor, so he stopped in the office and said I will take the remainder of the crew down to the break room. I will pre-brief them on what to expect. We will come and get you when we are ready. He did that. He gave me, I believe, a Xerox copy of his handwritten profile. He said these are the parameters I want. That's our primary interaction for that day, setting the initial settings and then resetting it after the sortie. In this particular case, he told us what he wanted, and if he want any cargo. The weight would be driven by cargo and fuel. Very light, I believe it was 20 to 25,000 pounds of fuel he wanted me to set. I asked him about winds, knowing what air show demonstration would entail. I said would you like light, over shooting ones typically from the north. I think that is always at, say approximately 02, 05.
  - 11Q. An over shooting wind would be?
- 11A. A wind which would push the airplane towards the runway. So, his goal certainly was to first of all demonstrate to the a pilot's with him and then later on observe as they were practicing their show profile. What he asked me to do was to stay out of the way and be transparent. Whenever one pilot practiced the procedure, to reset them to the same place and the place in this particular case, instead of the departure end of the runway or the approach end of the runway, we would move down to where they were going to start the demonstration from. It was approximately abeam taxiway bravo.
- 12Q. So, you provided the overall background and how they wanted the simulator set up----
  - 12A. The configuration.
- 13Q. The configuration of the simulator, and you mentioned that they were going to be flying practice profiles?
  - 13A. Yes.
  - 14Q. What is your understanding of a profile? Can you define that for us?
- 14A. Well, we understand that we are using an air show to demonstrate to the public our capability. We want to do that in a manner which showcases the ability of the airframe but

also takes into consideration the safety of the personnel demonstrating it and the safety of those attending the air show.

### **Questions by the Board President:**

- 15Q. Do you recall, if I may, the timeframe that this particular practice session was?
- 15A. Yes. I believe it was the first of July, about four weeks before the air show.

### **Questions by the Public Member:**

- 16Q. And if you could, during this process you would not be privy to the crew briefing. Is that correct?
- 16A. Unless they ask me to. Very similar to a check ride when they are pre-briefing a check ride, they will run it by us as instructors that they want us present or not.
- 17Q. As you previously mentioned then, the aircrew, MP in this case came to you and said they were ready and then he proceeded into the weapon system trainer, or simulator?
- 17A. Yes. In order to do that they need me present because it is behind a vault in a secure facility. I have to open the door and take them in there, yes.
  - 18Q. Can you describe the setting of the simulator?
- 18A. The simulator replicates the C-17 cockpit almost exactly as far as up to the point of the pilot in the left seat, copilot in the right seat. Behind the copilot is an observer seat referred to the right additional crew member, or RACM, and then on the left side of the airplane is another seat, the left or LACM seat. That is not present in the simulator. That is where we, simulator instructors, sit. To our left, we have two screens, instructor operator screens which we refer to as IOS. That is where I can program the configuration of the simulator, I can program malfunctions when we are doing training, or I can observe them on the screens similar to a radar scope.
- 19Q. You mentioned you program to the simulator in accordance with the previous parameters that you mentioned earlier as far as the weather, the weights of the aircraft, etc.?
  - 19A. Yes. The condition of the airplane and the ambient conditions of the weather.
  - 20Q. The sim, if you can describe, is it full-motion or is it?
- 20A. Yes. Our simulator was the 18th one built. It is an all electric simulator so we have an electric simulator which in other words, it is computer actuated. It is programmed in order to replicate the airplane as accurately as possible. But when we are setting in there, for example when we set the intensity, altitude, or temperature that will make it respond just as an airplane would in the same environment.

- MP 21Q. You mentioned that you proceed after said they were ready to enter the simulator. He proceeded into the simulator and then do you remember where the aircrew members sat initially?
- 21A. It has been 10 weeks, but my best recollection, MP was init seat. I think he had with him in the right seat and then CAPT SCO was initially in the left seat. I think he had
- , but I can't remember. There was more than one crew. They had five or six total aircrew demonstration pilots. MP had done some previously so he was the acknowledged expert, the one with the most time flying a profile.

- 22Q. You said it was CAPTSCO? Is that his name?
- was in the right seat, that would have put CAPT SCO 22A. I believe so. If in the RACM, right observer additional crewmember seat.

## **Questions by the Pilot Member:**

- 23Q. Based on that, do you know what their plan was to conduct the profiles that we
- previously mentioned?

  23A witness 15 at the time was fairly new, say she had been here about 6 months here. She was one of the more recent pilots so they were showing her how a profile looked since she had never flown it before and she was new into the demonstration. He was going to have both of them try to fly it with the non-flying pilot running the checklist from the RACM-helping from the RACM seat.

### **Questions by the Board President:**

- 24Q. When you say right from the checklist, were they doing normal checklists?
- 24A. In addition to that, one of the biggest things they were trying to do--their intended maneuver was to depart on runway 24 which takes you towards the Chugach Mountains. That would keep all the people observing the air show off to their right as they departed. They would turn left away from the crowd approximately 90 degrees. I say approximately because I observed 6 or 7 iterations and it varied from 80 degrees to 120 degrees of turn to the left. Then they were timed for a specified period of time and as they refer to the checklist they would talk ahead of time, I want you to count 5 seconds, 7 seconds, 8. They varied it to see which worked best. Then they would make a right, approximately 260 degree turn and that would bring them back towards the runway or they would do the pass in front of the crowd.

### **Questions by the Pilot Member:**

- 25Q. During a normal, non-aerial demonstration practice simulator profile, we would expect to hear checklists that are executed in a manner that is verbalized?
  - 25A. Yes.

- 26Q. Is there anything different during--do you remember specifically during this event there being anything different in the manner in which they executed checklist?
  - 26A. I can't recall. I'm sorry.
- 27Q. Do you remember if they were--the communication between the crew members, do you remember--if you don't remember specific checklists, do you remember the crewmember calling for a checklist and other crewmembers verbalizing responses?
- 27A. I know there was attention paid to the movement of gear and flaps and I remember that being addressed. Then calls are such as approaching, hitting or 10 degrees to rollout. I heard those a couple times as they were flying the profile.
- 28Q. That was true no matter who was sitting in which seat? That was their practice for that day?
  - 28A. Yes.

- 29Q. Do you remember specifically how the profile was flown as far as how it was operated, maneuvering the airplane, those types of things? If you do recall, can you describe it for us?
- MP flying the first one, he said I will 29A. The best I can remember with demonstrate the first one. Having done it before, he took off to a few hundred feet, leveled off to gain some airspeed to use. As they were gaining airspeed, they made the normal pause to make the gear up call and started to make the turnout. As they made the turn out it was more abrupt than you would normally expect for the training we provide because most of our training isn't in a low-level type of environment. We are either practicing instrument procedures or air refueling. Again, this is more on smooth application and smooth control. He made a turn to the left and they did their timing which again I say somewhere in the 5 or 10 second range. As I watched it, I referred to the operating screen to see how far they went. I would say it was somewhere between 1 and 1.3 miles north of the field. When they obtained that point, they made an almost perfect semicircle, 300 degree circle coming back in over the airfield, made the low pass, went out to the west, did the tear drop towards Mount Sue Sidna, looked to be approximately a 330 degree heading, now passed the confines of the air base, out over the water which is staying within tower airspace, a left turn back inbound, came over runway 6 and landed. That completed the first iteration of the air show profile. We reset the simulator to the same location, starting at taxiway bravo. He had the other pilot try it. They went through that 2 or 3 times. One of the pilots, I can't recall which, I remember looking at the screen and when they did their first attempt they didn't turn as aggressively with as much pull. The RACM slid their seat over in between the pilot and copilot seat, so from where I was sitting they was screwing my vision up. I could see what it looked like out the windows. I looked in the IOS and that particular pilot, when they made the right turn they overshot the runway maybe by 500 feet or a thousand feet to the south which is an emphasis item. We can't cross show center. They verbally debriefed that before they flew the profile again talking about how they either need to time further to the north or have a more aggressive turn back inbound so they wouldn't overshoot.

- 30Q. You mentioned you saw them on IOS. Was that your display screen?
- 30A. The display screen to my left.
- 31Q. That's the instrument landing system?
- 31A. Instructor operating screen. I'm not sure exactly what it stands for, but that's the panel that we use to observe, much like you watching a radar scope and tracking airplane.
- 32Q. During these profiles, was there any discussion about the bank angles that they were using and the air speeds they were going to be flying?
- 32A. I think I recall something. You need to roll right into the bank and I can't remember if they said right to 45 or right to 60. Whatever it was, because the second pilot who did it after MP was much smoother and more genteel in the roll, that was part of the reason why they overshot. They weren't pulling as aggressively.

- 33Q. Do you recall during any of these profiles, with any three of the pilots, the stall warning system going off?
- 33A. Yes. I remember it going off for a few seconds. Acknowledged. I heard something to the effect of acknowledged, expected and then within 1 to 3 seconds it was out again. It was no longer going off.
- 34Q. In your mind, how would you describe the maneuver that he was able to--what caused the stall warning to stop?
- 34A. I don't remember a change in navigation power. I assume a release of back pressure and/or bank. I have to guess. I don't know because I couldn't see what they were doing.

### **Questions by the Pilot Member:**

- 35Q. Did they verbalized any other response other than acknowledged and expected?
- 35A. No.

- 36Q. When you say back pressure, what do you mean?
- 36A. I mean knowing that when you are climbing--in this case we use a stick rather than a yolk so they would be pulling the stick back towards them. If they released the stick forward that would release some of the back pressure which would mean he would be able to get airspeed.

# **Questions by the Pilot Member:**

- 37Q. In your experience as a simulator operator over the years, have you noticed stall warnings occur during other non-demonstration types of flying?
  - 37A. Yes.
- 38Q. What were the reactions of the crewmembers to those at what phases did this occur?
- 38A. One of the things that is natural as a pilot, the young pilots in the airplane are very concerned because they haven't heard it and they know something is wrong, something is amiss. They tend to respond very quickly. Over time, as pilots we sometimes become immune to circumstances like that. For example, the TAS, terrain avoidance system that the airplane has, they felt it was giving false indications so people would become comfortable and complacent with that and were ignoring what might be warnings. Most likely, I would say some of the crew--I wouldn't say that they ignored it, but they tended to respect it less than they did when they first came into the airplane.
- 39Q. It is important to define what is a stall and stall warning. Stall warning, we mean--can you describe your understanding of stall warning?
- 39A. When you have an oral warning or you have--when you look on the display itself, primary flight display, in this particular airplane they are electronic screens, glass screens, and it is projecting an image of an attitude indicator. It projects and shows on the left side. It demonstrates their airspeed and their attitude. If they look at the airspeed, then it will give them a visual presentation. It will show them what safety margin they have for operating the airplane based upon a conditional flight which primarily would be tied to this particular case, airspeed and the flaps for example, how much lift you would expect to have in the aircraft.
  - 40Q. You mentioned earlier attitude indicator. Can you explain?
- 40A. Certainly. When you fly an Air Force airplane, we teach the control and performance school flying which means you put a control in and then you try to see the airplane perform it appropriately. One of the major things we use to help ensure that we do that correctly is a display, an older instrument that was a hardwired instrument. Now we have replaced those gauges with electronic displays. When you look at it, it gives you an artificial representation of the horizon. In our particular airplane and the simulator, blue represents sky and brown represents ground so you will know if you are climbing or descending and if you are level or turning.

- 41Q. Going back to MP when he demonstrated the profile itself was the profile-- you say it was not as genteel, what do you think it was a red federal rate more than usual or do you think he was trying to stay as tight to the runway as possible? How do you describe that? I know you were sitting at the panel, but do you remember? Do you recall?
- 41A. All I can describe it is that he was aggressively turning. It was a fairly rapid roll rate. I didn't time it so I can tell you what that was, but again, his intent was to stay close to the airfield boundary. He didn't tell me how many miles, but it that's the only reason he was making the timing and trying to time it exactly so it had just enough roll so they rolled over the air field without either over shooting or under shooting.
- 42Q. When they would go to a timeout or a pause between scenarios, did they talk about bank angles? Those types of things? You said you had a hard time seeing it, but did they discuss what bank angles they would go to?
- 42A. After the second pilot who distracted not mimic his own because the plain overshot the runway, that is all the things he discussed, the roll rate and the degree of bank angles.
  - 43O. That's on the 80----
- 43A. I will call it an 80, 260 maneuver which would be turning left 80 degrees off heading, pausing, and then turning right approximately 260 degrees to bring you back over the opposite direction of where you had taken off.

### **Questions by the Pilot Member:**

- 44Q. We were talking about roll rate. Roll rate is the rate at which the aircraft, based on the pilot's command, enters roll. Is that accurate?
- 44A. As you're flying, if you move the stick to the left or the right, depending on how rapidly you move it, you will turn at an increasing rate.

## **Questions by the Board President:**

- 45Q. And you said--do you remember what they talked about, roll rates and bank angles and things like that?
  - 45A. I know 45 degrees and 60 degrees were alluded to, but that's all I know.

# **Questions by the Pilot Member:**

46Q. Did it appear that MP instruction to the other pilot was to increase the roll right?

46A. Yes.

- 47Q. That was to make sure that the aircraft turned as quickly as possible and would make parameters?
  - 47A. Yes.
- 48Q. I did want to ask, in your experience if you noticed a difference between the way a crew who was for instance in a different training scenario or sorting responded to a stall warning in general versus a crew that was preparing for aerial demonstration?
- 48A. A very subjective question. I would say possibly in that they knew they were maximum performing the airplane in the air show and so they would be closer to the margin and if someone normally achieved a stall warning, it caught them by surprise. They weren't expecting that. They would expect to be 30 or 40 or 50% above their stall margin. They would have the wrong configuration of the airplane and they would not be performing correctly.

- 49Q. What you mean when you are saying max performing the airplane? What does that mean?
- 49A. When they made the turn to the north, they were trying to make it as expeditiously as possible, be liable, obtain enough altitude at enough displacement to make the 260 degree right turn, as I said, precisely rolling out over the runway in the opposite direction without any apparent break in the turn. In other words, a consistent turn at the degree of bank where it would be described as a perfect circle without breaking out into any tangents of level flight, one consistent turn.

# **Questions by the Pilot Member:**

- 50Q. Were they accelerating throughout the turn?
- 50A. They were accelerating as they made the turn to the north. Yes, they were accelerating.

#### **Questions by the Board President:**

- 510. Have you ever flown the demo profiles?
- 51A. Not in a C-17.

#### **Questions by the Legal Advisor:**

- 52Q. I just had some clarifying questions from earlier. These will be very basic. This is all in the simulator?
  - 52A. Yes.
  - 53Q. You mentioned runway pictures. They are able to see the runway?
  - 53A. Yes.

- 54Q. How does the sim do that, basically?
- 54A. The current grade of simulators, they grade the capability of it based upon how well you can depict the environment and then how well you can provide motion. In a particular simulator, they have taken satellite imagery and overlaid it on a digital database. The Air Force pays for extra definition, if you will. The closest comparison would be if you take your grandmother's analog TV and you replace it with an HD TV. You are at the same place, but you get a better picture. That's with the simulator does. It has higher resolution so it takes those pictures--when they sit on the runway, they see the hangars, airplanes, terrain, etc.
  - 55Q. This is all computer-generated animation?
  - 55A. Yes.
- 56Q. Is that computer-generated animation--it appears outside the simulator cockpit, but within the simulator structure itself? Is that correct?
- 56A. Yes. As they are sitting in the seats and I look out the windows, transparent to them, behind those windows are curved mirrors which are reflecting that imagery to them.
  - 57Q. So they get basically a view of what they would see in actual aircraft?
  - 57A. Yes.
  - 58Q. Also, the simulator, how does it replicate movement of the aircraft?
- 58A. It is on 4 struts and each of those struts are now better than previous generations. They are hydraulically actuated. They receive digital signals.
  - 59Q. You mentioned tear drop earlier. What did you mean by teardrop?
- 59A. After they did their initial pass, they would be flying down the longitudinal axis of the runway. They made a right turn at an angle of 30 to 45 degrees away from the runway. They would achieve enough displacement so that they would be able to make it turn back in the other direction toward the runway.
  - 60Q. The teardrop refers to the pattern?
  - 60A. Yes.
  - 61Q. Earlier, you said IOS which was instructor operated screen?
  - 61A. I believe. I'm not sure what the acronym stands for, but that is close enough.
  - 62Q. Later, I thought you said ILS. I just want to make sure you meant IOS.
- 62A. When you are flying ILS, instrument landing system, that is an instrument recovery procedure which we also teach.
  - 63Q. Earlier when you were talking about it, you were saying IOS?
  - 63A. Yes.

# **Questions by the Pilot Member:**

- 64Q. Did it appear that the students on the day we are speaking about with MP did they appear comfortable with the maneuvers that MP was demonstrating?
- 64A. I think they were a bit intimidated. It seemed second nature to me and I was very comfortable. It was stretching them beyond their comfort zone. That's the best assessment I can give you.

# **Questions by the Medical Member:**

- 65Q. I realize that you were not able to visually see everything on the instrument panel controlling, but you were able to hear certain portions of conversations, a debrief between profile execution. Were there any conversations regarding the use of a rudder input to be used in whatever context during the profile flight?
- 65A. I think they might have alluded to it in the 260 degree turn back to the right, talking about forcing the nose to track, that they would have to consider their rudder input as they made their turn back in, but I can't tell you to what extent it was mentioned.

### **Questions by the Pilot Member:**

- 66Q. Last thing I want to mention is that we have established that this was in July 2010?
  - 66A. Yes.
  - 67Q. Did we say the exact date? Do you recall the exact date this occurred?
- 67A. General Everhart had asked me, and I thought I said this was the 1st of July which was 4 weeks prior to the air show.

- 68Q. Were you at any other time with MP or the crew in the sim later, practicing those in the other time?
- 68A. I don't think I did anymore. I know I passed them in the hallway, in the 517th. I can't think of his name.
  - 69O. MCP
- 69A. MCP I remember him being in there one day. We passed when he had observed them on the ground the previous day. He made a comment to them about how they were tracking. It went back to what I talked about, a continuous turn. He said it looked like the bank was rolling in and out and they discussed that as I was passing, but I didn't have any interaction.

70Q. Are there any other matters that we haven't discussed the you believe would be important to our investigation?

70A. No.

PRESIDENT: You are reminded of the official nature of this interview. You may not discuss your testimony with anyone without my permission at any time before the report of this investigation is officially released to the public.

This concludes the interview. The time is now 1121 local, Alaska time.

#### V5. AIB INTERVIEW WITH

### WITNESS 5

#### VERBATIM TESTIMONY OF

# WITNESS 5

PRESIDENT: My name is Brigadier General Carlton D. Everhart, II. We are investigating the C-17 accident that occurred on 28 July 2010 at Joint Base Elmendorf-Richardson, Alaska. This investigation, conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 91-204. The purpose of this investigation is to produce a publicly releasable report on the facts and circumstances surrounding this accident and to gather and preserve evidence for use in claims, litigation, disciplinary actions, and adverse administrative proceedings, and for all other purposes. A safety investigation was previously conducted on the accident. Any testimony you gave before the safety investigation board will be kept confidential, if you were so advised, and can be used only for accident prevention purposes. This board does not have access to any confidential testimony you gave before the safety investigation board. Your sworn testimony to us may be used for any proper purpose. Additionally, your testimony can be released to the public. Do you understand the difference between your testimony before the safety board and this accident board?

WITNESS: Yes, sir.

PRESIDENT: Your testimony in this investigation will be under oath. At this time, I will administer the oath. Please raise your right hand.

[The witness did as directed.]

PRESIDENT: Do you solemnly swear that the testimony you are about to give in the matter now under investigation shall be the truth, the whole truth, and nothing but the truth, so help you God?

WITNESS: Yes, sir.

PRESIDENT: Today is the 13th of September 2010. This time is now 0922 local, Alaska time. This interview is being conducted in building 7309, room 105, Joint Base Elmendorf-Richardson, Alaska. The persons present are:

The witness, WITNESS 5

Pilot Member; Legal Advisor; Medical Advisor; Court Reporter; and,

me, [Brigadier General Carlton D. Everhart, II, Board President]

PRESIDENT: The witness has been sworn.

- 1Q. Please state your full name and rank.
- 1A. WITNESS 5,
- 2Q. How long have you served in the Air Force?
- 2A. Since 2003.
- 3Q. Your current unit of assignment and location?
- 3A. 517th Airlift Squadron.
- 4Q. Here at----
- 4A. Joint Base Elmendorf-Richardson.
- 5Q. How long have you been with this unit?
- 5A. Since April 2007.
- 6Q. At the unit, what is your job title?
- 6A. I'm the NCOIC of 517th Tactics, Instructor Loadmaster.
- 7Q. How long have you been doing his job?
- 7A. I've been a loadmaster since 2003.
- 8Q. Can you please describe your duties and responsibilities on 28 July 2010?
- 8A. On that date, I was in the office. I was scheduled to fly the next morning for the air show. I was dropping a truck off to get a radio installed and that was it. I had--I was asked that day to fly, throughout the day.
  - 9Q. So, you're familiar with the C-17 aerial demonstration program?
  - 9A. Yes.
  - 10Q. Can you describe the program for us?
- 10A. We were-- MP was upgrading pilots and other loadmasters in case any good deals came down for air shows so we would have more than just 1 group that could go.
  - 11Q. What do you mean by good deal?
- 11A. Last year, there was an air show that was going with the Thunderbirds to all locations out in the Pacific. It was that same crew going to all the air shows.
  - 12Q. Did you fly on any of those?
  - 12A. No, sir.
  - 13Q. Can you describe your aerial demonstration background?

- 13A. I had ground demo upgraded about 9 months prior in November and that was the only time I flew, getting my aerial demonstration upgrade. Coming up to the air show I had flown on all the practice flights except for the one the day the mishap occurred.
- 14Q. You stated that it was in your training process--what was your aerial demonstration training process? What were the steps you went through to become qualified?
- 14A. You had to be an instructor loadmaster and you would have to also be with a loadmaster that was already demo qualified so he could sign you off. You go through demo profiles in the aircraft and the instructor loadmaster teaching you would brief you on certain parts during the checklist.
  - 15Q. Do you know which demo profile that you were training for and flying?
- 15A. I've only done the 12 and 10 minute profiles. If I have done the 6 minute, I don't remember.
- MP 16O. You mentioned Do you recall any of the pilots that you might have flown the demonstration flights with or done your trading with?

  WITNESS 16
  WITNESS 16
  - 16A. Yeah, I've flown with

WITNESS 8 CAPT SCO

- **MCP** MSO and
- 17Q. You mentioned you flew with MP Do you remember flying with him in July 2010?
  - 17A. Yes.
  - 18O. Do you remember what dates they were?
- 18A. It was on the 9th, the 12th, and I want to say the 17th. It was the following Monday after the 12th.
  - 19Q. That's good. Do you recall who else was of those flights?
- 19A. I don't recall the name of the pilots. It was the list of pilots I gave you, I just don't witness 14 and then the 12th was remember, but all the flights were when I upgraded

MLM and then the following Monday, I think that was the 17th, was

- 20Q. Now, once you are upgraded, he checked you out, right? That doesn't mean they are actually certified, that means there is still some process that they have to go through?
- 20A. After they fly with us in the C-17, they have to go meet with the Wing Commander to get his blessing. Then their name gets put on the letter of X's.
- 21Q. Do you remember on those flights in July what the plan was for the training flight that day? Was it a 10 minute? Was it the 6 minute? What was--were you just going to practice the profiles? Or was it----
- 21A. They do the 12 and 10 minute profile and in between the profiles we would go to Goose Bay and hold and they would debrief on what was going on with the profile.

- 22Q. Goose Bay is a point out--a navigational aid or a point out on the map that you go out that is an uncluttered area?
- 22A. Yeah. It's a place where we would hold even on training locals that the fighters were coming in, just go out to goose and hold.
  - 23Q. So it just deconflicts the rest of the traffic?
  - 23A. Yeah.

# **Questions by the Legal Advisor:**

- 24Q. When you say hold, you go out to Goose Bay and hold, is the aircraft still flying or you have landed?
  - 24A. The aircraft, it is in a holding pattern, sir. It's still flying.
  - 25Q. It's kind of circling in an orbit?
  - 25A. Yeah. That's just lets the brakes cool and all.

# **Questions by the Board President:**

- 26Q. Were you at the pre-briefing for those flights?
- 26A. Yes.
- 27Q. And by pre-brief, I mean the brief prior to stepping out to the airplane to go fly?
- 27A. Yeah.
- 28Q. Do you remember what was discussed?
- 28A. It seemed like your standard brief that you go fly and then they would go into more of the air show stuff in the profiles.
  - 29Q. Do you remember what specifically they would go into?
- 29A. It was the order of the profiles they were going to do, the 12 minute first and then the 10 minute.
  - 30Q. Did they describe how they were going to fly the profiles?
  - 30A. I don't remember.
- 31Q. If I may, I want to show you a PowerPoint brief and just give you a couple minutes to take a look at it and see if you recognize this at all. I just handed the PowerPoint brief over to WITNESS 5 for the record.

[The witness reviewed the document.]

31A. I do remember this brief.

- 32Q. This particular brief that I showed you, it's the 2010 air show upgrade brief and it will be submitted for the record. Was this for your upgrade or was this a briefing that you use every time? When did you get that briefing and what was its purpose?
- 32A. We only saw the PowerPoint briefing once, but I believe it was e-mailed to us afterwards as well. It was kind of like a mass brief where everybody does it at the beginning of the air show upgrade brief. It was in the auditorium.
- 33Q. The briefing that you mentioned prior to the--the briefing that you just mentioned earlier, prior to stepping to the jet, or going to the jet to fly, this briefing is separate? This is just your upgrade briefing?
  - 33A. Yeah. I never saw a PowerPoint slide when we were stepping to go fly.
  - 34Q. So it was just an author normal checklist briefing?
  - 34A. Yeah.
- 35Q. So, just quickly with this one, can you walk us through kind of what you remember about how this briefing went and then how it was accomplished?

Legal: General, you are talking about the 2010 air show upgrade PowerPoint brief that you just had WITNESS 5 review?

President: Correct.

- 35A. During the PowerPoint slide he would go up there and explain just like it was a normal PowerPoint brief, here's the slide, what AFI's are applicable.
- 36Q. In this particular brief, this 2010 upgrade brief, there is a checklist in there. What is that checklist? Is that an official checklist for the Wing? What is that?
- 36A. It was a fan fold checklist. It was the air show checklist. Some of the stuff was in a different order than in our abbreviated checklist, I believe. That's why it was made like this.
- 37Q. So, did you use this checklist also? I know the pilots only use the fan fold, but in a loadmaster station, did you have a copy of this? How did that work?
- 37A. We should've had one on us at the time. The checklist for the loadmaster that we really run is going to be the before landing checklist and it's the--yeah, basically the before landing. The whole profile is pretty aggressive so you are sitting there on the back, strapped in. You are not really mobile.
- 38Q. When you say the back, strapped in, are you at the loadmaster station or are you at the paratroop doors in the back?
- 38A. Yeah, you're either on the last seat, left or right side of the aircraft, buckle down, and then you have your restraint harness which is of course clipped into the cargo floor, and your helmet.

- 39Q. So, when you practice these profiles, that's where the loadmaster always stays? He never would come up in the cockpit, on the flight deck, would he?
  - 39A. No. The only time he ever would will be when we are at Goose, holding.
- 40Q. So, do you remember this being an unofficial checklist or is this a techniques guide? Do you remember at all?
  - 40A. I don't know.

# **Questions by the Pilot Member:**

- 41Q. You may not remember if it's an official checklist or if it was a technique, but do you remember how the crew, the flight deck, ran the aerial demonstration checklist that we are referring to in the PowerPoint presentation? Do you remember how they executed that?
  - 41A. Not to my knowledge.

- 42Q. This upgrade PowerPoint, who actually briefed you on this?
- 42A. With the PowerPoint slide,
- MР
- 43Q. Going back to any briefings that you had, either pre flight briefings or this upgrade briefing, did the crew--let's just stay with your flights that you had, with those in July. Did you ever discuss or did the crew ever discuss bank angles and altitudes that they planned to fly?
  - 43A. I don't remember, but I know the bank angles--I want to say it was 45 degrees.
- 44Q. Did the crew ever discuss when you would go out to Goose Bay to hold, to say how the scenario went for that profile? Did he ever discuss going to more bank or flying it into the bank?
  - 44A. Not that I remember.
- 45Q. You said 45 degrees of bank. Was that done--why did you fly 45 degrees of bank?
  - 45A. During the PowerPoint slide he said the AFI says 45, but you could do it at 60.
- 46Q. Do you remember where he said you could do it at 60? Did he said you could do it at 60 the whole time or just certain portions?
  - 46A. I don't remember.
- 47Q. Do you remember, and there again just to clarify for the record, do you remember the bank angles that you all flew on your flights?
  - 47A. No.

- 48Q. Did the crew ever discuss use of the rudder at all?
- 48A. I don't remember.
- 49Q. When you would go out to fly, how was the plan executed as far as the profile?
- 49A. What exactly do you mean, sir?
- 50Q. Did he say we are going to go out and say we are going to fly the 12 minute profile and we are going to do it in these parameters. Do you remember a discussion going on?
- 50A. They would brief what profile they were doing before hand and I don't remember anything else after that.
- 51Q. When you flew, do you remember hearing or seeing anti stall alerts or stall warnings or anything like that going off?
- 51A. Yeah, you would hear stall sometimes and that would get acknowledged, they'd say acknowledged, crew.
- 52Q. So they would acknowledge it, but would they do any maneuvering to prevent it or get the stall warning to stop? How long would you hear the stall warning?
- 52A. I don't remember how long you would hear it. You would hear it go off and then they would say acknowledge and then it would go away.
- 53Q. Would it go away immediately or would it be just carried through for a little bit longer and then it would go away at the completion or termination of that maneuver?
  - 53A. Sometimes it would go a little bit longer and then go away.
- 54Q. So, if it was going off, did the crew just complete the maneuver and then it would just--again, I'm just clarifying for the record, would the crew just complete the maneuver and then once the maneuver was completed it would go off or cease?
  - 54A. Yes, sir.

#### **Questions by the Pilot Member:**

- 55Q. When it did go off, did they mention during the pre-briefing that, specifically about what actions the crew would take if it were to go off, and by it, I mean the stall warning system?
- 55A. I remember him mentioning it during his brief that you would hear those going off, but I don't remember what he said. That's MP

- 56Q. To add on to that, just for clarification of the record, do you remember--he just said they would go off, but was there any brief that if they go off we are going to do this action, or we are just going to----
  - 56A. If there was, I don't remember.

- 57Q. I want to touch again on the checklist. You said you are familiar with the checklist and you get the before landing checklist. You said that you were in the step that you were really concerned with. Do you remember how the crew executed checklists inside the aircraft when they were flying these profiles?
  - 57A. Fairly quickly.
- 58Q. Were they challenge and response? Did they say gear up, acknowledged gear up? Slats retract, flaps up? How was that?
- 58A. I believe that was done or how the checklist is normally ran, with the gear up. They actually make the call over and say gear up.
  - 59Q. Did you ever fly in an air show with MP
- 59A. I have never flown in an air show with him. It was just all for practices or upgrades.
- 60Q. There again, which checklist did they run? Was it this air show checklist or was it the normal -1 checklist? Would they call for this checklist or would they call for the normal--I see this checklist. I'm just trying to not confuse myself.
- 60A. I wasn't sitting up front so I know it's all part of our pro gear, to carry the abbreviated checklist. I'm sure that was up there with them, but I don't--I would assume they were using that one, the air show checklist, but then again I was never sitting up front for it.
  - 61O. Just again, for clarification of the record, what is the abbreviated checklist?
- 61A. We've got our amplified checklist in our -1 and the abbreviated checklist is the same checklist, just abbreviated.
  - 62Q. So when you say amplified, inside the -1, amplified is a?
  - 62A. It's a bigger checklist.
  - 63Q. So it has little steps?
  - 63A. There are more notes and warnings that are not in the abbreviated.
  - 64Q. So the abbreviated is more like just the steps without the notes?
  - 64A. Yeah, like what you should be looking for.
- 65Q. Just a couple more questions, if I may. Can you describe to me how MP flew, when you flew with him and the crew, how they flew the profile? Was it normal? Was it aggressive? Was it we've got to make this corner tight to show well for the crowd? How was that flown?
- 65A. I thought it was flown fine. I've never really flown the air show demo with any other pilots so I really have nothing to base it on as in what was wrong or right, but I felt safe in there.

- 66Q. Did you talk about the profiles or debrief after each demo training flight? Did you come back in together and debrief what went right and what went wrong?
  - 66A. The pilots would have their debrief.
- 67Q. How about the rest of them? How do the other crew members feel when they flew these profiles?
  - 67A. Everyone--it looked like everyone felt fine.

# Questions by the Legal Advisor:

- 68Q. WITNESS 5 you said that you hadn't flown the aerial demonstration profiles with any other pilot. Is that prior to the mishap or you have not flown since the mishap date?
  - 68A. I've flown, but----
  - 69Q. I'm sorry, flown the aerial demonstration profiles.
  - 69A. No, I have not flown in the aerial demonstration profiles since the mishap date.
  - 70Q. MP was the only person you hadn't flown with at least consistently?
  - 70A. Yes. He was the only one--he was on every demo flight I had been on.

#### **Questions by the Board President:**

- 71Q. He is the only one you have ever flown with?
- 71A. Basically, yes.

### **Questions by the Medical Member:**

- 72Q. You said that MP would brief that they would get the stall warning during the demo profiles. Is that correct?
  - 72A. Yes.
- 73Q. You mention that you flew with him on or about the ninth, 12 and 17th of July. Correct?
  - 73A. Yes.
- 74Q. So, would he have briefed that same statement during those 3 briefings that you guys got, that the pilots would anticipate hearing the stall warning horn?
  - 74A. I believe so.

- 75Q. You mentioned that when you were on board your aircraft during those flights that you would hear over your headset the stall warning horn going off sometimes. Is that correct?
  - 75A. Yes.
  - 76Q. Can you estimate how long? A second, 2 seconds or ballpark?
  - 76A. I would say maybe 3 to 4 seconds, maybe.
- 77Q. One other area, did you fly with MP in any other routine training missions?
  - 77A. No, sir.
- 78Q. So, the only time you flew with MP was during the demonstration profiles?
  - 78A. Yes.

## **Questions by the Pilot Member:**

- 79Q. You mentioned with the stall warnings that when you flew the demonstration with MP you would hear the pilot say acknowledged. Do you remember hearing that stall warning continue after stating acknowledged?
  - 79A. Occasionally it would.
- 80Q. I would also like to step back to the 3 dates just quickly. We talked about the step briefing just prior to going to the aircraft. Do you remember anyone being present at those briefings besides the aircraft you already mentioned that was going to fly?
  - 80A. No, sir.
- 81Q. How about the briefing that you discussed in the auditorium, a 2010 air show upgrade briefing, the one you defined as a mass briefing? Do you remember who was there?
  - 81A. No.
  - 82Q. Were there a lot of people? Were there a few people?
  - 82A. I would say maybe there was 8 or 9 people, I think, total.
  - 83Q. Was it only demonstration aircrew members?
  - 83A. Yes, sir. It was only people that were going to be getting upgraded.

- 84Q. Just to clarify for the record, you said you heard stall warnings. Did you hear the other warnings?
- 84A. You're going to hear your normal terrain when you are flying into Elmendorf. We always get that warning when we are coming in, but that's just because of the way the runway is.

- 85Q. Do you remember when this 2010 air show upgrade mass brief was?
- 85A. It was in early July. It was before the first flights. It was either early July or very late June.
  - 86Q. Of 2010?
  - 86A. Yes.

## **Questions by the Medical Member:**

- 87Q. When you have been on your training missions before, did the pilots or your flight crew ever brief that they would anticipate hearing the stall warning horn?
  - 87A. As we are stepping out to the jet?
  - 88O. On routine missions?
  - 88A. No.

PRESIDENT: You are reminded of the official nature of this interview. You may not discuss your testimony with anyone without my permission at any time before the report of this investigation is officially released to the public.

Do you understand?

Witness: Yes, sir.

This concludes the interview. The time is now 0949 local, Alaska time.

[END OF PAGE]

#### V6. AIB INTERVIEW WITH

## WITNESS 6

#### VERBATIM TESTIMONY OF

# WITNESS 6

PRESIDENT: My name is Brigadier General Carlton D. Everhart II. We are investigating the C-17 accident that occurred on 28 July 2010 at Joint Base Elmendorf-Richardson, Alaska. This investigation, conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 91-204. The purpose of this investigation is to produce a publicly releasable report on the facts and circumstances surrounding the accident and to gather and to preserve evidence for use in claims, litigation, disciplinary actions, and adverse administrative proceedings, and for all other purposes. A safety investigation was previously conducted on the accident. Any testimony you gave before the safety investigation board will be kept confidential, if you were so advised, and can be used only for accident prevention purposes. This board does not have access to any confidential testimony you gave before the safety investigation board. Your sworn testimony to us may be used for any proper purpose. Additionally, your testimony can be released to the public. Do you understand the differences between your testimony before a safety board and this accident board?

WITNESS: Yes, I do.

PRESIDENT: Your testimony in this investigation will be under oath. At this time, I will administer the oath. Please stand and raise your right hand.

[The witness did as directed.]

PRESIDENT: Do you solemnly swear that the testimony you are about to give in the matter under investigation shall be the truth, the whole truth, and nothing but the truth, so help you God?

WITNESS: I swear.

PRESIDENT: Okay. Please have a seat.

[The witness did as directed.]

PRESIDENT: Today is 13 September 2010. Time now is 1431 Alaska local time. This interview is being conducted in building 7309, room 105, Joint Base Elmendorf-Richardson, Alaska. The members present are:

The witness,

# WITNESS 6

Pilot Advisor;
Legal Advisor;
Court Reporter; and
me, [Brigadier General Carlton D. Everhart, II, Board President].

PRESIDENT: The witness has been sworn.

- 1Q. Please state your full name and your civilian status please.
- 1A. My name is WITNESS 6
- 2Q. What is your current occupation?
- 2A. I'm a C-17 flight simulator instructor for Boeing.
- 3Q. And Boeing's your employer and how long have you been with Boeing?
- 3A. I actually work for a subcontractor underneath Boeing called the Delaware Resource Group.
  - 4Q. How long have you been with the Delaware Resource Group?
  - 4A. About 3 -- correction. I got hired in November 2006 so --
  - 5Q. What is your job title?
  - 5A. C-17 Pilot Instructor.
  - 6Q. How long have you been operating the simulators?
  - 6A. Same amount of time.
  - 7Q. How long have you been here at Joint Base Elmendorf-Richardson?
  - 7A. I've been here the entire time of my employment as a C-17 simulator instructor.
  - 8Q. Since 2006.
  - 8A. Since November 2006.
  - 9Q. Could you please describe your duties and responsibilities in July 2010?
- 9A. I've been a C-17 flight sim instructor the entire time so the whole month of July I have about 3 or 4 flight simulator events to instruct per week. I was the instructor operating station simulator operator for these two Air Force time events for the crews to practice air show profiles. One was on June 16 and the last one was on -- correction -- July 16. The last one was

on I believe the 26th. My recollection of the mishap date I thought it was on the 28th. Okay, so on the 26th I believe was my [inaudible].

PRES: If I may, just a quick break.

[The interview took a break at 1434 hours and resumed at 1437 hours, 13 September 2010.]

LEGAL ADVISOR: This is We're back on the record. All those present when we took a break are again present. At this time considered some answers during the break. Mr.

WITNESS: Yeah, I wanted to say that I believe the second of the July events was on the 27th instead of my earlier date; I had said the 26th.

- 10Q. Then you are familiar with the C-17 demonstration training program here at Joint Base Elmendorf-Richardson?
- 10A. I wouldn't say I'm familiar with it. I found out there was a regulation governing it or whatever. I didn't know about that, but I do know -- I have flown with several years' worth of -- I have been the instructor -- excuse me. I have been the operator of the sim during the training of a couple of different air show crews over the last 3 ½ years.
  - 11Q. In that training program, what was your role?
- 11A. My role was to operate the sim and allow the crews to practice their events. They came over on an Air Force time, which is not a training event. It's just time that the Air Force has to use as they need. Pretty much we just operate the sim's motion control: bring it up and down off motion, run the instructor operator station as far as setting up the environmental conditions that the crew requests for that event relating to winds and the cloud ceilings and wind speed; the actual aircraft's simulated weight as far as how much the real airplane weighs and plus how much fuel or cargo if the crew asks for anything like that. We'll enter that into the simulation so that the simulator performs like the aircraft would under those conditions.
- 12Q. Could you please give us an overview of your interaction with -- I know you've loaded up the sims and all that kind of stuff, but the interaction you had with the aircrew during an aerial demonstration simulator event?
- 12A. During normal instructional event, I would have instructional topics to brief the aircrew on or Air Force directed topics that they want covered during those events. But for Air Force time, as I said, we pretty much just operate the sim to the requests of the customer. Therefore, I don't give any briefings or instructional stuff prior to the sim or after. The air crew did meet before the sim events on the occasions that I recall. Afterwards also they would have their own de-brief, but the instructor -- my fellow instructors or I didn't attend those.

- 13Q. If I just may for the record just to clarify then: In general terms you would set up the simulator prior to the sortie just to put the winds, weather, temperature, the cloud cover and then just bring it up on motion so the simulator's actually functioning now to act like -- replicate the performance of the airplane?
  - 13A. That's true, sir.

PILOT MEMBER: If I may, sir.

## **Questions by the Pilot Advisor:**

- 14Q. But you were actually present. Once the simulator started, you would be present during the simulator during their performance.
- 14A. That's correct. We would all be in the simulator and go up on motion and I would remain the entire time and bring it down at the end of their time.

- 15Q. Then besides these two times, 16 and 27 July 2010, how many times have you worked a simulator for demonstration aircrew practice?
- 15A. I would say approximately four more times maybe -- four or five over previous years.
- 16Q. Are you familiar with the profile 3, which is the 12-minute profile that the aircrews fly?
- 16A. The profile the mishap crew flew was a 12-minute profile. I did not -- I'm not aware of it being called profile 3. I never heard that.
- 17Q. Then you mentioned about the reg. Are you familiar with the AFI 11-246, Volume 6, Chapter 3?
  - 17A. I'm not familiar with it.
- 18Q. Have you seen MP MSO and MCP fly the aerial demonstration profiles, specifically the 12-minute profile, in the simulator in July 2010?
  - 18A. Yes, I did on the 27th.
  - 19O. On the 27th?
- 19A. Yes, sir. The three aircrew that you mentioned, all three were not in the event on the 16th.
  - 20Q. Do you know who was in the event on the 16th? Do you recall?
  - 20A. Yes. Yes, I do.

- 21Q. Who were they?
- 21A. It was MP CAPT SCO and I believe it was also MCP that was in the mishap crew. Mr. MSO -- or MSO MSO was not in the 16th event.
- 22Q. Then when MP was present in those simulator rides, the 12-minute demonstration, the practice, was he in the left seat?
- 22A. He was in the left seat for all the events on the 16th, but on the 27th MP flew in the left seat for the first two profile iterations. We did a total of five.

  MSO was in the left seat for the last three and MP was acting as the safety pilot. They basically swapped duties between the left seat and the safety pilot.
- 23Q. Now you briefly mentioned about the briefings. Were you present in the briefings that happened prior to going into the simulator at all, or in any of the de-briefs?
- 23A. I was not present. Actually during the 27th, which is the one I recall the best, it was a 3-hour block of time of Air Force time and the first hour was the tour for another aircrew member. So I came down about halfway into the 3-hour so it would have been about 9:30 local and they were finished with the first tour. I saw MP MSO -- MP MSO and MCP in the briefing room when I came down to get them. They were briefing -- I mean they were talking. They had kneeboards and charts out. A kneeboard, it's an aircrew has a board you can strap to your leg to keep papers and stuff like that on. They had pictorial diagrams, a color that looks like about a 4 x 8 sheet of paper or a half sheet -- a sheet of paper folded up and it had the overhead depiction of the air show profile on it. They looked busy. I caught
- MP eye and he gave me a head nod like he needed a few more minutes so I went out and got a drink of water, came back. They were ready and then we went up to the sim. But I wasn't aware of what they were discussing.

## [numbering error noted]

- 23Q. Having watched MP MSO and MCP fly the aerial demonstration profiles in the simulator, can you describe -- or will you describe how they flew the departure portion from the time of brake release to the initial climb to the initial 80-degree turn and then the turn back around to the -- how did they fly that profile? Can you describe that for me?
- 23A. Yeah. We started with aircrafts positioned at about the 4,000 feet to the runway remaining marker and 20,000 pounds of fuel in the simulation is what they asked for. Whenever they were briefed -- they basically were already pre-briefed on what they were going to do prior to, I guess, so there was minimal briefing in the jet. They would get a simulated time hack, or everybody on the same time getting ready to go. The take-off clearances I gave them as simulating the air traffic controller. The pilot monitoring known as the co-pilot was MCP and he would give a countdown to brake release like a 1 minute and 30 seconds, 5-4-3-2-1 brake release. Max power, the power was at -- full throttle is the maximum power and they began the take-off roll at the appropriate take-off speed. The pilot flying, which was MP for the first two iterations, would lift the nose -- raise the nose of the aircraft off the runway and continue to rotate the nose upward to about 35 degrees or so for like -- and then pause for 1

second and push the nose back over relatively aggressively to about 15 to 20 gaining speed. Then they would perform a pretty crisp bank to the left to go into a heading of 33 or 340, something like that. The safety pilot was in the right aircrew additional crew member seat and he had his seat fully to the left limit where it placed him approximately centered between the two pilot seats in front of him so he could get a view of the configuration, those kind of things. He was making verbal callouts of 20 degrees to rollout, 30 degrees to rollout, 20 degrees, 10 degrees to rollout, rollout, helping the flying pilot roll out on the heading that they had planned, assisting that. Then continued to accelerate on the A-degree off-heading. I think it was like 300 -- 300 and some odd, do the math. But for about 6 to 8 seconds and then they would make a bank back to the right. The descending we were about 1200 feet. It seems like 12 to 1500 feet at that point. Then the turn inbound would be a descending turn towards 500 and accelerating to go have a high speed flyby the air show center line, which was the -- I believe it's mike taxiway. It's the taxiway paralleling runway 624. And then build up whatever speed they could at that point. They would be cleaning out the aircraft -- they would be deconfiguring the aircraft to a clean wing where as previously the takeoff said flaps at a half and slats extended. So they would retract the flaps and the slats during the acceleration to the high speed flyby show center.

- 24Q. Then you mentioned they would practice with 20,000 pounds of gas. That's what they would ask for?
- 24A. On the 16th, MP asked for 20,000 pounds and again, on the 27th, I asked him how much fuel he wanted -- or did he want 20,000 again. He said he wanted 20,000.
- 25Q. Then during the -- just so I can clarify: Were they at max power? You know, from brake release in performing these maneuvers, did the throttles ever get retarded, or did they stay at max power the entire time?
- 25A. To my knowledge they were at max power, but again I wasn't noting every single thing as well as -- sometimes I was working on watching the panel and I really didn't see every single configuration change. It's just to my recollection I believe that to be true.
  - 26Q. Do you recall bank angles?
- 26A. Not really. It's 45 to 60. I don't remember any specific bank angle for any different maneuvers but, again, I had the safety pilot was right in front of me basically.
  - 27Q. One more if I may. In this profile do you recall the use of rudders?
- 27A. I believe for the turns -- and this is what I felt -- I believe they were using -- I could see they were using pretty much maximum control stick into the turn to demand a turn. I believe they were using rudder to assist during the roll ins and the rollout because there's a condition called yaw and you can feel when the aircraft is a little out of trim or when you need to use rudder to keep it in trim, which is flying a lot with the wind.
  - 28Q. What was the communication between the aircrew like inside the cockpit?
- 28A. I felt everything -- everything I heard was pretty --was professional and I believe pre-briefed to the extent of each person knew the duties of what they were supposed to do during the conduct of the profile. There was configuration changes that were -- that had to have been

pre-briefed so the pilot monitor was able to select the next configuration required by the profile without each one being commanded by the pilot flying.

- 29Q. Did the pilot monitoring announce configuration change, and was it acknowledged as a normal C-17 checklist challenge or response that would be performed?
- 29A. I would not say that every -- it was more like configure on speed, which meant to go to whatever -- a certain configuration in this case. I remember the configuration -- configure on speed would mean -- or have the effect on the pilot monitoring of allowing him to extend the slats, extend the flaps to a half, put the gear handle down. And it was confirmed just like the aircrews do per checklist as in the pilot monitoring would say where the condition was of each slats, flaps, gear. The pilot monitoring would confirm that as -- excuse me. The safety pilot would confirm that very visually with the pilot monitoring on the completion of the configuration. Then the pilot flying would command each flap -- further flap change more than half flaps. For instance, flaps to three-quarters and flaps to full.
- 30Q. That was on the configuration. How about on the deconfig say like bringing the gear up, bringing the flaps up, bringing the slats up?
- 30A. I believe a pilot flying would call for the gear up, which would occur basically immediately after leaving the ground -- or after the pilot monitors would say pause the brake. Flaps up I believe was also called. I believe the pilot flying would command his -- the cleaning up of the aircraft, but I don't really recall every single time. I saw it 5 times. I've been trying to run through my mind what I remember and that's to my best recollection.
- 31Q. How about what checklist did they run? Did they run -- which one? Was it the fan-fold checklist? Was it --
  - 31A. Yes, sir.
  - 32Q. Just a normal --
- 32A. A normal VFR pattern-style checklist. After takeoff and then approach before landing checklist, they would call for all of those.
- 33Q. Then as far as -- did you specifically when it comes to the checklist, did you see the use of any other things other than a flight manual checklist?
- 33A. No. I saw a fan-fold and a pilot monitoring -- MCP had that. The safety pilot had the air show -- I call it the air show diagram, but it was that color picture 4 x 8 sheet of paper with the white drawn -- it looked computer-generated drawn profile of the 80, 260, another course reversal on the 06 end and then a slow flight and then another course reversal and like a 360 over in the show center area. He had that in his hand and it had headings on it, seconds to countdowns for -- on a certain heading they would fly 7 seconds or 9 seconds depending on which course reversal they were doing. That was specifically when MP was the pilot flying and MSO was the safety pilot. He had it in his hand right in front of him I believe as a memory aid to what seconds he needed to countdown and what heading he needed to ask the pilot monitoring to put in the heading reference.

- 34Q. At anytime during the practices did you hear any aircraft warnings or cautions?
- 34A. I did. I heard "stall stall" a couple of times. At one point I heard a "flap over speed." I looked down and it was about 100 feet to 2 knots or 252.
  - 35Q. That over speed comes on --
- 35A. It comes on anytime you move the -- if you lower the gear or move the flaps to a half above 250 knots.
- 36Q. What were the aircrews reaction during the profile to these stalls? Warnings to the "stall stall"?
- 36A. It seemed to me that of the "stall stall," I think occurred during the roll into bank or during a configuration change to where the slats were not being lowered and it was momentary like "stall stall" right before -- or they rolled out of a little bank and it would go off -- it would stop, I mean. Or like I believe it occurred when extending slats to slow down, but then two warnings of maybe 2 seconds later the slats would reach the configuration commanded and again the warning would go off because the plane was -- the aircraft was configured appropriately.
  - 37Q. How about on the 80, 260 maneuver?
- 37A. I don't really remember exactly which maneuver it happened on, but that maneuver would be a bank so if it occurred I would expect that it was due to bank and they would roll out or release that pressure. It was -- yeah, it was pretty much the way I can remember it.
  - 38Q. Did everyone seem comfortable when they heard that or with the warnings or --
- 38A. Yeah, I believe they were comfortable. I didn't hear anybody say anything. It was more like they knew in just a second it was going to be corrected whatever made it go off. I mentioned getting to the slats extend, which decreases the stall rate -- the stall air speed and it would make the warning go off -- or stop.
  - 39Q. Go away?
  - 39A. Go away. Yes.

PRESIDENT: If I may, I think what we'd like to do is take a break right here just to collect what we've heard and then let you have anything that you may want to cover and then we'll come right back. So if we could take a break right now.

WIT: Okay.

[The interview took a break at 1502 hours and resumed at 1530 hours, 13 September 2010.]

LEGAL ADVISOR: This is we're back on the record. All attendees to the interview that were present prior to the break are again present.

# **Questions by the Board President:**

- 40Q. WITNESS 6 you stated in the break that you would like to clarify -- make a clarification to the record of what you stated as far as the question was: At anytime during the practices did you hear anything in reference to the stall warnings or cautions, i.e., the "stall stall" that you hear. Then I asked you specifically "did everyone seem comfortable," and you said you had a clarification that you wanted to make to that.
- 40A. Yes, sir. When asked that question I said, I believe they were comfortable. I would like to clarify to say that was my belief, but I didn't have -- the only fact I had was they did not appear to be uncomfortable. They didn't say anything that would lead me to believe that.

#### PRESIDENT:

# **Questions by the Pilot Member:**

- 41Q. WITNESS 6 you had mentioned in your previous statements that you do recall a couple instances -- or maybe more, you can define how many times if you remember -- the stall warning occurring specifically. Can you put that into terms of how long you think you heard the stall warning at its longest? Maybe if we consider stall ... stall, that would be 1 second in between those.
- 41A. Okay, I said that a couple of times during the profile I heard "stall stall." I don't remember if it was every time we did the profile each of the five times, but it did occur during the profile -- during the five profiles somewhere. I would say that the longest that I heard "stall stall" was about four iterations of the warning system saying "stall stall." It did happen again where it maybe just stall one time before the situation was mitigated.
- 42Q. Is it accurate to say you said you heard the word "stall" iterated four times during one particular episode so that would lead us to say if each stall was 1 second, 4 seconds total, is that accurate?
  - 42A. I believe that's accurate. Yes, that's accurate.
- 43Q. Do you remember if during that time they verbalized any reaction to that, or if they made a reaction?
- 43A. No one verbalized to my recollection any statements regarding the stall warning. But the stall warning stopped enunciating so there was -- the stall warning would stop so the condition would have had to have been handled.
  - 44Q. Okay, so something made the stall warning stop?
- 44A. Yes. If the condition that creates a stall warning persists, the stall warning continues to persist.
- 45Q. Okay, but you don't know specifically what made that stall warning cease. Is that accurate?
  - 45A. I do not know exactly what made it cease, but it did.

- 46Q. You had also mentioned earlier through the words that you'd used to describe parts of the profile were in the maneuvering portion of that was "aggressively" or "crisp." Can you elaborate a little bit on what you meant by crisp or --
- 46A. Okay, those are my words to describe what factually is/was the amount of control stick deflection into the direction of the turn. A small deflection to begin a turn results in a smaller rate of roll -- roll rate. A larger stick deflection would command a larger roll rate into or out of a turn and that is what I observed.
- 47Q. You talked about July 16. Just do you recall how many profiles mainly the 12-minute profile that MP flew on the 16th?
- 47A. No, I do not recall the amount -- the number of profiles that they accomplished, but the time allotted for their Air Force time event was 3 hours. I don't believe they actually used the entire 3 hours. But that amount of time would allow the crew to do the profile at least four or five times. I just don't know the number.
  - 48Q. Did he use aggressively quick to crisp turns then also?
- 48A. Both events the control deflection was the same from MP and also from MSO during the 27th profile when he was the pilot flying. It was a similar control deflections and roll rates commanded.
  - 49Q. Then in both events you mean the 16th and the 27th. Is that --?
- 49A. Right. MP was the only pilot flying on the 16th. There was a different safety pilot. On the 27th both the flying pilots, MP and MSO were using similar control stick deflections for turns.
- 50Q. Then on the 16th and 27th, what was the initial target altitude that the aircrews would climb out on after brake release prior to the 80 degree of heading change?
- 50A. I did not -- I was not told nor was I aware of a target altitude, but I did observe the target nose high demonstrating the climb capabilities of the aircraft would be between 30 and 35 degrees initially for 1 second and then a noticeable stick deflection to push the nose down to approximately 15 degrees, a 1 second pause and then a bank to the left to begin the 80 degree portion of the 80, 260 maneuver. I observed that altitude to be between 12 to 1400 feet on the radar altimeter display which the aircrew had selected on their instrumentation.
  - 51Q. A radar altimeter gives you altitude above ground?
- 51A. Radar altimeter gives you altitude above the ground and that was the reference the aircrew were flying at primarily to descend to the 500 foot above the ground altitude once crossing the air show centerline. That was the floor of the altitude they would fly to.

PRESIDENT: Thank you, Anything else?

# **Questions by the Board President:**

- 52Q. One last question and before I read you out, and matters that we haven't covered that you believe is important in our investigation?
- 52A. I believe -- I wanted to say that my -- I observed the demonstration aircrew conducting the profile -- or their actions inside the cockpit professionally with little with no chatter, no talking about anything that wasn't a subject at hand with the flying. Their words were concise and related to headings, airspeed changes, configuration changes, what the next desired heading would be. That kind of professional flying and I observed them treating the entire -- their entire time professionally and nothing taken lightly it didn't seem -- it didn't appear.

PRESIDENT: You are reminded of the official nature of this interview. You may not discuss your testimony with anyone without my permission and at any time before the report of the investigation is officially released to the public.

This concludes the interview. Time is now 1541 local, Alaska time.

#### V7. AIB INTERVIEW WITH

## WITNESS 7

### VERBATIM TESTIMONY OF

# WITNESS 7

PRESIDENT: My name is Brigadier General Carlton D. Everhart II. We are investigating the C-17 accident that occurred on 28 July 2010 at Joint Base Elmendorf-Richardson, Alaska. This investigation, conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 91-204. The purpose of this investigation is to produce a publicly releasable report on the facts and circumstances surrounding this accident and to gather and preserve evidence for use in claims, litigation, disciplinary actions, and adverse administrative proceedings, and for all other purposes. A safety investigation was previously conducted on the accident. Any testimony you gave before the safety investigation board will be kept confidential, if you were so advised, and can be used only for accident prevention purposes. This board does not have access to any confidential testimony you gave before the safety investigation board. Your sworn testimony to us may be used for any proper purpose. Additionally, your testimony can be released to the public. Do you understand the difference between your testimony before the safety board and this accident board?

WITNESS: Yes, sir.

PRESIDENT: Your testimony in this investigation will be under oath. At this time, I will administer the oath. Please raise your right hand.

[The witness did as directed.]

PRESIDENT: Do you solemnly swear that the testimony you are about to give in the matter now under investigation shall be the truth, the whole truth, and nothing but the truth, so help you God?

WITNESS: Yes, sir.

PRESIDENT: Today is the 14th of September 2010. This time is now 1441 local, Alaska time. This interview is being conducted in building 7309, room 105, Joint Base Elmendorf-Richardson, Alaska. The persons present are:

The witness.

WITNESS 7

Legal Advisor;
Maintenance Officer;
Maintenance Member;
Court Reporter; and,

me, [Brigadier General Carlton D. Everhart, II, Board President]

PRESIDENT: The witness has been sworn.

- 1Q. Please state your full name and rank.
- 1A. WITNESS 7,
- 2Q. How long have you served in the Air Force?
- 2A. Just under 9 years.
- 3Q. What is your unit of assignment and location?
- 3A. 703 AMXS, 517 AMU.
- 4Q. How long with this unit?
- 4A. Since April 26 of 2002.
- 5Q. What is your job title?
- 5A. Crew chief.
- 6Q. How long have you been in this job?
- 6A. Eight years.
- 7Q. What type of aircraft are you responsible for?
- 7A. Here at Elmendorf, C-17.
- 8Q. How much experience do you have maintaining the C-17?
- 8A. Six years.
- 9Q. Did you work on 28 July?
- 9A. Yes, sir.
- 10Q. What were the shift hours?
- 10A. Seven to three, dayshift.
- 11Q. Please take us through that day on 28 July from when you start fulfilling your duties.
  - 11A. It was a normal workday. I got assigned an aircraft by TSGT G
- . He took me to the aircraft and we started refueling. He told me what the fuel up was-refuel. We waited for the crew. They had 3 engines started and then we had shift changed.
  - 120. What was that aircraft? Was that aircraft 0173?
  - 12A. Yes, sir.

- 13Q. TSGT G is who?
- 13A. Our truck driver--expediter.
- 14Q. What was the status of aircraft 0173?
- 14A. It seemed good to go.
- 15Q. So, no hard write-ups?
- 15A. Now.
- 16Q. What typically happens when the maintainers recover an aircraft? What does recovery mean?
- 16A. Normally, we check oil, check serviceability, and verify any major discrepancies that we can find, if we do find any, and just look over the plane for cleanliness and serviceability of the aircraft.
  - 17Q. What is a through flight inspection?
- 17A. It's an inspection that happens when there is not enough ground time for a post flight or BPO inspection which is a basic post flight inspection. You have to have a certain amount of ground time for that inspection versus a BPO which is a lot longer ground time and then there is also a quick turn which we were accomplishing. That's even a shorter ground time than a through flight.
- 18Q. When you reference times like that, is there a specific time, like a 20 minutes, or is it supposed to be an hour? Like basic post flight requires two hours? What drives you to what phase, whether there is going to be a through flight, basic post flight? Is there a time limit?
- 18A. Yes, sir. You have to review your Dash 6 work cards and it tells you exactly how much time you need on the ground. Say, if you're doing it with one individual then you need this much time. It specifies if you have this many people then you can do it in this many hours.
  - 19Q. Was a through flight performed?
  - 19A. No. sir. Not while I was there.
  - 20O. Why not?
  - 20A. There wasn't sufficient ground time.
  - 210. Based off the work cards?
  - 21A. Yes, sir.
  - 22Q. What typically happens when the maintainers launch an aircraft?
- 22A. First of all, we verified all the write-ups that are grounding or possibly grounding are cleared from the forms. The expediter comes out and verifies behind us. We wait for the crew to show and when the crew shows they check over the jet and when the jet is good to them our pro-super releases it to them and we wait for them to start engines and send it out.

- 23Q. So, launch means?
- 23A. To marshal it out.
- 24Q. How would you know if any maintenance was needed or done during that time?
- 24A. By reviewing the forms.
- 25Q. Were there any maintenance related discrepancies, problems debriefed in the previous day's mission?
  - 25A. Not that I was aware of, sir.
- 26Q. Were there any man's related discrepancies or problems addressed between missions?
  - 26A. When I got to the jet, it was ready to go.
- 27Q. Were there any maintenance related issues, such as red ball maintenance, during the launch process?
  - 27A. No. sir.
  - 28Q. Did you witness the mishap?
  - 28A. No, sir.

President: At this time, WITNESS 7 I would like to take a break. It shouldn't take too long. We will discuss some things here then will call you right back in.

[The board recessed at 1447, 14 September 2010.]

[The board reconvened at 1500, 14 September 2010.]

Legal: We are back on the record. All parties present before the break are again present.

President: WITNESS 7 at this time I will turn the questioning over to you and

Ouestions by the Maintenance Member:

- 29Q. Do you know, was this the first mission of the day or was it the second sortie of the day?
  - 29A. It was definitely the second.
- 30Q. Earlier, you stated on the record when I was asking you about the through flight inspection that it is determined by the -6 cards. Can you kind of expound on that and describe what they are?
- 30A. Dash 6 work cards are inspection criteria that help us verify what is good or bad on the jet.

- 31Q. According to the Dash 6 cards, you didn't have enough ground time to perform the through flight inspection?
  - 31A. Yes, sir.
- 32Q. You stated before that you had gotten turnover and the aircraft was good to go. You are taking turnover from the expediter? Did you do an inspection yourself, go to the forms and check for yourself before you the refuel?
- 32A. Yes. Every time you go to a refuel or anytime you work on the jet, period, you always check the forms first and verify per your checklist that you are safe for refueling. You verify your checklist and let your checklist tell you what to do. That's what you do.

## **Questions by the Maintenance Officer:**

- 33Q. Just step us through some of the crew chief duties that you do perform when you are running that, checking those forms and running the work cards.
- 33A. When you verify the forms, you verify the inspection times and dates are good. You verify that any red X's for open discrepancies are not grounding because we have taken care of those before hand. You check the overall serviceability of the hydraulic systems and verify-well, that should have been checked when it landed, verifying the engine oil is good. You verify--like on a refuel per se, you verify your checklist and it will tell you to do certain stuff like wipe down the struts properly, verify seals, and you use all your checklist.
  - 34Q. When you were reviewing those forms, did you notice any grounding write ups?
  - 34A. No, sir.

- 35Q. so, just one quick follow-up question to that then. When you check the forms, is that sufficient enough to determine if the jet is good for the next flight?
- 35A. As long as the inspection dates are--inspection times and dates are up-to-date, then yes.
- 36Q. Just one question, actually, a couple last questions. Just to clarify, what did you specifically do on the aircraft, 0173?
- 36A. I was the refuel supervisor and I started the launch process. In the middle of the launch process, we got shift changeover.

# **Questions by the Legal Advisor:**

- 37Q. Just to build on and clarify a question, all the things you discussed and answered to Major questions about checking the forms and whatnot, and then you answered to General Everhart's question, as long as the inspection dates are up-to-date, do you remember if the inspection dates were up to date?
- 37A. They would have been if the jet left before we sent it out. At this time I don't remember.
- 38Q. Sure, but would it be correct to say you would not send out a jet to launch if the forms----
  - 38A. With an overdue inspection? No, sir.

## **Questions by the Board President:**

- 39Q. Do you have anything further to tell us that we have not covered that you believe would be important to our investigation?
  - 39A. No, sir.

PRESIDENT: You are reminded of the official nature of this interview. You may not discuss your testimony with anyone without my permission at any time before the report of this investigation is officially released to the public.

This concludes the interview. The time is now 1505 local, Alaska time.

[END OF PAGE]

#### V8. AIB INTERVIEW WITH

# WITNESS 8

#### VERBATIM TESTIMONY OF

# WITNESS 8

PRESIDENT: My name is Brigadier General Carlton D. Everhart II. We are investigating the C-17 accident that occurred on 28 July 2010 at Joint Base Elmendorf-Richardson, Alaska. This investigation, conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 91-204. The purpose of this investigation is to produce a publicly releasable report on the facts and circumstances surrounding this accident and to gather and preserve evidence for the use in claims, litigation, disciplinary actions, and adverse administrative proceedings, and for all other purposes. A safety investigation was previously conducted on the accident. Any testimony you gave before the safety investigation board will be kept confidential, if you were so advised, and can be used only for accident prevention purposes. This board does not have access to any of the confidential testimony you gave before the safety investigation board. Your sworn testimony to us may be used for any proper purpose. Additionally, your testimony can be released to the public. Do you understand the difference between your testimony before the safety board and the accident board?

WITNESS: I do.

PRESIDENT: Your testimony in this investigation will be under oath. At this time, I will administer the oath. Please stand and raise your right hand.

[The witness did as directed.]

PRESIDENT: Do you solemnly swear that the testimony you are about to give in the matter now under investigation shall be the truth, the whole truth, and nothing but the truth, so help you God?

WITNESS: I do.

PRESIDENT: Today is 15 September 2010. The time now is 1455 local, Alaska time. This interview is being conducted in Building 7309, Room 106, Joint Base Elmendorf-Richardson, Alaska. The persons present are:

> WITNESS 8 The witness, Pilot Advisor: Legal Advisor; Medical Advisor: Court Reporter; and,

me, [Brigadier General Carlton D. Everhart, II, Board President]

PRESIDENT: The witness has been sworn.

- 1Q. Please state your full name and rank.
- 1A. WITNESS 8
- 2Q. How long did you serve in the Air Force?
- 2A.  $5\frac{1}{2}$  years.
- 3Q. What is your unit of assignment and location?
- 3A. 517th Airlift Squadron, Elmendorf Air Force Base.
- 4Q. How long have you been with this unit?
- 4A. Almost 3 years.
- 5Q. What is your job title?
- 5A. Chief of Scheduling.
- 6Q. How long have you been doing that job?
- 6A. About a year now.
- 70. Can you briefly describe your current duties and responsibilities?
- 7A. I manage an office of ten schedulers comprised of pilots and load masters. We make up the local flying schedule, the simulator schedule, and task all missions.
  - 8Q. What was your unit of assignment from 2007 to 2010?
  - 8A. 517th Airlift Squadron.
  - 9Q. Are you familiar with the C-17 aerial demonstration program?
  - 9A. Yes, sir.
  - 10Q. Can you describe your C-17 aerial demonstration background?
- 10A. I started on the team in 2009. I was upgraded to safety position. At that time, I had ground training, simulator training, and training in the aircraft. I held that position for about a year. In the summer of 2010, I started my upgrade for the co-pilot position -- the same ground training, simulator training, and training in the aircraft. I have done 7 demonstrations, all international.
  - 11Q. Who were the crew that you did those demos with?
- 11A. MP MSO and WITNESS 3 were the pilots for all seven of those, and the load master was SSgt BE .

- 12Q. At this time, did you complete your co-pilot training?
- 12A. No, sir.
- 13Q. Can you please describe your demonstration training. Would you go into it in a little more detailed, the safety training you had?
- 13A. Yes, sir. MP conducted all my training. It started out with ground training, going over the AFI applicable to the demo, going over the demonstration checklist that we use during the demonstration, and then more ground talk conversation about what the profiles consisted of, how they flow. The next step, we went into the simulator. We run through the 10-minute profile and 12-minute profile. Once you were able to successfully accomplish that, you would go to the aircraft and you do the same.
- 14Q. Would you say you were familiar with the profiles that are established in AFI 11-246, Chapter 3?
  - 14A. Yes, sir.
- 15Q. Please explain in general terms how these profiles are used in aerial demonstration performances?
  - 15A. Can you be a little more specific?
- 16Q. Sure. Which specific profiles did you fly -- or flew and participated in -- and what were those profiles that you flew?
- 16A. In training, I flew both the 10-minute and 12-minute profiles -- or participated in them. In the actual demonstrations, we always flew the 12-minute demonstration the longest.
  - 17Q. Or Profile 3?
- 17A. Correct. The longest demonstration also meant departing the field and arriving at the same field. Usually, in our demonstrations, we were parked at the airfield that the air shows were being presented for. The 10-minute profile is meant more for departing an airfield that the air show is not present at or arriving in the air, so we never flew those in actual demonstration. The purpose of flying the demonstrations were to display the capabilities of the aircraft -- the C-17.
- 18Q. Do you think displaying the capabilities of the aircraft was at max performing the aircraft?
- 18A. I guess it depends on, maybe, parts of the profile where you are showing a high speed pass, which is max performing the high speed that you can go in the aircraft, the same at low speed. So, I would say, in a way, it is max performing the aircraft.
- 19Q. For the record, you said that you performed and certified in 7 air show demonstrations?
  - 19A. Yes, sir.

- 20Q. And the pilots that you had, again, for the record, if you could state the pilots again?

  20A. WITNESS 3 and MP were pilot positions, and MSO was co-pilot for all seven.
- 21Q. As a safety observer, did you ever feel the need to provide input or have an air show demonstration profile modified for any of the demos that you did?
- 21A. I know we talked frequently, prior to every show, on how we could change things to make them better and safer. I cannot think of anything specifically. I do know, one show in Korea, we had a terrain that was in our flying box. We discussed how we could modify or profile the altitude.
  - 22Q. When you say "flying box," what do you mean?
  - 22A. The altitude and radius of the field that we are flying in.
  - 23Q. It is a pictorial schematic; is that what you are referring to as a box?
  - 23A. I guess an operating area for the profile.

### **Questions by the Pilot Member:**

- 24Q. You said you had terrain in it, meaning, you had to adjust certain parameters based on that terrain; is that accurate?
  - 24A. Correct.
  - 25Q. Do you remember how you had to adjust them?
- 25A. For that instance, it was fairly easy. There was a rising terrain; I cannot remember which direction from the field. But it was one of our turns, off-centerline, that brought us over that terrain. So, our normal altitude that we fly, we obviously had to make it higher just to clear that terrain safely, so that is what we did.

- 26Q. As safety observer, did you see MP or MSO fly the profiles during the Thunderbird Tour in the Pacific?
  - 26A. Yes.
  - 27Q. Tell us about those flys?
  - 27A. There's not much -- what specifically?
- 28Q. How were they performed? Were they done specifically to AFI 11-246? Were they specifically there? Were they modified? How did they fly them? How did those pilots fly them?
  - 28A. I would say they flew them according to profile.

- 29Q. Let me ask you, specifically, then. On initial takeoff, what was your target altitude on initial takeoff?
- 29A. I am trying to remember as to safety, not as involved in the specifics of how the profiles, altitudes, speeds, all that. I want to say 1000 feet to 1500 feet., in that range, on initial takeoff, we would climb up to.
  - 30Q. I need a clarification, if I may. As a safety observer, what are you watching?
- 30A. Make sure the checklist are being accomplished. I am also giving responses on checklist. Making sure the landing gear and configuration of the aircraft is where it should be at proper times.
  - 31Q. Do you watch bank angles?
- 31A. I do. Personally, I do. I do not believe it was ever briefed as a requirement of safety. I took the position of "safety," meaning, safety of the entire airplane, so, yes.
- 32Q. How about warnings inside the airplane? Do you bring them up to the crew? Do you annunciate them to the crew? How is that handled?
- 32A. Yes, I would say -- I cannot remember, specifically, the warnings that we had. I do know that MP MSO and WITNESS 3 are all very good at acknowledging warnings. Usually, when we get to the point, where I would have to acknowledge it, the guys in the pilot and co-pilot seats would be quicker to acknowledge before I would have to bring it up. But, yes, that is something I am backing him up on, making sure that--
  - 33Q. You are familiar with the 12-minute program Profile 3, correct?
  - 33A. Yes, sir.
  - 34Q. Describe the departure portion from the static takeoff and Profile 3?
- 34A. Static takeoff, meaning, breaks were held and throttles were advanced to full power. As full power is attained, pressure is released and we start the takeoff roll.
- MP and WITNESS 3 being in the pilot position, would rotate the aircraft and takeoff, usually, 5 to 10 knots over the rotate speed, taking in the extra speed for the climb. Then they would pull up, climbing to -- like I said earlier, I am not sure -- I think it depended on where we were. But somewhere in the 1000 to 1500-foot altitude, they would pull up to, climbing out at a VMCO -- the climb out speed -- sometimes above that, depending on that day and variables. Once reaching altitude, we would start, again, depending on the show, a left or right bank turn, usually a 60-degree bank, and the heading would be dependent on the location.
  - 35Q. So, the initial, let's call it the 80/260, I think is what is inscribed; is that correct?
  - 35A. Yes, sir.
- 36Q. The initial 80-degree turn 80-degree off that primary heading -- was done at 60 degrees of bank?
  - 36A. Yes, sir.

- 37Q. And the 260 degrees back to show centerline, that was done at 60 degrees bank, or, at what bank angle?
- 37A. Max 60 degrees. Again, it would depend -- whatever bank, up to 60 degrees, to get you back to centerline. MP has always taught, either 45 degrees or 60 degrees.
  - 38Q. That is what he taught. What did he fly?
- 38A. He would fly either 45 or 60 degrees. It was something he always said over and over. Sometimes, flying, in between there, I guess, would create the pilots to -- they are not focusing on that bank angle when they are not flying 45 or 60. Does that make sense? So, he would always say that to make sure people were paying attention. That is something, as a safety observer, I would always point out: if they are flying 40 degrees, I would say 45 or 60.
- 39Q. You mentioned a range of 1000 to 1500-foot altitude above ground level. Did you ever see the altitude stop at 1000 foot?
  - 39A. I cannot specifically remember. I do not know.
  - 40Q. What was the use of the rudder during the 80/260 maneuver?
- 40A. I know MP taught -- I'm not sure. I know it helped in increasing the turn diameter or decreasing it. As long as you maintained that 60-degree bank, you are getting a tire turn by using a rudder. Other than that, I do not really know much. Like I said, never flying a profile -- never used it or fly that. I do know that it was used to get that tire to turn.
  - 41Q. Let me step back for a minute. You said you were upgrading in co-pilot training?
  - 41A. Yes, sir.
  - 42Q. Who was training you there?
  - 42A. MP
- 43Q. Did you ever back him up? Did you follow him through on the stick and rudders, throttles, things like that?
  - 43A. I was always ready to take control if I had to; so, yes, to that question.
- 44Q. As a co-pilot, you did not watch the bank angle, or sit as his co-pilot, in the upgrading?
- 44A. No, I would, depending on the -- as a co-pilot, you are running a lot of checklists and you are not as attentive as the safety is, in that aspect. It would depend on the phase of the flight. Yes, as a co-pilot, I am backing up the pilot; it is still my job. Does that answer your question?
- 45Q. Yes. During the 80/260 maneuver, how was the aircraft configured and deconfigured?
- 45A. On takeoff, you want to see a positive climbing rate from the ground as you come up. Throughout the whole 80/260 maneuver, you are preparing for the high speed pass, which is

a clean configuration, so you would be on speed. The computer figures out what speed the flaps track/re-track, and on those speeds, we would be cleaning up the configuration of the aircraft.

- 46Q. On speed, was it a challenge or response between the pilot and co-pilot, as the normal Dash-1 checklist is ran, or how does that work?
- 46A. The normal Dash-1 checklist is a challenge response. I have only done, as a copilot, I have flown, once, the aircraft, doing those duties for the demonstrations. I cannot remember --

### **Questions by the Pilot Member:**

- 47Q. When was the last time you flew -- co-pilot?
- 47A. It was a week from the Monday prior to the accident. I want to say the 19th?
- 48Q. So, fairly recent, right?
- 48A. Yes. I cannot remember, in the demo, if a pilot would challenge and there would be a response, or, if it was just a safety brief on speed.

### **Questions by the Board President:**

- 49Q. Regarding the AFI 11-246, C-17 profiles, what were you taught about adherence to those profiles? By "adherence," were they regarded as guidelines, only, or procedures?
- 49A. I cannot remember. I do know that we had thoughts of changing profiles. I know that we talked about how there was approval processes to get that done, you can't just do it. I cannot remember if we were taught guidelines or procedures.
- 50Q. Let me just ask you this: If you see a regulation, is that a guideline, or is that a procedure?
  - 50A. A procedure.

[Brief recess. All parties were again present.]

- 51Q. We were talking about the use of the checklist. Regarding the use of the checklist, again, which demo crewmember initiated or called for the checklist?
- 51A. The pilot, and sometimes the co-pilot, being proactive, would start a checklist -- would ask to start a checklist.
  - 52Q. Would the pilot call for the checklist during the profiles?
  - 52A. Yes.
- 53Q. Regarding the checklist, do you recall using something called an "aerial demonstration checklist"?
  - 53A. Yes.

- 54Q. What was that?
- 54A. It was a checklist with a -- I received it from MP to my training, as did everyone. It had all the Dash-1 checklists for the aircraft that we normally used, with added steps -- things that we would use for the profile.
  - 55Q. Do you know where it came from?
  - 55A. I do not know.
  - 56Q. Do you know who approved it?
  - 56A. I do not know.
  - 57Q. Could you talk us through how it was utilized?
- 57A. The same way the Dash-1 checklist was utilized, the checklist would be called for and then the steps would be completed by the co-pilot, pilot, and safety. Does that answer your question?
- 58Q. Yes, that is fine. We talked about warnings. But do you remember, specifically, getting warnings or alarms from the aircraft during aerial demonstration profiles?
  - 58A. I do. Warnings: the only one I can think of is stall warnings.
- 59Q. When you heard the stall warnings during the profile, what were your crews' response?
- 59A. It would be acknowledged. For the stall warning, the pilot obviously has the controls over correcting that warning; so he would take action. And then safety would make sure the stall warning would go away. If it did not, then make sure it is still being acknowledged and something is happening to fix it.
  - 60Q. The stall warnings happened when MP was flying?
  - 60A. I would say it was pretty common for the profile to enter the stall margin.
- MP -- I cannot remember specifically. I would say, yes, we got a stall warning with MP just recently.

  MP I do know that WITNESS 3 I cannot remember.
  - 61Q. When MP got the stall warning, what was his reaction?
- 61A. It's hard to say. I cannot remember exact instances. I do know it would usually occur around the same points.
  - 62Q. And where were they?
- 62A. Whenever we were in a high bank angle, 60 degrees, and at slower speed. It was always on the turn -- or, in a turn.
  - 63Q. When you say "a turn," did it occur during a 80/260 maneuver?
  - 63A. I cannot remember.

- 64Q. But you know that they occurred?
- 64A. Yes.
- 65Q. How long did the stall warning stay on?
- 65A. I cannot remember specifically. I cannot really say.

## **Questions by the Pilot Member:**

- 66Q. Do you remember how many times you heard it -- heard the words "stall"?
- 66A. It was frequent in the profile. They were making those tight turns. It is hard to say, never actually flying the profile. Everyone is aware that we were looking at the speed tapes on the displays that show the margin speeds, everyone knew when you are close to it. That is where the crew would try to fly, max performing the airplane. I cannot say how long, or how many times, specifically.

- 67Q. So, you did consider flying the profiles? You just said max performing the airplane, is that what you are -- the capabilities -- is max performing the airplane?
- 67A. I would not say that is a true statement. The capabilities of the aircraft -- showing some of the capabilities require max performing the airplane. Does that make sense?
- 68Q. Let's step back for a minute. You were talking about configuration and deconfiguring the airplane. When you made the initial 60-degree bank, 80 degrees off heading, that is when you would start cleaning up on speed, correct, to retract the flaps and retract the slats?
  - 68A. Correct.
- 69Q. Did you ever know of the aerial demonstration pause initiating the 260-degree turn back to runway centerline, or the show center -- when they initiated that, were they always clean, or did they retract slats to turn? Can you describe that?
- 69Q. I think it was different every time you fly, at what point you reach the airspeed to retract flaps or slats. I do know, in that turn, you make the 60-degree bank to approximately 80 degrees heading, and then once you hit that heading, you rollout and we would timeout bound for a certain time, wings level. Usually, in there is when you would get the speed to retract anything. It varied. Like I said, we also varied the times that we flew outbound; it was different every time. I cannot say I remember, at what point, exactly, what was retracted; it was different every time. It was always when we reached that speed. If it was in the turn-back to runway, I would say, yes, it would probably happen at some point -- at that point in return.
  - 70Q. What about on 19 July 2010?
  - 70A. I honestly cannot remember. I was the co-pilot.

# **Questions by the Pilot Member:**

- 71Q. You were sitting as the co-pilot; you would have been the person moving it?
- 71A. Correct.

- 72Q. You said you flew with MP during the air show tour and you did receive your initial training from him, correct?
  - 72A. Correct.
  - 73Q. Did MP have any particular strengths or weaknesses?
- 73A. I always knew MP as being a pretty sharp pilot. Usually, he will answer questions that a lot of the other pilots could not: technical stuff. I would say that is definitely one of his strengths was his knowledge of the aircraft, for sure. I cannot think of any weaknesses that I would have been able to see.
- 74Q. At any time before or after your training, did MP mentioned to you his philosophy or viewpoint regarding the aerial demonstrations?
- 74A. I think he made it clear to follow the 11-246. He never tried to put his personal touch, I would say, on anything -- if that is what you mean by philosophies.
- 75Q. Did he ever try to make it more crisp, or try to better improve the profile on how the aircraft performed, anything like that?
- 75A. When you say the word "crisp," he did always say -- he made it a point to do his rule-in and rule-out of his turns, his banks crisp, not do it slow, or do it half at once and continue. In that aspect, he tried to make it clean looking for the crowd, put on a good demonstration. That is all I can really say.
- 76Q. During your air show upgrade, did you review a PowerPoint slide show on an air show upgrade demonstration profile, those types of things; did you receive that?
  - 76A. Yes, sir.
- 77Q. In that there was a segment where you could hyperlink into videos of air show performances, did you ever see those?
  - 77A. I cannot remember.
  - 78Q. You do not remember what you saw during your upgrade briefing?
  - 78A. [Pause.]
- 79Q. I will remind you. For the record, I am showing the PowerPoint presentation of the 2010 air show upgrade [handed document to witness]. Do you recall seeing this?
- 79A. [Witness reviewed the documents.] I cannot say this is the exact presentation, but it is the same information presented. I cannot be sure if this is the exact one.

[The documents were retrieved from the witness. The board took a brief recess.]

[The board resumed with all members and the witness present.]

Board President: WITNESS 8 we are going to follow-up on some of the questions before we end this interview. I am going to turn it over to

### **Questions by Pilot Member:**

- 80Q. We had talked previously regarding stall warnings and we got some testimony from you regarding how long you might have heard some of those stall warnings and how many times throughout the different profiles you might have received stall warnings, specifically. I did want to revisit that and ask you whether it was during the air shows, when you were safety observer, or during your upgrade to the co-pilot position, during the ground training, simulators, or during the flights, if you did receive the stall warnings, what was verbalized when the stall warnings went off from the crew?
- 80A. In general, it was usually the pilot or co-pilot that would acknowledge it -- say, crew, stall warnings, acknowledged. And effort by the pilot, would rule out that the banks -- I would say that is usually where the stall warnings came into play -- rolling out of bank, power is already at max, in those instances. We are rolling out of the bank -- getting rid of the stall warning, it would be a brief encounter -- the bank would be increased back to, maybe, going into slower -- redoing the process of getting rid of it -- I would say how it would occur.
- 81Q. Do you recall hearing the stall warning, maintaining the bank, and an acknowledge call being made, and still carrying on with the maneuver, while still hearing: stall, stall?
- 81A. Yes, carrying on with maneuver would occur. But not without -- the same stall warning happening to that maneuver, that did not happen. Like I said, we would go out of a little bit of bank, which is usually right on the margin, there, on the stall, and then roll back in and maybe get it again, maybe not; I would say is how it occurred. The entire maneuver was never seized.

#### **Question by the Board President:**

- 82O. It was just adjusted?
- 82A. It was adjusted to fix the stall warning.

### **Questions by the Pilot Member:**

- 83Q. Do you remember any of the particular inputs -- and when I say inputs, I mean what the pilot flying was doing that might have caused the stall warning to come on, particularly?
- 83A. I would say that the high banking was the major cause. From what I remember, that was the only time I would ever hear the stall, was when we rolled onto that bank.

- 84Q. Do you ever remember it being tied to any specific movement? You mentioned bank. What about pitch or rudder? Do you remember that, particularly, having any effect on the stall warning?
- 84A. I cannot say pitch was ever -- it was always on a level turn. I do not remember hearing it in the climb. I guess, in that 80/260 turn, we are descending at the later part of it.
  - 85Q. What about back-stick pressure, specifically?
  - 85A. No. I cannot remember anything.
- 86Q. What does "acknowledge" mean to you as a crew member? Can you define that for me?
- 86A. Sure. Acknowledge means, one, you know that the warning is happening and you are going to do something to fix it. If you are not, you let the crew know what is going on, why it is not getting fix at that moment.
- 87Q. Were there ever times that you talked about it as a crew, versus doing an immediate correction?
- 87A. No. There was never -- it was always a correction in flight at that time. It was never anything like that.
- 88Q. So, once you interpreted acknowledged to mean "I have received and understood this warning and we are planning to do something to correct it," is that accurate? I will let you put it in your words.
  - 88A. Yes.
  - 89Q. If you want to put it in your words, that's fine.
- 89A. In my words "acknowledge that the warning is occurring and we are fixing it" is acknowledged.

- 90Q. In the 7 demonstrations that you flew in, in the pre-brief, did you ever brief the use of timeout and knock-it-off?
- 90A. Yes, every brief. It is in -- I cannot remember the name of the aircraft commander briefing.
- 91Q. But, specifically, for air shows? And, if so, did you ever see one, a timeout or knock-it-off occur?
- 91A. I have never seen one. Specifically, for the air shows, we talked about it the brief, but not for the procedures we were doing. The applications of those, I cannot say that we did. Just the general definition of timeout and knock-it-off and when you can use it. But I never saw one in the aircraft.

# **Questions by Pilot Member:**

- 92Q. Did you ever pre-brief or brief during the aircraft particular areas where you might encounter stall warnings?
  - 92A. I cannot say that we did.
- 93Q. You had mentioned earlier in your testimony that during your 80 degrees of heading change for the 80/260 maneuver, that you would plan a timing outbound after that 80 degrees of heading change. Can you put it in your words what that timing was for?
- MP and some input from the rest of the crew on ideas. But the timing, itself, was planned for the max bank angle, 60 degrees, to keep the aircraft closer to show center, as opposed to a lower bank angle, which would drive a further out, beyond the 80-degree rollout -drive further out away from show center, using a lower bank angle. I would say the timing was derived from using a max bank angle.
  - 94Q. Which, in this case, would be?
- 94A. 60 degrees. And that was always planned so that you would rollout on centerline and not overshoot. In the sim, it would have the printouts of our profile and it would have different timings and it would say: this one we did not overshoot and it was at this time. That was how it was narrowed down -- the timing that we would use.
- 95Q. You mentioned that it was to keep it closer to show center. Why would you want to keep it closer to show center?
- 95A. Me, personally, just for air show, displaying the aircraft and its capabilities, to me, that means you are not driving out 10 miles from the field, or whatever distance, but keeping it at a closer radius to the field.
- 96Q. Is the concept "keeping it closer" is better for presentation to the crowd; is that a fair statement?
  - 96A. Yes.

- 97Q. Did you ever see another overshoot during the Pacific tour?
- 97A. Yes.
- 98Q. What happened then?
- 98A. You have to accept an overshoot and fix it. When you rollout, you just get back to centerline and stay away from the crowd, obviously.

# **Questions by the Pilot Member:**

- 99Q. The other area I would like to touch upon, during and after the initial climb out and, again, for the Profile 3, and then as you maneuver to the 80/260. Can we talk more about the clean-up, in other words, when the flaps were put up and the slats were retracted? What speeds did you use; were they pre-briefed; and how was that announced to the crew?
- 99A. The speeds that were used were computed from the mission computer -- retract and flab tract speeds -- everyday, they were different. Those are the speeds you use to retract and clean the aircraft. We briefed on the ground before -- and got our TOLD--
  - 100Q. Takeoff and landing data?
- 100A. Right. Once we got the numbers, this is flat retract, this is slat tract, cleanup on speed. That is when we would clean up.
- 101Q. So, the co-pilot would be the person that cleaned up, that moved the handle, correct?
  - 101A. Right.
  - 102Q. Would he just do that automatically with the safety observer watching, or?
- 102A. I have seen that happened without a -- I assume, you mean, no challenge from the pilot?
  - 103Q. [Affirmative response.]
  - 103A. Yes. I have seen that happened. Me, personally, I would verbalize it.
- 104Q. So, you verbalize it. Did you ever fly with MP Do you know what his preference was?
- 104A. I cannot say he had a preference. He never made it known that he had a preference, if he did.
  - 105Q. You flew with him on the 19th, correct?
  - 105A. Correct.
  - 106Q. During that training, did you verbalize it, or did you just do it automatically?
  - 106A. When I was in the [inaudible], I verbalized.
- 107Q. Can you remember -- can you try to recall for us where that cleanup occurred? Was it before the 260-degree turn? Did you ever do the 260-degree turn, partially configured, or were you usually clean?
- 107A. I would say usually clean. Cleanup on speed, if it happened at the beginning of the turn, we would do it at the beginning. We would not wait to configure before going in the turn, if that was the situation. I cannot specifically remember a time doing it. But I do know that that is how it would happen.

108Q. Is it fair to say, if that speed occurred after the 260 was initiated -- let's use minimum slide retraction speed -- if that speed were to occur after the right turn was initiated, is it your interpretation that the slides would be retracted at that point, whenever that speed occurred?

108A. Correct.

109Q. Is it fair to say that it was not really a consideration, as to whether or not you were in a turn, to be configured?

109A. Correct.

## **Questions by the Legal Advisor:**

110Q. Building on question, you said that the slant retractor/flap retract speed, when that occurs, that is when you execute those moments on speed?

110A. Correct.

- 111Q. And whenever they occurred is when they would retract?
- 111A. Correct.
- 112Q. Would the outbound time that you would do that initial 80 degree heading change, you go outbound for a certain amount of time, because you are planning for a 60-degree bank, 260 heading change, is that right?
  - 112A. Right.
- 113Q. Would the time heading out adjust for the minimum slat retractor/flap retract speeds?
  - 113A. No.
  - 114Q. It would just, whenever it occurred, it occurred?
  - 114A. Right.
  - 115Q. And that is based on the mission computer in the aircraft?
  - 115A. Correct.
  - 116Q. And the mission computer takes up a number of variables?
  - 116A. Correct.
  - 117Q. In order to compute the slat retract and flap retract speed?
  - 117A. Yes.
- 118Q. Earlier, you mentioned that MP taught and flew bank angles at 45 and 60 degrees during aerial demonstration profiles. Can you explain what that meant?
- 118A. Yes. It was basically just a way of reminding people to have that crisp display of bank rate and not -- this is kind of hard to describe. If someone is not paying attention to bank

rate and they are doing a 30-degree bank turn and not realizing it, they could be going up to 45, and now they are going to overshoot, it was kind of a way of him making people think about what their bank rate is and that they are using it to have the correct turn rate.

- 119Q. But why the two bankings?
- 119A. I cannot say why. At 45 degrees, a common bank angle that we use, 60 degrees is the max----
  - 120Q. Are there different speeds at which these are occurring?
  - 120A. At higher speeds, we would be using the 60-degree bank.
  - 121Q. Why is that?
  - 121A. You are in a safer configuration, I guess.
  - 122Q. I think you used the term "safer regime"?
  - 122A. Yes.
- 123Q. At higher bank angles, if the aircraft is going faster, it is safer to go to a higher bank angle, up to 60 degrees?
  - 123A. Correct. And at slower speeds, a higher bank rate, a stall will occur.
  - 124Q. A stall will occur?
  - 124A. [Affirmative response.]
  - 125Q. Executing a 45-degree bank, it can be done at slower speeds?
  - 125A. It can be done at either slow or fast.
- 126Q. But a 60-degree bank, you would need more speed? You can go slower and do a 60-degree bank and avoid a stall?
- 126A. Right. It depends on what speed you are talking about. You could do a 60-degree bank and you are not in a stall.
  - 127Q. But you can do it if you have enough speed, basically?
  - 127A. Correct.

LEGAL ADVISOR: That is all I have, sir.

PRESIDENT: WITNESS 8 is there anything else you would like to add that would aid us in this investigation?

WITNESS: [Negative response.]

PRESIDENT: You are reminded of the official nature of this interview. You may not discuss your testimony with anyone without my permission at any time before the report of this investigation is officially released to the public.

This concludes the interview. The time is now 1626 local, Alaska time.

### **V9. AIB INTERVIEW WITH**

## WITNESS 9

#### VERBATIM TESTIMONY OF

## WITNESS 9

PRESIDENT: My name is Brigadier General Carlton D. Everhart II. We are investigating the C-17 accident that occurred on 28 July 2010 at Joint Base Elmendorf-Richardson, Alaska. This investigation, conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 91-204. The purpose of this investigation is to produce a publicly releasable report on the facts and circumstances surrounding this accident and to gather and preserve evidence for use in claims, litigation, disciplinary actions, and adverse administrative proceedings, and for all other purposes. A safety investigation was previously conducted on the accident. Any testimony you gave before the safety investigation board will be kept confidential, if you were so advised, and can be used only for accident prevention purposes. This board does not have access to any confidential testimony you gave before the safety investigation board. Your sworn testimony to us may be used for any proper purpose. Additionally, your testimony can be released to the public. Do you understand the difference between your testimony before the safety board and this accident board?

WITNESS: Yes, sir.

PRESIDENT: Your testimony in this investigation will be under oath. At this time, I will administer the oath. Please raise your right hand.

[The witness did as directed.]

PRESIDENT: Do you solemnly swear that the testimony you are about to give in the matter now under investigation shall be the truth, the whole truth, and nothing but the truth, so help you God?

WITNESS: Yes, sir.

PRESIDENT: Today is the 15th September 2010. This time is now 1642 local, Alaska time. This interview is being conducted in building 7309, room 106, Joint Base Elmendorf-Richardson, Alaska. The persons present are:

The witness.

WITNESS 9

Legal Advisor;
Maintenance Officer;
Maintenance Member;
Court Reporter; and,

me, [Brigadier General Carlton D. Everhart II, Board President]

PRESIDENT: The witness has been sworn.

- 1Q. Please state your full name and rank.
- 1A. WITNESS 9
- 2Q. How long have you served in the Air Force?
- 2A. 21 years.
- 3Q. What is your unit of assignment and location?
- 3A. 703d AMXS, 517 AMU, Elmendorf Air Force Base, Alaska.
- 4Q. How long have you been with his unit?
- 4A. Since April of last year, 2009.
- 5Q. Your job title?
- 5A. Production Superintendent.
- 6Q. How long have you been in this job?
- 6A. Since December 15th.
- 7Q. Please describe your duties and responsibilities on 20 July 2010.
- 7A. As far as duties, I oversee the flight line maintenance that goes on on the aircraft, and make sure everything is going expeditiously, but in a safe manner. I check on the people, make decisions on wherever we want to go depending on what our scheduled maintenance is, or any other maintenance that comes up like unscheduled maintenance. I make determinations on what has priorities according to the flying schedule and our other scheduling.
- 8Q. You said where you want to go. You mean how you want to conduct maintenance?
  - 8A. Yes, in which order, basically, to give us the best outcome.
  - 9Q. By order, you mean which order of aircraft?
- 9A. So, which order of aircraft and which order of jobs. Some jobs might be a little quicker to finish than compared to other ones, so you kind of prioritize and try and fit everything into your shift.
  - 10Q. You said your position in the maintenance organization was pro super, correct?
  - 10A. Yes, sir.
  - 11Q. Can you describe to me what a pro-super is?
- 11A. That's the overall enlisted supervision on the flight line. Basically, we are responsible for everything that happens on the flight line.

- 12Q. For which aircraft did you perform these duties?
- 12A. All the C-17s that are out there.
- 13Q. How much experience do you have maintaining the C-17 aircraft?
- 13A. Besides a brief stint in TA, I have a little over a year.
- 14Q. TA stands for?
- 14A. Transient alert.
- 15Q. Can you describe your total training that you have gone through in order to be a pro super for the C-17?
- 15A. I'm still going through training. It's an everyday deal, but it's pretty much on-the-job training so far. I was scheduled to go to pro-super school at Fort Dix, but I believe that has been pushed off for a little while longer. It has been on-the-job training since day one in December, for the C-17s.
  - 16Q. Were you at work on July 28, the day of the mishap?
  - 16A. Yes, sir.
  - 17Q. What shift hours did you work that day?
  - 17A. I work midnights, basically from 10:30 to 6:30 in the morning.
  - 18Q. Do remember what aircraft you signed off, or were involved with on that day?
  - 18A. I do remember 173, yes.
- 19Q. If an exceptional release--let me rephrase it this way. Did you sign an exceptional release on that airplane?
  - 19A. Yes, sir.
  - 20Q. Can you briefly describe what an exceptional release is?
- 20A. An exceptional release is basically you are telling the air crew that everything is fine with that aircraft and you believe it is safe to fly.
  - 21Q. What is a conditional release?
- 21A. A conditional release means there is a mission degrading problem with the aircraft or something we're working on. In that case, we have a dual role type of airdrop that we put a conditional release on just because they cannot perform part of their mission with that dual role system in the cargo area out. That is why it is a conditional release. It needs to be a highlighted area so that the air crew knows they can perform that part of their mission.

### **Questions by the Maintenance Member:**

- 22Q. You are trying to say you can't do an airdrop for the overall mission?
- 22A. Right.

- 23Q. But as far as the profile, the mission that was scheduled for that day, was the aircraft able to perform that mission?
  - 23A. Yes, sir.

- 24Q. An ER, exceptional release, or conditional release, would not necessarily involve any maintenance performed on the aircraft by you personally?
  - 24A. No, sir.
  - 25Q. You are just ensuring that the other maintenance professionals did their job right?
  - 25A. Yes, sir.
- 26Q. In your current job, what are your current responsibilities with regards to tail number 173, the mishap aircraft?
- 26A. Basically, to make sure it was maintained. When we get the jet down, we check to make sure everything is good and the write ups are worked, or if they can be pushed off to a later date, or if we can make a determination if we can get them up and get it on time for the next mission, and make sure we have the fuel, quick inspection, and then send it out on its way.
- 27Q. For the record, you said, when we get the jet down. Does that mean from scheduling or what?
  - 27A. When it lands from a scheduled flight or the previous night if it is flying.
- 28Q. What was your first interaction with the aircraft prior to the scheduled sorties on that day?
- 28A. Actually, we waited for it to land and then we did our--I believe we did a through flight, fueled it up and I can't remember the fuel off the top of my head, but we fueled it up. We had everything ready and everything looked good. We didn't have any write ups. If I'm not mistaken, they landed alpha 1 which was basically no maintenance write ups. It was ready for its next mission.
  - 29Q. What is a through flight?
- 29A. A through flight is a quick inspection, not necessarily a quick inspection, but we check critical components. You don't go in depth like a post flight inspection where you check a lot more things, engine, different components like that, but you go through and you check the--if I'm not mistaking, because I don't have the cards in front of me, but the tires, gear, hydraulic servicing, and a few things like that to ensure that it's ready to go and nothing major happened when it was in flight that the air crew didn't notice. We take those things and then determine whether it can fly on its next mission or not.
  - 30Q. How long had you been on the shift at this time?
  - 30A. I would say about 5 1/2 months.

- 31Q. Now that particular day, you said you worked midnights so were talking midnight of the 27th through the 28th, correct?
  - 31A. Yes, sir.
  - 32Q. How long had you been on shift by the time the aircraft had come back then?
  - 32A. Actually, I think it was landing as I was coming on, if I not mistaking.
  - 33Q. What time did you start your shift?
- 33A. The shift actually started at 10:30, but normally we would show up around 10 and try to get an idea of what was going on. It also depends on if we are going to the gym that night before or not.
- 34Q. So, your preparation for tail number 173, what does that entail, again, to prepare it for flight? What specifically do you remember was accomplished?
- 34A. I remember we did a through flight. I know we've put gas on it and we performed intake and exhaust inspections, one for after flight and one before flight.
  - 35Q. An intake and exhaust inspection, what does that accomplish?
- 35A. Basically come and makes sure there are no abnormalities inside the intake area, the blades are all straight and don't have any nicks on them, the sound suppression around them doesn't have any holes or damage, anything in the intake area that could be basically out of place, a little piece of metal that is up in the air or something like that that the wind could catch, take it into the blades, and cause damage to the engine. Behind the blades, they check in there for sound suppression as well and make sure there is nothing damaged on it. For exhaust, they check for cracks along the translating faring in the back, right above the tail cone. They check the tail cone, they check the blades, the turbine blades in the back of the engine. They check all that and make sure there is no damage to the aircraft or something that is not quite damaged yet, maybe it has a crack or something like that, that will prevent damage in the future.
  - 36Q. Do you know who was the pro-super on-duty for the shift prior?
  - 36A. I'm trying to remember. I believe it was
- WITNESS 2
- 37Q. What was your workload mission scheduled for this aircraft?
- 37A. Actually, it was fairly light. We didn't have a whole lot of things. We had to do the inspection and get all that straightened out, other than that, there was no heavy maintenance that had to be done.
  - 38Q. So, there were no discrepancies to be worked?
  - 38A. Not that I can remember.
  - 39Q. In your own words, would you please describe a discrepancy?
- 39A. Basically, it's something the air crews found that is unsatisfactory with the airplane, a component that is not working properly, say, a radio or something of that nature.

Maybe they can receive or transmit from outside the aircraft. If we have anything, we will have one of our maintainers go out there and find out what the problem is.

- 40Q. What was the status of the aircraft when it departed for the very next flight?
- 40A. For the first flight of the day?
- 41Q. For the first flight, correct.
- 41A. It would be PMCM for dual role, pretty sure.
- 42Q. PMCM means?
- 42A. Partial mission capable for maintenance. That was to do with that dual role problem and us not having the capabilities.
- 43Q. So, if I understand this correct, it was a fully functional airplane with no problems, except for it was written as coded partial mission capable only for the dual role modification that was needed?
  - 43A. Yes, sir.
  - 44Q. Is that correct?
- 44A. Yes. There were no other limiting factors other than there was the one we had. That's the reason we had that conditional release.
  - 450. How would you classify the mission capabilities at that time?
  - 45A. I think other than the dual role airdrop, it was fully mission capable.
  - 46Q. How about in between flights? What was the status of the aircraft?
- 46A. Once it landed, I believe it was PMCM as well, partial mission capable, as well. I don't remember a change in the status off the top of my head.
  - 47Q. Are you familiar with the term red ball maintenance?
  - 47A. Yes, sir.
- 48Q. Please give me a brief description of what red ball maintenance would be, or what it is.
- 48A. It is maintenance basically six hours prior to flight, any maintenance that happens on the aircraft. Most notably once the aircrew shows up to the airplane, you want to make sure that we have a little bit of a priority, letting them know it is pretty close to the schedule so we want to make sure everything is good. So, what happens is we supply priorities and things like that, and everybody pays little bit more attention because it is within our launch window of when we are trying to get the aircraft off the ground.
- 49Q. Were there any red ball issues for tail number 173 prior to its launch window that you know of?
  - 49A. Not that I know of, sir.

- 50Q. Do you know the person who performed through flight on this aircraft?
- 50A. No, sir. Not off the top my head.
- 51Q. With a through flight, you said it was performed on your shift?
- 51A. Yes, sir.
- 52Q. Did you see the actual mishap?
- 52A. I did not.

President: Okay, At this time we would like to take a break and collect our thoughts, and if I may, I'll ask you to step from the room and will bring you back in as soon as we determine if we have anything to clarify.

[The board recessed at 1655, 15 September 2010.]

[The board reconvened at 1703, 15 September 2010.]

Legal: We're back on the record. All those who are present in the interview are again present, to include

- 53Q: WITNESS I want to briefly ask you two questions that we have. The first question is, you stated you worked on this airplane for a year, the C-17 airplane. I would like for you, if you would, to briefly state your maintenance experience throughout your career. What planes did you work with and the time that you worked those airplanes?
- 53A. The first 8 years, I worked C-130s at Little Rock. From there, I went to Korea and worked A-10s and F-16s. Then, I went from there to Mountain Home and worked KC-135s. Went to Fairchild and worked KC-135s there for little over a year, that I spent a little over 5 years in FTD teaching the electoral environmental systems for the KC 135. I worked as a scheduler there as well. I stayed in contact with aircraft during those 5 years. I went from there to here and started working C-17s.
  - 54O. FTD Stands for?
  - 54A. Field Training Detachment.
- 55Q. The terms we talked about, red ball, exceptional release, conditional release and discrepancy, those terms are generically used throughout the maintenance career field, you are familiar with those terms and know what they are?
  - 55A. Yes.

56Q. Are there any other matters that we haven't covered today that you believe are important to this investigation?

56A. No, sir.

PRESIDENT: You are reminded of the official nature of this interview. You may not discuss your testimony with anyone without my permission at any time before the report of this investigation is officially released to the public.

This concludes the interview. The time is now 1637 local, Alaska time.

[END OF PAGE]

### V10. AIB INTERVIEW WITH

# WITNESS 10

### VERBATIM TESTIMONY OF

# WITNESS 10

PRESIDENT: My name is Brigadier General Carlton D. Everhart, II. We are investigating the C-17 accident that occurred on 28 July 2010 at Joint Base Elmendorf-Richardson, Alaska. This investigation, conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 91-204. The purpose of this investigation is to produce a publicly releasable report on the facts and circumstances surrounding this accident and to gather and preserve evidence for use in claims, litigation, disciplinary actions, and adverse administrative proceedings, and for all other purposes. A safety investigation was previously conducted on the accident. Any testimony you gave before the safety investigation board will be kept confidential, if you were so advised, and can be used only for accident prevention purposes. This board does not have access to any confidential testimony you gave before the safety investigation board. Your sworn testimony to us may be used for any proper purpose. Additionally, your testimony can be released to the public. Do you understand the difference between your testimony before the safety board and this accident board?

WITNESS: Yes.

PRESIDENT: Your testimony in this investigation will be under oath. At this time, I will administer the oath. Please raise your right hand.

[The witness did as directed.]

PRESIDENT: Do you solemnly swear that the testimony you are about to give in the matter now under investigation shall be the truth, the whole truth, and nothing but the truth, so help you God?

WITNESS: I do.

PRESIDENT: Today is the 10th of September 2010. This time is now 1520 local, Alaska time. This interview is being conducted in building 7309, room 105, Joint Base Elmendorf-Richardson, Alaska. The persons present are:

The witness, WITNESS 10

Pilot Member;
Legal Advisor;
Medical Member;
Court Reporter; and,

me, [Brigadier General Carlton D. Everhart, II, Board President]

PRESIDENT: The witness has been sworn.

- 1Q. Would you please state your full name and rank?
- 1A. I'm WITNESS 10
- 2Q. How long have you served in the Air Force?
- 2A. 11 years.
- 3Q. Your unit of assignment and location?
- 3A. Currently, I'm assigned to the 3d Operations Group, Stan Eval, OGV office symbol.
  - 4Q. How long have you been with Stan Eval?
- 4A. I was assigned to Stan Eval in November 2009. So, how long? It has been just less than a year now.
  - 5Q. For the record, your job title?
  - 5A. Chief, C-17 Standards and Evaluation.
  - 6Q. There again, just one more time, how long have you been in this job as a chief?
  - 6A. As the chief, the same amount of time, so, when I got here in November.
- 7Q. Could you please describe your duties and responsibilities for us that you had on that date of 28 July 2010?
- 7A. Well, it was a little bit of a mixed bag as we get in the Air Force here. I came over to Stan Eval in November and the big thing that was in front of our faces at that time was the ASEV which was coming up. The ASEV is the standards evaluation inspection, basically, for Stan Eval.
  - 8Q. That is conducted by?
  - 8A. That is conducted by the MAJCOM, so PACAF in this case.
  - 9O. Major Command?
- 9A. Yes. So, we wanted to get all our programs together and squared away for that and right after that I was also chosen to be the director for Arctic thunder 2010. As soon as the ASEV was over, I was the chief C-17 OGV pilot, but I was heavily weighted in my time and duties by directing the air show which encompassed everything from all the ground operations, putting the air show together, working with fire and police and just the whole system of the air show and pulling all the pieces together for that. So, the ASEV was May. Am I correct on that?

PILOT: I think I have heard that mentioned.

- 9A (continued). So, May, June, July, August, I guess is 3 months leading up, very heavily working on the air show.
  - 10Q. Okay. Two questions for the record, if I may, OGV is?
  - 10A. Basically, Standards and Evaluation office symbol.
  - 11Q. Arctic Thunder is?
- 11A. Arctic Thunder is the biannual, every 2 years, the air show that happens at Elmendorf Air Force Base.
- 12Q. Prior to this, you made a non-privileged statement to the Safety Board. It is transcribed and is now part of what we call tab R. Did you have a chance to review it?
  - 12A. I have.
- 13Q. That statement was not taken under oath. Would you like to adopt that statement as part of your testimony today?
  - 13A. Yes.
- 14Q. If I may, I would like to go over just a few questions to clarify and to expand on what you stated in your statement which is now adopted and then we'll just pass it back and forth, questions per se, between Major and myself. Can you describe your aircrew certification program and the documentation that you have to have for it?
  - 14A. For the demonstration program?
  - 15Q. Yes.
- 15A. The whole process, basically, well, let me back up just a little bit and talk about the program here at Elmendorf. It's a fairly recent program. We just stood up the C-17's in the summer of 2007 so we did not have a C-17 program at all. The people versed in the Stan Eval office created the demo program because there is a demand and so they went through a process by which to get 3rd Wing guidance and program management guidance together and they staffed that up to the PACAF level, Pacific Air Force, level. Once that had taken place, then came the task of qualifying crewmembers to crew those aircraft. The process there was basically to go through training programs. The training program basically involved doing simulators and flying the different profiles—the profiles we flew most frequently, the 10 minute profile or the 12 minutes profile.
  - 16Q. That is profile one, or two, and three? Is that how it is described?
- 16A. There are four profiles. I don't remember which one correlates with each. I would be guessing without the reg in front of me. I know there is a 6 minute profile and one other. At any rate, so simulator, aircraft flight, flying the profiles, and then the documentation, a letter to be signed by the wing commander and I think, I don't know if it's the PACAF commander, I think it's less than that. I think it is the PACAF DO level, A through T Office. So

that letter is staffed up and there is also a face to face with the wing commander that says hey, you are on the demo program--the demo team now. You are demo qualified. These are my expectations as the wing commander for this.

- 17Q. That's once you have done all the certification?
- 17A. Yes, absolutely. Then, once all that has taken place, it is basically the certification is done on the paperwork is signed and you had the meeting with the Wing Commander and things like that.

### **Questions by the Pilot Member:**

- 18Q. Is there a ground training?
- 18A. Yes, there is ground training as well. Usually, you do that prior to the sim. I didn't mention that.
- 19Q. All that is documented? You mentioned that documentation goes in the evaluation folder or is it documented in a different area?
- 19A. Yeah, I think reviewing it since the Safety Investigation Board which was 30 days ago, I think there is a statement, and I would be guessing at where it is, but there should be something in the FEF and upon my own review of that, I think that we did not have those in there.

- 20Q. TMS write-ups also?
- 20A. I believe so, yes.
- 21Q. Training management system?
- 21A. Yes.
- 22Q. Then, your FEF--FEF is?
- 22A. It's a flight evaluation folder. Basically, it's the place where we store all the crew qualification form eights, Air Force Form 8.
  - 23Q. Certifying that a crew is qualified?
- 23A. Qualified, yeah. So, if you are basic qualified as a first pilot for a mission commander, that's where the documentation would be held.
- 24Q. You talked about the training profiles and how you were trained in your previous statement. Would you mind going back and telling us exactly who trained you and how you were trained to fly the profiles?
- 24A. Yes. Another thing, just picking up information as we have gone a long, when I was trained, basically I'm reading into your question a little bit. I'm reading into the specifics of their speeds and bank angles and things like that. Am I correct to say that, or not necessarily?

- 25Q. However you were trained. If you were trained to fly a specific bank angle or airspeed, sure. I'll let you describe that.
- 25A. I would--I don't--there are so many details in such a compact amount of time. I think the key things that come into my mind about it and things that I have also learned since the accident are that basically we are trained to the profile by the regulation. I think there is space, some gray area, maybe it is a little less gray now that you really go back and look at it, but initially it is a max power takeoff in the C-17, climb up to 1500 feet AGL usually. A majority of the demo profile is flown at 500 AGL, so basically----
  - 26Q. AGL is?
- 26A. Above ground level. So, basically you are trying to display the max performance take off and short takeoff capability of the C-17. So, you have popped up to 1500 feet above ground level and you are at a pretty slow air speed. The VMCO which is min climb out air speed for the C-17, and then once you get to the 1500 feet AGL or a max bank angle or air speed, kind of whatever comes first type of thing, the piloting side of the thing, then you go into a 45 degree left-hand bank turn or right depending on the air show, and start pushing over to get down to that 500 foot AGL. This whole time, you should be in a max power to gain airspeed back and get the energy state that you want as the pilot. Then, there is a fly off. Once you get to 80 degrees off heading, then there is a fly off. For every turn in the demo profile, there is a fly off.
  - 27Q. What does that mean? What is a fly off?
- 27A. What I mean is for the 80, 260 when you are speeding from-going from a slow airspeed to a higher speed, you're going to calculate based on your density altitude and things like other factors like that, how long do we need to fly off straight and level on 80 degree off heading to be able to do a 260 degree turn to be lined up on the runway and not over fly the crowd line? We get into a lot of deep stuff pretty quickly here, but the crowd line is usually a line that is 500 feet off the fence line for air show spectators. So, as a performer in an air show, it is one of the big things that people are thinking about, not to over fly the crowd line because then the FAA or the people that are monitoring safety of flight issues for performers may say, hey, this guy is not going to perform this demo because he is over flying the crowd and making it unsafe for the spectators. So, there is that in the back of the minds of the pilot performing the demonstration. So, the fly off timing is all set to get you far enough to be able to complete the maneuver and not over fly the crowd line, but also get lined up on your show line which is 500 feet off the crowd line.

- 28Q. Let me just make sure that I understand what I believe I've heard, and correct me if I'm wrong. So, you would do a static max power takeoff. The throttles are all the way in the max power with brakes held. Once the engine stabilized, I'm going to release the brakes and I'm going to start my initial role. As soon as I am at takeoff speed, I am going to rotate and I'm going to try to obtain VMCO, or the minimum climb out speed, to about 1000 feet above the ground level and then start to roll--start my push down to 1500 feet AGL.
- 28A. Yup. The only thing I would correct you on there is in the reg it says 1500 feet AGL is what you will climb to and to break that climb, basically you go into a 45 left degree bank turn and push. Going into that left degree--45 degree left bank turn helps that nose come down because you have taken some of the lift away.
- 29Q. Okay. As soon as I make that turn, then that fly out is where I'm actually going to fly out and away once I establish wings level and after I have gone 80 degrees of course change? 29A. Yes.
  - 30Q. I'm going to time, fly out, straight and level?
  - 30A. Absolutely.
- 31Q. Then I'm going to make my--once I hit my timing, then I'm going to start my 260 degree turn back to show center line to not go over the crowd. Is that correct?
- 31A. Yes. So, the other thing, and this gets back to the training, the training that I went through, the way I was taught was that I did a 45 degree left turn, the fly off, then a 60 degree right turn. The intent, I think there, is two things.

### **Questions by the Pilot Member:**

- 32Q. Do you mean 60 degrees of bank?
- 32A. Yeah, 60 degrees of bank, right turn.

- 33Q. That is how you were taught to fly?
- 33A. Yes. So, there are a couple of thoughts that I have about that. One is, by the time you have descended down to 500 feet AGL and you are max power and you have done the fly off, you should have sufficient airspeed to go to 60 degrees of banked turn. The second thing that I am thinking about is when you look in the current regulation now, what it says in there is that you will complete a 45 degree bank, 80, 260. That's, if I'm correct, I think it's the only place in the regulation that says—that determines or says this is the bank angle that you will fly. As you go through the demo profile, any of the high-speed passes, you can go up to 60 degrees banked turn, and the other thing that is of note is that the max bank angle for the C-17 is 60 degrees of bank angle. So, those are a couple of things that I think the culture of the demo program and the way it has been taught—the third thing about that 60 degrees of bank turn, one additional point there is I think that the culture has been such that you are in the airplane flying it, you want to put a good show on for the crowd and to put a show on for the crowd means you

are close to the crowd and things like that. A 60 degree bank turn will keep you closer to the crowd than a 45 degree bank turn. I think there is some of that culturally in the education of the demo program.

### **Questions by the Pilot Member:**

- 34Q. When you were taught, were you taught that was the--the 60 degrees of bank is better?
- 34A. That's a great question. If you just get to what I was taught, it was you go 45 degrees left bank turn. You get to your 80, you fly off, and then 60 degrees right bank turn.

### **Questions by the Board President:**

- 35Q. Who was your instructor?
- 35A. My instructor when I went through the program, both in the sim and in the aircraft--when I did the aircraft profile it was
  - 36Q. Just for the record, when I said reg, I was meaning regulation?
  - 36A. Yes.
  - 37Q. That reg was 11-246 that describes the profiles?
  - 37A. Volume 6, yes.

# **Questions by the Pilot Member:**

- 38Q. You mentioned the fly off distances that were used, and were calculated.
- 38A. Yes.
- 39Q. Did these come from graphs or charts or were they mathematically derived?
- 39A. Yeah, no. I think part of it is just a little bit of experience, like hey, in this turn you need three seconds. Going from a slow speed to a high speed, you need a 3 seconds fly off. Going from a high speed to a slow speed, you need five second fly offs. Some of that is just something that the guys--the folks who have been flying the demo profile kind of know. To my knowledge, there isn't a graph, an official table out there that says hey, at this pressure and altitude this should be your fly off. It would be a great document to have, but to my knowledge there isn't one available. So, you start with kind of a baseline and before you go actually fly a demo profile in an air show, you get a practice in that area which allows you to work on some of those things. So, you start with a baseline. Let's go three seconds on this turn, five seconds on this turn, four seconds on this turn and maybe the density altitude is off and it is taking a lot more space over the ground to do your turns at the speeds, density and altitude. So you go, oh man, we over flew the crowd line this day of practice so we need to adjust our fly off times and we need to go 6 seconds and 5 seconds.
  - 40Q. Density altitude is the altitude corrected for temperature?

- 40A. Right.
- 41Q. Is that an accurate statement?
- 41A. Yes.

### **Questions by the Board President:**

- 42Q. I believe in your previous statement you talked about the use of rudder. What does the rudder do for you? How does that work?
- 42A. Big picture, rudder is the control surface that controls yaw of the aircraft. Yaw is the pivot around the vertical axis, basically. If you stuck a pole through the center of the aircraft, top to bottom, it would make it swivel around that pole.
  - 43Q. Like a fish tail?
- 43A. Like a fish tail, yes. Or like a weathervane. Perfect analogy. So, use of rudder in the C-17, culturally has not been taught to be used very well. A lot of times in the C-17 we are taught to have feet on the floor type of stuff because the C-17 has systems that basically introduce automatic rudder for you when you go into turns or things like that. When you turn an aircraft, you introduce usually aileron, and the aileron is the thing that changes the wing makeup and makes one wing have more lift than the other wing and basically lifts that wing and can turn the aircraft. You introduce yaw into that system and now what you are doing is you're going into a coordinated turn. The C-17 has a system that automatically puts rudder in for you and should automatically coordinate for you. The thing that helps out in the demo because what we tried to do in the demo is to make sharp turns, to be crisp, I guess. If we are straight and level and we want to go into a 45 degree bank turn, we want to go right to 45, stop it, and we don't want to be wavering around. You want to look crisp and sharp and we went right to the bank angle we want and stopped. Some of the thought process behind that is to introduce rudder and get it to be sharp and coordinated, hold it, and back off on the rudder once the system catches up. I want to-- I just had some thoughts, and this is kind of a little bit different than the statement that I made here. The statement I made here, as I reviewed it, was that I brought some of the use of rudder from the T-6, and that's kind of a true statement in the sense that an airplane is designed to be stick and rudder and fly the airplane and it takes all that. I will talk about the T-6 for just a second. The T-6 has a system on it, I don't remember the name of it, but it was-you remember the name of the rudder system?

PILOT: I do not.

# **Questions by the Pilot Member:**

- 44Q. The T-6 is your previous aircraft which is a two seat training aircraft?
- 44A. Yes. I can't remember the specific name of it, but it was a rudder system that helped with p-factor, and p-factor is when there is a prop going, it adds left yaw to the aircraft. So, the pilot would have to introduce right rudder to correct that. The T-6 had a rudder system that was supposedly supposed to help put right rudder in automatically as the air speed increased. As Major and myself could attest, that system did not work very well so it always took the

pilot to introduce yaw--right rudder. Similarly, the C-17 system works very well. If you are out there flying around and you go 30 degrees of bank which is what the C-17 is doing 90% of the time, the yaw and the rudder inputs for coordinated turns work very well. When you are out there and you are trying to do to do rapid rolls and things like that, it is helpful to add a little bit of rudder and fly coordinated turns that way. So, the other thoughts I have about rudder use in the C-17 is that a lot of times, I just know this from flying it, I don't know how systematically copilots are doing it up there, but I think in general people will use rudder around final turns for landing, lining up on the runway. Similarly, in the demo program, I know people will use rudder to help the airplane around a little bit. I specifically would also use rudder just because I felt comfortable, stick and rudder type of stuff, adding rudder, feeling the aircraft, having my feet and hands on all controls surfaces basically in dealing with the aircraft could give me or not give me. So, I think those are basically some of the things that I have thought about since the safety investigation interview and hopefully it's a good addition to this interview as well.

### **Questions by the Board President:**

- 45Q. Now, in your previous statement you said that there could be possibly the addition of a significant amount of rudder. In your mind, what does "significant amount of rudder" mean?
- 45A. In my mind--do you remember in what context I said that? I can flip and look at it, if you don't mind.

PRESIDENT: Yeah. If you don't mind. We will take a break right here and that will give you a chance to.

[The board recessed at 1548, 10 September 2010.]

[The board reconvened at 1550, 10 September 2010.]

### **Questions by the Board President:**

46Q. WITNESS 10 earlier we were talking about the use of rudder. In your previous statement, LT COL W asked you, specifically, and I quote, "Okay, when you use the rudder for a 60 degree bank turn, how much rudder are you putting in, and are you putting in just a little or maybe to bring the tail around some, or have you gotten to a point where you have gone all the way with the full right rudder?" My question to you was, what does that mean, "a significant," and you answered and said, I don't think I've ever gone to full right rudder. I have gone to a significant amount of rudder to continue flying in a coordinated turn. What does a significant amount of rudder mean?

46A. I think to get quite detailed on how to use the rudder in the situation is--when I said a significant amount of rudder, what I meant was when I'm wings level and I'm going to go into a 60 degree bank turn in either direction, I would probably start with, as I introduce aileron, at the same time I would introduce about proportionally right rudder, probably up to half of right rudder deflection. As I set the wings to their 60 degree bank level, meaning as the wings

approach 60 degrees of bank, I would at the same time neutralize the ailerons. So, I would be putting right aileron in to go right 60 and I would be--once I got to 60, I would take the ailerons out to have clean wing and just hold it at that bank angle. At the same time I take the aileron out, I would release on the rudder as well. So, it would be input in together, input out together. So that's what I mean by coordinated. It is right foot, right hand and then release right foot, right hand at the same time.

- 47Q. When you say right hand, that's how you are describing it to me right now?
- 47A. Yes, or when you are actually flying it. It's what you are doing with your feet and hands. I don't think I would ever be in a situation where once my bank angle was set that I would have a significant amount of rudder in. I might be putting a little bit of pressure on the rudder, but I would not have a full rudder in no case. It would probably be an eighth of rudder input just to keep pressure on the side towards the turn and feel what the aircraft is doing. That is kind of how I think about it.
- 48Q. Now, if I may, you were talking about the systems that keep the C-17 flying coordinated. Will a C-17 fly coordinated at 45 degrees of bank and will it fly in a coordinated turn at 60 degrees of bank without putting rudder in?
- 48A. That's a great question. I can't say that I know the system design off the top of my head on that. It would be a guess to say that I think the system would continue to try to coordinate the turn. If the aircraft were in a bank angle, it will probably try to maintain rudder so that the plane is coordinated, but that would be a guess.
- 49Q. Okay. One follow-up question that we discussed earlier about the crowd and the extended runway center line. So, you don't want to cross that crowd line. Can you give me the boundaries--does that centerline extend to infinity or does it go to airfield boundary or does it go to the end of the runway? Where is that?
- 49A. Basically, every show is different. The boundaries--the key things are the distances of the crowd line. Where is the fence line? Where is for the crowd line? There is Cat 1, Cat 2, and Cat 3 lines off of crowd line. Cat 3 are slow moving aircraft and that is 500 feet away from crowd line.
  - 50Q. Cat means category?
- 50A. Yes, category. Category 2 distance is 1000 feet. Category 1 distance is 1500 feet and that can be waived down to 1200 feet, but that is for your high performance aircraft, high speed, fast movers. Basically your major teams like Thunderbirds, Blue Angels, teams like that are going to be stuck out at the 1500 feet. So, for a C-17 demonstration, and not acrobatic by the way as well, you are going to have to stick out to that 500 feet away from the crowd line. The width, left to right basically, show left, show right, is up to the show. A lot of times they use things that are visibly identifiable on the ground, maybe the end of the runway, but it could be a building or a leg or something like that depending on what teams you have. They may extend that out. An example of that is you extended out a mile and three quarters for the Blue Angels if they are in town. They can do an inverted pass on one of their opposing solo passes. You give them that much space and time to get lined up on center line or on their show line, they can roll

inverted and complete the pass over crowd center and then roll out. There is a lot that goes into the design of show line and an aerobatic box area, but those are some of the things that are factors there.

- 51Q. Just to surmise, crowd line is basically a line where if I was to put an imaginary fence down, that is how close the crowd can stand to that fence and not cross over and still be in a safe zone. From the show center to 500 feet, crowds can be 501 feet more and they are over there in the safe area so you can actually perform in this area where it is safe?
  - 51A. Yes. You've got it.

## **Questions by the Pilot Member:**

- 52Q. WITNESS 10 you mentioned in your previous statement, you did talk a little bit about different areas where you may encounter stall warnings from the aircraft, and by stall warning, I mean when the aircraft alerts you that you are approaching stall airspeed. Can you talk me through the ways that the aircraft alerts you to a potential stall condition?
  - 52A. Yes.
  - 53Q. Sorry, before you start, we should define stall.
- 53A. I can define it. A stall is basically any time a lift providing surface such as a wing basically stops producing lift. The airflow over the wing is incomplete and it is not providing the lift that is required to maintain flight. You can have one wing stall and not the other, or you could have both wings stall. One wing stall would cause a dip in one wing and a lift in the other, but those are some of the things that are a factor with a stall with basically any aircraft flying in general. For the C-17, it has got what I think is a remarkable system for preventing stalls, basically. We have PFD which is basically our attitude indicator which is an electronic image of horizon and ground within aircraft image in it.
  - 54Q. PFD stands for primary flight display?
- 54A. Primary flight display. On each side of that we have both--on the right side of it we have altitude indication and on the left side of it we have airspeed indication. There are a lot of neat things about that. There is an electronic display that happens on the airspeed side of the house that indicates where either our stall speed is or where our over speed is. When flying, we basically refer to it as the stall bar or over speed bars.
  - 55Q. Can you elaborate a little bit on the speeds?
  - 55A. Yeah. Basically, the specific speeds? Is that what you are getting at?
  - 56Q. What do you mean by stall speed and over speed?
- 56A. Yeah, depending on the configuration of the aircraft, you are going to have different stall speeds and different over speeds, or max speeds, I should say. If you're a clean aircraft, you are going to have a max speed of .68 mach and that's 350 where it comes up. You don't fly in that region very often, but I think its right up there at 350.

- 57Q. That would be 350?
- 57A. 350 knots, nautical miles per hour. If you start to configure, you start to put slats out or flaps out to different levels----
  - 58Q. And that's what you mean by configuration?
- 58A. Yes. If you start to change the configuration of the aircraft, your max air speeds change, so to put this----
  - 59Q. And the maximum?
- 59A. Maximum. So to put the slats out, you need to be at 280 knots. To put the flaps out or the gear out, you need to be at 250 knots. By gear, I mean landing gear. To continue to put the flaps out, there is also a couple other speeds in there that keep getting lower. The stall speed will also change with weight and configuration. So, typically, I want to say the stall bars will come down around 120 knots or something like that.
  - 60Q. Depending on----
- 60A. Depending on weight and configuration. If you are configured for landing, a lot of times they will be right around 120 or maybe a little less than that.
- 61Q. Explain what you are seeing when you say the stall bar comes down. You were describing the stall warning systems in the aircraft, so explain what you see when you say a stall bar.
- 61A. For instance, if I'm just flying around with my gear down at my flaps at three quarters which would be normal landing configuration, and the slats extended, and I was flying straight and level, and I started pulling back on the nose of the aircraft, what I would see in the upper left-hand corner of my primary flight display would be a bar that's hashed that would kind of grow as I slowed down.

- 62Q. So, basically it starts extending?
- 62A. Yeah, it would start to extend down. It would be not visible if I was in a good flying envelope, and as I started getting out of a good flying envelope and started getting slower, it would start to extend down to meet whatever airspeed I'm at. If I was at 125 knots and I started pulling the nose up which would make the aircraft slow down if I didn't have power, the stall bar would start to extend to come down and meet my airspeed. I would get to 120 and it would start creeping down; 115, it would start creeping down some more. As that's when if my airspeed met, I would start getting some of the stall prevention system acknowledgments the airplane has.

# **Questions by the Pilot Member:**

- 63Q. Can you describe those?
- 63A. Yeah. I think the first one you get is the stick shaker. The stick shaker is saying hey, you are reaching a percentage above actual stall and it's just--the intent behind stick shaker is a false stall warning. If you go back to primary aircraft flying that doesn't have any prevention--stall prevention systems in it, what you're taught is--what any pilot is taught is to learn the characteristics of the aircraft they are flying in. One of the leading characteristics of a stall is aircraft buffet. If you're flying a Cessna, or any airplane, really, they all have stall characteristics, and you would want to know the stall characteristics of your aircraft and as--one of the stall characteristics is aircraft buffet. A lot of systems that are designed to prevent stalls have done what is called a stick shaker and they introduce a stick shaker at a certain percentage above actual stall so it feels like aircraft buffet to the pilot.
  - 64Q. In the C-17, can you explain what happens when you get the stick shaker?
- 64A. When you get the stick shaker, it's basically an indication to the pilot to release pressures on the stick, to stop demanding of the aircraft and let the aircraft fly on its own. The aircraft wants to fly. What happens is if the pilot is demanding a lot of the aircraft, meaning pulling back on the stick, demanding more than the aircraft could give, then it's going to go towards a stall region and those indications, like stick shaker, are built in to communicate to the pilot, hey, you're getting close to this. You don't want to be in this area. Do something to change it. The indication, or the intent, would be that the pilot would stop demanding from the aircraft and release controls. If the pilot just lets go of the controls of the aircraft, the aircraft would automatically seek flying airspeed. It would automatically pitch down. Depending on bank angle, it may even roll out a little bit.
  - 65Q. The things you're mentioning, you are not mentioning C-17s specifically, right?
- 65A. No, just generally. Even C-17s specifically, if you let go at that point when you got stick shaker, the stick shaker would almost immediately go away.
  - 66Q. Is that due to general aerodynamic principles?
  - 66A. Yes.
  - 67Q. And not something specifically the C-17 does versus any other aircraft?
- 67A. Right. That's the first indication, and we get into further indications. If the pilot flying at the time continues to demand from the aircraft, then he would get an oral warnings as well. The aircraft system would announce--I don't know everything specifically. I would have to get into the books to get all the details, but I think that next morning is an oral stall, stall warning.
  - 68Q. By oral, you mean?
- 68A. It's announced over a loudspeaker and in the headset. So, if you're off headset or in headset, you should hear it. So, that is a second warning that everybody in the crew should get. I don't know, maybe skipping one, there may be another step in there, but the other system

that the C-17 has is alpha mode. That is if we have gone into--basically, the way I understand it is the C-17 is basically designed to not let you ever get to an actual stall. So, if you're wings level, if you are pulling back and you go through the stick shaker and you go through stall, stall oral indications, now you are closer to the stall but you haven't actually stalled the aircraft. Now, the aircraft is going to say, hey, I can't give you what you are asking me to do so I'm going to go into alpha mode, and alpha mode is a pitch mode for the aircraft, and it is going to say, I'm going to seek a lower pitch attitude to allow this airplane to fly and I've got more information than you've got, apparently. The system takes over and it's not going to allow you to pull back and demand of the aircraft.

- 69Q. Does the system actually move any of the control surfaces?
- 69A. No. Well, it potentially—it potentially moves the control surfaces. It doesn't move the stick. You could have the stick in your lap, maybe the pilot is thinking I am going to demand a lot of this aircraft, but the system will say, I know better. I'm going to relieve some of the elevator pressure and not demand this much nose high or pull, and by pull, I mean elevator pressure.
- 70Q. So, the aircraft would not take and actually move the control stick, but it will take control.
- 70A. Yeah. You can hold it back and it wouldn't really feel like anything. The only thing it would feel like to the pilot is the aircraft is sinking because that is what it would be doing, it would basically be lowering the nose and trying to seek flying airspeed again. That is what the system is trying to do.

- 71Q. So, if the airplane is sinking like that, if that is what the pilot feels, how does he get it to stop sinking?
- 71A. He would have to use normal recovery procedures which thinking back to just basic pilot training, how do you recover a stall aircraft? You lower the nose which is what your aircraft is trying to do for you. You max power and you roll wings level. On the reverse side you lower the nose, roll wings level, and then power in that order to recover. Those are the key things that are going to help you recover from a stall situation in any airplane. In the C-17 specifically, hopefully the early indications make you decrease or demand less of the airplane.
  - 72Q. So the early indication would be the stall warning?
- 72A. Stick shaker. Yeah, this is the stall warning system. The stick shaker would be the first of those.
- 73Q. If I may, I just want to clarify a couple of definitions for the record. Aircraft buffet?
- 73A. Buffet would basically mean vibration or shake of the aircraft due to loss of smooth airflow over the wings.

- 74Q. So it's turbulent air over the wings?
- 74A. Yeah, turbulent air over the wings and most of the time you get buffet because that turbulent air over the wings--it doesn't buffet because of that, it buffets because the turbulent air over the wings hits the empennage of the aircraft which is the back end, the rudder and elevator section of the aircraft.
- 75Q. Okay. You said, and this is very basic, I understand that, but you said flaps and the slats. Where are the slots located and where are the flaps located in proportion as you look at a wing forward and aft? Where are they located and what do they do?
- 75A. The slats are basically movable surfaces on the leading edge of the wing. They act as the leading edge of the wing and they also extend forward and down once extended. The flaps are on the trailing edge of the wing and basically are the trailing edge of the wing and also extend out and down. The whole point of slats and flaps are to change the characteristics of the wings to allow for different airspeed flight, lift characteristics, things like that. So they change things like camber, wing area, all things that are basically in the equation of lift.
- 76Q. Subsequent to that, they also--if you had them extended then that would actually lower your stall speed, somewhat?
  - 76A. Yes.
- 77Q. So, you can fly at a slower speed without them being--a slower speed with them extended out, so slats extended and flaps extended, because you changed the camber or curvature of the wing? Is that correct?
- 77A. Yes. That's the whole point. Anybody who has flown on an airliner would know that flaps get extended as you come in to land, and what that allows these airplanes to do is land at a slower airspeed which is the point.
- 78Q. Then, the last clarification for the record I would like is you said, mode. People who are unfamiliar with the C-17 may not know what that means. You said alpha mode. Is it a flight code? Is it a parameter that the computer would--this is a fly by wire aircraft, correct?
  - 78A. Yes. So yes, exactly.
  - 79Q. What I mean by the fly by wire is it flies by electronic input?
- 79A. Yes. So there are many modes in the C-17, but alpha is one of them. Air drop approach----

### **Questions by the Pilot Member:**

- 80Q. Do you know if alpha has another term used to describe it?
- 80A. I'm sure it does. I don't know it off the top of my head. If you do, I would be happy for your input and I would say yeah, that's right.

## **Questions by the Board President:**

81Q. Going back to the air show and the profiles and things like that, did MP ever discuss his philosophy about how to fly air shows?

81A. As I said, he did not with me. But this is one of the things I didn't clarify, so I MP went through the demo program with on August 24th. That was the flight day, August 24 of 2009. That was the first and only time that I have actually flown the demo in the aircraft. Unfortunately, while I was qualified, it had been a year or more now. It has been 13 months since I've flown the demo program. What I remember about going through that is one, just MP enthusiasm about it. He liked it, he enjoyed that he got to do it. He liked teaching it. He liked teaching everything about the C-17. He really enjoyed that and that really came across, not because he said it. I think I took his training, what he learned in flying the demo since he has done some, and some of the little things that he had learned actually flying our show demos and learned to do the demo, but I wouldn't say that he gave me a lot of philosophy on flying the demo. It was pretty much a matter of fact and when you think about it, it was 2 days, 2 1/2 days of ground training with MP in a sim and another flight with MP so we did not talk a lot of philosophy about it or his general attitude towards it, but--I think that's all I've got there.

### **Questions by the Pilot Member:**

82Q. Now, just to wrap up from my perspective, to take a step back just for a second. I know we got very thorough with stalls and the alert system. What would be your reaction to the stall warning system?

82A. I think I touched on that in the earlier statement, but basically I'm a pretty big picture person. This touches on a little bit of the attitude that goes along with performing at an air show. You really need to have your ego in check, maybe, and I say that from a personal note, not that somebody else has an ego, but if you think about it, you're going to be out in front of the crowd. You want to put a good performance on and when you are right in front of the controls and they are staring right in your face, you think that this degree of bank or a sharp turn or this is going to make a difference. The fact, since I got to stand on the ground for the last air show, is that you don't really see that stuff. The crowd doesn't see that stuff. They just see an airplane flying. To your question, and to this situation, I think a couple of things. One, flying the demo program, you get comfortable getting the stick shaker. Just flying the C-17, you get comfortable flying and hearing the stick shaker when you are coming around the final turn and you are trying to do a full flap approach and you are trying to get down because the stall warning will come on a little more easily. You are in that slow airspeed regime and you will get some stick shaker and you do things to correct it. That is what everybody is taught. You do whatever is necessary to correct it. So, you push the nose over. To answer your question specifically about me, that's the way I fly it in every phase of flight. If I got a stick shaker, a stall warning, I would decrease bank. I would add power. I would do the little things that make the stick shaker go away because the stick shaker is trying to tell me something. Back to the other place where you get comfortable with the stick shaker, or in the way we were learning to fly the demonstration profile, it is going into the 260 degree turn back to the runway and going to 60 degrees of bank turn as you are speeding up. A lot of times, if you are demanding a lot of the aircraft and trying

to get back to the show and, you might say oh, it looks like we are going to overshoot and so the tendency would be because you don't want to over fly crowd line, to add a little more bank, and a little more pull, add a little more rudder to make that happen which may make the stall warning bar--the airspeed decreased to the point where you are getting stick shaker. I don't remember specifically if I got stick shaker when I flew the demo. I may have. I do know that I listened to the airplane. If I listened to the airplane, if the stick shaker is there, it's not feeling right in the airplane then I take less then what I want. I would rather over fly the crowd than demand so much from the aircraft that it is not going to give me what we need to keep flying. So, back to checking your ego, I think that is one of the things I thought. You just need to fly a safe airplane. The crowd is going to love it no matter what. You don't get sucked into that idea that everything has to be just perfect, real tight. Whatever you come up with is, this is a cool type of thing. I wouldn't say that was present with this group of demonstration pilots that we have here at Elmendorf, or this group that was in the accident, but I would say it is a systematic thing across the board for anybody who is out there flying a demonstration. It is something to consider. That's why we have the well defined profiles and we have to stick to those. So, it would be the individual input that doesn't take over, I guess.

# **Questions by the Medical Member:**

- 83Q. Sir, just to follow up again, you were talking about show center and the different categories. You mentioned that there is a category 3 for the slow flyers and category 2 and category 1. Where would you put the C-17?
  - 83A. The C-17 is category 3 for air show purposes because it is not aerobatic.
- 84Q. I think the number that you stated was maybe 1 3/4 miles off the runway for someone like the Blue Angels or whatever you said. It's very dependent upon the locale where the air show is being held. Do you know in fact what the distance of extended show line center is here at Elmendorf?
- 84A. We should. Off the top of my head, what we did for Arctic thunder 2010, Elmendorf's air show, was the west boundary was the approach end of runway 6, so right out the window. The east boundary--we had 2 boundaries. Category 1 line extended one and three-quarter miles off show center which is right in the middle of the crowd area. So, it went one and three-quarter miles to the east. That was for the Blue Angels since we had the Blue Angels here this year, and we had a secondary boundary for category 2 and category 3 aircraft. It was basically 500 feet off a road on the east side of the runway. It wasn't really aligned with the end of a runway, but it was inside of that a little bit so that we could have traffic flow and get people to come in and park on the airfield and not go underneath the aerobatic box. So, basically it was--I would say half a mile to three quarters of a mile from show center.

- 85Q. Following up with that, with that in mind, if during an air show practice or during an air show demonstration itself, if the crew were to misjudge or if there was a change in winds or whatever, if they were to cross that extended show line center beyond that mark, they would have a margin of error to come back and reestablish on that show line center prior to reaching that boundary. Is that correct?
- 85A. Yes. That's the other thing to point out. There is always misinterpretation with just about everything that we do as humans, I think. The other piece that goes into building a demonstration aerobatic box area for air shows is that there are corner markers which I didn't mention previously. Corner markers are basically markers that are 500 feet show left and show right, in line with the edges of the crowd fence line. So if you imagine a crowd fence line, at some point there is going to be a corner there. They can't extend forever, so there is going to be a crowd area and 500 feet off the right edge corner in line with the crowd line will be a corner marker and then 500 feet off the other end. The point of those markers is for things like what they called a banana pass or photo pass that a lot of demonstration aircraft do. They stay outside of those. You might have an aircraft that actually flies over the crowd line, but outside the corner marker. I would say that in the C-17 demo community, since the profile is set and we get lined up right back on the show line, we don't systematically want to cross that line. Would we be okay crossing that line? Yeah, probably. We would cross that line most likely past the corner markers. As long as we are back on track before we got to the corner markers, we are good to go. You see the Blue Angels or other teams behind the crowd all the time. They come out and they do a pass with their bank angle towards the crowd and they arch around the crowd and it gives that photo pass quality that the crowd likes, but that is a time where they are on the other side of the crowd line.

- 86Q. Just to clear this up a little bit, if I may, your main runway out there is how long?
- 86A. 10,000 feet. It's a little less than 2 miles.
- 87Q. A little less than 2 miles. Where the airplanes--for your demonstration, your typical take off is abeam taxiway bravo, correct?
  - 87A. Yeah, I would say probably near bravo would be a good place to start there.
  - 88Q. Then from bravo to the end of the runway, it gives you?
  - 88A. 8000 feet approximately.
- 89Q. So, if I'm doing the math right, basically a mile is 6000 feet. Then another third is 8000 feet. So, if I do a take off and I climb out and then I do my initial 80 degree turn and then 260, I'm outside that center line anyway if it's a mile and a third. Does that logically sound right?
  - 89A. Yeah, I mean in the way----
  - 90Q. That's assuming show center is about at bravo taxiway.
- 90A. Show center is offset from bravo, so bravo would be left of show center in Elmendorf's specific layout.

- 91Q. So, in Elmendorf's specific layout, from show center to the departure end of the runway, how far is that, roughly?
- 91A. I want to say show center was about 6 to 7000 feet from departure end of runway 6, a little over halfway down the runway. So, the crowd--the majority of the crowd, a mass of the crowd was just east of center of the runway for the layout. Now, a C-17 taking off for the demo would take off just west of center of the crowd area. By the time it took off and started its bank angle, it would be outside of the 500 foot corner marker. If you overshot in the specific situation, you would be outside the corner marker.
  - 920. So there is room to maneuver?
  - 92A. There would be room to maneuver.
  - 93Q. Without crossing show center line?
  - 93A. Yeah, well, yeah. Exactly. Without crossing the crowd boundary.
- 94Q. So, by the time the aircraft is speeding up and it starts its 260 degree turn back in at 45 or whatever bank, it has got enough turn radius out there to carry it far enough out that even if there was a slight mistake and it looked like they were going to cross show center line, they should, under normal conditions, make and correct and come across as a prescribed by 11-246 vol 6, chapter 3?
- 94A. Yes. That would not break the contract with the crowd and the show line. As I think about what you just described there in overshooting the intended flight path, as an air show director and putting together an air show, I say fine. It is totally fine for them to overshoot, get back on centerline and continue with their profile. It is definitely the preferred method if there is a problem with the time or you didn't work out or something like that. When I step in and put my demonstration pilot hat on, and I think about overshooting, I think about okay, overshooting isn't a problem but my intended flight path was to roll out on an 80, 260 and roll out right on the runway and do a straight, high-speed pass. Now I've introduced things that weren't initially a part of it which is overshot which means I need to continue my bank around to correct to my line show prior to getting to the crowd area. Then I need to make a left-hand bank turned to get back on show line, show center, or my show line and then roll back out. So I've introduced a couple maneuvers in there that are not a part of the laid out demonstration profile. In the demonstration pilots mind, that doesn't look good. To the crowd who has no idea what the C-17 demonstration profile is, it would look like he banked, and then he banked, and then he banked again. Wow, that was really cool. I think we learn from a young age in the pilot world that if we are going to intend to do something, then that is kind of what we stick to. So, the pilot side of me feels like oh, I screwed up. I really messed that up and didn't look as sharp as I could have. There are the two sides of the coin now. My analogy to this is back to both my own pilot training and being a pilot training instructor with many of the pilot training bases having three parallel runways and the outside runways have patterns that go to them which involve turning towards the center runway. As you come around final, if you had an overshooting situation, you may want to bank more. You may want to pull more so that you don't encroach on other aircraft that are going to those other runways or the outside runway even. You may want to do and demand more of the aircraft then the aircraft is willing to give you in some of those situations. Maybe that's not the

safest thing to do. May be the safest thing to do is to just roll out of and over fly the wrong runway and go around and try it again. It's one of those things that I remember being taught in pilot training and it is one of those things that are taught in pilot training as well. It's that balance of accepting the overshoot and not trying to demand too much of the airplane and put it in a bad situation.

President: If I may, what I would like for us to do is take a break right now and then that will allow us to collect our notes and ask any other questions that we may have of you. If I may, if we could just take a break.

[The board recessed at 1639, 10 September 2010.]

[The board reconvened at 1710, 10 September 2010.]

- 95Q. WITNESS 10 just to follow up, I have just a few more questions that I want to clarify for the record, if I may. Earlier, you discussed the demo culture. You said it was to put on a good show. Where does that come from for you personally?
- 95A. From me personally, it's just kind of my personality to do the best that I can at everything I do. If the demo profile is X, Y, and Z, I want to do X, Y, and Z to the best of my ability. On top of that, I think that there is a culture in the Air Force and in the air show community that basically--everybody wants to do their best and put on a good show and wow the crowd. I think that it's kind of where it comes from, the culture and your personal desire for excellence, or what we perceive as excellence.
- 96Q. Also, earlier you said that when you get the stall warning, you said the aircraft is saying you are demanding too much?
- 96A. That is just a figure of speech. That talks about the pressures that the pilot feels during any phase of flight.
  - 97Q. So when you say pressures, you mean how the airplane is flying?
- 97A. Yes, how it's flying, how it feels, how the pressures of the ailerons feel in your hand or the elevator feels in your hand or the pressures on the rudder or even the stick shaker.
  - 98Q. So, Airmanship?
  - 98A. Yeah.
  - 99Q. Which means how you fly?
  - 99A. Yes.

100Q. How long have you been a C-17 pilot?

100A. I've been a C-17 pilot since 2001. I flew at Charleston for 3 years there and I have been flying C-17s after a break flying the T-6 for 2 years here at Elmendorf, so 5 years of flying the C-17 total.

101Q. You flew the T-6 for 3 years at Laughlin Air Force Base.

101A. Yes.

102Q. So, 5 years total?

102A. Yes.

103Q. How many hours would you say you have?

103A. In the C-17, I have approximately 2000 to 2500. Total flying hours, I have approximately 2500 to 3000, somewhere in there.

104Q. Did you observe the incident on 28 July 2010?

104A. I did not see the actual incident. I had just arrived home, had heard about it through some phone calls and decided to come back to base. I was back on base shortly after the accident happened and saw some of the aftermath, but not at close range.

## **Questions by the Legal Advisor:**

105Q. I have one clarifying question. We were talking about demo culture and your idea that you always wanted to do the best that you could do. That also is with the safe operation, within the bounds of safety. Is that correct?

105A. Absolutely.

### **Questions by the Board President:**

106Q. I just want to close out with one last question before I read you out. Are there any other matters that we haven't covered today in your interview that might be important to our investigation that you want to discuss?

106A. Not that I can think of right now.

President: If you do think of anything, we can put you back on the record after we close this out and then we can talk about it then.

Witness: Do you have any topical thoughts or ideas that I should think about, or not necessarily?

President: No, not right now.

Witness: Okay.

President: You are reminded of the official nature of this interview. You may not discuss your testimony with anyone without my permission at any time before the report of this investigation is officially released to the public.

This concludes the interview. The time is now 1714 local, Alaska time.

### V11. AIB TELEPHONIC INTERVIEW WITH

WITNESS 11

### **VERBATIM TESTIMONY OF**

### WITNESS 11

PRESIDENT: Today is the 11th of September 2010. This time is now 1216 local, Alaska time. My name is Brigadier General Carlton D. Everhart II. We are investigating the C-17 accident that occurred on 28 July 2010, tail number 00-0173 at Joint Base Elmendorf-Lent, Alaska. The Accident Investigation Board is in building 7309, room 106 at Joint Base Elmendorf-Lent, Alaska and we are conducting a telephonic interview with the witness, WITNESS 11 who is in building 1535, suite AA 209, Joint Base Andrews, Maryland. Also present with LEGAL REP, the Staff Judge Advocate for the 316th Wing. Prior to the start of this interview, positively identified the witness and accordance with AFI 51-503, chapter 6, paragraph 6.7.

The persons present for this interview are:

Myself, Brigadier General Carlton D. Everhart II, Board President;
the Pilot Member;
Legal Advisor;
Maintenance Officer;
Medical Member;
Maintenance Member;
the Recorder; and
Court Reporter.

This investigation, conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 91-204. The purpose of this investigation is to produce a publicly releasable report on the facts and circumstances surrounding this accident and to gather and preserve evidence for use in claims, litigation, disciplinary actions, and adverse administrative proceedings, and for all other purposes. A safety investigation was previously conducted on the accident. Any testimony you gave before the safety investigation board will be kept confidential, if you were so advised, and can be used only for accident prevention purposes. This board does not have access to any confidential testimony you gave before the safety investigation board. Your sworn testimony to us may be used for any proper purpose. Additionally, your testimony can be released to the public. Do you understand the difference between your testimony you have given to the safety investigation board and the testimony to the accident investigation board?

WITNESS: Yes, sir. I do.

PRESIDENT: do you consent to having this interview recorded?

WITNESS: Yes, sir.

PRESIDENT: Your testimony in this interview will be under oath. At this time, will you please administer the oath to the witness?

LEGAL REP Yes, sir. please raise your right hand. Do you solemnly swear that the testimony you are about to give in the matter now under investigation shall be the truth, the whole truth, and nothing but the truth, so help you God?

WITNESS: Yes, sir.

LEGAL REP The witness has been sworn.

PRESIDENT: Thank you, LEGAL REP for your service. You may be excused.

[ LEGAL REP exited the interview room.]

PRESIDENT: WITNESS 11 he does confirm with us, please, that LEGAL REP has left the

room?

WITNESS: Yes, sir. He has.

- 1Q. Please state your full name and rank.
- 1A. WITNESS 11
- 2Q. How long have you served in the Air Force?
- 2A. 10 years-just over 10 years.
- 3Q. What is your unit of assignment and location?
- 3A. Currently, I'm in the 99th Airlift Squadron at Andrews Air Force Base, Maryland.
- 4Q. How long have you been with this unit?
- 4A. Since April 2010.
- 5Q. What is your job title?
- 5A. Right now, I'm just a special mission pilot.
- 6Q. How long have you been doing this job?
- 6A. Since the same date, April 2010.
- 7Q. Can you briefly describe your current duties and responsibilities?
- 7A. I'm a pilot for DV airlift in the Gulf Stream Squadron here at Andrews.

- 8Q. What was your unit of assignment back in 2008?
- 8A. My primary assignment was in the 517th at Elmendorf and I had occasional duties at the 3d Operational Support Squadron.
  - 9Q. Can you describe your duties and responsibilities at the time?
- 9A. With the 3d Operational Support Squadron, I was in current operations and I got there in the fall of '07 and remained until the spring of '09, but I flew with the 517th Airlift Squadron during that time.
  - 10Q. Are you familiar with the C-17 aerial demonstration program?
  - 10A. Yes, sir.
  - 11Q. Can you describe your C-17 aerial demonstration background?
- 11A. I was one of the primary ones chosen to start the demonstration team and it was originally chartered for supporting the 2008 Elmendorf air show which I believe was in June of 2008. I was one of the current performing team squadron commanders at the time. I chose myself and a few other people to head that up.
- 12Q. Are you familiar with Air Force Instruction 11-246, Vol 6, Chapter 3, Air Show Demonstration Profiles?
  - 12A. Yes, sir.
- 13Q. How many air shows did you perform while you were certified as a demonstration pilot?
- 13A. Four events. Included in those four events, some of those events have multiple shows. Actually, one of the events has multiple shows.
  - 14Q. So when you say an event, what do you mean by that?
- 14A. The first of them would've been the Elmendorf air show being the event, but we performed three times to support that air show. It was a Friday, Saturday and Sunday performances. In the subsequent ones were a Defense Cooperation demonstration in India and I think there were 6 performances associate with that. One event and one show only in New Zealand, and one event and one show only in Canada.
  - 15Q. Then, if I may, just briefly, can you define what a Defense Cooperation is?
- 15A. The Office of the Defense Cooperation is attached to the embassy in India and their primary function, as I understand it, not being the expert, is to assist in the export of US military services. In this case, the C-17--the Indian government was looking to buy the C-17 so the Boeing Corporation went through the Office of the Defense Cooperation in India and their talks with the Indian government to sell the C-17 to India.

- 16Q. Did you provide aerial demonstration training to the 3d Wing and 176th Wing crewmembers during your assignment to Elmendorf Air Force Base?
- 16A. I did. Subsequently, after the initial training was done by another source, then as the point guy on the team I provided the subsequent training to a degree at least.
  - 17Q. By point guy on the team, you mean? What do you mean by that?
- 17A. Anybody who is a pilot flying, qualified instructor. They are one and the same if you are the pilot flying for the demonstration. You had to be at least an instructor pilot. All those individuals were able to provide instruction on the demonstration maneuvers and so I didn't--I cannot remember if I did more after that or if it was other instructor pilots that did the subsequent training.
- 18Q. Just for clarification on the record, can you tell me who trained you?

  18A. WITNESS 12 At the time, it was Major. He was out of the 535th Aero Squadron at Hickam.
  - 19Q. What was the certification process?
- 19A. Well, the process itself involved simulators, actual flights, demonstration flights and then forwarding the--PACAF has a requirement that only one team at the base can do it and had to be signed off by the numbered Air Force commander. After we had finished multiple simulators, finished the flight, then we put together a single team package that process through the 3d Wing Commander and onto the 11th Air Force Commander for signature.
- 20Q. Just to clarify, because I asked you who trained you and then I asked you a question, what I want to do is clarify this is the training that you-the upgrade training that you provided to the members at the 3d Wing and the 176th, correct?
- 20A. No, this was what I received when I was trained. Subsequently when I provided the training, I would do the simulators, do the flights, and process the paperwork through the 3d Wing and the 11th Air Force Commander.
- 21Q. I apologize for the confusion. Who did you train during this time as far as the 3d and 176th crew members?
- 21A. MP and WITNESS 13 WITNESS 13 was in the 517th Airlift Squadron, 3d Wing and MP was in the 249th Aero Squadron under the 176th Wing. I know for sure I worked with them that winter of 2008 and I cannot remember if I worked with other people beyond that. I think MP and WITNESS 13 primarily did the training after that.
  - 22Q. Would you please describe that training?
- 22A. It involves the one simulator, but typically we did multiple simulators. In the simulator over at the Boeing building, we would have about 3 hours at a time and would execute all 3 profiles that you mentioned, 11-246, and I think they are labeled 6 minute, 10 minute and 12 minute profiles is how they are labeled in that C-17 demonstration. We performed each one of those multiple times, talked a little bit about the mission, computer set up for the actual C-17,

how we would perform the maneuvers with the mission computer, and then practice the maneuvers in the sequence that they were meant to be in. Once that was complete, we went out in the aircraft, scheduled the available aircraft time or as time availed itself, we would go out and practice at least the 10 and 12 minute demonstration which were not significantly different but were much more so different than the 6 minute which is an abbreviation of the 12.

- 23Q. Just for clarification of the record, the 6, 10 and 12 are known as profiles? Is that correct?
- 23A. They are, sir, and I wish I could come up with a better name for them but I believe they are called the 6 minute, the 12 minute, and the 10 minute profile. They are specific to the C-17, vol 6 there, that AMC-aerial demonstrations.
- 24Q. In general terms, can you just explain how these profiles are used for aerial demonstration performance?
- 24A. The profiles themselves, 2 of them are designed to take off from a field at land back at that same field, if you were doing the demonstration at that field. That's the 6 and a 12 minute profile. The 10 minute profile is sometimes referred to as the air to air profile and that is coming from another location, flying to the field you're performing at, doing the demonstration, and then going back to the original departure location. You kind of start the performance in the air and it is in the air flying away. All the maneuvers are the C-17 maneuvers that any C-17 pilot does. It's just in a compressed format, compressed timeline. The maneuvers themselves are very basic. They are designed to showcase--there is a narration that goes with it that is in that same 11-246 and that narration talks about-- it's a little antiquated, but it talks about the quietness of the engine, the capabilities of the aircraft, the turning radius, quick stopping distance, all the things we wanted to demonstrate that the C-17 is capable of.
- 25Q. In previous interviews we have had people describe the 12 minute profile as profile three. Are you familiar with that term?
  - 25A. Yes. I am. Not having anything in front of me, I do remember that. Yes.
  - 26Q. Could you provide, please, an overview of profile three?
- 26A. Again, not having it in front of me but going on the word that profile 3 is also the 12 minute profile, that starts with an assault take off which I believe is the verbiage in the profile. That is basically a max performance take off, level off at 1500 feet. You maneuver away from the crowd and set up for a high-speed pass. I think the maneuver is called an 80, 260 is how they've label it. Eighty degrees off, 260 back. There'll be a high-speed pass. That demonstrates the quietness. We usually go to idle at some point on that pass prior to passing the crowd to demonstrate the quietness of the engine. It will configure again for a slow-speed pass or will have the flaps and landing gear fully extended and slats fully extended and demonstrate the slow flight capability of the aircraft. Maneuver again to come back around and this time, it would do a 360 degree turn away from the crowd, demonstrating the turn radius. The final maneuver is a full stop assault landing where we do a maximum braking. Once we are fully stopped, we back a prescribed distance depending on what kind of runway we have available. We demonstrate the backing and that's the end of the profile.

- 27Q. For that profile, profile 3, can you describe how you've instructed crew members to fly the departure, specifically that 80, 260 maneuver?
- 27A. Primarily, what would do is after the initial climb we would level off at 1500 feet. Once we completed the level off we would make a left turn 80 degrees out-- I'm sorry. In the case of Elmendorf on runway 6, it's a left turn, but turn away from the crowd 80 degrees, whichever direction that may be, and rollout. The flaps and slats would be retracted when we reach the applicable speed automatically by the pilot flying in the right seat. So, when we had reached 140 knots, if that was the flap retract speed, he would automatically retract the flaps at 140 knots. The safety observer would verify that is accomplished, that the airplane is cleaning up. Typically, it depends on the field, but at Elmendorf we would run out about 9 seconds on an 80 degree course away from the crowd. Those 9 seconds allows us, and at the same time we are still at our takeoff power settings, to be accelerating quickly. I would say on average the flaps are retracted at about 3 seconds to 4 seconds after making the turn and then the slats are retracted within another 3 seconds of that and that about 3 or four 4 seconds after that is when we begin a right turn. Again, with runway 6 at Elmendorf it would be a right turn. We would accelerate toat that point you're already at about 210 or 220 knots and you would stay below 250 knots and go between 45 and 60 degrees to turn back to the runway. The initial takeoff was--the initial turn away from the runway was at 45 degrees and then the subsequent turn is 45 to 60 to judge the turn in order to not over shoot the extended runway center line. Once you have a guarantee that you are not overshooting it, you would accelerate. In practice, we could only accelerate to 250 knots. Where there is a terminal flight restriction, TFR, then we would accelerate with approval to about 310 to 320 knots. At that point we would bring the throttle to idle before crossing over the threshold of the runway at 500 feet--I'm sorry, we would also descend down to 500 feet in that turn and then we would bring the throttles to idle so that we go pass the crowd at idle and decelerating from about 310, 320 until we would get to mid field on the crowd, show center on the crowd, and then make a turn away from the runway.
- 28Q. If I may, I would like to clarify two things. You said you would deconfigure automatically and the checklists were run automatically. How did you know to do that? Is that in a pre-brief? How did you know?
- 28A. That was briefed. That was part of the training. We want to get it done as soon as possible so part of the training we discussed was as soon as you get a flap retract speed, retract the flaps. As soon as you get the slat retract speed, retract the slats. Over time it became much more habit pattern. You would always say flaps up, slats retract which was the verbiage we used in the C-17, but it was known that you maneuver those right away. At the speed you are accelerating, you would go through your--since you're going up to 310 knots you would over speed your flaps with the power setting you're at so you want to get those in as quickly as possible when you get to the safe speed.
- 29Q. What I think you just told me was that if you change the configuration, that was acknowledged, or stated, then acknowledged as per the normal checklist. Is that what you said?
- 29A. It was always verbalized, but it was initiated automatically so when you would get to the flap retract speed the pilot not flying would automatically say flaps up and retract the flaps. When he got to the slat retract speed, slats retract, and the pilots would acknowledge that but it

was initiated automatically. There was no command to bring them up just because of the rapid pace that you are accelerating.

- 30Q. What about the response? Did you get back a response from another crew member?
- 30A. I would not say it was--no, I wouldn't say it was guaranteed. It was a habit pattern built into most of us. I virtually always said it. When the copilot would say flaps retract, I would say flaps retract--flaps up. I'm already getting away from the plane here, but flaps up and I would acknowledge the flaps up. He has already moved the handle to begin the flaps tracking up.
- 31Q. Just to make sure that I understand, you actually taught the verbal response when you trained that?
- 31A. We taught to say that, that's what you were doing, that way you could cross check as the pilot flying. I would make sure that the copilot would verbalize what he is doing as a sanity check for all of us in the aircraft so we still know he hasn't tuned out. The second reason we would do that, especially when you're training somebody new, they would occasionally forget that. They would go through that speed and they haven't done anything and nobody has heard the flaps up yet and it would be me as the instructor saying okay, flaps up. Then they would go ahead with the handle up.

### **Questions by the Pilot Member:**

- 32Q. Since we're talking about what you defined as configuration, moving the flaps and the slats you said you would call for the deconfiguration at an applicable and safe speed?
- 32A. No. It was called while it was automatically done. The pilot flying that would not say flaps up unless it was forgotten. The reason it was forgotten primarily was because I didn't hear him say or her say flaps up. The pilot not flying, the copilot if you will, would retract the flaps and say flaps up.
  - 33Q. You defined that--that was supposed to be done at an applicable stafe speed?
  - 33A. At flap retract speed, correct. That is displayed in the heads-up display.
- 34Q. Am I reading this correctly that your statement of an applicable safe speed is the flap retract speed or the slat retract speed?
  - 34A. That is correct.

#### **Questions by the Board President:**

- 35Q. You said that your initial turn was at 45 degrees of bank?
- 35A. That is correct. Well, 45 is what the profile called for. More often than not we didn't get up to 45 degrees on that because you were just slightly over the MCO, climb out speed.

- 36Q. When you started to execute the 260 degree turn back to the runway, he said that it was 45 to 60 degrees of bank?
- 36A. Yes, sir. For the rest of the profile, this was--the more the profile is worded, and again, I don't have in front of me and I haven't looked at in 2 years, but the weather profile was worded and the way we train to was the initial turn--gosh, I wish I could see this thing in front of me. It basically scripted the whole performance and the only time it talked about a bank angle was on the initial turn. They would say----

President: with if I may just interrupt, we can probably get--if we can take a break right now, we can get that to you via e-mail if that will help out.

Witness: That's fine. I remember why we did the bank and what we did, I just don't remember the exact verbiage.

President: Okay.

36A (continued). The way we read it was the initial turn was 45 degrees and the way the profile read was do this. It's an 80 degree turn, 45 degrees of bank then an 80, 260 back. It didn't specify bank angles for anything else and the way that bank angle was included in there, it made it sound as if the 45 degree bank angle was a limitation for the initial turn away from the runway which was not usually a factor in that way because of the slow speed you were at you would never want to do 45 degrees and the plane will actually not let you go to 45 degrees as far as--it will physically let you do it, but the stall bar which appears in the arc for your bank angle in the HUD will appear and warn you that you are not going to get 45 degrees of bank out of it. Typically in that first turn, though the profile says 45 degrees of bank, it was typically done about 30. That's the best you could get out of it before hitting that stall bar. Subsequent maneuvers for the rest of the profile, we shot between 45 and 60 degrees depending on the situation. At higher pressure altitude, we would tend to bank a little bit harder because of the turn radius implication. Turning back to the runway at 4000 or 5000 foot pressure altitude, you need a little more bank to get the turn without overshooting the runway centerline.

- 37Q. So, was that automatic then to a specific bank angle?
- 37A. No, definitely not. It was a situation dependent. We never went above 60, but 60 is a fairly common bank angle. It's a hard turn on a low level--combat low level environment. It's a fairly common bank angle for the C-17. The profile was done at 500 feet and typically we do this at 300 feet in combat maneuvering when we practice in the aircraft itself. We used 60 as a for sure stop, but a bank angle between 45 and 60 is necessary for the conditions.
- 38Q. So, he said the profile was at 500. It's at 500 on that--I just want to clarify for the record you said you would climb up to 1500 feet AGL, altitude above ground level, and then now you said 500?
- 38A. Yeah, I'm sorry. The first altitude is 1500 feet. You climb to 1500 feet. During the turn back to the crowd, you would descend to 500 feet. All your passes over the runway

were done at 500 feet, the slow speed pass, the high-speed pass, and the 360 degree turn were all done at 500 feet AGL except for the first climb which is at 1500 feet, all the subsequent climbs were to 1000 feet AGL. We would climb to 1500 feet, turn away from the runway into the 80, 260, descend to 500 feet and do a high-speed pass. After the high-speed pass we would turn away from the crowd and climb to 1000 feet AGL, maneuver a 45 degree turn away from the runway and then turn back to the runway descending to 500 feet AGL again. All the passes past the crowd were at 500 feet.

- 39Q. You mention that you trained MP What instructions specifically did you give him regarding bank angle on that 80, 260 turn?
- 39A. I wouldn't be able to tell you specifically what I said, the way I performed it inthe way I think we--I would say it was MP WITNESS 13 and myself that were the primary pilots for it in the way we handled it in practice was to get enough runway displacement on the initial turn away so once you get the initial departure you get the 80 degree turn away from the runway and get enough displacement that will allow you to do between 45 and 60 degrees on the way back. That was the goal. At a high pressure altitude you are going to run out 12 or 15 seconds depending on how high you are. At Elmendorf, we run out around 9 seconds or so before turning back. That, with no wind, should allow you turn back at about 45 degrees of bank, and sometimes you would go over that, 50 or 55 if the winds were blowing from north to south, so blowing you into the runway. They might have to go up to 60 to get the turn radius so they didn't overshoot the extended centerline of the runway.
- 40Q. What was your instruction to MP regarding maybe the use of the rudder in the 80 and 260 turn?
- 40A. I don't know there was any explicit instruction. I know there was no explicit instructions on the use of the rudder. I can tell you that I use the rudder to a degree. What I would do is judge it kind of through the turn. I would go my 9 seconds out, speaking just for Elmendorf it would be about 9 seconds, start my bank and if I had 30 knots of wind blowing me from the north to the south, even 60 degrees is going to be pretty tight on overshooting the centerline. I might throw in a little bit of rudder and just gradually put the rudder in to turn around the corner. It wouldn't be to the floor or anything like that, but it would just be enough to tighten that turn radius up and the bank and displacement should've done that. Typically we will account for that window with the winds anyways. If we knew the winds were from the south, instead of going out 8 seconds or 9 seconds we'll go out 11 seconds to account for the wind.
- 41Q. Overall, regarding Air Force instruction 11-246, the C-17 profiles, what did you teach MP regarding adherence to these profiles and by adherence, did you teach them as guidelines or as procedures?
- 41A. The profile itself is pretty specific as far as the maneuvers, the sequence of maneuvers. It's pretty clear that's the law. It has become like that. I think in the profile, it talks about deviations to it had to be approved by MAJCOM. The profile was the profile. There was no modifying it all.

- 42Q. Just a quick clarification regarding the use of the checklist. Which demo crew member initiated a call for the checklist?
- 42A. That's a good question. The checklist were done at procedural times. Again, it was sort of automated. The approach checklist, for example, was done during the 360. It was all crew members responsibility to ensure that it got accomplished and ultimately it is the pilot flying, his responsibility to ensure that it-the aircraft commander's responsibility to ensure that it gets done. So, during a 360 maneuver I know the approach checklist should be running. If I don't hear it being run, because it still has be verbalized, challenged and response, if I don't hear that being run then I will prompt the copilot to begin it. The safety observer was onboard too to also assist in making sure that the checklist are forgotten, all the steps are done correctly. The challenge and response are still normal, but the safety observer still needs to be involved in ensuring all the steps get done. The pilot flying is doing a 360 degree turn during the approach checklist. It's a little harder to back up the co-Palm everything.
  - 43Q. Re: checklist, do you ever recall using an aerial demonstration checklist?
- Yes, sir. There was a checklist that came out of our sister squadron, the 535, that had some techniques, some really good techniques as far as setting altimeters and making sure you don't forget them. There is no checklist and 11-246. There has never been a checklist for aerial demonstrations. So what we did was we did a little bit of a modification of one, not changing any of the existing fan folder checklist which is the TO 2C-17-1CL-1 or CL-1-1, believe it is. We call it the fan fold. At a trifold piece of paper, or maybe even a quad folded piece of paper, that has an approach checklist, before landing checklist, all the quick axis checklist that we use in flight. So what we did was we were having basically logistical problems trying to get multiple checklist run and not missing steps when we were trying to ensure that we were in a safe configuration for the demonstration and we still met the TO requirements for the approach checklist and before landing checklist, so we took copies of the CL-1-1 or CL-1-1-1 or whatever it is, the fan fold, what are those copies and we would integrate our own but we boxed, and I did a lot of that, we boxed the TO checklist and we wrote the actual version and applicable date on it and boxed out the, for example, the approach checklist had a box around it so it didn't get intermingled, we didn't slide steps in there. It would just have that and then right next to it or below it in a separate area would be okay, remember to turn the landing lights on for the landing, poor example. We typically flew with the lights off for the profile, but the demonstration-- most of the airfields wanted the lights on for touchdown. So, trivial things like that, making sure we would put the landing lights on. Another issue we run into during the demonstration was we do multiple passes over the runway. Typically we would be in a habit of calling gear down, but in this scenario we kept flying over the runway at 500 feet and not calling gear down and we would forget to call gear down on the call that we--the one we are actually landing at. Would do this if you checks within the plane, but it is still an AFI requirement to actually say that prior to Crossing the threshold. So we would add that little note into the checklist as well. We basically took a checklist and edit notes to it, but we did it in a digital format we make sure we record the revision number of the official TO.

- 44Q. So, I guess my question would be then, is that an official checklist?
- 44A. No. The demo a checklist, they don't have a demo checklist. There is no demo checklist. The TO was not an official--the checklist that we kind of created was a TO extraction so that we can put notes on it. We needed more notes than what that fan fold would allow and the fan fold won't take the ink too well so we built this other one on top of that fan fold so that we could get more notes in there and get our demonstration specific notes in there.
  - 45Q. So the small writing was basically notes then is what you are saying?
- 45A. It was digital, correct, because you can't write on that fan fold. It is tear proof paper and it won't take pencil. There's just not enough room to get all the demo things that we want to incorporate in there and not forget.
- 46Q. First of all, when you say the notes, or that portion, was it in MS Word that you did it?
- 46A. I think that's what we built the demo technique items on, but the TO checklist was actual copies of the checklist on there. Zap Grab? is a pretty common tool the C-17 community used to capture digital images, but they are not editable. It is a picture of the actual checklist and then we would put it on there. You can't change the--for example, the approach checklist was completely--it was a picture of the approach checklist put on the sheet of paper. You cannot change the words or the letters or anything like that.
- 47Q. I've seen an aerial demonstration checklist and on the top that says 3d Wing. Does that mean it was approved by the 3d Wing?
- 47A. No, I don't member what ours look like, but no. It was used as a technique for us. I don't remember if ours had the 3d Wing on top of it or not.
- 48Q. All right. When you were in training for your demonstration crew members, do you remember getting any warnings or alerts from the aircraft?
- 48A. Sometimes on takeoff when you brake release, if you are low on fuel and had about 20,000 pounds of fuel in the tank's, which for the 17 is fairly low, when you would release breaks for the takeoff you would get a master caution like a fuel warning master caution. It would go away halfway down the runway. It was just an initial sense of fuel that was sloshed to the back and you would get a master caution. It would be the only one that I would say was fairly predictable. If you took off with about 20,000 pounds, you were going to get that quite a bit just because the take off really lurches. You come off the brakes and it really lurches forward to take off.
  - 49Q. So, you got no others in the profile itself or anything like that?
- 49A. No, anybody who is here on the C-17 will hear the stall warning on occasion, but if you get that, it was a very brief thing. Maybe you pulled a little too hard and it would say stall. Okay, you ease off right away. That's pretty standard for the C-17. You pull up to abruptly or make a bank to abruptly and you might get a momentary warning but it was half a second.

- 50Q. So, you are saying you would just take the appropriate action then?
- 50A. Usually, almost always, every time I got a stall warning is because I was pulling back on the stick. You ease off the stick right away and you are back in business.
- 51Q. So, if the folks you were training, say specifically MP those crewmembers that you trained, did you teach them anything like if they got a warning what they would do with it?
- 51A. No. We didn't really discuss it. They stall warning is a stall warning so you had to ease off. It was never really an issue. I can't even remember routinely hitting it. I'm sure I did just because in the C-17 if you pull back so hard you're going to get it, but I don't remember it ever going off in the profiles. I don't remember it being okay; it happens all the time. Let's talk about it. It happens in the C-17. It's not unusual in the C-17 to get that, but it is a standard response and anybody who was flown the C-17 knows to ease off the stick and get out of whatever's is putting you in that stall parameter, but it wasn't anything we would deliberately go after for sure.
- 52Q. Just real quick, what is your assessment of MP performance during his training?
- 52A. I would say initially we had--he wanted to keep it a little bit more aggressive. He wanted to keep it a little bit tighter to the runway. So instead of the 9 seconds out he would want to go 5 seconds and try and make the turn back. In the simulator, especially, we show that doesn't work. You overshoot quite a bit. But when did the actual demonstration in the aircraft, we videotaped at all. That was a requirement, to send it up to the 11th Air Force Commander. Those videotapes, we could see to how it's a C-17. You can only make is so sexy. Making it 5 seconds out versus 10 seconds out, from the ground it looks the same. It was fairly benign, but the workload in the cockpit increased quite a bit. We would discuss that and it was early on in the training with the profiles. It's just not worth making it that tight because it looks the same from the ground. It's pretty boring from the ground, from the spectator point of view. From that point on and all the performances that we did, we would go a little bit further knowing that the crowd view--the crowd is really watching the takeoff and landing. That's about it. That's the most exciting part of the profile really, from that point.
- 53Q. You said that MP was wanting to kind of keep it more aggressive. Did he mention why he wanted to do that?
- 53A. I think he just wanted to make it look like a good performance, make it captivate the audience. I think there is a little bit of an uphill battle there at Elmendorf because you are in competition with the fighters, but again, after you watch it on the tape that is especially when it sinks in. It doesn't look any different. Five seconds out and 10 seconds out is more pilot workload and there is absolutely no effect to the crowd and the observer. Speculating as to why that is--it was nipped in the bud early on, and it never really became an issue after that.

- 54Q. So you're saying that, and I don't want to put words in your mouth, but you said you reviewed the tape with MP and then basically said see, you don't need to be as aggressive. Is that what you're telling me?
- 54A. Yes, sir. It's absolutely correct. That was a lesson for all of us to really look at and say you cannot change the parameters of the profile. Again, the profile is the profile. It is set down by law and that AFI and you can't change it, change the sequence, or change the maneuvers or anything like that. You are stuck with that profile and you can only--you can't dress it up really. There is no real way on that plane to dress it up. Speaks for itself. The point is not to go out and be the Thunderbirds. The point is to go up there and demonstrate what the C-17 can do. I think that was taken to heart by all of us, especially after you watch the video. This is what the profile is going to look like regardless of how fast you do it.
- 55Q. Getting back to MP training, if I may, were there any particular strengths or weaknesses that you recall?
- 55A. The training blurs together. I have flown with him for a number of years. The specific training of the demonstration blurs together with just the times I have flown with him and worked with him. I don't know that I can answer about that specific training.
  - 56Q. Do you have any overall impressions of his performance?
- 56A. His flying performance, well, I thought he was very meticulous and in the books. When I was a brand-new aircraft commander I had flown with him several times in our own squadron at McCord and he was the go to guy for going into reg's and interpreting how would you do this, how would you do that? He was always on par. I wouldn't say he was world's best pilot, but he is also--there is nothing that sticks out in my head that goes oh, I would never want to fly with him. I would never have flown with him that was the case. He was a good pilot. I never had any issues with him.
- 57Q. Lastly, according to the TMS entry dated 30 December 08, you recommended MP to be a demonstration pilot. What considerations went into your recommendation?
- 57A. Certainly flying ability is the premium litmus test, if you will. That was a different requirement. If you couldn't do the profile then, then again, the maneuvers are not complicated. They are standard C-17 maneuvers but they are done in rapid succession. That was the most important thing, without question. Other things we looked at and evaluated before we even chose somebody to get involved with even go into the flying portion of it was to make sure the character of it in the situation we are in. PACAF was putting us into a lot of on our own situations where when you go, you manage your own missions, get your own diplomatic clearances, get your own flight plans and do everything to get to wherever PACAF was wanting us. Once you got there, you are the only Americans there so you needed to represent the wing and the country well. We looked at those long before we even put somebody in the simulator. We went off with that, we went off historical flying with that individual, then decided who is competent enough to fly this and then of course the simulator and the flight training portion was the ultimate critique. If you can fly it, you can do it. It is especially the case in this environment because training sorties are few and far between now. Locations, especially in Alaska, we are a

little bit challenged to find the time or we can do the performances in practice the performances. You need to be able to do this with limited practice before hand. We had a requirement of 7 days before every demonstration we had to practice it. You may only get to practice it twice and jump in the sim 3 or 4 times so you need to be able to knock the dust off quickly and those are the people that we chose, the people that were inherently good at flying and didn't take much to get the dust knocked off from the profile when they haven't done it in 6 months.

President: or would like to do is to take a small break and then I want to discuss any other follow up questions that the group may have to ask, just for clarifications, and then we will proceed with you and that will conclude the interview for the day.

[The board recessed at 1305, 11 September 2010.]

[The board reconvened at 1316, 11 September 2010.]

Legal: We are back on the record. All members attending the interview on both end of the telephone are present.

#### **Questions by the Board President:**

- 58Q. I would like to follow up with two questions before I read you out. The first one deals with a statement that you made reference to the training sorties being few and far between. Do you believe that impacted the overall performance or do you believe there was enough training to stay current and proficient in that profile?
- 58A. My primary reference was in reference to the demonstration training and how often we get to do the demonstration practice. Prior to any demonstration, I think we walked out of there well-prepared. The primary avenue for that was the sim. We did multiple sims in preparation for whatever venue we were going to. That was actually more helpful, if you will, because we could train to pressure and altitude that we wouldn't be able to train to at home station. Taking an aircraft out was tasking on resources from the squadron. It is tough to get the generated aircraft with that low amount of fuel to go up and do a demonstration.
- 59Q. My second question I had was reference to MP You asserted initially that he was a little bit aggressive and then you nipped that in the bud. How did you do that? Was it the video? Was that through discussion? Once it was resolved, how did it stay resolved?
- 59A. The comment was aimed mainly at MP who wanted to make the profile look as good as possible, but especially the video, by watching the profile, the profile can't be changed. It is the letter of the law. That's what the profile is. You cannot change that. He wanted to make it as awe-inspiring as you could, if possible, for the crowd but after the initial training when he watched the video and saw the video and saw how difficult it was--one example that we discussed, MP WITNESS 13 and myself, we discussed the outbound turns. When you initially departed and you climb to 5000 feet initially from the runway, how far do you go? Well, the further out you go the easier it is to make the turn back to the runway. He

wanted to keep it quick and keep it going fast so he would only want to go out a few seconds and then turn again. On the turn back he was working very hard to try and get the thing back in without overshooting the extended centerline. Now it's a more often than not that we did overshoot the extended centerline. We watched the video and we realize the difference between 4 seconds out, 5 seconds out, and 10 seconds out on the outbound from the runway and you realize it really looks the same from the crowd's point of view, but the workload on the pilot is exponentially less by going out 10 seconds. That was enough of a call right there. It reinforced it for the other 2 of us but it was definitely a sell for MP to say, you really can't see the difference. It doesn't look any different from the crowd's perspective but it is significantly different on the pilot's workload perspective by just going out that extra time. There was nothing that needed to go up to leadership. He was one of those where we just discussed it and there was no input in the profile for how far out you should go and rightfully so because it depends. At 4000 feet PA, you are going to go out 15 seconds, maybe.

- 60Q. That was done during his upgrade training, correct?
- 60A. Yes, sir. It was, which just based on the TMS, would have been December 08.
- 61Q. I apologize. I have one more question that just came to mind. You say 1500 feet is the profile. 1500 feet AGL is the profile. Was there ever a circumstance where you would like that profile at a lower altitude or was it always 1500 feet?
- 61A. The 1500 feet is what the profile says to do. I would say we would begin leveling off at 1200 to try and capture the 1500, but 1500 feet was the first turn and it was actually a little bit more of a challenge because you have to lose 1000 feet around the corner as you are making the descent. On the 80, 260 portion you are descending down to 500 feet AGL so you have to lose 1000 feet versus all the subsequent maneuvers where you are only at a thousand and want to lose 500 feet. It was a much more gentle descent to lose 500 feet. It was fairly easy.
- 62Q. Lastly, before I read you out of this interview, are there any other matters that we haven't covered that you believe may be important to our investigation?
  - 62A. No. No, I don't think I do.

PRESIDENT: You are reminded of the official nature of this interview. You may not discuss your testimony with anyone without my permission at any time before the report of this investigation is officially released to the public.

This concludes the interview. The time is now 1322 local, Alaska time.

[END OF PAGE]

#### V12. AIB INTERVIEW WITH

### WITNESS 12

#### VERBATIM TESTIMONY OF

# WITNESS 12

PRESIDENT: My name is Brigadier General Carlton D. Everhart, II. We are investigating the C-17 accident that occurred on 28 July 2010 at Joint Base Elmendorf-Richardson, Alaska. This investigation, conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 91-204. The purpose of this investigation is to produce a publicly releasable report on the facts and circumstances surrounding the accident and to gather and preserve evidence for use of claims, litigation, disciplinary actions, and adverse administrative proceedings, and for all other purposes. A safety investigation was previously conducted on the accident. Any testimony you gave before the safety investigation board will be kept confidential, if you were so advised, and can be used only for accident prevention purposes. This board does not have access to any confidential testimony you gave before the safety investigation board. Your sworn testimony to us may be used for any proper purpose. Additionally, your testimony can be released to the public. Do you understand the difference between your testimony before the safety board and the accident board?

WITNESS: Yes, sir.

PRESIDENT: Your testimony in this investigation will be under oath. At this time, I will administer the oath. Please raise your right hand.

[The witness did as directed.]

PRESIDENT: Do you solemnly swear that the testimony you are about to give in the matter under investigation shall be the truth, the whole truth, and nothing but the truth, so help you God?

WITNESS: I do.

MAJOR All right. And this is Major If I can have, also, make his appearance on the record, please.

LEGAL REP Yes. This is LEGAL REP I'm the Deputy Staff Judge Advocate for the 87th Air Base Wing legal office, at Joint Base McGuire-Dix-Lakehurst.

And thank you. And you are present, there, in the room with

WITNESS 12 ?

LEGAL REP I am.

Hold on one second. We have some jets passing overhead. All right. And were you able to witness his swearing in?

LEGAL REP I did.

And taking the oath?

LEGAL REP I did.

And did you verify his identity?

LEGAL REP I have.

Thank you very much, LEGAL REP You're excused at this time. Thank you for your assistance. Vou're excused at this time.

WITNESS 12 I'm still here.

And has LEGAL REP departed the room?

WITNESS 12 He has departed.

This testimony is being taken telephonically. We have your permission to record it?

WITNESS 12 Correct.

Okay. Thank you. Go ahead, sir.

PRESIDENT: Today is the 10 September 2010. This time is now 0920 local, Alaskan time. This interview is being conducted telephonically. The base legal office at joint base McGuire-Dix-Lakehurst, New Jersey, has verified the identity of the witness. The persons present here are:

the Pilot Advisor;
the Legal Advisor;
the Medical Advisor;
the Court Recorder; and,
me, [Brigadier General Carlton D. Everhart, II, Board President]

in room 105, at building 7309, joint base Elmendorf-Richardson, Alaska.

PRESIDENT: The witness, WITNESS 12 is at joint base McGuire-Dix-Lakehurst, New Jersey, in building 2901, room 112. The witness has been sworn.

- 1Q. Please state your full name and rank.
- 1A. My full name is WITNESS 12.
- 2Q. And how long have you served in the Air Force?
- 2A. I've been in the Air Force now 15 and a half years.
- 3Q. And what is your unit of assignment and location?
- 3A. Unit of assignment is the U.S. Air Force Expeditionary Center at Fort Dix.
- 4Q. And how long have you been with this unit?
- 4A. I have been here for four months now.
- 5Q. And what is your job title?
- 5A. I am an IDE student.
- 6O. And IDE means?
- 6A. It's an Intermediate Development Education.
- 7Q. How long have you been doing this job?
- 7A. For four months.
- 8Q. And please describe your duties and responsibilities on 30 July 2007?
- 8A. 30 July 2007. I was an evaluator pilot with the 535th Airlift Squadron out at Hickam Air Force Base, Hawaii.
  - 9Q. Okay. WITNESS 12 thank you and I'm going to turn this over to to continue with the questions at this time.
  - 9A. Roger, sir.

## **Questions by the Pilot Member:**

10Q. Hello, WITNESS 12 I'm the pilot member of the board.

10A. Hi.

11Q. I would like to start off and ask you are you familiar with the C-17 Aerial Demonstration Program?

11A. I am.

- 12Q. Can you describe for us your C-17 Aerial Demonstration background?
- 12A. My background was when I went up to Hawaii, PACAF did not have a C-17 Aerial Demo Team. When I was selected as the individual to start up a C-17 Demonstration Program for PACAF, at the time it was just the unit at Hawaii. Elmendorf hadn't stood up yet.

So, I was selected to start that program and became the first Team Commander and the first Demo qualified pilot for PACAF and the C-17.

- 13Q. And during that time, what was the certification process when you were certified?
- 13A. For us, for the first individuals, the certification process existed through AMC. So, we actually went TDY to Charleston and got trained by an Aerial Demonstration Pilot from Charleston and they trained our entire crew. And that was the crew we had for the first few air shows that PACAF performed.

#### **Questions by the Board President:**

14Q. And then, WITNESS 12 this is Brigadier General Everhart again. I understand, just for clarification of the record, PACAF is Pacific Air Forces, AMC is Air Mobility Command, and TDY is temporary duty to that other location at Charleston, correct?

14A. Correct, sir.

- 15Q. And after your certification process, what was the Pacific Air Forces certification process at that time?
- 15A. The process was similar to AMC's. They used the AMC standard and certification training guide until they could go through the wickets up through the Ops Group Stan Eval and then through PACAF Stan Eval to get a PACAF certification program established.
- 16Q. And is this what ultimately led to the Pacific Air Force Con Ops or concept of operations for aerial demo team?
  - 16A. Correct, sir. It was modeled after AMC.
- 17Q. Can you describe the certification training guide that you used to develop -- that was used to develop the PACAF concept of operations?
- 17A. The certification training guide, again, was similar to AMC's. It consisted of the same training profiles. So, you had one simulator where you performed all of the profiles that are located in the 246, the AFI. And then you would go out and you would fly with a demo certifying pilot on the 6 and the 10 and the 12 minute profiles as well on the airplane.
- 18Q. And by "profile," you mean a segment that demonstrates the aircraft capabilities for the purposes of aerial demonstration, correct?
- 18A. Correct. And those are the standard profiles right out of, I think, Chapter 6, AFI 11-246.
- 19Q. How many air shows did you perform while you were certified as a demonstration pilot?
  - 19A. I flew in three air shows while I was at Hawaii.

- 20Q. And in addition to that, did you provide Aerial Demonstration Training to any 3rd Wing crew members?
- 20A. I did. I provided training to 3rd Wing members. On one occasion, I think it was the first part of May of 2006, I was invited out there, myself and one of our loadmasters, got there and trained the initial crew for the 3rd Wing.
  - 21Q. And do you remember who the crew members were for that initial crew?
- 21A. I remember one was -- or WITNESS 26, at the time. And then MP And there was a third member which I can't remember.
  - 22Q. And you say that was in 2006. Did you, perhaps, mean 2008?
  - 22A. I'm sorry. 2008.
- 23Q. I just wanted to clarify that. And moving back to your -- quickly moving back to your actual air shows that you flew, do you remember which profiles you flew during those air shows?
  - 23A. We flew two of the 12 minute profiles and one of the 10 minute profiles.
  - 24Q. And the 12 minute profile being profile 3, is that correct?
  - 24A. Correct.
- 25Q. Moving back to your training in 2008 for the 3rd Wing crew members that you trained, can you describe the nature of that training?
- 25A. The nature of the training was that Elmendorf wanted to establish an Aerial Demonstration Program, which they didn't have at the time. And I went out there and trained their initial cadre. So, it was the first crew to get trained. The PACAF CONOPS at the time delegated the certification process to the Wing Commander and then to the NAF Commander, the Numbered Air Force Commander, and our Numbered Air Forces were different. So, I wasn't involved in the certification process, just the training part of it. So, I went out there and provided them the ground training, the sim training, and the flight training.

- 26Q. And WITNESS 12 if I may ask a question, the individuals that you trained, are you familiar at all with how they were selected as this initial cadre for the Elmendorf Demonstration Team?
- 26A. I was not, sir. When I showed up, I had no idea who I would be training, that I would just be training three individuals.

- 27Q. I think you already mentioned that the AFI 11-246 contains the demonstration profiles that you were referring to, correct?
  - 27A. Correct.

- 28Q. Can you explain in general terms how these profiles are used for an aerial demonstration performance?
- 28A. In general terms, they are used to demonstrate the capabilities of the aircraft to the general public. They show configured flight, maximum lift capabilities. So, max take-offs, assault landings, and then just general demonstration of flight characteristics.
- 29Q. And by "configured take-offs and configured performances," you mean with the flaps and slats --
  - 29A. Correct.
  - 30Q. -- meaning in a high lift --
  - 30A. A high profile --
  - 310. -- in a --
- 31A. -- with a full flap configuration with gear down, showing the capability of slow flight.
  - 32Q. So, in a high lift configuration?
  - 32A. After the initial take-off, it was a max power, max angle climb.
  - 33Q. Can you define what a max angle climb is or a max power climb is for us?
- 33A. A max power climb is taking off at max power from a static take-off and, essentially, the goal was to be at least 1000 feet by the end of the runway, which with the amount of weight that we took off on on a demonstration profile, was fairly easily done. And then the initial climb went up to 1500 feet AGL. So, again, it was just a max demonstration of climbing to altitude quickly before the end of the runway.
  - 34Q. Okay. Understand. And by "AGL," you mean above ground level?
  - 34A. Correct.

- 35Q. And then by "static," you mean that you held the brakes, pushed the power up to max power, then released the brakes, correct?
  - 35A. Correct.

- 36Q. And then when you were talking about above ground level and those numbers, 1000 feet, you were referring to altitudes, correct?
  - 36A. Correct.

- 37Q. Do you remember what, on your max power on that initial climb out, do you remember what speed that you would use?
  - 37A. You mean for rotate speed, sir, or --
- 38Q. The climb out speed. What speeds were you looking for? Or how did you know what angle to climb out at, at what speed --
  - 38A. Well, it's based on --
  - 39Q. -- now how you do but what was your target?
- 39A. Well, VMCO is your target. So, that's your min climb out speed. So, it changes depending on the weight of the aircraft. VMCO is the term that we use on the climb out.

- 40Q. Do you ever remember, during that climb out, getting below your VMCO or your minimum climb out airspeed?
  - 40A. No.
- 41Q. And I believe you already started talking us through that but can you provide an overview of the 12 minute profile, also known as profile 3, specifically?
- 41A. Sure. The profile is a, like I said, a max take-off, climbing straight ahead. It's up to 1500 feet above ground level, AGL. I used 1000 feet as my starting off point to level off. That was a technique that I taught, just to begin their acceleration. The profile calls for a 45 degree bank angle 80/260 back to the runway.
  - 42Q. And can you define the -- what you mean by "80/260 back to the runway?"
- 42A. Yeah. It's an 80 degrees offset from your runway alignment. So, your turn would be 80 degrees off. So, if I had a 290 runway heading, my turn would be to a 210 heading and then I would turn back the opposite direction 260 degrees to align myself with the runway the opposite direction of 290.
  - 43Q. Okay.
- 43A. And then you would set up for a high speed pass. So, you would begin to accelerate out at -- a high speed pass is done at 250 knots or if there is a waiver, you can go up to 300 knots, and then at show center, you'll turn off runway center line approximately 50 degrees and come back in for a slow flight demonstration. So, you are configuring coming back in and I think that it's a full configuration. So, it's gear down, slats extended, flaps full, and you're flying at approach speed.
  - 44Q. Okay.
- 44A. Approach speed is calculated based on wherever you are at the time that you approach the approach.

- 45Q. And "approach speed" is the speed at which the -- the landing speed for the aircraft during the approach phase?
  - 45A. Correct.
- 46Q. Do you ever remember flying below that approach speed during any phase of the profile?
- 46A. No. You're fairly light, so you're flying pretty slow as it is just based on the weight. So --
- 47Q. So, there's really not even need -- it's just stay at approach? There's no any need to go any slower because -- I mean, what would happen if you did?
- 47A. You'd usually get the stick shaker. You know, guys in training, in the sim training, they'd get the stick shaker but you're going to have to be substantiall -- well, it depends on the winds but substantially below your approach speed to get in any kind of trouble.
- 48Q. And by "stick shaker," you mean an alert from the aircraft that you are potentially approaching stall airspeed, correct?
  - 48A. Correct.
- 49Q. So, specifically for the 80/260 maneuver, can you describe how you instructed crew members?
- 49A. Yeah. I instructed crew members on the initial take-off, again, to start lowering the nose at 1000 feet while continuing to climb to 1500 feet AGL. When you start to get flying airspeed, I chose a technique at 15 knots above your flap retract speed was a good time to begin your turn maneuver --
  - 50Q. Okay. So, that 15 --
- 50A. -- I maintain 15 knots above whatever my min maneuvering airspeed was, we call it MUMAMA, and the airplane -- is a good indication for -- to turn using 30 degrees of bank.
- 51Q. You mentioned 15 knots above, so that would be 15 knots of extra speed that's required above the speed to move the flaps into the up position, correct?
  - 51A. Not required. Per the Dash 1, you can move it at the flap retract speed.
  - 52O. Okay.
- 52A. So, you know, there is a flap retract speed that's indicated on the HUD and the MFD, the multi-function display, and the heads-up display, and you're cleared to move flaps up. The Dash 1 does recommend, or at least I think it used to, I've been out of the airplane for two years, but it recommended anymore than 15 degrees of bank that if you're right on your flap retractor, your flap retract speed, to -- you use caution when going beyond 15 degrees bank. But I don't know if that's still in there or not.

- 53Q. Okay.
- 53A. So, I was taught add 15 knots if you're going to go more than 15 degrees and it's a 30 degree turn.
  - 54Q. So, your technique was to use 15 knots above that speed --
  - 54A. Correct.
  - 55Q. -- and how -- what reasons did you have for using 15 knots above that airspeed?
- 55A. It just, you know, it's extra airspeed for mom and the kids, so to speak. You know, it's just a little extra safety boundary. Because you are fairly slow taking off. You're lightweight. So, your speeds aren't usually what you're used to seeing on any typical mission taking off in a C-17. So, you're a lot lower in your speed. Granted the airplane does accelerate a lot faster. So, it's usually a non-factor but it's nice to have that extra 15 knots.
  - 56Q. If you could continue talking us through that maneuver?
- 56A. Sure. So, the book calls for 45 degrees on that 45/60, but again, I never used 45 degrees of bank because one, you start the turn just for crowd pleasing and everything else like that. Once you establish a turn, we taught don't go back into the book because it makes it look like it's a sloppy profile, just accept what you have. So, I taught 30 degrees of turn for the 80/260 --
  - 57Q. And you mean --
  - 57A. -- and maintain slower airspeed so --
  - 58Q. You mean 30 degrees of bank?
- 58A. -- if you're going 20 knots in that turn it's more than enough to maintain one, a good type boundary to the airfield and make it look clean throughout the maneuver. So, 30 degrees of bank, accelerate to 220, clean up, meaning bring your flaps up at your flap retract speed, slats up at slats retract speed, and then you set yourself coming back in. And once you're rolling out onto your crowd center line, and you're not going to overshoot, then you can begin to accelerate for your 250 knots or your 300 knots, whatever may be the case for your high speed pass.
- 59Q. So, to summarize, approximately 15 knots above your flap retract speed you would retract the flaps and then you would establish a bank angle somewhere around 30 degrees and then you would retract the slats on airspeed, on your minimum slat retract speed, and then you would continue to accelerate to 220 knots? And make --
- 59A. Correct. And just to clarify, the flap retract speed -- the flaps were retracted at flap retract speed but I didn't initiate any turns until 15 knots above flap retract speed.
  - 60Q. Okay.
  - 60A. So, it was a bank angle thing.

- 61Q. And you --
- 61A. Not so much a flap retract.
- 62Q. And you mentioned that that was for an extra safety margin before you started that turn, correct?
  - 62A. Correct.
  - 63Q. Yeah. Can you explain what you meant by "don't go back into the book?"
- 63A. The book calls for 45 degrees of bank. I didn't say "don't go back into the book." What I meant was if you've established a 30 degree turn, which is all you really need when you're at slower speeds, there is no need to go to 45 degrees because the crowd, they see you establish a 30 degree bank angle, and then they see you turn again another 15 degrees. So, just for the crowd, it makes it look like it's a sloppy turn and that's what I taught. So, 30 degrees is more than enough bank whereas the book calls for 45 degrees of bank angle for that turn. So --
  - 64Q. And "by the book," you mean AFI 11-246, correct?
  - 64A. Correct.
- 65Q. And during the configuration changes, "configuration changes" mean moving the flaps to the up position and retracting the slats, who called for those configuration changes? Was it the pilot, co-pilot, or safety observer?
  - 65A. That's called for by the pilot.
  - 66O. And was that verbalized?
  - 66A. That was.

- 67Q. And that's what you taught also?
- 67A. Yes, sir.

- 68Q. Did you teach anything specifically or did you fly specifically with a plan for rudder use?
- 68A. No, sir. The rudder is a technique that has been out there. I know years back the reserves liked to use it but I always taught that there was no requirement for use of the rudder on this airplane.
  - 69Q. And did you ever --
- 69A. The planes aren't that close in. They're just not that -- there's no requirement for it.

- 70Q. And so, you never found that the rudder was required at the bank angles that you flew to make the -- to make the profile work correctly?
- 70A. No, sir. And in fact, you know, usually on the 12 minute profile, we usually finished in about 10 minutes and 20 seconds. So, there was no need to tighten up the turns or do anything different.
  - 71Q. And did you teach that also?
- 71A. I mentioned the technique but I also mentioned the fact that there wasn't a requirement to use that.
- 72Q. You mentioned that the checklist or the configuration was changed or called for by the pilot and it was verbalized. Were all checklists also verbalized?
- 72A. We used two checklists. All normal aircraft checklists, like the profile checklist, the approach checklist, and the before landing checklist, and the full stop taxi back checklist, those were the four checklists that were used on the profiles. Those were all called out normally and verbalized normally in the airplane just like you would on any given mission. There is another checklist that basically it's an aerial demonstration checklist and that was written by the reserves a long time back as well that kind of sets up the airplane internally so that it makes the switchology match what you want it to match and it also eliminates unwanted cause alerts or terrain calls, you know, from the caution warning system in the airplane. That was verbalized by the pilot flying -- or by the pilot not flying and the safety observer. So, there is two checklists. But that was never a checklist that configured the airplane or put it in anything unsafe. All that did was set the airplane and the box, the mission computer, up for the actual profile and then it set it up for the landing so you didn't miss landing lights, you got a good gear call, you got just a typical FAA required items prior to landing, that you got those knocked out. And the pilot wasn't required to call that but I always taught hey, give me at least one or two indications that you're running that step. Give me a chance to acknowledge it. If I don't, continue on. But everything else was normal.
- 73Q. And just a few things to clarify. By "switchology" you mean the position of the switches in the aircraft?
  - 73A. Correct.
- 74Q. And the pilot not flying? That would mean the co-pilot in the air show demonstration configuration, correct?
  - 74A. Correct.
  - 75Q. And then FAA, you're referring to the Federal Aviation Administration?
  - 75A. Correct.
- 76Q. And in regards to the checklist, was it common practice for aerial demonstration crews in the 3rd Wing to use the Aerial Demonstration checklist?
- 76A. I'm not sure what the 3rd Wing used. Like I said, I was out there for 72 hours. I trained those guys and I never saw them fly a profile, never saw their training program after that.

- 77Q. Was that checklist in use at your home station or was that just relevant to the 3rd Wing? Was that something that was specific to the --
- 77A. No, it was provided to me by Charleston and was trained to me at Charleston and I used it to train my folks. It did a great job of setting up the box and making sure you didn't miss anything. So --
- 78Q. And do you know if that checklist was ever certified as part of the 3rd Wing's approved checklist?
- 78A. Not that I'm aware of and it never was at Hickam, either. It was strictly technique only.
- 79Q. So, when you saw this checklist or your interaction with this checklist, did it have any certification written on it or did it appear to be an official checklist from any of the wings?

  79A. It did not.

80Q. WITNESS 12 can we just take one pause -- quick pause for the minute, if we may?

80A. Absolutely, sir.

MAJOR And we're back on the record. This is Major Go ahead, sir.

#### **Questions by the Board President:**

- 81Q. So then, WITNESS 12 just to qualify what you were saying about the two checklists, the -- your normal checklist that you run is the Dash 1 checklist. The aerial demonstration checklist is the one that's used as technique only, just to make sure that the switches are in -- as a reminder that the switches can be placed in positions that are better for the demonstration. Is that correct?
- 81A. That is correct, sir. The Dash 1 checklists are mandatory. The technique checklists, the aerial demonstration checklist, was just there for our own benefit to make sure that we got the switches where they needed to be.

- 82Q. And you never used that aerial demonstration checklist to take the place of any of the technical order, meaning the Dash 1 technical order checklists that are required?
- 82A. That is correct. They were run in conjunction with each other but one never took the spot of the other one.
  - 83O. Okay.
  - 83A. Ever replaced it.

- 84Q. During the -- during your experience with training the demonstration pilots, you mentioned the profiles and you talked us through those. During any phase of the profiles, do you remember specifically a propensity or do you remember the aircraft stall warning system alerting?
- 84A. Not that I can recall. Again, it's been a little over two years. So -- the sim profile, each of the members I believe they got into the stall warning system but that's fairly typical for a brand new pilot that's jumping in to do the profiles, day 1 in the sim, after, you know, they've never seen it before. So, I want to say there were a few times in the sim that we got the stick shaker and I'm not sure about the airplane.
- 85Q. And we defined the "stick shaker" earlier as when the aircraft alerts the crew that it's approaching stall speed and the stall warning system also accomplishes that same task.
  - 85A. Correct.
- 86Q. In the simulator when they -- when you -- when these students did -- were alerted by the stall warning system, what did you teach the students to do regarding the recovery or their response to that stall warning system?
- 86A. If it's on the initial take-off, usually it's because they pulled too quick which can lead to a tail scrape or something else. So, usually I just taught them it's a normal take-off, nice, smooth back pull, continuing to a steady climb. If the stick -- or the stall warning came in a turn, it was as simple as relaxing the stick and then rolling out.
- 87Q. Regarding the AFI 246 C-17 profiles, what did you teach your -- what did you teach your students or what did you teach members in aerial demonstration upgrade regarding adherence to these profiles?
- 87A. We printed out those profiles and made them into knee boards. So, we provided the folks I trained at Elmendorf with copies of those knee boards that they could use, where they put the entire profile, it's shrunk down into a easily readable format and it's placed on a knee board and strapped to their knee. So, they have access to those profiles visually within the airplane.
  - 88Q. And by adherence, did you teach them as guidelines or procedures?
  - 88A. Those were procedures.
- 89Q. And in regards to our previous conversation about stall warnings, what -- was there a lag time between the stall warning and the reaction or did you teach -- did you teach an immediate recovery to that stall warning?
- 89A. No. It's an immediate recovery and I think that's inherent in most Air Force pilots. You know, they're taught from an early age, when you get a stall warning that you immediately release back pressure and roll out. So, that's ingrained in us early on through pilot training.
  - 90Q. And that's true even for demonstration profiles?
  - 90A. Correct.

- 91Q. Previously you had mentioned that you trained MP Is that correct?
- 91A. Correct.
- 92Q. During that training, what was your assessment of his performance?
- 92A. Again, it was a 72 hour snapshot. I got one sim and one flight with him but overall I would say he wasn't one of the stronger of the three. In fact, he was probably the weaker of the three that I trained that day. Again, I chocked it up to he was a Boeing sim instructor full-time at the time of the training. So, I wasn't aware of his frequencies of flights or anything like that. So, I thought maybe he was just a little rusty but he would -- had been picked to be there and be the initial cadre on the Aerial Demonstration Team so I trusted the leadership knew that they were putting a good pilot up there to learn.

PRESIDENT: Hey

WITNESS 12 I'm sorry, again. We just got a knock on the door. So, we need to take a real quick break to answer this question and I'll be right back with you. Is that okay?

WITNESS 12 That's fine, sir.

PRESIDENT: Thank you for your patience.

WITNESS 12 You bet, sir.

- 93Q. Hey, it's again, the pilot member. You mentioned that MP was not the strongest of the three that you trained at the 3rd Wing. Were there any particular areas of weakness that you noticed?
- 93A. It's just basic flying skills, basic control. And again, it was -- I chopped it up to the fact that maybe he -- because he was the only reserve member of the three -- or guard member, that maybe he hadn't flown as much as the other two had flown frequently.
- 94Q. Following you -- following this training, did you certify MP to fly demonstration profiles?
- 94A. Again, I had no involvement in the certification process. All I did was recommend that he be certified in the position but the 3rd Wing has the process ownership of certifying all those individuals. And I recommended MP be certified as a safety observer.
- 95Q. And was there a reason you recommended him for safety observer in particular or was that your overall perspective at the time?
  - 95A. That was just my overall perspective at the time. So --

- 96Q. Did you make any other recommendations regarding MP and his upgrade?
- 96A. I recommended he be upgraded to pilot flying at another time. I don't know if they used -- if I gave a time frame or if I just said at the earliest convenience.
  - 97Q. And you did document that in the training management system. Is that correct?
  - 97A. That's correct.
- 98Q. Lastly, did you, during your demonstration experience, notice any unusual handling characteristics of the aircraft at any time during the profiles?
  - 98A. I did. I did have an ALS system go off and I can't remember what that stands for.
  - 99Q. That's the AOA limiting system.
- 99A. There you go. On initial take-off, on one of ours, we were about 200 feet off the ground and continuing my pull up to -- usually we pulled to about 20 to 25 degrees nose high attitude for the initial take-off, and on that initial pull about 200 feet into that I got the ALS system that flashed in the HUD and took over the stick control and begin to pull back even further on the stick, which it's not supposed to do per the Dash 1. So, I ended up having to push forward on the stick to break the ALS system and then manually push the stick forward. That was the only odd thing I ever saw out of the airplane on a demo profile, though.
- 100Q. And to clarify, the ALS is the angle of attack limiting system and that's designed to prevent a stall from occurring. And the design of the system is to phase out back stick or nose high commands from the pilot or co-pilot positions and return the nose to a more level configuration.
  - 100A. Correct.
- 101Q. When you mentioned that the ALS activated during take-off, you said at 200 feet, you mean 200 feet of altitude? So, above ground level?
  - 101A. Correct. AGL. Above ground level.

## **Questions by the Legal Advisor:**

- 102Q. This is I'm sorry, just to clarify, you're talking about -- the 200 feet during take-off, what time frame are you talking about? What year? Was this during your training of the demo pilots here or was this just in another experience that you had?
- 102A. No, that was at the Avalon Air Show in I believe it was February of 2007. I'm not sure on that date.
- 103Q. And did you have this ALS activation or signal, did you have this during your training time -- during your training period with the 3rd Wing here?
  - 103A. No, I did not.

- 104Q. Also, I'm sorry, just to clarify, you also mentioned the "HUD." What is the HUD, please?
  - 104A. It's a heads up display.
  - 105Q. And what does it display in general?
- 105A. It displays the primary flight characteristics. So, airspeed, attitude, altitude and it will give you a flight director reference on the airplane -- on the HUD also.
  - 106Q And the "flight director" is?
- 106A. It's basically a superimposed airplane and shows your relative position of the airplane to the horizon.
- 107Q. And when you -- you mentioned several times the "stick shaker," the "stick," can you just tell me what the stick is, please?
- 107A. The stick would be the flight control stick. Basically you would call it a yoke in a big airplane.
- 108Q. And it's the stick that the pilot uses to direct the aircraft to change its heading and --
  - 108A. Correct. To control all flight controls.
- 109Q. And you said that when the ALS system kicked in that you had to push the stick forward. Can you -- how much force did you have to use to push the stick forward?
- 109A. It wasn't much. The airplane has what's called force mode. So, if you push too much on a -- when it's got the automatic flight control system engaged, it'll go into force mode which is a different problem. So, this was maybe only one to two pounds of pressure, of forward stick pressure, to stop the ALS system from continuing to pull back on the stick.

110Q. WITNESS 12 just to finish, just one last question if I may and that is for you. Are there any other matters that we haven't covered today in this interview that you feel might be important to our investigation?

110A. No, sir.

PRESIDENT: If I may, now, I would like just to read you, to close up the interview, if I may. You are reminded of the official nature of this interview. You may not discuss your testimony with anyone without my permission at any time before the report of this investigation is officially released to the public.

This concludes the interview at this time. The time is now 1009 local.

#### V13. AIB INTERVIEW WITH

### WITNESS 13

#### VERBATIM TESTIMONY OF

# WITNESS 13 USAF

[14 September 2010, 1311, local Alaska time.]

PRESIDENT: My name is Brigadier General Carlton D. Everhart, II, President of the Accident Investigation Board, convened to investigate the C-17 mishap that occurred on 28 July 2010, Tail Number 00-0173, at Joint Base Elmendorf-Richardson, Alaska. The accident investigation board is in Building 7309, Room 106, JBER, Alaska. We are conducting a telephonic interview with the witness, WITNESS 13, who is in Building 52, Room 1715, Altus AFB, Oklahoma. Also present with the witness is LEGAL REP with the Altus AFB, Legal Office. Prior to the start of this interview, positively identified the witness in accordance with AFI 51-503, Chapter 6, Paragraph 6.7.

The persons present in this interview are:

Brigadier General Carlton D. Everhart, II, Board President;
Pilot Member;
Legal Advisor;
Medical Advisor; and
Court Reporter.

This investigation, conducted under AFI 51-503, is separate and apart from the safety investigation conducted under AFI 91-204. The purpose of this investigation is to produce a publicly releasable report on the facts and circumstances surrounding this accident and to gather and preserve evidence for the use in claims, litigations, disciplinary actions, adverse administrative proceedings, and for all other purposes. A safety investigation was previously conducted on this accident. Any testimony you may have given before the safety investigation board will be kept confidential, if you were so advised, and can be used only for accident prevention purposes. This board does not have access to any of the confidential testimony you gave before the safety investigation board. Your sworn testimony to us may be used for any proper purpose. Additionally, your testimony can be released to the public.

WITNESS 13 do you understand the difference between any testimony you may have given before the safety investigation board and your testimony to the accident investigation board?

WITNESS: Yes, sir. I do.

PRESIDENT: WITNESS 13 do you consent to having this interview recorded?

WITNESS: Yes, sir.

PRESIDENT: Your testimony in this investigation will be under oath. At this time, please administer the oath to the witness.

LEGAL REP Yes, sir. Please raise your right hand.

WITNESS: [Did as directed.]

LEGAL REP Do you solemnly swear that the testimony you are about to give in the matter now under investigation shall be the truth, the whole truth, and nothing but the truth, so help you God?

WITNESS: Yes, I do.

PRESIDENT: Thank you, LEGAL REP for your service. You may be excused.

LEGAL REP [Withdrew.]

PRESIDENT: I would like to start with the questioning.

#### **Questions by the Board President:**

- 1Q. Please state your full name and rank.
- 1A. WITNESS 13
- 2O. How long did you serve in the Air Force?
- 2A. Sir, it has been 9 years.
- 3Q. What is your unit of assignment and location?
- 3A. 58th Airlift Squadron, Altus AFB, Oklahoma.
- 4Q. How long have you been with this unit?
- 4A. Sir, just almost a month.
- 5Q. What is your job title?
- 5A. Currently, I am in training to be a flight training unit instructor with the expectation of becoming an executive officer in the squadron once my certification is complete.
  - 6Q. Could you briefly describe your current duties and responsibilities?
- 6A. Yes, sir. Currently, I will fly from familiarization rights in the aircraft, familiarizing myself with the local area -- just basic local training objectives here at Altus. I will also be observing and, also, conducting training sorties with students, to be ready to be certified as a flight instructor here at Altus AFB.

- 7Q. What was your unit of assignment from 2007 to 2010?
- 7A. 517th Airlift Squadron, Joint Base Elmendorf-Richardson.
- 8Q. What were your duties and responsibilities when you were stationed at Elmendorf AFB, or Joint Base Elmendorf-Richardson, at the 517th?
- 8A. Sir, in the beginning, I was a scheduler in the squadron. Then I became a chief scheduler, then assistant flight commander for support flight, then the support flight commander, then an assistant director of staff for the commander in the squadron, and then Director of Staff for the Commander, 517th Airlift Squadron.
  - 9Q. Are you familiar with the C-17 aerial demonstration program?
  - 9A. Yes, sir, I am.
  - 10Q. Can you describe your C-17 aerial demonstration background?
- 10A. Yes, sir. In late December of 2008, I believe it was, I was brought into the office by my commander. He advised me that he had selected me to become a demonstration pilot in the squadron for the 3d Wing. From there, I went through a training upgrade with, basically, WITNESS 11 as my instructor.
  - 11Q. You were an aerial demonstration qualified pilot?
- 11A. Yes, sir, I was. Initially, I went through the safety pilot upgrade to be a safety pilot. Once we flew the simulators a couple of times, it was determined I could become a full pilot for the aerial demonstration, based on the fact I was an instructor pilot. That was discussed by WITNESS 11 and my commander at the time. And then I become fully qualified as a pilot for the aerial demonstration.
  - 12Q. WITNESS 11 what was his duty title? Who was he?
- 12A. His duty title, at that time, I'm not quite sure, to be honest with you. I believe it was in the current operations in the wing; I believe he was working there. He was fully qualified as a C-17 instructor pilot and, also, was fully qualified as a pilot for aerial demonstrations.
  - 13Q. Also, you mentioned the squadron commander. Who was that at that time?
  - 13A. That was

- WITNESS 23
- 14Q. Would you please describe your demonstration training?
- 14A. Yes, sir. From what I remember, we did multiple simulators, basically getting familiar with the three profiles, primarily, the 12-minute and 8-minute, I believe it was -- the shorter one and the longer one, with most of the practicing with the 12-minute profile, which is the most common. We did several of those simulators and then we went and did several local flights at Elmendorf, to further practice and become fully certified for the aerial demonstrations. That was also included, on the last flight, for the certification of videotaping, to get the full certification.

- 15Q. What was the certification process during your training?
- 15A. The certification training ----

[Note: Computer problem. Brief recess.]

- 16Q. WITNESS 13 thank you for your patience. I want one clarification for the record. You talked about the profiles, Profile 3, or the 12-minute profile. That is the profile that you are most familiar with, correct?
  - 16A. Yes, sir, it was.
  - 17Q. What was the certification process during your training?
- 17A. Sir, from best I remember, I am pretty positive this is the way it went. We got a MFR type document which listed out the things to accomplish, which was reviewing the regulations pertaining to aerial demonstrations. I believe there was also an operations group amendment to that when I got trained, if I remember right. And then we would do several simulators and several flights -- I cannot remember numbers to be exact -- with the last flight we did a videotaped flight, which was for the Wing Commander, from my understanding. He could review and fulfill the final certification we could become aerial demonstration pilots. That was the training process I remember doing, December-January timeframe.
  - 18Q. Who did you initially train with? Who were the other people being certified?
  - 18A. Sir, it was WITNESS 11 as my instructor who trained myself and, also,
- MP who was, also, in the process of getting certification, as a pilot, for the aerial demonstration.
- 19Q. Once you were qualified, did you actually provide demonstration training to other crewmembers?
  - 19A. No, sir, I did not.
  - 20Q. Are you familiar with AFI 11-246, Vol. 6, Chapter 3, Demonstration Profiles?
- 20A. Sir, if that is the regulation that talks about Profiles 1, 2, and 3 of the C-17, yes, I am pretty familiar.
- 21Q. And just for clarification, that is the regulation. Please explain in general terms how these profiles are used for aerial demonstration performance?
  - 21A. Sir, can you explain that a little bit better?
  - 22Q. Specifically, Profile 3, how would you perform that profile?
- 22A. Sir, the profile would start with takeoff from the place where the aerial demonstration was performed for the crowd, which was a high angle the tech climb out, it would be a max power static takeoff. The initial climb out, we would climb out, and once we approach the VMCO speed, we would lower the nose. The target altitude from what I remember was -- I believe it was 1000 to 1500 AGL was the window you were trying to hit, but, of course, the overarching thing was your air speed not getting below VMCO and lowering the nose. After

lowering the nose, there would be a turnout. You would turn depended on where the crowd was, you would turn away from the crowd. That would be to an 80 degree off-heading to perform a 260 during maneuver, which is an 80 degree turn, initially, and then 260 degree back around for the first pass. On the turnout, lowering the nose and turning out, we would be at max power, still, holding max power, and cleaning up the plane on speed, with the flaps up, then the flaps retract. Also, with that, we knew there was -- the way we determined was by timing -- with practicing, we would use timing and seconds. Once we rode out that heading 80 degrees, off from the takeoff, we would time -- I believe it was in the vicinity of 8 seconds from, what I remember for most cases, maybe a little bit more, if it was a higher pressure altitude, hotter temperature type thing, conditions, or maybe heavier fuel. The timing outbound and accelerating the whole time, cleaning up on speed, once we hit the timing and we are at a pretty decent speed, I would say, probably, in the 230 range of air speed, I would guess, from what I remember, we would start the turn back around 260 degrees towards the airfield. This was setting up for the high speed pass where we are trying to accelerate on up to -- the target was basically 330 knots, once you would cross the threshold, on the runway, before show center. Turning around for that 260 degree turn, the big thing for that first turnout was knowing that initial heading to turnout and then using the curve path to judge your rollout heading for getting on the threshold with an extended centerline we use on the NAV display.

- 23Q. You say "curve path," you mean the flight path predictor?
- 23A. Predictive flight path, I'm sorry.
- 24Q. And then you mentioned "VMCO"?
- 24A. Yes, sir.
- 25O. What is that?
- 25A. There's a speed in your heads-up display, your minimum climb out speed. Basically, you would not want to get below that speed, so we would lower the nose before that. That was like our minimum maneuvering speed in the takeoff mode for the plane.
- 26Q. How many air shows did you perform while you were certified as a demonstration pilot?
- 26A. I performed two air shows in India, at the India Trade Show, I believe it was called. It had another name and I'm blinking on the name. It was in India and it was a trade show. And then I did a practice and one air show in New Zealand. That was the extent of my air show demonstrations.
  - 27Q. Do you remember when those air shows occurred?
- 27A. The India Air Show was early February 2009, and the New Zealand Air Show was the end of March 2009.
- 28Q. Who did you fly them with?
  28A. The India Air Show was with WITNESS 11 and WITNESS 26

  WITNESS 11 and WITNESS 26

- 29Q. Did you need to modify the demonstration profiles for any of the air shows you flew?
- 29A. No, sir. We did not do that. From my understanding, that needed a waiver process to do any modification.
- 30Q. What about distances, as far as how you flew out on the 80-degree heading change from show center, did you modify that at all?
- 30A. No, sir. I did not modify that. We, basically, had a basic idea -- our way of figuring out the distance without being heads down much was the timing. We used the timing that worked well for Elmendorf, because it was pretty close to a standard day in the summer. The India Air show is a good example; it was hotter and higher pressure altitude there. We had to extend the timing more for that air show.
- 31Q. In the India Air Show and the New Zealand Air Show, you were in the left seat as a demonstration pilot, correct?
- 31A. We did seven total demonstrations in India for the Trade Show. I did two of the seven. One of the seven was the practice air show which witness 11 flew. He flew two more actual demonstrations; MP flew two more; and then I flew the last two demonstrations there. Seven total at India.
- 32Q. Did you see MP or MSO fly profiles during the Thunderbird Tour in the Pacific?
  - 32A. No, sir. I was not on that mission.
  - 33Q. Going back to the performance demonstrations that you performed in India with MP flying, did you observe those flights?
- 33A. Yes, sir. I do not recall exactly. I was either the co-pilot, or the safety, or I might have been each of those positions -- I might have been the co-pilot on one of the flights and a safety on another flight. I do not recall, exactly, my crew position on those two.
- 34Q. With MP flying, could you elaborate how those flights were conducted and how they went?
- 34A. Sir, from what I remember, they went fine. The only demonstration I recall, specifically, was the practice demonstration where we were not accustom to the higher pressure altitude, higher temperature. We used our normal timing we had used before, which made us -- we overshot the high speed pass turn, crossing the safety line, basically, on that practice, because we were at 60 degrees of bank, but that was the best we could do. That is the show I remember. That is when we decided we had to do more timing, extend out that 80-degree turnout for the next six shows to make it work.
- 35Q. For clarification, you said 60 degrees of bank because that's what stated in the Dash-1?
- 35A. Yes, sir. Sixty degrees would be the maximum banking we would use on the plane. We would never go over 60 degrees for the bank angle.

- 36Q. Let's go back to talk about some of the profiles. Please describe the departure portion, from the static takeoff for Profile 3.
- 36A. Okay, sir, what you just mentioned is a static max tire takeoff. I believe we would put a Delta-V rotate in to get a little more speed before rotating -- get a higher rotate speed. We would rotate to a higher than normal angle of attack, higher than 15 degrees. And then when we saw the speed approaching -- the minimum control speed for the takeoff -- we would lower the nose to not get below that. Once we had done all that, we would start the turnout for 80 degrees off, and go to that initial heading we had talked about prior to flying.
- 37Q. You said higher than normal AOA. Can you describe that? What were those degrees?
- 37A. Best I remember, you could get to about 30 degrees would be about as high as it would get -- angle of attack.
  - 38Q. And what was your target altitude for the takeoff and climb out?
- 38A. From best I could remember, it was between 1000 and 1500 AGL was the target. But, again, in our minds, the min speed would be first thing before that, which would cause to get more like a 1000 AGL. I would say closer to that as an altitude reference.
  - 39Q. 1000 feet AGL, what was the reason for that?
- 39A. Sir, from what I remember, you would hit the main control speed at about that point, or you would be approaching that. We did not want to get below that speed, so we lower the nose and that would start stopping the climb. From what I remember, it would be about 1000 AGL in most cases. I do not remember getting all the way to 1500 feet AGL.
- 40Q. What was your plan to fly, the target altitude or to fly the target speed? Can you describe that for me?
- 40A. The target altitude was in mind. We want to reach 1000 AGL, basically, per the flight profile. Speed, in our mind, was our biggest concern because, with that high of an angle of attack, you could get slow pretty fast. As soon we started approaching the minimum control speed, we would lower the nose and arrest that slowdown of speed.
  - 41Q. Why was speed a bigger concern, versus altitude?
- 41A. In my eyes, you get into the stall region. You probably start getting ALS, maybe, flashing on the FMAs, or stall indications if you kept it going. I never remember that happening. But that would be my guess, as the first thing you would see.
  - 42Q. "FMAs" stands for?
  - 42A. I'm sorry, sir. I'm having a mind blank.
  - 43Q. I think it is Flight Motor Annunciation, right, or Annunciator?
  - 43A. That sounds right, sir.

- 44Q. What were you taught as far as the initial altitude? Were you taught 1000 feet? Were you taught 1500 feet?
- 44A. I am pretty sure I was always told 1000 to 1500. Every time we put it, it seems closer to 1000. But the altitude that really stands out in my head, you never want to be lower than 500 AGL for any of the maneuvers coming up -- the high speed pass, the low speed pass, all that kind of stuff.
- 45Q. You described the 80/260 maneuver. What was your instruction, specifically, regarding the bank angle for that turn -- for the 80 turn, degrees off, and then the 260 back to the runway, what was your instruction regarding bank angle?
- 45A. I remember the initial turnout no more than 45 degrees -- the bank angle there. From there on out, I would say most turns would be between 45 and 60 degrees, but never more than 60 degrees.
- 46Q. The 260 was no more than -- is 45 to 60 degrees. Was it initially 45 degrees, or did you go straight to 60? How were you taught?
- 46A. I think we were taught, after that first turnout, we could go up to 60 degrees. Again, it seemed to me that we were more dependent on the speed you were at when you started that turn back around, because you knew you had a growing flight path vector. I would say it was closer to 60 degrees on that that first turn back inbound.
  - 47Q. What was your instruction regarding the use of rudder during those turns?
- 47A. I do not remember a specific instruction on how much rudder to use, or to use rudder. I knew I could use some rudder if I needed to. But I do not remember specific instruction as to use of the rudder, per se.
  - 48Q. And then you say some rudder. How do you describe "some rudder"?
- 48A. I don't know. I don't remember a ton of rudder. Are you looking for degrees or how much pressure, maybe?
  - 49Q. Was it half rudder, a little bit of rudder, full rudder?
- 49A. I don't remember going full rudder. I would say maybe half. But, 60 degrees, once you get to that point and, say, you were going to overshoot, in my mind, and the way I was taught, you accept it and you fix it the next time you did it. You did not fly out enough time -- what we base on time -- you did not fly out enough distance to make that turn. I do not remember going full rudder with 60 degrees.
  - 50Q. Did you learn that based off your experiences?
- 50A. I would say that is experience-based. By then, once you are coming around that turn, you are accelerating, you are trying to get to 500 feet AGL, I would think a whole lot of rudder, it would be harder to keep it level, or keep the altitude you are trying to keep.

- 51Q. Why is that?
- 51A. It is quite a bit of bank angle. It seems like it would be -- I know you have to have a lot of back stick pressure with 60 degrees -- a decent amount, I should say. The rudder I would use, it would be a little bit more. I don't know how much full rudder would -- I don't know how much back stick pressure that would require. I would say quite a bit.
  - 52Q. You said "decent" or "quite a bit." What is that?
- 52A. I remember pulling a pretty good amount, I would say. I don't know how to explain it in good qualifying terms. You definitely had to physically pull back on the stick to hold it level once you got to 500 feet with 60 degrees of bank. That might have been more because I might have to add some rudder in. I don't know how to quantify, if you add full rudder and full 60 degrees of bank.
- 53Q. During the 260 maneuver, if you were at 1000 feet, would you ever hold level flight, initially, and then descend? How would you do that with the stick pulled? You said you could go up to 60 degrees bank. If you went to 60 degrees bank, would you hold the stick back the whole level of flight and then eventually descend, or was it a descending movement once you started the 260 degrees?
- 53A. It was a descending turn for the 60-degree turn. From what I remember, when you roll-out, you were pretty close to approaching the threshold. If I delayed that descent more towards the end of the turn, from what I remember when I flew it, it was very difficult to get down to 500 AGL with that much time.
  - 54Q. You said to the threshold of the runway?
- 54A. Yes, sir, usually to the threshold of the runway, basically, prior to pulling the power to idle to quiet the jet for the show center pass, to provide speed, yes, sir.
- 55Q. During this maneuver, the 80/260 turn, how was the aircraft configured or deconfigured?
- 55A. We would do the 80-degree turnout and the plane would start accelerating, starting at turnout and lowering the nose and we would be lighter weight for aerial demonstrations. I don't remember being much more than 40 or 50 thousand pounds of fuel, I would say. When I flew the demonstrations, we would start that 80-degree turn outbound and de-configure on speed. I would always tell my co-pilot we wanted flaps up on speed, flaps retract on speed, everything on speed. I would try to annunciate that when I saw that point come. From what I remember, everything would be cleaned up, flaps and slats, before we turn back inbound.
- 56Q. Regarding the de-configuration and configuration process, with the use of a checklist, which demo crewmember initiated and called for the checklist?
- 56A. Well, when I flew it, I would try to call for flaps up and flaps retract. I told my co-pilot if I miss that and he saw the speed -- my VMFR speed -- the speed for flap retraction or the speed for flat retraction, if he saw that, I told him to annunciate flap up, basically, and I would confirm it. That was basically the way we ran that. There wasn't another checklist. The

first checklist we would run would be the approach checklist. Is that what you are referring to, the checklist?

PRESIDENT: Yes.

WITNESS: The first checklist we would run would be the approach checklist. That was the 160 knot, 360 degree turn where we would start that process.

- 57Q. Overall, regarding the AF 11-246, C-17 profiles, what were you taught in regard to adherence to the profiles? By "adherence," were they regarded as guidelines or procedures?
- 57A. Well, it was a regulation. I considered it guidelines you follow. From what I remember, reading that regulation, it was not specific as how to fly the profile. I say "specific," like, exact banking goes on everything, exact timing, distance type things, speed you are shooting for; I do not remember specifics like that. There were guidelines on the type of pass and the type of maneuver to get that pass, from what I remember.
- 58Q. Let's go back to the checklist. In regards to those checklists, do you recall using something called the "aerial demonstration checklist"?
- 58A. Yes, sir. I do recall that we had a fanfold which was a modified -- the modified areas I remembered were, basically, before the demonstration. I want to say there might have been some things after the demonstration. But it was more setup like having extended centerlines, so we could better judge our turns back inbound, that kind of thing. I believe there was a GPWS TAWS -- tactical mode, I believe, if I remember right.
  - 59Q. GPWS and TAWS, what do they stand for?
- 59A. I'm sorry. Ground Proximity Warning System and Training & Awareness Warning System. I believe it went to tactical mode. It has been a while. But I believe that is what we went to before the profile.
  - 60Q. Can you tell me where the checklist came from?
- 60A. No, sir, I cannot. I thought it was referenced from the regulation, but I cannot be for certain on that.
  - 61Q. Do you know who approved it?
- 61A. From what I remember, that was a Wing CCV approval authority on that checklist.
  - 62O. CCV?
- 62A. I'm sorry. I am mixing up my acronyms and what they stand for. They called it CCV at Elmendorf. Basically, OGV, Standardization Evaluations Flight.

- 63Q. With the aerial demonstration checklist, tell us how that was utilized?
- 63A. It was utilized just like we utilize the fanfold in the airplane. We treat it like a fanfold for the checklist we would run for the profile, from before starting the profile, to the approach checklist, before landing checklist and after landing checklist.
- 64Q. Do you recall getting warnings or alerts from the aircraft during the aerial demonstration profiles?
- 64A. I'm sorry, I forget a lot about checklists. I don't know if that is important. All the required checklists were in there. Could you please repeat the question? I'm sorry, sir.
- 65Q. Do you remember getting warnings or alerts from the aircraft during the aerial demonstration profiles?
- 65A. The only alert I definitely recall from doing the profile would be the fuel quantity alert. Sometimes, we would be at 2000 pounds of fuel to start a demonstration, once you got the slush for banking, turns, stuff like that, I remember getting fuel quantity indication in tanks. Those are the warnings I remember.
  - 66Q. I would like to ask you specifically. Did you ever get any stall warnings?
- 66A. No, sir. I don't remember stall warnings. I don't even remember a stall warning on final if you are DLC and not pushing -- Direct Lift Control -- using that button, and pushing the nose down -- not pushing the nose down to account for that. From what I remember, there was not even any of that, as far as a stall warning; I don't remember that.
  - 67Q. How about when other people flew the aircraft?
  - 67A. No, sir, not on the demonstrations.
- 68Q. You mentioned that you flew with also said that you received your initial training with 68A. Yes, sir.

  MP during the air show tour. You MP correct?
- 69Q. During your training, from your perspective, how did MP perform during that upgrade training?
- 69Q. I thought he performed fine. I kind of looked to him as being a little bit more experienced. I believe he was already qualified as, maybe, a demonstration co-pilot. I remember this warning from him, especially WITNESS 11 who taught the speed demonstration pilots. From what I remember flying with him, Air India, which is the name of -- I liked the fact that we had to fly a lot of shows, but we had what I thought was really good CRM, Crew Resource Management, within the cockpit, I knew the way we flew and practiced together and we knew headings we were going to go to, timing, which is what we use as technique, to me I thought it gelled pretty well as a our group of three, especially in that air show.
- 70Q. Going back to the upgrade training with MP do you recall any particular strengths or weaknesses?
  - 70A. No, sir. I do not recall that I can recollect at all.

- 71Q. Was he ever debriefed by the instructor, WITNESS 11 on any particular areas of his performance?
  - 71A. I do not remember any, sir.
- 72Q. At any time before or after your training, did MP mentioned to you his philosophy or viewpoints regarding aerial demonstrations?
- 72A. From what I remember after we flew that Aerial India -- I don't remember talking to him much more about the aerial demonstrations. Like I said, I flew New Zealand with

WITNESS 26, instead of MP If we did discuss anything, it would seem like it would be more of the timing thing for the outbound legs, because that was always the thing we were trying to get better, especially when were at Aerial India and we had multiple times to do the show. Other than that, I don't remember conversations beyond that.

[The board recessed.]

- 73Q. WITNESS 13 were you taught by any other demo instructors?
- 73A. No, sir. My only instructor was
- 74Q. During the interview, you stated that you would shoot for target altitude at initial climb between 1000 and 1500 feet altitude above the ground. Where did you learn this?
- 74A. Sir, my recollection, that altitude was part of the profile in the regulation. I could be totally wrong on that, but that is my recollection, that was the target altitude.
  - 75Q. Do you recall in the regulation what the target was -- attitude? Was it a range?
  - 75A. From what I recall, I thought it was a range of 1000 to 1500 AGL.
- 76Q. There were several times during your interview you said "in my mind." What does that mean to you when you say "in my mind"?
- 76A. I believe, in those instances, it would have been "in my recollection" that is what I remember.
- 77Q. There were times when you talked about CRM. You would offer a challenge and be responded to as far configuration and de-configuration of the aircraft. Did MP did he use challenge and response -- Cockpit Resource Management, also?
- 77A. Yes, sir. We all did it. I referred to it as jelling -- especially down at Air India. Before every aerial demonstration, we would sit in the seats we would be in for that demonstration and we would, basically, chair-fly -- the big things we would hit with the chair-fly, the headings we were going to go to on every turnout, the timing we were going to use for that particular turn. Timing was not just for the initial turnout for the setup for the high speed pass. We had a timing on every turnout, except for the 360-degree turnaround. We went through all that stuff in our minds. I do not remember, ever, not using it. We would have a stick diagram of the profile, which had the headings we were going to go to. We already knew the

side the crowd was on, so we knew which side we were going to be turning away from the crowd. We had all those headings to pick. We had the timing on the stick diagram. In that sense, that is why I keep saying the CRM management -- what I thought was really good. I know from my personal experience flying that profile, it is very task-saturating and busy. Knowing those types of things in my head was huge to help me keep flying and keep my mind on what I should be doing, which is flying the aircraft.

- 78Q. Just for the record, "chair-flying," what does that mean?
- 78A. Chair-flying, in the sense, I am using it as -- we would sit in the seats we were going to be in for the demonstration we were about to perform. We would, step-by-step, go through the profile with each turn, each timing, each maneuver we were about to do, whether it be the high speed pass, the low speed pass, the 360-degree turn, the final landing, all the way to the getting the aircraft on the ground on the runway, and then backing the aircraft, we would step through that process all the way through.
- 79Q. You would do this on the ground prior to flight, going through it, mentally, in your head?
  - 79A. Yes, sir, as a crew.
  - 80Q. And then you did that in the aircraft, or, in a separate room, or?
- 80A. We definitely had talks during that show of how to improve. If we needed more time on a turn -- like I said, that first performance, we did not timeout enough because we were basing it on training at Elmendorf. But, yes, before every flight, in the plane, we walked through each part of the profile.

## **Questions by the Pilot Member:**

- 81Q. You mentioned, during the 80/260 maneuver, on that initial 80/260, that after the 80 degrees of heading change, you would time outbound, correct?
  - 81A. Yes.
  - 82Q. About how long, in general, did you time outbound?
- 82A. I am almost 100 percent positive it was 8 seconds. I want to say, in India, it was more like 10 seconds; it was longer because of the higher pressure altitude, higher temperature.
- 83Q. You timed outbound in order to make your turn inbound without overshooting the runway or the show centerline, correct?
  - 83A. Yes.
  - 84Q. What bank angle did you plan to use in order to make that timing work out?
- 84A. That turn back inbound for the high speed, it was 60 degrees -- it was planned to be at 60 degrees, from what I remember.

- 85Q. Also, you mentioned, during the initial departure and the cleanup -- and we define cleanup as putting the flaps up and retracting the slats -- that usually occurred after the 80 degrees of heading change, but prior to making that 260-degree turn. In your recollection, I think you said you remember always having a clean aircraft, meaning, the flaps were up and the slats were retracted prior to making that 260-degree turn; is that accurate?
- 85A. Yes, that is accurate. I did not remember thinking about or cleaning up, at all, with that turn.
- 86Q. Do you ever remember, you or anyone else, actually retracting the flaps or the slats during that 260-degree turn?
  - 86A. Are you saying as a pilot flying?
- 87Q. As a pilot flying, or, in another crew position during demonstration, do you remember any of the other pilots calling for that cleanup or initiating that cleanup during the 260-degree turn?
- 87A. I do not remember, ever, not being the co-pilot that would raise the handle for the flaps or the slats. But I am sure there were times that it might have been, even the safety, that would have sager at flat speed -- something to the nature, to get the flats or slats up. That could have very well happened there. But I do not remember anybody but the co-pilot retracting the flats or slats.
- 88Q. But when anyone else was flying, do you remember the cleanup occurring during the 260 degree turn?
  - 88A. No. I just don't recall that ever happening.
- 89Q. WITNESS 13 is there anything else you would like to add to assist us in our investigation?
- 89A. I would just say. You asked about strengths and weaknesses of MP I failed to add that -- Air India, especially. We had a lot of air shows -- when we flew that particular trade show, my impression was -- as we flew that air show over and over, day after day, MP and all of us, for that matter, would have the open the mind to -- whether it be getting our timing better or flying it better as a crew, we would always be trying to figure out ways to do it better. In my eyes, all three of us tried to excel to do it right and do it better -- or, more right, I should say.

#### PRESIDENT: Thank you.

You are reminded of the official nature of this interview. You may not discuss your testimony with anyone without my permission at any time before the report of this investigation is officially released to the public.

At this time, this concludes the interview. The time is now 1430 local, Alaska time.
