Subject: Security correction for Lotus notes document.
I have implemented the following steps to correct the security problem:1. Searched the current lotus notes database to check that the document was not saved into the system.2. Wiped the hard disk of the computer the document was created on with Norton utilities government approved disk wipe program. This program erases all files on the hard drive and overwrites it with a random generated pattern to make sure information can not be retrieved from the hard drive.
