**Subject:** computer

Something weird happened when I tried to turn on my computer this morning. I just turned it on and it started to make a noise that sounded like an alarm. Then it said "incorrect drive" and told me I had entered my password incorrectly. I had not done anything more than turn it on, and I had not typed my password. So at that point I tried to type jzimmerman (as it was asking me to do) and it just flashed on the screen and would not go forward. What does this mean? I then turned it off and started again, and it seems to have started. I did not use any other drives, and I did not do anything out of the ordinary yesterday. The computer has never done this before.
