| **Subject:** | Macros for the tickle system |
| | The following might be helpful for our tickle system. Essentially (if I understand this right) you run a macro that updates the document after you run your tickle macro.From the workflow database:Automatically update the age of a documentYou need a periodic background macro to age the document containing the above formula. It should run daily, updating existing documents. Don't include it in the Tools Run Macros menu, since it is part of the daily workflow process and shouldn't be run at will by users.FIELD AgeofDoc := (@Abs(@Integer((Currentdate - DateCreated) / (86400))));FIELD macrun:="tmp";Use the macrun field as a place holder so that the document contains a change after the second macro is run (below). Without this macrun field, unless the document is changed by another process, the macro does not run on it again to update the age of the document. This is because background macros run only on those documents they have not yet run on.The second macro ensures that the document is changed so the first macro runs again. |
