Subject: Re: Creating subfiles
In wp select the file command then under the file menu select open. The shortcut for this is to hit CTL-O When you get the file dialog box. Select file options (its on the righthand side) Under that is a selection called create directories. That will make them. Use short but easy to remember names (8 Characters max) To save a file, I think the best way is to type in the full path in front of the file name For example. I have a file called CAT to save it to my PET subdirectory (Which I created using the above info) I would save as E:\wp-docs\pet\CAT good luck. To: Chet Rhodes/ARRBcc: From: Sheryl Walter/ARRB Date: 02/14/95 03:32:27 PMSubject: Creating subfiles Could you show me how to create subfiles on my "e" directory so that I don't create a monster?
