Subject: Re: Dogs

You mean, not insofar as you are aware. Bob and I -- don't worry, your identity has been protected -- have discussed at length the respective and contributing roles of genes vs. environment, re: susceptibility to an outbreak of the punning disease. Bob claims it is not communicable -- I am not so sure, and think perhaps there is simply insufficient medical knowledge regarding the means of transmission (not unlike the state of medical knowledge regarding, say, mad cow disease, just a few years ago). Bob maintains, however, that a predisposition to the disease is inherited, where it awaits only the right environment before manifesting itself in the theretofore-healthy-seeming victim. If Bob is right, his presence here as your colleague and friend has clearly brought your own case on and served to reveal your punicial tendencies....
