MEMORANDUM FOR: THE RECORD

SUBJECT

: MKULTRA, Subproject No. 56

a research program

This

program is designed to exploit all the knowledge and facilities available

at the in providing information of direct interest

to the Agency in the area of alcohol intoxication. Specifically, basic

information required to provide practical answers will be developed.

A proposal for an extension of the work during the coming year has been submitted and is attached herewith.

- at the was the principal investigator on this project. The direction of the research in the hands of the Acting Executive of the Department of Neurology,

  It has been determined that the research program to be pursued under the budget proposed herewith will be pursued in a diligent and fruitful manner.
  - 3. The funds for this project will be transferred using the

manner.

contraded to:

56-4

4. Costs for this program for a period of one year are estimated to be \$17,940.00. To this sum must be added a four per centmaking a total amount of \$18,657.60.

Charges should be made against Allotment 0525-1009-4902.

- has requested to submit to them a summary accounting on an annual basis of all monies\_received from Marie Any unexpended funds remaining at termination will be returned to the
- 6. The requirement for a six months' informal accounting on the part of the principal investigator is waived.
- Title to any permanent equipment purchased by funds granted shall be retained in lieu of higher overhead rates.
- 8. In connection with travel under this project, it is agreed that the Agency will accept the travel documentation and accounting which conform with the practices
- 9. It is agreed that technical reports reflecting the progress of the research program shall be submitted at mutually acceptable intervals.
  - 10. The project is unclassified after it leaves in the

Distribution: Original only.

## PROPOSAL

We are desirous of continuing our research activities on measures aimed at permitting consumption of larger amounts of ethanol without an increase in overall nervous system depression. Our research to date (see technical reports) has brought us to a better understanding of the intermediary metabolism of ethanol. As previously reported, it appears that the limiting factor in the rate of disappearance of ethanol from the body is due to the relative rate of conversion of ethanol to acetaldehyde. Any measures that can increase the rate of this reaction would certainly reduce the overall effects of ethanol upon the nervous system.

Currently, we have established a coordinated clinical program of investigation with human volunteer subjects in the and affiliated and affiliated This, of course, would open up many new vistas and avenues of approach and investigation.

Therefore, it is our proposal to continue to conduct our research activities as follows:

# I. The state of th

The continuing program of work will be biologically and enzymologically oriented to determine the steps involved in the intermediary metabolism of alcohol.

- A. A comparison of the incorporation of acetate 1-C<sup>14</sup> and ethanol 1-C<sup>12</sup> in fat fractions will be made to determine whether the pathway of ethanol metabolism enters the acetate stage.
- B. In view of the fact that large doses of ethanol will inhibit methanol metabolism, attempts will also be made to compare the path-ways of methanol vs. ethanol metabolism. The influence and effects of catalase, both in vivo and in vitro, upon methanol and/or ethanol metabolism will be investigated.
- C. The role of alcohol dehydrogenase in reducing glyceraldehyde to glycerol and its relationship to the effects of fructose in increasing the rate of ethanol metabolism will also be investigated. The implications in this specific instance hold great promise towards devising an antagonist against the depressant effects of ethanol.

# PROGRESS REPORT

Research on Antagonists to the Depressant Effect of Ethyl Alcohol

As an informal interim progress report, the following research for this year has been completed and is in preparation for publication.

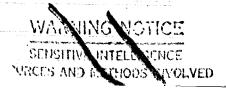

# 1. Tri-iodothyronine

The prominence attributed to the use of tri-iodothyronine as an agent for rapid "sobering up" has not been substantiated in our laboratories. The dosage of tri-iodothyronine used experimentally in our dogs were astronomical in relation to the usual therapeutic dose in man. Amazingly, the dogs tolerated the high dosage quite well and manifested only a rise in body temperature and increased panting. The effect of tri-iodothyronine on the rate of alcohol oxidation was neglegible and certainly not more than that normally caused by the increase in body temperature.

## 2. Pyridoxine

The effectiveness of pyridoxine or vitamin B6 is essentially the same as that of tri-iodothyronine. It is difficult to account for the reputation recently gained by both pyridoxine and tri-iodothyronine in the press without the support of critical experimental data.

Perhaps this can be accounted for by the fact that the effect of a rising concentration of alcohol in the blood does not have a linear relationship to nervous system depression, but rather a logarithmic one. Therefore, there is a critical concentration below which the individual may appear relatively sober and above which, by a very small margin, a few milligrams/100cc, a considerable demonstrable degree of intoxication is present. Therefore, any agent, with or without any appreciable effects on the rate of alcohol metabolism and/or concentration, given at this critical level, may give a spurious impression of being an excellent alcohol antagonist.

# 3. Alcohol metabolism in mice

The effects of glucose, fructose, pyruvate, alanine, glycine, glutamine, glutamic acid and aspartic acid on the rate of ethanol metabolism in vivo were studied in mice with equivocal results. Data obtained were extremely variable from mouse to mouse, as well as from week to week, in spite of the large number of animals used. There is strong indications that the mouse may possess metabolic pathways for ethanol that are unique to that specie.

# 4. Alcohol metabolism in dogs

Various compounds studied showed a definite effect in promoting an increase in the rate of alcohol metabolism. Glycine showed an increase of 25-50%; alanine 25-60%; and fructose, which gave an increase of about 25%. Glucose, pyruvate, tri-iodothyronine and pyridoxine showed no increase. In the case of acetate, the converse, a slowing of alcohol metabolism seemed to result.

# 5. In vitro studies on rat and mouse liver slides

Experiments with liver slices showed that liver from a fasting animal metabolizes alcohol about one half as rapidly as that from normal animals.

Steps were initiated to determine where the block in alcohol metabolism by liver slices from fasting rats may occur. The most likely starting place seemed to be the first step in oxidation, the conversion of alcohol to acetaldehyde. Since the necessary coenzyme of the enzyme mediating this step is diphosphopyridine nucleotide, or DPN, the first experiments were designed to determine whether the coenzyme is deficient in the livers of fasting animals. Our experimental measurements showed that DPN was not deficient in the livers of fasting animals.

Attention was next directed to the enzyme itself, alcohol dehydrogenase. Livers were assayed for total content of alcohol dehydrogenase and it was determined that fasting animals had a higher concentration of the enzyme.

Since the equilibrium constant for alcohol dehydrogenase is far to the left in favor of alcohol, it would appear that if the concentration of acetaldehyde rises, the rate of alcohol oxidation would be slowed. Therefore, semicarbazide, which couples with acetaldehyde, was added to the incubating medium. Our data shows that the addition of semicarbazide did not change the rate of oxidation. Moreover, the addition of either acetaldehyde or acetate did not change the relationship. Thus it would seem that the accumulation of acetaldehyde did not influence the rate of alcohol metabolism.

56-14

The possibility that the rate of oxidation and reduction od DPN may have a direct relationship to the rate of alcohol metabolism was investigated. The reduced DPN molecule (DPNH) must be reoxidized to DPN before it is available to oxidize another molecule of ethanol. Three compounds capable of reoxidizing any DPNH which might accumulate were tested: methylene blue which acts as a short circuit between the flavin system and oxygen; ferricyanide which directly links DPNH and oxygen; and pyruvate, which in the process of being enzymatically reduced to lactate oxidizes DPNH. Experiments show that pyruvate increased the rate of

From the promising leads above, investigation of the actual state of oxidation and reduction of the DPN in liver was undertaken and is now in progress.

metabolism in both the fed and fasting animal livers. Methylene blue and ferricyanide raised the rate in the fasted animal livers, but not in the fed.

## 5. Radioactive alcohol and acetate

The deposition of radioactive carbon in the tissues of mice fed radioactive alcohol or radioactive acetate indicate that the metabolic pathways for both alcohol and acetate were very similar.

56-19

August 22, 1958

## Gentlemen:

We are desirous of continuing our work further on measures aimed at permitting consumption of larger amounts of ethanol without an increase in nervous system depression. Considerable progress has been made in our research program since September 1, 1957.

The attached progress report summarizes our research completed to date. In the past year, we have made tremendous strides towards a better understanding of the intermediary metabolism of ethanol. It appears that the limiting factor in the rate of disappearance of ethanol from the body is due to the rate of conversion of ethanol to acetaldehyde. Any measures that can increase the rate of this reaction would reduce the overall effects of ethanol on nervous system depression.

Moreover, we are now in the position of being able to conduct clinical experiments with human volunteer subjects. This, of course, opens up many new avenues of approach and investigation.

Provided we are able to obtain a supplemental for the coming year,
who is at the conduct a series of experiments to dtermine whether or not tranquilizers exert a synergistic and/or supplemental effect or action upon the usual rate and degree of alcohol intoxication.

Therefore, it is our proposal to continue to conduct our next year's investigation along the following lines:

1. Expedite the removal of alcohol from the blood stream through selective metabolic pathways.

Preliminary studies indicate that glycine, alanine and fructose will increase the rate of alcohol metabolism. We plan to determine whether or not these effects are statistically significant.

We also intend to continue studies on the intermediary metabolism of alcohol. Experiments have been formulated to determine the effects of lactate on the speed of alcohol metabolism; the effects of pyruvate on the DPN/DPNH ratio and the use of another enzyme system, such as the oxalo-acetate-malate one, to reoxidize the DPN coenzyme so necessary to convert alcohol to acetaldehyde.

The use of radioactive alcohol will be continued in the study of intermediary metabolism pathways. After ingestion of radioactive alcohol, various tissues and fractions, including the water soluble fraction, phospholipids, non-saponifiable fraction and fatty acids will be isolated and their specific activities determined.

2. Determine the effectiveness of various types of fat and fat products in delaying the absorption of alcohol from the gastrointestinal tract.

Preliminary work demonstrated that fat will delay the absorption of alcohol from the gastrointestinal tract. We intend to initiate clinical studies on the various types of fat in this respect. Expressed fats and oils, theobroma, butter, suet, lanolin, kaolin and gastric mucin will be investigated.

The effects of wine buffers on the rate of absorption will also be investigated clinically.

3. Determine the effectiveness of sympathomimetic drugs in delaying the absorption of alcohol from the gastrointestinal tract.

Since the absorption of alcohol from the gastrointestinal tract is related to the emptying time of the stomach, the effectiveness of various sympathomimetic drugs, such as nalline, Bonamine, ephedrine and others, will be investigated.

The following is the proposed yearly but	lget:
I Professional services	
Neurologist (MD) half time	\$5,000.00

## PROPOSAL

To determine whether or not tranquilizers exert a synergistic and/or supplemental action upon the usual rate and degree of alcohol intoxication.

#### INTRODUCTION

The present day definitions of anxiety and stress remain in dispute. However, anxiety can be considered essentially a human function because it is associated with the capacity for delayed reaction, self reflection of motivation and the capacity for projection of the individual into the future. The concept of stress revolves around the arousal of anxieties. In general, anxiety may be aroused by any condition which threatens the integrity of the organism.

Therefore, any stimulus may, in principle, arouse an anxiety response because of the particular meaning of threat it may have for that particular individual. However, we can distinguish a class of stimuli which will invariably produce disturbances in most individuals. The term "stress" can be applied to this class of conditions.

Acute stresses and anxieties with in our social patterns of behavior necessitates the use of tranquilizers on the part of many persons to adequately meet and cope with these problems. Often times people will partake of "a few tranquilizers" prior to going out for an evening of social drinking and partying. How does the combination of tranquilizers and alcohol affect the motor skills, sensory processes and critical judgements which are not normally affected by either tranquilizers or alcohol taken separately?

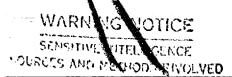

Therefore, the following course of investigation is proposed:

To determine whether or not tranquilizers exert a synergistic and/or supplemental action upon the usual rate degree of alcohol intoxication.

- 1. Design and test methods involving clinical subjects which will descriminate between normal, tranquilized, alcoholic, and tranquilized-alcoholic states; and for particular and specific states or effects which can eventually be related to overt behavioral responses of a sort which entail some possibility of practical exploitation.
- 2. Validate the above methods and effects in normal humans and relate them to alterations in mood and behavior in as objective a fashion as possible.

The above methodology will involve the use of a Nystagmograph, electroencephalograph (Lead II), Breathalyzer, Polygraph, and Drive-U-Meter. Biochemical methods include enzymatic and biochemical determinations of alcohol levels in blood, urine, and saliva.

It is envisioned that at the end of a ninety days study, some definitive answers, substantiated by objective data, will be obtained.

MEMORANDUM FOR: THE RECORD

SUBJECT:

MKULTRA Subproject No. 56

1. The purpose of this project is to provide funds to continue the research program conducted by This program is designed to exploit all the knowledge and facilities available to its director in providing answers to specific questions of direct interest to the Agency in the area of alcohol intoxication. In addition, those areas of basic knowledge required to provide these practical answers will be developed. It should be noted that although the attached proposal describes the facilities which will be used in the study, the program itself was 🐇 deliberately described in general terms in order to comply with its unclassified status.

- 2. Attached is the research proposal submitted by requesting a renewal of the project for another year. According to his interim progress report, considerable progress has been accomplished; in a relatively short period of time, to wit: additional laboratory facilities have been equipped and placed inta functional state, additional personnel have been recruited and specially trained, and substantive research completed to date and now in progress.
  - 3. In view of the above, it is desired to describe more specifically the various phases of the general program to be initiated or continued as an extension of research activities now in progress.
    - (a) Expedite the removal of alcohol from the blood stream by selective metabolic pathways that will allow the alcohol to be stored rather than completely metabolized. Studies will be conducted on a number of agents claimed to expedite alcohol metabolism (alanine, pyruvate, fructose, alcohol dehydrogenase).
    - (b) Determine the effectiveness of foodstuffs in delaying the absorption of alcohol from the gastrointestinal tract. Investigations will be conducted on the effects of various fats on the absorption rate of alcohol. The effects of gastric mucin, kaolin and wine buffers will also be determined.
    - Determine the effectiveness of sympathomimetric drugs in (c)

Downwaded to: ority of: ES IMPOURT OF BA

- 2

TO IMPOET: W. BY

delaying the absorption of alcohol from the gastrointestinal tract. The effectiveness of various sympathomimetric drugs on the emptying time of the stomach will be investigated on larger animals. (Amphetamine, Nalline, Bonamine)

- 3. The funds for this project will be transferred using the the usual manner.
  - 4. Costs for this program for a period of one year beginning August 31, 1957 are estimated to be \$39, 330.00 to which must be added a four percent (4%) fee to the making the total amount \$40, 903.20. Charges should be made against Allotment 7-2502=10-001.
- has requested to submit to them a summary accounting on an annual basis of all monies received from Also, it has been requested that any unexpended funds be returned at the close of the grant year.
  - 6. The requirement for a six months! informal accounting on the part of the principal investigator is waived.
- 7. Title to any permanent equipment purchased by shall be retained by higher overhead rates.
  - 8. In connection with travel under this project, it is agreed that the Agency will accept the travel documentation and accounting which conform with the practices of
  - 9. It is agreed that technical reports reflecting the progress of the research program shall be submitted at mutually acceptable intervals.
  - 10. Discharged through TOP SECRET and is aware of the true purposes of the program. He has also agreed to

B

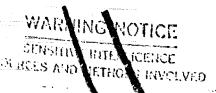

## Gentlemen:

We are desirous of continuing our work further on measures aimed at permitting consumption of larger amounts of ethyl alcohol without an increase in nervous system depression. Considerable progress has been made in our research program since 1 September 1956.

Our laboratories have been equipped and placed into functioning condition since the last visit of your representative. The suite of three rooms in the Nurses' Residence has been converted into a Biochemistry Laboratory and an Enzymology Laboratory and an enzymology Laboratory is set up for in vitro work with tissues and enzymes. In addition, a Neurophysiology Laboratory, named for our jacent to the Animal Surgical Operating Theatre, on the fifth floor of the Medical School Building, has been allotted to the Department of Neurology under me. As a nucleus for expansion, the Neurophysiology Laboratory is already equipped with an 8 channel Grass Model 3 EEG and a Meditron EMG.

As an informal interim progress report, the following research for this year has been completed or is very near completion.

A. The deposition of carbon derived from the ingestion of radioactive alcohol has been published under joint authorship with and and in the

- B. A paper on the EEG in acute alcohol intoxication has been submitted for publication to the Quarterly Journal of Studies on Alcohol.
- C. We have completed a paper on the effects of premedication with nicotinamide on the speed of alcohol metabolism.
- D. The comparison of the deposition of radioactive carbon in the tissues after continued feeding of alcohol and acetate is being completed by
- E. The dehydrogenase method of alcohol determination has been standardized by whereas continues to refine the dichromate method. With these two micro techniques developed to a satisfactory stage, in vivo studies on mice can be conducted.

It is our proposal to continue to conduct our next year's in-

(1) Expedite the removal of alcohol from the blood stream by selective metabolic pathways that will allow the alcohol to be stored rather than completely metabolized.

We plan to study the effects of a number of agents that are claimed to expedite alcohol metabolism (alanine, pyruvate, fructose, alcohol dehydrogenase). Preliminary studies indicate that the nutritional state of the animal is very important and if this is maintained at an optimal state, none of the agents show any striking, if indeed statistically significant effects.

(2) Determine the effectiveness of foodstuffs in delaying the absorption of alcohol from the gastrointestinal tract.

Preliminary work demonstrated that neither carbohydrate nor protein can be expected to delay the absorption of alcohol. However, fat was found to be effective in an inconsistent way.

We intend to continue studies on the effects of various types of fats on the absorption rate of alcohol. (Expressed oils, olive, peanut, theobroma; soft animal fats, butter, suet, lanolin.) The effects of gastric mucin and kaolin will also be investigated in this respect.

Work on the effects of wine buffers on human subjects is being continued under the auspices of a subject of the subjects is

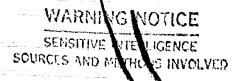

(3) \_\_\_\_Determine the effectiveness of sympathomimetric drugs in delaying the absorption of alcohol from the gastrointestinal tract.

With the addition of the Neurophysiology Laboratory, we plan to re-enter the field of working with larger animals (dogs, cats), and testing synergism and antagonism between alcohol and other drugs.

Since we are convinced that the effectiveness of fat in delaying the absorption of alcohol from the gastrointestinal tract is related to the slowing of the emptying time of the stomach, it is desired to investigate the effectiveness of other measures which might have the same effect. The sympathomimetric drugs suggest themselves as likely candidates in this respect. (Amphetamine, Nalline, Bonamine, Ephedrine.)

In order to utilize to advantage the increased laboratory space now available to me, I plan to increase my research staff and also, my own active participation. The following is the proposed yearly—budget:

Neurologist (M.D.) half time	\$4,000.00
Fellow, neurophysiclogist (Ph.D.)	7,500.00
Enzymologist (Ph. D.)	8,000.00
Technician, Laboratory	4,000.00
Laboratory, animal keeper	2,000.00
Equipment & apparatus	3,500,00
Supplies (chemicals, radioactive	•
alcohol, etc.)	3,000.00
Large animals (upkeep, etc.)	1,500.00
Travel	1,000.00
Total	\$34,500.00
Overhead 14%	4,830.00
-	\$39,330.00
	14 500.
	35,315
	2 4

i= -.-.

It is our hope that with our assembled research team, more definitive results will be obtained in the very near future.

Very truly yours,

Cl

## Gentlemen:

We are desirous of continuing our work on measures aimed at permitting consumption of larger amounts of ethyl alcohol without increase in nervous system depression. Progress in the past year has been slow; this may be attributed largely to the necessity of my devoting a larger share of my time to development of a growing Neurological Service in the Medical School. As a result of this effort, has now secured support from

which have made a residency training program in Neurology possible, with increased personnel to put it into effect. Accordingly, I will be able to again devote a reasonable amount of personal time to research in alcohol, and want to take this opportunity to apply for continuing support.

It is our proposal to conduct our investigations along the following lines:

(1) Determine the effectiveness of foodstuffs in delaying absorption of alcohol from the gastrointestinal tract.

Preliminary work relative to determining the effect of various foodstuffs in slowing the absorption of alcohol has been of more promise, in that, as set forth in the preliminary report forwarded to you previously, the ingestion of reasonable amounts of fats or oils previous to the taking of alcohol has been demonstrated to lower significantly the peak value of blood alcohol concentration. We believe that further work along this line is indicated, to determine the optimal timing of the fat ingestion, and the degree of uniformity of the effect in different individuals.

(2) Determine the effectiveness of sympathomic drugs in delaying the absorption of alcohol from the gastrointestinal tract.

Since we are convinced that the effectiveness of fat in this regard is related to slowing of the emptying time of the stomach, it is desired to investigate the effectiveness of other measures which might have the same effect. The sympathomimetic drugs suggest themselves as likely candidates; indeed amphetamine was shown to have such an effect. Although such measures cannot be expected to delay indefinitely the absorption of alcohol into the blood, they may be sufficiently effective to delay absorption until the stomach can be emptied by induced vomiting by some individuals with some facility in this maneuver. Of course, the ideal substance would be a compound that would combine with the alcohol in a form that would be unabsorbable, and it is possible that some such compound not in itself unduly toxic might be found.

(3) Expedite the removal of alcohol from the bood stream by selective metabolic pathways that will allow the alcohol to be stored rather than completely metabolized.

Another point of attack on the problem is the search for measures that will expedite the elimination of absorbed alcohol from the body. The amount eliminated in the urine, breath, and sweat is not of sufficient magnitude to be of practical importance even if doubled, and obviously a greater increase than this in volume of any of these channels would not be practically acceptable for the purpose in which we are interested. Increased combustion of alcohol, especially if coupled with slowed absorption, might be highly effective. If the normal pathway of complete combustion to carbon dioxide and water alone is considered, one is limited theoretically by the fact that the ordinary rate of combustion supplies about half the caloric output needed for the body metabolism of a sedentary man, and thus any considerable increase would produce an excess of heat. Even so, it is probable that the difference of rate of alcohol metabolism brought about by a diet that will favor the burning of protein rather than fat will be of sufficient magnitude to allow

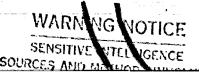

alcohol to be absorbed at double the rate without an increase in the slope of the blood alcohol curve. Even more effective would be measures aimed at promoting storage of the alcohol by utilizing alternative metabolic pathways, so that combustion would not be complete, but that the acetate formed from the alcohol might be converted to glycogen or fat. Work of others with tracer techniques using radioactive carbon incorporated in alcohol seems to show that a small proportion of the alcohol takes this pathway. It is our desire to explore this possibility more fully with long-term feeding experiments in rats and mice.

(4) Develop a simple and reliable test of tolerance to alcohol for use in selection of personnel and prediction of behavior.

We have demonstrated (and indeed it is common knowledge) that individuals vary greatly in their resistance to the depressant effect of alcohol. Indeed
it is because of this difference in tolerance that
the whole study is necessary. Would it not be profitable to develop a simple and reliable test of
tolerance to alcohol which would be of value in
the selection of personnel whose mission and job
might entail the necessity of consuming considerable
quantities of alcohol? The techniques which we have
developed over the years in this type of research
should be valuable in this connection.

It is our proposal, then, to explore further the effectiveness of foodstuffs and drugs in delaying absorption of alcohol from the gastrointestinal tract; to investigate by the use of alcohol incorporating radioactive carbon the possibility of expediting the removal of alcohol from the blood by favoring metabolic pathways that will allow it to be stored rather than completely burned; and finally to develop a simple and reliable test of tolerance to alcohol for possible use in the selection of personnel.

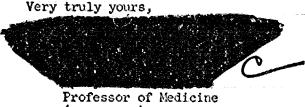

The experience in this type of research we have already gained over a period of some 25 years in similar investigations. We also have the facilities for determination of blood alcohol concentration, and apparatus for testing the degree of nervous system depression produced by alcohol. My own active participation in the work is reasonably assured by the addition of personnel to the Medical School faculty to take over the bulk of the routine teaching and administrative detail of the Division of Neurology. It will be necessary to secure additional technical assistance, and if possible a research Fellow trained in neurophysiological techniques to assume the burden of the actual testing of subjects. Funds will also be required for reimbursement of subjects for this rather unpleasant and arduous research, and their retention in the hospital under observation during the period that they are intoxicated.

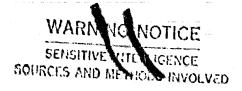

The following is the proposed yearly\_budget:

Neurologist (MD)	9,000	
Fellow, neurophysiology (PhD)	6,000	
Technician, chemical	3,600	
Clerk-secretary	3,000	
Laboratory-animal keeper	1,800	
Equipment & Apparatus (Classware, etc.) Supplies (Chemicals,	1,000	
radioactive carbon, alcohol, etc.) Subjects' fees (incl.	3,000	•
hospitalization)	3,000	
TOTAL	\$30,400	

Although it is hoped that definitive results might be obtained in a year's time, it would be highly desirable in assembling such a team to plan for at least a two-year period.
