STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL

1-0 SUMMARY

The strength and stiffness of the $\frac{1}{12}$ scale hovering and transition model, its supporting structure and fairings are analyzed.

The stressing of all parts except the ring load gages is carried out with an ultimate load factor of 4.

The strength of all components has been found satisfactory and the deflections small enough to be negligible.

Balance calibration procedure is outlined and pertinent data provided.

WRITTEN BY	CHECKED BY	DATE	ISSUE	AIRCRAFT
G. Jacquemin	DC Ferguson	Sept. 1957		

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL.

2-0 INTRODUCTION

As a part of the system 606 A test program, a $\frac{1}{12}$ scale model of the P.V. 704 aircraft has been designed for installation in the 20' diameter Mame Memorial Wind Tunnel at Wright-Patterson Airforce Base. The purpose of the model is to study the take-off, hovering and transition to forward flight characteristics of the aircraft. The proposed tests are outlined in AVRO/SPG/TR 98 - Test Specifications for the $\frac{1}{12}$ scale Hovering and transition model. The development of loads, and the stressing of the model, model support structure and fairings are contained in this report.

The model is circular in plan form: 35.3" DIA, with intake and jet exhaust flows simulated. These flows are supplied through large diameter pipes which also serve to support the model on the wind tunnel balance. In order the the balance is not affected by the supply pressures, these pipes come into the tunnel in a horizontal plane to supply the vertical pipes supporting the model.

The wind tunnel balance is a three components balance measuring lift, pitching moment and drag. However, due to the distances involved compared with the size of the model and the relatively light aerodynamic and heavy tare loading of the installation, sufficiently accurate readings of drag and moments cannot be obtained. For this reason, and to provide for the measurement of rolling moments, a second, body fixed balance system

WRITTEN BY	CHECKED BY	DATE	ISSUE	AIRCRAFT
G. Jacquemin	H C Ferguson	Sept. 1957		

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL

2-0 INTRODUCTION - CONT'D.

is provided near the model.

This second balance employs ring type load gages to measure drag forces and pitching and rolling moments. Lift forces are also indicated on this balance, but since they include forces due to the model supply pressure, readings of lift will be taken on the tunnel balance only.

Aerodynamic loads on the model and support structure fairings are estimated using standard aerodynamic theory; the model lift, drag and moment coefficients being estimated from the results of previous tests. Hovering loads are based on Avro reports: AVRO/SPG/TR 29 & AVRO/SPG/TR 33. An ultimate load factor of 4 is used throughout.

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL

3-0 DESCRIPTION OF INSTALLATION -

3-1 GENERAL -

Fig 1 shows the general arrangment of the installation. The model is suspended from a vertical arm below a horizontal tube attached to the main balance struts. The incidence of the model is adjusted by using the rear balance strut acting on a control arm extending from the horizontal tube.

In order to remove the airload from the model mounting, the whole installation is enclosed in a fairing supported independently of the balance system on the strut fairings.

Additionnal streamlining of the horizontal tube fairing is provided but has not been shown on fig 1 for clarity.

3-2 MODEL -

The model is composed of two dish-shaped steel turnings joined together to form a hollow circular wing; and three profiled turnings joined to form a circular center body (Fig 2)

The two halves of the wing are held apart by 24 radial ribs and attached together by screws into these ribs and into each other around the outer edge of the model. Each half contains three sets of holes distributed around three circles concentric with the model center as shown in fig 8. The holes are covered by segmented plates containing matching holes of a smaller diameter. Several sets of plates with different hole sizes are provided in order to vary the sizes of the final openings

WRITTEN BY	CHECKED BY	DATE	ISSUE	AIRCRAFT

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL-

3-0 DESCRIPTION OF INSTALLATION

3-2 MODEL - CONT'D.

The peripheral outlets are 336 holes: .242" dia. distributed along a circle of rad 16.825". They are covered with segment plates having holes of dia. ranging in steps from .242" to .120" dia. Plates are also provided to close the holes completely.

The propulsive outlets are 48 holes: 1.40" dia distributed along a circle of rad. 15.80". They are covered by the segment nozzle plates which direct the airflow aft at about 20° to the wing surface. Plates are also provided to close the holes completely.

Both of these outlets are covered by the same plates. Various arrangment of propulsion and control being provided by changing the plates.

The center outlets are 96 holes: .453" dia distributed along a circle of rad 11.312". They are covered with segment plates having holes of dia ranging in steps from .453" to .228" Plates are also provided to close the holes completely.

The wing is clamped by bolts between two of the center body turnings. The upper turning (A in fig 2) is in the shape of a dummy intake and ramp and is attached to the outer model support tube. The center turning (B in fig 2) forms the lower intake ramp and connects with an inner tube to form a duct leading to the wing. High pressure air is admitted through this duct to exhaust through the openings described above to simulate the aircraft propulsive system.

The lower turning (C in fig 2) forms the lower intake roof and forms a duct leading to the center tube

WRITTEN BY	CHECKED BY	DATE	ISSUE	AIRCRAFT
G. Jacquemin	Ferguson	Sept. 1957		

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL-

3-0 DESCRIPTION OF INSTALLATION

3-2 MODEL CONT'D.

This tube is partially evacuated to draw air through the intake to simulate lower intake airflow. The lower turning is attached to the center supply tube by a suspension rod and to center turning by six soldered tubes. These tubes also duct some of the high pressure air through a central nozzle in the lower turning to simulate the aircraft Viper exhausts.

This model is intended to simulate take-off, hovering and transition configurations close to a simulated ground board. For this reason, only the lower intake is used.

Hovering conditions will be tested for the model horizontal and tilted up to 20°

Transition will be tested for angles of attack ranging from -10° to +45°

Ground distance will be adjusted from zero to about 2 dia.

3-3 MODEL SUPPORT STRUCTURE -

The model is attached at the end of a vertical arm (fig. 3) by a suspension rod and 4 ring gages measuring pitching and rolling moments and loads parallel to the model

The vertical arm is made up of two concentric tubes which are connected to the model through elastic joints at the

DECLASSIFIED

WRITTEN BY	CHECKED BY	DATE	ISSUE	AIRCRAFT

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL

3-0 DESCRIPTION OF INSTALLATION -

3-3 MODEL SUPPORT STRUCTURE - CONT'D.

measuring gage section. The outside tube carries the pressure supply to the model while the inner tube carries the suction.

The lower part of the arm is removable together with the model and gage section by disconnecting a flange on the outside tube. The top & bottom of the inner tube in the removable section are connected to the upper part of the inner tube and to the model by sliding couplings so that all loads transmitted to the upper part of the arm are carried by the outer tube.

The model suspension rod is attached to the outer tube by means of a cruciform bracket at the level of the connecting flange. This bracket also supports the lower part of the inner tube.

The vertical arm is welded at its upper end to the horizontal tube and to the control arm.

The horizontal tube supplies pressure to the nozzles of the model on one side and suction to the intake of the model on the other side. It is supported at both ends by ball-bearing assemblies (fig 4). bolted to the end of the main balance struts. It is attached to the external parts by means of belows allowing free movement of the ends and is fixed against side motion at the pressure side ball-bearing. It is free to slide on the suction side to allow for thermal expansion. A tension rod takes the load due to pressure and suction in the tubes. This rod is attached at its outer end to a 3 armed bracket welded inside the horizontal tube coming through the tunnel wall on the pressure side.

WRITTEN BY	CHECKED BY	DATE	ISSUE	AIRCRAFT
G. Jacquemin	M.C. Ferguson	Sept. 1957		

3-0 DESCRIPTION OF INSTALLATION

3-3 MODEL SUPPORT STRUCTURE - CONT'D.

A similar bracket at the other end contains ball-bearings to avoid twisting of the rod when changing the angle of incidence of the model.

The control arm (fig. 5) is a welded steel structure in the shape of an I beam with height decreasing toward the rear balance strut.

3-4 FAIRINGS -

The vertical arm of the fairing (fig. 6) is a streamlined light alloy structure with wooden ribs and formers. The two lower parts of this fairing are removable to give access to the measuring gage section. It is attached at its upper end to the steel fairing of the control arm and to the horizontal tube fairing (fig 7)

The horizontal tube fairing is another steel tube concentric with the model support tube and supported at each end on plain bearings attached to the sides of boxes extending below the main balance struts fairings. In the section between tunnel wall and main balance strut, the fairing and the inner tube are assembled as a rigid unit. They are supported by the tunnel walls and the box extending below the main balance struts fairings.

The control arm fairing is a steel box and is attached by a linkage to the rear balance strut fairing.

All fairings are completely independant of

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL.

3-0 DESCRIPTION OF INSTALLATION -

3-4 FAIRINGS - CONT'D.

the balance system and clearances are provided to ensure that no contact will occur through possible deflection of the structure or misalignments.

A follow-up mechanism maintains the alignment between the model support tubes and the fairings when changing the angle of attack of the model.

- STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL -

4 - 0 LOAD ANALYSIS

4 - 1 LOADING CONSIDERATIONS -

4.1.1. General.

The model forces are taken by the ring load measuring gages and transfered through the model support to the 3 balance struts.

The fairing loads, both static and aerodynamic are taken by the 3 balance strut fairings.

4.1.2 Loads on the model

The model loads include: weight, aerodynamic loads, jet reaction and pressure forces on the ducting.

Jet reaction: In the hovering cases, the jet reaction is entirely directed downward. In the flying cases, the jet reaction may be divided between lifting and propelling thrust. In all cases, it must be assumed that the jets will be operating with the tunnel stopped, thus the loads will not be relieved by air drag or lift. Pressure and suction on the ducting area at the inlet of the model will add a force normal to the plane of the model. These pressures and suctions will be assumed uniform over the area thus having no moment about the center of the model. It should be noted that this may not be true in practice. However, since the moment is likely to be relatively small and owing to difficulties in obtaining reliable estimates, this moment has been neglected in the analysis. Also, the full delivery pressure and suction have been used while some drop is to be expected.

Aerodynamic loading The model can be placed in the tunnel at angles α varying between $-10°$ & $45°$ with a preferential range from $-10°$ to $20°$. The tunnel is to

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL -

4-0 LOAD ANALYSIS.

4-1 LOADING CONSIDERATIONS - CONT'D.

be operated at $q = 30$ PSF for the preferential range and its speed will be reduced for the range 20° to 45° so that the airloads do not exceed those produced in the preferential range thus allowing the use of smaller ring load measuring gages at the model attachment.

Since accurate values of C_L, C_D & C_m are not available, these parameters have been taken on the high side in order to ensure that the stressing of the model will amply cover all possible cases.

4.1.3 Model supporting structure. The model supporting structure takes the model loading plus the static loads due to its own weight and pressure loads in the ducting.

4.1.4 Fairings. The fairing loading is both static and aerodynamic: i.e. fairing weight and airdrag. In addition, it has been assumed that a deviation of the airflow in the tunnel would not induce more than a 5° angle of attack to the vertical fairing hence producing a side load on the attachment of the fairing.

4.1.5 Load Factor.

A load factor $n = 4$ is applied to all parts of the structure except on the ring load measuring gages which are stressed for their operating conditions as per report AVRO/SPG/TR 87.

4-2-4 SUMMARY OF CRITICAL LOADING CASES -

The critical case is the transition case for $\alpha = -10°$ which give together the max. pitching moment and the max. downward load normal to the model

The max. drag load is obtained in the zero thrust case and the max. forward load in the max. thrust case.

The max. upward load normal to the model occurs at $\alpha = 35°$.

The hovering cases are not critical so; only the transition cases will be used to check the model support structure.

STRESS ANALYSIS OF $\frac{1}{2}$ SCALE HOVERING & TRANSITION MODEL-

4·3 MODEL SUPPORT STRUCTURE LOADS

4·3·1 LOADING CONSIDERATIONS

Since the model support structure is entirely shielded from the airflow, the only loads applied to it are its own weight and the loads coming from the model.

The model support structure is supported on the 3 balance struts. The two main balance struts take vertical and horizontal loads and the rear balance strut takes vertical load only.

Side loads on the model structure are due mostly to pressure in the delivery pipes. The side load due to model airload has been estimated not to exceed 50 lb.

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL

4-3 MODEL SUPPORT STRUCTURE LOADS

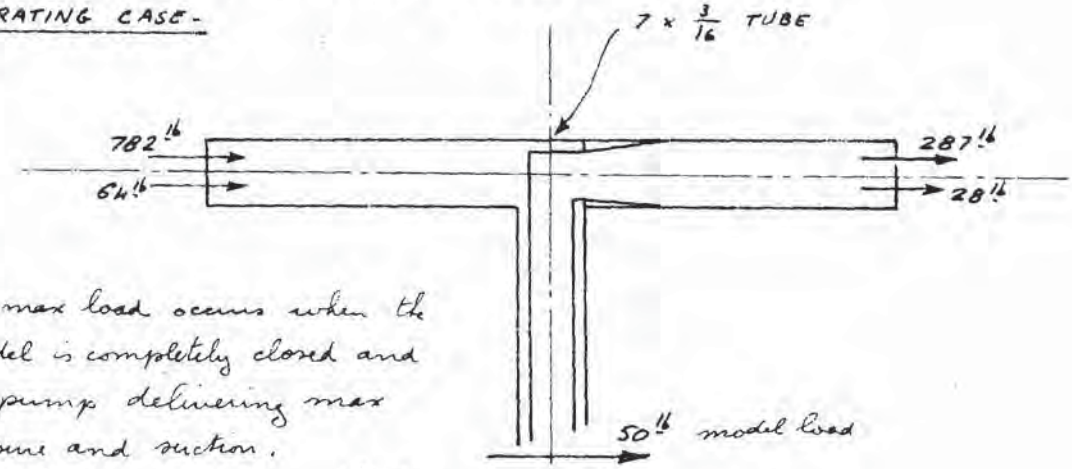
4-3-4 LOADS DUE TO PRESSURE & SUCTION.

HORIZONTAL LOAD ON MODEL SUPPORT.

OPERATING CASE.



The max load occurs when the model is completely closed and the pump delivering max pressure and suction.

In the operating case, the load decrease to 782 lb static load and 64 lb reaction to mass flow on the pressure side and 287 lb static load and 28 lb reaction to mass flow on the suction side:

hence: $782 + 64 + 28 + 287 = \underline{\underline{1211\ lb}}$

PRESSURE CASE:

TUBE AREA: $\left[7 - (2 \times .187)\right]^2 \frac{\pi}{4} = 34.5\ in^2$

MAX. ABS. PRESSURE: 44.7 PSIa

MIN. ABS. PRESSURE: 6.34 PSIa

TOTAL LOAD: $(44.7 - 6.34)\ 34.50 + 50 = \underline{\underline{1372\ lb}}$

G. Jacquemin	[illegible]	Sept. 1957		

4 - 4 FAIRING LOADS

4 - 4 - 1 LOADING CONSIDERATIONS

The fairings are loaded by aerodynamic drag force and static weight only. A side load due to lift on the vertical fairing caused by a deviation of the tunnel airflow has been considered.

A drag coef. $C_D = 1.0$ has been taken for the horizontal tube. Aerodynamic characteristics for the vertical fairing at an angle of incidence $\alpha = 5°$ have been estimated by comparison with other thick airfoils.

The loads on the fairings are taken by the balance strut fairings, the main strut fairings taking vertical and horizontal loads and the rear strut fairing taking vertical load only.

The part of fairing tube between tunnel wall and balance struts are considered as simply supported beams their loading dividing between the 2 supports.

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL

4-4 FAIRING LOADS

4-4-2 LOADS DUE TO AERODYNAMIC FORCES

For a Circular Cylinder, the drag coef. $C_D \simeq 1.0$

Thus, for a 10" tube, the drag per running foot is:

$$D = C_D S q = 1.0 \times .833\, q = .833\, q$$

Hence: at the max speed of the tunnel: ($q = 30$ PSF)

$$D = 30 \times .833 = 25 \text{ lb/ft.}$$

and at the reduced speed: ($q = 18$ PSF)

$$D = 18 \times .833 = 15 \text{ lb/ft.}$$

Length of tube between balance struts: 80"
Length of tube outside balance struts: 230 - 80 = 150"

Thus, on balance struts fairings, the load is:

at $\underline{\underline{30\,q}}$: $$25\left[\frac{80}{2\times12} + \frac{150}{4\times12}\right) = 25\left(3.33 + 3.13\right) = 25 \times 6.46 = \underline{\underline{164\text{ lb}}} \rightarrow$$

and load on tunnel walls:

$$25\ \frac{150}{4\times12} = 25 \times 3.13 = \underline{\underline{78.2\text{ lb}}} \rightarrow$$

at $\underline{\underline{18\,q}}$: on strut fairings: $15 \times 6.46 = \underline{\underline{97\text{ lb}}} \rightarrow$

on tunnel wall: $15 \times 3.13 = \underline{\underline{46.9\text{ lb}}} \rightarrow$

Drag on vertical fairing

The drag coef for the streamlined shape will be taken at:

$$C_D = .20$$

Frontal area: $\frac{42 \times 11}{144} = 3.2 \text{ ft}^2$

DECLASSIFIED

WRITTEN BY	CHECKED BY	DATE	ISSUE	AIRCRAFT
G. Jacques	[illegible]	Sept. 1957		

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL

4-4 FAIRING LOADS.

4-4-2 LOADS DUE TO AERODYNAMIC FORCES

Drag on vertical fairing : cont'd.

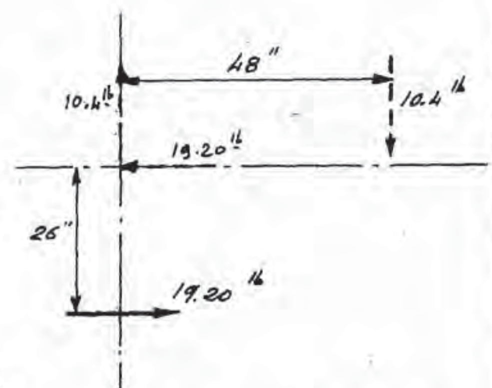
Drag force: $.20 \times 3.2 \times q = .64\,q$.

High speed case: $q = 30$ PSF. $D = .64 \times 30 = 19.20^{lb}$.
Low speed case: $q = 18$ PSF. $D = .64 \times 18 = 11.50^{lb}$

Load on strut fairings:
$q = 30$ PSF. $\frac{19.20}{2} = \underline{\underline{9.60^{lb}}}$ →

$q = 18$ PSF. $\frac{11.50}{2} = \underline{\underline{5.75^{lb}}}$ →

REACTION ON INCIDENCE STRUT FAIRING.



$\alpha = 0°$.
(30 q) $19.20 \; \frac{26}{48} = 10.4^{lb}$
(18 q) $11.50 \; \frac{26}{48} = 6.22^{lb}$

$\alpha = 45°$
At this angle the airload on the fairing will be approximately balanced by that on the arm fairing. Hence the reaction will be small and can be neglected.

$\alpha = 20°$
Since the reaction at $\alpha = 0°$ is only 10^{lb} it will be conservative to assume the same value for $\alpha = 20°$.

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL

5 - 0 MODEL STRESS ANALYSIS.

5 - 1 - 1 LOADING CONSIDERATIONS -

The aerodynamic loads developed in section 4 have been used together with pressure in the supply tubes, only to check the strength of the attachment of the model to its supporting structure (see sections 6 & 7)

Due to the robust nature of the model structure, stresses induced in the model by these external loads will be low and can be neglected. The validity of this statement is illustrated by the pessimistic assessment of the loads in the wing attachment bolts (section 5-2-1)

The highest stresses will be those due to the pressure differential between the interior and outside of the model.

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL

DECLASSIFIED

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL

5-1-2 DIFFERENTIAL PRESSURE ON THE WING UPPER SURFACE.

MAX. internal pressure in the wing: 30.74 PSIA

Assume the A/C is at 45° incidence. and a pressure distribution giving an average value of $C_p = -5$ on the front part of the wing.
Assume also that the mean value of C_p over the first 3" after L.E is $C_p = -10$.

Hence: the local pressures: $\Delta P = C_p q$

$$\Delta P_{AVE} = -5 \times 30 = -150 \text{ PSF} = -1.04 \text{ PSI}$$
$$\Delta P_{TIP} = -10 \times 30 = -300 \text{ PSF} = -2.08 \text{ PSI}$$

Hence total external pressure: $P_{AVE} = 14.7 - 1.04 = 13.66$ PSI
$P_{TIP} = 14.7 - 2.08 = 12.62$ PSI

Differential pressure taken by the wing structure:

$$\Delta P_{AVE} = 30.74 - 13.66 = 17.08 \text{ PSI}$$
$$\Delta P_{TIP} = 30.74 - 12.62 = 18.12 \text{ PSI}$$

A General stressing of the wing will be carried out using 17.10 PSI and a local stressing near the leading edge using 18.20 PSI.

With a load factor of 4, these pressures become:

$$17.1 \times 4 = \boxed{68.4 \text{ PSI}}$$
$$18.2 \times 4 = \boxed{72.8 \text{ PSI}}$$

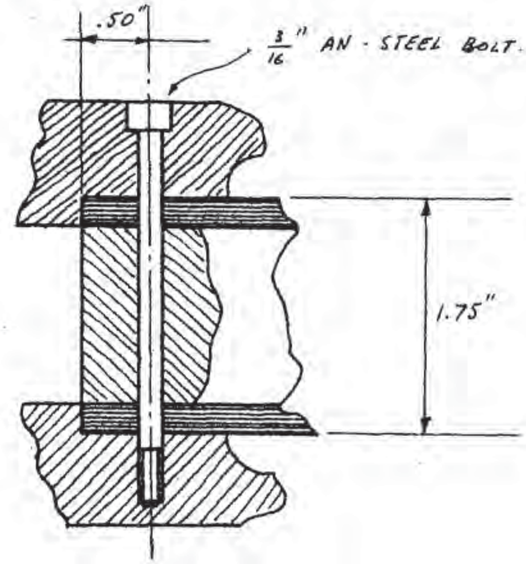
STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL

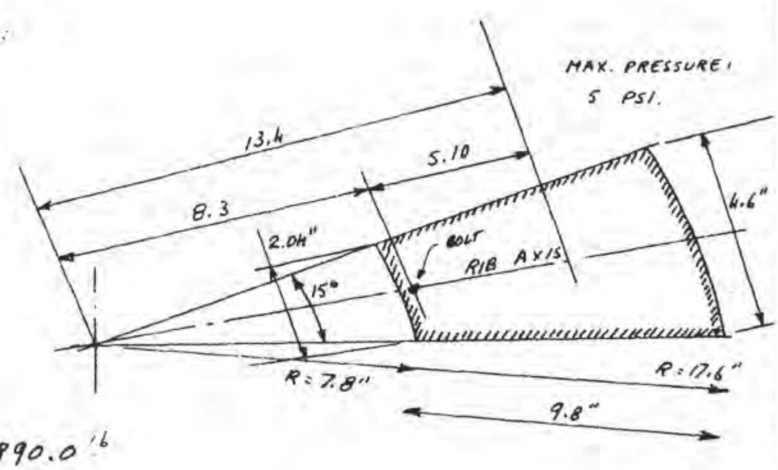
5·0 MODEL STRESS ANALYSIS

5-2-1 WING ATTACHMENT BOLTS



As a covering strength, the bolt is assumed to take in shear the moment calculated from the diagram below under an arbitrary pressure of 5 PSI. At the same time, it will be considered under the tension due to internal pressure of 68.4 PSI on an area of 10 in²

Hence: tension in the bolt:
$68.4 \times 10 = 684.0$ lb



Area of the wing segment:
$(2.04 + 4.6)\,\frac{9.8}{2} = 32.5$ in²

Moment about the bolt:
$4 \times 32.5 \times 5 \times 5.1 = 3308$ in lb

Shear on the bolt: $\frac{3308}{1.75} = 1890.0$ lb

Strength of the 3/16" bolt as per AN-C-5: Tension: 2160 lb
shear: 2070 lb

Combined loading: allowable tension: $Y = \sqrt{b^2\left(1 - \frac{x^3}{a^3}\right)} = b\sqrt{1 - \frac{x^3}{a^3}}$

$$Y = 2160\sqrt{1 - \left(\frac{1890}{2070}\right)^3} = 2160 \times \sqrt{1 - .835} = 2160 \times .406 = 875 \text{ lb}$$

$$M.S. \quad \frac{875}{684.0} - 1 = .128$$

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL.

5-0 MODEL STRESS ANALYSIS

5-2-2 WING SKIN PANELS

Consider the rectangular plate shown in dotted line.
This plate is relatively thick and will take the load in bending rather than as a membrane.

we have: $b = 3.32''$ $a = 9.80''$ $\frac{b}{a} = .339$

Ref. Resistance des materiaux appliquee a l'aviation by Paul Vallat.

Max. bending stress in the plate: $f_{b_M} = Ap\left(\frac{b}{t}\right)^2$

Max. deflection at the center : $\delta_M = C\frac{p\,b}{E(1-\sigma^2)}\left(\frac{b}{t}\right)^3$

Coef. A from curve (2) Diagram 32-1 - $A = .50$
Coef C " " (4) " " " - $C = .212$

Thus: $f_{b_M} = .50 \times 17.10\left(\frac{3.32}{.15}\right)^2 = 4190$ PSI @ 55000 PSI.

$$\delta_M = .212 \times \frac{17.10 \times 3.32}{30\,10^6(1.069)}\left(\frac{3.32}{.15}\right)^3 = .000209''$$

Fully factored bending stress: $4 \times 4190 = 16780$ PSI

M.S. $\frac{55000}{16780} - 1 =$ 2.28

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL

5-0 MODEL STRESS ANALYSIS

5-2-2 WING SKIN PANELS

ATTACHMENT SCREWS.

The skin is held on the ribs by 8 screws
AN-510 #4 or #5.

Screw strength in tension as per specifications:

#5: 396 lb

#4: 313 lb

Load per screw with a max pressure force of 556 lb per panel at a pressure of 17.10 PSI. (unfactored)

$\frac{556}{8} = 69.5$ lb unfactored.

Fully factored load per screw: $69.5 \times 4 = 278$ lb

Considering now a screw at the outer end of the rib and using the higher pressure 18.2 PSI.
Fully factored load per screw:

$278 \frac{18.2}{17.1} = 296$ lb (average load)

Considering the drawing, it can be seen that the outer screw will take approximately the pressure on a strip 4" long and 1.3" wide : hence a load : at 72.8 PSI (fully factored)

$72.8 \times 4 \times 1.3 = \underline{\underline{379}}$ lb

∴ #5 screws are required

M.S. $\frac{396}{379} - 1 =$ ———— * .068

* NOTE. This Margin of safety is pessimistic as no account as been taken of the effect of the edge attachment.

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL -

5-0 - MODEL STRESS ANALYSIS

5-2-3 - WING NOZZLE REGION

ASSUMPTIONS FOR STRESSING THE EDGE.

1 - The differential pressure will be taken at 18.20 PSI as calculated previously.

2 - The edge will be first treated as a rectangular plate .086" thick with all four sides fixed. Size: $a \times b = 4.6'' \times 2.0''$
then $\frac{b}{a} = .435$

This assumption can be made since it was found that the deflection at the center of the .15" thick plate would be of the order of .0002" hence negligible. (page: 68)

3 - The max. stress in bending found from plate theory will be assumed to be constant over the plate for the purpose of stressing the 3 sections A, B & C indicated on the sketch, but will be factored up due to the local reduction in section.

4 - Section A will be considered .086" thick.
Section B will be considered as two plates: .086" + .064" working together independently.
Section C will be considered .086" thick.

Note: The .064" plate has to be assumed ineffective near its edges due to insufficient attachment. It is assumed however that enough load can be picked up by the plate to make it effective between the 1.41" holes at section B.

BENDING STRESS IN THE PLATE AS PER ASSUMPTIONS (1) & (2)

$$f_b = Ap\left(\frac{b}{t}\right)^2 = .49 \times 18.20 \left(\frac{2.0}{.086}\right)^2 = 4830 \text{ PSI}$$

$A = .49$ (curve (2))

WRITTEN BY	CHECKED BY	DATE	ISSUE	AIRCRAFT
G. Jacques	[illegible]	Sept. 1957		

5-0 MODEL STRESS ANALYSIS

5-2-3 WING NOZZLE REGION

STRESSING OF THE EDGE.

SECTION B.

Basic section in bending will be assumed to be a 15° arc of radius 15.90"
i.e: 4.16" long, having a section modulus:

$$\frac{4.16}{6}\ .086^2 = .00512\ \text{in}^3$$

The actual section is made of $(1.34" \times .086") + (1.34" \times .064")$
having a section modulus. $\frac{1.34}{6}(.086^2 + .064^2) = .00257\ \text{in}^3$

Hence, the bending stress:

$$4830\ \frac{.00512}{.00257} = 9640\ \text{PSI} \quad @\ 55000$$

fully factored: $9640 \times 4 = 38600$ PSI M.S: $\frac{55000}{38600} - 1 =$ ——— .425

SECTION C -

Basic section in bending will be assumed to be a 15° arc of radius 16.95" i.e: 4.43" long. having a section modulus:

$$\frac{4.43}{6}\ .086^2 = .00545\ \text{in}^3$$

The actual section has only $1.49" \times .086"$
having a section modulus: $\frac{1.49}{6}\ .086^2 = .001832\ \text{in}^3$

Hence, the bending stress:

$$4830\ \frac{.00545}{.001832} = 14400\ \text{PSI} \quad @\ 55000.$$

fully factored: $14400 \times 4 = 57600$ PSI

M.S: $\frac{55000}{57600} - 1 =$ ——— -.04

ACTUAL MARGIN OF SAFETY ON APPLIED LOAD ——— 3.95

5-2-4 WING EDGE ATTACHMENT.

STRESSING OF THE EDGE.

ATTACHMENT SCREWS.

Strength in tension of #5-44 & #4-48 - AN-510 SCREWS per turn of thread.

Screw strength in tension as given by AN-510 - Spec.

#5 - 396 lb for fully engaged threads.
#4 - 313 lb

This strength is based on threads engaged in a standard nut.
min height of nut and nb of turns of thread:

#5-44 : $h = .102'' - .114''$ $n = 4.48$
#4-48 : $h = .087'' - .098''$ $n = 4.17$

strength per turn of thread:

#5-44 : $\frac{396}{4.48} = 88.4$ lb
#4-48 : $\frac{313}{4.17} = 75.0$ lb

SCREWS ATTACHING WING FLANGES AT THE EDGE.

- Length of thread engaged $\approx .15'' > .102''$ hence full strength available.
- Each screw can be considered as taking a maximum load equal to the pressure over 2 in² : $18.2 \times 2 = 36.4$ lb

if n° 4 screws are used: M.S : $\frac{313}{4 \times 36.4} - 1 =$ ——— 1.15
" " 5 " " " : M.S : $\frac{396}{4 \times 36.4} - 1 =$ ——— 1.72

SCREWS ATTACHING THE COVER PLATES.

- Length of thread engaged : .086" i.e: nb of thread engaged:
#5 : 3.78 available strength : $88.4 \times 3.78 = 334$ lb
#4 : 4.13 " " : $75 \times 4.13 = 310$ lb
- Assuming again 2 in² pressure as a max load : 36.4 lb per screw.

6-0 LOAD GAGE DESIGN.

6-1 LOAD ANALYSIS.

6-1-1 LOADING CONSIDERATIONS

DESCRIPTION OF GAGE SECTION

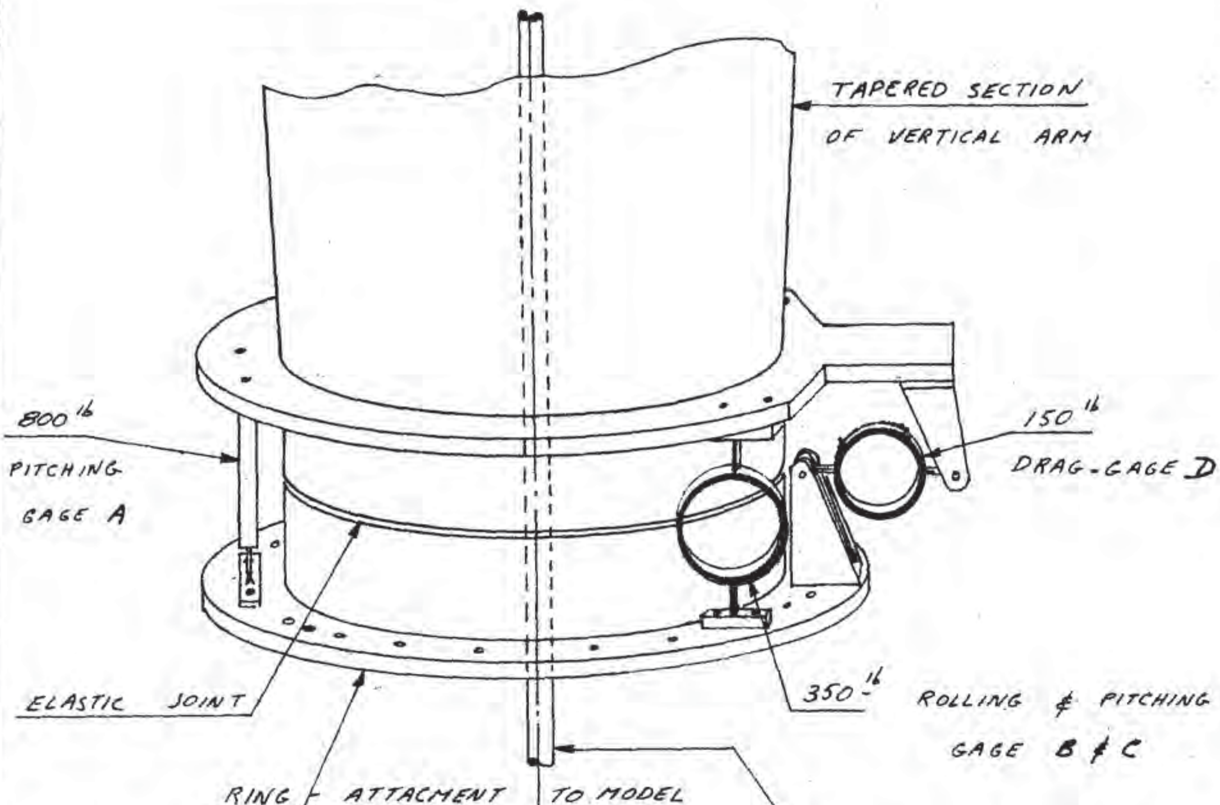

FIG-10 GAGE SECTION

The model is attached at the bottom of the vertical arm by means of a vertical steel rod and four rings load measuring gages as shown above.

The suspension rod is used to support the model in such a way that no load due to model weight is registered by the gages when the arm is vertical.

Gages A, B & C will measure both pitching moments and loads normal to the plane of the model. In addition, gages B & C

DESCRIPTION OF GAGE SECTION - CONT'D

will measure rolling moments. Gage D will measure loads parallel to the plane of the model.

No gage has been provided for measurement of side load.

LOAD PATHS THROUGH GAGE SECTION -

The loads resolved at the model center consist of three forces: Vertical, fore/aft and side and two moments: pitching and rolling. Due to symmetry around the vertical axis, no yawing moment can be produced.

Due to the offsett between model center and gage center, the gages will have the following response to the case of fore/aft and side load:

a/ Fore/aft load: Gage D will indicate a pull or a push. Gages A, B & C a pitching moment.

b/ Side load: Gages B & C will indicate a rolling moment.

Side forces will be taken as side loads on gages AB & C which are designed to resist them without affecting their normal load measuring accuracy.

The gage center in the case of fore/aft load is obviously contained in a horizontal plane passing through the drag gage D. In the case of side load, it must be in a

6-1-1 LOADING CONSIDERATIONS -

LOAD PATHS THROUGH GAGE SECTION - CONT'D

plane passing by the points of zero bending in gages A, B & C operating as cantilever beams with the free end guided against rotation. Since the point of zero bending of gages A, B & C is at the mid distance between the two flanges and since gage D is also placed at mid distance between the same two flanges, the two planes are coincident. The gage center under vertical loads lies on the vertical axis. Hence, the center of all gages is at the intersection of the vertical axis and the plane defined above.

NOTE.

At the time this section of the report was written, the geometry of the gage section was as shown on 6-1-2. Later on, this geometry has been slightly modified to the dimensions shown in 6-3. Since this modification does not materially alter the gage loading, the section has not been rewritten.

However, should exact values of the loads on the gages be needed, they can be computed easily from the equations given in 6-3.

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL

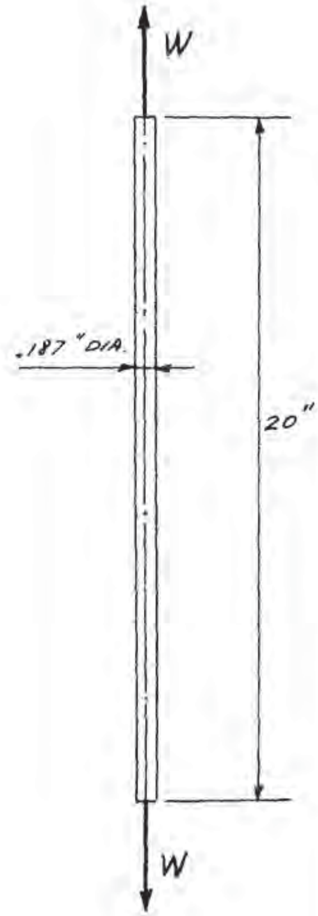
6-1-3 LOAD DISTRIBUTION

SUSPENSION ROD.



The rod is designed at an operating stress of 20000 PSI. to take a max. load of 550 lb

Required diameter: $\sqrt{\frac{4}{\pi}\frac{W}{f}} = D$

$$D = \sqrt{\frac{4}{\pi}\frac{550}{20000}} = \sqrt{.035} = .187''$$

Sectional area: $.187^2 \frac{\pi}{4} = .0275 \text{ in}^2$

ELONGATION: $\delta = \frac{WL}{AE}$

MAT: SAE - 4130 - CHR. MOLY - STEEL.
@ 125000 PSI U.T.S.

ELONGATION PER POUND LOAD.

$$\delta = W \frac{20}{.0275 \times 30\ 10^6} = 2.42\ 10^{-5}\ W \text{ in/lb}$$

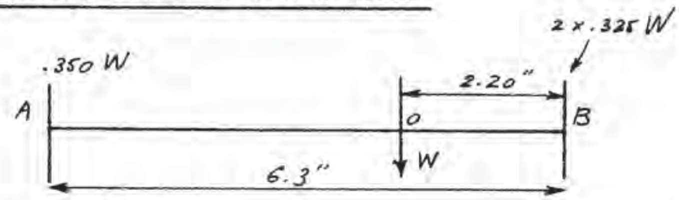
DECLASSIFIED

WRITTEN BY	CHECKED BY	DATE	ISSUE	AIRCRAFT
G. Jacquemin	[illegible]	Sept. 1957		

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL -

6-1-3 LOAD DISTRIBUTION -

DISTRIBUTION OF LOAD BETWEEN GAGES AND CENTER ROD.



Deflection rate:

Gage A : $2.66\ 10^{-5}\ \frac{in}{lb.}$

Gage B : $7.42\ 10^{-5}\ \frac{in}{lb.}$

For a unit gage load.

Deflection at A : $.35 \times 2.66\ 10^{-5} = .93\ 10^{-5}$ in

Deflection at B : $.325 \times 7.42\ 10^{-5} = 2.415\ 10^{-5}$ in

Then : deflection at O:

$$\left[2.415 - (2.415 - .93)\frac{2.2}{6.3}\right] 10^{-5} = 1.895\ 10^{-5}\ \frac{in}{lb}$$

Deflection rate of the rod: $2.42\ 10^{-5}\ \frac{in}{lb}$

Now, let W_1 & δ_1 be the load and deflection of the rod and W_2 & δ_2 be the load and deflection of the gage system at point O and ΔW the incremental load on the system.

Then, we must have: $\Delta W = W_1 + W_2$ and $\delta_1 = \delta_2$

Let $\Delta W = 1$ and calculate a relation between W_1 & W_2

we have: $\delta_1 = 2.42\ 10^{-5}\ W_1$

$\delta_2 = 1.895\ 10^{-5}\ W_2$

$$\therefore \quad 2.42\ \cancel{10^{-5}}\ W_1 = 1.895\ \cancel{10^{-5}}\ W_2$$

$$W_2 = \frac{2.42}{1.895}\ W_1 = 1.278\ W_1$$

Hence: $\Delta W = W_1 + 1.278\ W_1 = 2.278\ W_1 = 1$

then: $W_1 = \frac{1}{2.278} = .44$: The rod takes 44% of W

the gages 56% of W.

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL -

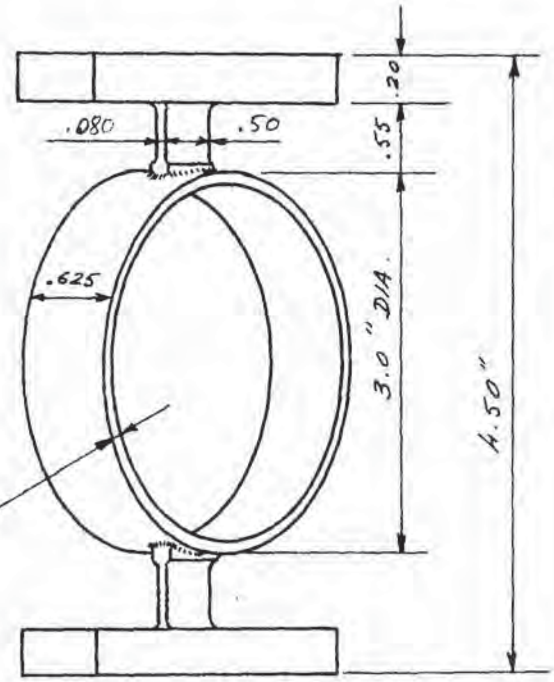
6 - 2 GAGE DESIGN

6-2-1 GAGE A - 800 lb



This gage is designed according to report AVRO/SPG/TR-87 for an operating max stress of 40000 PSI at the strain gage section.

Required thickness:

$$t = \sqrt{.07425\ K^2 + .545 \times 3K} - .2725\ K$$

$$\text{where} \quad K = \frac{W}{40000 b} = \frac{800}{40000 \times .625} = .032$$

$$\therefore t = \sqrt{.07425 \times .032^2 + 1.635 \times .032} - .2725 \times .032$$

$$t = \sqrt{.000076 + .0523} - .008725 = \sqrt{.052376} - .008725$$

$$= .2287 - .0087 = .220''$$

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL-

6-2 GAGE DESIGN

6-2-1 -

GAGE A - Cont'd.

With reference to "Formulas for Stress and Strain" by Roark-

a) Max. bending in the ring at the flexure: $.3183\ W R_m$ in-lb

b) Max bending in the ring at the strain gages: $.1817\ W R_m$ in-lb

at a/, we also have a max shear load = $\frac{W}{2}$ per section

at b/, we also have a tensile or compressive load = $\frac{W}{2}$ per section.

Section modulus of the ring: $\frac{.625 \times .22^2}{6} = .00504\ in^3$

Sectional area of the ring: $.625 \times .22 = .1375\ in^2$

Bending moments:

$$\text{at a/}: \quad .3183 \times 800 \times \frac{3-.22}{2} = 354 \text{ in-lb}$$

$$\text{at b/}: \quad .1817 \times 800 \times \frac{3-.22}{2} = 202 \text{ in-lb}$$

Stresses at point a/

Bending: $\frac{354}{.00504} = 70200$ PSI

Shear: $\frac{800}{2 \times .1375} = 2910$ PSI

Principal stress: $\frac{70200}{2} + \sqrt{\left(\frac{70200}{2}\right)^2 + 2910^2} = 70320$ PSI unfactored.

Stresses at point b/

Bending: $\frac{202}{.00504} = 40000$ PSI

Tension: $\frac{800}{2 \times .1375} = 2910$ PSI

Total stress: $40000 + 2910 = 42910$ PSI unfactored.

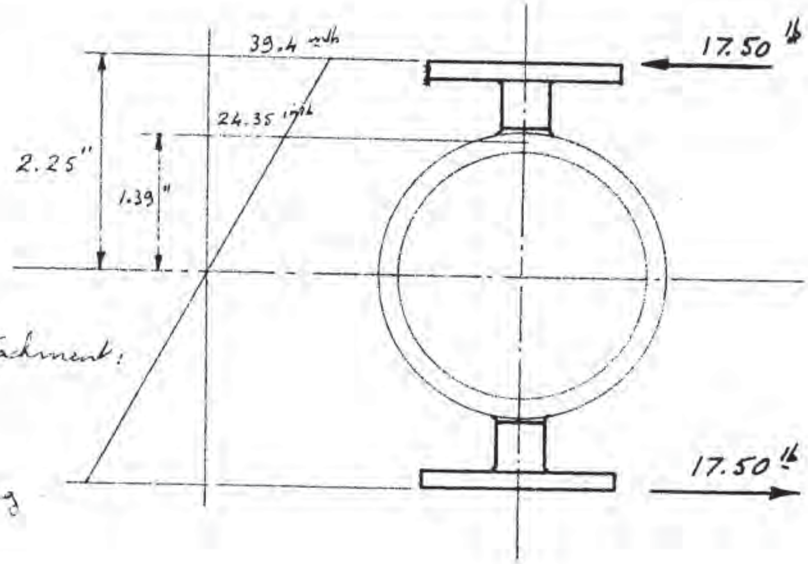
STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL -

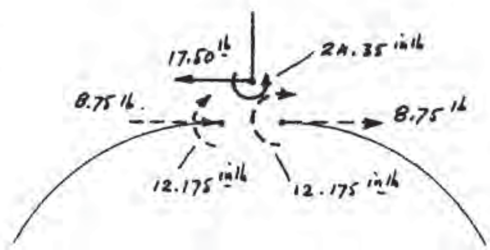
6-2 GAGE DESIGN

6-2-1-
GAGE A - cont'd.



Bending moment at attachment:
$17.5 \times 2.25 = 39.4$ in-lb

Bending moment in ring attachment:
$17.5 \times 1.39 = 24.35$ in-lb



Ring section modulus: .00504 in^3
Ring sectional area: .1375 in^2

Bending stress in ring:
$\frac{12.175}{.00504} = 2420$ PSI

Normal stress: $\frac{8.75}{.1375} = 63.7$ lb

Max. total normal stress: $2420 + 63.7 = 2483.7$ PSI say 2500 PSI

Total stress on the ring at this point:
$70320 + 2500 = \underline{72820 \text{ PSI}}$ unfactored.

LIM. M.S. $\frac{100000}{72820} - 1 =$ ———— *.37

*. This margin of safety is quoted against the actual stress. The factor n = 4 does not apply in this case.

GAGE A - cont'd.

FLEXURES -

From report AVRO/SPG/TR-87 for a flexure operating at 20000 PSI under 800 lb with width $b = .50''$
thickness $h = .080''$ - Sectional area : $.5 \times .08 = .040 \text{ in}^2$
Flexure length : .55"

The side load on the ring induces a bending moment:
$$17.5 \times 2.05 = 35.9 \text{ in lb}$$

Section modulus :
$$\frac{.08}{6} .50^2 = .00333 \text{ in}^3$$

Bending stress :
$$\frac{35.9}{.00333} = 10800 \text{ PSI}$$

Total max normal stress : 20000 + 10800 = 30800 PSI unfactored.

Stability in compression as per JOHNSON'S FORMULA.

Least moment of inertia : $\frac{.5 \times .08^3}{12} = .00002135 \text{ in}^4$

Radius of gyration $\rho = \sqrt{\frac{.00002135}{.040}} = \sqrt{.000533} = .0231''$

Slenderness ratio : $\lambda = \frac{.55}{.0231} = 23.8$

Buckling stress : Johnson's formula : $f_c = f_u - \frac{1}{4E}\left(\frac{f_u \lambda}{\pi}\right)^2$

$$f_c = 125000 - \frac{1}{4 \times 3\ 10^7}\left(\frac{125000 \times 23.8}{\pi}\right)^2 = 125000 - \frac{89.5\ 10^{10}}{12\ 10^7}$$

$$= 125000 - 7450 = 117550 \text{ PSI}$$

unfactored : MARGIN OF SAFETY : $\frac{117550}{30800} - 1 =$ 2.82

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL.

6 - 2 GAGE DESIGN

6 - 2 - 3
GAGE D - cont'd.

FLEXURES :

From report AVRO/SPG/TR 87, for a flexure operating at 20000 PSI under 150 lb with width $b = .25''$: thickness $K = .030''$
Flexure length : .35"
Sectional area : $.25 \times .03 = .0075 \text{ in}^2$

Stability in compression as per JOHNSON'S FORMULA.

Least moment of inertia : $\frac{.25 \times .03^3}{12} = .5625 \; 10^{-6} \text{ in}^4$

Radius of gyration : $\rho = \sqrt{\frac{.5625 \; 10^{-6}}{.75 \; 10^{-2}}} = .866 \; 10^{-2} = .00866''$

Slenderness ratio : $\lambda = \frac{.35}{.00866} = 40.5$

Buckling stress : Johnson's formula : $f_c = f_u - \frac{1}{4E}\left(\frac{f_u \lambda}{\pi}\right)^2$

$$f_c = 125000 - \frac{1}{4 \times 3 \; 10^7}\left(\frac{125000 \times 40.5}{\pi}\right)^2$$

$$= 125000 - \frac{1}{12 \; 10^7}\left(25.95 \; 10^{11}\right) = 125000 - 21650$$

$$= 103350 \text{ PSI}$$

MARGIN OF SAFETY : $\frac{103350}{20000} - 1 =$ ———— 4.17

NOTE. A large Margin of Safety is necessary on this flexure as bending stresses due to deflection of the other gages could not be assessed with sufficient accuracy.

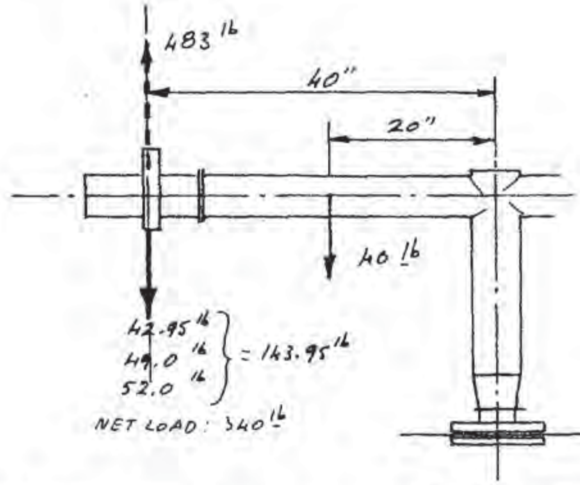
7.0 STRESS ANALYSIS - MODEL SUPPORT STRUCTURE

7-1 HORIZONTAL TUBE

7-1-1 TUBE IN BENDING.



SECTION PROPERTIES OF THE TUBE.

Size: 7" × 3/16" - ID = 6.625"

Sectional area:

$A = \frac{\pi}{4}(7^2 - 6.625^2) = 3.94 \text{ in}^2$

Moment of inertia:

$I = \frac{\pi}{64}(7^4 - 6.625^4) = 23.3 \text{ in}^4$

Section modulus.

$Z = \frac{\pi}{32}\left(\frac{7^4 - 6.625^4}{7}\right) = 6.65 \text{ in}^3$

The max. support reactions under both static and aerodynamic loading occurs with the incidence of the model at 45° then:

45° CASE. REF. SECTION 4-3-3 - & APPENDIX A.

Bending moment under static load

Bending moment at the center line:

$M = -(340 \times 40) + (40 \times 20) = -13600 + 800 = -12800 \text{ in lb.}$

Bending moment under model airload

Vertically. $333.1 \times 40 = 13330$ in lb

REF. 4-3-5.

Horizontally: $126.1 \times 40 = 5050$ in lb

WRITTEN BY	CHECKED BY	DATE	ISSUE	AIRCRAFT
G. Jacques	[illegible]	Sept. 1957		

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL-

7-0 STRESS ANALYSIS - MODEL SUPPORT STRUCTURE.

7-1 HORIZONTAL TUBE

7-1-1 TUBE IN BENDING

45° CASE - CONT'D.

Since airloads relieve the static loads, the critical loads occur with the tunnel off

Then: max. bend. stresses in the tube:

$$f_b = \frac{M}{Z} \quad 4\,\frac{12800}{6.65} = 7660 \text{ PSI}$$

$$M.S. \quad \frac{55000}{7660} - 1 = \text{———} \quad 6.16$$

−10° CASE.

This case is to be considered as bending moments from static load add to bending moment from airload. $(330 - 144) = 186 = R_A$.

Static load:

$$M = (186 \times 4) - (40 \times 20) = 7440 - 800 = 6640 \text{ in lb.}$$

Airload:

Vertical: $109.31 \times 40 = 4370$ in lb

Horizontal: $13.59 \times 40 = 544$ in lb

Total Bending moment:

$$M_T = \sqrt{(6640 + 4370)^2 + 544^2} = 11024 \text{ in lb}$$

Max bending stress:

$$fb = 4\,\frac{11024}{6.65} = 6640 \text{ PSI}$$

$$M.S. = \frac{55000}{6640} - 1 = \text{———} \quad 7.30$$

7-2- - INCIDENCE CONTROL ARM.

7-2-1 - BENDING

MARGIN OF SAFETY -

Section C: $\frac{55000}{8908} - 1 =$ ——— 5.18

Section B: $\frac{55000}{7432} - 1 =$ ——— 7.40

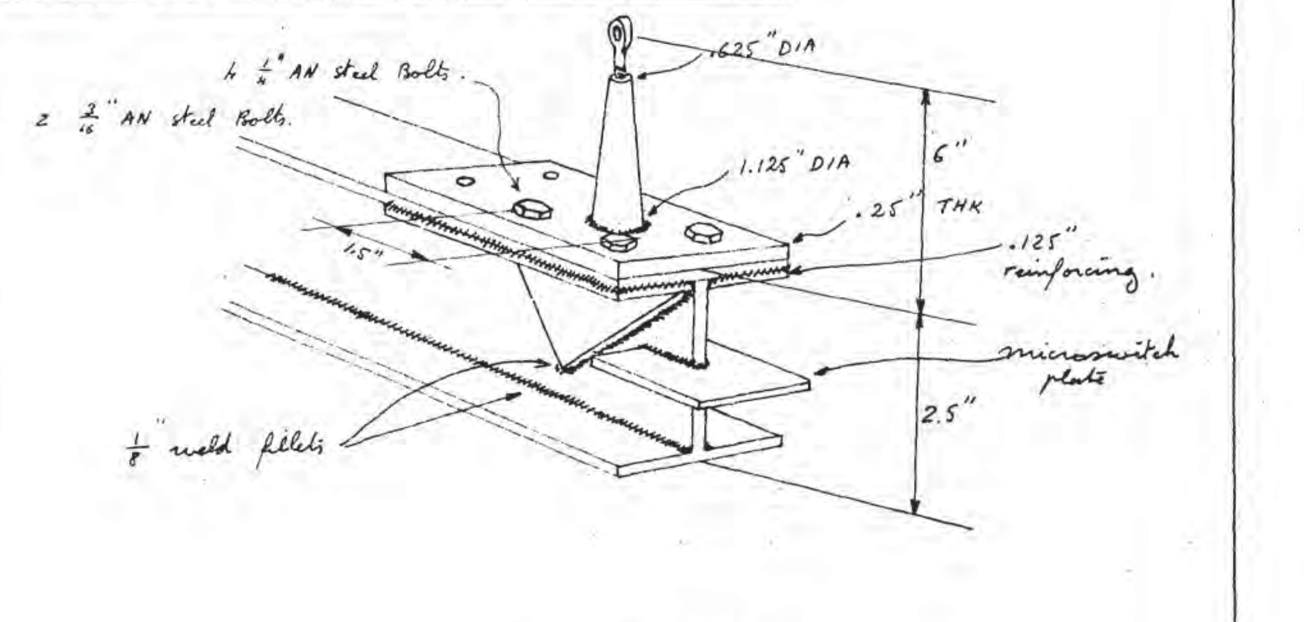
WELD FILLETS - AT SECTION B.

The stresses are the same as those calculated at section B.
The strength of the weld metal is 51000

M.S: $\frac{51000}{7432} - 1 =$ ——— 5.87

7-2-2

ATTACHMENT LINK TO BALANCE STRUT.



WRITTEN BY	CHECKED BY	DATE	ISSUE	AIRCRAFT
G. Jacques	[illegible]	Sept. 1957		

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL

7-0 STRESS ANALYSIS - MODEL SUPPORT STRUCTURE

7-2 INCIDENCE CONTROL ARM.

7-2-2

ATTACHMENT LINK - CONT'D

Circular section in bending + compression at bottom of link.
1.125" dia. SAE 1020 steel.

Bending moment : $707 \times 6 = 4242$ in lb

Section modulus : $\frac{\pi}{32} D^3 = .0984 \times 1.125^3 = .0984 \times 1.424 = .14$ in^3

Sectional area : $\frac{\pi}{4} D^2 = \frac{\pi}{4} \times 1.125^2 = 1.0$ in^2

Bending stress: $\frac{4242}{.14} = 30300$ PSI

Compression stress: $\frac{707}{1.0} = 707$ PSI

Total max. comp. stress : $30300 + 707 = 31007$ PSI

M.S : $\frac{55000}{31007} - 1 =$ ———————— .77

WELD FILLETS -

2 FILLETS. $\frac{1}{8}$" wide.

Consider the fillets as rings having $\frac{1}{8}$" width and a mean dia. of 1.125"

$\therefore D = 1.25"$ $d = 1.00"$

Sectional area: $\frac{\pi}{4}(D^2 - d^2) = \frac{\pi}{4}(1.25^2 - 1^2) = \frac{\pi}{4} \times .56 = .440$ in^2

Section modulus: $\frac{\pi}{32}\left(\frac{D^4 - d^4}{D}\right) = .0984\left(\frac{1.25^4 - 1^4}{1.25}\right) = .0984 \times \frac{2.44}{1.25} = .092$ in^3

Hence, for both sections:

$A = .44 \times 2 = .88$ in^2

$Z = .092 \times 2 = .184$ in^3

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL

7-0 STRESS ANALYSIS - MODEL SUPPORT STRUCTURE

7-2- INCIDENCE CONTROL ARM.

7-2-4

LOCAL REINFORCMENTS - CONT'D.

SHEAR STRESS IN FILLET Nº 1

Area of fillet in shear: $.125 \times 2.00 = .25$ in²

Shear on this section: $1.5 \frac{W}{h} = 1.5 \frac{1234}{.25} = 7410$ lb fully fact.

Shear stress in the weld:

$$\frac{7410}{.25} = 29600 \text{ PSI}$$

$$M.S. \quad \frac{32000}{29600} - 1 = \text{———} .083$$

NOTE The length of weld has been taken as 1.30" along the length + .70" across the back.

SHEAR STRESS IN FILLET Nº 2

It is assumed that ½ of the load is introduced in the 3/16" web by the upper ⅛" cap. The other half through the reinforcing bracket. The effect of moments will be accounted for by assuming that the whole load is introduced through only one oblique side 3" long.

Weld area: $3.0 \times .125 = .375$ in²

fully factored load: $\frac{1234}{2} = 617$ lb

Shear Stress in the weld: $\frac{617}{.375} = 16500$ PSI

$$M.S. \quad \frac{31000}{16500} - 1 = \text{———} .88$$

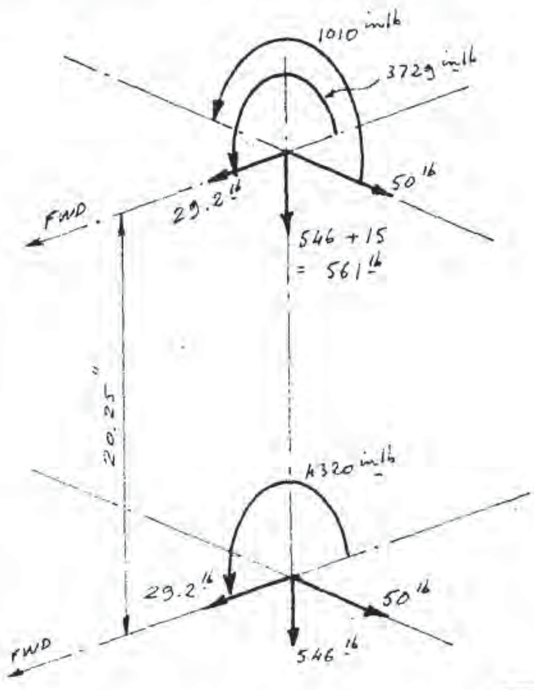
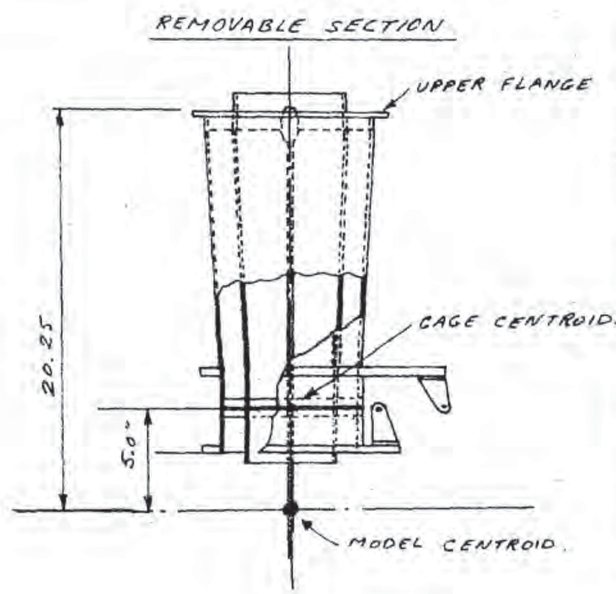
7-3- TAPERED SECTION OF VERTICAL ARM.

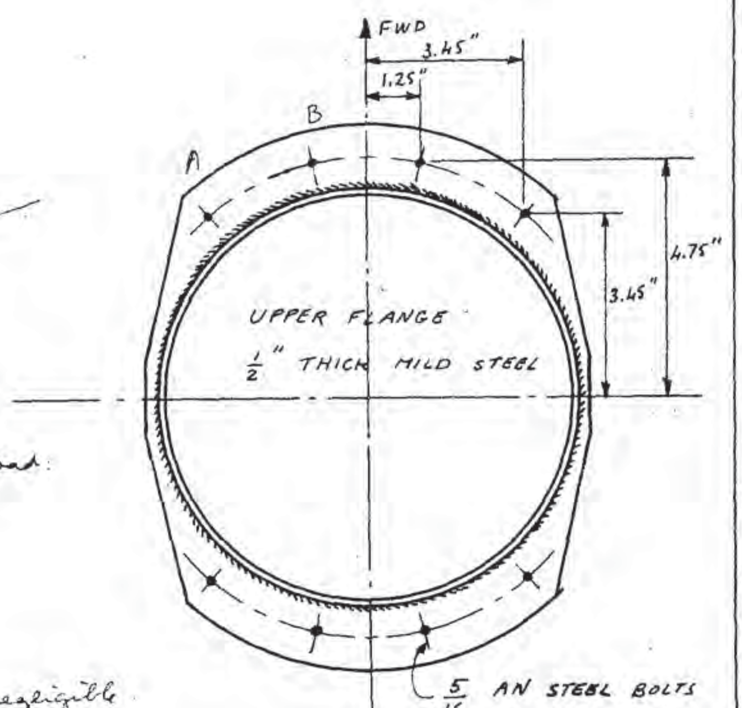
7-3-1 UPPER FLANGE.

Considering the same cases as for the gages (Section 6) and resolving at the upper flange.

$-10°$ Case is the stressing case.







Load per bolt due to Vertical load:

$\frac{561}{8} = 70.2^{lb}$ tension

Total shear on the bolts:

$\sqrt{29.2^2 + 50^2} = 57^{lb}$

Shear per bolt: $\frac{57}{8} = 7.25^{lb}$ negligible

WRITTEN BY	CHECKED BY	DATE	ISSUE	AIRCRAFT
G. Jacquemin	[illegible]	Sept. 1957	DECLASSIFIED	

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL

7-0 STRESS ANALYSIS - MODEL SUPPORT STRUCTURE.

7-3-

TAPERED SECTION OF VERTICAL ARM- CONT'D.

7-3-1 UPPER FLANGE

Loads on the bolts due to moments.

The bolts are stressed as clusters under tension & compression.

Longitudinal moment.

Load on bolt B. $\frac{M \times 4.75}{4 \times (4.75^2 + 3.45^2)} = 1.188 \frac{M}{34.5} = .0344\ M$

$= .0344 \times 4320 = 148.5^{lb}$

Load on bolt A: $\frac{M \times 3.45}{4(4.75^2 + 3.45^2)} = .0250\ M.$

$= .025 \times 4320 = 108^{lb}$

Transversal moment:

Load on bolt A: $\frac{M \times 3.45}{4(3.45^2 + 1.25^2)} = .862 \frac{M}{13.46} = .064\ M$

$= .064 \times 1010 = 63.4^{lb}$

Load on bolt B: $\frac{M \times 1.25}{4(3.45^2 + 1.25^2)} = .0232\ M$

$= .0232 \times 1010 = 23.4^{lb}$

Total max. load is on bolt: $A = 108 + 63.4 = 171.4^{lb}$ tension

$B = 148.5 + 23.4 = 171.9^{lb}$ tension

Say $172^{lb} + 70.2^{lb}$ from direct load on previous page

Total unfactored load on one $\frac{5}{16}$ AN Bolt: $172 + 70.2 = 242.2^{lb}$

With factor of 4: $242.2 \times 4 = 968.8^{lb}$

Strength of bolt in tension: Ref. AN-C-5: 6500^{lb}

$M.S.: \frac{6500}{968.8} - 1 =$ ——— 5.7

8-0 STRESS ANALYSIS - FAIRING.

8-2 VERTICAL FAIRING.

8-2-2 - VERTICAL FAIRING ATTACHMENT.

Loads on groups of rivets.

RIVETS AA : $\frac{10000}{9} = 1120$ lb

RIVETS BB : $\frac{6020}{32} = 201$ lb

Bearing strength of -AD-$\frac{5}{32}$" rivets on .064" 35-$\frac{1}{2}$H al. alloy.

In the absence of exact data regarding the max. allowable bearing stress on 35-$\frac{1}{2}$H, this stress is taken as being twice the UTS. by comparison with other similar soft al. all.

UTS. = 20 000 PSI (Ref. Engineering Manual)

$\therefore$ UBS = 2 × 20000 = 40 000 PSI.

Bearing strength on .064 (AN-C-5) for $\frac{e}{D} = 2.0$.

$$1020 \ \frac{40000}{100000} = 408 \text{ lb}$$

The 1120 lb load is to be taken by rivets at 2.00" pitch. and a length of: 12" will be interested to take this load. Hence 6 rivets having a total strength of: 6 × 408 = 2448 lb

$$M.S. \ \frac{2448}{1120} - 1 = \ 1.19$$

9 - 4 . 2.

DEFLECTION OF FAIRING TUBE UNDER AIR LOAD. - HORIZONTAL.

The characteristics are similar to the static load case with a UDL: $25 \frac{lb}{ft}$: $2.08 \frac{lb}{in}$ say. $2.10 \frac{lb}{in}$ and a drag load of 80.5^{lb} from the fairing of the Vertical arm.

Hence Deflection

$$\delta = 3.71 \; 10^{-3} \times 2.10 + 7.34 \; 10^{-6} \times 80.5 =$$

$$7.79 \; 10^{-3} + 5.92 \; 10^{-4} = \underline{.008382''}$$

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL.

9-0 DEFLECTIONS

9-5. CONCLUSION -

In view of the clearance provided the deflection under load of this structure is insignificant.

We can see that the smallest clearance is .10" just above the surface of the model. In the static condition, the model mount sinks: .0142" while the fairing sinks .0052" hence the relative motion is:

$.0142 - .0052 = .0090"$. Thus approximately 10% of the clearance provided

Considering the effect of model lift, a critical case is the $-10°$ case with a total down load of 546 lb i.e. an extra 346 lb on the static case which would induce an additional deflection: $1.525\ 10^{-5} \times 346 = .00527"$
Then, the relative motion becomes:

$.009 + .00527 = .01427"$ about 14% of the clearance provided.

All other clearances are larger hence less critical than the above.

10-0-1 INTRODUCTION

In this section, the symbols and sign convention used in the rest of the report have been replaced by those of report AVRO/SPG/TR 98 " Test Specifications for $\frac{1}{12}$ Scale Hovering and Transition Model ".

In 10-1-1, the basic gage equations from section 6-3 have been repeated using the new symbols. It should be noted that these equations apply only when the model suspension rod is engaged. When the rod is disengaged, the load distribution on the gages changes to that calculated on 6-1-3 page.

The basic equations from 10-1-1 can be simplified for calibration purpose by noting that : 1/ angle $\alpha = 0$
2/ Pressure and suction are off
The reduced equations are given in 10-1-2.

Equation: $\pm .130\ M_R = G$

$$\therefore \quad \frac{350}{\pm .130} = \underline{\underline{\pm 2690}} \text{ inlb.}$$

SUMMARY-

The max. and min. loads and moments that can be applied on the system must no exceed those which will produce the rated load of the weaker gage. Thus, gage B & C are limiting these loads and moments to the values underlined in the text and summarized below:

F: Fore/aft ± 150 lb
Y: Side ± 50 lb
N: UP: 1275 lb DOWN -1925 lb
M_P: Pitching Mt. ± 4440 inlb
M_R: Rolling Mt. ± 2690 inlb

NOTE: F & Y are limited by design consideration rather than gage strength.

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL

10 - 0 CALIBRATION

10-2-0 CALIBRATION PROCEDURE.

The equations on page give the relations between gage loading and the applied loads N, F & Y and the moments M_P & M_R. These equations will hold only when there is no other interaction between the gages. The purpose of calibration is to find out any such interaction which may exist and provide means of adjusting these equations accordingly.

The calibration tests will be carried out in 4 series:
Series 1 - Each load or moment applied singly.
Series 2 - Loads N, F & moment M_P in combinations
Series 3 - Loads N, F, Y & moments M_P & M_R in combinations
Series 4 - Cases representing expected loading as calculated in the stress analysis report.

SERIES 1 - Each load or moment applied singly

Table 1 & 2 indicate the loads to be applied on the calibration rig. These loads should be applied in steps from 0 to max. to 0 and from 0 to min. to 0.

SERIES 2 & 3 Combined loading.

The general principle used for calibrating under combined loading is a system where the gage load is held at a definite value and the applied loads and moments adjusted in various combination to produce the same gage load. Thus, by using values of the applied loads and moments which should theoretically give a chosen gage load, it will be possible to estimate the error on the

10-2-0 CALIBRATION PROCEDURE - CONT'D.

gage reading at various gage loading level. A minimum of 5 different combinations should be tested at each gage level for both 2 or more applied loads or moments combinations.

Series 2 - All possible combination of N, F & MP are shown graphically on charts 3 & 4 for gage A and on charts 5 & 6 for gages B & C.

Series 3 - All possible combinations of N, F, Y, MP & MR are shown graphically on charts 7 & 8 for gages B & C.

It should be noted that gage A is not theoretically affected by Y or MR. However, it will be necessary to observe its reading during calibration of gages B & C.

SERIES 4 - Stressing Cases.

This series is an attempt to represent approximately the conditions of the model tests. It is felt that this series of calibration tests will give some information on the behaviour of the balance in a range close to that we may expect in operation. Loads to be applied on the calibration rig for each cases stressed in this report are given on table 3.

CHART N° 8

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL

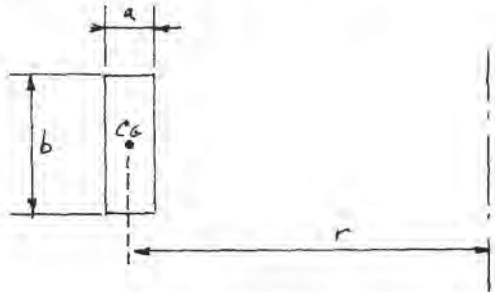
APPENDIX A - CALCULATION OF WEIGHT.

A-1 - WEIGHT OF MODEL

A-1-1 GENERAL.

Volume of an annulus: Sectional area x path of the CG.

$V = a\,b\,2\pi r$



$W = \rho\,a\,b\,2\pi r$

Using Simpson's rule we can fix

$a = .25''$

$\rho = .283\ \frac{lb}{in^3}$ hence: the term $2\pi a \rho = 2 \times \pi \times .25 \times .283 = .445$

Hence: the weight of one element: $dW = .445\ b\,r$

and the total weight of one annular part is

$W = .445\ \Sigma\, b\,r$

Values of br are tabulated for each part.

Item 71 : = $2\pi \times .283 \times .175 \times 5.26$ = [illegible] lb

165 204

Weight = 163.55 + .284 + 1.17 = 73.5 lb

DECLASSIFIED

TOTAL WEIGHT OF MODEL: 104.3 + 73.5 = 177.8 lb

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL

4-1-5 WEIGHT OF MODEL COMPONENTS

Weight of ribs

Side area: $\frac{7.5}{2}(.82+1.45) + (.95 \times 1.45) + \frac{.625}{2}(.65+.82) =$

$8.5 + 1.378 + .46 = 10.338 \text{ in}^2$

Weight per rib: $.283 \times 10.338 \times .30 = .887 \text{ lb}$

Total weight of ribs: 24 ribs:

$.887 \times 24 = 21.30 \text{ lb}$

4-1-6 TOTAL WEIGHT OF MODEL.

TOTAL WEIGHT OF MODEL WITHOUT DEDUCTION OF HOLES:

$177.8 + 21.30 = 199.1 \text{ lb}$

The holes will remove about 10 lb However, instrumentation inside the model will add to the total and we can expect other variations due to tolerances etc...

TOTAL WEIGHT OF THE MODEL IS TAKEN AT: 200 lb

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL

APPENDIX A - CALCULATION OF WEIGHT

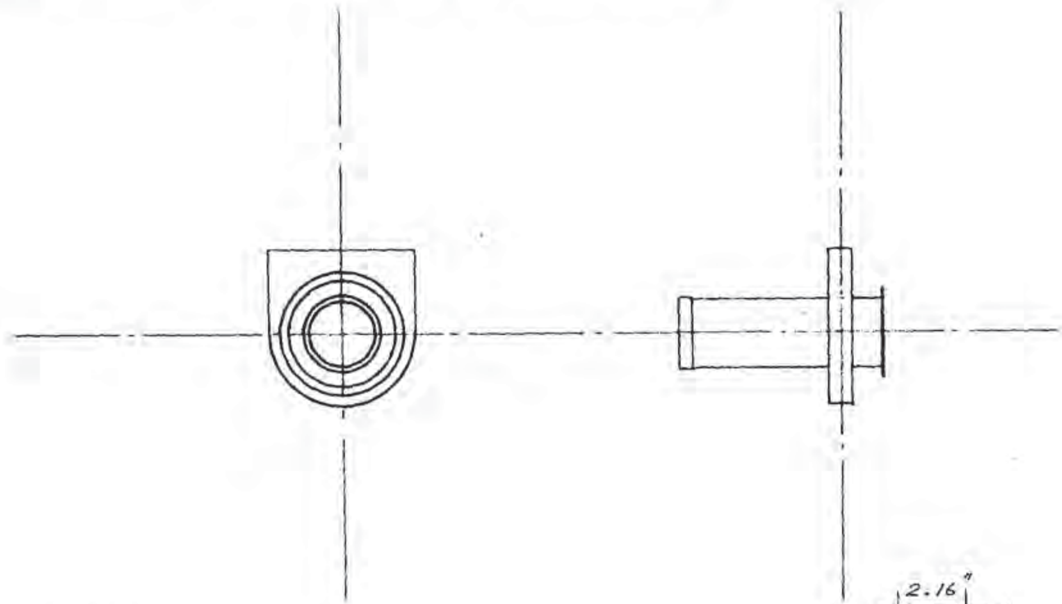
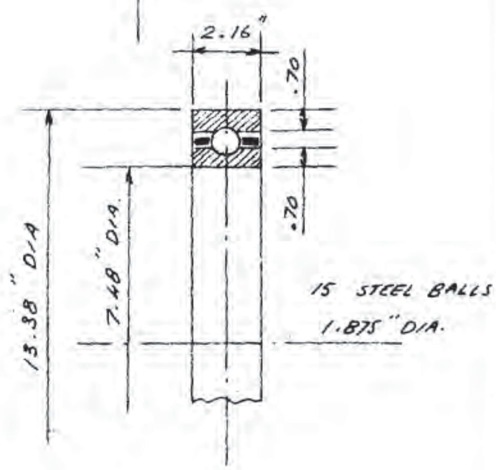
A-2 WEIGHT OF MODEL SUPPORT STRUCTURE.

A-2-3.

WEIGHT OF ATTACHMENT TO BALANCE STRUTS.



BALL-BEARING. SKF- 6238-M



Weight of balls: $V = \frac{\pi D^3}{6}$

$15 \times .283 \times \pi \frac{1.875^3}{6} = 14.68^{lb}$

Outer race:

Mean dia: $13.38 - .70 = 12.68''$

Sectional area: $2.16 \times .70 = 1.51\ in^2$

Weight: $.283 \times 1.51 \times 12.68\pi = 17.12^{lb}$

Inner race:

Mean dia: $7.48 + .70 = 8.18''$

Sectional area: $2.16 \times .70 = 1.51\ in^2$

Weight: $.283 \times 1.51 \times 8.18\pi = 10.95^{lb}$

Weight of Bearing: $14.68 + 17.12 + 10.95 = 42.75^{lb}$

Note. By not removing the weight of the grooves, that of the retainer is $\simeq$ taken care off.

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL

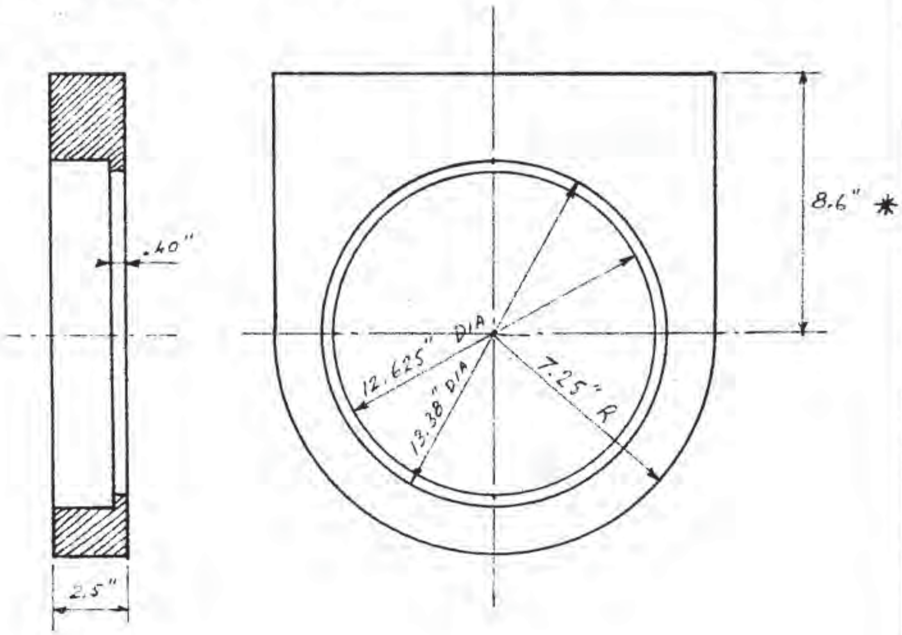
APPENDIX A - CALCULATION OF WEIGHT.

A-2 WEIGHT OF MODEL SUPPORT STRUCTURE

A-2-3

ATTACHMENT TO BALANCE STRUTS. CONT'D.

BEARING HOUSING.



Side area:

$$(14.5 \times 8.6) + \left(7.25^2 \frac{\pi}{2}\right) - \left(13.38^2 \frac{\pi}{4}\right) = 124.8 + 83 - 141 = 66.8 \text{ in}^2$$

Weight: $66.8 \times 2.5 \times .283 = 47.3$ lb *

Retainer ring:

$$.283 \times .40 \times \frac{\pi}{4}\left(13.38^2 - 12.625^2\right) = 1.70 \text{ lb}$$ *

Total weight: $47.3 + 1.70 = 49$ lb **

* NOTE Dimension 8.6" is now 17.28". However, a number of large holes have been cut in the rectangular part of this component. Exact weight has not be computed again.

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL

APPENDIX A – CALCULATION OF WEIGHT

A-2 WEIGHT OF MODEL SUPPORT STRUCTURE

A-2-3

ATTACHMENT TO BALANCE STRUTS – CONT'D.

TUBE, FLANGE & OTHER RINGS.

Tube length: 21.50" $7 \times \frac{3}{16}$ Tube. Steel:
weight: 13.32 lb per ft.

Tube weight: $13.32 \times \frac{21.5}{12} = 23.9$ lb

Flange: 5.33 lb (Ref. page B-)

Ball bearing mounting ring: assumed 12 lb

End rings: assumed 6 lb

Total weight: $23.9 + 5.33 + 12 + 6 = 47.23$ lb

add 10% for welds, bolts, etc:
$47.23 \times 1.10 = \underline{\underline{52}}$ lb

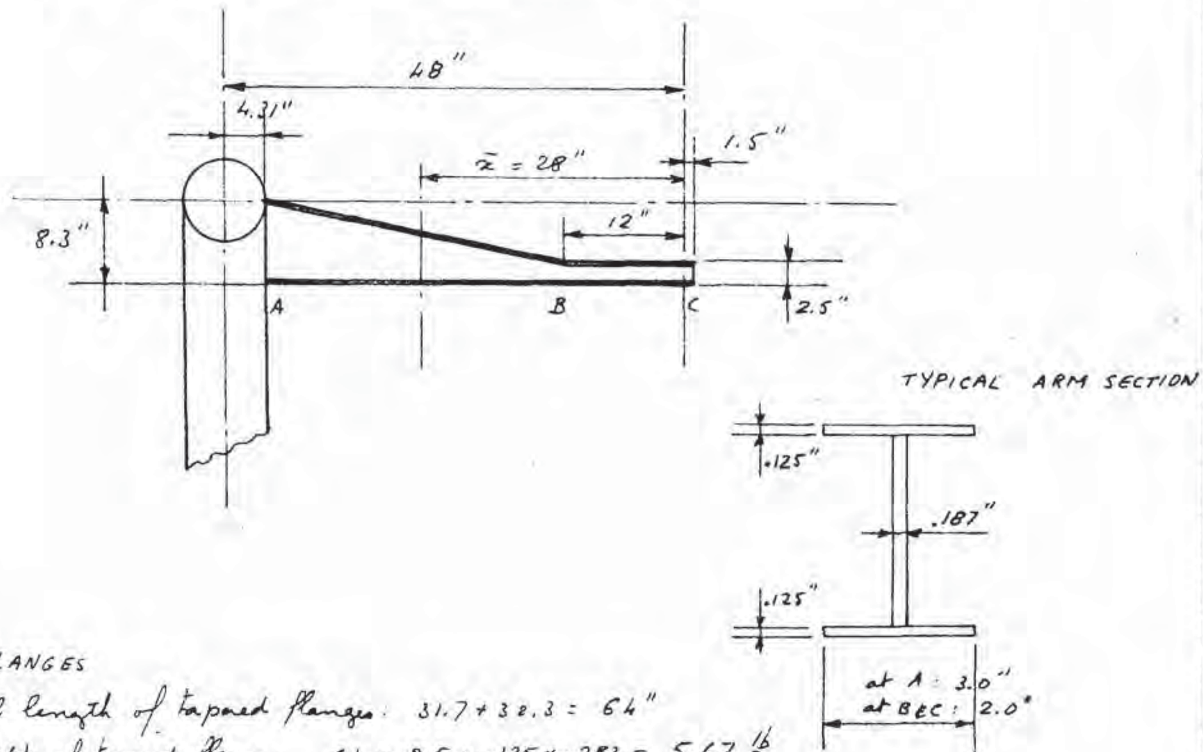
WRITTEN BY	CHECKED BY	DATE	ISSUE	AIRCRAFT
G. Jacques		Sept. 1957	DECLASSIFIED	

STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL

APPENDIX A - CALCULATION OF WEIGHT

A-2 WEIGHT OF MODEL SUPPORT STRUCTURE

A-2-4 - INCIDENCE CONTROL ARM.



FLANGES

Total length of tapered flanges: 31.7 + 32.3 = 64"

Weight of tapered flange: 64 × 2.5 × .125 × .283 = 5.67 lb

Total length of constant width flange: (12 + 1.5) 2 = 27"

Weight of constant width flange: 27 × 2 × .125 × .283 = 1.91 lb

WEB

Rectangular part: Side area: (2.5 - .25) (12 + 1.5) = 30.4 in²

weight: 70.4 × .187 × .283 = 1.6 lb

Trapezoidal part: Side area: $(8.05 + 2.25)\ \frac{48-12-4.31}{2} = 163.5$ in²

weight: 163.5 × .187 × .283 = 8.65 lb.

Weight of web: (163.5 + 30.4) × .187 × .283 = 10.25 lb

Total weight of arm: 10.25 + 1.91 + 5.67 = 17.83 lb

then $\bar{x} = \frac{(33 \times 14.32) + (6 \times 3.51)}{17.83} = 28"$

Weight of rear balance strut connecting link: ≃ 3.5 lb

Total weight of arm: 17.83 + 3.5 = 21.35 say 21.50 lb

add 10% for welds: 23.70 lb say 24.0 lb

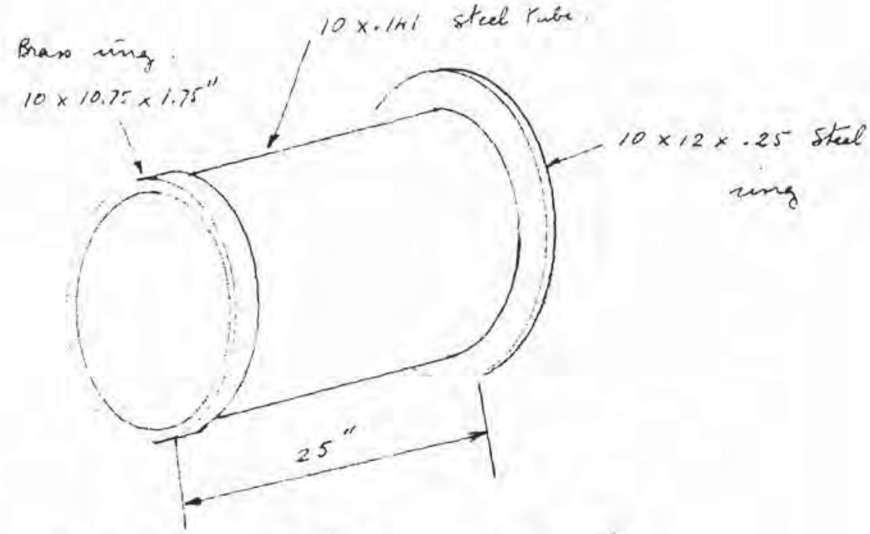
STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL.

APPENDIX A - CALCULATION OF WEIGHT

A-3 WEIGHT OF FAIRING.

A-3-1

FAIRING - OUTER SECTION.



Weight of 10" tube: Ref. Ahunco catalog $14.81 \frac{lb}{ft.}$

Weight of tube: $14.81 \frac{25}{12} = 30.9$ lb.

Weight of steel ring:
$.283 \times .25 \frac{\pi}{4}(12^2 - 10^2) = 2.44$ lb

Weight of brass ring.
$.306 \times 1.75 \frac{\pi}{4}(10.75^2 - 10^2) = 6.53$ lb

Total weight: $30.9 + 2.44 + 6.53 = 39.87$ lb

add 10% for welds, bolts, etc....
$39.87 \times 1.10 = 43.85$ lb

WRITTEN BY	CHECKED BY	DATE	ISSUE	AIRCRAFT
G. Jacquemin		Sept. 1957		

DECLASSIFIED

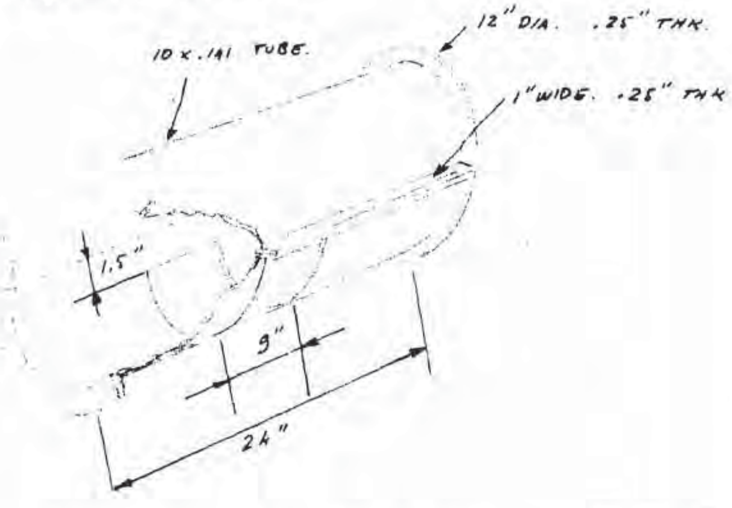
STRESS ANALYSIS OF $\frac{1}{12}$ SCALE HOVERING & TRANSITION MODEL

APPENDIX A - CALCULATION OF WEIGHT

A-3 WEIGHT OF FAIRING

A-3-2

FAIRING - CENTER SECTION - CYLINDRICAL PART.



Weight of tube: Ref. ARMCO CATALOG. Size 10 x .141. $14.81 \frac{lb}{ft}$

Weight of uncut tube: $14.81 \frac{24}{12} = 29.62^{lb}$

Weight removed by cut. arc: 165°

$$14.81 \ \frac{9}{12} \ \frac{165}{360} = 5.10^{lb}$$

Total weight of tube: $29.62 - 5.10 = 24.52^{lb}$

Weight of rings: $2 \times .283 \times \frac{\pi}{4}(12^2 - 10^2).25 = 4.87^{lb}$

Weight of side strips: $4 \times .283 \times 1.0 \times .25 \times 23.5 = 6.65^{lb}$

Total weight of component:
$24.52 + 4.87 + 6.65 = 36.04^{lb}$

add 10% for welds, bolts, etc: $36.04 \times 1.1 = 39.7^{lb}$

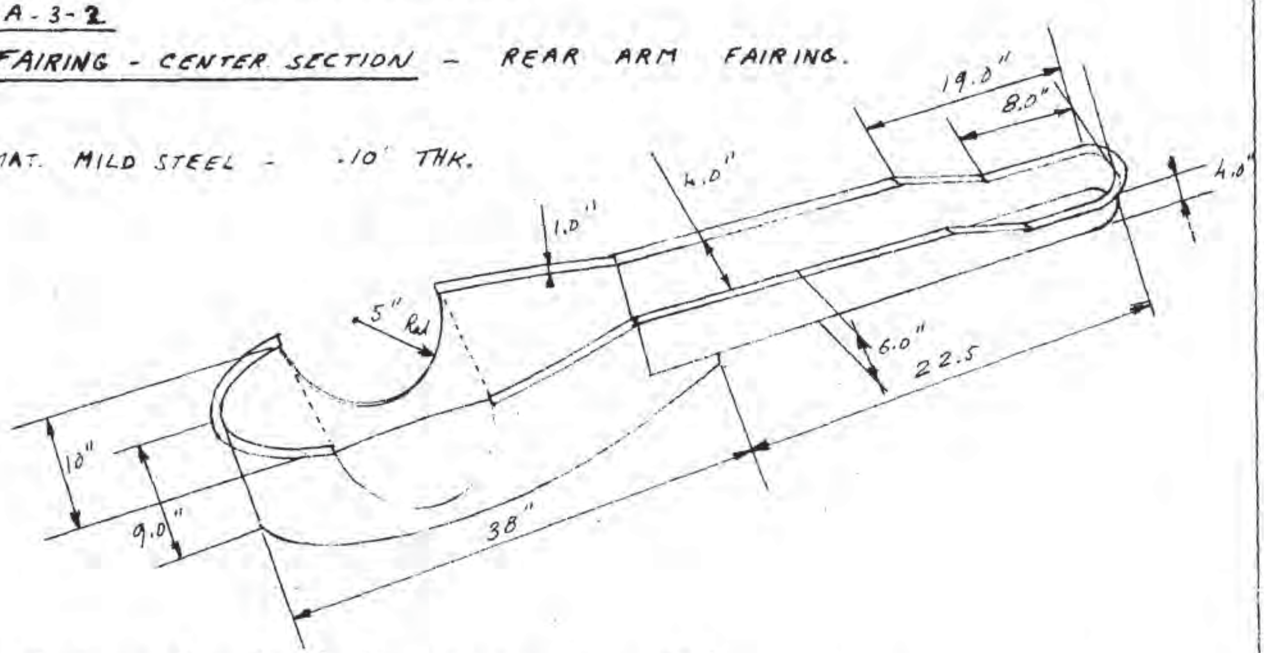
APPENDIX A - CALCULATION OF WEIGHT

A-3 WEIGHT OF FAIRING

A-3-2

FAIRING - CENTER SECTION - REAR ARM FAIRING.

MAT. MILD STEEL - .10" THK.



Developed length of streamlined part: 82"

Lateral area of developed part: $(82 \times 9.0) - \pi \times 5^2 = 738 - 78.5$
$= 659.5$ in²

Arm fairing:

Sides: area: $6.0\,(2 \times 22.5 + 4.0) = 294$ in²

Bottom: $22.5 \times 6 = 135$ in²

Edge: 1.0" wide: total length measured on dwg. 105"

Area: 105 in²

Cover plates: Front plate $\approx \frac{1}{2}$ circle : rad. 3.0" 14 in²

Rear plate $\approx \frac{25 \times 12}{2} = 150$ in²

$+ \; 25 \times 6 = 150$ in²

Total area of plate: $659.5 + 294 + 135 + 105 + 150 + 150 = 1493.5$ in²

Weight of plate: $.283 \times .10 \times 1493.5 = 42.3$ lb

add 10% for welds, bolts etc:

$42.3 \times 1.1 = 46.50$ lb
