At 23-17 [8-19 W]

At bearing 026 [true north], elevation approx. 15 degrees.

Position of Muller: during the first 15 minutes of observation, the light was pulsating or fluctuating in brightness at approx. one second intervals. For the next two minutes of observation, the light began pulsating:

Concentric rings of light, which flowed from the central source in a rippling, shimmering fashion diminishing in brightness as they grew further and further away from the originating source. During the fourth minute of observation, a bluish-green beam of light appeared from the central core of the configuration, extending outward and downward to the left at an angle of approx. 45 degrees, and reaching to the fade out point of the radiating rings of light. Approx. five mins after the appearance of the bluish-green beam (similar in appearance to a searchlight beam), the radiating circles of light disappeared, leaving
Only the original, core of light and the core, following the disappearance of the circles, the beam seemed to retract towards the central core, growing broader and stouter as it retracted. Finally, the beam and core seemed to form into a nebulous cloud-shaped mass, which drifted south on the wind, fading from view after approx. 14 mins. During this event, the following atmospheric data was accumulated: barometer 29.91

Temperature - 63 degrees dry/78 degrees wet, visibility excellent, four-tenths cloud cover (stratus and cumulus), wind E X N.S. at 12 knots. Electrical storm forming over immediate area of city of Hava.
