Re: FOIA Request No. F-00151-16
First Interim Response

Dear Mr. Greenewald:

The United States Agency for International Development (USAID) regrets the delay in responding to your Freedom of Information Act (FOIA) request. Unfortunately, USAID is experiencing a backlog of FOIA requests. Please know that USAID management is very committed to providing responses to FOIA requests and remedying the FOIA backlog.

This is the first interim response to your FOIA request to USAID, dated March 6, 2016, and received by this office on March 7, 2016. You requested a copy of all reports pertaining to the administration, status, and accomplishments of the Pandemic Influenza and Other Emerging Threats (PIOET) program of USAID. The time frame for the requested documents was January 1, 2010 to March 7, 2016.

For your information, Congress excluded three (3) discrete categories of law enforcement and national security records from the FOIA. See 5 U.S.C. § 552(c) (2006 & Supp. IV (2010)). This response is limited to those records that are subject to the requirements of the FOIA. This is a standard notification that is given to all of our requesters and should not be construed as an indication that excluded records do, or do not, exist.

USAID conducted a comprehensive search of the Bureau for Global Health (GH) for documents responsive to your request. This first interim response has yielded a total of 2,198 pages. Of those pages, we have determined that all 2,198 pages of the records are releasable in their entirety.

You have the right to appeal this first interim response. Your appeal must be received by USAID no later than 30 days from the date of this letter. In order for it to be considered an official appeal, please address and send directly to the FOIA Appeal Officer:

Director, Office of Management Services
U.S. Agency for International Development
1300 Pennsylvania Avenue, NW
Ronald Reagan Building, Room 2.12.010
Washington, DC 20523

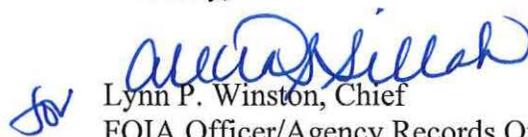

If you wish to fax your appeal, the fax number is (202) 216-3369. Both the appeal and envelope should be marked "**FOIA APPEAL**." Please include your tracking number F-00151-16 first interim response in your letter.

Please be advised that this is not our final response as we are still processing records from the respective program. We will continue to provide you with interim releases until such time all records have been evaluated. There is no charge for this FOIA request.

If you need to contact our office again about this request, please refer to the tracking number cited above. You may contact Theresa Morris on (202) 712-0286 or at thmorris@usaid.gov.

Thank you for your interest in USAID and continued patience.

Sincerely,

Lynn P. Winston, Chief
FOIA Officer/Agency Records Officer
Bureau for Management
Office of Management Services
Information and Records Division

Enclosures: Responsive Records (2,198 pages)

Global Health Program Impact

Pandemic Influenza and Other Emerging Threats

USAID has been a major leader in the global response to the dangers posed by emerging pandemic threats. In today's globalized world, the speed with which newly emergent diseases can surface and spread, as illustrated by the H1N1 2009 pandemic virus, raises serious public health, economic, security and development concerns. It also underscores the need for the global community to act pre-emptively and systematically to improve individual countries' abilities to identify early and mitigate quickly health threats arising within their borders. That we are now in an era of new, re-emerging and recurring global health threats that have their origins in animals argues for a longer-term, more strategic approach to global health security.

Pandemic Influenza and Other Emerging Threats

Since 2005, the dual goal of USAID's Pandemic Influenza and Other Emerging Threats (PIOET) program has been to (1) minimize the global impact of existing pandemic influenza threats such as H5N1 avian influenza and (2) pre-empt the emergence and spread of future pandemic threats. USAID's work in this programmatic area started in 2005 as H5N1 avian influenza began rapidly spreading from Southeast Asia to other regions. Investments in preparedness and pandemic planning, animal and human surveillance, outbreak containment and case management, communications and risk reduction, and provision of key commodities (e.g. diagnostics, supplies for disinfection of farms and markets, and personal protective equipment) were largely successful and by 2008 the emergency phase for H5N1 avian influenza was ending. Recognizing that the majority of new diseases in humans (including HIV/AIDS and H5N1 avian influenza) since 1940 have been zoonotic (i.e. originated in animals), USAID began to broaden its avian influenza program in 2008 to focus on detecting and responding to other emerging diseases of animal origin that posed significant public health threats. This expansion was necessary since the rate of zoonotic disease emergence has been increasing over time and this trend is expected to continue for the foreseeable future as the frequency of animal-human interactions increases due to land use changes and increases in animal production, both of which are a direct consequence of growing human populations.

Since 2005, USAID has been a major leader in the global response to the dangers posed by emerging pandemic threats. Through its sizeable technical, budgetary, and research inputs, USAID has led efforts to strengthen in-country capacities related to animal and human health (a.k.a. "One Health") to proactively detect and respond to new threats before they become entrenched in the human population. This represents a dramatic shift away from traditional public health approaches that react to threats (e.g. HIV/AIDS) after they have fully emerged, making them much more difficult and expensive to address. The H1N1 2009 pandemic virus clearly demonstrated that, in today's globalized world, the speed with which newly emergent diseases can surface and spread can have serious public health, economic, security, and development consequences. It also underscores the need for the global community to act pre-emptively and systematically to improve individual countries' abilities to identify early and mitigate quickly health threats arising within their borders. That we are now in an era of new,

re-emerging and recurring global health threats that have their origins in animals argues for a longer-term, more strategic approach to global health security.

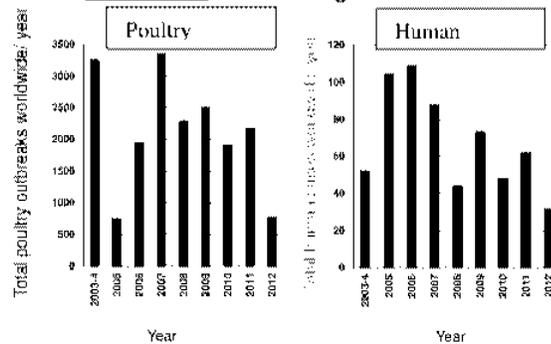

The effectiveness of each of the three main areas of focus by the PIOET program (H5N1 Avian Influenza, H1N1 2009 pandemic virus, and Emerging Pandemic Threats) are described below.

H5N1 Avian Influenza: Since mid-2005, USAID has strengthened the capacities of more than 50 countries for monitoring the spread of HPAI among wild bird populations, domestic poultry, and humans, to mount a rapid and effective containment of the virus when it is found, and to assist countries prepare operational capacities to mount a comprehensive response in the event a pandemic capable virus emerges.

USAID’s efforts have contributed to dramatic downturns in reported poultry outbreaks and human infections, and a dramatic reduction in the number of countries affected. At the peak of its spread in 2006, HPAI had been reported in 53 countries across three continents. By 2012, only 11 countries were affected. Five of these countries (Indonesia, Vietnam, China, Bangladesh and Egypt) are the primary reservoir of the virus and accounting for more than 95% of all reported outbreaks involving either poultry or humans. The following summarizes this progress:

(1) The overall pandemic threat caused by H5N1 avian pandemic has diminished, with reported numbers of poultry outbreaks and human cases having decreased since peaking in 2006.

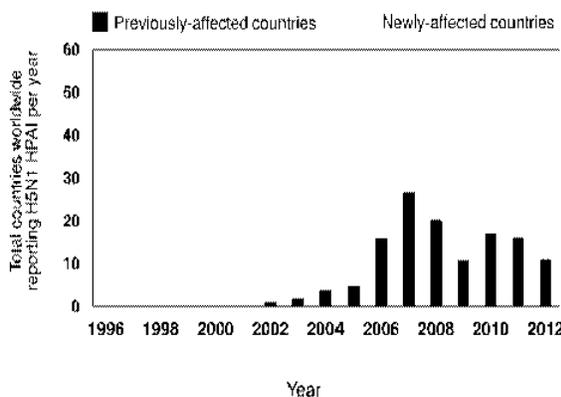

Reported Poultry Outbreaks and Human Cases Worldwide Decreasing Since 2003

After the initial spread of H5N1 avian influenza between 2003 and 2006, the total numbers of poultry outbreaks and human cases reported globally have decreased. Similar trends have been seen in highly-affected countries such as China, Indonesia, Thailand, and Vietnam following the application of aggressive surveillance and/or effective control measures such as mass poultry vaccination.

Sources: OIE, FAO, and WHO

Countries Reporting H5N1 Avian Influenza

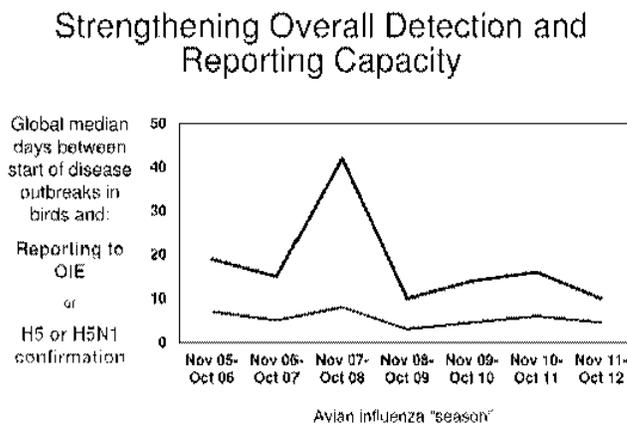

(2) H5N1 appears to have not only stopped spreading to new countries, but there has also been a dramatic contraction of its geographic range.

Following the explosive spread of the H5N1 virus from Southeast Asia to

Europe, the Middle East, South Asia, and Africa in 2005-2006, the virus appears to have stopped spreading to new countries, at least for now. Of the 11 countries affected in 2012, five of them (Bangladesh, China, Egypt, Indonesia, and Vietnam) account for more than 95% of all reported H5N1 poultry outbreaks and human cases.

(3) Affected countries have strengthened their capacities to identify and respond to future poultry outbreaks.

Combined country data from OIE. Does not include Indonesia after Aug 2008 and Egypt after Jun 2008.

To contain the H5N1 virus, USAID has focused on strengthening the capacity of affected countries in three key areas: early identification of H5N1 infections in both poultry and people; promotion of timely and effective response to contain and eliminate the virus; and education of the general population to reduce risk of infection. All of these are key capacities that are applicable to other emerging zoonotic diseases.

Although these successes are significant, H5N1 avian influenza remains a serious threat and sustained vigilance is required since the virus continues to spread in poultry, the mortality rate among infected humans remains above 60%, and the virus may only be a few mutations away from being easily transmitted from person to person. Mindful of the need for continued vigilance, USAID has focused its efforts in recent years on consolidating its programs where H5N1 avian influenza poses the highest immediate risk.

2009 H1N1 Pandemic Influenza virus: In FY 2009 USAID supported three lines of H1N1-related work:

- deployment of more than 40 million doses of the H1N1 vaccine and related ancillary materials (syringes, needles, etc.) to more 60 countries;
- support for a global laboratory network to monitor impact of the H1N1 virus as it spread around the world, with a special focus on upgrading the surveillance and laboratory capacities of 26 countries in West and Central Africa and Central and South America – where such capacities were previously non-existent; and,
- support for heightened community-level readiness to mitigate through non-pharmaceutical interventions the effects of the pandemic virus in 28 countries in Africa

and Asia using a coalition of the International Federation of Red Cross Societies, UN partners, military authorities, the private sector and NGOs.

Fortunately the H1N1 pandemic virus proved to be less virulent than feared, with limited global health consequences. However, USAID's ability to quickly and effectively mobilize its technical, programmatic, and financial resources in support of the H1N1 pandemic response underscores the value of the having capacities in place (as a consequence of efforts to control of the threat posed by the H5N1 avian influenza virus) that can be adapted for new threats.

Emerging Pandemic Threats: The on-going threat from recently emerging infections such as H5N1 (avian) influenza, the H1N1 pandemic influenza virus and the more recent threats posed by the novel H7N9 avian influenza virus and the Middle East Respiratory Syndrome (MERS) coronavirus has raised awareness of the global interdependence of human and economic security and the need for a more systematic effort to identify and respond to sudden global public health emergencies. That nearly 75 percent of all new, emerging, or re-emerging diseases affecting humans at the beginning of the 21st century have been documented to have originated in animals (zoonotic diseases) underscores the need for the development of comprehensive disease detection and response capacities that span the traditional domains of animal health, public health, ecology and conservation.

In 2009, USAID launched the Emerging Pandemic Threats program - a suite of capacity building investments designed to give earlier insight into the emergence of new public health threats and enhance country-level capacities to mitigate their potential impact. In collaboration with CDC, Department of Defense, WHO, and Food and Agriculture Organization, USAID has expanded surveillance to monitor wildlife and domestic animals for potential pandemic threats; enhanced pre-service training for public health, animal health, and related programs; strengthened in-service field epidemiological training; strengthened laboratory capability to address common infectious disease threats in animals and people; broadened ongoing efforts to prevent transmission of H5N1 avian influenza and other pandemic threats; and strengthened national capacities to prepare for the emergence and spread of a pandemic.

The EPT portfolio initially drew heavily from the experiences and lessons acquired from efforts to address the threats posed by H5N1 avian influenza -- and as such reflects a strategic approach that (1) builds on the understanding that the future well-being of humans, animals and the environment are inextricably linked, (2) promotes a "One Health" approach that spans the animal health, public health, environmental and conservations communities, (3) targets promotion of those policies and the strengthening of those skills and capacities critical for both minimizing the risk of new disease emergence and the ability to limit their social, economic and public health impact, and (4) uses a "risk" based approach to target investments where the likelihood of disease emergence is greatest. At the country level, the EPT partners have been working with governments and other key in-country and regional partners to enhance the understanding of viral distribution and key drivers of disease emergence—from deforestation and land use change to wildlife trade and livestock product demands. This information, along with other EPT investments to strengthen country-level capacities for routine infectious disease detection and outbreak response, are being used to improve surveillance and response as well as risk-mitigation strategies. Over its life, EPT has significantly refined our understanding of the "drivers" that

underlie disease emergence and established important new partnerships and platforms for even more timely and effective detection, control and prevention of future threats.

The success of USAID's Pandemic Influenza and Other Emerging Threats program has been validated by the rapid response to H7N9 avian influenza in China following its emergence in 2013. In the case of the latter, China was able to quickly respond contain the H7N9 virus within a few months and prevent it from spreading throughout the country and to neighboring nations by using capacities, platforms, and partnerships that USAID had helped develop for H5N1 avian influenza. In contrast, the general lack of these capacities, platforms, and partnerships in the Middle East has slowed efforts to contain MERS-CoV since it emerged in 2012.

Emerging Threats Program

USAID
FROM THE AMERICAN PEOPLE

Problem – Past Spillover of Animal Diseases

Steady stream of animal diseases spilling over into people

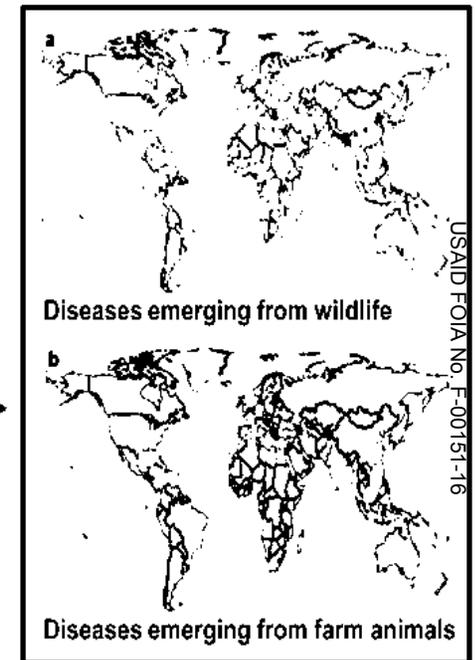

→ *Most countries not prepared to deal with new threats*

1. Analysis of disease emergence (1940 to 2004*):

- Most new microbes from animals, particularly wildlife such as bats, rodents, primates
- Many of the new microbes are viruses
- Emergence concentrated in specific geographic regions with favorable conditions →
- Some spillovers have resulted in pandemics

2. Impact of zoonotic diseases**

- Mortality – varies (few cases to tens of millions)
- Economic – can be significant, e.g. >\$200 billion in direct and indirect costs over the past decade

* Global Trends in Emerging Infectious Diseases, Jones, et al., 2008, *Nature*, 451:990-994.

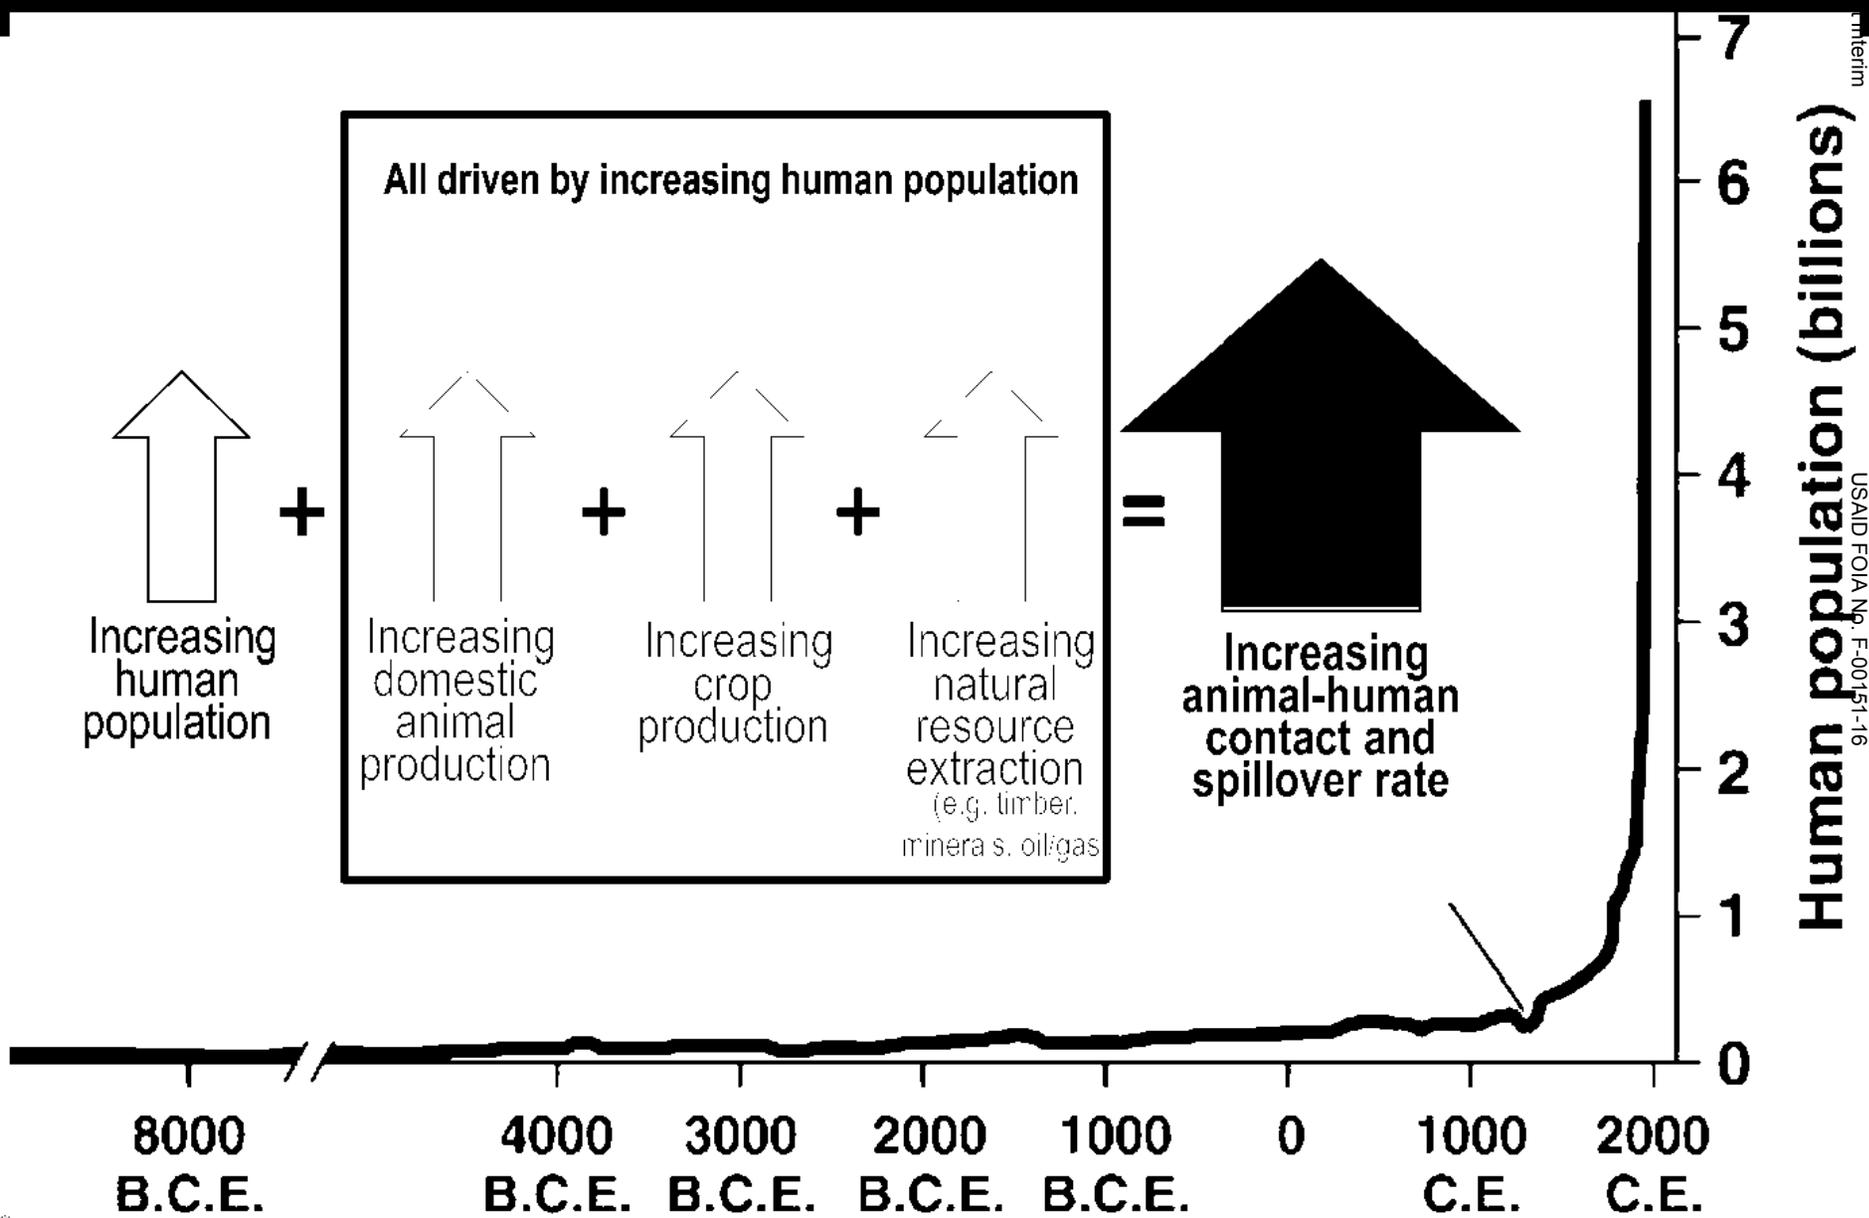

** People, Pathogens and Our Planet – Volume 1: Towards a One Health Approach for Controlling Zoonotic Diseases, World Bank.

Pandemic Preparedness

■ = primary focus

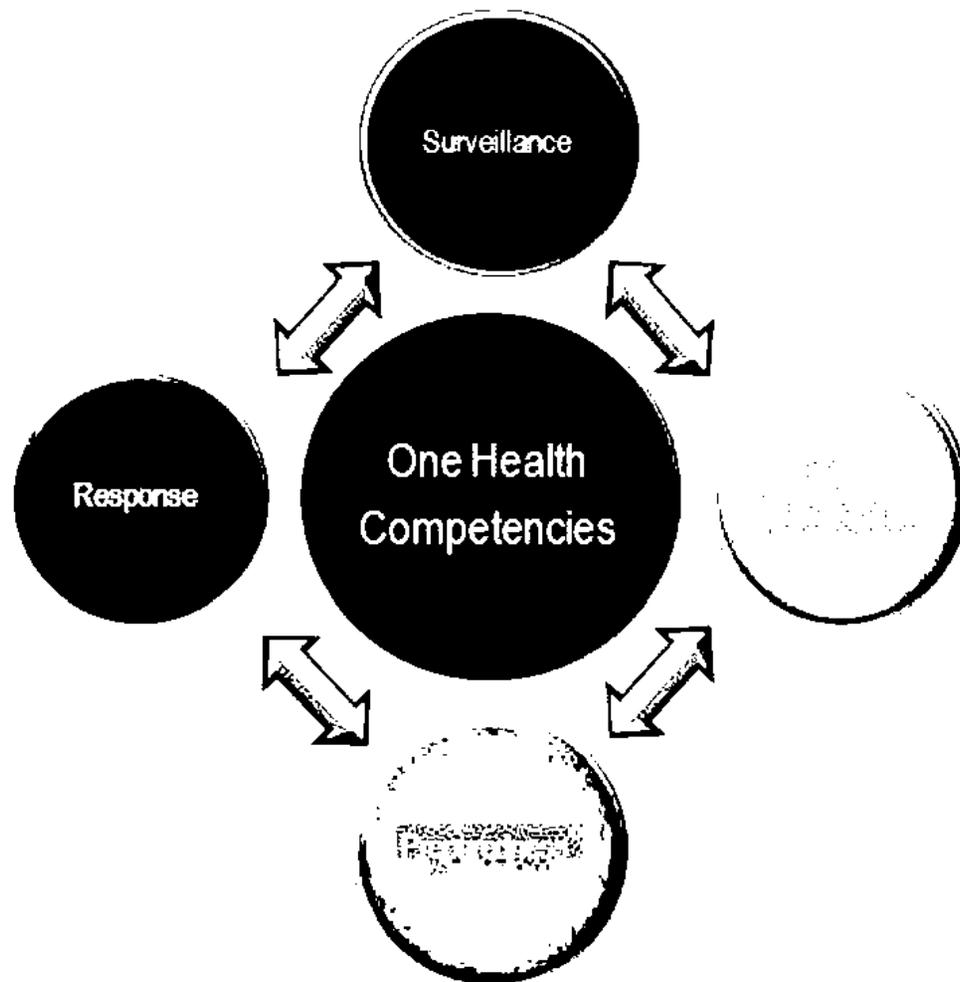

Emerging Pandemic Threats

EPT *plus*

Programmatic and Strategic Focus

Target geographic “hot spot” areas with a history of disease emergence

→ *East/Central Africa, South and Southeast Asia*

Focus on 20+ viral families associated with human disease

→ *includes influenzas, Ebola, Marburg, Nipah, Coronaviruses, others*

Focus on animal taxa associated with disease spillover

→ *includes bats, rodents, non-human primates*

Focus on specific animal-human interfaces associated with disease spillover

→ *includes hunting, extractive industry, markets, wild animal farms*

USAID
FROM THE AMERICAN PEOPLE

Program Areas: Avian Influenza

Expected result: decreased public health risk from H5N1 AI

Target: contain/reduce virus in Bangladesh, China, Egypt, Indonesia, and Vietnam and prevent spread to neighboring countries

Activity areas:

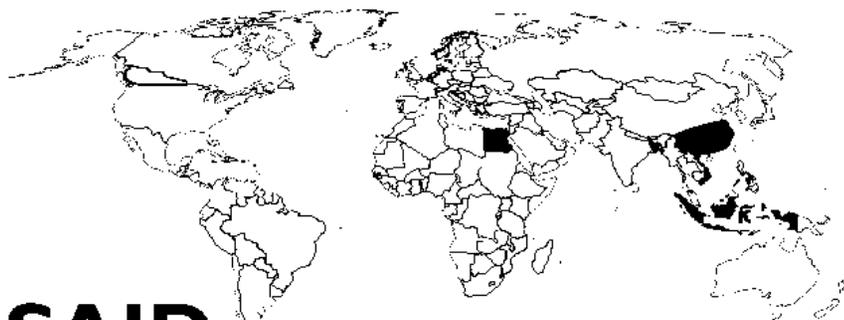

- monitor H5N1 AI virus in birds and humans*
- mount rapid and effective containment*
- identify risk factors associated with spread and promote prevention measures

Partners: FAO, WHO, UNSIC, (USAID bilaterals)

Progress since 2005-2006:

- median detection and reporting times for bird outbreaks in developing countries decreased 36% and 47% respectively
- reported poultry outbreaks and human cases worldwide decreased by about 75%
→ including in high-burden countries
- number of affected countries decreased from 51 to 11**
→ allowed USAID to further focus its resources

** 5 endemic countries and 6 neighbors

USAID
FROM THE AMERICAN PEOPLE

* Support reporting requirements of *International Health Regulations* and OIE

Avian Influenza Success Story – Indonesia

Background:

- 30 of 33 provinces affected at some point after 2004
- global leader in poultry outbreaks (11,000) and human infections (192)

Key USAID inputs since 2005:

- public-sector AI surveillance system in high-risk districts to routinely monitor for poultry infections in villages and live bird markets
- research to determine efficacy of approximately 20 poultry vaccines

Outcome/Impact:

- with vaccine efficacy information, commercial poultry producers more-effectively used own resources to protect flocks
- between 2007 and 2012, number of reported poultry outbreaks and birds testing positive at markets decreased by >50%
- similar decrease seen in reported human cases
- *reduced AI infections in poultry and people have decreased the opportunities for the virus to further evolve into a pandemic-ready form*

Program Areas: Pandemic Preparedness

Expected result: enhanced readiness to address pandemic threats in Africa and Asia

Target: improve planning in 35 countries in Africa and Asia

Activity areas:

- refine country-level “whole of society” pandemic plans to include training and simulations
- develop a regional plan for pandemic preparedness in Asia (through ASEAN)

Partners: WHO, UNDP, WFP, UNSIC, DOD, PREPARE, (USAID bilaterals)

Progress since 2007:

- 30 countries established national coordinating bodies for preparedness
- 25 countries developed “first order” pandemic preparedness plans
- Military authorities in 32 countries developed “civ:mil” preparedness response plans
- USAID-led global “lessons learned” exercise held in Rome in 2011
 - *included case studies looking at the complexities and benefits of preparedness*

USAID
FROM THE AMERICAN PEOPLE

Program Areas: Emerging Pandemic Threats

Expected result: decreased public health risk from emerging viruses with pandemic potential

Target: strengthen capacity in 18 countries to identify and respond to “normal” and new infectious diseases

Activity areas:

- monitor wildlife, people for known/novel viruses*
- strengthen lab diagnosis for common diseases*
- identify high-risk groups and factors associated with spillover and improve predictive models
- develop/test plans for outbreak response*
- strengthen regional/national capacities for training on outbreak investigation and response*
- promote risk mitigation among high-risk populations

Partners: CDC, FAO, WHO, OIE, PREDICT, PREVENT, IDENTIFY, RESPOND, Universities, Chatham House

Progress since 2009:

- 20 of 33 targeted labs begun screening wildlife samples for viral families; >200 novel viruses discovered
- “hot spot” models for disease emergence further refined
- bush meat trade, wildlife farming, consumption of wild animals, and behaviors/practices being mapped to better quantify risk
- safe sample handling, diagnosis, and reporting of major endemic diseases improved in 70 labs in 25 countries
- “One Health” university networks started in C/E Africa and SE Asia
- risk assessment/mitigation tool developed for extractive industry

USAID
FROM THE AMERICAN PEOPLE

* Support reporting requirements of *International Health Regulations and OIE*

Program Areas: EPT+

Expected result: decreased public health risk from influenza viruses

Target: strengthen capacity in China, Vietnam and Bangladesh to identify and characterize influenza viruses circulating in farm animals

Activity areas:

- conduct surveillance for influenza viruses in poultry and swine populations*
- identify risk factors associated with spread of influenza viruses among farm animals

Partners: FAO

Progress since 2012:

- surveillance and lab protocols developed with international and in-country partners
- agreements reached with in-country authorities and labs
- first round of surveillance conducted
- lab testing initiated

* Support reporting requirements of *International Health Regulations and OIE*

PIOET Response to Recent Emerging Events

Rapid use of PIOET platforms and expertise for new threats:

1. H1N1 influenza pandemic (2009-2010)*

- detailed technical and logistics experts to WHO to assist in planning distribution of vaccine and ancillary equipment
- deployed >70 million doses of H1N1 pandemic vaccine (including U.S. donation) and injection equipment to >60 countries
- upgraded H1N1 surveillance and laboratory capacities in 26 countries in Africa and Latin America

H7N9
(2013)

MERS-CoV
(2012)

H1N1
(2009)

2. Novel coronavirus (2012-2013)*

- genetic sequence comparison used to target surveillance
- surveillance and lab protocols used to identify animal source

H5N1
(2005)

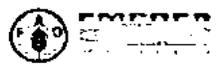

SARS
(2002)

3. H7N9 avian influenza (2013)*^

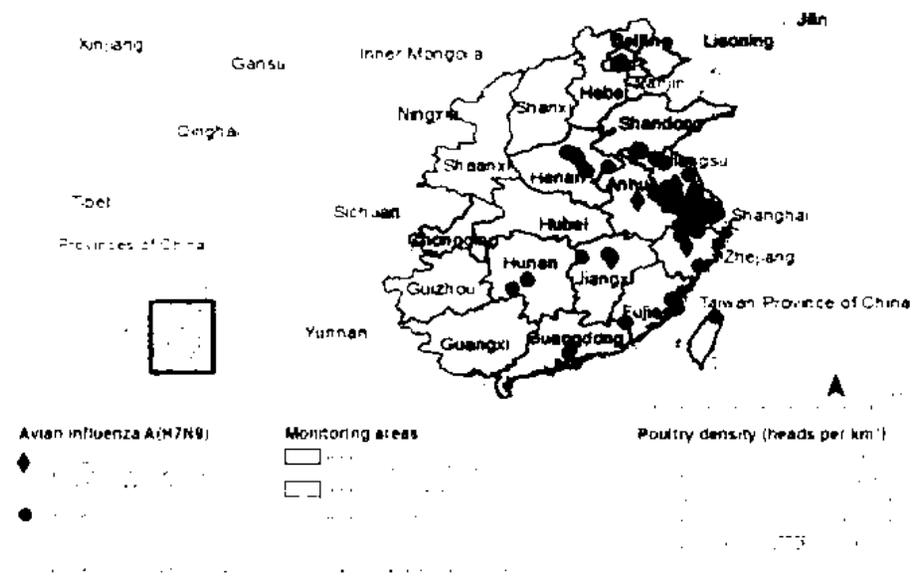

- surveillance and lab protocols used to identify animal source and other potential threats circulating in animals

Animal and human
infectious disease
programs

Influenza A/H7N9 February–July 2013

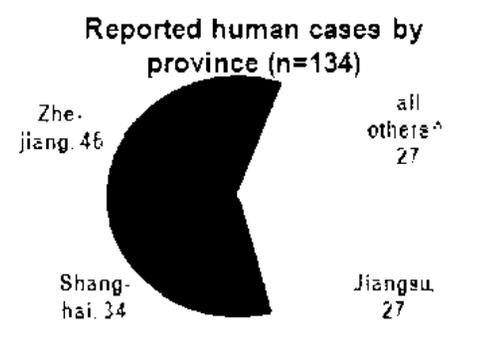

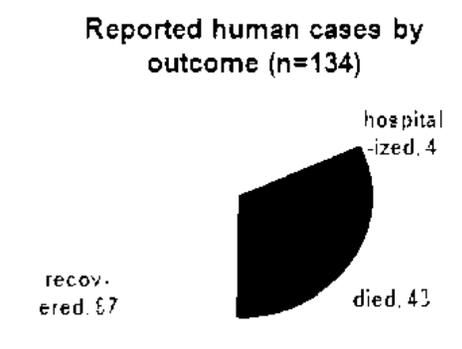

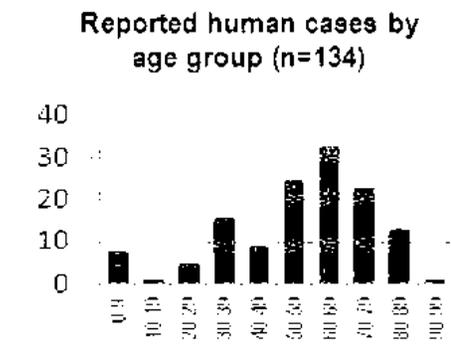

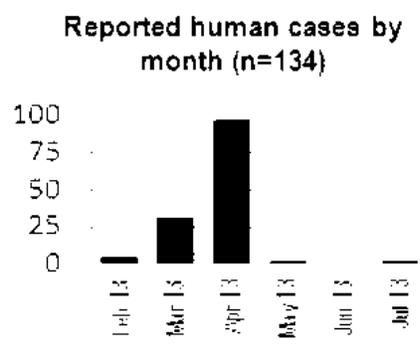

Avian influenza (A/H7N9) human cases and positive findings in birds and the environment, mainly in live bird markets / vendors

- Summary of confirmed human infections¹
- Average age = 58 years (range 4-91)
 - 74% cases male
 - Apparent case fatality rate = 32%
 - Cases in clusters (2 or more) = at least 6%
 - Cases with connections to China = 100%
 - Cases with likely contact with poultry = 17%
 - Cases involving health workers = 0%
 - Cases with basic data² = 27%

Sources = World Health Organization, Food and Agriculture Organization, OIE, ProMed, Eurosurveillance, and scientific publications through 7/20/13; ¹ may be biased towards more-severe cases that are more-easily recognized; ² includes age, gender, location, illness outcome, and dates for symptom onset, hospitalization, death, if applicable

Middle East Respiratory Syndrome– Coronavirus (MERS-CoV)

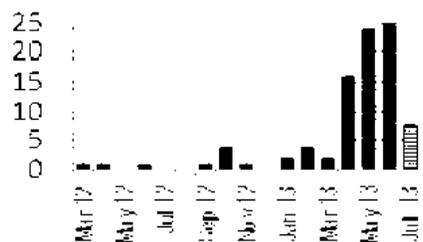

March 2012-July 2013

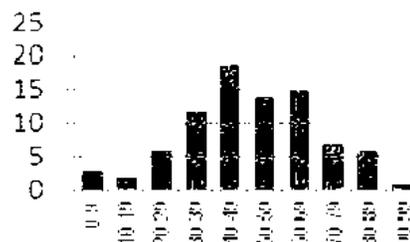

- Summary of confirmed human infections*
- Average age = 51 years (range 2-94)
 - 62% cases male
 - Apparent case fatality rate = 50%
 - Cases with comorbidities = at least 56%
 - Cases in clusters (2 or more) = at least 77%
 - Cases with connections to Saudi Arabia = at least 94%
 - Cases involving health workers = 16%
 - Cases with basic data** = 32%

Sources = World Health Organization, ProMed, and scientific publications through 7/26/13. * may be biased towards more-severe cases that are more-easily recognized. ** includes age, gender, location, clinical outcome, and dates for symptom-onset, hospitalization, death, if applicable

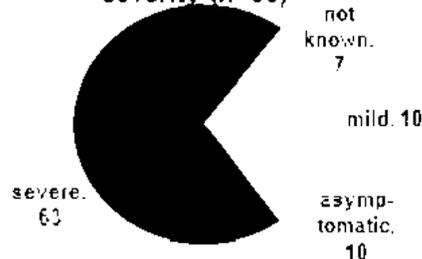

Reported human cases by month (n=90)

Reported human cases by age in years (n=85)

Reported human cases by severity (n=90)

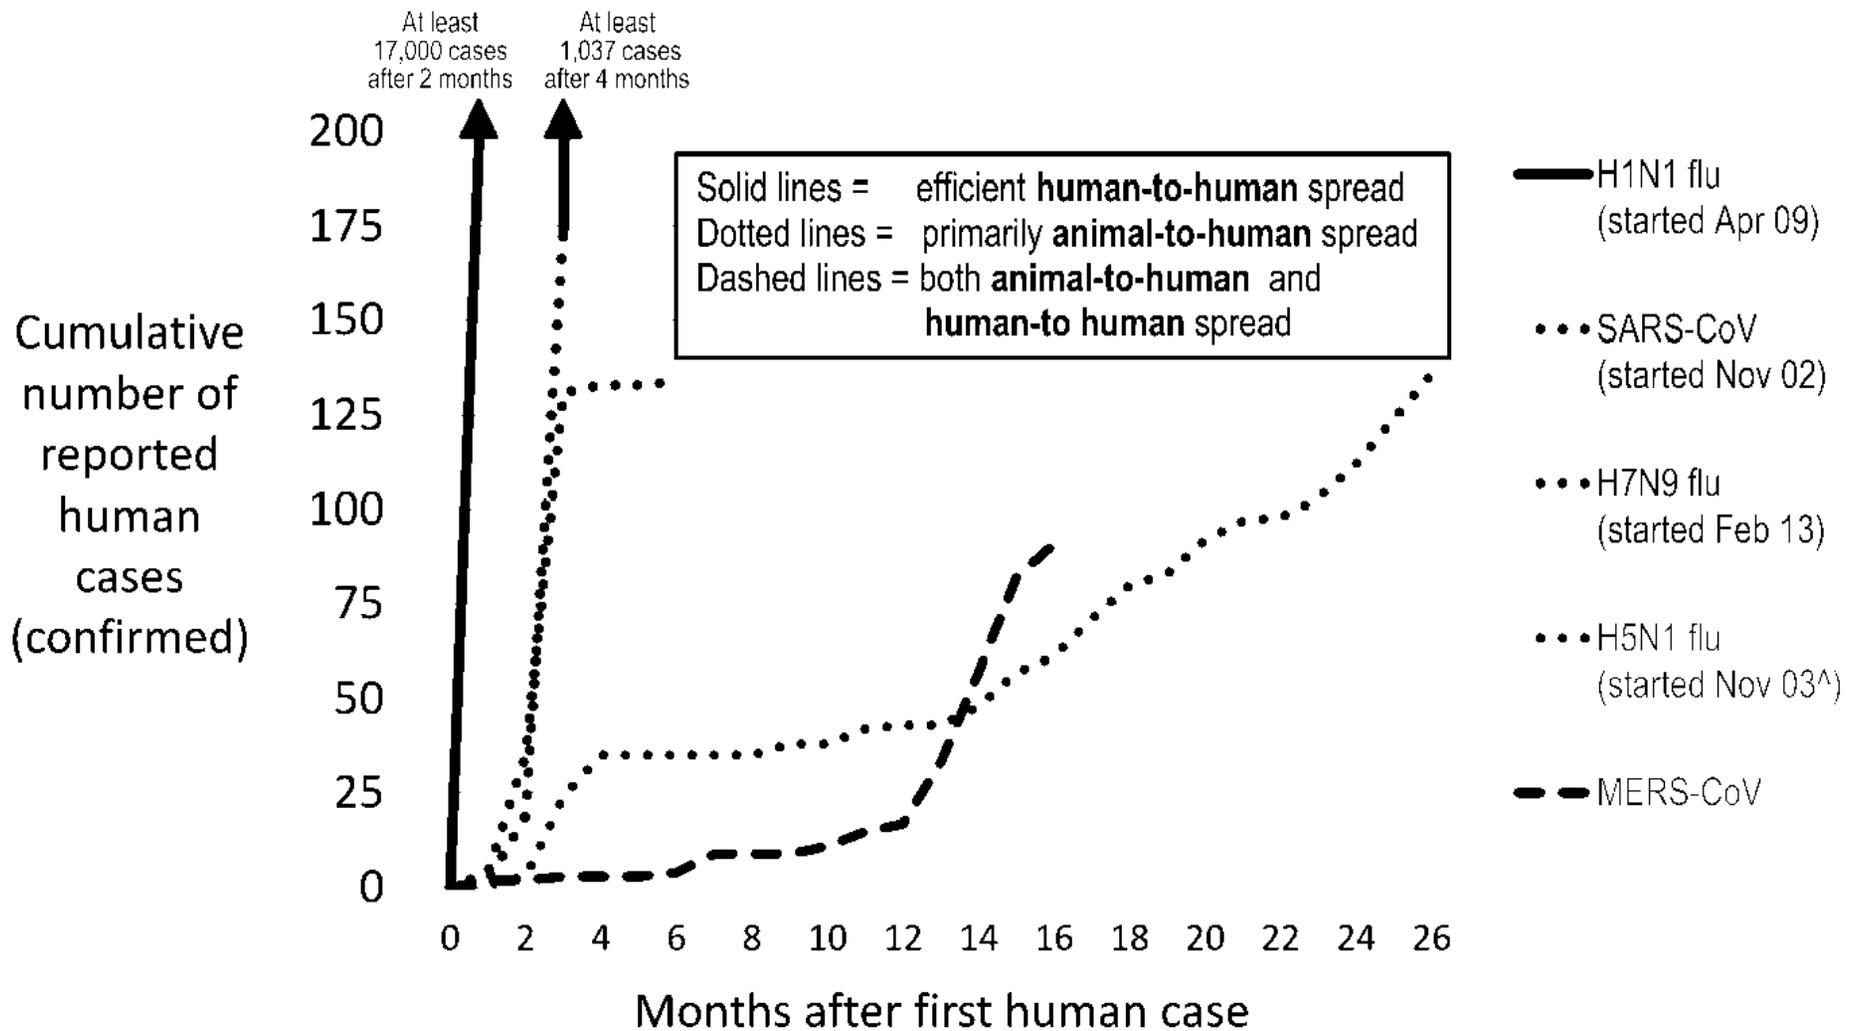

Reported human cases by country (n=90)

* 11 Qatar case detected in Germany; 1 Qatar and 1 UAE case detected in UK

Early stages of human infections with 5 “new” viruses*

* Based on symptom onset data from WHO (H5N1, H7N9, Middle East Respiratory Syndrome-Coronavirus [MERS-CoV]), WHO case counts (H1N1), and Molecular Evolution of the SARS Coronavirus During the Course of the SARS Epidemic in China, Science, 12 March 2004, 303, pp. 1666-1669. ^ November 2003 used for H5N1 since this was the beginning of this virus' continued spillover into human populations in multiple countries.

Comparison of the Response to MERS-CoV and H7N9

Indicator	MERS-CoV*	Influenza A/H7N9
Primary region affected	Middle East	East Asia
Months since first known human <u>illness</u>	16	5
Months since first human case <u>reported</u>	10	4
Number lab-confirmed human cases	91	134
Apparent case fatality rate (confirmed cases)	51%	32%
Number of other probable cases	15	2
Number of countries with human cases	9#	1##
GNI PPP per capita (US\$)^ for affected countries	Average = 26,223	Average = 7,640
Time from symptom onset in humans to WHO report	Average = 27 days Median = 13 days	Average = 11 days Median = 9 days
Percent of confirmed human cases in clusters	76%	6%
Number of genetic sequences publicly available	9 (human only)	88 (animal + human)
Time from WHO report to <u>human</u> sequences being publicly available	Average = 52 days Median = 37 days	Average = 15 days Median = 14 days
Previous experience with emerging zoonoses	Limited (H5N1 for 1-2 years)	Extensive (SARS; H5N1 for >10 years)
International experts^^ invited to participate	Yes, but limited	Yes
Animal host identified	No	Yes
Animal-human interface identified	No	Yes
“One Health” collaboration	Weak	Strong
Status of outbreak	On-going (Apr = 16; May = 24; Jun = 25; Jul = 9)	Contained/Seasonal? (Apr = 100; May = 2; Jun = 0; Jul = 1)

H7N9: Preparedness and Response

Targeted “high risk” countries: China, Vietnam, Laos, Myanmar, Thailand, Cambodia, Bangladesh, Bhutan, Nepal, Indonesia

H7N9 Package of Actions

Goal: Disrupt spread of virus beyond China during upcoming “AI season”

Strategy: Build on existing platforms for AI and other emerging diseases

Actions - targeting “high risk” countries

- Laboratory capacities for rapid diagnosis of H7N9 virus
- Intensified surveillance for spread of H7N9 via poultry “value chain” (begun in May)
- Parallel surveillance for human infections via ILI/SARI platforms
- Targeted control measures where virus found
 - Market closures/cleaning
 - Targeted “depopulation”
 - Supportive communication

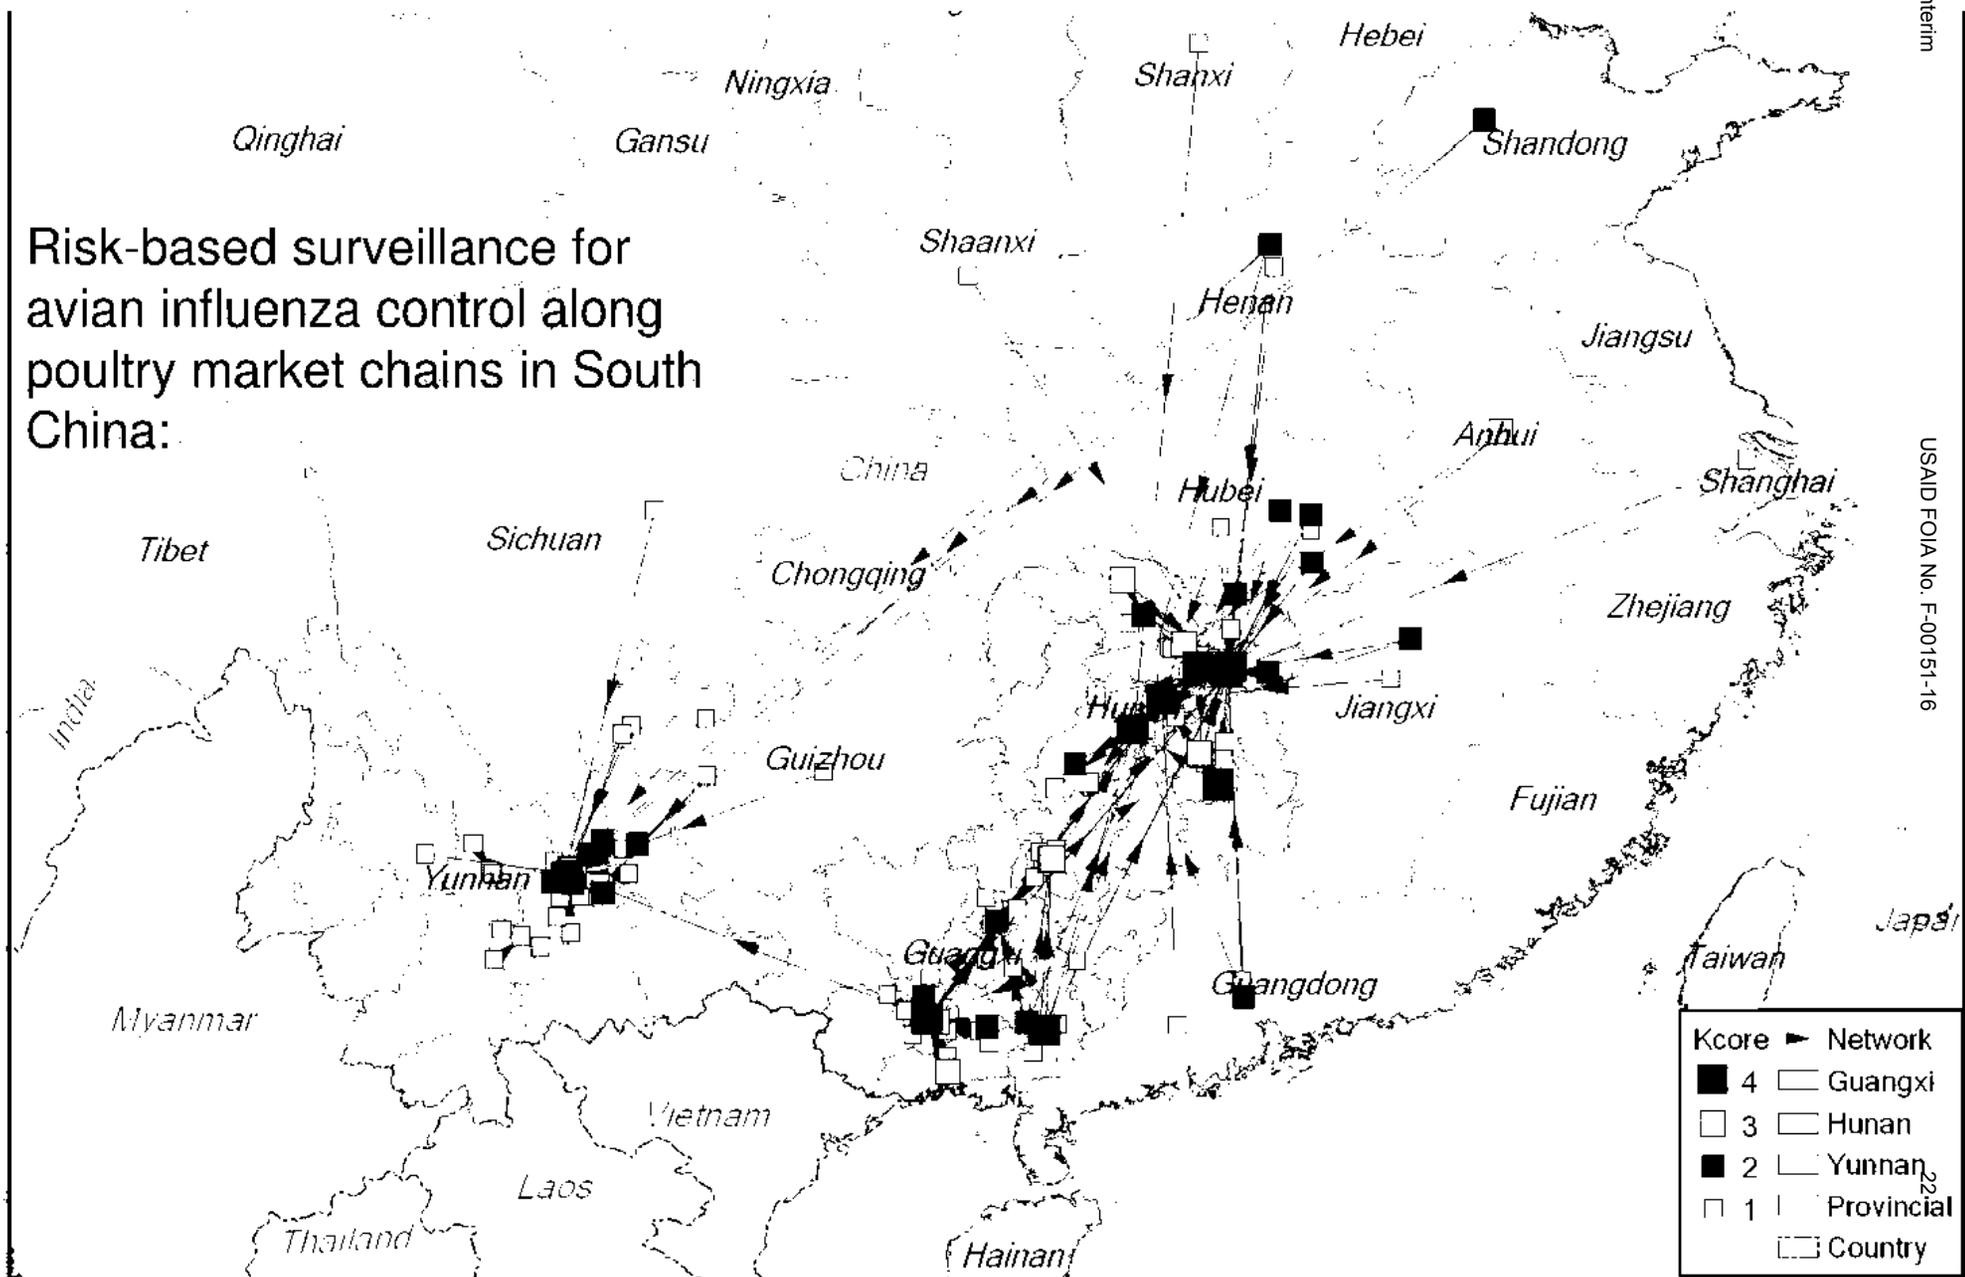

USAID
FROM THE AMERICAN PEOPLE

MERS-CoV Package of Actions

Goal: Disrupt spread of virus outside of Arabia Peninsula (AP) during upcoming Hajj

Strategy: Build on existing influenza and other platforms

Actions – Targeting “high pilgrim” countries

- “Traveler Advisory” materials on importance of “personal hygiene” during travel to AP and recognition of “signs/symptoms” and appropriate actions upon return
- Laboratory capacities for rapid diagnosis of MERS-CoV
- Intensified surveillance for severe “respiratory” symptoms with recent travel to AP at ILI/SARI platforms
- Increased attention to “infection control protocols” in referral hospitals

USAID
FROM THE AMERICAN PEOPLE

Emerging Threats Program

H7N9 and MERS-CoV: Their “pandemic potential”

Recent research have offered up the following insights:

H7N9

- The virus can spread by droplets in animal models
- The virus causes extensive infection of surface (epithelial) cells - by comparison, H5N1 infects only some cells
- The virus is particularly efficient in infecting human respiratory tissues and cells on par or exceeding pH1N1

MERS-CoV

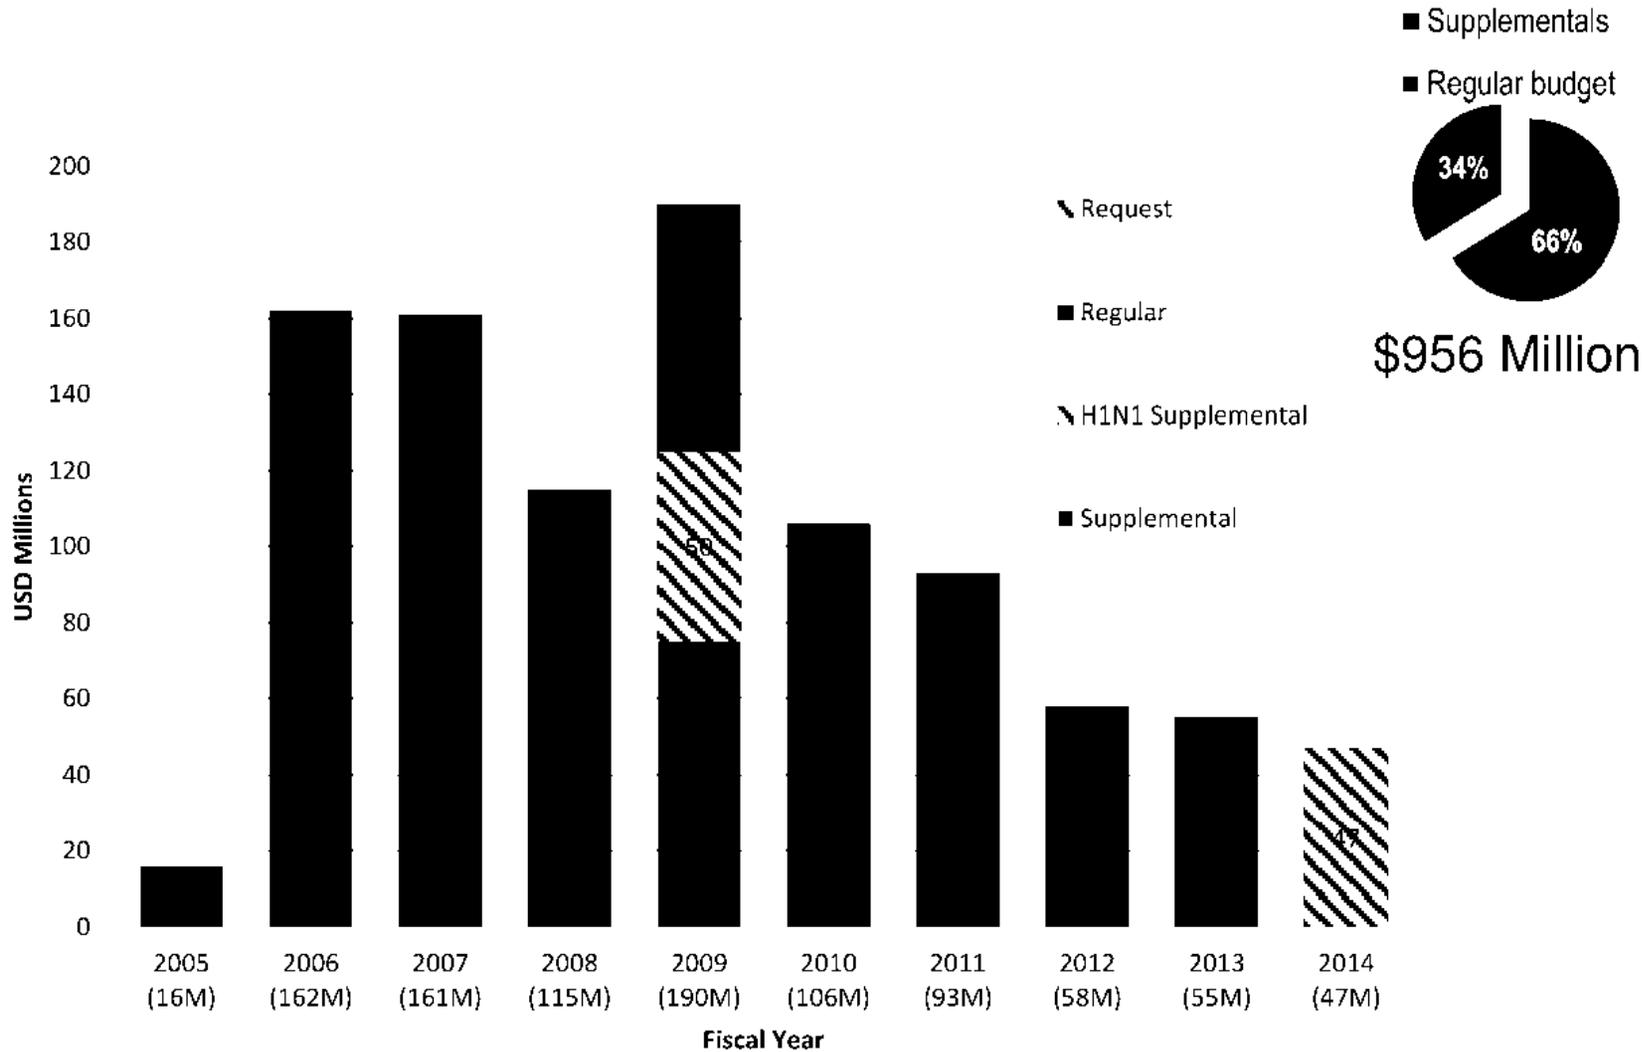

- Less “infectious” than its “cousin” SARS-CoV – this reflected in its “binding receptor” profile
- Current modeling puts R_0 at <1 (little pandemic potential)
- Appears relatively (genetically) stable

Global Health Program Effectiveness Pandemic Influenza and Other Emerging Threats

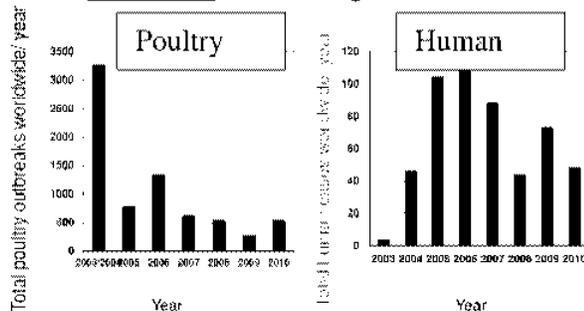

USAID has been a major leader in the global response to the dangers posed by emerging pandemic threats. The dual goal of USAID’s Pandemic Influenza and Other Emerging Threats (PIOET) program is (1). to minimize the global impact of existing pandemic influenza threats, particularly from the H5N1 high path avian flu (HPAI) and the H1N1 2009 pandemic viruses, and (2). pre-empt the emergence and spread of future pandemic threats. The effectiveness of each of the three main areas of focus by the PIOET program: H5N1 Avian Influenza, H1N1 2009 pandemic virus, and Emerging Pandemic Threats are described below

H5N1 Avian Influenza: Since mid-2005, USAID has strengthened the capacities of more than 50 countries for monitoring the spread of HPAI among wild bird populations, domestic poultry, and humans, to mount a rapid and effective containment of the virus when it is found, and to assist countries prepare operational capacities to mount a comprehensive response in the event a pandemic capable virus emerges.

USAID’s efforts have contributed to dramatic downturns in reported poultry outbreaks and human infections, and a dramatic reduction in the number of countries affected. At the peak of its spread in 2006, HPAI had been reported in 53 countries across three continents. As of now the number of countries affected had shrunk to 9; with five of these countries (Indonesia, Vietnam, China, Bangladesh and Egypt) as the primary reservoir of the virus, accounting for more than 95% of all reported outbreaks involving either poultry or humans. The following summarizes this progress:

(1) The overall magnitude of the H5N1 avian pandemic has diminished, with reported numbers of poultry outbreaks and human cases having decreased since their peak in 2006.

.. Reported Poultry Outbreaks and Human Cases Worldwide Decreasing Since 2006

Over the past five years, the total numbers of reported poultry outbreaks and human cases have decreased. In 2006, nearly 1,500 H5N1 outbreaks in poultry were reported, compared to 600 in 2007 and 500 in 2008, with these low levels being maintained up to the beginning of 2011.

Similarly, while more human cases were reported between November 2005 and October 2007 than in the previous three-year period, the number of human cases has been on the decline since as illustrated. In addition, there has been an 81% reduction in human

→ Decrease in total poultry outbreaks and human cases in 2007 and 2008 also apparent peaks in 2006

Sources: OIE, FAO, and WHO

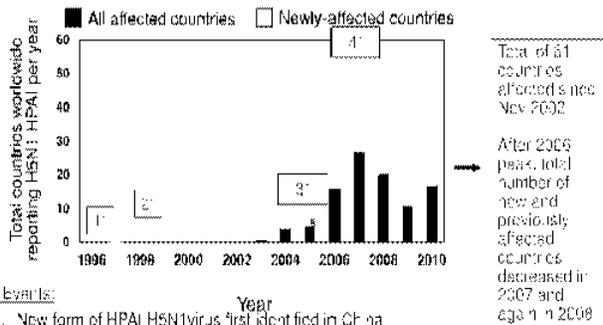

cases during the peak influenza period of November 2010 to February 2011 compared to November 2007 to February 2008.

Progress has been particularly significant in Thailand and Vietnam, two of the most affected countries. Between December 2003 and December 2005, both countries accounted for a total of 3,447 reported H5N1 outbreaks in poultry, or 86% of the global total. After an aggressive package of control measures was introduced in both countries in 2005, total poultry outbreaks between January 2006 and June 2008 fell to 182, with these low levels being maintained through 2010. On the human-health side, results have been equally remarkable. During the same 2003-2005 period, both countries reported 115 human cases, or 78% of the global total. Since 2006, there have been 20 human cases in both countries (through February 2011).

(2) H5N1 appears to have not only stopped spreading to new countries, but there has also been a dramatic contraction of its geographic range.

H5N1 appears largely to have stopped spreading to new countries, at least for now. Between

Number of H5N1 Affected Countries Increased Rapidly Through 2006 then Decreased Since

Events:

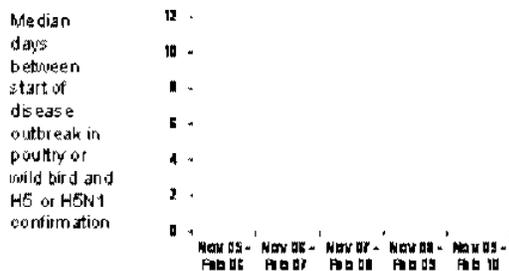

1. New form of HPAI H5N1 virus first identified in China
2. Poultry outbreaks and human cases in Hong Kong; a poultry cull
3. New H5N1 genotype emerges and spreads across Southeast Asia
4. Additional H5N1 genotypes identified in China; clade 2.2 virus spreads to Eurasia, Europe, Near East, Africa, South Asia

Sources: WHO, CDC records through 2009. Each affected country had at least 1 outbreak or case reported to WHO or CDC.

2003 and mid-2005, nine countries in Southeast Asia reported H5N1 outbreaks. Beginning in late 2005, there was an explosive movement of the virus outside of Southeast Asia to Europe, the Middle East, South Asia, and Africa. At the height of the poultry pandemic in 2006, a total of 53 countries had reported outbreaks. By the end of 2010, the number of countries affected shrank to 9, with five of these countries (Bangladesh, China, Egypt, India, and Vietnam) accounting for more than 95% of all reported outbreaks.

(3) Affected countries have strengthened their capacities to identify and respond to future poultry outbreaks.

Comparison of Recent AI Seasons: All Developing Countries Worldwide

Data from WHO and HPAI Reports through 2010. Poultry outbreak data from WHO and CDC reports complete, respectively. China data includes Hong Kong.

USAID has focused on strengthening the capacity of affected countries in three key areas: early identification of H5N1 outbreaks involving the H5N1 virus in both poultry and people, promotion of timely and effective response in containment and elimination of the virus, and education of the general population on the risks associated with avian influenza and steps they can take to protect themselves. These investments have led to improved capacities in early-warning surveillance for HPAI

outbreaks in domestic poultry, wild birds, and humans, have strengthened capacities of veterinary and human health laboratory diagnosis of the H5N1 virus, and have established rapid response teams involving veterinary and public health professionals trained in core principals of field epidemiology. All of these are key capacities that could prove the backbone of any effort to address the larger threats posed by emerging zoonotic diseases. Per the adjacent figure, a comparison of recent AI seasons (November through February) indicates that the average number of days between the start of disease outbreak in poultry or wild birds and H5 or H5N1 confirmation has fallen from in excess of eight days (in November 2005-February 2006) to four days (during the 2009-2010 season). This is a strong indicator that the worldwide response to HPAI outbreaks has dramatically improved.

Although these successes are significant, HPAI remains a serious threat and sustained vigilance is required: it continues to spread in poultry, the mortality rate among infected humans remains above 70%, and with the emergence of the H1N1 pandemic virus the potential exists for a new and more deadly genetic variant to emerge and again spread rapidly across the globe. Over the past year a new genetic variant of the H5N1 virus has spread from China to Vietnam where it has begun to rapidly replace earlier variants. Initial reports indicate that this “new” mutated virus is not susceptible to existing vaccines raising concerns that it will spread more widely among poultry in the coming months; it also suggests that current H5N1 vaccines stockpiled for human use in the event the H5N1 virus becomes an efficient human-human transmitter may be no longer efficacious. Mindful of the need for continued vigilance USAID has focused its efforts over the past year to build on its successes in HPAI and H1N1 and further consolidate our programs in the highest risk countries.

H1N1 Pandemic 2009 virus: In FY 2009 the PIOET programmed a total of \$85 million to address the H1N1 virus. These funds were used to support three lines of H1N1 related work:

- deployment of more than 40 million doses of the H1N1 vaccine and related ancillary materials (syringes, needles etc) to more 60 countries;
- supporting a global laboratory network to monitor impact of the H1N1 virus as it spread around the world, with a special focus on upgrading the surveillance and laboratory capacities of 26 countries in West and Central Africa and Central and South America – where such capacities were previously non-existent; and,
- supporting heightened community-level readiness to mitigate through non-pharmaceutical interventions the effects of the pandemic virus in 28 countries in Africa and Asia through a coalition of the International Federation of Red Cross Societies, UN partners, military authorities, the private sector and NGOs.

Fortunately the H1N1 pandemic virus proved to be less virulent than feared, with limited global consequences. However, USAID’s ability to quickly and effectively mobilize its technical, program and financial resources in support of the H1N1 pandemic response underscores the value of the significant capacities that have been put in place as a consequence of efforts to control of the threat posed by the H5N1 avian influenza virus.

Emerging Pandemic Threats: The on-going threat from recently emerging infections such as H5N1 (avian) influenza , the H1N1 pandemic influenza virus and the earlier threat

posed by severe acute respiratory syndrome (SARS), has raised awareness of the global interdependence of human and economic security and the need for a more systematic effort to identify and respond to sudden global public health emergencies. The speed with which these diseases can surface and spread, as illustrated by the H1N1 pandemic virus, presents serious public health, economic, security and development concerns. Further, it underscores the need for the global community to act pre-emptively and systematically to improve individual countries' abilities to identify and mitigate the severity of health threats arising within their borders. That nearly 75 percent of all new, emerging, or re-emerging diseases affecting humans at the beginning of the 21st century have been documented to have originated in animals (zoonotic diseases) underscores the need for the development of comprehensive disease detection and response capacities that span the traditional domains of animal health, public health, ecology and conservation.

USAID's approach to reducing the threat posed by new emergent diseases is based on a strategic approach that (1) builds on the understanding that the future well-being of humans, animals and the environment are inextricably linked, (2) promotes cross-sectoral coordination that spans the animal health, public health, environmental and conservations communities, (3) targets promotion of those policies and the strengthening of those skills and capacities critical for both minimizing the risk of new disease emergence and the ability to limit their social, economic and public health impact, (4) uses a "risk" based approach to target investments to those places, populations, times and situations where the likelihood of disease emergence is greatest.

USAID's emerging pandemic threats (EPT) strategy is guided by the following assumptions:

- All populations are vulnerable to new diseases emerging in other countries; it is in our collective interest to strengthen the capacity of all high-risk countries to prevent the emergence and spread of these new disease threats.
- Deadly zoonotic disease threats will increase steadily in the coming decades driven by population growth and expanded interactions between people, animals and the environment.
- Measures are currently available that if properly deployed could greatly reduce the risk of new disease emergence and their impact.
- It is possible, in the event of new disease emergence, to minimize its potential economic and public health impact through enhanced surveillance and early deployment of control measures.
- Enhanced coordination across animal, human, conservation, and environmental sectors will contribute to reduced risk of new disease emergence and lead to early and effective control minimizing their impact should they emerge.

USAID's EPT strategy has two overarching goals: the prevention of new zoonotic disease emergence, and the timely and effective control of any disease should it emerge. Towards these

ends USAID's Emerging Pandemic Threats Program addresses those events that occur (1) exclusively within animal populations, wild and domestic, that could facilitate disease emergence, spread and possible amplification; (2) at the "animal-human interface" which enable the transfer of a potential new microbial threat from animals (domestic and wild) to humans; and, (3) exclusively within human populations that could further spread and amplify a novel pathogen resulting in heightened threat to public health. The objectives of USAID's EPT program are:

- **Early discovery of new, emergent disease threats:** The most effective approach for minimizing the risk of new disease threats is to be able to "discover" these new microbial "threats" at their point of emergence, or even better to be able accurately forecast their emergence *before they emerge*. Advances in genomics and informatics allow for investing in longitudinal data-bases that track changes in select microbes for the purpose of developing reliable "predictive" models for pathogen emergence. This capability would allow for the earliest possible introduction of interventions designed to pre-empt the spread of the new pathogen beyond its initial point of emergence.
- **Obtain timely and reliable data on "known" zoonotic threats:** For those pathogens which have already emerged and are "known" to infect humans having the capability to systematically monitor for their spread among populations of animals and humans, and any related genetic and epidemiologic changes, allows for the mobilization of earlier and more timely control interventions.
- **Adoption of effective "biosecurity" measures to minimize the spread of zoonotic pathogens:** The routine application of currently available "biosecurity" measures has been demonstrated to be highly effective in protecting livestock from zoonotic and other animal infections and by extension exposure of humans to possible infection. Even when a new zoonotic disease may emerge in wildlife, if livestock are raised and marketed under proper biosecurity, then the opportunity for the amplification and further spread of the pathogen among animals and to humans will be greatly diminished.
- **Minimize human practices and behaviors that contribute to disease spread across the animal-human interface:** Human behaviors are key to enabling new zoonotic disease threats to cross the animal-human interface. These behaviors or practices may be associated with institutions, such as the those linked with the extractive industry and related encroachment on wildlife domains; they may be more communal and linked how communities rear livestock proximal to wildlife domains; and they may be more of an individual nature, such as those associated with the exposures of hunters to wildlife. Understanding those practices and behaviors and their relative "risk" is a critical step to being able to formulate and implement risk mitigation interventions.
- **Enhanced capacities for effective control of disease outbreaks among animals and humans:** While "risk mitigation" may decrease the frequency with which new diseases emerge, capabilities still need to be in place to be able to identify early and mount timely and effective responses to new outbreaks. This will require broad cross-sectoral investments to strengthen diseases surveillance, laboratory diagnostics, case management, and outbreak response measures.

In implementing its EPT program USAID is guided by the following principles to ensure efficiency and effectiveness:

- Strengthen and leverage key multilateral organizations, global partnerships and private sector engagement that are focused on strengthening the normative capacities across animal and human health sectors in surveillance, training and disease control.
- Work in close coordination and partnership with other efforts by the United States Government, particularly the *Global Health Initiative* and the *Countering Biological Threats Program*
- Focus on those new disease threats that originate in animals and have potential for efficient human infection via either human-to-human or vector-borne transmission.
- Exploit advances in risk-based modeling for forecasting new zoonotic diseases to target interventions to those places, populations, times and situations where risk of disease emergence is greatest.
- Institutionalize a “one health” approach across objectives.
- Contribute directly to those capacities required for the effective implementation of the International Health Regulations
- Increase impact through strategic coordination and integration
- Encourage country ownership and invest in country-led plans

Over the past two years USAID’s EPT program has taken significant steps to adapt the early warning surveillance and response programs built to address HPAI and H1N1 to be able to address the broader dynamic that has given rise to a stream of new and increasingly deadly diseases to develop a global early warning system for emergent pandemic threats. These efforts have focused on four main lines of work: (1) expand our H5N1 monitoring of wild birds to more broadly address the role played by wildlife in facilitating the emergence and spread of other new pathogens; (2) broaden our training partnerships with schools of public health in Africa to include new “One Health” alliances/networks with schools of veterinary medicine, human medicine, and environment in central and east Africa, as well as southeast Asia; (3) enhance our support for animal- and public-health diagnostic laboratories to more fully address a broader array of infectious disease threats; and, (4) broaden ongoing behavior change and communications efforts to prevent H5N1 transmission from poultry to humans to include potential transmission of other emergent wildlife pathogens. The Agency’s focus is on delivering this package in geographic “hotspots” for the emergence of new infectious disease threats originating from animals (the Amazon region, the Congo Basin, the Gangetic Plain, and Southeast Asia).

Update on FY10 supplemental funding for Avian Influenza and other Emerging Threats
May 9, 2011

Summary: The availability of the \$45 million FY10 supplemental funds¹ has enabled USAID to provide uninterrupted program support to: (1) consolidate the gains made controlling the threat posed by the highly pathogenic H5N1 virus over the past five years, (2) monitor for possible mutations involving the H1N1 pandemic virus and the H5N1 avian flu virus, and (3) further enhance country and regional capacities across the Congo basin and SE Asia to address the continuing threats posed by newly emergent infectious diseases of major public importance.

Background: USAID has been a major leader in the global response to the dangers posed by emerging pandemic threats, including highly pathogenic avian influenza (HPAI) and the pandemic 2009-H1N1 virus. Since mid-2005, USAID has strengthened the capacities of more than 50 countries for monitoring the spread of HPAI among wild bird populations, domestic poultry, and humans, to mount a rapid and effective containment of the virus when it is found, and to assist countries prepare operational capacities to mount a comprehensive response in the event a pandemic capable virus emerges.

USAID's efforts have contributed to dramatic downturns in reported poultry outbreaks and human infections, and a dramatic reduction in the number of countries affected. At the peak of its spread in 2006, HPAI had been reported in 53 countries across three continents. As of now, however, the number of countries affected had shrunk to 9; with five of these countries (Indonesia, Vietnam, China, Bangladesh and Egypt) as the primary reservoir of the virus, accounting for more than 90% of all reported outbreaks involving either poultry or humans

Although these successes are significant, HPAI remains a serious threat and sustained vigilance is required: it continues to spread in poultry, the mortality rate among infected humans remains above 70%, and with the emergence of the H1N1 pandemic virus the potential exists for a new and more deadly genetic variant to emerge and again spread rapidly across the globe. Over the past year a new genetic variant of the H5N1 virus has emerged and has begun to rapidly replace earlier variants across SE Asia. Initial reports indicate that this "new" mutated virus is not susceptible to existing vaccines raising concerns that it will spread more widely among poultry in the coming months; it also suggests that current H5N1 vaccines stockpiled for human use in the event the H5N1 virus becomes an efficient human-human transmitter may be no longer efficacious. Mindful of the need for continued vigilance USAID has focused its efforts over the past year to build on its successes in HPAI and H1N1 and further consolidate our programs in the highest risk countries.

¹ NOTE: Consistent with the language of the FY10 Supplemental these funds have been programmed as part of our FY11 OP: "The Committee recommends \$45,000,000 for Global Health and Child Survival, which is \$45,000,000 above the request, for USAID's Avian Influenza and Other Emerging Threats program to minimize the global impact of pandemic influenza, particularly from the H5N1 and H1N1 viruses, and to pre-empt the emergence and spread of future pandemic threats. The Committee notes that the fiscal year 2011 request significantly reduces funding for pandemic preparedness and response and believes such a decrease ignores the continuing threats from such deadly diseases in many geographic regions."

Update: FY 2010 supplemental funding has enabled uninterrupted program support for pandemic prevention in priority “hot spot” regions of and the “highest risk countries” of Indonesia, Bangladesh, Vietnam, China, Pakistan and Egypt. During this time USAID has been able to continue its efforts to adapt the early warning surveillance and response programs built to address HPAI and H1N1 to be able to address the broader dynamic that has given rise to a stream of new and increasingly deadly diseases to develop a **global early warning system for emergent pandemic threats**. This latter effort includes four main lines of work: (1) expand our current H5N1 monitoring of wild birds to more broadly address the role played by wildlife in facilitating the emergence and spread of other new pathogens; (2) enhance support for field epidemiological training of relevant animal and human health teams beyond HPAI and H1N1 to more broadly address the threat posed by other newly emergent zoonotic diseases; (3) enhance our support for animal- and public-health diagnostic laboratories to more fully address a broader array of infectious disease threats; and, (4) broaden ongoing behavior change and communications efforts to prevent H5N1 transmission from poultry to humans to include potential transmission of other emergent wildlife pathogens. The Agency’s focus is on delivering this package in geographic “hotspots” for the emergence of new infectious disease threats originating from animals (the Amazon region, the Congo Basin, the Gangetic Plain, and Southeast Asia)

Program highlights enabled by this funding during FY 11 include:

- Sponsoring a meeting of Vietnamese and Chinese influenza experts to share information and experiences for controlling the H5N1 virus. This exchange is part of a larger effort by USAID to coordinate the control of avian flu among the remaining six endemic countries. Given the emergence of the latest mutant strain of H5N1 maximizing information sharing and coordination of activities is critical.
- Enhanced “risk” mapping across 14 countries in Central Africa and South/Southeast Asia of the geographic and species distribution of targeted pathogens including: monkey pox, Nipah virus, Ebola virus, Marburg virus, simian foamy virus and their genetic “nearest neighbors”. This mapping is allowing for better monitoring and targeting of resources against high risk pandemic threats
- Fostering a network of 14 schools of African public health/medicine and veterinary medicine across eastern and central Africa (Ethiopia, Kenya, Rwanda, Uganda, Tanzania, DR Congo) as part of our larger effort to build enhanced capacities for investigating and controlling disease threats. A similar network is being established in Southeast Asia linking institutions in Vietnam, Thailand, Malaysia and Indonesia
- Laying the groundwork for a technical partnership with Chinese experts to assess the risk posed by the dramatic expansion of Chinese mining and logging operations in the Congo basin of triggering exposures to and spreading of new emergent diseases threats.
- Targeting 32 regional and 32 country public health and veterinary laboratories in Africa and Southeast Asia for enhanced capacities in the diagnosis of “diseases of international importance”.
- Broadening support for the development of “all of society” pandemic preparedness plans in across Africa and Asia. This effort involves linking our congressionally directed pandemic preparedness investments of militaries in Africa and Asia via DOD’s PACOM and AFRICOM and our ongoing support for the development civilian national pandemic preparedness plans.

**The Rising Threat of Zoonotic Diseases
The Use of “Risk-Based” Strategies to Build a Global Early Warning
System for Surveillance and Response
A Strategic Framework for Action**

Dennis Carroll, PhD
Director, Avian Influenza and other Emerging Threats Program
U.S. Agency for International Development

Summary

We are now in an era of new, re-emerging and recurring global health threats that argue for a longer-term, more strategic approach to global health preparedness. The on-going threat from recently emerging infections such as severe acute respiratory syndrome (SARS), H5N1 (avian) influenza and, most recently the H1N1 pandemic influenza has raised awareness of the global interdependence of human and economic security and the need for a more systematic effort to identify and respond to sudden global public health emergencies. The 2005 revision of the International Health Regulations (IHRs) under the auspices of W.H.O. and their entry into force in 2007 signaled a normative shift in the responsibility of states to build their internal capacities to monitor and report emerging disease threats, intended in part to help reduce the risk of inter-state spread of health threats.

The speed with which these diseases can surface and spread, as illustrated by the H1N1 pandemic virus, presents serious public health, economic, security and development concerns. It also underscores the need for the global community to act pre-emptively and systematically to improve individual countries' abilities to identify and mitigate the severity of health threats arising within their borders. That nearly 75 percent of all new, emerging, or re-emerging diseases affecting humans at the beginning of the 21st century have been documented to have originated in animals (zoonotic diseases) underscores the need for the development of comprehensive disease detection and response capacities that span the traditional domains of animal health, public health, ecology and conservation.

Over the past decade, in response to the threats posed by SARS, H5N1 avian influenza, and the H1N1 pandemic influenza virus the United States Government has significantly increased its support in partnership with other nations and institutions to build global capacities related to zoonotic disease emergence, including disease surveillance, detection, diagnosis, reporting, and control, while simultaneously supporting efforts to mitigate the risk of emergence.

This paper is intended to guide future investments by USAID in the development a global surveillance and response capacities to pre-empt or combat new naturally emergent diseases of pandemic potential. With its focus on emerging pandemic threats this *Strategy* is intended to complement and support the United States Government's *Global Health Initiative Strategy*, which is focused on addressing the threats posed by existing international health challenges, such as HIV and malaria, and the *National Strategy for Countering Biological Threats*, which addresses the threats posed by the intentional use of biological agents to cause harm.

Background

The recent emergence of the H1N1 pandemic virus and the earlier emergence of the highly pathogenic avian influenza (HPAI) H5N1 virus in the mid-1990s are part of a broader dynamic that has given rise to a stream of new and increasingly deadly zoonotic diseases (1). Over the past several decades, many previously unknown human infectious diseases have emerged from animal reservoirs, including agents such as human immunodeficiency virus (HIV), Ebola Hemorrhagic Fever virus, Nipah virus, and Hanta virus. In fact, more than three-quarters of new, emerging, or re-emerging human diseases at the beginning of the 21st century have been caused by pathogens originating from animals or animal products (2). These newly emergent threats, such as the Ebola and Marburg outbreaks in Central Africa (3) or the 2003 outbreak of SARS in East Asia (4), frequently appear suddenly and spread quickly, and after a brief time they often disappear almost as quickly as they appeared. Other newly emergent diseases, such as the HIV virus, have emerged less dramatically and have

proven far more robust in their ability to survive and infect over long periods of time.

The convergence of people, animals and the environment has led to a growing consensus among the scientific and public health communities that the emergence of new, deadly zoonotic disease threats will increase steadily in the coming decades (1). As evidenced by the H1N1 pandemic virus and SARS before it, the speed with which these diseases can spread across the globe puts a premium on identification and launch of rapid containment and response as early as possible when new diseases emerge. Driven by these growing concerns public- and animal-health professionals, conservationists and ecologists have recently formulated a new global health paradigm, called "One World One Health" (OWOH) (5), which identifies the future well-being of humans, animals and the environment as inextricably linked.

Multiple factors contribute to the emergence of new zoonotic infectious diseases, particularly the increased interaction between human and animal populations driven by growth in human population, new trends in animal production practices, changing patterns of wildlife populations, human intrusion on new ecosystems, and trans border mobility of humans, animals, food and feed products (1). A wide variety of animal species, both wild and domesticated, can serve as reservoirs for these pathogens. While new global markets have created unprecedented economic opportunities and growth, the health risks of our increasingly interconnected world continue to grow.

Over the past century, notable reminders of just how vulnerable the world is to the growing risk of emerging zoonotic diseases include the 1918 influenza pandemic, which was caused by an influenza virus that initially jumped from birds to humans and killed over 50 million people (6) globally; HIV, which originated as a simian virus and now infects more than 33 million individuals (7); and the more recent threats posed by SARS and the HPAI H5N1 virus. Increasingly, all populations are vulnerable to new diseases emerging in other countries; it is in

our collective interest to strengthen the capacity of all high-risk countries to prevent the emergence and spread of these new disease threats.

Recent studies suggest that in a global pandemic caused by a virus similar to the one that caused the 1918 pandemic, a quarter of the world's population would be infected and between 51-81 million people would die, with the toll in the United States exceeding 400,000 casualties (8). Related studies also forecast that the toll on the world's economy would exceed \$4 trillion and result in a five percent loss of GDP in the United States (9). Even short-lived and geographically focused outbreaks of recent zoonotic diseases have been devastating; SARS in 2003, for example, cost the economies of East Asia an estimated \$50 billion (10). Having in place capacities for early detection of and rapid response to new emergent disease threats will be central to minimizing their potential impact on our social and economic well-being.

Emerging Infectious Diseases and the Threat Posed by "Zoonotics"

Among the 1,461 pathogens recognized to cause diseases in humans, nearly 60% are of animal origin (11). An analysis of the more than 300 infectious diseases that have emerged since 1940 (2), shows that 75% were caused by zoonotic pathogens. Of these new infectious diseases, nearly three-quarters have emerged from a limited number of agents of wildlife origin, with bats (the Corona virus, responsible for SARS, and the Nipah virus), rodents (Hanta virus) and non-human primates (HIV) serving as the most frequently implicated hosts for spread of new infectious agents to humans.

The other major source of zoonotic pathogens, domestic animals, has been shown to account for approximately 20% of all new zoonotic diseases (2). Viral pathogens, especially avian RNA viruses like H1N1 and HPAI H5N1, were the principal pathogens identified. Due to their often high rates of nucleotide substitution, poor mutation error-correction ability, and their higher capacity to adapt to new hosts, including humans, they have proven particularly deadly.

While the emergences of new zoonotic infectious diseases are difficult to forecast, a strong enough pattern has been established to instill confidence that the regular appearance of new infectious diseases or syndromes is virtually inevitable. Recent studies have indicated that the number of new zoonotic diseases has been steadily increasing over the past several decades (12). As such, unless measures are put in place for more effective detection and control of new emerging disease threats, their economic and human toll over the coming decades could prove unprecedented.

“Drivers” of Emergence

Until recently our understanding of the process of diseases emergence has been limited. Advances in understanding the risk factors for their emergence and the environmental factors that drive them, however, has led to the following observations (13): the risk for emergence of new zoonotic agents from wildlife depends largely on three factors, 1) the diversity of wildlife microbes in a region (the “zoonotic pool”); 2) the effects of environmental change on the prevalence of pathogens in wild populations; and 3) the frequency of human and domestic animal contact with wildlife reservoirs of potential zoonoses.

The emergence of a successful zoonotic pathogen such as SARS or HIV requires 3 steps (13). First the pathogen must be successfully transmitted between a wild reservoir and humans or their domestic animals. Several recently emerging zoonoses have achieved this stage without further transmission, e.g. Hendra virus. Second, the pathogen must be directly transmitted between humans. Finally, the pathogen must move from a local epidemic into the global population. Understanding and predicting the global emergence of pathogens require knowledge of the drivers of each of these steps.

Evidence suggests that many pathogens are transmitted between their animal reservoirs and humans but fail to be transmitted efficiently from human-to-human. However, there is some concern that repeated transmission of nonhuman viruses to humans, such as the H5N1 virus, most of which results in no human-to-human transmission, will increase the diversity of viruses and

sequence variants moving into humans (13). This situation, could in turn, increase the probability of transmission of a pathogen that can successfully replicate, and ultimately increase the ability of a human-adapted virus to emerge. Minimizing the opportunity for repeated transmission of nonhuman viruses to humans will be critical to pre-empting the emergence of new zoonotic pathogens.

One example of how wildlife is increasingly a source of new infections comes from the consumption of “bush meat” in sub-Saharan Africa (14). In this region, people are increasingly turning to wild animals to meet their nutritional needs, particularly in the face of growing food insecurity. In the Congo Basin, this trend has fueled an increase in outbreaks of zoonotic diseases such as Ebola Hemorrhagic Fever. Ebola, like the HIV virus that causes AIDS, passes into the human population through contact with blood from infected primates, such as gorillas and chimpanzees, which regularly form part of the bush-meat trade. The consumption of bush meat is particularly acute across west and central Africa where there are still large equatorial forests with up to five million tons of bush meat consumed annually. The multi-billion dollar bush meat industry is a key contributor to local economies throughout the developing world. It is also among the most immediate threats to tropical wildlife.

In contrast, the emergence of zoonotic diseases from domesticated animals is predicted by a combination of animal population density, farming practices, human population density and human population growth. The explosion in poultry produced across Asia since the 1970s has been a key factor in the rapid spread of HPAI virus among domesticated animals in recent years. China typifies the dramatic changes in poultry production. In 1969, an estimated 500 million poultry were being raised in China to feed a population of 750 million. To meet the growing human population, increased household wealth, and a corresponding rise in demand for animal protein, the number of poultry had risen to 15 billion (15) by 2000. In China, this dramatic increase in poultry farming has taken place largely on non-industrial farms following traditional animal husbandry practices, particularly those involving the informal animal-production sector of “backyard farmers”. This sector is largely unregulated and biosecurity is low.

High human and poultry population densities, coupled with the employment of poor farming practices, have proven a lethal combination in facilitating the rapid spread of poultry diseases such as HPAI over the past few years, not only in China but also in other countries and regions with similar profiles. As a consequence, new zoonotic threats of domestic animal origin, such as HPAI and the more recent H9N2 avian influenza virus, have arisen with increasing frequency. Given that the demand for animal-based protein is expected to increase by 50% by 2020 (16), there is a greater risk for past trends to continue, further fueling conditions for increased emergence of new disease threats.

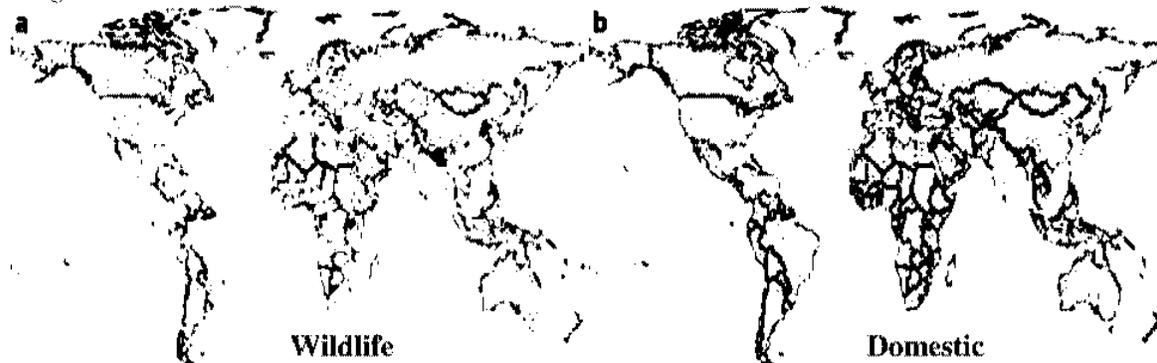

Using Risk-based Forecasting for Early Detection of Rare Events

Even as the risk of new zoonotic diseases is increasing their emergences remain relatively rare events whose occurrences have proven difficult to predict. One of the biggest obstacles to early detection of these diseases is the lack of sufficient, sensitive surveillance capacity geared toward rapid and reliable detection of highly unusual pathogens. Traditional disease-surveillance approaches tend to assume disease risks are relatively homogenous across populations or geographic areas; applying traditional disease surveillance to monitoring for rare events, such as emergent diseases, however, would be exceedingly cost- and infrastructure prohibitive. However, recent advances in the understanding of factors that drive the emergence of zoonotic diseases have led to the development of risk-based models for forecasting new zoonotic diseases, thereby opening opportunities to bring greater focus to emergent-disease surveillance. The origins of newly emergent diseases have been found to strongly correlate with “high risk” geographic areas, animal hosts, microbial agents, and people.

Geographic “Hot Spots”: In a retrospective analysis of outbreaks of new diseases over the past 50 years, zoonotic pathogens (2) from wildlife were found to be most concentrated in lower-latitude regions of tropical Africa, Asia and Latin America, with high risk foci in eastern China, the Gangetic and Indus River plains of the India sub-continent, Congo Basin, and the neighboring Rift Valley regions

of East Africa, the Niger delta of West Africa, and the northwest region of South America (Figure 1a). Wildlife host-species richness was shown to be a significant predictor for the emergence of zoonotic diseases. Significantly, this study showed a substantial risk of wildlife zoonotics originating at lower geographical latitudes where there are very limited surveillance and response capacities.

Figure 1

In this same study, zoonotic pathogens from domestic animals were found to be highly concentrated in eastern China, the Gangetic plain of the India sub-continent, and along the Nile River in Egypt. Not surprisingly, these are the same areas where the HPAI virus is principally concentrated (Figure 1b).

While retrospective studies can provide important insight into the general distribution of past zoonotic “hot spots”, the maps illustrated in figure 1, do not necessarily serve as predictors for where future diseases might emerge. Another study (Figure 2), (17) which used ecologic niche modeling of outbreaks and sporadic cases of filovirus-associated hemorrhagic fever, provides the first large-scale “predictive map” on the most likely geographic and ecologic distributions of Ebola (2a) and Marburg virus (2b). The significance of predictive modeling is that it provides greater insight into where emergent pathogens may be circulating but are undetected; they also highlight geographic areas that may currently be free of a particular pathogen but possess the requisite ecological risk factors to make them highly vulnerable to its introduction. Most importantly, predictive

models allow for more strategic focusing of resources for monitoring for the emergence and spread of zoonotic threats.

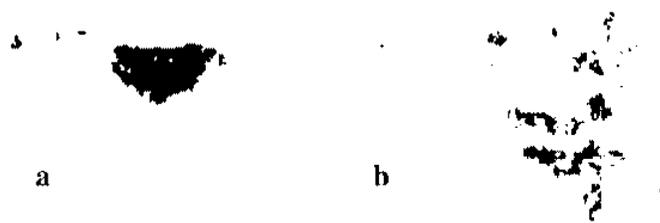

Figure 2

High-risk host species: There are an estimated 50,000 vertebrate species that are potential reservoirs for viruses, bacteria, and other pathogens that could potentially infect humans (18). Very few of these species, however, will ever have the kind of direct or even indirect contact with people or domestic animals that allow for the transfer of animal pathogens to humans, with the “hot spots” representing some of the most remote and least-accessed regions of the earth. Yet, over the past several decades, there has been an almost exponential growth in the frequency of these contacts as new human settlements and roadways increasingly infringe on once-pristine wildlife domains.

The frequency of interaction, therefore, is a critical factor in weighing the risk specific animal hosts pose to transferring potentially dangerous new microbial agents to humans. Animal host-to-human and animal host-to-domestic animal interactions provide ideal circumstances for pathogens that initially affect only animals to evolve first into agents that can cause primary infections in humans through direct animal-to-human contact to agents that can cause limited outbreaks through both human-to-human contact and animal-human contact (19). The numbers of species that have accounted for the majority of past transfers, however, have been limited; rodents have proved highly adaptive in their ability to spread pathogens to humans, such as Hanta virus through their feces and urine. Conversely, bats have infected people with Nipah virus directly through contaminated fecal droppings and indirectly by infecting pigs that are later consumed by humans. In the case of the Ebola and Marburg viruses,

infected non-human primates (which were most likely infected by bats) have been the source of human infections when consumed as bush meat (20).

While other species of wild animals have undoubtedly been involved in either the direct or indirect infection of humans with novel animal pathogens, there is an emerging consensus that it is the limited sub-set of infected wildlife that has frequent interactions with humans that poses the greatest risk for enabling the infection of humans with potentially new and deadly pathogens. This suggests that these “high-risk host species” should be prioritized for monitoring for the emergence and spread of potential microbial threats.

High-Risk microbial agents: Wildlife is a reservoir of an extraordinarily deep and diverse pool of microbial agents. There are an estimated 1 million different viruses, alone, circulating among wildlife of which 99% have yet to be recorded (18). Even considering such overwhelming diversity, the actual numbers of microbial agents that have been reported to infect humans and cause disease are limited. RNA viruses, such as retro-viruses (AIDS) and influenza A viruses (influenza), Corona viruses (SARS), and Filoviruses (Ebola and Marburg) are examples of families of pathogens that have proven capable of human-to-human transmission. As such, families of viruses with demonstrated capacities to infect humans provide a first, but not exclusive, line for focused monitoring and surveillance. By tracking their movement within and among animal species, including domestic animals and humans, and monitoring for key genetic changes can prove a critical tool for an early identification of emergent threats. As illustrated less than ten years ago by the Corona virus, however, new disease threats can emerge from families of viruses that previously have not been known for posing threats to humans. It will be important to monitor other microbes circulating within the “high-risk” animal hosts for their ability to diversify their host range or for changes in their epidemiologic profile.

High-Risk populations: Ultimately, the key event in the transfer of a novel animal pathogen is either direct or indirect exposure of an individual to an infected animal host. Individuals and populations with frequent exposure to wild animals

or their products, such as hunters and related butchers of wild game, bush meat traders and consumers, as well as those whose economic activities lead to incursions in wild life areas, such as loggers, miners and road builders are at particular risk of infection of new microbial threats (21). In addition, domestic animals that live in close proximity to wildlife habitats can act as an intermediary source of infection; for example, the infection of domesticated pigs by bats or the hunting/scavenging of wild game by domesticated dogs. It is likely that monitoring of population settlements where human and domestic animals have high levels of exposure to wild animals will provide the earliest insight into events involving the transfer of a new microbial threat from a wild animal host.

Together, these observations about the relationship between “risk” and geographic “hot spots”, animal hosts, microbial agents, and vulnerable populations demonstrate that the emergence of new zoonotic diseases strongly correlates with socio-economic, environmental, genetic, biological, and ecological factors. Importantly “risk-based” intervention strategies can be used to provide the basis for a highly cost-effective and strategic allocation of resources to preempt or combat the first stages of disease emergence. In effect, risk-based interventions allow the use of knowledge about the heterogeneity of risk to target disease detection to those places, populations, times or situations where risk of disease is greatest and the likelihood of finding it is highest. The result is more efficient use of limited resources in detecting a rare “emergent” event.

A Strategic Approach

Reducing the threat posed by new emergent diseases requires a strategic approach that (1) builds on the understanding that the future well-being of humans, animals and the environment are inextricably linked, (2) promotes cross-sectoral coordination that spans the animal health, public health, environmental and conservations communities, (3) targets promotion of those policies and the strengthening of those skills and capacities critical for both minimizing the risk of new disease emergence and the ability to limit their social, economic and public health impact, (4) uses a “risk” based approach to target

investments to those places, populations, times and situations where the likelihood of disease emergence is greatest.

This *Strategy* provides a framework for future USAID investments intended to reduce both risk of emergence of new diseases of animal origin and their potential economic and human toll. At the heart of this *Strategy* is a recognition that to be effective the USAID cannot be successful on its own and must partner with a range of other USG, multi-lateral, bi-lateral, national, non-governmental, and private sector players. This Strategy is guided by the following assumptions:

- All populations are vulnerable to new diseases emerging in other countries; it is in our collective interest to strengthen the capacity of all high-risk countries to prevent the emergence and spread of these new disease threats.
- Deadly zoonotic disease threats will increase steadily in the coming decades driven by population growth and expanded interactions between people, animals and the environment.
- Measures are currently available that if properly deployed could greatly reduce the risk of new disease emergence and their impact.
- It is possible, in the event of new disease emergence, to minimize its potential economic and public health impact through enhanced surveillance and early deployment of control measures.
- Enhanced coordination across animal, human, conservation, and environmental sectors will contribute to reduced risk of new disease

emergence and lead to early and effective control minimizing their impact should they emerge.

Expected Strategic Results

This *Strategy* has two overarching purposes: the prevention of new zoonotic disease emergence, and the timely and effective control of any disease should it emerge. Towards these ends the *Strategy* addresses those events that occur (1) exclusively within animal populations, wild and domestic, that could facilitate disease emergence, spread and possible amplification; (2) at the “animal-human interface” which enable the transfer of a potential new microbial threat from animals (domestic and wild) to humans; and, (3) exclusively within human populations that could further spread and amplify a novel pathogen resulting in heightened threat to public health. The *Strategy* is particularly focused on:

- **Early discovery of new, emergent disease threats:** The most effective approach for minimizing the risk of new disease threats is to be able to be able to “discover” these new microbial “threats” at their point of emergence, or even better to be able accurately forecast their emergence *before they emerge*. Advances in genomics and informatics allow for investing in longitudinal data-bases that track changes in select microbes for the purpose of developing reliable “predictive” models for pathogen emergence. This capability would allow for the earliest possible introduction of interventions designed to pre-empt the spread of the new pathogen beyond its initial point of emergence.
- **Obtaining timely and reliable data on “known” zoonotic threats:** For those pathogens which have already emerged and are “known” to infect humans having the capability to systematically monitor for their spread among populations of animals and humans, and any related genetic and epidemiologic changes, allows for the mobilization of earlier and more timely control interventions.

- **Adoption of effective “biosecurity” measures to minimize the spread of zoonotic pathogens:** The routine application of currently available “biosecurity” measures has been demonstrated to be highly effective in protecting livestock from zoonotic and other animal infections and by extension exposure of humans to possible infection. Even when a new zoonotic disease may emerge in wildlife, if livestock are raised and marketed under proper biosecurity, then the opportunity for the “spillover”, amplification and further spread of the pathogen among animals and to humans will be greatly diminished.
- **Minimizing human practices and behaviors that contribute to disease spread across the animal-human interface:** Human behaviors are key to enabling new zoonotic disease threats to cross the animal-human interface. These behaviors or practices may be associated with institutions, such as the those linked with the extractive industry and related encroachment on wildlife domains; they may be more communal and linked how communities rear livestock proximal to wildlife domains; and they may be more of an individual nature, such as those associated with the exposures of hunters to wildlife. Understanding those practices and behaviors and their relative “risk” is a critical step to being able to formulate and implement risk mitigation interventions.
- **Enhancing capacities for effective control of disease outbreaks among animals and humans:** While “risk mitigation” may decrease the frequency with which new diseases emerge, capabilities still need to be in place to be able to identify early and mount timely and effective responses to new outbreaks. This will require broad cross-sectoral investments to strengthen diseases surveillance, laboratory diagnostics, case management, and outbreak response measures.

Implementation of the Strategy

In implementing this *Strategy* the USAID will be guided by the following principles:

- Strengthen and leverage investments across USAID, by other USG agencies, key multilateral organizations, global partnerships and private sector engagement that are focused on strengthening the normative capacities across animal and human health sectors in surveillance, training and disease control.
- Work in close coordination and partnership with other efforts by the United States Government, particularly the *Global Health Initiative* and the *Countering Biological Threats Program*
- Focus on those new disease threats that originate in animals and have potential for efficient human infection via either human-to-human or vector-borne transmission.
- Exploit advances in risk-based modeling for forecasting new zoonotic diseases to target interventions to those places, populations, times and situations where risk of disease emergence is greatest.
- Institutionalize a "one health" approach across objectives.
- Contribute directly to those capacities required for the effective implementation of the International Health Regulations
- Increase impact through strategic coordination and integration
- Encourage country ownership and invest in country-led plans

- Build on the USAID's existing H5N1 (avian) influenza control platforms so as to: (1) expand our current monitoring of wild birds for H5N1 to more broadly address the role played by wildlife in facilitating the emergence and spread of new pathogens; (2) enhance support for field epidemiological training of relevant animal and human health teams beyond avian influenza to more broadly address the threat posed by other newly emergent zoonotic diseases; (3) enhance our support for animal- and public-health diagnostic laboratories to more fully address a broader array of infectious disease threats; (4) broaden ongoing behavior change and communications efforts to prevent H5N1 transmission from poultry to humans to include potential transmission of other emergent wildlife pathogens.

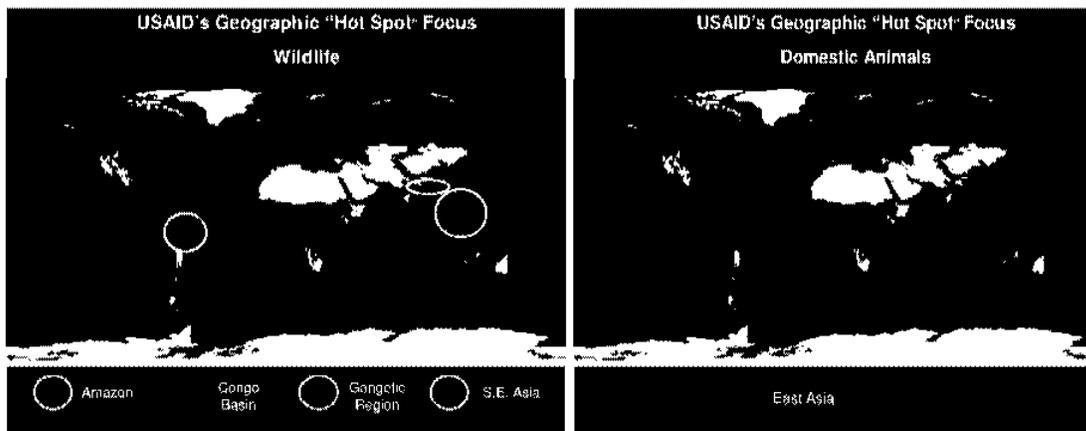

A "Four Part Package" for Control of Emergent Zoonotic Threats: Building on USAID's HPAI Control Platforms

Over the past several years, USAID's Highly Pathogenic Avian Influenza (HPAI) program has focused on building capacities for monitoring the spread of the H5N1 virus among wild bird populations, domestic poultry and humans, and to mount rapid and effective containment of the virus when found. The successes in Africa, Europe and Eurasia and large parts of Asia in containing the spread of the HPAI virus have begun to signal the opportunity to begin rethinking our current exclusive "emergency" focus on the HPAI virus in favor of a transitional strategy to address the broader threats of other emergent diseases of animal origin.

In this section the basis for a comprehensive **emerging pandemic threats program** is described. The program description draws from the strategic framework already described, and uses risk-based modeling to target a package of highly cost-effective surveillance and response interventions. Importantly, this effort builds on USAID's ongoing HPAI control platforms.

To address the rising threat posed by new emergent diseases, USAID will build on its current HPAI portfolio to develop a global early warning system for disease emergence and response that includes four main lines of work: (1) expand our current monitoring of wild birds to more broadly address the role played by wildlife in facilitating the emergence and spread of new pathogens; (2) enhance support for One Health competency training of relevant animal and human health teams beyond HPAI to more broadly address the threat posed by other newly emergent zoonotic diseases; (3) enhance our support for animal- and public-health diagnostic laboratories to more fully address a broader array of infectious disease threats; (4) broaden ongoing behavior change and communications efforts to prevent H5N1 transmission from poultry to humans to include potential transmission of other emergent wildlife pathogens. Using risk-based modeling, our focus will be on delivering this package in geographic “hotspots” for the emergence of new infectious disease threats originating from both wild animals (the Amazon region, the Congo Basin, the Gangetic Plain, and Southeast Asia) and domestic animals (East and Southeast Asia) (Figure 3)).

Figure 3

1. Expanded Risk-Based Surveillance for Emergent Zoonotic Threats: A key part of USAID's HPAI program has been the monitoring of both wild bird populations and domestic poultry for HPAI. These investments have allowed for

the tracking of movement of the virus within communities and among regions and for the formulation of predictive models for where the virus might spread; related outcomes have been key to guiding where investments are made in combating the threat from the HPAI virus. Both streams of monitoring -- in wild birds and domestic poultry -- provide important platforms for an expanded response to the broader threat from emerging zoonotic diseases

a. Monitoring Wildlife: Through the wild bird monitoring program USAID has supported, a global surveillance network involving wildlife conservation groups, governments, and the United Nations (U.N.) has been established in over 34 countries. This network has improved the collection, coordination, and laboratory evaluation of viral samples from wild birds. As a consequence, this program has been instrumental in identifying geographic locations of avian influenza viral strains, characterizing genetic changes in virus isolates, enhancing links with wild bird distribution and migration information, and providing an early-warning system for global spread of the HPAI virus.

In considering the possible emergence and spread of other new zoonotic threats, the trends over the last half-century have clearly indicate that wildlife will be the single largest source of animal pathogens threatening humans. The experience from the avian influenza wildlife surveillance program highlights the benefits of an effective global network for monitoring possible animal pathogens.

Proposed Actions: Modify the scope of our current wild-bird surveillance program to include the monitoring for the emergence of new infectious diseases in high-risk wildlife (e.g. bats, rodents, and non-human primates) that could pose a major threat to human health. Particular focus would be placed on establishing an enhanced wildlife monitoring capacity in those geographic "hotspots" that pose a particular risk for the emergence of new infectious disease threats. The monitoring would include wildlife in their natural habitats, market trade of wildlife, wildlife products and foods, including characterizing the risks associated with "bush meat".

b. Monitoring Domestic Animals: In the case of the HPAI virus, domestic poultry have proven to be the major reservoir for the virus and the primary source of infections in humans. Working closely with the U.N.'s Food and Agricultural Organization (FAO), the World Health Organization, and with host-country ministries of agriculture and health, USAID has invested significantly in strengthening veterinary and public health capacities, including laboratory diagnostic capacities, to monitor for HPAI in domestic poultry. These efforts have contributed to a dramatic increase in the early detection of the virus and the mobilization of a rapid containment response – two factors which have proven key to achieving the successful reductions in the numbers of poultry and humans reported to have been infected with the virus over the past year. The threat posed by the H5N1 is not unique. Poultry and other domestic animals, such as pigs, have proven to be a significant source of new zoonotic diseases, particularly other influenza viral threats. Figure 1b shows that the emergent zoonotic pathogens from domestic animals have been highly concentrated in eastern China, the Gangetic Plain of the India sub-continent, and along the Nile River in Egypt. Not surprisingly, these are the same areas where the HPAI virus is principally concentrated and are the locations of the highest concentrations of domestic animals in the world.

Proposed Actions: Modify the scope of our current programs with FAO, WHO and national governments supporting veterinary and public-health teams monitoring suspect H5N1 outbreaks to be able to address the broader threat posed by other novel emergent pathogens. Particular focus would be brought to geographic “hot spots” areas of East and Southeast Asia for newly emergent threats arising from domestic animals. For example, in the past decade the RNA virus H9N2 (a close relation of the HPAI H5N1 virus) has been evolving and acquiring characteristics that raise concerns it may become more transmissible among humans – and as such a candidate for unleashing a global influenza pandemic. Emphasis would be placed on training veterinary and public health surveillance teams to recognize signs and symptoms indicative of novel disease threats including and beyond H5N1.

Expected Results: As a consequence of an expanded program for monitoring wildlife and domestic animals, it is expected that at the end of five years:

- Identification and characterization of “high-risk” animal hosts and microbial agents
- Identification of “high-risk” human populations and characterization of their “risky” behaviors
- Characterization and mapping of market trade of wild animals and animal products
- Refined predictive models allowing for an early determination of which animal hosts and emergent pathogens from wildlife and domestic animals might pose a new and deadly threat to humans
- Enhanced networks of early-warning surveillance in up to 12 “hot spot” countries in the greater Congo Basin of Central Africa, eight countries in Asia, and five countries in the Amazon region of South America covering animal wildlife, domestic animals, and humans would be able to detect quickly the emergence of any new infectious diseases from animal reservoirs that could pose a significant risk to humans.
- Use these predictions to more strategically focus efforts to prevent the possible emergence of a new and deadly pathogens and contain its spread should it emerge,

2. Enhanced Capacity for Outbreak Investigation and Response: Much of the recent success in controlling HPAI can be attributed to dramatic improvements in the capacities of national programs to mount rapid and highly targeted responses to confirmed outbreaks of the virus in both animals and humans. The spread of the HPAI virus in 2005 and 2006 across large parts of the world where disease surveillance and response capacities were severely lacking put a premium on ramping up the training of cohorts of veterinary and public-health workers in correct methods for the collection and analysis of outbreak data and their use in mounting a rapid and effective response. Over the past two years, significant investments have been made in “high- priority HPAI” countries across Africa, Asia, and the Middle East in dramatically expanding these capacities. New

training programs in field epidemiology developed in concert with a coalition of U.S. and developing country schools of public health have been established, and expanded support for their field operations has given rise to new capacities in disease outbreak investigation and response. These new training and field operations platforms, while initially conceived to respond to the immediate threat posed by the spread of the HPAI virus, could if broadened to more fully embrace meeting the needs of a comprehensive One Health competencies could prove the backbone for mounting an effective response to the emergence and spread of any of the new emergent zoonotic threats.

Proposed Actions: Modify the scope of the current investments made in partnership with academic institutions, the U.N. system, development partners, and other U.S. government (USG) agencies to include expanded One Health related training and provision of field operations support. The training strategies would focus on providing a combination of long in-depth courses related to One Health competencies to senior leadership from ministries responsible for health, agriculture, and wildlife and short-courses targeting provincial and district veterinary and human-health teams for training in the core principles of disease outbreak investigation and response. Linked to this training would be investments in upgrading the capacities of veterinary and human-health laboratories in related diagnostic capacities. The geographic scope of this expanded effort would be directed to those zoonotic “hotspots” of wildlife and domestic animal origins illustrated in figures 1a and 1b. Particular priority would be given to areas where there is strong geographic overlap involving the risk posed by the HPAI virus.

Expected Results: The expected results from these investments after five years would be:

- A network of academic institutions spanning the targeted “hotspot” countries with programs supporting One Health curriculum providing advance degrees to mid- and senior-level public health, veterinary health and wildlife professionals
- Enhanced ability to isolate and contain the onset of a confirmed outbreak of new and/or existing pathogens in up to 12 “hot spot” countries in the

greater Congo Basin of Central Africa, eight countries in Asia, and five countries in the Amazon region of South America

- Expanded capacity of central-level leadership in up to 12 countries in the greater Congo Basin of Central Africa, eight countries in Asia, and five countries in the Amazon region of South America to plan, strategize, and execute effective programs in disease surveillance, outbreak investigation, and response
- Enhanced capacities of provincial and district-level teams in up to 12 “hot spot” countries in the greater Congo Basin of Central Africa, eight countries in Asia, and five countries in the Amazon region of South America to monitor early for introduction or spread of new disease pathogens and to quickly and effectively mount appropriate outbreak investigations and response actions.
- Enhanced capability to predict which newly emergent animal pathogens might pose a new and deadly threat to humans,
- Increased readiness of global/national communities to respond to both the health and non-health aspects of a pandemic should a novel and deadly pathogen emerges and spread across the world.

3. Enhanced Regional Networks of Integrated Animal and Public Health

Diagnostic Laboratories: Central to the successes recorded in HPAI control has been the dramatic decrease in the time between onset of HPAI outbreaks and their confirmation. The ability to quickly confirm the cause of an outbreak has enabled increasingly rapid and highly targeted responses. USAID’s HPAI strategy has been to direct its investments to lead to the quickest upgrade in confirmation capacities, from supporting the use of rapid diagnostics for field confirmation of H5 to upgrading laboratories with full H5N1 confirmation capacities. In considering the challenge of “pre-empting or combating the first stages of a zoonotic disease emergence – at its source”, rapid characterization of suspected emergent diseases among animals and people will be key. There is a substantial risk of wildlife zoonotics originating in the very regions of the world where surveillance, and in particular laboratory, capacities are weakest; as noted

earlier, the emergence of a new disease is inherently a rare event. To build a network of diagnostic laboratories in these resource-poor regions of the world that would focus on monitoring for rare emergent diseases, however, would be both cost- and infrastructure-prohibitive. Additionally prohibitive would be to invest separately in animal- and human-health laboratories. An alternative and more sustainable approach would be to build integrated networks of animal- and human-health laboratories in the each of the targeted “hot spots” that would be fully capable of diagnosing what the International Health Regulations refer to as “notifiable diseases” – those most common causes of animal and human infections in each region – and, when faced with a “un-diagnosable” agent, would be responsible to transferring it quickly to international reference laboratories for further characterization.

Proposed Actions: Modify the scope of our current agreements with WHO, FAO/ the World Organization for Animal Health (OIE) and key USG partners to develop enhanced regional networks in each of the targeted “hot spots” of integrated animal- and public-health diagnostic laboratories. A critical step in this effort will identification by WHO, FAO and OIE of candidate laboratories spanning the animal- and human-health sectors in each of the “hot spot” regions that would serve as the platform for these integrated diagnostic networks.

Expected Results: The expected results from these investments after five years would be:

- Integrated networks of veterinary and human-health laboratories covering the “hot spots” serving up to 12 countries in the greater Congo Basin of Central Africa, eight countries in Asia, and five countries the Amazon region of South America are in place
- These laboratory networks are fully capable of rapidly diagnosing and reporting on IHR/ “notifiable diseases” for animal and human diseases
- An international reference laboratory network is in place for full characterization of “un-diagnosable” agents

4. Enhanced Capacity in Prevention of Emergent Disease Transmission: A critical part of USAID's HPAI program has been the use of behavioral change/communication strategies for the dual purpose of identifying behaviors and/or practices that increase the risk of H5N1 infection of either poultry or people and the use of communications and public outreach activities to generate public awareness and promote behaviors that help reduce risk for disease transmission. Working closely with U.N. partners (UNICEF, FAO, WHO), national governments, community groups, non-governmental organizations and the private sector, USAID has made significant investments in strengthening the behavioral change/communications capacities in more than 54 HPAI affected or at-risk countries. These efforts have contributed to a dramatic increase in awareness of risks and adoption of new "safe" practices by poultry farmers, market vendors, and consumers that have directly contributed to dramatic reductions in the spread of the HPAI virus. Public awareness campaigns targeting journalists, as well as community and political leaders, have proven instrumental in the adoption of new policies and regulations for the prevention of HPAI.

In considering the nature of the threat posed by other zoonotic diseases, both those originating among domestic and wild animals, the behaviors of and practices of farmers, traders and consumers will prove critical to enabling the transmission of novel agents among animals and potentially people. Characterizing those "risky" behaviors and promotion of their change, however, will need to be understood in the context that infection by novel agents will be inherently "rare" events. Traditionally, behavior change/communications strategies have been formulated to address public-health issues and are generally understood to be relatively common occurrences; they include promotion of the benefits of hand washing to avoid enteric diseases, immunization for common childhood illness, and family planning. Our experience with HPAI, however, has underscored that traditional approaches toward promoting behavior change are not effective for what are "rare" epidemiological events. As a result, novel communication strategies that are specifically tailored

to address rare and highly infrequent events, such as the emergence of a new disease, will need to be developed.

Proposed Actions: Modify the scope of our HPAI behavior change/communications program to address other disease threats of animal origin, including supporting efforts to characterize "high-risk" practices that increase the potential for new disease threats from wildlife or wildlife products to spread and infect people; identify high-risk groups that need to be targeted for communication/behavior change messages; and formulate behavior change/communication strategies and interventions that are consistent with meeting the challenges posed by "rare" events, such as the emergence of a new infectious disease.

Expected Results: The expected results from these investments after five years would be:

- A field validated communication/behavior change strategic approach for "rare" infectious disease events
- Characterization of "high-risk" practices that enable transmission of novel pathogens from animal hosts to people, and among people
- Identification of "high-risk" groups that are particularly vulnerable to being exposed to and infected by novel pathogens from animal hosts
- Field validation of effective communication/behavior change interventions that reduce the risk of human infection by novel pathogens of animal origin
- Elevated awareness among the general public and policy makers on risks and appropriate actions needed to minimize human infection by novel pathogens of animal origin.

Vietnam	

1st Interim

USAID FOIA No. F-00151-16

	"Hyper-Endemic"		Endemic		Epidemic-prone		Previously-affected, but contained		Never Affected
Locations with most H5N1 HPAI disease within endemic countries since Jan 2007		H5N1 HPAI detected in >10 months since Jan 2009		H5N1 HPAI detected in 1-10 months since Jan 2009		H5N1 HPAI detected between 2003-2008, but not since Jan 2009		No H5N1 HPAI detected	

68

Sources = OIE, WHO, FAO reports and viral sequence submissions through 2/8/11

Number of H5N1 Affected Countries by Year

Total countries worldwide reporting H5N1 HPAI per year

Total of 62 countries affected since Nov 2003

After 2006 peak, annual total of affected countries generally decreased over time

→ Only a few new countries have been affected since 2008

Of the 19 countries with bird outbreaks in 2009 -2011, five are endemic* and eleven** are near endemic countries

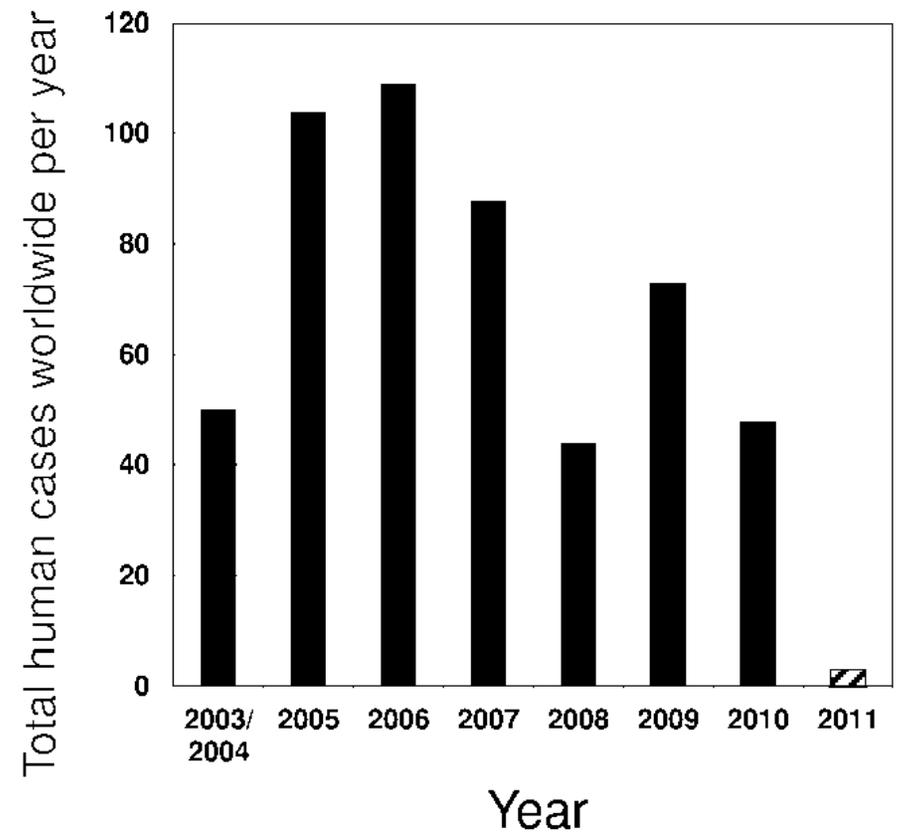

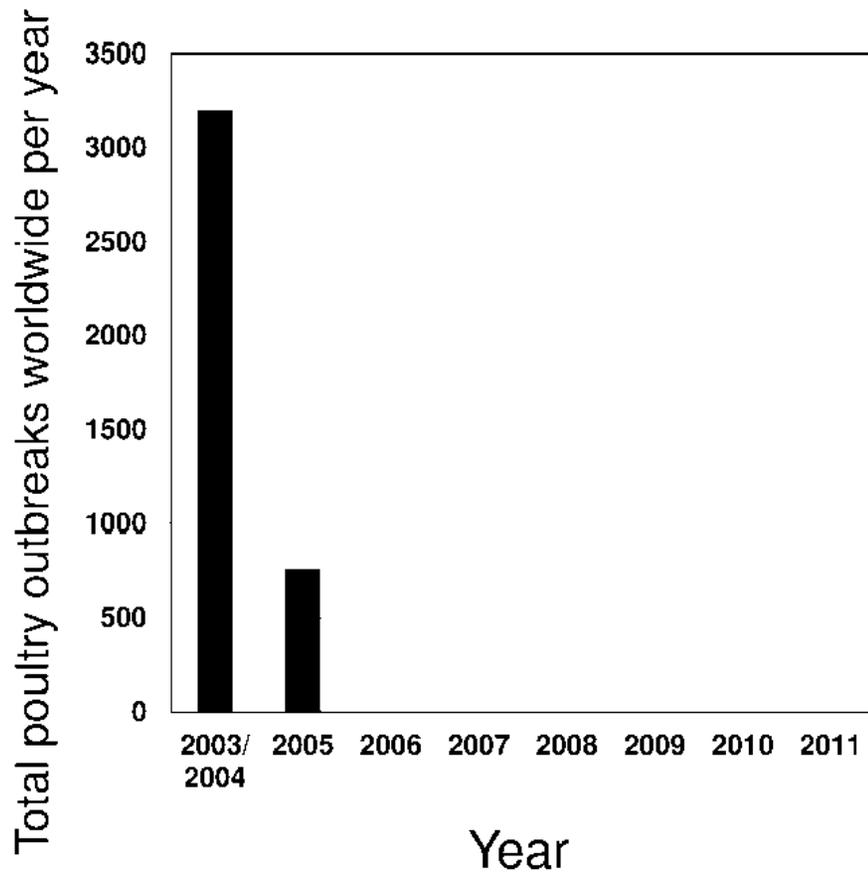

* Bangladesh, China, Egypt, Indonesia, Vietnam; ** Bhutan, Burma, Cambodia, India, Israel, Japan, Laos, Mongolia, Nepal, Russia, S. Korea

Sources: WHO, OIE, FAO reports through 2/8/11. Each affected country had at least 1 outbreak or case in poultry, wild birds, or humans. Number in box indicates total number of affected countries during that year.

Reported Poultry Outbreaks and Human Cases Worldwide

1st Interim

Note: a decrease in reported outbreaks/cases may not equal a decrease in actual outbreaks/cases

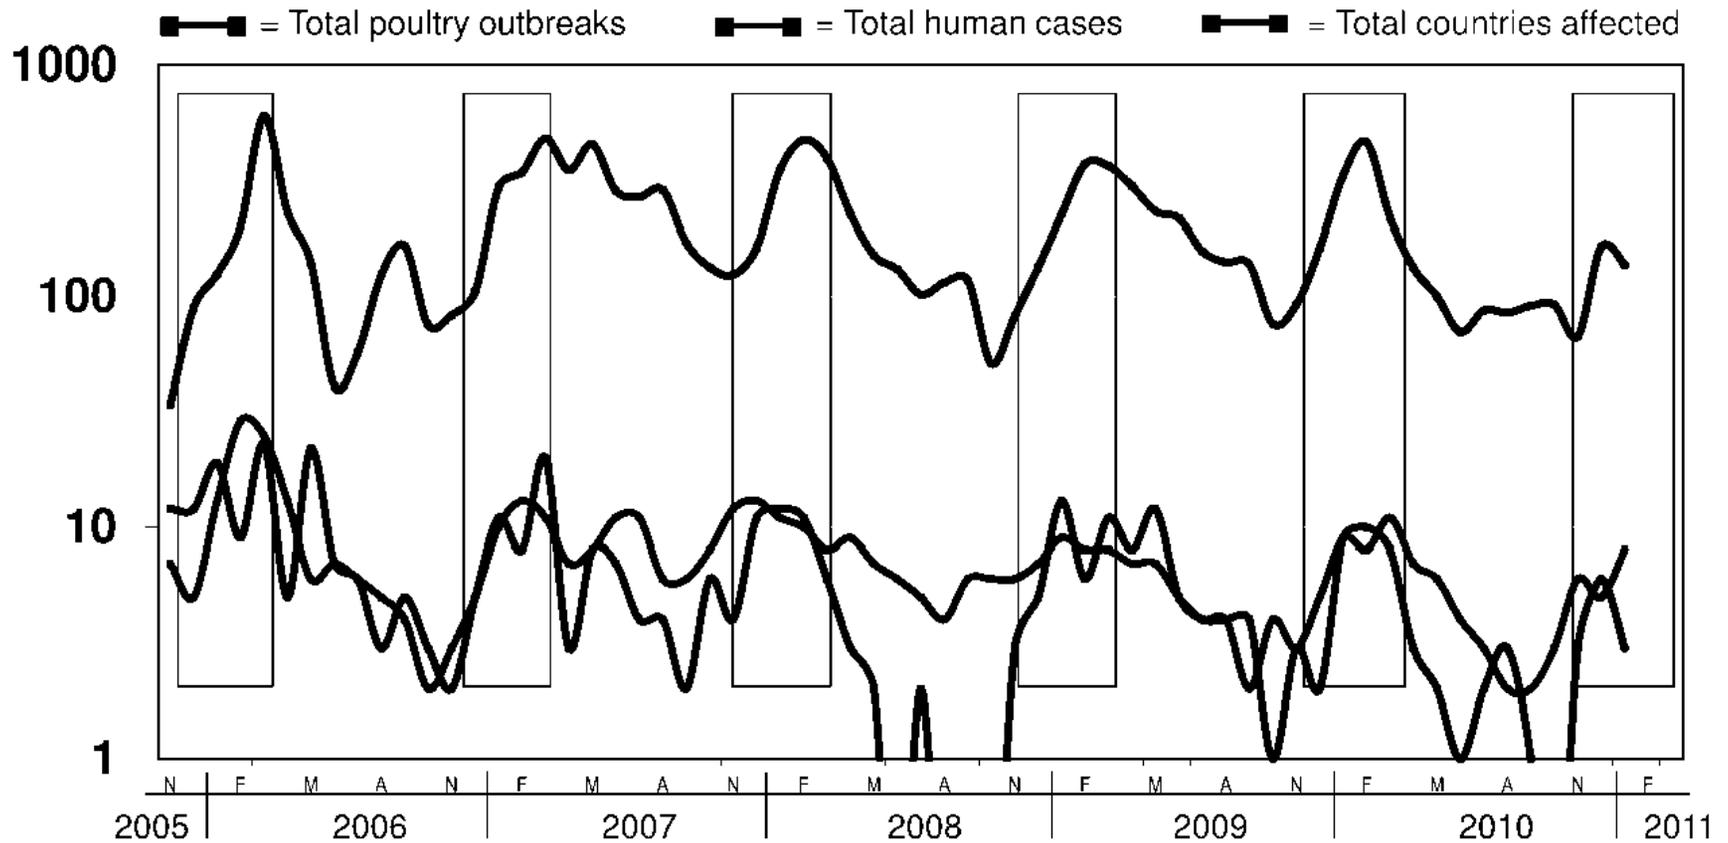

USAID FOIA No. F-00151-16

→ General decrease in poultry outbreaks & human cases since 2006-2007 peaks
 → Poultry outbreak and human case data since 2006 dominated by Indonesia and Egypt which together account for 86% of poultry outbreaks and 75% of human cases (2006-11)

70

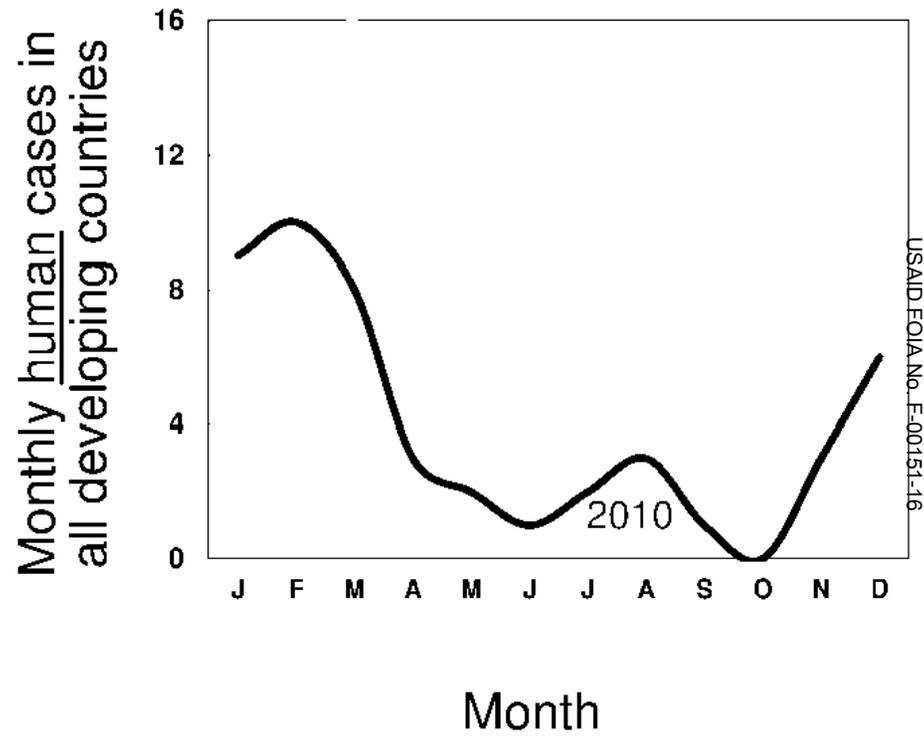

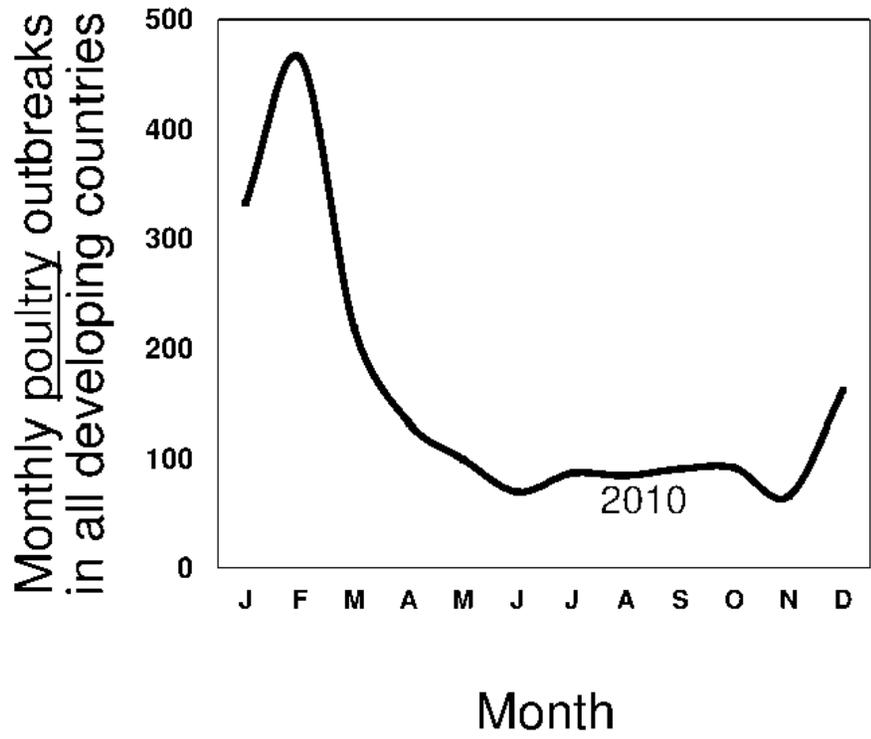

H5N1 Poultry Outbreaks, Human Cases, and Affected Countries by Month

Total monthly H5N1 poultry outbreaks, human cases, and countries affected worldwide

→ Monthly poultry outbreaks, human cases, and affected countries tend to peak around Dec to Mar each year providing an opportunity to concentrate interventions
 → Intensity of peaks for monthly poultry outbreaks, human cases, and affected countries gradually decreasing over time?

Comparison of H5N1 Poultry Outbreaks and Human Cases in 2010 with Previous Years

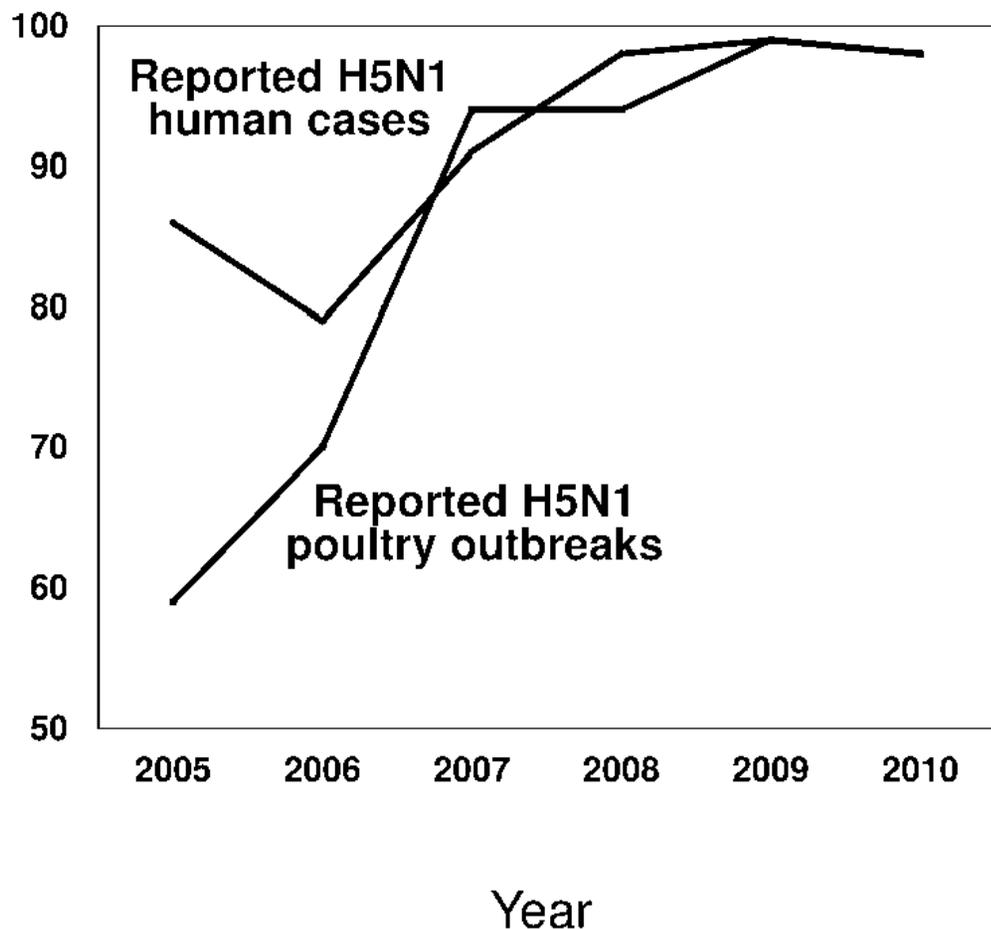

→ Compared to previous years, number of reported H5N1 poultry outbreaks and human cases in 2010 is generally about or below the monthly median

Sources: OIE, WHO, FAO (Egypt and Indonesia) from Nov 2005 through 2/7/11.

H5N1 Disease Burden Increasingly Concentrated in 5 Countries

Percent of the world's annual total due to 5 highly-affected countries*

Over time, H5N1 disease has become increasingly concentrated in 5 highly-affected countries*

This is likely due to:

- Favorable conditions (e.g. large poultry populations) in the 5 highly-affected countries that allow for continuous transmission of the virus
- Unfavorable conditions in all other countries so that continuous viral transmission is not possible

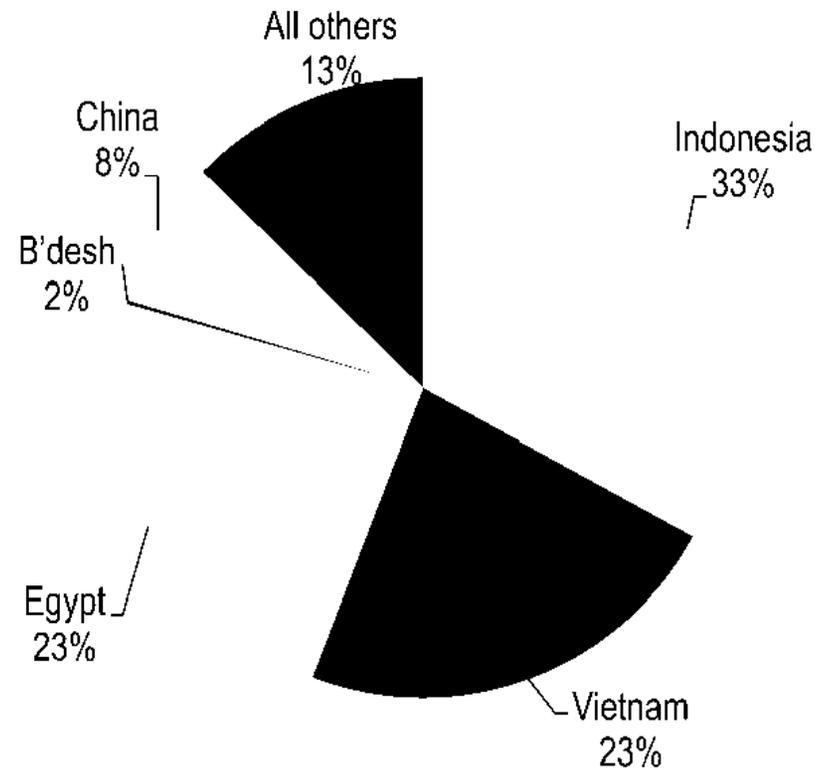

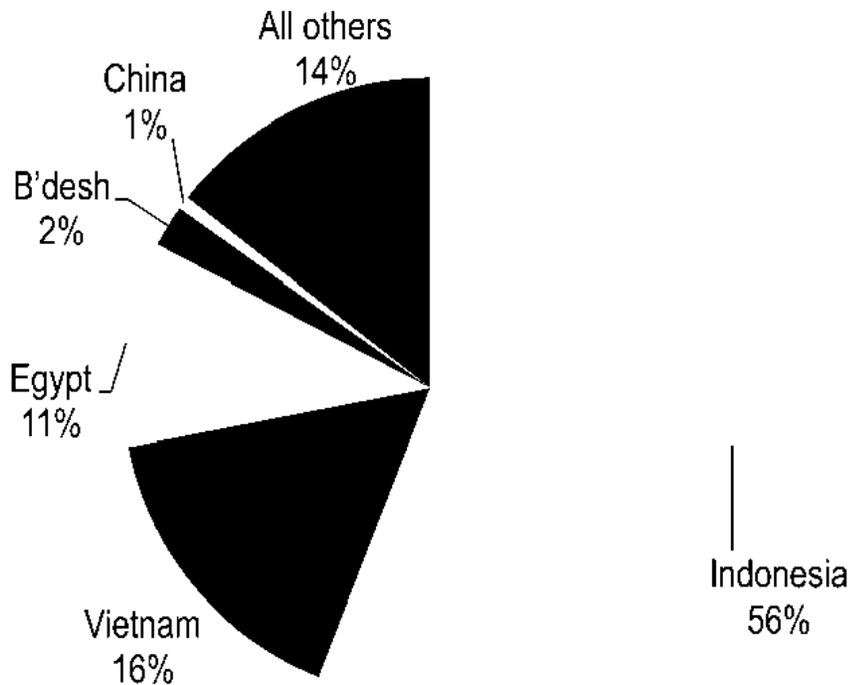

In 2009-2010, these 5 countries accounted for at least 98% of H5N1 poultry outbreaks and human cases

Based on OIE, FAO, and WHO reports between January 2005 and January 2011. * 5 highly-affected countries = Bangladesh, China, Egypt, Indonesia, Vietnam.

Distribution of H5N1 Disease Burden by Country

**Total poultry outbreaks
(2003-2011) = 16,142**

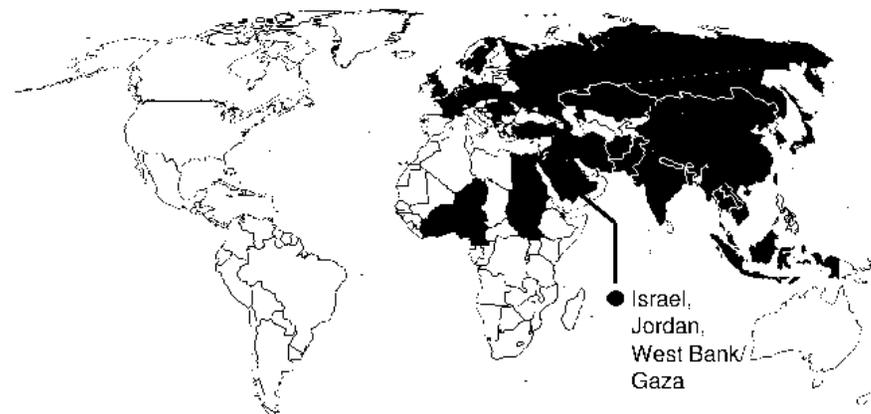

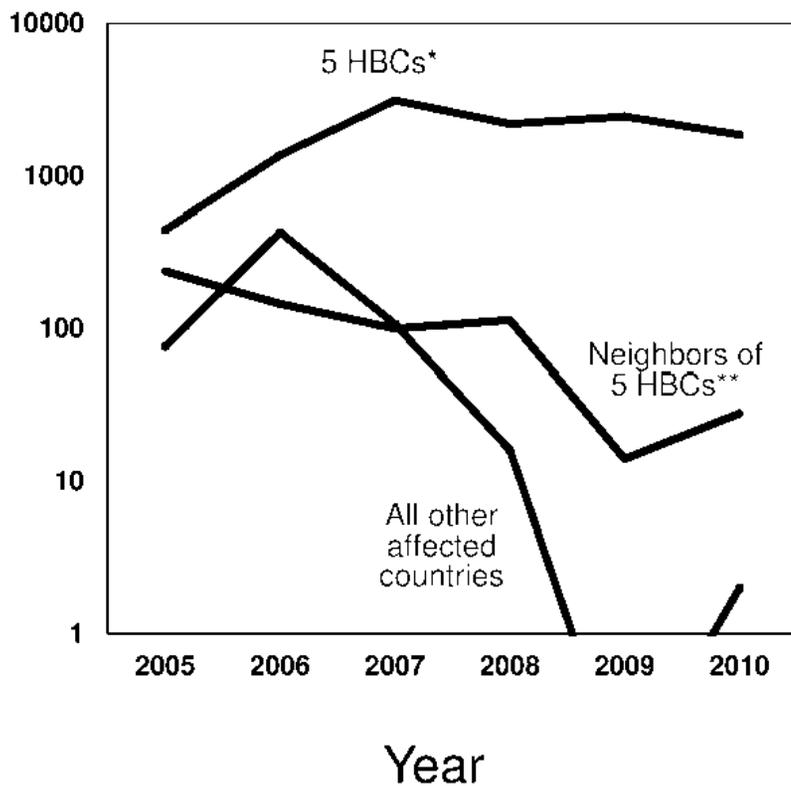

**Total human cases
(2003-2011) = 519**

Sources: OIE , FAO, and WHO reports between November 2003 and January 2011.

Neighbors of 5 Highly-Affected Countries Also at Risk for H5N1 Infections

Total number of H5N1 poultry outbreaks per year

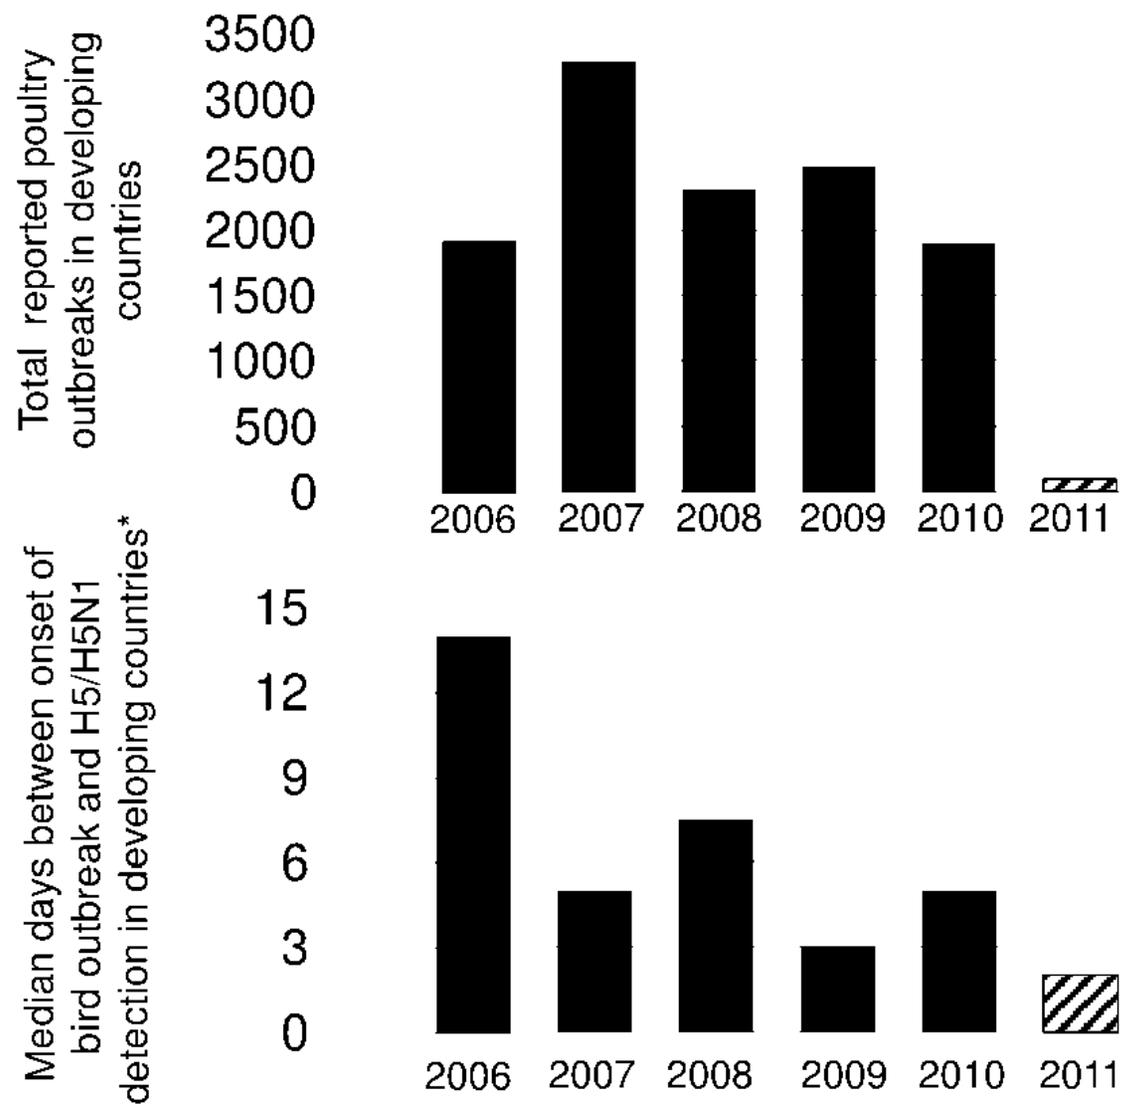

- = High-burden countries
- = Neighbors of high-burden countries that have also detected H5N1
- = All other H5N1-affected countries

→ Of countries that are not H5N1-endemic (i.e. no sustained circulation of the virus), greatest number of poultry outbreaks is in countries *proximal* to the 5 high-burden countries.

→ Virological data suggests that periodic outbreaks in countries proximal to the 5 high-burden countries are often due to re-importation of the virus from endemic countries.

Based on OIE, FAO, WHO reports between January 2005 and January 2011. * 5 high-burden countries = Bangladesh, China, Egypt, Indonesia, Vietnam. ** Includes: Afghanistan, Bhutan, Burma, Cambodia, India, Israel, Japan, Jordan, Kazakhstan, Kuwait, Laos, Malaysia, Mongolia, Nepal, Pakistan, Russia, Saudi Arabia, South Korea, Sudan, Thailand, West Bank/Gaza.

Association between Faster Detection and Reduced Poultry Outbreaks Over Time

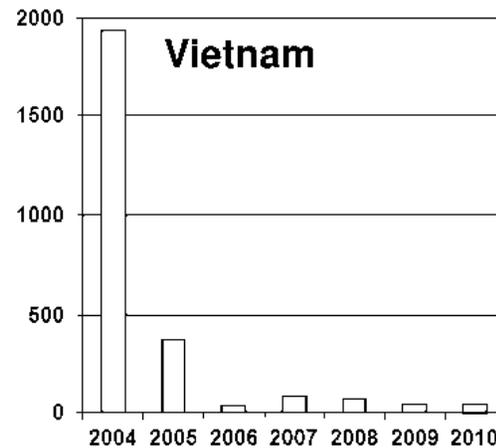

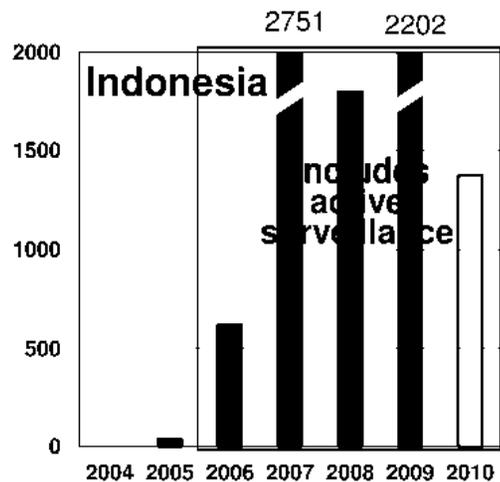

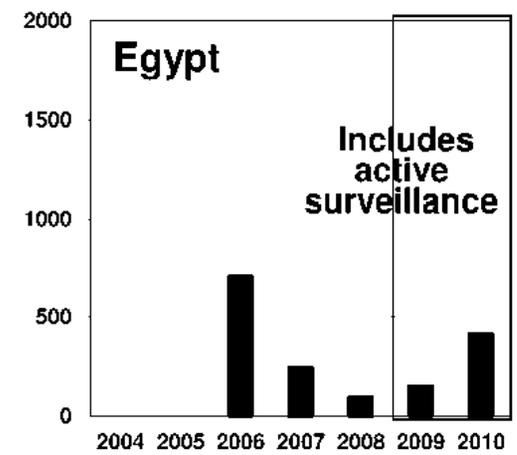

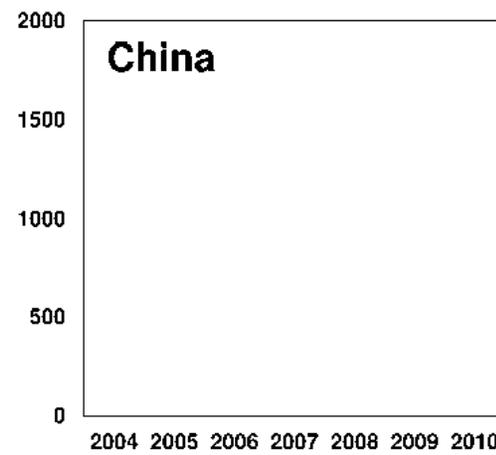

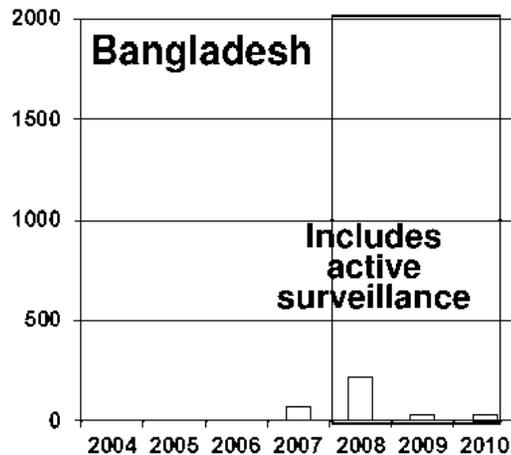

General decrease in number of poultry outbreaks in developing countries is associated with a general decrease in H5N1 detection time

Faster detection time allows for faster containment measures which limits H5N1 spread

Sources: OIE and FAO reports (Egypt, Indonesia) through 2/8/11. * Only ~6% of reported outbreaks have data on detection time.
 [Hatched Box] , [Hatched Box] = partial 2011 data

Some Highly-Affected Countries Have Reduced Reported Poultry Outbreaks Over Time

Number of poultry outbreaks per year per country

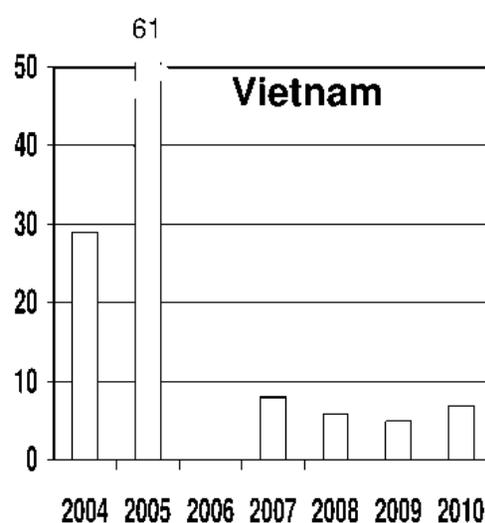

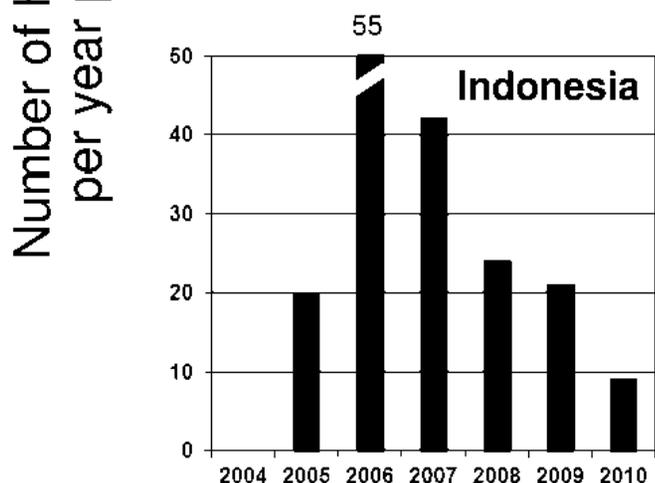

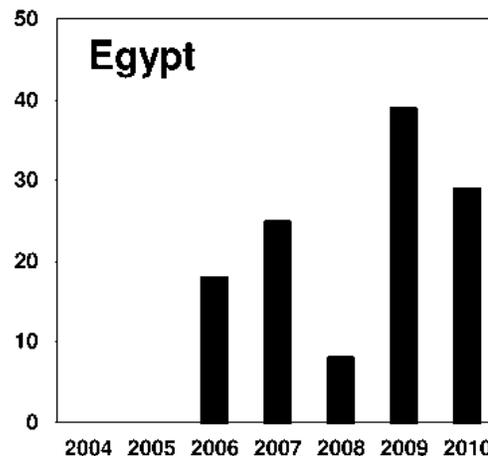

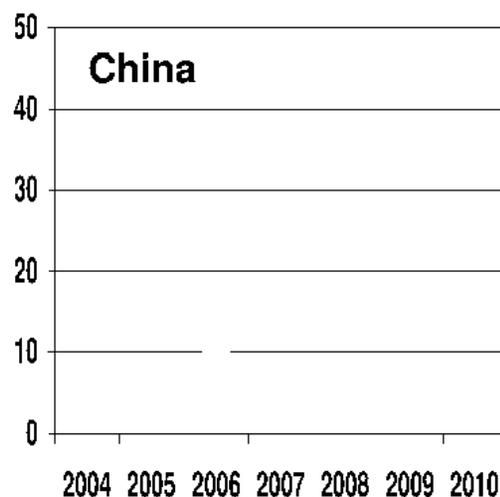

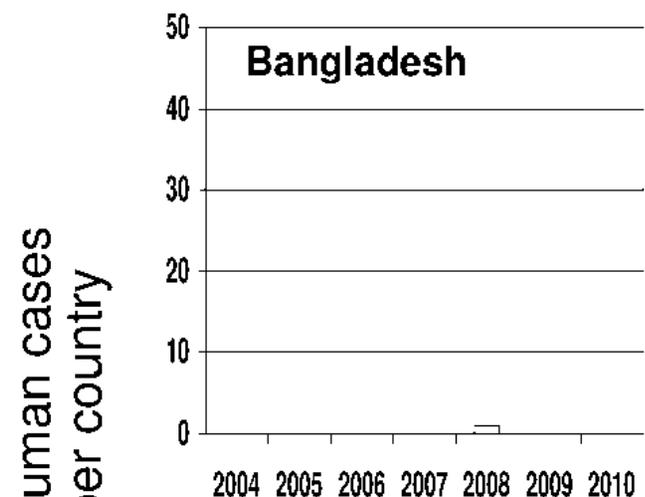

→ Bangladesh, China, and Vietnam have reduced reported poultry outbreaks over time and maintained low levels

→ Indonesia appears to have a decreasing trend

→ Egypt's increases in 2009-2010 may be due to active surveillance

Some Highly-Affected Countries Also Have Reduced Reported Human Cases Over Time

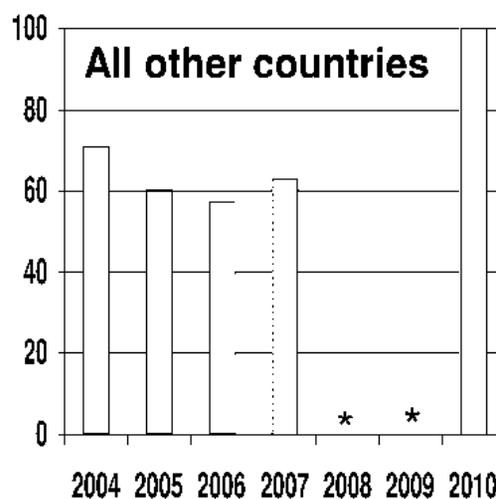

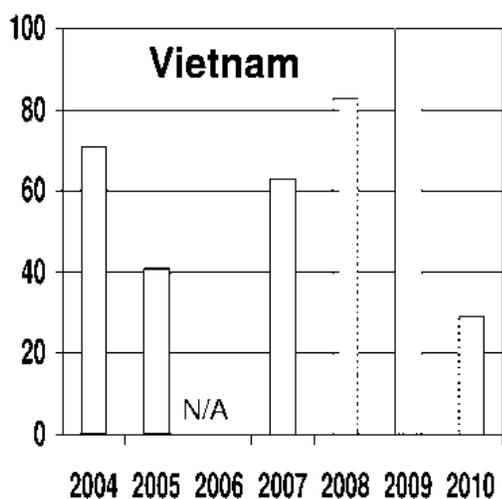

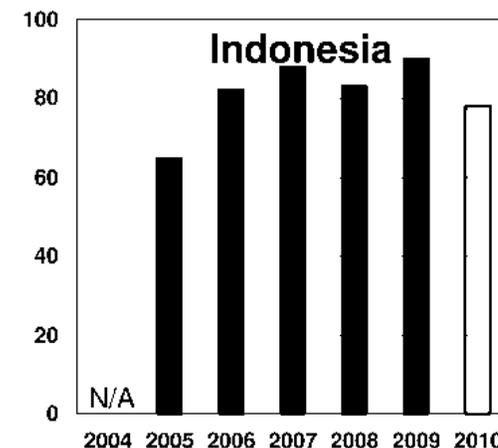

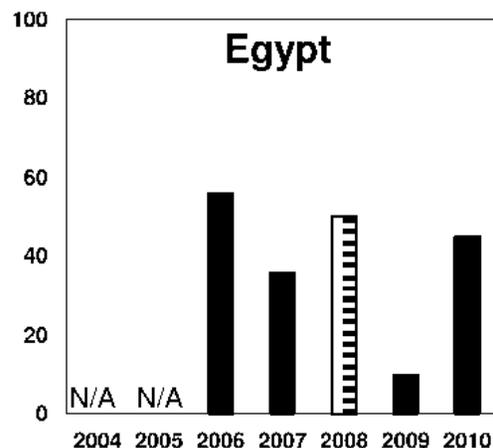

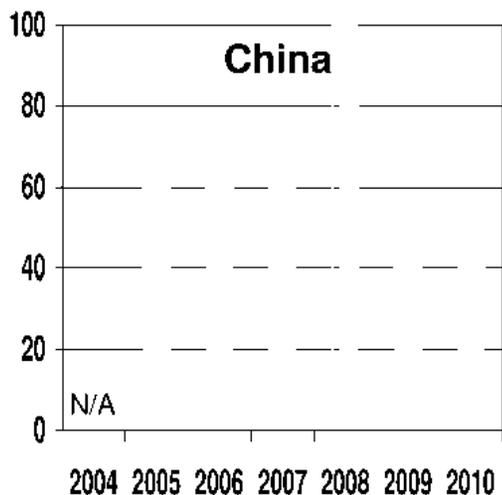

→ China and Vietnam have reduced reported human cases over time and maintained low levels

→ Indonesia has had a decrease in reported cases since 2006

→ Trend in Egypt not clear yet

Most Countries Have Not Lowered Human Case Fatality Rate

Average human fatality rate per year per country

→ In most countries, human fatality rate remains stable at about 60% or higher

→ Egypt lowered fatality rate to 10% in 2009; however higher in 2010 which is similar to other years

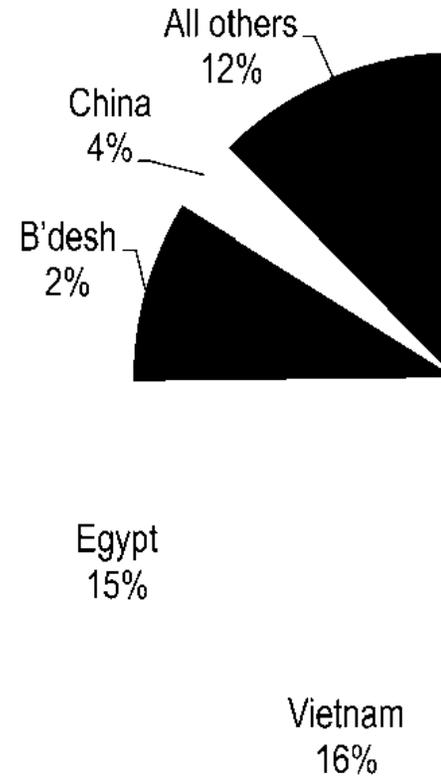

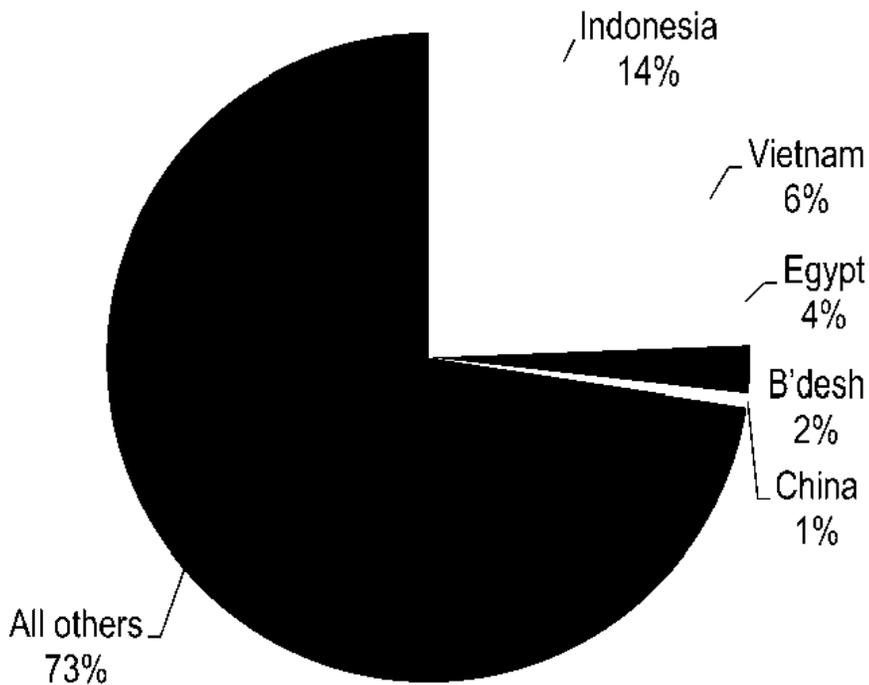

→ Vietnam appears to have improved in 2010

Source: WHO reports through 2/8/11. N/A, not applicable since no cases were reported. [Dotted bar] and * = 1-5 cases with data; [Hatched bar] = 6-10 cases with data; [Solid black bar] = >10 cases with data

Distribution of USAID H5N1 Avian Influenza Funding (2005-2010)

Total AI Funding (2005-2008) = \$129 million

Total AI Funding (2009-2010) = \$72 million

H5N1 Avian Influenza: Key Points

- In general, **H5N1 Avian Influenza disease burden in poultry and humans appears to be decreasing** over time due to control measures
- **Almost all recent bird and human infections have been concentrated in five endemic countries*** in Asia and Middle East that all have large poultry populations
- Even as some of these endemic countries have decreased their H5N1 AI burden, **there continues to be “leakage” of virus to neighboring countries**
- Although rare, human cases more common in countries with many poultry outbreaks since transmission is primarily bird-to-human; **fatality rate for human cases is high (33-83%)**
- H5N1 AI virus **continues to evolve over time; pandemic risk remains** as long as virus continues to persist
- **Donor funding for H5N1 AI continues to decrease**; in the next year or two, USAID will likely be the only remaining donor

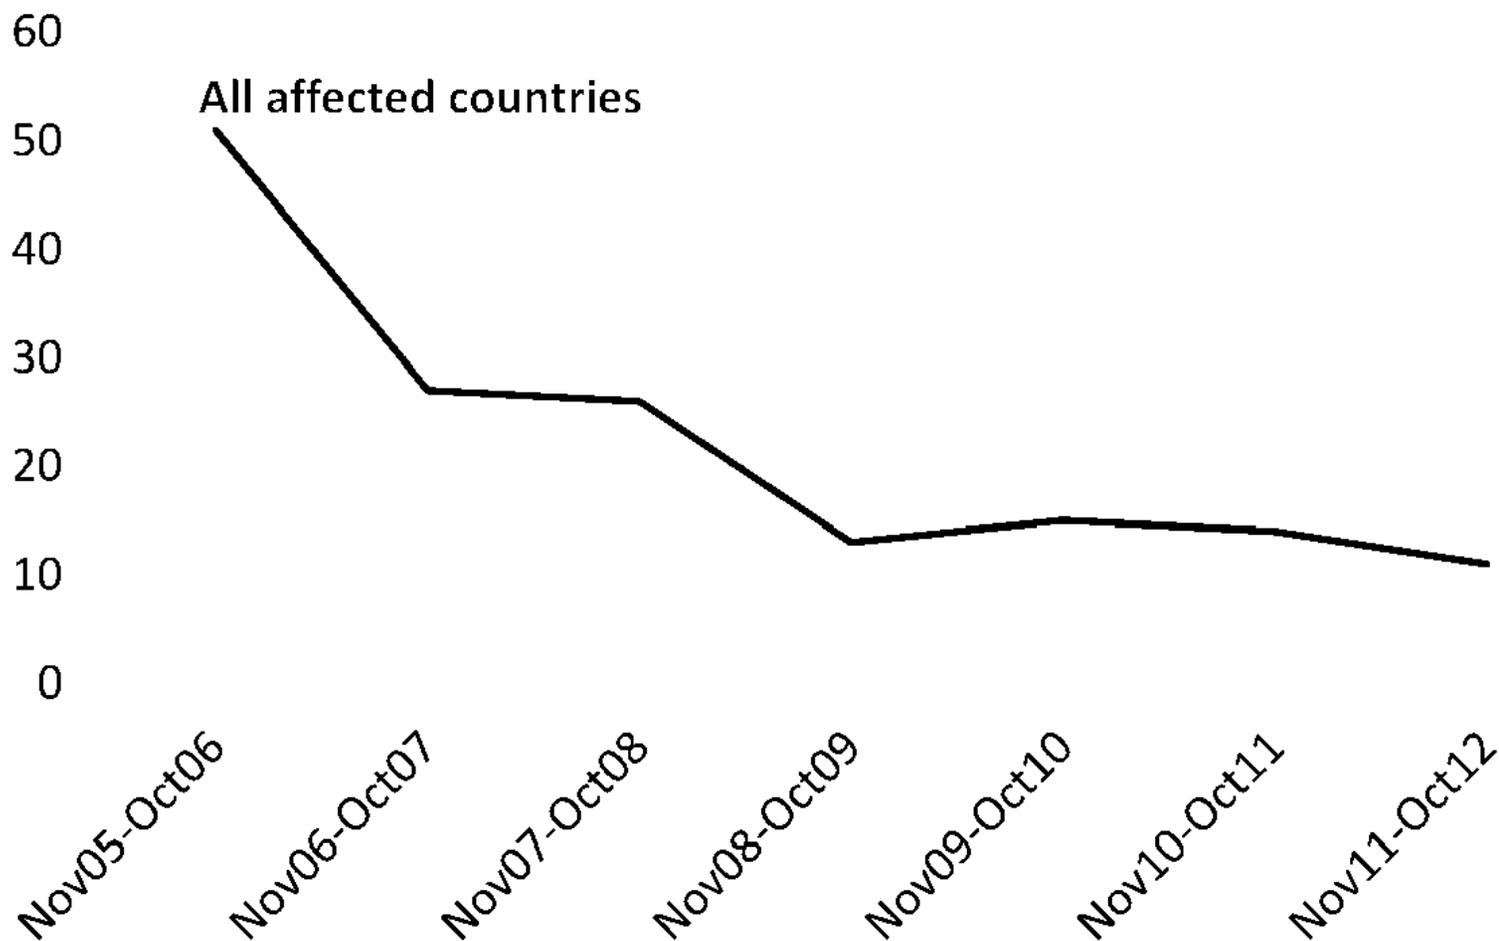

* Bangladesh, China, Egypt, Indonesia, Vietnam

H5N1 Trends, Nov 2005-Oct 2012

Notes on data:

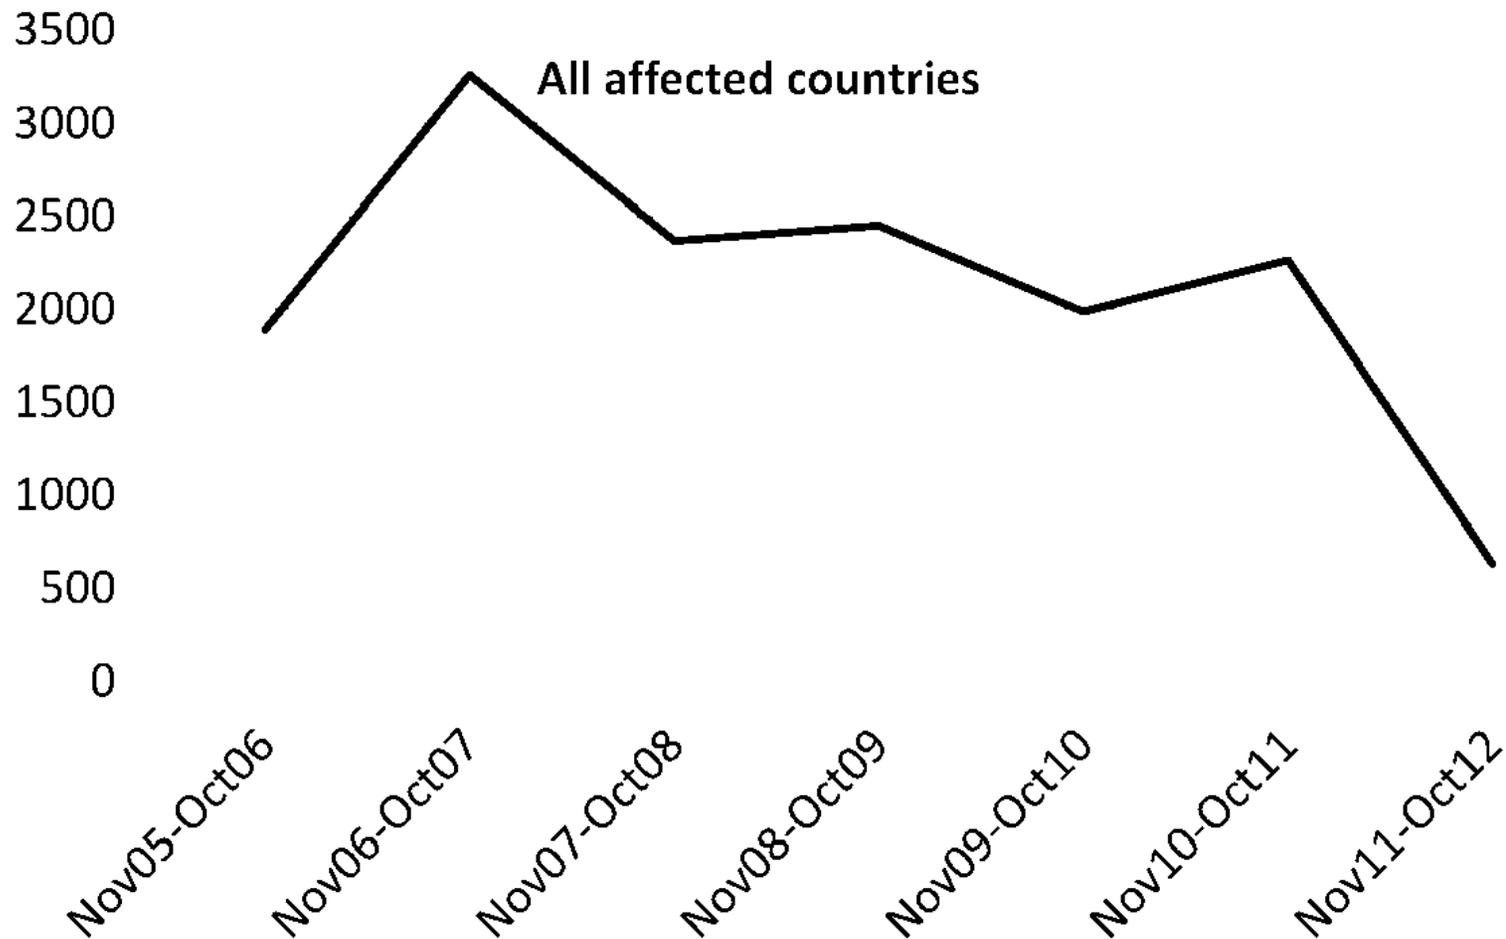

- Analysis only includes information (mostly from passive surveillance) reported to FAO, OIE, and WHO.
- Most countries have limited surveillance capacity; as a result, actual number of bird outbreaks and human cases may be higher than the reported numbers.
- Little to no OIE data from Egypt and Indonesia after June 2008 and Aug 2006, respectively; as a result, these two high-burden countries are underrepresented in the global trends for the time between onset of bird outbreaks and lab confirmation.

EXECUTIVE SUMMARY

Transboundary animal disease (TAD) outbreaks occurred during the past years in the border provinces of the Islamic Republic of Afghanistan (Afghanistan) and the Islamic Republic of Pakistan (Pakistan). The TADs are spread by the movement of infected live animals or animal products around the area. In Pakistan, independent outbreaks of Highly Pathogenic Avian Influenza (HPAI) were detected in 2006, 2007 and 2008; and in Afghanistan, the disease outbreaks occurred solely in 2006 and 2007. In all cases, frequent poultry commercial trade (both legal and illegal) and the traditional movement of chicken or poultry products for sale in live bird markets (LBMs) contributed to the introduction and spread of HPAI in cross-border provinces and subregions.

The Government of the United States of America, through the United States Agency for International Development (USAID), initially contributed USD 1.3 million to the Food and Agriculture Organization of the United Nations (FAO) for the implementation of project OSRO/RAS/703/USA, entitled "Highly Pathogenic Avian Influenza: strengthening cross-border surveillance and containment activities between Afghanistan and Pakistan". The project started in April 2008 and formed part of FAO's overall relief and recovery programme in Afghanistan and Pakistan. The initially planned end date was in September 2008; however, the project was extended three times with the actual end date on 31 May 2011 and the total financial contribution of USD 3.2 million. Considering the high risk of HPAI introduction and spread in the cross-border region between Afghanistan and Pakistan, the aim of this project was to establish a shared, sustainable and harmonized HPAI surveillance system to strengthen the capacity for early detection and control of HPAI in the defined areas.

Originally the project considered four provinces at the border between the two countries: Nangarhar and Khost for Afghanistan, and Khyber Pakhtunkhwa (KPK) [former North West Frontiers (NWF)] and Federally Administered Tribal Areas (FATA) provinces for Pakistan. In consultation with the Chief Veterinary Officers of both countries and the Donor, Kandahar and Balkh provinces were subsequently included for Afghanistan, and Abbottabad area in KPK, Balochistan and Sindh provinces for Pakistan. Furthermore, subregions were established for surveillance in different Afghan provinces at the border and those where outbreaks had been reported previously.

In February 2008, the surveillance teams started collecting samples from LBMs, farms and villages, so that at the end of the project in May 2011, 30 358 samples were received from Afghanistan and 126 470 from Pakistan. The difference in the number of samples obtained was influenced by the total population of poultry in each country. At the beginning of the project in 2008, there were no technicians in the laboratories in Afghanistan dedicated to Avian Influenza (AI) diagnosis. The Afghan veterinarians, therefore, received training on the basic concepts of serology procedures, molecular diagnosis and practical proficiency tests. In Pakistan, technicians were trained on conducting tests in the laboratory that included serology, virus isolation and molecular diagnosis, as well as antigen preparation for use in serological tests towards the end of the project. The antigen is now distributed to provincial laboratories in Pakistan on a regular basis, and it has also been delivered to Afghanistan. Improvement of the central laboratory in Pakistan to biosecurity level 2+ now allows for the sample preparation for virus isolation. The capacity for genetic sequence analyses for virus characterization was supported in Pakistan. Laboratories in Abbottabad, KPK and Karachi are conducting serological tests in Pakistan, and the laboratories in Jalalabad and Mazar-e-Sharif in Afghanistan have the infrastructure to conduct serological tests for regional screenings. All of them received training, equipment and reagents.

The results obtained during the surveillance activities showed that there was no evidence of HPAI H5N1 virus circulation in the region. However, the identification of other AI virus subtypes circulating in the region should be considered as a possible threat for reassortment and eventually emergence of novel virus subtypes. The security circumstances that are present in both countries, and especially in the cross-border region, made it difficult to implement some project activities, but the commitment of the project staff, particularly those in the field, was the key success factor for the results obtained.

1. INTRODUCTION

1.1 Project background

The Islamic Republic of Afghanistan (Afghanistan) and Islamic Republic of Pakistan (Pakistan) have experienced Highly Pathogenic Avian Influenza (HPAI) outbreaks caused by H5N1 subtype in various provinces of the bordering areas. The first outbreak started in 2006 in Khyber Pakhtunkhwa (KPK) (former North West Frontier) province and Abottabad region in Pakistan. It was later detected in Nangarhar, Kunar, Kapisa, Kabul, Logar, Laghman, Parwan and Kapisa provinces in Afghanistan. In 2007, outbreaks were initially identified in KPK, Abottabad and Punjab in Pakistan and later in Nangarhar, Kunar, Nuristan, Kabul and Kapisa provinces in Afghanistan. The last outbreaks of HPAI virus subtype H5N1 were detected in June 2008 in KPK and Sindh provinces in Pakistan, and no reports were made in Afghanistan at that time.

Although it was not possible to directly link the occurrence of outbreaks in Afghanistan with those detected in Pakistan, it was speculated that detection of HPAI outbreaks in Pakistan (especially in the northern areas) would likely be followed by an occurrence of outbreaks in Afghanistan, since genetic comparison showed close similarity among the viruses sequenced. In both occasions HPAI entered into Afghanistan through its northeast province of Nangarhar. The reasons for this might be: (i) the area around the capital, Jalalabad city, of Nangarhar province has probably the highest density of commercial and semi-commercial poultry farms of Afghanistan, estimated at around 243 farms with an average number of poultry from 1 500 to 5 000, mainly broilers; (ii) intensive trade activities in the cross-border area between the main cities, Peshawar (KPK) and Jalalabad (Nangarhar), in all types of poultry (broilers, old breeders, one-day-old chicks) from Pakistan; and (iii) porous borders along the countries with security complications that affect efficient control and inspection.

The economic impact on poultry production was severe as a result of the bans imposed on trading poultry and poultry products from Pakistan, and the severe depopulation, stamping out procedures and quarantine measures that affected poultry production in Afghanistan. Moreover, the reluctance of the population to consume poultry meat and eggs affected other regions in both countries, with direct effect on the poor rural households. Additionally, in Pakistan, during the outbreak of 2007, two human casualties owing to H5N1 infection were recorded in KPK, as well as limited human-to-human possible transmission by cluster families and intra-hospital infection. Both Pakistan and Afghanistan declared themselves free of HPAI H5N1 in 2009.

The epidemiological pattern observed in Afghanistan during the two epidemics was rather similar, with the disease entering in Nangarhar province, spreading to other regions and later reaching Kabul city (where market prices for poultry products are higher). In Pakistan, the data available does not allow for an identification of a clear pattern. Even in the last epidemic, a great gap (both in time and space) between the series of outbreaks was observed, indicating, most probably, that the virus had persisted without being reported to authorities (rather than suggesting continuous reintroductions).

In Afghanistan, with 98 percent of the poultry population in the backyard sector, the risk of endemicity is considered low, while in Pakistan, where the poultry sector is economically more important, the risk of infection of the commercial poultry is higher. In particular, the small poultry production units in both countries are the most vulnerable owing to the low level of biosecurity and to traditional production systems for raising chicken (especially for broilers), which are largely un-regulated.

An important risk factor that could make the disease undetectable by clinical signs (especially in Pakistan) is the easy access to vaccines, although the quality of them may, in some circumstances, be questionable (in particular for some of those that are locally produced). During and after outbreaks, poultry producers tend to urgently vaccinate their flocks when experiencing episodes of high mortality in an attempt to slow down the course of the disease. In that case, the vaccinated animals do not show clinical signs while the virus replicates and spreads to other susceptible non-vaccinated poultry.

1.2 Financial contribution of the Donor

The Government of the United States of America, through the United States Agency for International Development (USAID), initially contributed USD 1.3 million to the Food and Agriculture Organization of the United Nations (FAO) for the implementation of the project OSRO/RAS/703/USA, entitled “Highly Pathogenic Avian Influenza: strengthening cross-border surveillance and containment activities between Afghanistan and Pakistan”. The project started in April 2008 and formed part of FAO’s overall relief and recovery programme in Afghanistan and Pakistan. The initially planned end date was September 2008; however, the project was extended three times until 31 May 2011, with the total financial contribution of USD 3.2 million.

1.3 Project objectives

The primary objective of the project was to promote collaboration between the two involved countries for improving HPAI surveillance by adopting common and shared approaches in areas which may share cultural and social features. The secondary objectives were to strengthen the capacity for early detection and control of HPAI in the defined areas, and thus to avoid further spread of infection to other non-infected parts of the countries and consequently to the human populations.

In the original project, two provinces were considered in each country: Nangarhar and Kandahar in Afghanistan, and KPK and Balochistan in Pakistan. However, during the first inception workshop, the Chief Veterinary Officers (CVOs) of the countries requested extending the benefits of the project to one additional province in each country. Consequently, Khost province was considered for Afghanistan, and the Federally Administered Tribal Areas (FATA) and Abbottabad area in KPK were considered for Pakistan (because of the large number of poultry farms that form the “poultry belt” in the north of both countries). Later, during the second Steering Committee meeting, the CVOs requested including the Sindh province for Pakistan and Balkh for Afghanistan in phase III based on the large numbers of poultry farms in these provinces.

1.4 Planned beneficiaries

The intended beneficiaries of the project were the Ministries of Agriculture and the Animal Health Departments/Chief Veterinary Offices in both countries. Other planned beneficiaries were poultry owners, producers and traders benefiting from a reduced incidence of HPAI through improved knowledge of poultry disease prevention and control methods and through avoiding losses owing to the stamping out procedures; national veterinary and public health services benefiting from strengthened government agencies including management, technical understanding and responsibilities; the general population benefiting from a reduced risk from avian influenza (AI); and the international community benefiting from a reduced risk of the spread of HPAI and of an AI human pandemic.

2. PROJECT IMPLEMENTATION

The project was carried out in high-risk areas that could potentially be infected with HPAI. These included areas that historically represented an entry point for the HPAI virus to spread from one country to another. The modalities under which this event might occur could be rather different: (i) the virus could be transported from the original source (farms) and reach the final destination passing through the concerned areas without any involvement of the local poultry population; or (ii) the local poultry population might be affected, thus providing direct evidence of virus introduction and the infection can spread from village to village because of proximity. The first modality would call for an intensification of border control activities, the second for an intensification of surveillance activities among the local populations and live birds markets (LBMs) that could play an important role in spreading the disease.

The trade routes for poultry and poultry products are basically unidirectional (from Pakistan to Afghanistan), mainly from KPK province, with a significant number of poultry farms, of both layers and broilers, and retailers of live poultry. There were reasons to argue that in Pakistan the infection was underreported. Diseased chickens were frequently sold to and from the markets, as in the case when the outbreaks occurred in 2006. Because they were vaccinated, the animals were not recognized as sick, which could account for the serial outbreaks that largely exceeded several incubation periods. Pakistan made efforts to contain the disease, and the National Avian Influenza Programme was approved to be financed by the Government of Pakistan. However, at the end of this project, the National Programme was closed, making early detection of possible outbreaks in the future difficult, owing to Pakistan's proximity to some HPAI H5N1 endemic areas localized in regions of India, Bangladesh, Nepal and Myanmar, where the disease is continuously identified.

One important issue addressed under this project was the availability of laboratory facilities and expertise in the concerned areas. Pakistan provided reliable diagnostic services at central level but Afghanistan did not. Therefore, provision of diagnostic services at central level in Afghanistan and at peripheral level in both countries needed to be upgraded. This issue was considered under this project.

The activities were established mainly in the following border cities: Peshawar and Abbottabad in KPK, Quetta in Balochistan province, FATA in FATA province and Karachi in Sindh province in Pakistan; and Jalalabad in Nangarhar province, Khost in Khost province, Kandahar in Kandahar province and Mazar-e-Sharif in Balkh province in Afghanistan.

Owing to the number of provinces on both sides of the border (three in Pakistan and seven in Afghanistan), it was necessary to include adequate subregions in Afghanistan for surveillance purposes as follows: eastern region: Nangarhar, Laghman, Kunar and Nooristan provinces; southern region: Khost, Paktya and Paktika provinces; southwestern region: Kandahar, Helmand and Zabul provinces and northern region: Balk, Sar-e-pol, Jowzjan, Faryab and Samangan provinces.

2.1 Implementation arrangements

The project was executed by FAO's Animal Health Service (AGAH) and Emergency Operations Service (TCES) through the Emergency Centre for Transboundary Animal Diseases (ECTAD) under the supervision of the Chief of AGAH and the operational responsibility of the Chief of TCES. Some of the activities were implemented separately in each country, others (common activities) at regional level.

The project was directly supervised by the Regional Technical Coordinator for the Central Asia Network for Avian Influenza and the Chief Technical Advisor (CTA) of the project. In each country, one national consultant/epidemiologist closely monitored the implementation of activities, four national consultants/field veterinarians were appointed for each country (one in Kandahar, Khost, Jalalabad and Mazar-e-Sharif, in Afghanistan; and one in Peshawar and Abbottabad, FATA, Quetta and Karachi, in Pakistan) to coordinate activities at local level, each of them assisted by one paraveterinarian.

In Afghanistan, the project counterpart management unit was operated under the supervision of the General Director of Animal Health and Production, who was also technically responsible for the Provincial Veterinary Departments. In Pakistan, the counterpart initially was the Federal Ministry of Food, Agriculture and Livestock and then the Federal Ministry of Livestock and Dairy Development. This ensured good coordination with the Livestock Departments of KPK, FATA, Baluchistan and Sindh that were operationally responsible for undertaking disease control in their regions. The project counterpart management unit was the National Reference Laboratory for Poultry Diseases of the National Animal Research Council. The counterpart institutions assisted all consultants and experts in the performance of their assigned tasks and guaranteed appropriate mechanisms of coordination with the relevant authorities in their respective countries.

A Steering Committee headed by the CVOs of both countries was established with the scope of driving and facilitating project activities. As there were important security issues in the areas of concern, the Committee advised and guaranteed the support of the local authorities.

The FAO project team actively liaised with all stakeholders and agencies in order to avoid duplication of efforts and ensure complementarities with other interventions and local ownership of project activities.

2.2 Main project activities

2.2.1 Technical assistance outputs

Output 2.2.1 Common strategies and approaches for surveillance developed in the different subsectors in the concerned areas

During the project, it was necessary to establish three main working groups linked in a network system: (i) field veterinarians responsible to visit farms, LBMs and villages to collect information on the health status of poultry in the premises and carry out sampling on a weekly basis to collect blood serum and swabs to submit them to the laboratory for testing; (ii) laboratory staff to introduce the collected information in the data management system developed under the project, process the serological tests indicated for AI surveillance (agar gel immunodiffusion [AGID] test and hemagglutination inhibition [HI] test for detecting antibodies against H5, H7 and H9) and conduct rapid tests for virus identification (positive samples were

processed for virus isolation in Pakistan only and/or tested by real-time reverse transcriptase polymerase chain reaction [rRT-PCR] for identification of M gene [virus type] and H5, H7 in both countries and H9 [virus subtype] in Pakistan); and (iii) epidemiological units to maintain the field information and laboratory results, so that they can be analysed under the supervision of the national epidemiologist in each country. The selected epidemiological units for surveillance were farms (large-scale and small production), LBMs (especially those that distribute imported poultry in the main cities), vendors of live chicken in small towns and household chickens in villages. A unique surveillance format was prepared to gather field information from each type of premises and a data management system was developed named Avian Influenza Surveillance Information System (AI-SIS), which was designed for recording the information collected during routine surveillance. AI-SIS contains six modules to introduce the information obtained from the surveillance format and from laboratory results. The system allows a rapid analysis to obtain quick information about the frequencies of laboratory results by district, province and country and allows being connected to a geographical information system (GIS) to identify in space the location of positive samples, if any. The system was initially established at central level in both countries. After several evaluations, the software was installed in the main provincial laboratories in Pakistan, and in Nangarhar and Balkh in Afghanistan.

Output 2.2.2 The diagnostic ability of field and laboratory staff enhanced

Field staff: At the start, it was necessary to conduct a series of trainings for field veterinarians from both countries, and national trainings for official veterinarians on disease recognition, during which the characteristics of the disease were discussed. The suspicious case definition was established when at least two or more of the clinical signs were identified in a single epidemiological unit. The size of each epidemiological unit was defined as 20 samples (serum and swabs from trachea and cloacae) per premise (epidemiological unit) based on the ongoing circumstances and on international experience. Thereafter, a bi-national training on differential diagnosis to identify AI from other similar diseases was conducted and cascade trainings at national level were held.

Laboratory staff: At the beginning of the project in 2008, there were no laboratory technicians in Afghanistan working on a routine basis on AI diagnosis; therefore, the General Director of Animal Health and Production designated four members of the laboratory to be trained: two of them on serology procedures and the other two on molecular diagnosis. Laboratory biosecurity conditions in Afghanistan did not allow for the conducting of the virus isolation, as the laboratory technicians could be infected. The four members were trained daily for six months by the CTA and the national laboratory expert on the routine diagnosis of the disease. In Pakistan, two technicians regularly conducted serological diagnosis and virus isolation, and two specialists in the diagnosis of PCR procedures worked on molecular diagnosis and sequencing. One laboratory member from each country attended a diagnostic international training course for laboratory technicians held at the FAO/World Organisation for Animal Health (OIE) Reference Laboratory for AI and Newcastle Disease in Padova, Italy, from 6 to 17 July 2009. One laboratory staff member from Pakistan was trained in the FAO/OIE Reference Laboratory for Avian Influenza in the United States of America on antigen production for AI because international antigens are difficult to purchase and the price is very high. Now, the laboratory in Pakistan produces antigen for HI tests for H5, H7 and H9 that is distributed to the provincial laboratories in the country and, upon request, to Afghanistan.

Owing to the expertise in AI diagnosis in Pakistan, two trainings were conducted at the National Reference Laboratory for Poultry Diseases for the laboratory staff from Afghanistan: one of the

courses was for general serological diagnosis and the other for molecular diagnosis with the purpose of harmonizing the procedures. A manual for diagnosis was developed in Pakistan, and the standard operating procedures (SOPs) were established for all laboratory tests, common to both countries in order to harmonize the techniques.

National training courses for provincial laboratory staff were conducted by the national central laboratory staff from each country, for serological diagnosis; and the installation of the enzyme-linked immunosorbent assay (ELISA) equipment in Jalalabad and Mazar-e-Sharif in Afghanistan and Peshawar, Abbottabad, Quetta and Karachi in Pakistan, for proper use. Reagents were allocated to all provincially established laboratories.

Initially, only the National Reference Laboratory for Poultry Diseases in Pakistan was able to conduct AI diagnosis. At the end of the project, all the provincial laboratories indicated in the project document were able to conduct serological diagnosis in Pakistan. In Afghanistan, only Nangarhar and Balk laboratories are now able to conduct serological diagnosis owing to the security constraints in Kandahar and Khost, where the laboratories could not be established owing to the lack of electricity, water and security conditions for proper work in the local offices of animal health.

The central laboratories in both countries participated in a practical proficiency test conducted by the FAO/OIE Reference Laboratory from Padova, Italy, in November 2009. The Reference Laboratory submitted samples to the laboratories in Afghanistan and Pakistan that were both positive or negative. The results for central laboratory in Pakistan scored with 98 percent precision in their identification of the samples, meanwhile the central laboratory in Afghanistan scored 80 percent. Therefore, both laboratories demonstrated satisfactory precision in conducting serological and molecular diagnosis for AI.

Output 2.2.3 Procedures for inspection of poultry and poultry products at border control posts standardized

A workshop that included participants from the authorities of both countries was held in August 2010 in order to establish an understanding of mutual agreements of interest on trading poultry and poultry products, which is indicated below. The veterinary authorities of both countries agreed to work on improving mutual agreements regarding future arrangements for importing/exporting meat, live birds, chicken, day-old chicks, fertile eggs and table eggs.

2.2.3a Certification for farms for exporting

2.2.3a.1 Share information about the requirements and content of the animal health certificate.

2.2.3a.2 Conduct periodic (bi-annual) meetings of the veterinary authorities to review registration and certification of newly authorized farms for exporting. The exporting establishments must be declared by the veterinary authority to access the capacity to fulfill the demand/set standard/measures of the concerned veterinary authority and specify the diseases under control and tests for exporting purposes.

2.2.3a.3 Every import/export document produced by the importer/exporter country must be referred back to the concerned veterinary authorities of the countries for verification and to update the export/import data. Monthly exchange of information regarding the health certificate issued for import/export should be shared between the countries.

2.2.3b Border inspection

2.2.3b.1 Both countries will establish a harmonized and uniform inspection system for different products traded between the two countries.

2.2.3b.2 There should be mutually agreed upon SOPs for border inspection of different products.

2.2.3b.3 The number of border check posts should be increased from three to at least 14 on each side and should be equipped and have trained staff.

2.2.3b.4 There should be a regular joint short-term training programme (one-two weeks) on inspection procedures.

2.2.3c Quarantine station and animal health measures upon arrival

2.2.3c.1 Establish normal standard animal health measures for checking certificates and checking documents with the consignee (certificate No., expiry date, container seal, etc.) as well as conducting physical checking.

2.2.3c.2 Proper samples should be taken randomly from poultry and poultry products for eventual laboratory testing. In the case of positive rapid tests for AI, the poultry products should be detained and confiscated.

2.2.3c.3 In the case of negative results, distribution of the poultry and poultry products would be allowed.

2.2.3d Provision of future demand in Afghanistan

The veterinary authorities of Afghanistan should provide information on the future demand for live birds, animals, day-old chicks, eggs and other livestock products, so that measures can be taken to fulfill the future demand. A follow-up meeting to the August 2010 workshop could not be held since. As of November 2010, the Government of Pakistan was reorganizing its ministries and no authority was recognized as CVO until the end of the project.

Output 2.2.4 Capacity to improve the overall surveillance system enhanced

At the beginning of the project, there were no established epidemiological units in the two countries, and the responsibilities of the epidemiologists were distributed among other entities. A basic workshop was conducted for the high-level authorities in Afghanistan to demonstrate to them the importance of the epidemiology units. Subsequently, for Pakistan, a small unit within the laboratory was established. Instead of the originally foreseen Masters degree course for one person from each country which did not materialize. As no reply to the invitations was received from the Governments of both countries, the CVOs of the two countries opted to send the veterinarians of the units for short-term training, which was conducted in Jordan for 12 weeks for two participants from each country.

During the course, the participants learned about biostatistics, analytical epidemiology and the importance of questionnaires to collect information from the field in order to conduct an epidemiological analysis. The field veterinarians also learned about the importance of collecting complete information from the visited premises, analysing the data and reaching conclusions that could drive the decision-making process. They also learned about the production of antigens at regional level that would considerably reduce the cost of the tests. By the completion of the project, both countries had the technical capacity to continue the surveillance process in a sustainable way.

At the end of the bi-national socio-economic training course conducted in Istanbul, Turkey, in April 2010, the field veterinarians prepared a simple programme in Excel to analyse the economic information obtained from the field in order to measure the economic impacts and consider the social effects of high mortality. As a result, they now better understand the socio-economic impact of the disease in different sectors of the commercial chain: farmers, traders, vendors and consumers.

During visits to the epidemiological units towards the end of the project, the field veterinarians joined workers in farms, vendors at LBMs and households in villages to explain to them the characteristics of the disease and the impacts of the disease if the mortalities were not reported. Similarly, they visited schools to raise awareness among students from different towns about AI in order to improve the surveillance of the disease.

H5N1 subtype was not identified during the project implementation period, but the virus subtype H9N2 was continually identified in both countries. Molecular comparison analysis with other H9N2 viruses in the region, obtained from the gene bank, revealed that the hemagglutinin gene segment was within at least three H9N2 sublineages within the major G1-like lineage that are co-circulating in the Middle East. The genetic variability identified among the H9N2 viruses used in the comparison study showed that the isolates in Afghanistan and Pakistan contain specific substitutions, which are believed to increase the efficiency of the replication in non-avian species, especially in mammals, and therefore highlight the need to constantly monitor the evolution of this potential pandemic strain in the Middle East. Other AI virus subtypes that were also identified in poultry in Pakistan were H3N1 and H4N6. These are not notifiable AI viruses, but could be considered so owing to the possible reassortments among different AI viruses. These viruses in turn could originate novel, emerging AI viruses, which could affect not only birds but also mammals, including humans; therefore, the spread of these novel viruses should be monitored in the future.

Output 2.2.5 Surveillance in LBMs strengthened

Main LBMs in the cross-border region were identified and continuously visited to detect any virus circulation. During the surveillance period, H5N1 virus was not identified. The easy recognition and the acceptance of the vendors to maintain the surveillance in those markets resulted in more confidence in the government monitoring programmes of the health status of the birds in those markets. In Pakistan, a formal course was conducted in Islamabad for the main LBM vendors.

2.2.2 Procurement and distribution of inputs

(i) Afghanistan

The Central Veterinary Diagnostic and Research Laboratory in Kabul received non-expendable equipment such as real-time PCR system, conventional thermocycler, documentation system for gel identification of PCR bands in conventional system with camera included to save the results, safety cabinets for sample processing, computer for collection of the field data and laboratory results, ELISA reader and automatic washer system, ultra-low temperature freezer, respirator class III for biosafety laboratory work and container for liquid nitrogen for virus sample store necropsy instruments. The laboratory also received expendable equipment, such as materials for sample collection and sample processing in the laboratory as ELISA kits, antibodies and antigens for other serological test for AI diagnosis, primers and probes for molecular diagnosis by PCR, a series of micro-pipettes for all serological and molecular diagnosis.

The epidemiology unit of the General Directorate of Animal Health and Production received computers, printers and copier machines for their daily work and for connection with the laboratory. At the provincial level, only the laboratories in Nangarhar and Mazar-e-Sharif received low temperature freezers for sample preservation, ELISA equipment, including washer

machines and a computer for ELISA recording system, pipettes and reagents for serological diagnosis.

(ii) Pakistan

The National Reference Laboratory for Poultry Diseases received non-expendable equipment consisting of a complete conventional PCR equipment including a thermocycler, PCR workstation, documentation system for automatic evaluation of the results, vacuum system for concentration during antigen preparation for serological diagnosis, ELISA washers, an air-conditioner system to improve the biosecurity in the laboratory from level 2 to level +2 to allow working with the HPAI virus without emitting any residues to the environment and protecting the laboratory workers from infection and a table top centrifuge. The expendable equipment included laboratory glass materials, micropipettes, antigens, antiserums, ELISA kits, primers and probes for molecular diagnosis, a NanoDrop system with software for DNA/RNA sample analysis and reagents for virus genome sequencing.

The provincial laboratories in KPK, Abbottabad and Sindh received an ELISA washer machine system, micropipettes and other materials for necropsy and performance of serological tests and reagents such as antigens and antiserums.

2.3 Actual beneficiaries

The main beneficiaries of the project were the Ministries of Agriculture of both countries and the population in the areas surveyed in the study.

A total of 758 provincial veterinarians were trained in the two countries on recognizing the disease and reporting suspicious cases as well as on basic epidemiology. Fifteen laboratory technicians were trained in four provinces in Pakistan and three provinces in Afghanistan, and are now able to conduct serological diagnosis and perform rapid tests for early detection. Seventy vendors, 190 poultry producers and more than 500 students received training on the importance of the disease and early recognition by proper reporting. Both countries are beneficiaries of local antigen production.

Fourteen provinces surveyed in Afghanistan with a total of 280 villages in 100 districts, and four provinces with 156 villages in Pakistan showed no evidence of circulation of HPAI subtype H5N1 virus. In general, the entire population in the surveyed provinces can be considered as beneficiaries; for they gained confidence that there was no evidence of the disease. Attached are the maps of Afghanistan and Pakistan where the surveillance was conducted.

2.4 Training

- A national training course on disease surveillance, clinical diagnosis and outbreak investigation was conducted in Kabul, Afghanistan, and attended by 22 veterinarians from several provinces at the border area with Pakistan.
- The inception workshop was conducted in Islamabad, Pakistan, from 15 to 18 July 2008, where 15 participants, four from the Government of Afghanistan, six from the Government of Pakistan, the CTA and three officers from FAO headquarters attended. Additionally, the Donor was represented at the workshop.
- One national Participatory Disease Surveillance (PDS) introductory workshop was held in Islamabad on 6 November 2008, where 10 participants from Pakistan attended.

- A national training course on general epidemiology and rapid diagnosis was conducted in Kabul, Afghanistan, from 23 November to 2 December 2008, and was attended by 16 veterinarians from Nangarhar, Khost and Kandahar.
- A national five-month training (February to August) was conducted in Afghanistan on laboratory tests for AI (serological and molecular diagnosis) for four veterinarians from the Central Veterinary Diagnostic and Research Laboratory in Kabul.
- One bi-national (Afghanistan-Pakistan) training-of-trainers (ToT) course on “Disease recognition and surveillance objectives” was conducted from 23 to 27 February 2009 in Islamabad, Pakistan, with the participation of 16 veterinarians (six from Afghanistan and ten from Pakistan).
- A national pilot one-day training for LBM vendors was conducted in Jalalabad, Afghanistan, on 17 March 2009 on AI update and advantages of biosecurity and biosafety to prevent spread of poultry diseases and human infections. It was attended by 40 participants.
- The following national trainings were conducted for veterinarians in Pakistan on AI surveillance procedures :
 - 7 April 2009 in Balochistan, with the participation of 20 veterinarians from the region;
 - 9 April 2009 in Peshawar, with the attendance of 20 veterinarians from the region;
 - 4–5 May 2009 in Nasirabad (Dera Murad Jamali), Balochistan, with the participation of 20 provincial veterinarians;
 - 5–6 May 2009 in Jaferabad (Dera Ailhyar), Balochistan, where 20 provincial veterinarians attended; and
 - 6–7 May 2009 in Sibi, Balochistan, where 20 provincial veterinarians attended.
- One bi-national (Afghanistan-Pakistan) training for ToTs on basic concepts of epidemiology of infectious diseases, outbreak investigation methods and LBM surveillance and monitoring methods was conducted in Islamabad, Pakistan, from 16 to 18 April 2009, with the participation of 16 veterinarians: eight from Afghanistan and eight from Pakistan.
- Two one-day national training courses for village women involved in poultry production were conducted on 5 April 2009 in Mazar-e-Sharif (20 participants) and 6 April 2009 in Kunduz (22 participants) in support of women’s development.
- A national workshop was conducted on surveillance and review using AI-SIS in Islamabad, Pakistan, from 10 to 12 May 2009, with the attendance of seven participants from border areas with Afghanistan.
- National trainings on disease recognition, surveillance, awareness and reporting for field veterinarians from the Government, private sector and non-governmental organizations (NGOs) of three border regions in Afghanistan as follows:
 - 25–26 May 2009 at FAO facilities in Jalalabad for 34 veterinarians and paraveterinarians;
 - 29–30 May 2009 at FAO Dar Ul Aman facilities in Kandahar (Kabul) for 32 veterinarians and paraveterinarians; and
 - 7–8 June 2009 at FAO Dar Ul Aman facilities in Khost (Kabul) for 20 veterinarians and paraveterinarians.
- A national training on basic concepts of epidemiology of infectious diseases and outbreak investigation and methods to be used for surveillance in LBMs was conducted in Islamabad, Pakistan, on 22 and 23 June 2009, with the participation of 14 veterinarians.
- A national training on passive surveillance, awareness and reporting was conducted in Islamabad, Pakistan, from 3 to 5 July 2009, with the attendance of six veterinarians from the Government.
- A bi-national (Afghanistan–Pakistan) workshop for ToTs on participatory disease surveillance methods was conducted from 3 to 5 July 2009 in Kabul, Afghanistan, with six participants from each country.

- The Steering Committee meeting took place in Kabul, Afghanistan, in July 2009, with the participation of 12 officials from Afghanistan and two from Pakistan to review the project progress and achievements, and during which the preparation of Phase III of the project was requested.
- One person from the central diagnostic laboratory of each country attended a two-week training on AI diagnosis at the FAO/OIE Reference Laboratory in Padova, Italy, from 6 to 17 July 2009.
- A national four-day training course for Afghanistan on basic epidemiology and surveillance of LBMs was conducted from 2 to 5 August 2009 in Kabul, with the participation of 20 government veterinarians.
- A national training course on basic epidemiology for 22 high-level officials from the General Directorate of Animal Health and Production, including the CVO, was conducted on 29 and 30 August 2009 in Kabul, with USAID cooperation.
- A regional meeting for preparation of national contingency plans was organized by a regional AI project in Kazakhstan from 16 to 20 November 2009, where two participants from Pakistan and three from Afghanistan attended.
- A one-day training course on update of the AI situation in the country, surveillance and current developments of vaccines was conducted on 16 January 2010 in Islamabad, Pakistan, with the participation of 30 attendants.
- A ten-day bi-national (Afghanistan-Pakistan) training course in laboratory procedures was conducted at the National Reference Laboratory for Poultry Diseases in Islamabad, Pakistan, from 1 to 12 February 2010, for five participants from Afghanistan's central laboratory and four participants from regional laboratories in Pakistan.
- National trainings for provincial laboratory staff in Pakistan were conducted on serological procedures and data management for introducing results in AI-SIS data software as follows:
 - 12–13 March 2010 in Quetta for 20 veterinarians;
 - 15–16 March 2010 in Karachi for 20 veterinarians; and
 - 19–20 March 2010 in Islamabad for KPK and FATA with participation of 32 veterinarians.
- A bi-national (Afghanistan-Pakistan) training for ToTs on communication was conducted in Istanbul, Turkey, from 5 to 9 April 2010, with participation of four government officials from Afghanistan and one from Pakistan.
- One ten-day national training course in Afghanistan was conducted from 1 to 10 April 2010 in Mazar-e-Sharif, Afghanistan, for 16 provincial officers on how to conduct PDS activities.
- One-week training on PDS for 30 women involved in poultry production was conducted in Mazar-e-Sharif, Afghanistan, from 12 to 16 April 2010.
- A five-day training on AI differential poultry diseases for ToTs was conducted in Istanbul, Turkey, for six veterinarians from both countries, from 19 to 23 April 2010.
- A bi-national (Afghanistan-Pakistan) training on socio-economics for ToTs was conducted in Istanbul, Turkey, from 26 to 30 April 2010, and included 12 participants, six from each country.
- A national workshop was organized to evaluate the data format used in the project areas in Islamabad, Pakistan, on 2 May 2010, with the participation of seven veterinarians from the border provinces.
- A national training course for laboratory technicians was conducted in Hayderabad, Pakistan, on 25 May 2010, with the participation of 20 veterinarians from official and private laboratories.
- A national training workshop for surveillance and monitoring LBMs was organized in Islamabad, Pakistan, on 27 and 28 May 2010 with the participation of ten veterinarians.

- More than 20 national one-day trainings were conducted in commercial poultry farms and LBMs in the eastern region in Afghanistan (Kunar, Laghman, Nangarhar and Noorestan) on the importance of HPAI and the surveillance to prevent its spread. More than 100 poultry keepers, and more than 500 students from secondary and bachelor schools in the region were trained from May 2010 until the end of the project.
- National trainings for harmonized laboratory protocols for AI diagnosis and surveillance were conducted in Pakistan as follows:
 - 4–5 June 2010 for 10 veterinarians of the provincial laboratory in KPK;
 - 7–8 June 2010 in Peshawar for 25 veterinarians of FATA provincial laboratory; and
 - 9 June 2010 in Quetta for Balochistan and Sindh provinces with participation of 20 veterinarians.
- A workshop was organized from 26 to 30 June 2010 in Istanbul, Turkey, to review and update the contingency plan for HPAI for Afghanistan with the participation of two Government officials.
- Participation in the workshop on applications of epidemiology concepts in animal disease control in Central Asia held in Istanbul, Turkey, from 5 to 19 July, with the participation of two officials from Pakistan.
- A 15-day training for two laboratory technicians from the central laboratory in Afghanistan was conducted at the central laboratory in Pakistan, from 12 to 24 July 2010. The aim of the course was to review and harmonize the molecular diagnostic methodologies for AI diagnosis, and four laboratory technicians from Pakistan also attended.
- National training courses on biosecurity and its applications for veterinarians, poultry producers and poultry keepers were held in Pakistan as follows:
 - 13–14 July 2010 in Karachi for 53 participants; and
 - 16–17 July 2010 in Abbottabad for 43 persons.
- A national training course was conducted on 10 August 2010 in Kabul, Afghanistan, on data collection using the new AI-SIS developed within the project, with the participation of 10 veterinarians from border areas.
- The Steering Committee meeting was conducted in Azerbaijan, on 19 and 20 August 2010, with the participation of federal authorities to review project advances and make decisions. Participants from Afghanistan were three and from Pakistan four.
- A training workshop was held for high-level authorities from both countries to discuss veterinary legal aspects for trading poultry and poultry products in Baku, Azerbaijan, from 25 to 27 August 2010. Four from Afghanistan and five from Pakistan participated.
- Short-term training for one technician from the central laboratory in Pakistan on AI reagent production was conducted at the FAO/OIE Reference Laboratory in Ames, Iowa, USA, from 6 to 25 September 2010. The participant was trained on the protocols for processing virus fluids to prepare antigens and antisera for serological tests. The preliminary batches will be prepared soon.
- A ten-day training course, from 19 to 30 September 2010, on serological diagnosis was conducted in the central laboratory in Kabul for four officials responsible for the serological tests in the provincial laboratories in Nangarhar, Mazar-e-Sharif, Kandahar and Herat.
- Two training courses on ELISA data entry for laboratory technicians in Afghanistan were held as follows:
 - 8–10 November 2010 in Nangarhar for four participants; and
 - 24–28 December 2010 in Balk for five participants.
- A national training workshop was conducted in Islamabad, Pakistan, on biosafety and biosecurity in avian disease control, on 23 and 24 March 2011, with the participation of ten veterinarians from project locations.
- A 12-week training course on epidemiology basic statistics analysis of information and epidemiological reporting was conducted at Jordan University for Science and Technology,

from 23 March to 22 May 2011, with the participation of two veterinarians from each country.

- National training was conducted on 26 and 27 May 2011 in Islamabad, Pakistan, on strategic communication for prevention and control of HPAI with the participation of 18 veterinarians.
- A national meeting for final discussion of the project was conducted on 12 May 2011 in Islamabad, Pakistan, with the participation of 18 persons, including provincial officers, USAID and the United States Department of Agriculture representatives and FAO officers.
- A national meeting for final discussion of the project was conducted on 27 June 2011 in Kabul, Afghanistan, with the participation of representatives from the Ministry of Agriculture, Irrigation and Livestock; General Directorate of Animal Health and Production; USAID; and FAO authorities.

2.5 Other project elements

- A number of samples amounting to 30 358 from Afghanistan and 126 470 from Pakistan were submitted to the laboratories and analysed. The difference in the number of samples obtained was influenced by the total population of poultry in each country.
- Fourteen provinces (100 districts) in Afghanistan were included in the project, based on the subregions mentioned above (i.e. Balk, Herat, Jawsjan, Kabul, Kandahar, Kapisa, Khost, Kunar, Kunduz, Laghman, Logar, Nangarhar, Parwan and Takhar) with 141 farms, 159 LBMs and 280 villages sampled, contributing to a total of 580 epidemiological units. In Pakistan, four provinces (i.e. KPK, FATA, Balochistan and Sindh) were included on the basis of their high poultry populations, and more than 156 villages visited.
- High mortalities in poultry were reported in Afghanistan in August 2008, January 2009 and April 2011 from Khost and Balk provinces. Samples were collected and tested in the laboratory to identify the presence of AI virus type by molecular diagnosis. The samples were thereafter submitted to the OIE/FAO Reference Laboratory in Padova, Italy, for confirmation of the diagnosis. The Reference Laboratory reported that all samples were positive to AI virus subtype H9N2 in 2008 and 2009. The viruses were sequenced and sequences were compared with other H9N2 virus genetic sequences deposited in the gene bank. The genetic relationship indicated that isolated AI viruses in Afghanistan were closely related to strains that circulate continually in Iran and Pakistan. Sero-diagnosis and surveillance conducted under other FAO projects indicated that H9N2 that is endemic in the countries could mix with other influenza viruses to allow the emergence of novel influenza viruses that could be a threat to poultry and human health. Other outbreaks were related to toxicity in the feed.
- Owing to an emergence of a novel influenza virus (H1N1) that became pandemic from April 2009, seminars for senior officials from divisions of the Animal Health Directorates in both countries were conducted with the aim to provide a reliable and comprehensive situation of the influenza A H1N1 pandemic. Additionally, several project leaders and coordinators from NGOs dealing with animal health and production attended, and regular technical support was provided by FAO AI experts (ECTAD and AGAH) to the Governments of both countries.

2.6 Difficulties encountered during implementation

Personnel

- Field veterinarians and paraveterinarians in Afghanistan who were approached by FAO to work on the project did not wish to leave their positions in the Government for the period of the project's duration, as they had been working for several years with the Government and did not wish to lose their positions at the end of the project. Therefore, they were contracted under supplementary salary to resolve the situation. Only the field veterinarian for Nangarhar was contracted on a full-time basis.

Counterparts for implementing the project

- Afghanistan: The General Director of Animal Health and Production was the government counterpart for project implementation. During the project life, there were four different General Directors of Animal Health and Production. Although a good relationship was established with each one of them, some delays occurred during the transitional periods.
- Pakistan: The counterpart was the Animal Husbandry Commissioner who was first located in the Ministry of Food, Agriculture and Livestock. In 2009, there was a restructuring of the ministries, and the Commissioner was moved to the Ministry of Livestock and Dairy Development. From the end of 2009 until the end of 2010, he was changed, and the newly appointed Commissioner during that period had intermittent contracts that delayed some of the activities. Finally, by the end of the project, the first Commissioner returned to his position, but was moved to the Ministry of Economy given the low interaction with other sections within the newly restructured Ministry of Agriculture. The excellent coordination with the Programme Management Unit (i.e. the Poultry Disease Laboratory belonging to the National Animal Research Council) gave the opportunity for continuing the project activities as prepared in the work plan of the project.

Security

- Cross-border areas of the project were the most volatile areas in terms of security owing to threats and attacks suffered during project implementation; therefore, the field personnel were very cautious to visit the selected premises to collect information and samples. Their commitment allowed constant surveillance in the regions at both sides of the border.

Technical capacity

- At the beginning of the project, the technical capacity between the staff members and national employees in both countries was different. But with the continuous training and supervision, by the end of the project, the knowledge gap narrowed, and better results were obtained in the implementation of activities.

Communication systems

- The main problem in both countries was the telecommunication systems that made immediate communication and the establishment of a working network system sometimes difficult. In Afghanistan, internet connections are not available in all regions, and connecting to the internet via satellite is expensive and not available in all regions of the project. The internet service is better in Pakistan, but often there is no service owing to power cuts or other reasons. However, the network system was installed between the central laboratory

and provincial laboratories in both countries, so that it can be fully functional when the internet service is improved.

Trade

- An important issue is to continue the talks between the two countries in order to regulate the trading of poultry and poultry products that is necessary to be implemented in both countries.

Other difficulties

- It was not possible to complete the following two outputs:
 - Slats in LBM for poultry processing: The design of the slats was intended for both countries, but municipality authorities in Islamabad and Kabul did not authorize the installation of the model, arguing that they did not have resources for expanding the slats and there was no regulation for authorizing the proper processing in both countries.
 - Verification posts at the border between the countries: The agriculture authorities denied the authorization to build a separate post for animal import/export verification owing to security issues along the border that might pose a risk for veterinarians on duty.

3. PROJECT IMPACT

Veterinarians from the veterinary services at central and provincial level in both countries received a complete training programme with manuals and guidelines for full understanding of the precautions they would have to adopt when carrying out field activities in surveillance and outbreak investigation. Trainees also had a better insight into the modes and means of transmission of HPAI. They are now able to carry out field investigations for evaluating suspected clinical cases. The veterinarians from the veterinary services as well as private veterinarians learned about the major poultry diseases and how to differentiate them from HPAI virus infection. They also received training on biosecurity in the farms and small-scale production.

The actual numbers of trainees amounted to 758 veterinarians and 15 laboratory technicians, exceeding the foreseen number indicated in the project document. Many of them have the capacity to replicate the training courses following the guidelines provided to them. More than 70 vendors now know about the importance of the disease and how to report to local authorities in their provinces. More than 190 poultry producers and poultry farm managers understand the importance of preventing the introduction of diseases by installing better biosecurity measures, and more than 500 students were informed about the main concepts for considering hygienic measures to avoid being infected, if the disease were to be identified in their localities.

A surveillance system can be continued in both countries if the government authorities are interested in preventing new reintroductions of the virus and if they are interested in controlling other virus infections, as for example the H9N2 AI virus that is endemic in the region and in other poultry diseases, such as the Newcastle Disease or pneumovirus that limit the expansion of the poultry industry in the two countries.

Both countries have field veterinarians, laboratory staff and epidemiologist who are well trained not only on the control of AI but also of other diseases, where the development of surveillance programmes is necessary.

Both countries have a reliable data management system (AI-SIS) that can be easily adjusted for surveillance of other diseases.

Antigen production in Pakistan will allow the convenience of the availability, at a low price, of diagnostic reagents that are equal in quality to those produced in reference laboratories.

One of the requests raised at the beginning of the project by the poultry producer associations was to make available local diagnosis for routine monitoring of the flocks. Now, there are two places in Afghanistan, where 90 percent of the commercial farms are located, and in all provinces in Pakistan that provide AI diagnostic service.

Impact on project beneficiaries has been as follows:

- Diagnostic services and antigen for diagnostic purposes in both countries are easily accessible. It is necessary to make the producers aware of the availability of the services for monitoring flocks.
- Equipment, basic laboratory reagents and qualified personnel for serology are in place for diagnosis in two provinces in Afghanistan and four provinces in Pakistan.
- There has been no indication of the presence of HPAI virus, and the countries have the necessary information that is statistically valid for declaration of the countries to be free from HPAI virus infection.
- The populations in Afghanistan and Pakistan have the confidence that poultry and poultry products are free from HPAI.

4. RECOMMENDATIONS AND CONCLUSIONS

Governments of both countries do not have enough resources to continue the surveillance programme that was developed through the project, which requires additional funds for government staff and procurement of reagents. Funds are needed from donors for continuing the programme. For example, in Pakistan, the National Programme for Avian Influenza Surveillance was closed upon the conclusion of the project; and in Afghanistan, there is no formal government programme for AI. Trained human resources and valuable equipment provided are in the field and the laboratories, but they are not fully utilized.

The project has been successfully implemented, providing the countries with the basis for carrying out surveillance activities of other diseases that are endemic in the region as a result of the free movement of animals across the borders almost without restrictions. The project addressed the concern that the disease could be endemic and unrecognized, as this was possible owing to introductions from infected neighboring countries.

Food and Agriculture Organization of the United Nations

Project Highlights

AFGHANISTAN AND PAKISTAN

“Highly Pathogenic Avian Influenza: strengthening cross-border surveillance and containment activities between Afghanistan and Pakistan”

Project code: OSRO/RAS/703/USA

Donor: USA

Contribution: USD 3.2 million

Implementation: 01/04/08–31/05/11

Target areas: cross-border provinces and subregions

Contact: Daniele Donati

Title: Chief, Emergency Operations Service

Email: daniele.donati@fao.org

Objective:

To promote collaboration between the two involved countries for improving HPAI surveillance by adopting common and shared approaches in areas which may share cultural and social features.

Key partners:

The Ministry of Animal Health and Production in Afghanistan and the Ministry of Livestock and Dairy Development and the National Animal Research Council in Pakistan.

Beneficiaries reached:

Ministries of Agriculture, the Animal Health Departments/Chief Veterinary Offices; national veterinary authorities and animal health and livestock services; poultry producers and traders; the general public; and the international community.

Activities implemented:

- 30 358 samples were received from Afghanistan and 126 470 from Pakistan collected from live bird markets, farms and villages.
- Training of 758 provincial veterinarians, 15 laboratory technicians, 70 vendors, 190 poultry producers and more than 500 students in the two countries.
- 14 provinces surveyed in Afghanistan with a total of 280 villages in 100 districts, and 4 provinces with 156 villages in Pakistan.
- Procurement and distribution of expendable and non-expendable equipment in the two countries.

Impact:

- Diagnostic services and antigen for diagnostic purposes in both countries are easily accessible.
- Development of common strategies and capacities for surveillance in the different subsectors in the concerned areas.
- Equipment, basic laboratory reagents and qualified personnel for serology are in place for diagnosis in two provinces in Afghanistan and four provinces in Pakistan.
- Standardized procedures for inspection of poultry and poultry products at border control posts.

Semester I 2010Project Monitoring Sheet: **OSRO/RAS/703/USA Baby 1 and 2**

Project title: **Highly Pathogenic Avian Influenza: strengthening cross-border surveillance and containment activities between Afghanistan and Pakistan**

Reporting period: **October 2010 – March 2011**

Regional component: Central Asia
Project title: Highly Pathogenic Avian Influenza: strengthening cross-border surveillance and containment activities between Afghanistan and Pakistan
Code: OSRO RAS 703 USA
Budget : 1 300 000 (Phase I), 1 300 000 (Phase II), USD 600 000 (Phase III)
Total budget: USD 3 200 000
Effective starting date: 1 April 2008
Planned end date: 31 May 2011
<p>Context of the project</p> <p>The Highly Pathogenic Avian Influenza (HPAI) H5N1 has been detected both in Afghanistan and Pakistan. In Afghanistan, the disease has had a limited spread in time and space, and outbreaks were all detected within a time frame of two months. In Pakistan, outbreaks have been occurring without a clear pattern, and it is likely that the disease is under-reported in the country. It was observed that the outbreaks in Afghanistan were preceded by the outbreaks detected in Pakistan. The introduction of the virus in Afghanistan could have originated from Pakistan, but this information was not confirmed. Therefore, there has been a need to develop joint activities to strengthen the veterinary collaboration between the two countries and to formulate common approaches and strategies.</p>
<p>Objectives of the project</p> <p>Impact</p> <p>The project aims at building a strategic platform where shared approaches - taking in consideration cultural and social features - can be jointly developed by the two countries. This will contribute to the intensification of information exchange and confidence building on both sides. The project aims at improving HPAI surveillance systems and enhance local capacities for early detection and control of HPAI to avoid further spread to non-infected areas of the countries.</p> <p>Outcomes</p> <ul style="list-style-type: none"> • Inter-country consensus built on containment measures, communication interventions and socio-economic issues; • laboratory and field services capacity enhanced in Federal Administered Tribal Areas (FATA), Khost, Balochistan, Kandahar, Nangarhar, Kyber Pakhtunkhwa (KPK) Province in Peshawar and Abbotabad districts, Sindh and Balkh provinces; • procedures for border control inspections standardized; • strengthening of the surveillance activities in the different sub-sectors; and • common methodological approach to surveillance in live-birds markets (LBMs) elaborated and agreed upon.

Planned activities**Output 1.1 Common strategies and approaches to surveillance developed in the different sub-sectors in the concerned areas.**

Activity 1.1.2 Socio-economic studies on farming practices and market chains.

- Present preliminary results of the analysis.

Output 2.1 Diagnostic ability of field and laboratory staff enhanced.

Activity 2.1.1 Training on laboratory methods for AI and other poultry diseases.

- Continue national training courses in Afghanistan and organize national training courses at the central and provincial laboratories to train the provincial laboratory staff to conduct serological tests.
- Conduct preliminary test for serological tests to be confirmed by the Central Laboratories.
- Support the Central Laboratory in Pakistan in preparing the pilot antigen hatches for haemagglutination inhibition (HI) that will be used in central and provincial laboratories for routine AI surveillance and diagnosis.
- Prepare the SOPs for antigen preparation and complete the training laboratory manual.

Activity 2.1.2 Training on clinical recognition of main poultry diseases.

- Complete and translate the manuals for training on surveillance, differential diagnosis and laboratory in local languages in Afghanistan.
- Conduct the national trainings for refreshing sampling collection, submission to the laboratories, washing and disinfection.

Output 3.1 Procedures for inspection of poultry and poultry products at border control posts standardized.

Activity 3.1.1 Seminar on the legislation framework and procedures for import-export issues of animals and products of animal origin.

- Follow up on the agreement from both countries to complete the review of the main topics for establishment regulations to allow regular legal trading.

Activity 3.1.2 Review and upgrade inspection methodologies.

- Prepare the agenda for the training course on inspection methodologies.
- Conduct the training course on inspection methodologies.
- Finalize the review of SOPs for laboratory procedures and complete the laboratory working manual in the next reporting period.
- Conduct training in both countries for inspectors on international inspection procedures during the next quarters.

Output 4.1 Capacity enhanced to improve the overall surveillance system.

Activity 4.1.1 Regional training workshop on surveillance methods.

- Continue the surveillance activities in all project regions.
- Implement the geographic information system (GIS) for easy recognitions of the places where the surveillance is ongoing.
- Continue with the establishment and analysis of the information from the network of the AI-SIS (Avian Influenza – Surveillance Information System).
- Link the AI-SIS to Transboundary Animal Disease Information System (TADInfo).
- Identify the venues for short-term courses (two months) in epidemiology.
- Identify the most appropriate candidates from the field to be trained abroad in short-term courses on epidemiology.

Activity 4.1.2 National training for the surveillance teams operating in the commercial sector.

- Continue national trainings in the provinces of both countries.

Activity 4.1.3 National training for field veterinarians (from the government, NGOs, private sector).

- Provide national trainings on sample methodologies.

Activity 4.1.4 Training for the surveillance teams that will operate in the rural areas (participatory disease surveillance [PDS] training).

- Review the methodology of PDS conducted by the surveillance teams and make improvements.
- Prepare the PDS technical manual.

Activity 4.1.5 Field activities.

- Continue surveillance activities.

Output 5.1 Surveillance in LBMs strengthened.

Activity 5.1.1 Workshop on methodology of surveillance in LBMs.

- Conduct the workshop on methodology of surveillance in LBMs in each country.

Activity 5.1.2 National training workshop for veterinarians operating in LBMs.

- Conduct a workshop in both countries during the next quarter.

Activity 5.1.3 Surveillance activities in LBMs.

- Carry out the evaluation of the LBMs with respect to the trade movement in all provinces that can provide information on risk assessment in case of an outbreak and on economic impact on the areas.

Activities undertaken during the reporting period

Following the approval of a no-cost project extension until 31 May 2011 from the Donor, a work plan was prepared to complete the pending activities to reach the achievements of intended objectives of the project.

Output 1.1 Common strategies and approaches to surveillance developed in the different sub-sectors in the concerned areas.

Activity 1.1.2 Socio-economic studies on farming practices and market chains.

- The information from the field was collected, and some indicators will be established to analyse the data and assess the economical impact of outbreaks in both countries.

Output 2.1 Diagnostic ability of field and laboratory staff enhanced.

Activity 2.1.1 Training on laboratory methods for avian influenza (AI) and other poultry diseases.

- The laboratory training courses were continued for subregional laboratories in Afghanistan. The enzyme linked immunosorbent assay (ELISA) readers and other laboratory utilities were handed over to the laboratories in Jalalabad (Eastern region: Nangarhar, Laghman, Kunar and Nuristan provinces) from 8 to 10 November 2010, four participants in Mazar-e-Sharif (Northern region: Balk, Samanghan, Jawzjan, Faryab and Sarepol provinces) from 24 to 28 December 2010.
- Following the provision of laboratory equipment and the installation of the software and computer, laboratory staff also received training on electrical recording of ELISA results. ELISA kits were provided for use to test samples during the higher risk period to observe outbreaks of influenza (February to April 2011).
- In addition to these laboratories, the AI-SIS software was installed to feed the

subregional sample information obtained from the field.

- A two-day training course for three persons from National Reference Laboratory for Poultry Diseases in Pakistan was conducted on 11 and 12 October 2010 for data entry of the AI-SIS software. Compilation of information and interpretation of the information analysed were the main topics. The training familiarized the participants with the knowledge of the system.
- The first batches of antigen produced in Pakistan was prepared and distributed to the subregional laboratories (Peshawar, Abbotabad, Karachi and Quetta) for field evaluation. The titers were recorded in the provincial labs to observe the stability of the reagent after transport.
- Field evaluation to test capability at provincial laboratories in Pakistan is ongoing. In Afghanistan, it is pending owing to the lack of antigen for provincial laboratories.
- The SOPs for antigen production are under preparation and will be completed by next reporting period.

Activity 2.1.2 Training on clinical recognition of main poultry diseases.

- Training was conducted in the past, but no training activities are considered in the future.
- The laboratory manual is being finalized in the months of April and May 2011, and the English version is forthcoming.
- FAO participated in the OFFLU meeting on 16 and 17 November 2010, in which two posters were presented, one indicating the surveillance activities conducted in the project and other related to the identification of a novel AI virus that circulated in poultry farms in Pakistan and of a possible another virus subtype.

Output 3.1 Procedures for inspection of poultry and poultry products at border control posts standardized.

Activity 3.1.1 Seminar on the legislation framework and procedures for import-export issues of animals and products of animal origin.

- A meeting between the two CVOs was planned to follow up on the agreement on trade to be conducted in March in Islamabad. However, the Deputy Technical Minister from Afghanistan did not authorize the travel of the Chief Veterinary Officer (CVO). Therefore, the intervention of the Representation was requested to discuss if the mission could be established in the next period.

Activity 3.1.2 Review and upgrade inspection methodologies.

- The quarantine inspection procedures for both countries are still under review and the training on inspection methodologies will be conducted in the next period after the meeting with both CVOs to discuss the procedures.
- The SOPs were established in Pakistan and still are under revision in Afghanistan.

Output 4.1 Capacity enhanced to improve the overall surveillance system.

Activity 4.1.1 Regional training workshop on surveillance methods.

- The regional workshops were completed, and the rapid response is being tested to assure early response to outbreaks.
- An outbreak of sudden mortality was reported on 22 November 2010 in Chawaki district, Kunar province, Afghanistan. The surveillance team was immediately deployed to the place to gather information and collect samples. The samples were tested (HI test and PCR for AI) and were negative. The toxin in the feed from the feed producer company was identified as the cause of mortality.

- An outbreak of respiratory disease in poultry was reported in Lahore at the beginning of January. Therefore, a workshop was conducted in situ to analyse the situation. The Newcastle Disease (ND) virus was identified in the laboratory.
- On 23 and 24 March 2011, a national training workshop on biosecurity was held with the attendance of 75 participants for poultry farmers and laboratory personnel.
- The ten-week training course in Jordan started from 13 March 2011 and will be completed on 22 May 2011. Two nationals from Afghanistan and two nationals from Pakistan are participating. They will initiate a more organized Epidemiology Unit in each country to prepare surveys, collect information and provide informed decisions on animal health issues.
- The GIS was established in both countries and presented the results in the OFFLU meeting in November 2010. The immediate location of the two outbreaks described was identified in the maps of corresponding provinces.
- The network in Pakistan is currently in use with regular internet communication. In Afghanistan, the provincial labs do not have internet access, and the wireless network does not work properly in the country. However, the computers from Mazar-e-Sharif and Jalalabad have installed the necessary system with the capacity to connect, as soon as the technical difficulties with the network are resolved.

Activity 4.1.2 National training for the surveillance teams operating in the commercial sector.

- Continuous national training was conducted in commercial poultry farms with the personnel from Eastern Region in Afghanistan (Nangarhar, Laghman, Kunar and Noorestan) on the importance of HPAI and the HPAI surveillance to prevent the spread of the disease.

Activity 4.1.3 National training for field veterinarians (from the government, NGOs, private sector).

- National training was conducted in the past, therefore no additional courses on this topic will be conducted. However, the field veterinarians have organized informal meetings, following sample collection, as reported from the team in Nangarhar, Afghanistan.

Activity 4.1.4 Training for the surveillance teams that will operate in the rural areas (PDS training).

- For security reasons, the PDS surveys could not be conducted. To avoid problems with the participants and with the survey teams, informal questions were posed during sample collection about morbidities and mortalities. Thus far, no other reports were prepared.

Activity 4.1.5 Field activities.

Surveillance activities:

Afghanistan:

- During the reporting period, 7 265 samples were submitted to the Central Veterinary Diagnosis and Research Laboratory (CVDRL) in Kabul from Eastern (Nangarhar, Laghman, Kunar and Noorsitan), Southern (Kosth. Paktika and Paktia), Southwestern (Kandahar, Zabul and Helamand) and Northern (Mazar-e-Sharif, Samanghan, Jawzjan, Farjab and Sarepol) regions (provinces). Positive serology was found for H5, H7 and H9, without any clinical signs. Positive serology was found for NDV. Six samples were positive for M gene, and none were positive for H5 or H7. The rRT PCR for H9 will be established in the future, since previous samples submitted to the National Reference

Laboratory for Poultry Diseases (NRLPD) in Pakistan resulted positive for H9 viruses.

Pakistan:

- During the reporting period, a total of 13 486 samples were received at NRLPD from the surveillance areas (Abbotabad, KPK, FATA, Balochistan and Sindh provinces).
- Positive serology was identified against H7 and H9, the last one in non-vaccinated animals.
- Isolations were done for AI viruses (H9N2), Newcastle Disease Virus (NDV), Avian Pneumovirus (APV) and Infectious Bronchitis Virus (IBV).
- The Laboratory in Pakistan recently nominated as regional laboratory for AI in a regional project for surveillance of transboundary animal diseases (TADs), owing to the capacity to conduct analysis, virus characterization and training.

Output 5.1 Surveillance in LBMs strengthened.

Activity 5.1.1 Workshop on methodology of surveillance in LBMs.

- Weekly trainings on biosecurity, AI impacts and awareness have been conducted in the East region of Afghanistan. More than 300 persons (poultry vendors, small farmers and villagers and students) have received information on AI prevention. The same training could not be conducted in other regions for security reasons and may have to be discontinued in the other region owing to heightened security issues.

Activity 5.1.2 National training workshop for veterinarians operating in LBMs.

- Informal conversations have been conducted with LBMs vendors, as no veterinarians work at LBMs.

Activity 5.1.3 Surveillance activities in LBMs.

- Surveillance activities are ongoing as indicated above.

Planned activities for the next six-month reporting period

Output 1.1 Common strategies and approaches to surveillance developed in the different sub-sectors in the concerned areas.

Activity 1.1.2

- Conclude the socio-economical study.

Output 2.1 Diagnostic ability of field and laboratory staff enhanced.

Activity 2.1.1 Training on laboratory methods for AI and other poultry diseases.

- Evaluation of the antigen prepared in Pakistan: the antigen will be evaluated in each provincial laboratory to measure its efficacy after transport and time of storage.

Output 3.1 Procedures for inspection of poultry and poultry products at border control posts standardized.

Activity 3.1.1 Seminar on the legislation framework and procedures for import-export issues of animals and products of animal origin.

- The meeting with two CVOs is planned to establish the strategy for trading.

Activity 3.1.2 Review and upgrade inspection methodologies.

- The course will be conducted after the strategy is established among both CVOs.

Output 4.1 Capacity enhanced to improve the overall surveillance system.

Activity 4.1.1 Regional training workshop on surveillance methods.

- Completed.

Activity 4.1.2 National training for the surveillance teams operating in the commercial sector.

- No additional activities are foreseen.

Activity 4.1.3 National training for field veterinarians (from the government, NGOs, private

sector).

- No additional training is planned. This activity was completed.

Activity 4.1.4 Training for the surveillance teams that will operate in the rural areas (PDS training).

- No additional activities will be conducted.

Activity 4.1.5 Field activities.

- Continue the surveillance activities during the next period.

Output 5.1 Surveillance in LBMs strengthened.

Activity 5.1.1 Workshop on methodology of surveillance in LBMs.

- No additional activity is considered for the next period.

Activity 5.1.2 National training workshop for veterinarians operating in LBMs.

- No additional activities will be conducted.

Activity 5.1.3 Surveillance activities in LBMs.

- Routine surveillance will continue until the end of the project.

Main challenges encountered and response provided

- Instalment of equipment and in situ training for Khost and Kandahar provinces could not be carried out owing to security reasons. The project implementation in these provinces is not cleared by the United Nations Department of Safety and Security. Therefore, FAO is unable to provide technical assistance to the laboratories and improve their conditions. Considering the above, the laboratories do not have the required capacities to carry out the tests.
- The CVOs appointed in both countries were fully informed about the project activities, and good relationship has been established to assure the final phase of the project could be implemented. Both CVOs are interested in supporting the findings of Donors to continue the activities and even apply them to other diseases.
- The continued education for vendors, poultry farmers and chicken householders in villages has been carried out with a low profile approach in Afghanistan and continued meetings with farmers are being conducted in Pakistan.
- The epidemiological units in both countries are under construction. The veterinarians in the ongoing course for epidemiology are expected to be responsible for those units to make proposals for future surveys and surveillance strategies for AI and other animal diseases.

Main progress made towards the achievement of project outputs**Output 1.1 Common strategies and approaches to surveillance developed in the different subsectors in the concerned areas.**

- The surveillance activities were conducted at the cross-border region between Afghanistan and Pakistan, and no evidence was found to indicate that the virus is endemic in the region. Therefore, the surveillance should be maintained to detect any possible introduction to other sources. The outbreaks in India should be monitored for early detection.
- The presence of virus H9N2 in the region seems to be endemic and additional programmes to control the virus circulation should be established. Vaccines are used to reduce the clinical signs, but the efficacy of the vaccines should be tested.
- The identification of novel AI virus H3N1 and H4N6 should be monitored to prevent the spread.
- The presence of antibodies against H7 AI virus should be closely monitored in other regions to identify the source.

Output 2.1 Diagnostic ability of field and laboratory staff enhanced.

- Both national laboratories have the capacity to conduct basic analysis for AI detection throughout serology and molecular diagnosis. The laboratory in Pakistan has the capacity to conduct virus isolation and molecular sequencing to support the surveillance conducted in Afghanistan and to produce antigen at low-cost for sustainability of the activity, specially for Afghanistan, but requires funds to maintain the capacity and establish the methodology for distribution.

Output 3.1 Procedures for inspection of poultry and poultry products at border control posts standardized.

- The procedure has been in place since the establishment of formats to gather information, sample collection and logistics for sample submission to the laboratory.
- The poultry inspection methodology, once elaborated, should be established at main border control offices and evaluated.

Output 4.1 Capacity building developed to improve the overall surveillance system.

- The systematic collection of information from the field and from the laboratory results has been established, including a simple software to be used for this purpose. The use of the system should continue beyond the conclusion of the project. However, it would be essential that the government provide further human and financial resources to this activity, otherwise its sustainability would be compromised.

Output 5.1 Surveillance in LBMs strengthened.

- The confidence obtained from the LBM vendors to accept the surveillance from the teams is recognized. It is still necessary to work closely with them in order to provide them with technical assistance to improve the management practices so that the biosecurity measures can be better implemented.

I Quarter 2010

Project Monitoring Sheet: **OSRO/RAS/703/USA Baby 1 and 2**

Project title: **Highly Pathogenic Avian Influenza: Strengthening cross-border surveillance and containment activities between Afghanistan and Pakistan**

Reporting period: **January – March 2010**

Regional component: Central Asia
Project title: Highly Pathogenic Avian Influenza: strengthening cross-border surveillance and containment activities between Afghanistan and Pakistan
Code: OSRO RAS 703 USA Baby 1 and 2 (Phase I, Phase II and Phase III)
Budget : 1 300 000 (Phase I), 1 300 000 (Phase II), USD 600 000 (Phase III)
Total budget: USD 3 200 000
Effective starting date: 1 April 2008
Planned end date: 30 September 2010
<p>Context of the project</p> <p>The Highly Pathogenic Avian Influenza (HPAI) H5N1 has been detected in the recent past, both in Afghanistan and Pakistan. In Afghanistan, the disease has had a limited spread in time and space, and outbreaks were all detected within a time frame of two months. In Pakistan, outbreaks have been occurring without a clear pattern, and it is likely that the disease is under-reported in the country. It was observed that the outbreaks in Afghanistan were preceded by the outbreaks detected in Pakistan. The introduction of the virus in Afghanistan could have originated from Pakistan, but this information was not confirmed. Therefore, there has been a need to develop joint activities to strengthen the veterinary collaboration between the two countries and to formulate common approaches and strategies.</p>
<p>Objectives of the project</p> <p>Impact</p> <p>The project will build a strategic platform where shared approaches - taking in consideration cultural and social features - can be jointly developed by the two countries. This will contribute to the intensification of information exchange and confidence building on both sides. The project will improve HPAI surveillance systems and enhance local capacities for early detection and control of HPAI to avoid further spread to non-infected areas of the countries.</p> <p>Outcomes</p> <ul style="list-style-type: none"> • inter-country consensus built on containment measures, communication interventions and socio-economic issues; • laboratory and field services capacity enhanced in Federal Administered Tribal Areas (FATA), Khost, Balochistan, Kandahar, Nangarhar, North Western Frontier Province (NWFP) (Peshawar and Abbotabad districts), Sindh and Balkh provinces; • procedures for border control inspections standardized; • strengthening of the surveillance activities in the different sub-sectors; and • common methodological approach to surveillance in live-birds markets (LBMs) elaborated and agreed upon.

Planned activities

Output 1.1 Common strategies and approaches to surveillance developed in the different sub-sectors in the concerned areas.

Activity 1.1.1 Regional training workshop on socio-economic issues;

- Prepare agenda, select experts and identify the venue for the workshop

Activity 1.1.2 Socio-economic studies on farming practices and market chains.

- After the workshop, prepare the questionnaires to be used for conducting socio-economic studies

Output 2.1 Diagnostic ability of field and laboratory staff enhanced.

Activity 2.1.1 Training on laboratory methods for avian influenza and other poultry diseases;

- Conduct the bi-national training course in laboratory methods in the National Reference Laboratory for Poultry Diseases (NRLPD) in Pakistan during February 2010, once the security situation improves.
- Enhance laboratory diagnostic capacity in the identified provinces in both countries (FATA, Balochistan, Herat, Kandahar, Nangarhar, NWFP (Peshawar and Abbotabad districts), Sindh and Balkh) through training and setting up of the laboratory equipment.
- Renovate facilities in the NRLPD in Islamabad by March 2010.

Activity 2.1.2 Training on clinical recognition of main poultry diseases.

- Hold the bi-national training course on recognition of major poultry diseases in March 2010 (the venue will be identified in accordance with the security conditions, and therefore it may be held in a third country, should the security situation in Afghanistan and Pakistan not be improved).

Output 3.1 Procedures for inspection of poultry and poultry products at border control posts standardized.

Activity 3.1.1 Seminar on the legislation framework and procedures for import-export of animals and products of animal origin;

- Review the current legislation in both countries.

Activity 3.1.2 Review and upgrade inspection methodologies.

Output 4.1 Capacity enhanced to improve the overall surveillance system.

Activity 4.1.1 Regional training workshop on surveillance methods;

- Conducted

Activity 4.1.2 National training for the surveillance teams operating in the commercial sector;

Activity 4.1.3 National training for field veterinarians (from the government, NGOs, private sector);

- Identify the most suitable candidates for the Master Course in Epidemiology and the respective University to conduct the studies

Activity 4.1.4 Training for the surveillance teams that will operate in the rural areas (Participatory Disease Surveillance (PDS) training);

- Develop Standard Operating Procedures (SOPs) and the manual for the establishment of the sentinel farms and sentinel vendor shops according to the risk factors "likely to be infected" in both countries, in order to improve surveillance of avian influenza and monitoring of the vaccinated farms

Activity 4.1.5 Workshop on communication strategies for villagers; and

Activity 4.1.6 Field activities.

- Initiate surveillance activities in the two new provinces (Balkh in Afghanistan and Sindh in Pakistan) after the recruitment of the field veterinarians and para-veterinarians

Output 5.1 Surveillance in live-birds markets strengthened.

Activity 5.1.1 Workshop on methodology of surveillance in LBMs;

Activity 5.1.2 National training workshop for veterinarians operating in LBMs; and

Activity 5.1.3 Surveillance activities in LBMs.

- Evaluate the LBM in function of the trade movement in all provinces that can give details of risk assessment in case of outbreaks and economic impact in the areas

Activities undertaken during the reporting period

Output 1.1 Common strategies and approaches to surveillance developed in the different sub-sectors in the concerned areas.

Activity 1.1.1 Regional training workshop on socio-economic issues;

- The bi-national training was scheduled to be conducted in Istanbul, Turkey from 26 to 30 April. The course will be conducted by experts of the Royal Veterinary School from the University of London, United Kingdom. The invitations will be sent to the CVOs of both countries for their nomination of candidates.

Activity 1.1.2 Socio-economic studies on farming practices and market chains;

- The study will be carried out as soon as the socio-economic training course is conducted and the strategy in both countries defined during the workshop.

Field activities.

- During the reporting period, the advances were made to the surveillance data management software, named "Avian Influenza Surveillance Information System (AISIS)", and all the provinces from both countries were included. Currently, the procedure on how to link the system to the Geographic Information System (GIS) in Pakistan is being established. The position for the System Data Manager was advertised in Afghanistan and the candidate will be selected at the beginning of next quarter. The expert will provide a training course related to the management of the system and implement the network between the central laboratory and central epidemiological unit and among the laboratories and the countries. In Pakistan, the system is already in on-trial process in order to detect failures and make corrections to the collected information on the surveillance carried out during the project.

Output 2.1 Diagnostic ability of field and laboratory staff enhanced.

Activity 2.1.1 Training on laboratory methods for avian influenza and other poultry diseases;

- The bi-national training course was conducted at the NRLPD in Islamabad, Pakistan for six participants from Afghanistan from the central laboratory and four participants from regional laboratories in Pakistan. All of the participants were provided with an update on the serological tests with practical sessions. In addition, three Afghans experts were instructed practically on virus isolation and molecular diagnosis.
- The renovation of the facilities in the NRLPD to upgrade the air system was completed and it is now fully operational.

Activity 2.1.2 Training on clinical recognition of main poultry diseases.

- This training was scheduled to be conducted in Istanbul, Turkey from 19 to 23 April 2010 with the participation of six veterinarians from both countries. Invitation letters were sent to the Chief Veterinary Officers (CVOs) of both countries and logistics managed with the support of FAO-HQ and FAO office for Central Asia in Turkey. Trainers have been contacted and their travel and contractual arrangements are being finalized.

Output 3.1 Procedures for inspection of poultry and poultry products at border control posts standardized.

Activity 3.1.1 Seminar on the legislation framework and procedures for import-export issues of animals and products of animal origin;

- One expert from each country was contracted to prepare a review of the current legislation to import and export poultry and poultry products. After their review is finalized, the documents will be sent to an expert in regulation who will conduct a seminar workshop with senior officials from both countries to identify proper ways to fill the gaps in the use of the regulations. The seminar is planned to be conducted in July 2010 after the approval from both CVOs.

Activity 3.1.2 Review and upgrade inspection methodologies.

- After the seminar, the proposal to upgrade the inspection methodologies will be prepared by the expert in trading regulations.

Output 4.1 Capacity enhanced to improve the overall surveillance system.

Activity 4.1.2 National training for the surveillance teams operating in the commercial sector;

- One-day training workshop was conducted with the Pakistan Poultry Association on 16 January 2010 to update the avian influenza situation, surveillance procedures and the current development of vaccines.

Activity 4.1.3 National training for field veterinarians (from the government, NGOs, private sector);

- Three national training courses on surveillance, disease control, and data management were conducted from 12 to 19 March 2010 in the capital cities of three provinces in Pakistan: Quetta, Sindh and Islamabad with the participation of 20, 20 and 32 participants respectively for each course.

Activity 4.1.4 Training for the surveillance teams that will operate in the rural areas (PDS training);

- Preparation of a one ten-day national training course that will be conducted in April in Mazar-e-Sharif, Afghanistan for 16 provincial officers on how to conduct PDS activities.
- Preparation of one-week training that will be conducted in Mazar-e-Sharif for women involved in poultry production on how to establish PDS activities, as it is the women who are responsible for raising poultry in villages. The expert for both activities has been hired, and the participation of one national expert is also confirmed.

Activity 4.1.6 Field activities;

Afghanistan:

- During the reporting period, 1243 serum samples were collected and 1571 swabs were tested in the laboratory for Enzyme-Linked Immunosorbent Assay (ELISA), Agar Gel Immunodiffusion (AGID) and HI tests for serology and rapid test and rRT-PCR for swabs. No positive reactions were detected for HPAI.
- Also, the contract of the Veterinarian and the Para-veterinarian for Mazar-e-Sharif was completed for the surveillance activities and the sampling in the region already started.
- The European Union will finance the building of a new laboratory facility; a visit to Mazar-e-Sharif was carried out in order to prepare the budget for the construction. The project will focus on serological tests and sample preparation to be submitted to the central laboratory in Kabul.
- The equipment and reagents from the project were delivered to the central laboratory which is ready to work at the central level. The distribution of the equipment and reagents for provincial laboratories is ongoing and the national course will be conducted during the next reporting period.

Pakistan:

- A total of 3 393 serum samples, 3 539 swabs and 656 organs from suspicious cases of influenza were collected in the reported period and the laboratory results indicate the continuous circulation of AI H9N2 and Newcastle in the region.
- Training for the provincial laboratories technicians was conducted, as indicated before, and antigen, antisera and ELISA kits were delivered to the laboratories in Peshawar, Abbottabad, Quetta and Karachi.
- The hiring of veterinarians for FATA and Karachi has been delayed due to some administrative problems in the provincial office to release the selected persons. However, in both regions, the para-veterinarians are conducting the surveillance activities.
- The current security situation did not allow for the planned technical visit by the project Chief Technical Advisor (CTA) to Abbottabad and Peshawar laboratories to verify the advances.

Output 5.1 Surveillance in live-birds markets strengthened.*Activity 5.1.3 Surveillance activities in LBMs;*

- The surveillance outputs during the reporting period were included in the 4.1.6 activity above.
- One day training course was conducted in the mail LBM with the participation of 25 vendors related to the avian influenza recognition and reporting.

Planned activities for the next quarter**Output 1.1 Common strategies and approaches to surveillance developed in the different sub-sectors in the concerned areas.***Activity 1.1.1 Regional training workshop on socio-economic issues;*

- Training will be conducted in Istanbul, Turkey from 26 to 30 April, 2010.

Activity 1.1.2 Socio-economic studies on farming practices and market chains.

- Questionnaires will be prepared during the next quarter.

Output 2.1 Diagnostic ability of field and laboratory staff enhanced.*Activity 2.1.1 Training on laboratory methods for avian influenza and other poultry diseases;*

- National training courses will be conducted at the central and provincial laboratories for provincial laboratory staff to conduct serological tests.
- The SOPs and the laboratory manual will be completed in the next reporting period.

Activity 2.1.2 Training on clinical recognition of main poultry diseases.

- The training will be conducted in Istanbul, Turkey, in April 2010.

Output 3.1 Procedures for inspection of poultry and poultry products at border control posts standardized.*Activity 3.1.1 Seminar on the legislation framework and procedures for import-export issues of animals and products of animal origin;*

- The national reviews will be concluded and planning for the seminar will be done.

Activity 3.1.2 Review and upgrade inspection methodologies;

- The review will take place after the seminar.

Output 4.1 Capacity enhanced to improve the overall surveillance system.*Activity 4.1.1 Regional training workshop on surveillance methods;*

- A review of the surveillance procedures and formats will be conducted in both countries

along with the use of the AISIS.

- The establishment of the sentinel farms and sentinel vendor shops according to risk factors to be infected will be established in both countries in order to improve surveillance for avian influenza and monitoring the vaccinated farms will be completed by June, 2010.
- Identify the most suitable candidates for the Master Course in Epidemiology and the respective University to carry out the studies for the preparation of the Letter of Agreement (LoA) for the period of study.

Activity 4.1.2 National training for the surveillance teams operating in the commercial sector;

- National trainings will continue in the provinces of both countries.

Activity 4.1.3 National training for field veterinarians (from the government, NGOs, private sector);

- National trainings on sample methodologies will be provided, since they lack sample submission procedures and methodologies.

Activity 4.1.4 Training for the surveillance teams that will operate in the rural areas (PDS training);

- The PDS report formats will be developed.

Activity 4.1.5 Workshop on communication strategies for villagers;

- Preparation of a workshop will be considered.

Activity 4.1.6 Field activities;

- Surveillance activities will continue.

Output 5.1 Surveillance in live-birds markets strengthened.

Activity 5.1.1 Workshop on methodology of surveillance in LBMs;

- The workshop on methodology of surveillance in LBMs will be conducted in each country

Activity 5.1.2 National training workshop for veterinarians operating in LBMs;

- A workshop will be conducted in both countries in May and June 2010.

Activity 5.1.3 Surveillance activities in LBMs

- Surveillance activities will continue.
- The evaluation of the LBM in function of the trade movement will be implemented in all provinces that can provide details of risk assessment in case of outbreaks and economic impact in the areas.

Main challenges encountered and response provided

- The change of the CVO in Pakistan at the end of the reporting period influenced the appointments of the participants for the planned activities. The appointment of the new CVO is pending, and care will be taken to ensure that enough time and attention is given to proper handover procedures, so that the newly appointed CVO is fully informed about the ongoing and planned project activities.
- The present security deterioration and the restrictions are still in place in both Afghanistan and Pakistan. With an improved security situation in the future, it is expected that the remainder of project activities will be completed on time.
- Organizing regional activities as well as regional training and workshops required more time than expected for reasons of limitation of movement and restricted travel for the invited participants of Afghanistan and Pakistan. Considering the unstable security situation in both countries, the regional training courses had to be held in third countries. National training courses, however, may be conducted keeping a low profile in the recommended cities, should the UN security officials allow it.

- Central epidemiology units in both countries, but in particular in Afghanistan, need to be re-established and provided with trained personnel in order to generate reliable disease information needed to implement a prevention and control plan.

Main progress made towards the achievement of project outputs**Output 1.1 Common strategies and approaches to surveillance developed in the different subsectors in the concerned areas.**

- Considering the high risk of virus transmission, the surveillance activities in the cross-border region were improved as compared to the previous quarter, as the avian influenza outbreaks began in January and February. During this reporting period, no evidence of the presence of HPAI virus in the countries was found. However, an alert is in place to increase awareness of the recent outbreaks reported in India, Bangladesh and Lao particularly.

Output 2.1 Diagnostic ability of field and laboratory staff enhanced.

- Routine surveillance in project areas detected consistent circulation of H9N2 AI virus and ND virus at their laboratories. It is, thus, recommended to establish a control program to reduce the incidence of the virus circulation.

Output 3.1 Procedures for inspection of poultry and poultry products at border control posts standardized.

- Progress was limited as a result of a severe security situation.

Output 4.1 Capacity building developed to improve the overall surveillance system.

- The advances made to the data management system for surveillance that will be implemented in both countries will facilitate the analysis of the results of laboratory and field research.

Quarter III 2010**Project Monitoring Sheet: OSRO/RAS/703/USA Baby 1 and 2**

Project title: **Highly Pathogenic Avian Influenza: strengthening cross-border surveillance and containment activities between Afghanistan and Pakistan**

Reporting period: **July – September 2010**

Regional component: Central Asia
Project title: Highly Pathogenic Avian Influenza: strengthening cross-border surveillance and containment activities between Afghanistan and Pakistan
Code: OSRO RAS 703 USA
Budget : 1 300 000 (Phase I), 1 300 000 (Phase II), USD 600 000 (Phase III)
Total budget: USD 3 200 000
Effective starting date: 1 April 2008
Planned end date: 31 May 2011 (new extended date)
<p>Context of the project</p> <p>The Highly Pathogenic Avian Influenza (HPAI) H5N1 has been detected in the recent past, both in Afghanistan and Pakistan. In Afghanistan, the disease has had a limited spread in time and space, and outbreaks were all detected within a time frame of two months. In Pakistan, outbreaks have been occurring without a clear pattern, and it is likely that the disease is under-reported in the country. It was observed that the outbreaks in Afghanistan were preceded by the outbreaks detected in Pakistan. The introduction of the virus in Afghanistan could have originated from Pakistan, but this information was not confirmed. Therefore, there has been a need to develop joint activities to strengthen the veterinary collaboration between the two countries and to formulate common approaches and strategies.</p>
<p>Objectives of the project</p> <p>Impact</p> <p>The project aims at building a strategic platform where shared approaches - taking in consideration cultural and social features - can be jointly developed by the two countries. This will contribute to the intensification of information exchange and confidence building on both sides. The project aims at improving HPAI surveillance systems and enhance local capacities for early detection and control of HPAI to avoid further spread to non-infected areas of the countries.</p> <p>Outcomes</p> <ul style="list-style-type: none"> • Inter-country consensus built on containment measures, communication interventions and socio-economic issues; • laboratory and field services capacity enhanced in Federal Administered Tribal Areas (FATA), Khost, Balochistan, Kandahar, Nangarhar, North Western Frontier Province (NWFP) in Peshawar and Abbotabad districts, Sindh and Balkh provinces; • procedures for border control inspections standardized; • strengthening of the surveillance activities in the different sub-sectors; and • common methodological approach to surveillance in live-birds markets (LBMs) elaborated and agreed upon.

Planned activities**Third Project Steering Committee (SC) meeting:**

As planned in the project document, the objectives of the third project SC meeting were the review of the project activities and achievements and the identification of pending issues. The Chief Veterinary Officers (CVOs) of Afghanistan and Pakistan, the project Chief Technical Adviser (CTA), the national project managers and FAO- Emergency Centre for Transboundary Animal Diseases Operations (ECTAD) relevant officers were invited to attend this meeting.

Output 1.1 Common strategies and approaches to surveillance developed in the different sub-sectors in the concerned areas.

Activity 1.1.2 Socio-economic studies on farming practices and market chains.

- Use the questionnaires in the field.

Output 2.1 Diagnostic ability of field and laboratory staff enhanced.

Activity 2.1.1 Training on laboratory methods for avian influenza (AI) and other poultry diseases.

- Arrange for a short-term training on a joint reference FAO/the World Organisation for Animal Health (OIE) laboratory for a person from the central laboratory in Pakistan involved in the production of AI reagents for the provincial diagnostic and surveillance units.
- Continue national training courses in Afghanistan organized at the central and provincial laboratories to train the provincial laboratory staff to conduct serological tests.
- Use pilot tests in provincial laboratories for conducting serological tests and report results to the central laboratory.
- Finalize the review of the Standard Operating Procedures (SOPs) and complete the laboratory manual in the next reporting period.

Activity 2.1.2 Training on clinical recognition of main poultry diseases.

- Conduct national trainings.

Output 3.1 Procedures for inspection of poultry and poultry products at border control posts standardized.

Activity 3.1.1 Seminar on the legislation framework and procedures for import-export issues of animals and products of animal origin.

- Finalize the bi-national review at the meeting scheduled for 5 and 6 August 2010 in Dubai.

Activity 3.1.2 Review and upgrade inspection methodologies.

- Conduct the review after the seminar with the recommendations obtained.
- Carry out trainings in both countries for inspectors on international inspection procedures during the next quarters.

Output 4.1 Capacity enhanced to improve the overall surveillance system.

Activity 4.1.1 Regional training workshop on surveillance methods.

- Distribute the updated formats for AI to the surveillance teams.
- Conduct a short training course for data collection by using the new AI-Surveillance Information System (SIS) developed in the project.
- Run pilot tests in both regions to facilitate the exchange of information between the regional epidemiological units, the central pilot unit and the central laboratory.

- Carry out pilot tests for the analysis of the results collected under the AI-SIS in the following quarter.
- Identify the most suitable candidates for the Master Course in epidemiology and finalize the terms of the Letter of Agreement (LoA) with the selected university to conduct the studies.

Activity 4.1.2 National training for the surveillance teams operating in the commercial sector.

- Continue national trainings in the provinces of both countries.

Activity 4.1.3 National training for field veterinarians (from the Government, non-governmental organizations (NGOs), private sector).

- Provide national trainings on sample methodologies.

Activity 4.1.4 Training for the surveillance teams that will operate in the rural areas (Participatory Disease Surveillance (PDS) training).

- Distribute the PDS report formats to the veterinary officials to conduct the studies.

Activity 4.1.5 Field activities.

- Continue surveillance activities.

Output 5.1 Surveillance in live-birds markets strengthened.

Activity 5.1.1 Workshop on methodology of surveillance in LBMs.

- Carry out the workshop on methodology of surveillance in LBMs in each country.

Activity 5.1.2 National training workshop for veterinarians operating in LBMs.

- Conduct a workshop in both countries.

Activity 5.1.3 Surveillance activities in LBMs.

- Conduct the evaluation of the LBM with respect to the trade movement in all provinces that can provide information on risk assessment in case of an outbreak and on economic impact on the areas.

Activities undertaken during the reporting period

Third Project Steering Committee meeting:

The third SC meeting was held in Baku, Azerbaijan, on 19 and 20 August 2010 owing to the security situation in the beneficiary countries and the difficulties to obtain an entry visa for Dubai in the United Arab Emirates (UAE). Three governmental officers from Afghanistan, the Director of the Central Laboratory (on behalf of the CVO) and four officials from Pakistan (including the Deputy Animal Husbandry Commissioner on behalf of the CVO) attended the meeting. The project manager from Afghanistan, and the field veterinarian from Kyber Pakhtunkhwa (KPK; former NWFP) Province on behalf of the project manager from Pakistan, in addition to the CTA of the project, the administrative assistant from Afghanistan and the national consultant for the network. The participants from FAO headquarters were the Regional Technical Advisor and Regional Coordinator - Operations.

The main points discussed were: i) balance of good achievements reached during the period; ii) request for an extension of the project owing to the existing funds and pending issues to be resolved; iii) short-term courses in epidemiology for field veterinarians to build the epidemiological units in both countries; iv) suspension of the construction of the slats for the slaughter of chickens in LBM; and v) establishment of the network for surveillance data transmission from the field to a central unit.

Output 1.1 Common strategies and approaches to surveillance developed in the different sub-sectors in the concerned areas.

Activity 1.1.2 Socio-economic studies on farming practices and market chains.

- The questionnaires were prepared and are used in the field to collect economical

information from the surveillance target areas (LBM, farms and villages). The information is processed in the AI-SIS developed for the analysis.

Output 2.1 Diagnostic ability of field and laboratory staff enhanced.

Activity 2.1.1 Training on laboratory methods for avian influenza (AI) and other poultry diseases.

- The short-term training for one technician from the Central Laboratory in Pakistan for AI reagents production was conducted at the FAO/OIE reference laboratory in Ames Iowa, USA from 6 to 25 September 2010. The participant was trained on the protocols for processing virus fluids to prepare antigens and antisera for serological tests. The preliminary batches will be prepared soon.
- The preliminary pilot batches of antigen for haemagglutination inhibition (HI) test will be prepared and used in provincial laboratories for conducting serological tests and reporting results to the Central Laboratory in Pakistan.
- A 15-day training for two laboratory technicians from Central Laboratory in Afghanistan was conducted in the Central Laboratory in Pakistan (from 12 to 24 July 2010). The aim of the course was to review the methodologies and to solve doubts in practical training.
- A ten-day (from 19 to 30 September 2010) training course for serological diagnosis was conducted in the Central Laboratory in Kabul for four officials responsible for the serological tests in the provincial laboratories in Nangarhar, Mazar-e-Sharif, Khandahar and Herat.

Activity 2.1.2 Training on clinical recognition of main poultry diseases.

- The planned trainings were not conducted owing to other priorities.

Output 3.1 Procedures for inspection of poultry and poultry products at border control posts standardized.

Activity 3.1.1 Seminar on the legislation framework and procedures for import-export issues of animals and products of animal origin.

- The review workshop was conducted in Baku, Azerbaijan from 25 to 28 August 2010, instead of Dubai (visa was not granted for the participants). The workshop was conducted by an international expert who lectured on: i) the interests of the authorities from both countries to improve the legal trade under proper regulations; ii) the review of the old agreement of the farms approved to export poultry (one-day old chickens) from Pakistan to Afghanistan; iii) maintaining close contact with the counterparts for trading issues; and iv) holding six-monthly meetings to review progress. Three senior officials from both countries attended the workshop, including the Deputy Minister for Agriculture from Pakistan and former CVOs.

Activity 3.1.2 Review and upgrade inspection methodologies.

- Both countries are reviewing their own inspection methodologies to identify gaps and provide assistance with their improvement.

Output 4.1 Capacity enhanced to improve the overall surveillance system.

Activity 4.1.1 Regional training workshop on surveillance methods.

- The updated formats for AI were distributed to the surveillance teams and the information collected and transferred online from Jalalabad (network pilot tests).
- A short training course (10 August 2010) was conducted in Kabul to collect data (owing to security advisory alert, the field veterinarian from Nangarhar could not attend) by using the new AI-SIS developed in the project in both countries.
- Pilot tests are ongoing in both countries to facilitate the exchange of information

between the regional epidemiological units, the central pilot unit with the Central Laboratory.

- Owing to delays in the collection of data, the pilot tests for the analysis of the results collected under the AI-SIS will be conducted in the next reporting period.
- Following a request by both countries, the Master of Science course was cancelled, as the nomination of the candidates could not be completed. Therefore, it has been agreed on a new requirement to substitute the long-term course with short-term trainings in the universities or centres for field epidemiologists and to establish the Central Epidemiological Unit for both countries.
- A workshop was organized from 26 to 30 June 2010 in Istanbul, Turkey to review and update the contingency plan (CP) for HPAI under the consultancy of an expert from the University of Melbourne, since the CP developed in Australia is considered as one of the best CPs developed. The workshop was attended by the staff from the CVO and the National Reference Laboratory from both countries.

Activity 4.1.2 National training for the surveillance teams operating in the commercial sector.

- Continuous national one-day trainings have been conducted in commercial poultry farms with the personnel from Eastern Region in Afghanistan (Nangarhar, Laghman, Kunar and Noorestan) on the importance of HPAI and the surveillance to prevent the spread.

Activity 4.1.3 National training for field veterinarians (from the government, NGOs, private sector).

- National two-day trainings were conducted in July 2010 (on 13 and 14 July in Karachi and on 16 and 17 July in Abbotabad), Pakistan on Biosecurity in Poultry Farms with the participation of 35 and 40 persons from poultry farms for each training.

Activity 4.1.4 Training for the surveillance teams that will operate in the rural areas (PDS training).

- The PDS report formats were distributed to the veterinary officials in Afghanistan to conduct the studies.

Activity 4.1.5 Field activities.

Surveillance activities:

Afghanistan:

- During the reporting period, 4 729 samples were submitted to the Central Laboratory from the Eastern (Nangarhar, Laghman, Kunar and Noorsitan), Southern (Kosth. Paktika and Paktia), Southwestern (Kandahar, Zabul and Helamand) and Northern (Mazar-e-Sharif, Samanghan, Jawzjan, Farjab and Sarepol) regions (provinces). Positive serology was found for H9. From polymerase chain reaction (PCR), 13 samples were positive for Influenza type A.
- The 13 positive samples by PCR were sent to the laboratory in Pakistan (being considered as a potential subregional laboratory) for confirmation, and only nine samples were determined to be positive for H9N2.
- The adaptation of the laboratory in Mazar-e-Sharif was concluded and the personnel will start to work in this area very soon. The equipment was already submitted for the network from the lab.

Pakistan:

- During the reporting period a total of 5 189 samples were submitted to the lab from the provinces KPK (Peshawar, Abbotabad), Balochistan (Quetta), FATA and Sindh (Karachi). Positive serology was found for H9 viruses and isolations were obtained of H9N2 AI and Newcastle Disease (ND) viruses and salmonella spp infection.

- The national reference laboratory is under a selection process to become the Subregional Laboratory for Central Asia in order to provide support for AI diagnosis to the Central Asian countries, including Afghanistan. Therefore, all documents were prepared, and the evaluation was supported by the project.
- As mentioned before, the Central Laboratory in Pakistan conducted the subtyping of the AI viruses identified in Afghanistan as type A. From the samples submitted to the laboratory, it was possible to identify the H9N2 AI virus. It is necessary to improve the procedure for sending-receiving samples to the laboratory by optimizing the request from the CVO in Afghanistan and obtaining the approval for introduction of the samples by the CVO in Pakistan.

Output 5.1 Surveillance in LBMs strengthened.

Activity 5.1.1 Workshop on methodology of surveillance in LBMs.

- Weekly trainings were conducted in the East region in Afghanistan within the cities' LBM, where a total of 160 vendors from different markets were trained on the causes of diseases, HPAI warnings, surveillance and biosecurity.
- The same training could not be conducted in other regions owing to security conditions.

Activity 5.1.2 National training workshop for veterinarians operating in LBMs.

- There are no veterinarians operating in the LBMs, therefore it is necessary to conduct the trainings for local vendors.

Activity 5.1.3 Surveillance activities in LBMs.

- The evaluation of the LBMs is on standby owing to security conditions in the regions. The assessment of the economic impact of any disease outbreak, and with respect to the trade movement, will be conducted in all provinces that can provide information on risk assessment in case of an outbreak and on economic impact on the areas. The preliminary information is being gathered in the basic information format and will be analysed and reported in the next reporting period.

Planned activities for the next reporting period

Output 1.1 Common strategies and approaches to surveillance developed in the different sub-sectors in the concerned areas.

Activity 1.1.2 Socio-economic studies on farming practices and market chains.

- Present preliminary results of the analysis.

Output 2.1 Diagnostic ability of field and laboratory staff enhanced.

Activity 2.1.1 Training on laboratory methods for AI and other poultry diseases.

- Continue national training courses in Afghanistan and organize national training courses at the central and provincial laboratories to train the provincial laboratory staff to conduct serological tests.
- Conduct preliminary test for serological tests to be confirmed by the Central Laboratories.
- Support the Central Laboratory in Pakistan in preparing the pilot antigen batches for HI that will be used in central and provincial laboratories for routine AI surveillance and diagnosis.
- Prepare the SOPs for antigen preparation and complete the training laboratory manual.

Activity 2.1.2 Training on clinical recognition of main poultry diseases.

- Complete and translate the manuals for training on surveillance, differential diagnosis and laboratory in local languages in Afghanistan.
- Conduct the national trainings for refreshing sampling collection, submission to the laboratories, washing and disinfection.

Output 3.1 Procedures for inspection of poultry and poultry products at border control posts standardized.

Activity 3.1.1 Seminar on the legislation framework and procedures for import-export issues of animals and products of animal origin.

- Follow-up the agreement from both countries to complete the review of the main topics for establishment regulations to allow regular legal trading.

Activity 3.1.2 Review and upgrade inspection methodologies.

- Prepare the agenda for the training course on inspection methodologies.
- Conduct the training course on inspection methodologies.
- Finalize the review of SOPs for laboratory procedures and complete the laboratory working manual in the next reporting period.
- Conduct trainings in both countries for inspectors on international inspection procedures during the next quarters.

Output 4.1 Capacity enhanced to improve the overall surveillance system.

Activity 4.1.1 Regional training workshop on surveillance methods.

- Continue the surveillance activities in all project regions.
- Implement the geographic information system (GIS) for easy recognitions of the places where the surveillance is on-going.
- Continue with the establishment and analysis of the information from the network of the AI-SIS.
- Link the AI-SIS to Transboundary Animal Disease Information System (TADInfo).
- Identify the venues for short-term courses (two months) in epidemiology.
- Identify the most appropriate candidates from the field to be trained abroad in short-term courses on epidemiology.

Activity 4.1.2 National training for the surveillance teams operating in the commercial sector.

- Continue national trainings in the provinces of both countries.

Activity 4.1.3 National training for field veterinarians (from the government, NGOs, private sector).

- Provide national trainings on sample methodologies.

Activity 4.1.4 Training for the surveillance teams that will operate in the rural areas (PDS training).

- Review the methodology of PDS conducted by the surveillance teams and make improvements.
- Prepare the PDS technical manual.

Activity 4.1.5 Field activities.

- Continue surveillance activities.

Output 5.1 Surveillance in LBMs strengthened.

Activity 5.1.1 Workshop on methodology of surveillance in LBMs.

- Conduct the workshop on methodology of surveillance in LBMs in each country.

Activity 5.1.2 National training workshop for veterinarians operating in LBMs.

- Conduct a workshop in both countries during the next quarter.

Activity 5.1.3 Surveillance activities in LBMs.

- Carry out the evaluation of the LBMs with respect to the trade movement in all provinces that can provide information on risk assessment in case of an outbreak and on economic impact on the areas.

Main challenges encountered and response provided

- In both countries, the processes for replacement of the CVOs have been very slow, and no agreements could be established with the acting CVOs. Care needs to be taken to ensure that the newly appointed CVOs is fully informed about the ongoing and future project activities.
- As a result of the elections of the parliament authorities in Afghanistan, UN staff movement restrictions have been in place. The UN security office is anticipating some reactions from the political parties to the elections during October and November, limiting the project field activities and trainings planned. The bi-national trainings were conducted in a third country, and local trainings were conducted under low profile and in low risk cities. Therefore, the current security conditions in Afghanistan need to be taken into consideration while organizing the upcoming project activities. In Pakistan, the threats to international activities persist as an important element to be considered when planning or implementing project activities. Restrictions to the movement of UN staff may hinder the implementation of project activities.
- Central epidemiology units in both countries are not fully established and require provision of intensive training for understanding epidemiological concepts. Although some veterinarians have been trained in Pakistan, it is necessary to identify the location of the Central Unit in question.
- It was estimated that more time was required to implement the earlier planned activities in order to achieve the intended objectives, owing to the difficulties encountered and the security restrictions in both countries. Although most of the provisions are on the ground, they will require additional time to be made operational. As a result of this, a no-cost project extension of eight months (up to 31 May 2011) was requested and duly granted by the Donor.

Main progress made towards the achievement of project outputs**Output 1.1 Common strategies and approaches to surveillance developed in the different subsectors in the concerned areas.**

- Considering the high risk of virus transmission, the surveillance activities in the cross-border region were improved. During this reporting period, no evidence of the presence of HPAI virus in the countries was found. However, there is a need for an increased awareness about the pandemic potential of H9N2 and H7 for AI and ND viruses that are limiting poultry production. An evaluation of the control strategies should be carried out.

Output 2.1 Diagnostic ability of field and laboratory staff enhanced.

- Routine surveillance in project areas detected consistent circulation of H9N2 AI and ND viruses at their laboratories. It is, thus, recommended to establish a control programme to reduce the incidence of the virus circulation.
- The new facility, established in Pakistan, for virus isolation at a level of biosecurity higher than level 2 will conduct the biosafety diagnosis for the region.
- A mission from FAO reviewed the conditions of the laboratory in Pakistan and its suitability in becoming a subregional laboratory for AI typing confirmation and sub-typing samples obtained in other countries. Additionally, the laboratory could conduct regional trainings for neighbour countries for AI improvement diagnosis and supply antigens for serological studies. It could also serve as a twin laboratory of one of the joint FAO/OIE reference laboratories, which will be important for the regional diagnosis of AI.

Output 3.1 Procedures for inspection of poultry and poultry products at border control posts standardized.

- Progress was limited as a result of a severe security situation at the border areas.

Output 4.1 Capacity building developed to improve the overall surveillance system.

- The advances made to the data management system for surveillance that will be implemented in both countries will facilitate the analysis of the results of laboratory and field research.

Project Monitoring Sheet: OSRO/BGD/902/USA

Project Title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) in Bangladesh, including active surveillance

Reporting period: October 2010 – March 2011

Country: Bangladesh
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) in Bangladesh, including active surveillance
Code: OSRO/BGD/902/USA + OSRO/RAS/605/USA Baby 01
Effective starting date: October 2009
Planned end date: September 2010
Budget OSRO/BGD/902/USA: USD 3 082 800 (Phase I)
Total budget: USD 3 082 800
Budget OSRO/RAS/605/USA Baby 01: USD 515 000 (Phase I), USD 1 365 000 (Phase II), USD 1 225 000 (Phase III)
Total Budget: USD 3 105 000
Effective starting date: July 2006
Planned end date: September 2011
Context of the project
<p>At present, there are five high-risk countries that are still considered endemic for Highly Pathogenic Avian Influenza (HPAI) H5N1: Bangladesh, China, Egypt, Indonesia and Viet Nam. Since the first outbreak in March 2007, Bangladesh has experienced a total of 493 outbreaks (437 commercial and 56 backyard). Fifty one out of 64 districts and 170 out of 492 Upazilas/Thanas (subdistricts) have been affected thus far, resulting in the culling of over 2.2 million birds. Following the peak of HPAI H5N1 incidence in 2008, the number of annual outbreaks remains at around 30 in 2009 and 2010 respectively. However, as of January 2011 and after an absence of over six months, the number of outbreaks among poultry started to rise. The situation is compounded by the occurrence of crow die-offs and detection of a non-fatal second and a third human infection with H5N1 virus and a fourth one with H9N2 virus.</p>
Objectives of the project
<p>The primary objective of the project is to improve control of infectious diseases by enhancing outbreak responses for preventing poultry diseases and developing awareness of HPAI in Bangladesh.</p> <p>Specific immediate objective is to improve the HPAI surveillance capacity of the Government of Bangladesh to respond more effectively to HPAI outbreaks and thereby reduce economic losses and a global human pandemic threat. Specifically, the project aimed to achieve the following:</p> <ul style="list-style-type: none"> • increasing the capacity of the Department of Livestock Services (DLS) to manage the surveillance programme without technical or operational help from the Food and Agriculture Organization of the United Nations (FAO); • early reporting of poultry diseases by door-to-door surveillance; • early HPAI detection by diagnostic specimen collection and testing to ensure a rapid and effective disease response to control HPAI;

- increasing awareness among the surveyed farmers and villagers to strengthen passive surveillance; and
- improving and monitoring minimum biosecurity standards in commercial farms.

Planned activities:

Output 1: Improved coordination and management for disease detection, diagnosis, control and prevention

- Continue to provide expertise to the Government of Bangladesh, facilitate contacts between the Government and Donors and coordinate projects and regional activities.
- Increase coordination role to cover activities funded by the World Bank (WB) and the United States Agency for International Development (USAID).
- Complete geospatial farm mapping project and use the system for facilitating outbreak responses.

Output 2: Enhanced outbreak response by effective Outbreak Response Management Centre

- Support the Government in conducting outbreak investigation on avian influenza (AI).
- Improve post-outbreak investigation by collecting samples from free-ranging ducks in backyards in the vicinity of affected farms and inoculate samples into embryonated eggs to attempt virus isolation.
- Support the Government to design and conduct case control study to ascertain the risk factors.
- Conduct a longitudinal study in a selected district.
- Conduct 'simulation' or 'drill' to examine the standard operating procedures (SOPs) and train field staff for practicing SOPs during operations.
- Support the Government on any disease response and control efforts.
- Enhance collaboration between the USAID-supported staff and WB-supported staff according to the matrix developed in discussion between the two organizations.

Output 3: Improved biosecurity status in poultry sectors through biosecurity campaigns in the target areas

- Conduct biosecurity campaigns across the country targeting the large-, medium- and small-scale poultry farmers through Additional Veterinary Surgeons (AVSs)/ Community Animal Health Workers (CAHWs), expanding from 260 up to 306 Upazilas.
- Provide continuous assistance to Public-Private Partnership (PPP) and Cleaning and Disinfection (C&D) of LBM project (OSRO/INT/805/USA)
- Conduct training for farm managers to improve biosecurity of commercial farms.

Output 4: Provision of assistance to the Government of Bangladesh to implement the National Avian Influenza and Human Pandemic Influenza Preparedness Plan

- Support continuously the Government in the execution of National Avian Influenza and Human Pandemic Influenza Preparedness Plan.

Output 5: Active surveillance of HPAI

- Assist in the implementation of the active surveillance programme in 306 Upazilas/ Metrothanas under the programme financed by WB under the Avian Influenza Preparedness and Response Project (AIPRP). Carry out active surveillance through 88 AVSs.
- Awareness building among school children in selected areas to encourage reporting of sickness and death in poultry.

Activities undertaken during the reporting period**Output 1: Improved coordination and management for disease detection, diagnosis, control and prevention.**

- The Team Leader (TL)/Chief Technical Adviser (CTA) and FAO Representative visited the Japanese Ambassador to update him on the progress and explore possibilities for future funding.
- The TL/CTA liaised with the World Organisation for Animal Health (OIE) headquarters, OIE Representation for Asia and the Pacific to facilitate information sharing initiatives.
- Provided expertise on various issues, including vaccinations by attending national technical committee meetings or in direct consultation with the Director General (DG) DLS, the Secretary and the Minister for Fisheries and Livestock.
- Assisted the Chief Veterinary Officer (CVO) (Director Animal Health Administration) to attend “Regional Cooperation Programme on Highly Pathogenic and Emerging Diseases (HPED) in South Asia”, held on 30 September and 1 October 2010 in Colombo, Sri Lanka. Operationalization of a number of activities including the establishment of the Regional Support Unit (RSU), Regional Epidemiology Centre (REC) and the three Regional Reference Diagnostic Laboratories on priority transboundary animal diseases (TADs) was discussed.
- An international expert on AI was recruited in order to provide Technical Assistance Services (TAS) for AIPRP, Project Coordination Unit (PCU), DLS, supported by WB along with other national and international staff.
- Assisted the Secretary of the Ministry of Fisheries and Livestock to attend the “36th Session World Food Security Committee” held from 11 to 14 October 2010 in Rome.
- Assisted CVO (Director Animal Health Administration) to attend the Global Rinderpest Eradication Programme (GREP) held on 13 and 14 October 2010 in Rome.
- In the “USAID/Bangladesh” Lessons Learned and Disseminated Workshop: H5N1 Virus” held on 13 October 2010 in Dhaka, a national consultant presented the paper “Improved biosecurity and hygiene at production, collection points and live bird markets including decontamination”. The workshop was attended by the Minister for Fisheries and Livestock and the Mission Director of USAID.
- Co-organized the “Workshop on orientation of cross-border preparedness to HPAI control” with the Emergency Centre for Transboundary Animal Diseases (ECTAD) South Asian Association for Regional Cooperation (SAARC) component, FAO Nepal on 29 and 30 December 2010, and on 2 and 3 January 2011.
- A relevant government high official of Bangladesh and CTA participated in “High level regional consultation on the control of priority transboundary animal and other emerging infectious diseases in South Asia” held on 13 and 14 January 2011, Bangkok, Thailand. Both policy and technical issues related to a concerted and coordinated action plan for improved control of priority TADs in South Asia were

discussed.

- Co-organized with ECTAD/SAARC component the “Workshop on evaluation of Foot-and-Mouth Disease (FMD)-progressive Control Pathway” on 5 January 2011 to understand the current status of FMD control programmes in Bangladesh, India and Nepal.
- Co-organized with ECTAD/SAARC component “Sensitization workshop for media in Bangladesh for prevention and control of HPAI” held on 15 February 2011 in Dhaka. The TL/CTA presented a paper on the status of H5N1 HPAI outbreaks in Bangladesh. The opening ceremony was attended by the Minister for Fisheries and Livestock, Secretary of the Ministry of Fisheries and Livestock, DG and CVO, DLS.
- “AI situation report” was frequently updated and distributed among stakeholders, donors and others for sharing up-to-date information on AI in Bangladesh.
- Collaborated with other organizations including the United States Geological Survey (USGS), the International Centre for Diarrhoeal Disease Research Bangladesh (ICDDRDB), in assisting wild birds surveillance in relation with H5N1 HPAI.
- Maintained close contact with public health sectors such as DG Health, the Institute of Epidemiology, Disease Control and Research (IEDCR) and the World Health Organization (WHO) in sharing information on H5N1 infection in humans as well as other diseases, such as Nipah virus infection and anthrax.
- One oral and three poster presentations were held during the event “Vet2011” at Bangladesh Agriculture University, Mymensingh, held on 9 and 10 February 2011.
- The AI Technical Unit (TU) team actively participated in the 7th International Poultry Show and Seminar organized by the World’s Poultry Science Association-Bangladesh Branch (WAPSA-BB), and one consultant chaired a scientific session.
- CTA and other consultants investigated the decontamination status of several HPAI outbreaks.

Output 2: Enhanced outbreak response by effective Outbreak Response Management Centre

- A number of SOPs were updated/developed as follows:
 1. Culling and disposal
 2. Decontamination
 3. Restocking
 4. Outbreak investigation
 5. Post-outbreak/Infected place management (comments need to be incorporated)
 6. Laboratory and biosafety
- Assisted the national reference laboratory for AI, the Bangladesh Livestock Research Institute (BLRI), and the Central Disease Investigation Laboratory (CDIL) to be assessed for their biosafety by international expert to ensure laboratory safety.
- To facilitate outbreak response management, geo-spatial information from all commercial farms and major LBMs in the country was entered into a computer. The data was being further processed to compute the density of farms as well as LBMs in relation to affected farms to strengthen ongoing countrywide HPAI surveillance programme.

Output 3: Improved biosecurity status in poultry sectors through biosecurity campaigns in the targeted areas.

- Workshops on “Record keeping and biosecurity auditing in commercial poultry farm”

were held on 20 and 27 October 2010 and 23 December 2010. A record keeping template was developed in the workshop.

- “Biosecurity SOP’s writing workshop for poultry producers and service providers” was held from 19 to 21 January 2011.
- “Training on farm biosecurity and decontamination for poultry farm managers in HPAI affected areas” was held on 22 and 23 March 2011.
- In “Biosecurity training for poultry industry suppliers”, a total of 838 poultry industry suppliers were trained on biosecurity. The trained industry suppliers transferred their biosecurity knowledge to 5 500 poultry farmers.
- “Training of trainers (ToT) on biosecurity auditing for the Department of Livestock Services (DLS) officials”, 26 DLS officials at the District Livestock Office level were trained.

Output 4: Provision of assistance to the Government of Bangladesh to implement the National Avian Influenza and Human Pandemic Influenza Preparedness Plan

- In response to an urgent request from the Government of Bangladesh, FAO Mission on “In-depth assessment of the present and past situation of the anthrax outbreak in Bangladesh” was dispatched to Bangladesh from 25 October to 3 November 2010.
- One of the FAO Mission members, FAO Representative and CTA of AI TU/Country Team Leader of ECTAD appeared in a TV talk show to disseminate evidence-based information to the general public, and the TV programme was repeatedly broadcast.
- Upon request from DLS, SOPs on culling and disposal, decontamination, restocking, outbreak investigation, post-outbreak/infected place were provided to be distributed to all District Livestock Offices in the country.

Output 5: Active surveillance on HPAI

- Assisted AIPRP in training on active surveillance using SMS Gateway for Avian Influenza Workers (AIWs; previously called “CAHWs”).
- Assisted AIPRP in refresher training for AVSs on active surveillance using SMS Gateway on 30 and 31 March 2011.
- “Training in HPAI active surveillance network programme” was conducted on 7 November and 27 December 2010.
- Technical Meeting on HPAI active surveillance programme was held on 6 January 2011 for AVSs.
- Assisted AIPRP in training AVSs on culling, safe disposal, biocontainment and biosecurity on HPAI (March 2011).
- Maintained the system receiving approximately 1 000 SMS messages per day from 1 035 AIWs in 306 Upazilas.
- Maintained the network of 88 AVSs supervising AIWs.
- Supported installation of transmitters in migratory birds in Hakaluki Haor in February 2011.
- An international expert was employed to integrate existing databases to design integrated and effective data entry and analysis.

Planned activities for the next six-month period

Output 1: Improved coordination and management for disease detection, diagnosis, control and prevention

- Continue to provide expertise to the Government of Bangladesh, facilitate contacts between the Government and donors and coordinate projects and regional activities.
- Increase coordination role in activities funded by WB and USAID.
- Using geospatial farm mapping data, develop a system to enable outbreak responses to be carried out more efficiently.
- Collaborate and coordinate with public health and wild life sectors to develop a more holistic approach in line with the One Health initiative.

Output 2: Enhanced outbreak response by effective Outbreak Response Management Centre

- Support the Government in conducting outbreak investigation on AI.
- Ensure that affected farms are properly and repeatedly decontaminated after immediate post-outbreak decontaminations.
- Improve post-outbreak investigation by collecting samples from free-ranging ducks in backyards in the vicinity of affected farms and inoculate samples into embryonated eggs to attempt virus isolation.
- Develop a system to support the Government in any disease response and control efforts.
- Enhance collaboration between the USAID-supported staff and WB-supported staff according to the matrix developed in discussion between the two organizations.
- Further strengthen search for reservoirs of H5N1 HPAI as well as LPAI among free-ranging, scavenging ducks in backyards in the proximity of affected farms.
- Reduce the risk of re-occurrence of H5N1 HPAI outbreaks by removing hidden reservoirs, as well as by rapid disposal of dead wild birds.

Output 3: Improved biosecurity status in poultry sectors through biosecurity campaigns in the target areas

- Conduct biosecurity campaigns across the country targeting the large-, medium- and small-scale poultry farmers through AVSS/CAHWs, expanding from 306 up to 492 Upazilas.
- Continue to provide assistance to the Public-Private-Partnership (PPP) and C&D of LBM project (OSRO/INT/805/USA).

Output 4: Provision of assistance to the Government of Bangladesh in implementing the National Avian Influenza and Human Pandemic Influenza Preparedness Plan

- Continue to provide support to the Government in the implementation of National Avian Influenza and Human Pandemic Influenza Preparedness Plan.

Output 5: Active Surveillance on HPAI

- Assist in the implementation of the active surveillance programme across 306 Upazilas/Metrothanas under the programme financed by WB AIPRP.
- Assist in providing necessary refresher training to Avian Influenza Workers on the Active Surveillance using SMS Gateway system.
- Carry out active surveillance through 88 AVSS.

Main challenges encountered and response provided

- The post-outbreak decontamination and improvement of biosecurity are two main challenges encountered during the implementation of the project. Decontamination of affected sheds and premises need to be intensified as a part of post-outbreak responses. To ensure the chain of transmission is broken, decontamination needs to be repeated after immediate post-outbreak decontaminations. Further, FAO has developed Standard Operating Procedures (SOPs) for post outbreak decontamination and submitted to government for implementation in the field. FAO has already flagged the issue in different meetings with the government.
- Backyard poultry was considered secondary to the poultry on commercial farms. Awareness needs to be heightened among backyard farmers that they play critical roles in prevention of HPAI outbreaks in commercial farms in the vicinity. FAO has piloted school training programme for raising awareness for reporting poultry sickness and death. Technical support has been provided to develop communication materials to sensitize backyard farmers for disease reporting.
- Most of the backyard poultry are free-ranging and are allowed to scavenge in the environment. Risk of intermingling with wild migratory birds, as well as free-ranging ducks, need to be acknowledged by backyard farmers. Training of backyard farmers are needed. FAO has supported development of communication material to encourage separating terrestrial birds from aquatic fowls in backyards. Advocacy is also needed.
- Owing to a shortage of human and material resources at the field level, quick and appropriate response to disease events was lacking at times. Additional Veterinary Surgeons need to be advised to provide assistance to ascertain quick and appropriate response and to complement the veterinary services. FAO has raised the issue with the government and government is planning to reorganize DLS with more human and material resources.
- Motivation was weak among DLS staff to capture every disease event at the earliest stage. Awareness of DLS staff needs to be heightened by training.
- Compliance to animal disease regulation is weak. Compliance needs to be reinforced by training veterinary officers, raising public awareness, communication and farmer education. FAO has recruited one consultant to review legislation to recommend mitigation options of implementation bottlenecks.
- Registration of farms is not established. Farmers need to be encouraged to register their farms. Benefits of being registered need to be widely known through advocacy.
- Movement control in densely populated areas is difficult. Cooperation from communities needs to be sought by deploying community leaders. FAO has developed SOPs where directives have been given for implementation of movement control.
- Properties are often not easily accessible. Farms in remote places nevertheless need to be visited in an event of unusual mortality. Unwilling farmers need to be persuaded.

Main progress made towards the achievement of project outcomes

- FAO TU was established at DLS comprising a team of international and national experts and support staff.
- The office for the TU at DLS was refurbished including the provision of standby power supply. TU is fully computerized with high-speed reliable internet services.
- AI TU is technically and logistically supporting the DLS.
- Biosecurity and awareness of HPAI are reinforced and strengthened by: the Active Surveillance Programme, teachers training and dissemination of 50 000 leaflets, posters and stickers to schools and at various national and regional meetings.
- Door-to-door/farm-to-farm surveillance was initiated using a network of 1 035 AIWs (CAHWs). The CAHWs, 103 AVSs and respective 306 supervising Upazila livestock officers (ULOs), 32 veterinary officers of the “Strengthening of support service for combating avian influenza” (SSCAIB) project received the necessary training. As a result, disease surveillance enhanced disease reporting. Better surveillance combined with increased awareness and constant reinforcing of biosecurity messages helped to reduce the number of HPAI outbreaks.
- All 1 035 recruited AIWs (CAHWs) received training and refresher training by FAO consultants on basic communication skills, specifically on those related to HPAI and SMS gateway.
- Various laboratory supplies including polymerase chain reaction (PCR) kits, RNA extraction kits, primers and other consumables were provided to BLRI laboratory to support the increase in diagnostic workload.
- SOPs for laboratory tests for AI diagnosis were drafted and submitted to the Government.
- SOPs for outbreak response, disease investigation, culling, C&D were drafted and are being reviewed.
- FAO team facilitated the Laboratory Working Group meetings attended by BLRI, CDIL and the Field Disease Investigation Laboratory (FDIL) to provide advice on laboratory design and procurement.
- Technical officers of eight leading farms and selected government veterinarians received training on biosecurity and routine disinfection for poultry raising establishments.
- Two hundred government veterinarians received training on post-outbreak decontamination.
- FAO contributed to the development of the Second Communication Strategy for Avian and Pandemic Influenza.
- Web-based SMS gateway improved the early reporting system.
- Lowering of the number of HPAI H5N1 outbreaks was achieved without resorting to vaccination during the last three years.
- Strong partnership was established between the DLS and FAO allowing for smooth transmission of information and collective action.
- With the support of USAID and WB, a team was formed consisting of four international staff and 11 national staff members.
- All of the 780 CAHWs involved in the active surveillance programme using SMS Gateway were transferred from FAO to AIPRP, DLS as a part of the process of ownership transfer by the end of September 2010.
- For the improvement of LBMs, a solid collaboration was established with AIPRP, DLS.

I Quarter 2010

Project Monitoring Sheet: OSRO/BGD/902/USA

Project Title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) in Bangladesh, including active surveillance

Reporting period: January – March 2010

Country: Bangladesh
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) in Bangladesh, including active surveillance
Code: OSRO/BGD/902/USA + OSRO/RAS/605/USA Baby01
Budget OSRO/BGD/902/USA: USD 3 082 800 (Phase I)
Total budget: USD 3 082 800
Effective starting date: October 2009
Planned end date: September 2010
Budget OSRO/RAS/605/USA Baby01: USD 515 000 (Phase I), USD 1 365 000 (Phase II), USD 1 225 000 (Phase III)
Total Budget: USD 3 105 000
Effective starting date: July 2006
Planned end date: September 2010
Context of the project
<p>Bangladesh is a high-risk country with respect to Highly Pathogenic Avian Influenza (HPAI) H5N1, experiencing its first outbreak in March 2007. As of 31 March 2010, a total of 351 (298 commercial and 53 backyard) outbreaks have been recorded in 49 out of 64 districts and in 156 out of 492 Upazilas/Thanas (sub-districts), resulting in the culling of over 1.8 million birds.</p>
Objectives of the project
<p>The primary objective of the project is to improve control of infectious diseases by enhancing outbreak responses for preventing poultry diseases and developing awareness of HPAI in Bangladesh.</p> <p>Specific immediate objective is to improve the HPAI surveillance capacity of the Government of Bangladesh to respond more effectively to HPAI outbreaks and thereby reduce economic losses and a global human pandemic threat. Specifically, the project aimed to achieve the following:</p> <ul style="list-style-type: none"> • increasing the capacity of the Department of Livestock Services (DLS) to manage the Surveillance programme without technical or operational help from the Food and Agriculture Organization of the United Nations (FAO); • early reporting of poultry diseases by door-to-door surveillance; • early HPAI detection by diagnostic specimen collection and testing to ensure a rapid and effective disease response to control HPAI; • increasing awareness among the surveyed farmers and villagers to strengthen passive surveillance; • monitoring minimum biosecurity standards in commercial farms.

Planned activities :**Output 1: Improved coordination and management for disease detection, diagnosis, control and prevention**

- The national capacity for disease detection, diagnosis, control and prevention will be strengthened through coordinated efforts of all stakeholders.
- Continuous assistance will be provided by international and national experts to the Government of Bangladesh to facilitate contacts between the Government and donors, and coordinate projects and regional activities.
- FAO country team will take lead role in the coordination and technical backstopping to cover activities funded by the World Bank (WB) and Asian Development Bank (ADB).

Output 2: Enhanced outbreak response by effective Outbreak Response Management Centre

- The capacity of the Outbreak Response Management Centre within DLS will be strengthened through the provision of appropriate human resources and equipment.
- DLS' capacity for communicating with field operators, facilitating logistics, collection and analysis of data will be improved.
- National and international experts in disease surveillance, control and epidemiology will provide technical inputs to assist the Government of Bangladesh in animal disease management.

Output 3: Improved biosecurity status in poultry sectors through biosecurity campaigns in the target areas

- Biosecurity campaign across the country will be implemented as much as possible in targeted large-, medium- and small-scale poultry farmers in poultry-dense areas in every district.
- Educational materials to train trainers will be developed by technical experts in epidemiology, response management and advocacy.
- The campaign on biosecurity is aimed to reach at least 20 percent of the entire poultry farmer population in the targeted areas.

Output 4: Provision of assistance to the Government of Bangladesh to implement the National Avian Influenza & Human Pandemic Influenza Preparedness plan

- The Government of Bangladesh will be assisted in the implementation of the national Avian Influenza & Human Pandemic Influenza Preparedness Plan for 2009-2011, which was elaborated in collaboration with FAO.
- Specifically, FAO will assist in surveillance, disease response and diagnostics and will provide further technical inputs.

Output 5: Active Surveillance on HPAI

- Door-to-door active surveillance will be conducted to collect information on sickness and unusual deaths in poultry of 260 Upazilas, of which 150 have been already under surveillance since 1 October 2008.
- Reports will be sent through coded message to web-based SMS gateway System.
- Sites of potential outbreak will be investigated by Upazila livestock officers (ULOs)

and/or additional veterinary surgeons (AVSs) supported by the project.

- Specimens for diagnosis in suspected cases will be collected by ULOs or AVSs and shipped to laboratories.

Activities undertaken during the reporting period

Output 1: Improved Coordination and Management for disease detection, diagnosis, control and prevention.

- International and national experts continued to provide expertise to the Government of Bangladesh, facilitated contacts between the Government and donors and coordinated projects and regional activities.
- FAO country team continued its coordination role to cover those activities funded from WB, ADB, and United States Agency for International Development (USAID).
- The monitoring and evaluation of the Teachers Training Programme of three pilot Upazilas (Panchagar, Trishal and Sreepur) showed positive impact in awareness building and passive surveillance. The students of primary schools where teachers had been trained on HPAI were also better informed on HPAI.
- FAO continued to facilitate the Laboratory Working Group meetings attended by Bangladesh Livestock Research Institute (BLRI), Central Disease Investigation Laboratory (CDIL) and Field Disease Investigation Laboratory (FDIL), World Health Organisation (WHO), USAID, and Japan International Cooperation Agency (JICA) to provide advice on laboratory design and procurement.
- In collaboration with US Geological Survey, Wildlife Trust of Bangladesh (an affiliate of Wildlife Trust New York), FAO funded the training course on sampling of birds for testing avian influenza.
- FAO has supported the shipment of samples from the outbreak cases to the World Organisation for Animal Health (OIE)/FAO Reference Laboratory for Newcastle Disease and Avian Influenza located in Padua, Italy.
- Samples collected from free-ranging ducks around farms affected with HPAI have been collected and submitted to National Reference Laboratory for Avian Influenza, of BLRI in Savar for virus propagation and identification.
- One National Consultant was the main speaker in the awareness building meeting arranged by DLS at Kishoregonj district.
- Three National Consultants (Laboratory Expert, IT specialist, and Communication and Advocacy) have joined the Avian Influenza Technical Unit.

Output 2: Enhanced Outbreak Response by effective Outbreak Response Management Centre

- FAO has been providing training on post-outbreak management to DLS field officials.
- Chief Technical Advisor (CTA) and other members of the team have been monitoring the outbreak management system by visiting the vicinity of affected farms after occurrence of outbreaks.
- As part of the post-outbreak investigation, samples have been collected from free-ranging ducks in backyards for monitoring.
- Samples have been brought to BLRI to be inoculated into embryonated eggs for isolation of viruses.

Output 3: Improved biosecurity status in poultry sectors through biosecurity campaigns in the targeted areas

- The biosecurity campaign continued across the country's targeted large-, medium- and small-scale poultry farmers through AVSs/Community Animal Health Workers (CAHWs).
- FAO drafted a standard operation procedure (SOP) titled "Biosecurity for Backyard poultry".
- AVSs/CAHWs have been provided with written instructions on biosecurity by visiting individual commercial farms.
- The project supported and contributed to the Public-Private-Partnership (PPP) project, also supported by USAID, in delivering biosecurity training for poultry industry suppliers.
- The letter of agreement (LoA) on Geospatial Farm Mapping for commercial poultry farms and markets in Bangladesh has been signed and the project will start soon.

Output 4: Provision of assistance to the Government of Bangladesh to implement the National Avian Influenza and Human Pandemic Influenza Preparedness plan

- The FAO team participated in further review of the Second National Avian Influenza and Human Pandemic Influenza Preparedness Plan for 2009-2011.
- The team also contributed in the development of a contingency plan for influenza pandemic management by the Department of Health.

Output 5: Active Surveillance on Highly Pathogenic Avian Influenza

- The Active Surveillance programme is continuing in 260 Upazilas with 780 CAHWs and 88 AVSs.
- The newly recruited CAHWs and the ULOs of newly added Upazilas were trained on active surveillance.
- The Veterinary Officers (VOs) working under "Strengthening of Support Service for Combating Avian Influenza (SSCAIB) in Bangladesh" were trained to be involved in active surveillance.
- A fourth member team from Nepal was trained on SMS gateway system.
- The National Consultant and Programme Coordinator/Representative from the Government monitored activities of AVSs and CAHWs.

Planned activities for the next quarter

Output 1: Improved Coordination and Management for disease detection, diagnosis, control and prevention.

- International and national experts will continue to provide expertise to the Government of Bangladesh, facilitate contacts between the Government and donors and coordinate projects and regional activities.
- FAO country team will increase its coordination role to cover activities funded by WB, ADB and USAID.
- FAO country team will support Geospatial farm mapping project.

Output 2: Enhanced Outbreak Response by effective Outbreak Response Management

Centre

- National and International Consultant will support the Government in conducting outbreak investigation on avian influenza.
- Post-outbreak investigation will be intensified by collecting samples from free-ranging ducks in backyards in the vicinity of affected farms. Samples are to be inoculated to isolate viruses, if any.
- The FAO Avian Influenza Unit, consisting of one international, six national consultants, one web page manager, one operation officer, one logistics and procurement assistant, and one secretary, financially supported by the project, will be ready to support the Government on any disease response and control efforts.

Output 3: Improved bio-security status in poultry sectors through bio-security campaigns in the target areas

- Biosecurity campaign will be conducted across the country targeting the large-, medium- and small-scale poultry farmers through AVSs/CAHWs, expanding from 150 to up to 300 Upazilas.
- Continuous assistance will be provided to PPP and Cleaning and Disinfection of Live Bird Market projects.

Output 4: Provision of assistance to the Government of Bangladesh in implementing the National Avian Influenza and Human Pandemic Influenza Preparedness plan

The team will continuously support the Government in the execution of National Avian Influenza and Human Pandemic Influenza Preparedness Plan.

Output 5: Active Surveillance on Highly Pathogenic Avian Influenza

The active surveillance programme will be extended to 300 Upazilas.

Main challenges encountered and response provided

- The implementation of the project was delayed because of the time taken to receive government endorsement of the project activities. However, the Government gave *post facto* approval of the project documents and clearance of the appointment of a new CTA.
- The National Consultant for Laboratory left the Unit. Recruitment of an International Consultant was delayed because of the Government clearance. The position of communication and advocacy consultant has been vacant for a long time due to difficulties of finding suitable candidates. This severe staff shortage has resulted in high work pressure on all staff in the unit. However, a new National Consultant for Communication and Advocacy was identified and recruited in January and the National Consultant for Laboratory was finally recruited in February 2010.

Main progress made towards the achievement of project outcomes

- FAO Technical Unit has been established at DLS comprising a team of international and national experts and support staff.
- The office for the Technical Unit at DLS has been refurbished including the provision of standby power supply. The Unit is fully computerized with high-speed reliable internet services.
- AI Technical Unit is technically and logistically supporting the DLS. The AI Unit's technical support enhances DLS staff capacity.
- Biosecurity and awareness of HPAI are reinforced and strengthened by: Active Surveillance Programme; Teachers Training; and dissemination of 50 000 leaflets, posters and stickers to schools and at various national and regional meetings.
- Door-to-door/farm-to-farm surveillance has been initiated using a network of 780 CAHWs. The CAHWs and respective 260 supervising ULOs, 32 veterinary officers of SSCAIB project have received the necessary training. As a result, disease surveillance has enhanced disease reporting. Better surveillance combined with increased awareness and constant reinforcing of biosecurity messages have helped to reduce the number of HPAI outbreaks.
- All 780 recruited CAHWs were given training and then refresher training by FAO consultants on basic communication skills, specifically on those related to HPAI and SMS gateway.
- Various laboratory supplies including PCR kits, RNA extraction kits, primers and other consumables have been provided to BLRI laboratory to support the increase in diagnostic workload.
- SOPs for laboratory tests for AI diagnosis have been drafted and submitted to the Government.
- SOPs for outbreak response, disease investigation, culling, cleaning and disinfection have been drafted and are being reviewed.
- FAO team facilitated the Laboratory Working Group meetings attended by BLRI, CDIL and FDIL to provide advice on laboratory design and procurement.
- Technical officers of eight leading farms and selected government veterinarians have received training on biosecurity and routine disinfection for poultry raising establishments.
- Two hundred government veterinarians received training on post-outbreak decontamination.
- FAO contributed to the development of the Second Communication Strategy for Avian and Pandemic Influenza.
- Web –based SMS gateway has improved the early reporting system.

Project Monitoring Sheet: **OSRO/BGD/101/USA**Project title: **Strengthening Emergency Preparedness and Response for Highly Pathogenic Avian Influenza in Bangladesh**Reporting period: **April 2013 to September 2013**

Country: Bangladesh
Project title: Strengthening Emergency Preparedness and Response for Highly Pathogenic Avian Influenza in Bangladesh
Code: OSRO/BGD/101/USA
Total Budget: USD 2.5 million
Effective starting date: 1 October 2011
Planned end date: 31 December 2013
<p>Context of the project</p> <p>The Food and Agriculture Organization of the United Nations (FAO) and its Emergency Centre for Transboundary Animal Diseases (ECTAD) continues to support the Government of Bangladesh in controlling Highly Pathogenic Avian Influenza (HPAI) H5N1 outbreaks and in building national veterinary service capacity to report and respond to outbreaks. These efforts were initiated in 2007 after which successive projects were designed and implemented to assist the Government. However, Bangladesh remains one of five countries in which HPAI is still considered endemic. Since March 2007, there have been a reported total of 555 outbreaks (498 commercial and 57 backyard farms) in Bangladesh. Some 52 out of 64 districts and 179 out of 492 <i>upazilas</i> (sub-districts) have been affected so far. This resulted in the culling of over 2.7 million birds and the destruction of over 3.5 million eggs.</p> <p>Following the peak of HPAI H5N1 incidence in 2008, the number of annual outbreaks remains at approximately 30 in 2009 and 2010. Another peak was reported 2011, when the number of outbreaks reached 171. However, in 2012, a total of 23 outbreaks were reported. In 2013 (as of 24 September), three outbreaks were confirmed. While new clades 2.3.2.1 and 2.3.4 were reported in addition to clade 2.2, only clade 2.3.2.1 was detected in 2012. One fatal human case of H5N1 virus has been reported in Bangladesh. In total, seven people were infected since 2008, out of whom, three were found to be found as part of a cluster related to a live bird market (LBM) in Dhaka in 2011.</p> <p>The Government decision to approve vaccination against HPAI targeting the commercial sector in the Districts of Gazipur and Kishorgonj is likely to require additional surveillance framework. There is also a substantial risk that the active surveillance system, supported under World Bank funded project will collapse unless the Government is able to secure necessary funds. Since Bangladesh continues to face other emerging disease threats, the ECTAD mandate has continued to expand to address these issues through the <i>One Health</i> approach.</p>
<p>Objectives of the project</p> <p>The primary objective of the project is to strengthen the emergency preparedness to prevent and control HPAI in Bangladesh. The immediate objective is to improve the HPAI surveillance capacity of the Government of Bangladesh to respond more effectively to HPAI outbreaks and thereby reduce economic losses and the global human pandemic threat. Specifically, the project aims to achieve the following:</p> <ol style="list-style-type: none"> 1. increased capacity of the DLS to manage the surveillance programme; 2. early reporting of poultry diseases and early HPAI detection; 3. increased public awareness; 4. improved biosecurity and hygiene in poultry farms and LBMs; and 5. identification and elimination of the sources of HPAI infection.

Planned activities for the reporting period (April 2013 to September 2013)

In accordance with the no-cost extension of the project to 30 September 2013, two main components were included; (i) LBM development, advocacy and capacity building; and (ii) serological monitoring and virological surveillance of the experimental HPAI vaccination programme implemented by the Government. The following activities were planned:

1. upgrade biosecurity and biosafety in a maximum of 12 LBMs;
2. intensify advocacy with city corporations/municipalities and market committees to improve biosafety and biosecurity at a total of 31 LBMs;
3. conduct regular surveillance of the 25 renovated LBMs;
4. train LBM personnel, traders, transporters, local government staff and veterinary officers in adopting biosafety and biosecurity measures;
5. hold meetings, at least monthly, with all stakeholders for promoting public private partnership (PPP) in sustaining LBM biosecurity;
6. raise public awareness for ensuring that biosecurity is maintained and sustained in LBMs; and
7. monitor and characterize presence or absence of viruses in the two districts where the Government conducted experimental vaccination (Gazipur and Kishorgonj).

Activities undertaken during the reporting period (April 2013 to September 2013)

1. Improvements in biosecurity and safety in 12 LBMs were carried out. Approximately 80 percent of renovation/construction work was completed.
2. Advocacy with city corporations/municipalities and market committees to improve biosecurity and safety at 31 LBMs (24 existing and seven new) continued.
3. Regular surveillance of 25 LBMs was conducted jointly with sister project OSRO/BGD/202/USA. Other LBM surveillance activities were also conducted under the influenza A(H7N9) prevention programme.
4. Eight meetings were held with key LBM stakeholders (City Corporations/Municipalities, District Livestock Officers and market committees) for promoting biosecurity and PPP in LBMs. Project staff also continued to raise public awareness for ensuring that biosecurity is maintained and sustained in LBMs.
5. Regular cleaning and disinfection in LBMs was promoted. Advocacy continued for weekly rest-day for thorough cleaning and disinfection practices. Decontamination commodities and metallic cages were distributed to LBMs through district livestock officers.
6. Monitoring of the Government's experimental vaccination in two districts (Gazipur and Kishorgonj) was conducted by the Government of Bangladesh Expert Committee, in which FAO ECTAD was represented. FAO ECTAD attended five meetings of this committee and extended technical advice.

Planned activities for the next three-month period

Under the no-cost extension of project OSRO/BGD/101/USA to 31 December 2013, no additional activities are planned. Monitoring the renovation of 12 LBMs will be conducted and committed funds for LBM renovations will be released. Other activities will be funded under sister projects.

Main challenges encountered and responses provided

1. Sustaining and extending the LBM weekly rest-day and decontamination practices will require continued advocacy with stakeholders, especially market committees and City Corporations/Municipalities.
2. Sustainability of SMS surveillance system by the national government is at risk due to the lack of financial support available during 2013. This means that field staff do not currently receive incentive. Discussions are ongoing to find solutions for sustainability of the SMS surveillance system in the future.
3. The Government of Bangladesh started implementing an experimental vaccination of poultry

against HPAI in two districts in December 2012. Although FAO was not directly involved in taking this decision, it provided technical advice and worked with the Experts Committee during the planning and implementation of this programme.

Main progress made towards the achievement of project outcomes

1. National capacity was strengthened to report and effectively respond to HPAI outbreaks, including surveillance (active and passive) and diagnostic capabilities.
2. Significant technical and logistic support was provided to DLS, Bangladesh Livestock Research Institute, Central Disease Investigation Laboratory, two national universities and national veterinary services to increase the capacity in disease surveillance, diagnosis and control/prevention.
3. The project sustained smooth continuity of activities initiated by previous projects funded by the United States Agency for International Development, and facilitated coordination with other projects and partners (Emerging Pandemic Threats [EPT] Program, EPT Plus, Food Safety and Family Health International [FHI]-360 EPT PREVENT, Eco-Health Alliance and International Centre for Diarrhoeal Disease Research, Bangladesh [icddr,b] and the United States Centers for Disease Control and Prevention [CDC]).
4. The focus of the *One Health* approach has shifted from conceptual acceptance by key stakeholders to the adoption of strategies through which it can be practically implemented, which include creating and supporting the *One Health* Secretariat within the Government's structures. A multisectoral *One Health* approach for controlling rabies is being adopted. ECTAD Bangladesh will continue to play a pivotal role in this evolutionary process.
5. A novel disease reporting system, the Livestock Disease Information System, has been developed and disseminated. All DLS field staff have been trained in operating the system, which will allow for quick reporting of the animal health situation directly from the field to Dhaka.
6. Biosecurity and HPAI awareness have been strengthened through active surveillance, training and dissemination of information.
7. A strong partnership has been established between DLS and FAO, allowing for the smooth transmission of information and collective action.
8. For the improvement of LBMs, a solid partnership was established with key stakeholders, including DLS, local governments, icddr,b, United Nations Children's Fund, FHI-360 EPT PREVENT and market committees.

Project Monitoring Sheet: **OSRO/BGD/202/USA**

Project title: Strengthening national capacity to respond to Highly Pathogenic Avian Influenza and emerging and re-emerging diseases in Bangladesh

Reporting period: April 2013 to September 2013

Country: Bangladesh
Project title: Strengthening national capacity to respond to Highly Pathogenic Avian Influenza and emerging and re-emerging diseases in Bangladesh
Code: OSRO/BGD/202/USA
Total Budget: USD 2 million
Effective starting date: 1 October 2012
Planned end date: 30 December 2013
<p>Context of the project</p> <p>The Food and Agriculture Organization of the United Nations (FAO) and its Emergency Centre for Transboundary Animal Diseases (ECTAD) continues to support the Government of Bangladesh in controlling Highly Pathogenic Avian Influenza (HPAI) H5N1 outbreaks and in building national veterinary service capacity to report and respond to outbreaks. These efforts were initiated in 2007 after which successive projects were designed and implemented to assist the Government. However, Bangladesh remains one of five countries in which HPAI is still considered endemic. Since March 2007, there have been a reported total of 555 outbreaks (498 commercial and 57 backyard farms) in Bangladesh. Some 52 out of 64 districts and 179 out of 492 Upazilas (sub-districts) have been affected so far. This resulted in the culling of over 2.7 million birds and the destruction of over 3.5 million eggs.</p> <p>Following the peak of HPAI H5N1 incidence in 2008, the number of annual outbreaks remained at approximately 30 in 2009 and 2010. Another peak was reported 2011, when the number of outbreaks reached 171. However, in 2012, a total of 23 outbreaks were reported. As of September 24 2013, three outbreaks were confirmed. While new clades 2.3.2.1 and 2.3.4 were reported in addition to clade 2.2, only clade 2.3.2.1 was detected in 2012. One fatal human case of H5N1 virus has been reported in Bangladesh. Of seven people infected since 2008, three were found to be found as part of a cluster related to a live bird market (LBM) in Dhaka in 2011.</p> <p>The Government decision to approve vaccination against HPAI targeting the commercial sector in the Districts of Gazipur and Kishorgonj is likely to require additional surveillance framework. There is also a substantial risk that the active surveillance system, supported under World Bank funded project will collapse unless the Government is able to secure necessary funds. Since Bangladesh continues to face other emerging disease threats, the ECTAD mandate has continued to expand to address these issues through the <i>One Health</i> approach.</p>
<p>Project Impact</p> <p>The project will contribute to the improvement of livelihoods of vulnerable populations in Bangladesh by safeguarding human and animal health, and improving food security and safety.</p>
<p>Outcome of the project</p> <p>The outcome of the project is a decreased spread of H5N1 HPAI and other emerging and re-emerging diseases of significant public health and economic impact in the country. This will be achieved through enhanced coordination, a multi-sectoral approach, outbreak management, disease surveillance systems and biosafety and biosecurity at the farm and LBM levels.</p>

Planned activities for the reporting period (April 2013 to September 2013)**Output 1: Strengthened coordination, planning and policy support for effective management and control of HPAI and other emerging and re-emerging diseases.***Activities:*

- 1.1 Support the Country Team Leader and the Team to provide inputs for planning coordination required at the country level.
- 1.2 Actively engage with animal health authorities as appropriate.
- 1.3 Conduct regular meetings with DLS, the Ministry of Fisheries and Livestock (MOFL), Institute of Epidemiology, Disease Control and Research (IECDR), Ministry of Health and Family Welfare (MOHFW), International Centre for Diarrheal Diseases Research, Bangladesh (icddr,b) and the World Health Organization (WHO) to promote *One Health* coordination using avian influenza as a model.
- 1.4 Organize regular coordination meetings with DLS and MOFL, and liaise with relevant stakeholders in the public and private sectors.
- 1.5 Attend regional meetings and workshops to integrate national project activities and to facilitate coordination of the country programme with national, regional and global projects such as AIPRP, the European Union (EU) Highly Pathogenic Emerging Diseases (HPED) programme, the United States Agency for International Development (USAID) Emerging Pandemic Threats (EPT) program and EPT Plus (+).
- 1.6 Conduct an analysis of the key strengths and weaknesses of the current control approach including the HPAI vaccination policy and provide the policy advice and necessary support in consultation with the Government, including post-vaccination serological monitoring and virological surveillance.
- 1.7 Provide technical support to facilitate contact between the Government, FAO and donors.
- 1.8 Facilitate the participation of officials of national veterinary services and policy makers in regional and international conferences and seminars related to HPAI and other emerging infectious diseases.
- 1.9 Ensure the active participation, as appropriate, and facilitate the coordination of the country programme with other projects or programmes (including EU-HPED, AIPRP, EPT and EPT+) and explore collaboration with USAID's PREVENT project on risk communication and prevention at the LBMs.
- 1.10 Advocate with poultry farmers and associations in collaboration with the Government agencies to adopt biosecurity measures at the farm level.
- 1.11 Advocate with DLS and poultry associations to encourage commercial poultry farmers to register their farms in compliance with regulations, including biosecurity guidelines.

Output 2: Enhanced veterinary services capacity in HPAI surveillance and control.*Activities:*

- 2.1 Review and refine standard operating procedures (SOPs) already developed by the ECTAD-Bangladesh Team for controlling HPAI and other zoonotic diseases, to ensure the application of best practices, based on international standards and guidelines.
- 2.2 Ensure full operation and dissemination of web-based Livestock Disease Information System (LDIS) by following up on its implementation for the timely electronic reporting on HPAI and other zoonotic diseases by all Upazila Livestock Offices and Disease Investigation Laboratories, and assist the Epidemiology Unit and Outbreak Response Management Centre of DLS to conduct outbreak investigations and process epidemiological data to identify risk factors and adjust control programmes accordingly.
- 2.3 Create and operationalize the Bangladesh Laboratory Response Network in collaboration with FAO/USAID's EPT-IDENTIFY project, DLS, Directorate General of Health and other partners involved in providing laboratory services.

2.4 Conduct surveillance and respond to signs of small-scale mortality among backyard poultry in areas indicated as high risk by spatial temporal analysis of outbreaks.

2.5 Conduct epidemiological studies, in collaboration with DLS and other relevant stakeholders, to identify the trends and patterns of HPAI in Bangladesh, as well as virological investigations whenever crows and other birds die off, in order to identify links to poultry in commercial farms and backyards.

2.6 Continue conducting an in-depth longitudinal study that has already been initiated on free-ranging ducks in the vicinity of affected farms for sequence analysis in five selected districts and ensure synergy with the EPT+ activities.

2.7 Ensure biological samples from outbreak investigations and active surveillance to be 1) processed for isolation of low pathogenic avian influenza (LPAI) and HPAI in Central Disease Investigation Laboratory (CDIL) and Bangladesh Livestock Research Institute (BLRI); and 2) shipped to the FAO/World Organisation for Animal Health (OIE) Reference Laboratory for molecular characterization.

2.8 Strengthen the capacity of DLS and BLRI for molecular analysis of sequence data derived from the H5N1 virus isolated in Bangladesh.

2.9 In collaboration with the environmental/forestry sector, monitor mortality in wild birds to effectively roll out preventive measures such as carcass disposal to contain the virus and to have samples collected.

2.10 Further expand the geospatial mapping programme by including smaller commercial farms.

2.11 In collaboration with DLS, conduct formal biosecurity audits of commercial poultry farms adopting assessment tools developed under a previous USAID-funded project on public private partnership (PPP).

2.12. Support the participation of national epidemiologists from DLS to the regional and sub-regional (SAARC) Field Epidemiology Training Programme for Veterinarians (FETPV).

Output 3: Improved biosecurity of LBMs through targeted renovation.

Activities

3.1 Select and upgrade biosecurity in up to six LBMs out of the already developed 24 LBMs.

3.2. Intensify advocacy with city corporations/municipalities and market committees to improve biosafety at LBMs.

3.3 Conduct regular surveillance for avian influenza viruses and conduct regular biosecurity audits of the 24 LBMs.

3.4 Train LBM personnel, traders, and veterinary officers in adopting biosafety and biosecurity measures and conduct refresher training of LBM cleaners and traders in cleaning and disinfection exercises following SOPs in collaboration with DLS and city corporations/municipalities/development authorities and AIPRP.

3.5 Hold meetings at least monthly with market committees for promoting PPP in sustaining the biosecurity in LBMs, and continue to provide technical advice to the Government and stakeholders on the renovation and rehabilitation of LBMs in collaboration with the AIPRP of the WB.

3.6 Raise public awareness for ensuring that biosecurity is maintained in LBMs and poultry farms and distribute communication materials on biosafety and biosecurity in collaboration with stakeholders, including DLS, AIPRP, city corporations/municipalities, school teachers, religious leaders and the United Nations Children's Fund (UNICEF).

Output 4: A model is developed for monitoring the movement of poultry from production to LBMs.

Activities:

4.1 Hold meetings with the DLS Services to adopt a short message service (SMS) gateway system and geospatial maps of commercial farms for monitoring the movement of poultry from production to LBMs.

4.2 Initiate a pilot study for monitoring poultry movement and its biosecurity practices using the SMS

system by selecting one major LBM in Dhaka.

Sub -activities include:

4.2.1 Support DLS in establishing checking posts for monitoring the movement of poultry on transportation routes into Dhaka.

4.2.2 Assess the feasibility of the monitoring used the system.

4.2.3 Expand the system to the remaining LBMs in Dhaka.

Activities undertaken during the reporting period (April 2013 to September 2013)

Output 1: Strengthened coordination, planning and policy support for effective management and control of HPAI and other emerging and re-emerging diseases.

- Five funding proposals and five progress reports were prepared.
- Daily contact was maintained with the Chief Veterinary Officer and key DLS staff.
- More than 20 meetings were held with DLS on HPAI and other diseases, including two monthly meetings, three meetings on rabies control, and 10 meetings to discuss specific requests made by DLS. Twelve meetings were also held with key stakeholders such as MOFL, the Institute of Epidemiology, Disease Control and Research (IEDCR), MOHFW, UNICEF and WHO, including two meetings of the National Expert Committee on Vaccination.
- MoFL approved strategic Framework and Action Plan for a One Health approach to Infectious Diseases in Bangladesh in July 2013. Two workshops (one national and one regional) were organized in May 2013 to prepare a One Health project proposal to the EU.
- A meeting was held with BLRI in July 2013 to discuss the activities of national avian influenza and regional peste des petits ruminants (PPR) reference laboratories. Decisions were made to continue support to the avian influenza laboratory for testing samples from surveillance (HPAI, EPT+ and H7N9) and to undertake a PPR pilot study.
- Three Coordination meetings were held with icddr,b and other EPT partners (Family Health International FHI-360/EPT PREVENT, Eco-Health Alliance, IEDCR), BLRI and CDIL to promote the coordination of the EPT program.
- Seven regional meetings and four workshops/conferences were organized and/or attended to integrate project activities (EPT, EPT+, One Health, H7N9, rabies and gender).
- Ongoing analysis of the key strengths and weaknesses of the current control approach was performed. A checklist was developed and used during field visits/outbreak investigations.
- Contact between the Government and donors was facilitated by liaising with relevant Government departments to ensure timely approval of project documents.
- Support was provided to nine officials and policy makers of the Government who participated in seven regional conferences/meetings related to HPAI and other emerging infectious diseases including H7N9.
- ECTAD continued to take the lead in coordinating EPT partners in Bangladesh three coordination meetings were held. Three meetings with FHI-360 PREVENT were held to prepare a joint plan for implementing behaviour change communication at the LBMs.
- ECTAD and icddr,b continued to share information on locations where LBM, duck and pig surveillance are conducted. icddr,b animal health laboratory will continue conducting sample testing for EPT+ and H7N9 samples through a letter of agreement (LoA).
- Project activities were coordinated with other USAID funded and FAO projects to ensure no duplication of efforts (EPT-IDENTIFY, EPT-PREVENT, EPT+, Food Safety, Feed the Future (FtF)-Poultry upscaling, FtF-Nutrition and with icddr,b/United States Centers for Disease Control and Prevention [CDC] Atlanta).
- Project staff participated in 11 technical meetings and workshops on various diseases (anthrax, HPAI, H7N9, rabies, Nipah, EID, Leishmaniasis and PPR).
- ECTAD was involved in organizing a three-day workshop on Elimination of Rabies from SAARC (South Asian Association for Regional Cooperation) countries in Dhaka in August 2013. ECTAD

took the lead role in planning and implementing a multi-sectoral rabies control programme through mass dog vaccination (MDV) and dog population management. ECTAD is currently working with DLS and Public Health in planning and implementing a MDV campaign in Dhaka division utilizing 200 000 rabies vaccine doses provided by OIE, adopting a One Health approach. Five meetings were held so far.

- ECTAD continued to support the HPED regional project. A field mission was supported to investigate a PPR outbreak in Bhola district. A national laboratory technician was recruited to expedite sample testing. Of the 107 serological samples tested, 67 (62.6 percent) indicated presence of antibodies, and the 61 nasal swab and tissue samples tested for virus indicated 52 (85.2 percent) positive cases.
- A total of 100 farmers/farm managers were trained on farm biosecurity and decontamination to adopt improved biosecurity including decontamination. The need for farm registration was emphasized. Government of Bangladesh guidelines and SOPs on biosecurity practices, record keeping and farm registration were used as primary references. A manual was distributed to the participating farmers.

Output 2: Veterinary services capacity in HPAI surveillance and control enhanced.

- LDIS a web-based information system to support DLS animal disease surveillance was disseminated to all the 492 Upazilas in the country; 638 DLS staff were trained.
- A total of 84 Veterinary Surgeons from DLS were trained on the use of Microsoft Excel in processing and analysing epidemiological data, and on Field Epidemiology.
- ECTAD continued to take the lead in supporting the Bangladesh Laboratory Response Network, which was established in 2011 with key players (DLS/CDIL, BLRI, icddr,b, Bangladesh Agricultural University [BAU] and Chittagong Veterinary and Animal Sciences University [CVASU]). Six meetings were held to review the progress of different surveillance activities.
- Two cohorts of hands-on lab training on reverse transcription polymerase chain reaction for partners were conducted at icddr,b in May 2013.
- A backyard duck survey was conducted in three Upazilas (NetrakonaSadar, Kendua and Modon) of Netrakona district to assess the present biosecurity, disease and mortality conditions of backyard poultry (ducks, chickens, pigeons etc.).
- Two publications from ECTAD were produced, one on reassortant influenza A(H5N1) sequence analysis in Bangladesh (Emerging Infectious Diseases journal), and the second one on risk factors for HPAI (Transboundary Animal Diseases journal) were made. A third article on genetic diversity and phylogenetic analysis of HPAI was submitted and is currently being reviewed by Transboundary Animal Diseases Journal.
- A total of 2 948 samples (1 155 cloacal, 1 155 tracheal and 638 blood) were collected from 1 180 ducks. A total of 457 Serum samples were tested, of which 57 percent were H5 antibody positive.
- A total of 1 850 Ducks, 185 Sheds and 4 625 kg of feed were distributed to 185 beneficiaries and training was provided on duck rearing and biosecurity practices.
- Biological samples that were collected from H5N1 outbreak (two positives) and for H7 (four suspected positives) from LBM were sent to the OIE/FAO Reference Laboratory for molecular characterization. Four putative H7 positive samples were confirmed to be H9N2 and negative to H7.
- An LoA was signed with a consulting firm (CEGIS) to further develop the Geospatial mapping management information system, which includes commercial poultry farms, check posts and LBMs. Data from DLS and primary sources is being updated and validated; CEGIS prepared a detailed work plan and initiated activities to develop the information management system and to validate the data.
- For the second attempt, four DLS participants could not attend the SAARC FETPV training in Nepal in September 2013 owing to delayed release process within the Government.
- A new letter of agreement (LoA) with CVASU was signed to undertake avian influenza surveillance in LBMs and wild birds to detect incursion of influenza viruses in migratory birds in five districts.

Output 3: Improved biosecurity of LBMs through targeted renovation.

- A second consultant mission was completed in May-June 2013 and the report was prepared, setting plans for the renovation of six LBMs. The drawings and bill of quantity were prepared by an architect. Eighty percent of the renovation work in the six LBMs has been completed as per the plan.
- Integration of FAO interventions at LBM in collaboration with the sister FAO food safety project was planned using a risk assessment approach to ensure disease control as well as food safety.
- Advocacy by FAO continued with LBM stakeholders for local governments to institute a weekly rest day in LBMs, which commenced in April 2012 in Dhaka and was later extended to other parts of the country. FAO continued to provide technical support for these operations through the presence of veterinarians at the LBM level.
- Twenty three meetings were held with stakeholders to advocate for LBM renovation, decontamination, surveillance and weekly closures.
- Planning for behaviour change communication in collaboration with FHI-360/EPT-PREVENT has been initiated in six LBMs.
- LBM surveillance continued at 25 markets. A total of 824 samples were tested of which three were positive for influenza A virus.
- Monitoring of regular cleaning and disinfection practices in the LBMs was continued.
- Decontamination commodities were distributed to the LBMs through District Livestock Officers.

Output 4: A model is developed for monitoring the movement of poultry from production to LBMs.

- Thirty-three check posts were established by DLS around Dhaka and in other parts of the country to monitor poultry movement and to look for signs of HPAI.
- Discussion was initiated to develop the model and a plan was devised to implement it in Gazipur district and two major LBMs in Dhaka.
- The community-based biosecurity model initiated by stakeholders in Kapasia Upazila of Gazipur district will be assessed and further developed for implementation in the next quarter.

Additional activities performed:

- The project supported SMS gateway staff salaries for two months (January to February 2013) following the completion of the WB-funded AIPRP on 31 December 2012. The Government is currently looking for an alternative funding mechanism.

Planned activities for the next three-month period

In addition to maintaining the activities mentioned above in Outputs 1-4, the following activities are planned:

- Use findings of duck surveillance to narrow down flocks of HPAI-infected ducks without symptoms.
- Build evidence to further promote and extend the policy and practice of having a weekly rest day for cleaning and disinfection to the rest of the country.
- Complete post-vaccination monitoring including virological investigation and challenge experiments.
- Develop a model for monitoring the movement of poultry from production to LBMs.
- Hold meetings with the DLS to adopt and sustain the SMS gateway system and geospatial maps of commercial farms for monitoring the movement of poultry from production to LBMs.
- Initiate a pilot study for monitoring poultry movement and its biosecurity practices using the SMS system by selecting one major LBM in Dhaka.
- Assess the feasibility of monitoring by using the SMS system and expand the SMS system to the remaining LBMs in Dhaka.

Main challenges encountered and responses provided

- The experimental vaccination of poultry against HPAI in two districts, which was initiated in December 2012 by Government of Bangladesh, was completed in June 2013. A final report was provided to DLS by the technical committee. The report is yet to be made public. If HPAI vaccination continues, it might compromise the active surveillance by masking manifestation of symptoms in

infected birds and could have an impact on public health.

- The SMS based active surveillance system on HPAI was terminated by the completion of the WB-funded AIPRP. Although support was provided to DLS under this project, continued advocacy and public awareness raising is needed for it to remain operational and sustainable within the Government system.
- Sustaining and extending the LBM rest days and decontamination practices will require continuous advocacy with stakeholders and monitoring. City corporations have become engaged in sustaining cleaning and disinfection activities.
- The institutionalization of *One Health* remains a priority. Funding and coordination efforts must continue.
- The lengthy process of obtaining release for Government officials to attend regional and international meetings, workshops and training hamper the ability of the project to support their attendance of these important events.

Main progress made towards the achievement of project outcomes

- National capacity was strengthened to report and effectively respond to HPAI outbreaks, including surveillance (active and passive) and diagnostic capabilities.
- Significant technical and logistic support was provided to DLS, BLRI, CDIL, two national universities and national veterinary services in improving capacity in disease surveillance, diagnosis and control/prevention.
- The project established sustained smooth continuity of activities initiated by preceding USAID-funded projects, and facilitated coordination with other projects and partners (EPT, EPT+, Food Safety and FHI-360 EPT PREVENT, Eco-Health Alliance and icddr,b/CDC).
- The focus of the *One Health* approach has shifted from conceptual acceptance by key stakeholders to the adoption of strategies through which it can be practically implemented, which include creating and supporting the *One Health* Secretariat within Government structures. A multi-sectoral *One Health* approach for controlling rabies is being adopted. ECTAD Bangladesh will continue to play a pivotal role in this evolutionary process.
- A novel disease reporting system, LDIS, has been developed and disseminated. All DLS field staff has been trained in operating the system, which will allow quick reporting of the animal health situation directly from the field to Dhaka.
- Biosecurity and HPAI awareness have been strengthened through active surveillance, training and dissemination of information.
- A strong partnership has been established between DLS and FAO, allowing for the smooth transmission of information and collective action.
- For the improvement of LBMs, a solid partnership was established with key stakeholders, including DLS, local governments, icddr,b, UNICEF, FHI-360 EPT PREVENT and market committees.

I Quarter 2009Project Monitoring Sheet: **OSRO/MYA/702/USA**

Project title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)**

Reporting period: **January-March 2010**

Country: Myanmar
Project: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)
Code: OSRO/MYA/702/USA
Budget: USD 500 000 (Phase I), USD 750 000 (Phase II), USD 375 000 (Phase III)
Total budget: USD 1 625 000
Effective starting date: January 2008 (Phase I), January 2009 (Phase II), September 2009 (Phase III)
Planned end date: September 2010
<p>Context of the Project</p> <p>Myanmar experienced three waves of Highly Pathogenic Avian Influenza (HPAI) outbreaks in 2006 and 2007, and a resurgence of outbreaks in the first quarter of 2010. A national duck survey conducted from November to January 2010 showed that 40 percent of surveyed duck flocks had antibody to the H5 virus, suggesting that avian influenza is endemic in duck flocks throughout the country. These issues resulted in a major shift in strategy during the last quarter, with emphasis on expanding the surveillance program. The Food and Agriculture Organization of the United Nations (FAO) is implementing an integrated avian influenza control programme, consisting of three projects with complementary activities: OSRO/MYA/702/USA project, OSRO/MYA/801/WBK project and OSRO/MYA/601/AUL project. The report describes activities funded or co-funded by the project in the context of the overall program.</p>
<p>Objectives of the project</p> <p>The major objective of the project is to address the urgent short-term actions to strengthen Myanmar's capacity to rapidly detect HPAI and minimize its spread. Specifically, the project aims to provide necessary assistance in:</p> <ol style="list-style-type: none"> 1. strengthening HPAI prevention and control in Myanmar, particularly the capacity to effectively contain the outbreak, including animal surveillance, collaboration and communication between the animal and human health sectors; 2. strengthening the capacity of the veterinary services at the field level; 3. mobilizing stakeholders towards building a community based rapid warning and response system to meet the challenge of an AI outbreak in Myanmar.
<p>Planned Activities</p> <p>Output 1: Strengthened cross-sectoral coordination at the national level</p> <p><i>Activity 1.1: Recruit an International Technical Advisor (CTA) to assist in coordinating the project implementation with the government.</i></p> <ul style="list-style-type: none"> • The chief technical adviser (CTA), national operations officer, administrative assistant finance assistant and national project manager, will be in place throughout the quarter. It is expected that an international operations officer will be mobilized in the next quarter.

- Two national consultants' (an epidemiologist and a biosecurity and logistics support expert) contracts will expire in February 2010. These contracts are expected to be renewed. Three new contracts for a national laboratory expert, disease control technical support expert and risk assessment and management expert will be agreed upon early in the next quarter.

Activity 1.2: Organize coordination meetings of the working groups related to HPAI control in animals.

- Coordination meetings will be held with the World Health Organisation (WHO), Livestock Breeding and Veterinary Department (LBVD) and Ministry of Health (MoH). The topics will be the follow-up to the Field Epidemiology Training Program (FETP) for the previous quarter and the update on the findings of the national cross-section study and other studies on disease epidemiology, as well as the linkages between animal and human sectors in passive surveillance near duck raising areas.

Activity 1.3: Support the review and revision of the National Strategy Contingency plan and Standard Operating Procedures (SOPs) related to HPAI control measures.

- The Integrated Results Framework will be utilized.
- SOPs will be developed for laboratory, especially related to serology for avian influenza (AI).

Activity 1.4: Support national staff of LBVD to participate and give presentations/share information in international conferences, meetings or workshops.

- The project will provide support to LBVD staff participating in laboratory and surveillance trainings and workshops related to the regional project on H1N1.

Output 2: Strengthened capacity in HPAI disease surveillance and response at the field level

Activity 2.1: Recruit an international short term consultant (epidemiologist).

- The epidemiologist (Risk Assessment) will not be required for this quarter, rather for the following quarter.

Activity 2.2: Surveillance Rapid Response Team (SRRT) refresher training courses and cooperation between animal and human health sectors.

No activities planned for this quarter.

Activity 2.3: Strengthen SRRTs on effective investigation of AI outbreaks and response.

- Animal surveillance and rapid response team (SRRT) training will start once all the results of the national cross sectional study and associated policy discussions are completed. Health sector will be involved in both policy discussions and in some of the trainings. Outbreak management will form a part of the training.

Activity 2.4: Procure necessary equipment and supplies for surveillance and response.

- The need for further equipment and supplies will depend on recommendations from the national cross-section study. It is likely that more supplies will be procured, as it is expected that a series of cohort studies will be designed and then implemented.

Activity 2.5: Support national staff to participate in Regional FETPV.

- The LBVD staff trainee, who began the Field Epidemiology Training Programme for

Veterinarians (FETPV) in Thailand in 2009, will return to Thailand in January 2010 for several weeks. The project will assist the trainee in the analysis of secondary data collected from the surveillance activities from 2006 to 2009.

- One LBVD staff will participate in the Epidemiology in Action short course in January-February 2010.

Activity 2.6: Support passive and active surveillance for the high risk areas including wetlands, duck-raising and border areas.

- The national duck cross sectional study will be completed and the data processed, analyzed and policy discussions undertaken, with the support of epidemiology expert inputs.
- Passive surveillance programs will be strengthened through the expected agreement to a letter of agreement (LoA) on Disease Control, aiming to improve data management within LBVD including township surveillance reporting, and an analysis of the quality and quantity of passive surveillance activities; and the implementation of an LoA on national database of commercial farms.
- There will be some follow-ups on the border studies already completed, and the nature of the border studies will depend on the final results of the national duck cross section study which will dictate policy and resource allocations.

Output 3: Strengthened capacity in HPAI laboratory diagnosis

Activity 3.1: Organize local training by trainees previously trained overseas.

- Lab staff returning from regional trainings related to the regional project on H1N1 will train local staff.

Activity 3.2: Conduct semi-annual proficiency testing (PT) and quality assessment (QA) for serological and rapid tests by linking national labs with Australian Animal Health Laboratory.

- The project will discuss with the Australian Animal Health Laboratory (AAHL) as to how to coordinate PT and QA within the context of the regional project on H1N1.

Activity 3.3: Manage a local quality assurance/quality control (QA/QC) program for the national laboratory network.

- This is an ongoing activity that will be extended through an amendment to the existing LoA on laboratory activity assessment/improvement. Through this extension, there will be a second round of Q/QC in domestic laboratories.

Activity 3.4: Procure necessary laboratory equipment and supplies.

- The need for further equipment and supplies will be reviewed in light of the recommendations arising from the national duck cross-section study.

Output 4: Enhanced risk management measures including biosecurity improvement among the high risk poultry population and selected live bird markets

Activity 4.1: Organize meetings/workshops among the stakeholders to discuss risk management for poultry production zone and cross-border trade.

No activities planned for this quarter.

Activity 4.2: Support activities related to biosecurity improvement in selected live bird markets and production zones.

- The LoA on the production zones is expected to be completed and a new follow-up LoA will be prepared, based on findings from the first LoA.
- The LoAs on “Area Risk Assessment for Yangon and Mandalay Markets” and “Area Risk assessment for Ayeyarwaddy and Inle Lake Areas” will both begin implementation and will continue through the next quarter.

Activity 4.3: Recruit an international consultant (epidemiology).

- The consultant will provide support to the risk assessments around markets and the Ayeyarwaddy and Inle Lake areas.

Activity 4.4: Conduct studies to assess risk along the poultry supply chain.

- These include the “Area Risk Assessment for Yangon and Mandalay Markets” and “Area Risk assessment for Ayeyarwaddy and Inle Lake Areas” as described in 4.2.

Activities undertaken during the reporting period

Output 1: Strengthened cross-sectoral coordination at the national level

Activity 1.1: Recruit an International Technical Advisor (CTA), Operations Officer (OO) and National Consultants (NC) to assist in coordinating the project implementation with the government.

- There were no changes in the Management team during the reporting quarter. The project funded the position of the Chief Technical Adviser (CTA) for three months.
- As planned, five National Consultants (NCs) continued working under the programme. The assignment of a new NC in charge of risk assessment began. In particular, the project co-funded the epidemiologist and the risk assessment expert.

Activity 1.2: Organize coordination meetings of the working groups related to HPAI control in animals.

- A coordination meeting was held between the FAO, LBVD, WHO and Department of Health (DoH) on 5 February 2010 during which the parties agree to hold a joint national zoonoses workshop. In addition, FAO updated WHO and DoH on the findings of the national duck survey, while DoH and WHO updated FAO and LBVD on H5N1-H1N1 status.
- Plans were made for to the National Steering Committee to be held June 2010.

Activity 1.3: Support the review and revision of the National Strategy, Contingency plan and Standard Operating Procedures (SOPs) related to HPAI control measures.

- The Integrated Results Framework was utilized and updated.
- As part of programme activities, SOPs on outbreak investigation, including updating reporting forms, are being developed. Management Guidelines are also being produced to support an expanded surveillance program. Further work was done on laboratory SOPs with the support of the FAO regional project on animal influenza.

Activity 1.4: Support national staff of LBVD to participate and give presentations/share information in international conferences, meetings or workshops.

No relevant activity undertaken during the reporting period.

Output 2: Strengthened capacity in HPAI disease surveillance.

Activity 2.1: Recruit an international short term consultant (epidemiologist).

- The international short term consultant was not required for this quarter.

Activity 2.2: Surveillance Rapid Response Team (SRRT) refresher training courses and cooperation between animal and human health sectors.

- The Animal - SRRT training was conducted under the workshop described in 2.3.

Activity 2.3: Strengthen SRRTs on effective investigation of AI outbreaks and response.

- The program provided support to the LBVD in management of the three reported outbreaks, two in the Yangon area and one in Sagaing Division.
- The project supported two planning workshops for follow-up surveillance activities based on the findings of the national duck cross sectional study and the fact that HPAI outbreaks had re-emerged in February. These were:
- The workshop “Lower Myanmar H5N1 Surveillance Planning Workshop” held in Yangon from 2 to 4 March 2010. This was attended by 81 participants (51 male and 30 female);
- The workshop “Upper Myanmar H5N1 Surveillance Planning Workshop” held in Yangon from 7 to 9 March 2010. This was attended by 59 participants (38 male and 21 female).
- In addition, the project covered the travel costs for national and international consultants to travel to Pyarbo township in Ayeyawaddy Division to conduct an outbreak investigation and for an international epidemiologist to travel to Central Myanmar to monitor surveillance activities.

Activity 2.4: Procure necessary equipment and supplies for surveillance and response.

- The project procured 2 100 litres of disinfectant, 250 live bird cages, 35 000 plastic bags, 45 fibreglass containers and 150 gas cylinders for use during disease response activities

Activity 2.5: Support national staff to participate in Regional FETPV.

- One LBVD staff trainee is participating in the Field Epidemiology Training Programme for Veterinarians (FETPV) in Thailand. The project co-funded the trainee’s travel costs to Thailand in January and February and supported field work in Myanmar which included the analysis of secondary data collected from the surveillance activities from 2006 to 2009.
- One LBVD staff participated in the Epidemiology in Action short course in January and February 2010 in Bangkok and was subsequently selected for the second session of the FETPV course.

Activity 2.6: Support passive and active surveillance for the high-risk areas including wetlands, duck-raising and border areas.

- The national duck cross sectional study was completed, data processed and analysed. Policy discussions were completed with the support of epidemiology expert inputs. It involved sampling of about 16 000 ducks on 541 farms. The study showed that 15 percent of ducks and 40 percent of flocks were seropositive for H5 virus, suggesting the

HPAI virus may be endemic in ducks in Myanmar. One of the LoAs with LBVD, targeting Lower Myanmar, was co-funded by the project.

- Due to the urgency of responding to the outbreaks, the planned LoA on disease control /epidemiology was postponed to next quarter. The implementation of an LoA on national database of commercial farms began in January and will be completed in the next Quarter of 2010.
- During the reporting period, the China-Thai Border Risk Assessment Study, funded by the project, was completed in February. This study analysed the risk of HPAI being imported through poultry trade. The follow-up to this study consists of surveillance and outbreak investigations in border areas. This will be incorporated in the Surveillance and Outbreak Investigation Programme, which will be implemented in 76 townships. Planning and training for this programme began in the reporting period, and field activities will start in the next quarter.

Output 3: Strengthened capacity in HPAI laboratory diagnosis.

Activity 3.1: Organize local training by trainees previously trained overseas.

- Lab staff returning from regional trainings in Geelong (Australia) related to the regional project on H1N1 trained local staff through on the job training.

Activity 3.2: Conduct semi-annual PT and QA for serological and rapid tests by linking national labs with AAHL.

- Under the programme, viruses isolated from the first two outbreaks were sent to AAHL Geelong and National Institute for Animal Health (NIAH), Thailand for analysis. Sera from the duck survey were sent to AAHL Geelong for N-type testing and quality assessment.

Activity 3.3: Manage a local QA/QC program for the national laboratory network.

- The local QA/QC programme is active and ongoing. As a part of the QA/QC, national staff visited regional laboratories and conducted QA/QC on serology and virology. They also conducted three workshops on "Activity Assessment and Improvement of Laboratories" in Kaingtoung on 31 January 2010, Eastern Shan State on 31 January 2010, and Lashio and Muse, Northern Shan State on 21 March and 22 March 2010, respectively. These workshops were attended by 38 (5 women), 29 (2 women) and 30 (8 women) participants, respectively.

Activity 3.4: Procure necessary laboratory equipment and supplies.

- The project procured miscellaneous items for the laboratory such as marker pens, detergent powder and disinfectants; supplies for processing of swabs collected in the duck cross sectional study, including eggs, chickens and chicken feed. Additional lab reagents and supplies were procured under the other 2 projects.

Output 4: Enhanced risk management measures including biosecurity improvement among the high risk poultry population and selected live bird markets

Activity 4.1: Organize meetings/workshops among the stakeholders to discuss risk management for poultry production zone and cross-border trade.

- No activities were originally planned for this quarter. Since outbreaks occurred in the reporting period, several meetings were organized:

- twelve meetings in the Yangon area with poultry farmers, traders and local authorities aimed at raising awareness during the period immediately after the HPAI outbreaks in Yangon with a total of 747 (108 women);
- four meetings, with poultry farmers, traders and local authorities on HPAI in Pyay, WestBago Division with 651 participants (80 women);

Activity 4.2: Support activities related to biosecurity improvement in selected live bird markets and production zones.

- The LoA on the production zones is ongoing and will be completed in the next quarter.
- The LoAs on “Area Risk Assessment for Yangon and Mandalay Markets” and “Area Risk assessment for Ayeyarwaddy and Inle Lake Areas” are being implemented. A workshop on “Yangon Area Risk Assessment” was held in Yangon on 29 January, with 22 (10 women) participants, including poultry farmers, traders and local authorities for the purpose of introducing and starting up the LoA activities.

Activity 4.3: Recruit an international consultant (biosecurity specialist).

- An International Biosecurity Specialist was recruited for a month, focusing mostly on supporting LBVD in outbreak management.

Activity 4.4: Conduct studies to assess risk along the poultry supply chain.

- These include the “Area Risk Assessment for Yangon and Mandalay Markets” and “Area Risk Assessment for Ayeyarwaddy and Inle Lake Areas” and the ongoing production zone LoA as described in 4.2.

Future Planned Activities

Component/Output A - Strengthened cross-sectoral coordination at the national level.

Activity 1.1: Recruit an International Technical Advisor (CTA) to assist in coordinating the project implementation with the government.

- Management team will be in place with the addition of an international operations officer.
- Six NCs will be in place and co-funded by the project.

Activity 1.2: Organize coordination meetings of the working groups related to HPAI control in animals.

- DoH will participate to the Programme NSC. Meetings with WHO will be organized.

Activity 1.3: Support the review and revision of the National Strategy, Contingency plan and Standard Operating Procedures (SOPs) related to HPAI control measures.

- Finalization of SOPs to support the expanded surveillance programme. This includes management guidelines as well as technical guidelines such as outbreak investigation.
- Ongoing review of SOPs on outbreak management in the light of the recent outbreaks and an assessment on outbreak management in backyard or duck farms.

Activity 1.4: Support national staff of LBVD to participate and give presentations/share information in international conferences, meetings or workshops.

No activity planned.

Output 2: Strengthened capacity in HPAI disease surveillance and response at the field level.

Activity 2.1: Recruit an international short term consultant (epidemiologist).

No activity planned.

Activity 2.2: Surveillance Rapid Response Team (SRRT) refresher training courses and cooperation between animal and human health sectors.

- Training workshops are planned in Upper and Lower Myanmar.

Activity 2.3: Strengthen SRRTs on effective investigation of AI outbreaks and response.

See 2.2.

Activity 2.4: Procure necessary equipment and supplies for surveillance and response.

- The project will purchase large quantities of syringes, masks, gloves, swab tubes, plastic bags, marker pens, containers and antibiotics.

Activity 2.5: Support national staff to participate in Regional FETPV.

- One LBVD staff to attend second session of FETPV in Bangkok at end of May for 2 months and the first session trainee will undertake field work in Myanmar.

Activity 2.6: Support passive and active surveillance for the high risk areas including wetlands, duck-raising and border areas.

- Investigation programme in 76 townships will be completed and field activities will begin.
- The project will support a new LoA with LBVD for Disease Control/Epidemiology, which will provide technical support to the field activities.
- An additional LoA will support management of data generated from the recently-completed national duck survey; data from the soon-to-be completed national GPS census of commercial poultry farms; and FETV related field activities.

Output 3: Strengthened capacity in HPAI laboratory diagnosis.

Activity 3.1: Organize local training by trainees previously trained overseas.

- Ongoing through on the job training.

Activity 3.2: Conduct semi-annual PT and QA for serological and rapid tests by linking national labs with Australian Animal Health Laboratory.

- Lab results from samples submitted to AAHL and NIAH are expected to be received. Action for further QA will be taken accordingly.

Activity 3.3: Manage a local QA/QC program for the national laboratory network.

- See 3.4. Domestic QA/QC program is ongoing. Central Lab staff will travel to regional laboratories to conduct QA/QC on serology, virology and poultry post mortem under the LoA supporting the Surveillance and Outbreak Investigation Programme.

Activity 3.4: Procure necessary laboratory equipment and supplies.

- The project will support the upgrading of cooling infrastructure at Yangon laboratory. This will include a larger chilling machine and larger ducts.

Output 4: Enhanced risk management measures including biosecurity improvement among the high risk poultry population and selected live bird markets.

Activity 4.1: Organize meetings/workshops among the stakeholders to discuss risk management for poultry production zone and cross-border trade.

- The LoA on risk assessment in Yangon and Mandalay is expected to be completed. The LoA on Ayeyewaddy and Inle lake area will be ongoing and is expected to be completed in the following quarter.

Activity 4.2: Support activities related to biosecurity improvement in selected live bird markets and production zones.

- The LoA on production zones biosecurity improvement will be completed. Planning for a follow-up LoA will be undertaken.

Activity 4.3: Recruit an international consultant (epidemiology).

No activity planned.

Activity 4.4: Conduct studies to assess risk along the poultry supply chain.

See 4.1.

Main challenges encountered and response provided

- The January-March period was a very busy time, marked by the completion of the national duck cross sectional study, the emergence of three new outbreaks and the shift in strategy to the expanded surveillance program. The major technical challenge has been how to respond to the duck survey results and to the re-emergence of outbreaks. The main question with respect to the duck survey results was whether the circulating virus was indeed the HPAI H5N1, and if so, why no outbreaks have been reported, and what threat the new findings might pose. The response has been to expand the surveillance program to 76 townships (funded by other donors) and to have this project fund the key support activities of epidemiology and laboratory services. In addition, the project is sending sera to AAHL Geelong to test for N1 and the virus isolated from the outbreaks to AAHL and NIAH Thailand for analysis.
- No serious internal or external challenges or impediments have been encountered.

Main progress made towards the achievement of project outcomes (from the start of the project activities)

Output 1: Strengthened cross-sectoral coordination at the national level

While the project lacked a CTA for a six month period in 2008, there is now a full-time CTA in place, and this is allowing the project to move forward. The project team has now been stabilized with a CTA, five national consultants and three national operations staff. There continue to be good relations with the Government, and coordination between the FAO program and the national AI program is very good. Coordination between the animal-human sectors is good when there is an outbreak, but at other times remains a challenge, although some progress has been made. The agreement of a national zoonoses workshop is significant and may lead to further collaboration.

Output 2: Strengthened capacity in HPAI disease surveillance

The finalization of the national duck survey, with improved data collection and management systems, including the use of GPS and computer technology, was a major achievement. Expanding surveillance into 76 townships and utilizing community animal health workers and township veterinary officers in a systematic fashion is a new approach for the LBVD. Epidemiology capacity is steadily building with the second FETPV trainee being accepted and the first trainee making a good progress. LBVD has attained a fair understanding of the value of good data management. The recent outbreaks indicated that disease reporting is adequate and response is well managed and transparent.

Output 3: Strengthened capacity in HPAI laboratory diagnosis

There is good capacity for HPAI diagnosis and HA/HI testing in Myanmar. The domestic QA/QC program is developing well. The prompt shipment of sera to Geelong for N testing and of the virus samples to Geelong and NIAH is testament to the readiness of Myanmar to seek international support when needed.

Output 4: Enhanced risk management measures including biosecurity improvement among the high risk poultry population and selected live bird markets

The LBVD has developed a range of risk management strategies, most significant of them being the development of production zones and permit systems for poultry movement. The recently-developed risk assessment/management framework and its initial application has been a notable achievement that has received strong government support. On the basis of the conducted studies, the LBVD is in a much better position to assess and manage risks. The LBVD has acquired a good understanding of risks in major border and duck raising areas, based on the results of the duck survey.

Project Monitoring Sheet: **OSRO/RAS/604/USA Baby 01**Project Title: **Support to Highly Pathogenic Avian Influenza Surveillance Programme in Cambodia**Reporting period: **October 2010 – March 2011**

Country: Cambodia
Project title: Support to Highly Pathogenic Avian Influenza Surveillance Programme in Cambodia
Code: OSRO/RAS/604/USA Baby 01
Budget: USD 1 150 000 (Phase I), USD 1 900 000 (Amendment I), USD 600 000 (Amendment II), USD 400 000 (Amendment III), USD 400 000 (Amendment IV) Total budget: USD 4 450 000
Effective starting date: 1 October 2006
Planned end date: 30 September 2011
Context of the project The sporadic outbreaks of Highly Pathogenic Avian Influenza (HPAI) in poultry and humans indicate that the H5N1 virus is still circulating in Cambodia. Therefore, it is necessary to detect the outbreaks as early as possible and ensure that immediate and appropriate containment measures are taken to prevent the spread of the disease. The continued improvement of capacities and capabilities in Cambodia to prevent and control HPAI in animal population is necessary to limit its impacts in poultry sectors and minimize the risk of an infection in humans. The Food and Agriculture Organization of the United Nations (FAO) Avian Influenza (AI) Programme in Cambodia is currently funded by the United States Agency for International Development (USAID) in Cambodia for surveillance activities and a World Bank funded project for Village Animal Health Workers' (VAHWS) training and strengthening of the laboratory capacities and capabilities.
Objectives of the project The main objective of the project is to reduce and stop the spread of H5N1 among and between flocks of birds in Cambodia and between Cambodia and the neighboring countries (Viet Nam, Thailand and the Lao People's Democratic Republic), thus reducing the risks of the pathogen spread to mammals and humans and of the emergence of pandemic influenza.
Planned activities Output: Surveillance activities in the cross-bordering area between Cambodia and neighbouring countries (especially Viet Nam and Thailand) strengthened. Activity 1: Promote (whenever and if possible) a pre-notification system for trade purpose between Cambodia and neighboring countries. Activity 2: Continue active surveillance activities focusing on sentinel flocks, live bird markets (LBMs) and border inspection posts in targeted provinces following a risk assessment approach. Activity 3: Continue to improve the diagnosis service for poultry diseases and provide laboratory supplies to further enhance laboratory diagnostic capacity at national and regional levels in order to complete the surveillance activities. Activity 4: Continue to improve and facilitate sample dispatch from surveillance activities to national laboratory at the National Veterinary Institute (NaVRI) and in case of discovered outbreaks to national and/or regional and/or international reference laboratories.

Activities undertaken during the reporting period

Output: Surveillance activities in the cross-bordering area between Cambodia and neighbouring countries (especially Viet Nam and Thailand) strengthened.

Activity 1: Promote (whenever and if possible) a pre-notification system for trade purpose between Cambodia and neighboring countries.

No major action has been taken under Activity 1 during the reporting period. In coordination with the World Bank-funded project, Avian and Human Influenza Preparedness and Response Project, this activity will be summarized into the study of poultry market chain, which is going to be conducted later in 2011.

Activity 2: Continue active surveillance activities focusing on sentinel flocks, LBMs and border inspection posts in targeted provinces following a risk assessment approach.

- LBM Surveillance of AI in ducks in eight markets of Phnom Penh, Kampong Cham, Kampot, Prey Veng, Siem Reap and Takeo and the Sentinel Flock Surveillance in 12 commercial duck farms of Battambang, Kampong Cham, Kampot, Preah Sihanouk Prey Veng and Takeo were set up through Letters of Agreement (LOAs) with NaVRI to determine the presence of HPAI/H5N1 in the major duck producing regions of Cambodia as part of the national AI surveillance programme and to estimate the level of risk that ducks pose to poultry (chickens and ducks) in traditional and commercial enterprises.
- From 1 September 2010 to 31 March 2011, 3 325 cloacal, 3 325 tracheal swabs and 3 228 sera were collected from the above-mentioned markets, and all of them were found negative for A/H5N1 virus by egg-inoculation test and antibody of AI by haemagglutination (HA) and haemagglutination inhibition (HI) tests.
- From 1 September 2010 to 31 March 2011, 1 440 cloacal, 1 440 tracheal swabs and 1 440 sera were collected from sentinel duck flocks, and all of them were found negative for A/H5N1 virus by egg-inoculation test and antibody of AI by HA and HI tests.
- Both LOA with NaVRI were reviewed and renewed for a six-month period from January to June 2011.
- The contract on supplying fertilized eggs with Celagrid was extended for three months at no-cost from October to December 2010 and renewed for six months in support to the LOAs of surveillance signed with NaVRI.
- A new LOA with the Institut Pasteur du Cambodge (IPC) was signed, aimed at two months of environmental surveillance in two Phnom Penh markets (Deumkor and Orisey) to determine the presence of HPAI-H5N1 in the environment of the two LBMs as part of the national AI surveillance programme. In addition, the aim was to assess the risks that the virus poses to the humans (sellers and consumers) in surrounding markets and to enhance the public awareness of AI at LBMs. The outcomes of the surveillance activities could also be useful in the restructuring of the poultry selling places in LBMs.
- Following the first HPAI field simulation exercise organized in Svay Rieng in early September, two others were conducted during November and December in Kampong Cham and Preah Sihanouk provinces. The Chief of Office of Animal Health and Production of the 24 provinces, four officers from NaVRI and two officers from the Department of Animal Health and Production (DAHP) participated in the field simulation exercise.

Activity 3: Continue to improve the diagnosis service for poultry diseases and provide laboratory supplies to further enhance laboratory diagnostic capacity at national and regional levels in order to complete the surveillance activities.

- Two officers in the epidemiology unit of NaVRI/DAHP were sent to the Department of Livestock Development (DLD) Thailand, to attend a one-month training in Field Epidemiology Training Programme for Veterinarians (FETPV). The coming country FETPV is being discussed by the Emergency Centre for Transboundary Animal Diseases (ECTAD) in Cambodia.
- Coordinated the collection of weekly AI inputs from NaVRI for the United Nations Resident Coordination Office, which has the lead on AI update from the Ministry of Agriculture, Fisheries and Forestry (MAFF), the Ministry of Health (MOH), FAO and the World Health Organization (WHO), as well as other partners in Cambodia, to be included in AI bulletin and circulated to all concerned agencies.

Activity 4: Continue to improve and facilitate sample dispatch from surveillance activities to national laboratory at NaVRI and in case of discovered outbreaks to national and/or regional and/or international reference laboratories.

- The 27th HPAI outbreak occurred in a small poultry farm of Kandal province on 4 January 2011. The veterinary measures were applied, including investigation, culling, disinfection, banned animal movement and education.
- The 12th human case, a five-year old boy, and the 13th human case, a 19-year old mother with an 11-month old baby, were the three human cases that occurred respectively in the outskirts of Phnom Penh (Sang Kat Prek Leap) on 4 February 2011 and in Banteay Meanchey Province on 12 and 17 February 2011. The three cases were fatal and were experienced previously in contact with poultry. Following the human H5N1 cases, the animal health authorities carried out the investigation and collected samples from occurring and neighbouring locations. Preliminary results of 90 samples from Sangkat Prek Leap, 12 from Banteay Meanchey and ten from Prey Veng were negative. Further investigations and sample collections are still ongoing and were expanded to a 5 to 10 km radius.

Other related activities funded under the project

- A legislation mission was fielded in February 2011. The mission examined the chapters which did not conform to the World Organisation on Animal Health (OIE) and the World Trade Organisation (WTO) guidelines and requested further adjustments.
- A joint mission for the National Medium Term Priority Plan for Animal Health (NMTTP-AH) and the Strategy for Animal Production were fielded from 24 January to 4 February 2011. A full Cambodian Animal Production and Health Strategy will be ready for the country in mid-2011 after a completion of series of missions for the animal production strategy. More detailed information will be made available in the next progress report.
- The first Zoonotic Technical Working Group was held in December 2010 with the participation from NaVRI/DAHP, FAO, MOH and WHO. The working group is focusing on, not only HPAI-H5N1, but also zoonotic diseases in general.
- A Workshop on Human and Animal Health Collaboration on Zoonosis Diseases was co-organized by MAFF and MOH and co-financed by FAO and WHO. It is a first workshop aiming at sharing surveillance and response system of human and animal health and at designing the Terms of Reference (TOR) for the Human and Animal

Health Technical Committee and its roles and responsibilities. The technical working committee is composed of existing AI technical working group committee members (MAFF, MOH, FAO, WHO and IPC) and two prospective members, the Forestry Administration (FA) and the Wildlife Conservation Society (WCS).

- The certification of the biosafety cabinets in NaVRI was done under the Emerging Pandemic Threat (EPT) Identify Component of a FAO regional and USAID-funded programme, in collaboration with the Asia-Pacific Biosafety Association (APBA). The APBA organized the Biosafety Management Training in Singapore in mid October 2010 where two laboratory experts were sent to certify the four biosafety cabinets of NaVRI. The three of the four safety cabinets were certified by the team, and the fourth safety cabinet did not obtain certification in accordance with the regional standards.
- Three regulator auto voltages and electricity cables were installed in NaVRI building in order to ensure stable electricity power and therefore to reduce the risks of breakage for the laboratory equipment.

Planned activities for the next six-month period

Output: Surveillance activities in the cross-bordering area between Cambodia and neighbouring countries (especially Viet Nam and Thailand) strengthened.

Activity 1: Promote (whenever and if possible) a pre-notification system for trade purpose between Cambodia and neighboring countries.

Activity 2: Continue active surveillance activities focusing on sentinel flocks, LBMs and border inspection posts in targeted provinces following a risk assessment approach.

Activity 3: Continue to improve the diagnosis service for poultry diseases and provide laboratory supplies to further enhance laboratory diagnostic capacity at national and regional levels in order to complete the surveillance activities.

Activity 4: Continue to improve and facilitate sample dispatch from surveillance activities to national laboratory at NaVRI and in case of discovered outbreaks to national and/or regional and/or international reference laboratories.

Main challenges encountered and response provided

As the communication component is not any more supported by this project because of reduced funding, a gap has been perceived in the AI Programme in Cambodia. The public awareness which is considered as an essential component in the AI control efforts has been neglected by the different stakeholders working in the country. It is important to maintain the momentum for the farmers, poultry traders and animal health authorities to understand the risks of transmission and continue funding public arenas/communication component.

Main progress made towards the achievement of project outcomes

Output: Surveillance activities in the cross-bordering area between Cambodia and neighbouring countries (especially Viet Nam and Thailand) strengthened.

- Eight LBMs and twelve duck commercial farms are being surveyed in six provinces.
- 4 765 cloacal, 4 765 tracheal and 4 668 sera collected were negative for H5N1.
- Signed new LOA for environmental surveillance in two LBMs of Phnom Penh with IPC.
- Produced an educational training video on HPAI field simulation, which was widely distributed in the country.
- Organized two more HPAI field simulations in Kampong Cham and Preah Sihanouk

Province, which covered all the provinces of Cambodia.

- Established zoonosis committee and regular monthly zoonosis technical working group meetings.
- Organized the workshop on human and animal health collaboration on zoonotic disease in January 2011.
- The Permanent Representatives of Bangladesh, Congo, Denmark, Finland, the United States of America and Uruguay to FAO headquarters visited NaVRI's facilities.

I Quarter 2010

Project Monitoring Sheet: **OSRO/RAS/604/USA Baby 01**Project title: **Support to Highly Pathogenic Avian Influenza control programme in Cambodia**Reporting period: **January – March 2010**

Country: Cambodia
Project title: Support to Highly Pathogenic Avian Influenza control programme in Cambodia
Code: OSRO/RAS/604/USA Baby 01
Budget: USD 1 150 000 (Phase I), USD 1 900 000 (Phase II), USD 600 000 (Phase III), USD 400 000 (Phase IV)
Total budget: USD 4 050 000
Effective starting date: 1 October 2006
Planned end date: 31 December 2010
Background
The sporadic outbreaks of Highly Pathogenic Avian Influenza (HPAI) in poultry and humans clearly indicate that the H5N1 virus is still diffused in the country. Therefore, it is necessary to detect the outbreaks as early as possible and ensure that immediate and appropriate containment measures are taken place to prevent the spread of the disease. The continued improvement of capacities and capabilities of Cambodia to prevent and control HPAI in animal population is necessary to limit its impacts in poultry sectors and minimize risk of infection to humans.
Objectives of the project
The main objective of the project is to reduce and stop the spread of H5N1 among and between the flocks of birds in Cambodia, and between Cambodia and the neighboring countries (Viet Nam, Thailand and the Lao People's Democratic Republic), thus reducing the risks of the pathogen to mammals and humans, and reducing the risk of the emergence of pandemic Influenza.
Planned activities
Output: Surveillance activities in the cross-bordering area between Cambodia and neighbouring countries (especially Viet Nam and Thailand) strengthened.
<i>Activity 1: Develop harmonized procedures and protocols for surveillance activities.</i>
<i>Activity 2: Promote (whenever and if possible) a pre-notification system for trade purpose between Cambodia and neighboring countries.</i>
<i>Activity 3: Continue active surveillance activities focusing on sentinel flocks, live bird markets and border inspection posts in targeted provinces following a risk assessment approach.</i>
<i>Activity 4: Continue to improve the diagnosis service for poultry diseases and provide laboratory supplies to further enhance laboratory diagnostic capacity at national and regional levels in order to complete the surveillance activities.</i>

Activity 5: Continue to improve and facilitate sample dispatch of surveillance activities to national laboratory at the National Veterinary Research Institute (NaVRI) and in case of discovered outbreaks to national and/or regional and/or international reference laboratories.

Activities undertaken during the reporting period

Output: Surveillance activities in the cross-bordering area between Cambodia and neighbouring countries (especially Viet Nam and Thailand) strengthened.

Activity 1: Develop harmonized procedures and protocols for surveillance activities.

- Two Letters of Agreement (LoAs) on market surveillance of avian influenza in duck and duck sentinel flock surveillance were designed. Procedure and protocol for the surveillance activities are clearly stated in the LoAs.
- The Avian Influenza Technical Working Group (AI-TWG) meeting has been revamped, and the Food and Agriculture Organization of the United Nations (FAO) supported NaVRI to continue the TWG meetings. The first AI-TWG meeting for the year was held on 18 March at NaVRI, presided by the Ministry of Agriculture Forestry and Fisheries (MAFF). Participants in the meeting were from MAFF, Ministry of Health (MOH), FAO, World Health Organisation (WHO) and *Institute Pasteur de Cambodge* (IPC). The meeting allowed information exchange between MAFF and MOH on the last outbreak in Takeo. Meetings are now held every two weeks, though the meeting planned on 1 April 2010 was cancelled due to some external factors.

Activity 2: Promote (whenever and if possible) a pre-notification system for trade purpose between Cambodia and neighboring countries.

This activity was not carried out during the reporting period.

Activity 3: Continue active surveillance activities focusing on sentinel flocks, live bird markets and border inspection posts in targeted provinces following a risk assessment approach.

- Conducted Market Surveillance of AI in duck (through LoA with NaVRI) in eight markets of Phnom Penh, Takco, Kampot, Siem Reap, Kampong Cham, Prey Veng from March 2010.
- Conducted Duck Sentinel Flock Surveillance (through LoA with NaVRI) in 12 duck commercial farms in Takeo, Kampong Cham, Prey Veng, Kampot, Battambang and Sihanouke Ville from March 2010.
- 400 ring duck tags were provided to NaVRI to be used in duck sentinel flock surveillance.
- The extended two months LoA with NaVRI (January to February) of duck surveillance in the 12 targeted markets in 11 provinces collected 1 435 cloacal swabs, 1 435 tracheal swabs and 1 434 serum. All the collected swabs were found negative for AI virus by egg-inoculation test and all the serum samples were negative for antibody of avian AI by Haemagglutination and Haemagglutination Inhibition tests.

Activity 4: Continue to improve the diagnosis service for poultry diseases and provide laboratory supplies to further enhance laboratory diagnostic capacity at national and regional levels in order to complete the surveillance activities.

- Issued a contract with the Center of Livestock and Agriculture Development (CelAgrid) to provide eggs to NaVRI for virus inoculation procedure. The number of supplied eggs per week has increased in parallel with the number of cloacal, tracheal swab and serum samples.
- Continued to support consumable laboratory equipments to NaVRI.
- Purchased a full digital 500 eggs incubator for NaVRI to respond to the increasing

number of eggs required for inoculation.

- Coordinated the training on Animal Influenza Viruses Diagnosis and Molecular Characterization for six laboratory staff of NaVRI from 3-5 March 2010.
- Ensured safety of the electricity running in the laboratory of NaVRI by providing the following:
 - an Auto Voltage Regulator (AVR);
 - installation of the AVR with proper cable and connection;
 - installation of load shedding contactor; and
 - installation of new electrical line from the sub panel to the laboratory equipment.

Procurement processes have been finalized and the project is now identifying suitable local suppliers.

Activity 5: Continue to improve and facilitate sample dispatch from surveillance activities to NaVRI and in case of discovered outbreaks to national and for regional and/or international reference laboratories.

- H5N1 virus were found by NAVRI in duck samples from Bralaymeas village, Romenh communc, Koh Andeth district, Takoc Province on 29 January 2010. Samples were then sent to IPC for confirmation on 1 February 2010, and MAFF officially declared AI outbreak in the said village on 2 February 2010 (Prakas number 040).
- FAO assisted in the complete investigation and culling of 500 chickens and 760 ducks in the outbreak surrounding areas.

Planned activities for the next quarter

Output: Surveillance activities in the cross-bordering area between Cambodia and neighbouring countries (especially Viet Nam and Thailand) strengthened.

Activity 1: Promote (whenever and if possible) a pre-notification system for trade purpose between Cambodia and neighboring countries.

Activity 2: Continue active surveillance activities focusing on sentinel flocks, live bird markets and border inspection posts in targeted provinces following a risk assessment approach.

Activity 3: Continue to improve the diagnosis service for poultry diseases and provide laboratory supplies to further enhance laboratory diagnostic capacity at national and regional levels in order to complete the surveillance activities.

Activity 4: Continue to improve and facilitate sample dispatch from surveillance activities to NaVRI and in case of discovered outbreaks to national and/or regional and/or international reference laboratories.

Main challenges encountered and response provided

While overall coordination is shared between MOH and MAFF, FAO still plays an important role during outbreak investigation and response in advising the Department of Animal Health and Production. WHO and FAO are the two United Nations agencies still involved in the disease surveillance on H5N1. However, the public awareness component of the national programme is not fully addressed, as no donor is supporting it, therefore creating a gap vis-à-vis the implementation of the strategy..

Main progress made towards the achievement of project outcomes**Output: Surveillance activities in the cross-bordering area between Cambodia and neighbouring countries (especially Viet Nam and Thailand) strengthened.**

Major achievements still have to be generated for this current phase because the LoA for the main surveillance activities has just been signed and started.

- Twelve live bird markets in 11 provinces have been surveyed (extended LoA, January to February), 1 435 cloacal swabs, 1 435 tracheal swabs and 1434 serum were collected;
- Eight live bird markets are being surveyed in six provinces, 960 ducks are to be sampled fortnight;
- Twelve duck commercial farms are being surveyed, 360 identified ducks are to be sampled fortnight.

Project Monitoring Sheet: **OSRO/RAS/604/USA Baby 02**

Project title: **Immediate technical assistance to strengthen the surveillance and response capacity for Highly Pathogenic Avian Influenza (HPAI)**

Reporting period: **October 2010 – March 2011**

Country: People's Republic of China
Project title: Immediate technical assistance to strengthen the surveillance and response capacity for Highly Pathogenic Avian Influenza (HPAI)
Code: OSRO/RAS/604/USA Baby 02
Budget: USD 500 000 (Phase I), USD 500 000 (Phase II), USD 650 000 (Phase III), USD 1 150 000 (Phase IV), USD 1 250 000 (Phase V) Total budget: USD 4 050 000
Effective starting date: October 2010
Planned end date: September 2011
Context of the project Despite efforts by the Government of the People's Republic of China to improve the surveillance and control of Highly Pathogenic Avian Influenza (HPAI), the disease is still endemic in some parts of the country, and some basic understanding about the disease and key ecological risk factors is still lacking. Vaccination has been used widely throughout the country to dampen down the infection and bring the disease under control. However, the virus is still circulating in some production systems where the implementation of the vaccination policy requires major effort and where regulation enforcement is difficult. This project was designed to improve the country's ability to detect and control HPAI infection and disease in identified high-risk ecological and production systems at an early stage, through the implementation of intensified surveillance activities, epidemiological studies, socio-economic activities, capacity building and training.
Objectives of the project The main objectives of the assistance under Phase V of the United States Agency for International Development (USAID) project are to continue working in Hunan, Yunnan, Guangxi and Chongqing while extending activities to Guangdong province in order to increase the scope and impact of project activities in Southern China and provide technical assistance and support in the areas of HPAI epidemiological investigation, disease risk analysis and control strategy. In addition, Phase V of the project is expected to increase support to training activities under the China Field Epidemiology Training Programme for Veterinarians (FETPV) umbrella and provide a significant leap in understanding of HPAI ecology. Through project activities, a strengthened early detection and response mechanism will enable China to increase its capacity to detect and eliminate the disease in a timely manner, thereby minimizing production losses and risk to human safety. The immediate objective of the project is to improve the understanding of HPAI infection and disease distribution, assist the country in defining high-risk areas for targeted control activities in order to minimize the risk to human health and produce skilled and experienced veterinary field epidemiologists who can provide China with expertise and service to address transboundary and emerging infectious diseases among animals.
Planned activities (Phase V)
Output 1: Strengthened cross-sectoral coordination at the national and international level
Activity 1.1 Support national consultants to assist in coordinating project implementation with the Government

Activity 1.2 Organize regular meetings with the Ministry of Agriculture (MoA), the Veterinary Bureau, the State Forestry Administration and the Department of International Cooperation (DIC) to discuss project activities

Activity 1.3 Contribute to and facilitate the coordination of surveillance and applied research activities at the wild bird/domestic poultry interface at Poyang Lake reserve including joint meeting with the State Forest Administration (SFA), provincial veterinary and wildlife authorities to discuss, plan and coordinate field activities

Activity 1.4 Strengthen cooperation with the FAO/ the World Organization for Animal Health (OIE) Network of Expertise on Animal Influenza (OFFLU) and other laboratory and epidemiology networks - discuss and define joint scientific collaboration perspectives and opportunities

Activity 1.5 Organize steering committee workshop and inception workshop (involving MoA, the Veterinary Bureau, the China Animal Health Epidemiology Center (CAHEC), Harbin, provincial Centres for Animal Disease Prevention and Control (CDCs) and other project partners and stakeholders)

Activity 1.6 Coordinate the newly created United Nations subworking group on diseases at the human-animal interface

Activity 1.7 Foster exchange of experiences with Viet Nam and Indonesia on vaccination strategy and market chain analysis

Activity 1.8 Improve public-private partnership cooperation through case-study activities (e.g. live bird market [LBM] restructuring) and missions of the international expert on public private partnership (PPP)/biosecurity

Activity 1.9 Engage in joint collaboration activities with Guangdong Province and use the province as a model for PPP activities; engage Guangdong in FETPV

Output 2: Capacity building in epidemiology: implementation of the China FETPV programme

Activity 2.1 1st module of FETPV: short-term basic training course in epidemiology

Activity 2.2 Training through services

Activity 2.3 2nd module of FETPV: short-term training course in the geographic information system (GIS) and epidemiology. Presentation of investigations and research activities performed in the framework of the training through services (see 2.2)

Activity 2.4 International experts in veterinary epidemiology from the Netherlands will develop case studies for outbreak investigation during March-April

Activity 2.5 Introduce and promote the concepts of diseases at the human-animal interface through training and multidisciplinary approach to disease surveillance and control

Activity 2.6 3rd module of FETPV: advanced training on epidemiology, socio-economic studies, risk assessment and understanding diseases at the human-animal interface

Activity 2.7 Support the participation of two Chinese national to the regional FETPV training in Bangkok

Output 3: Improved knowledge of HPAI epidemiological, ecological and socio-economic risk factors

Activity 3.1 Assist national authorities in analysing national surveillance results and provide guidance on improving national and provincial surveillance policies

Activity 3.2 Strengthen existing risk based surveillance approach through the longitudinal monitoring of selected LBMs in order to identify seasonal changes in infection distribution in winter and define early warning indicators associated to HPAI emergence

Activity 3.3 Facilitate the implementation of epidemiological studies at the domestic poultry/wildlife interface in Poyang Lake Reserve to uncover risk factors associated with the emergence of new virus strains and their subsequent spread

Output 4: Improved HPAI surveillance and control strategy through focused control actions

Activity 4.1 Assist in refining the strategic vision for the national vaccination campaign, provide guidance on improving the progressive control of HPAI, H5N1 through vaccination and share views on establishing a vaccination exit strategy

Activity 4.2 Organize training on biosafety, management and test validation for project province laboratories

Activity 4.3 Organize ring trial between provincial laboratory and Harbin National Reference laboratory

Activity 4.4 Establish GIS-based system at provincial level (Chongqing municipality) to support HPAI surveillance activities

Activity 4.5 Procurement of necessary laboratory equipment and supplies for HPAI diagnosis, data analysis and information sharing including for Guangxi CDC laboratory

Activity 4.6 In the framework of the PPP activities, organize a stakeholder meeting and group discussion for the development of minimum biosecurity standards for LBMs

Activities undertaken during the reporting period (October 2010 – March 2011)

Output 1: Strengthened cross-sectoral coordination at the national level

Activity 1.1 Support national consultants to assist in coordinating project implementation with the government

- Initiated the recruitment of National Programme/Operations Officer in March. The new Programme/Operations Officer is expected to join the team in April.

Activity 1.2 Organize regular meetings with MoA, the Veterinary Bureau, the State Forestry Administration and DIC to discuss project activities

- Maintained close contact/communication with MoA, the project team ensured smooth implementation of the planned activities during the first six months.

Activity 1.5 Organize steering committee workshop and inception workshop (involving MoA, Veterinary Bureau, CAHEC, Harbin, provincial CDCs and other project partners and stakeholders)

- Hold three Steering Committee Meetings in September, November and January. These meetings discussed progress and other key issues regarding FETPV at regular intervals.

Activity 1.6 Coordinate the newly created UN sub-working group on diseases at the human-animal interface

- Coordinated the United Nations Theme Group on Health (UNTGH) 4th Subworking group meetings (diseases at the human-animal interface) in October, December and March. The newly created subworking group will be used as a forum of exchange of scientific information on animal and human health related issues.

Activity 1.7 Foster exchange of experiences with Viet Nam and Indonesia on vaccination-strategy and market chain analysis

- Organized the China-Vietnam Discussion Forum on HPAI Risk Management and Control on 8 and 9 March. The meeting reviewed the scientific progress made in HPAI H5N1 control and explored avenues for joint collaborations.

Output 2: Strengthened HPAI Disease Surveillance System and capacity building

Activity 2.1 1st module of FETPV: short-term basic training course in epidemiology

- 15 trainees from the national institutions and provincial veterinary departments attended the first module of FETPV. The focus of the training was mainly on basic concepts of field epidemiology was held from 29 November to 23 December 2010.

Activity 2.2 Training through Services

- FETPV trainees' surveillance plans of first Phase of training through services (TTS)

were reviewed by MoA. Three trainees' surveillance plans are under improvement, the rest of the trainees' surveillance plans have been submitted to their international mentors for review and comments.

Activity 2.3 2nd module of FETPV

- The second module of FETPV which focuses on participatory epidemiology, risk analysis, basic statistical analysis, data management and applied surveillance, as well as outbreak investigation started on 28 March 2011. An English communication training was provided to the 15 trainees on 26 and 27 2011 March to enhance their language abilities and presentation skills.

Activity 2.4 International experts in veterinary epidemiology from the Netherlands will develop case studies for outbreak investigation during March-April 2011.

- Two Dutch experts conducted their first mission to China from 21 to 25 March 2011. Field mission to Guangxi Province was implemented to discuss with local China Animal Disease Control Centre (CADC) officials about work plan for the next step.

Activity 2.5 Introduce and promote the concepts of diseases at the human-animal interface through training and multidisciplinary approach to disease surveillance and control

- Addressed the One Health concept at the human-animal interface in the framework of FETPV.

Activity 2.7 Support the participation of two Chinese nationals to the regional FETPV training in Bangkok

- One Chinese national expert from CAHEC, Qingdao participated in the third annual regional training course from 17 January to 11 February 2011 in Bangkok.

Output 3: Improved knowledge of HPAI epidemiological and ecological and socio-economic risk factors

Activity 3.1 Assist national authorities in analysing national surveillance results and provide guidance on improving national and provincial surveillance policies.

- Produced and disseminated China HPAI highlights to donors, animal health units at FAO RAP, headquarters and MoA.

Output 4: Improved HPAI surveillance and control strategy through focused control actions

Activity 4.1 Assist in refining the strategic vision for the national vaccination campaign, provide guidance on improving the progressive control of HPAI, H5N1 through vaccination and share views on establishing a vaccination exit strategy.

- Recommendations on how best to sustain the efforts to control HPAI H5N1 in China and Vietnam were provided during the China-Vietnam Discussion Forum in March.

Activity 4.5 Procurement of necessary laboratory equipment and supplies for HPAI diagnosis, data analysis and information sharing including for Guangxi CDC laboratory.

- Procured laboratory equipment and materials for Guangxi CACD, the National Harbin Reference Laboratory (NHRL) and CAHEC; 15 laptop computers were also procured for FETPV trainees.

Planned activities for the next six-month period

Output 1: Strengthened cross-sectoral coordination at the national level

Activity 1.2 Organize regular meetings with MoA, the Veterinary Bureau, the State Forestry Administration and DIC to discuss project activities

- Regular meetings with MoA to discuss China FETPV and other programmatic/operational matters of Phase V.

Activity 1.4 Strengthen cooperation with OFFLU and other laboratory and epidemiology networks - discuss and define joint scientific collaboration perspectives and opportunities

- Organize a ring trial between Harbin National laboratory and provincial laboratories under the guidance of the Istituto Zooprofilattico Sperimentale (IZS), Padova Reference Laboratory on AI.

Activity 1.6 Coordinate the newly created UN subworking group on diseases at the human-animal interface

- Regular working group meeting will be held every two months.

Activity 1.8 Improve public private partnership cooperation through case-study activities (e.g LBM restructuring) and missions of the international expert on PPP/biosecurity

- The PPP expert will visit Guangdong Province in April.

Output 2: Capacity building in epidemiology: implementation of the China FETPV program

Activity 2.2 Training through services

- The first Phase of TTS activities will be implemented from May to August.

Activity 2.6 3rd module of FETPV

- 3rd module of FETPV will start at the end of June.

Output 4: Improved HPAI surveillance and control strategy through focused control actions

Activity 4.2 Organize training on biosafety, management and test validation for project province laboratories

- Organize the biosafety laboratory training for provincial laboratory staff in May.

Activity 4.6 In the framework of the PPP activities, organize a stakeholder meeting and group discussion for the development of minimum biosecurity standards for LBMs.

- Conducted field mission to Guangdong Province in April with the PPP expert.

Main challenges encountered and responses provided

There are no major issues at present.

Main progress made towards the achievement of project outcomes

The project has made noticeable progress towards achieving the expected outputs of the project. Main progress can be summarized as follows:

- Increased MoA's involvement and support to the implementation of project activities of the current phase. MoA has shown strong commitment to FETPV programme and has allocated resources (RMB 500 000) to this programme in both 2010 and 2011.
- Strengthened the cooperation with MoA, provincial partners and international partners. International partners such as Canada, the Netherlands, the United States Center for Disease Control (USCDC) and the European Union have contributed to the successful rollout of the FETPV training.
- Trained 15 key veterinary staff from national institutions and provincial veterinary departments through China FETPV.
- Promoted exchange of experiences on HPAI H5N1 control, especially on the use of vaccination in endemic situation through the organization of China-Vietnam Discussion Forum of HPAI Risk Management and Control.
- Strengthened the link and collaboration between the animal health sector and public health sector, addressed the One Health approach at the human-animal interface through regular meetings involving a wide range of disciplines and scientific communities.
- More project information/event sharing with MoA, national counterparts, RAP, headquarters and donors through the production of China HPAI Highlights.

I Quarter 2010**Project Monitoring Sheet: OSRO/RAS/604/USA Baby 02**

Project title: Immediate technical assistance to strengthen the surveillance and response capacity for Highly Pathogenic Avian Influenza (HPAI)

Reporting period: January- March 2010

Country: People's Republic of China
Project title: Immediate technical assistance to strengthen the surveillance and response capacity for Highly Pathogenic Avian Influenza (HPAI)
Code: OSRO/RAS/604/USA Baby 02
Budget: USD 500 000 (Phase I), USD 500 000 (Phase II), USD 650 000 (Phase III) USD 1 150 000 (Phase IV)
Total budget: USD 2 800 000
Effective starting date: November 2009
Planned end date: September 2010
Context of the project
<p>Despite efforts by the Government of the People's Republic of China to improve the surveillance and control of Highly Pathogenic Avian Influenza (HPAI), the disease is still endemic in some parts of the country, and some basic understanding about the disease and about key ecological risk factors is still lacking. Vaccination has been used widely throughout the country to dampen down the infection and bring the disease under control. However, the virus is still circulating in some production systems where the implementation of the vaccination policy requires major effort and where regulation enforcement is difficult. This project was designed to improve the country's ability to detect and control HPAI infection and disease in identified high-risk ecological and production systems at an early stage, through the implementation of intensified surveillance activities, epidemiological studies, socio-economic activities, capacity building and training.</p>
Objectives of the project
<p>The main objectives of the assistance under Phase IV of the United States Agency for International Development (USAID) project are to continue and expand the activities in southern China (Hunan and Guangxi with the addition of Yunnan Province and Chongqing Municipality during Phase III and IV) and provide technical assistance and support in the areas of HPAI epidemiological investigation, disease risk analysis and control strategy.</p> <p>Through project activities, a strengthened early detection and response mechanism will enable China to increase its capacity to detect and eliminate the disease in a timely manner, thereby minimizing production losses and risk to human safety. The immediate objective of the project is to improve the understanding of HPAI infection and disease distribution, and assist the country in defining high-risk areas for targeted control activities in order to minimize the risk to human health.</p>

Planned activities (Phase IV)**Output 1: Strengthened cross-sectoral coordination at the national level**

Activity 1.1 Support national consultants to assist in coordinating project implementation with the Government.

Activity 1.2 Organize regular meetings with the Ministry of Agriculture (MoA), Veterinary Bureau (VB) and Disease Investigation Center (DIC) and organize project steering committee meetings involving MoA, VB, China Animal Health Epidemiology Center in Qingdao (CAHEC), National Harbin Reference Laboratory (NHRL) and provincial Center for Animal Disease Prevention and Control (CDCs)

Activity 1.3 Contribute to and facilitate the coordination of surveillance and applied research activities at the wild bird/domestic poultry interface in Poyang Lake reserve and organize joint meeting with State Forestry Administration (SFA), provincial veterinary and wildlife authorities to discuss, plan and coordinate field activities.

Activity 1.4 Coordinate meeting with CAHEC and National Animal CDC to improve data integration and analysis at national level.

Activity 1.5 Strengthen international cooperation with the World Organization for Animal Health (OIE) and the Food and Agriculture Organization of the United Nations (FAO) Network of Expertise on Animal Influenza (OFFLU) and other laboratory and epidemiology networks.

Activity 1.6 Organize steering committee workshop and inception workshop.

Activity 1.7 Organize FAO HPAI team building workshop to optimize the resource, definition of tasks and responsibilities and increase project delivery.

Activity 1.8 Organize final workshop at national level to report on the results and achievements of the 3rd and 4th Phase of the project.

Output 2: Strengthened HPAI disease surveillance system

Activity 2.1 Training and capacity building.

Activity 2.2 Establish a Geographical Information System (GIS) at the provincial level to support HPAI surveillance activities.

Activity 2.3 Procurement of necessary laboratory equipment and supplies for HPAI diagnosis, data analysis and information sharing.

Activity 2.4 Produce the China HPAI quarterly bulletin – update on HPAI situation and analysis of surveillance results. Produce and disseminate the HPAI monthly highlight summarizing key achievements of the project on a monthly basis.

Output 3: Improved knowledge of HPAI epidemiological, ecological and socio-economic risk factors

Activity 3.1 Assist national authorities in analysing national surveillance results. Identify additional risk factors and data to be collected at local, provincial, and national levels to refine HPAI risk assessment at national and provincial level in order to better advice on priority surveillance and control activities.

Activity 3.2 Strengthen existing risk based surveillance approach through the longitudinal monitoring of selected live bird markets (LBM) in order to identify seasonal changes in infection distribution in winter and define early warning indicators associated to HPAI emergence.

Activity 3.3 Follow-up socio-economic studies: compile key information on poultry sector and its structure, analyse product flow along the market chains and determine the implications for disease surveillance and control issues in selected border provinces (Guangxi and Yunnan). Produce a report summarizing the main findings of the socio-economic studies performed in Hunan, Yunnan and Guangxi, their application in risk assessment studies and the lessons learned).

Activity 3.4 Facilitate the implementation of studies at the domestic poultry/wildlife interface in Poyang Lake Reserve to uncover risk factors associated with the emergence of new virus strains and their subsequent spread.

Output 4: Improved HPAI control strategy through focused control actions

Activity 4.1 Assist national authorities in collating and analysing post-vaccination surveillance data from the Ministry of Agriculture and CAHEC for the evaluation of the nationwide vaccination surveillance campaign.

Activity 4.2 Assist in refining the strategic vision for the national vaccination campaign, provide guidance in improving the progressive control of HPAI H5N1 through vaccination and share views on defining a vaccination exit strategy.

Activity 4.3 Compile results of above-mentioned epidemiological and socio-economic studies into a final report that will present a framework for changes of national surveillance and control policy.

Activity 4.4 Use LBM survey results generated during the Phase III of the project, assess biosecurity levels in LBM of the three pilot provinces, collect information on current regulations and plans for restructuring and advise national/provincial authorities accordingly

Activities undertaken during the reporting period (January -March 2010)

Output 1: Strengthened cross-sectoral coordination at the national level

Activity 1.1 Support national consultants to assist in coordinating project implementation with the government.

With newly joined national epidemiologist (risk analysis), the AI project team is working in full capacity to ensure a smooth and efficient delivery of the project work plan for the reporting period

Activity 1.2 Organize regular meetings with MoA, Veterinary Bureau and DIC and organize project steering committee meetings (involving MoA, Veterinary Bureau, CAHEC, Harbin and provincial CDCs).

- Through frequent communication and working meetings with MoA, the project team found better ways and measures to speed up delivery of the planned project activities particularly LBM surveillance, training workshops in the four project provinces/municipality and preparation for the establishment of the China Field Epidemiology Training Program for Veterinarians (FETPV).
- Prepared a concept paper for the stakeholders' meeting on China's FETPV in Beijing (3rd week of May 2010) and identified the necessary steps to achieve the expected results of the event.
- Supported FAO headquarters' efforts to obtain agreement from the Russian Federation regarding a proposal for an FAO regional project on transboundary animal diseases (TADs) surveillance.
- Organized the second session of team building training for the project staff to improve communication skills in public speaking, problem solving and action planning.

Activity 1.3 Contribute to and facilitate the coordination of surveillance and applied research activities at the wild bird / domestic poultry interface at Poyang Lake reserve. Organize joint meeting with SFA, provincial veterinary and wildlife authorities to discuss, plan and coordinate field activities

Communication and working group meetings involving FAO's Wildlife Unit, the China Forestry University and the Jiangxi Provincial veterinary authorities to work out the detailed plan for a field study at the Poyang Lake in Jiangxi Province, China, which were part of the ongoing effort to enhance the understanding of virus transmission capability between domestic and wild waterfowl and the overall HPAI epidemiological cycle.

Output 2: Strengthened HPAI Disease Surveillance System and Capacity Building

Activity 2.1 Training and Capacity Building

Organized training in disease outbreak investigation and surveillance protocols in Zhang Jiajie, Hunan Province. A total of 26 veterinarians and animal health officers from 11 prefectures/municipalities in Hunan attended the four-day training that was conducted by Dr. Flavie Goutard, veterinary epidemiologist of the French Center for International Agricultural Research (CIRAD) and Ms. Jia Beibei, veterinary epidemiologist (risk analysis), ECTAD China.

Activity 2.3 Procurement of necessary laboratory equipment and supplies for HPAI diagnosis, data analysis and information-sharing.

Laboratory supplies and equipment for provincial laboratories were procured.

Activity 2.4 Disease analysis: HPAI analysis of surveillance results

Produced the China HPAI Quarterly Bulletin – Volume 5.

Output 3: Improved knowledge of HPAI epidemiological and ecological risk factors

Activity 3.2 Strengthen existing risk based surveillance approach through the longitudinal monitoring of selected Live Bird Markets (LBM) in order to identify seasonal changes in infection distribution in winter and define early warning indicators associated to HPAI emergence.

- Organized training for provincial veterinarians and staff to prepare for another round of LBM survey in the two provinces of Hunan and Guangxi, and in Chongqing Municipality.
- Carried out LBM survey in Hunan and Guangxi provinces and Chongqing Municipality.

Activity 3.3 Follow-up socio-economic studies: compile key information on poultry sector and its structure, analyse product flow along the market chains and determine the implications for disease surveillance and control issues in selected provinces (Yunnan and Hunan).

Updated the plan and design for poultry sector review in Yunnan and Hunan provinces.

Activity 3.4 Facilitate the implementation of studies at the domestic poultry/wildlife interface in Poyang Lake Reserve to uncover risk factors associated with the emergence of new virus strains and their subsequent spread.

Organized a field study at the domestic poultry/wildbird interface in Poyang Lake in Jiangxi Province in China (January 2010).

Planned activities for the next quarter (April –June 2010)

Output 1: Strengthened cross-sectoral coordination at the national level

Activity 1.1 Organize regular meetings with MoA, Veterinary Bureau and DIC and organize project steering committee meetings (involving MoA, Veterinary Bureau, CAHEC, Harbin and provincial CDCs)

Regular meetings with MoA to discuss programmatic and operational matters.

Activity 1.2 Contribute to and facilitate the coordination of surveillance and applied research activities at the wild bird/domestic poultry interface at Poyang Lake reserve and organize joint meeting with SFA, provincial veterinary and wildlife authorities to discuss, plan and coordinate field activities

Facilitate the coordination of surveillance and research at the Poyang Lake, enter the data/information into the HPAI data base, analyze the findings and present the results to relevant authorities for further action.

Activity 1.3 Data integration and analysis workshop organized at national level.

Organize a data integration and analysis workshop in Qingdao on 26 May 2010.

Activity 1.4 Strengthen cooperation with OFFLU and other laboratory and epidemiology networks - discuss and define joint scientific collaboration perspectives and opportunities

- Visit of OFFLU partner laboratory in China scheduled in April by Istituto Zooprofilattico Sperimentale delle Venezie (IZSve) - Padua/Italy to share information, establish effective communication and contacts to facilitate future cooperation opportunities
- Organize training on laboratory biosafety (by IZSve) in Chongqing and Guangxi.

Activity 1.5 Organize a stakeholder meeting on FETPV

Hold Stakeholder Meeting on FETPV on the third week of May 2010.

Output 2: Strengthened HPAI Disease Surveillance System and Capacity Building

Activity 2.1 Training and capacity building.

- Two more training sessions in disease outbreak investigation and surveillance protocols at provincial and local levels following the first training in Hunan in March 2010 (eight days in Guangxi and four days in June in Yunnan).
- Organize theoretical and hands-on training in biosafety, management and test validation for the provincial laboratory staff in Chongqing and Guangxi (by IZSVe).
- Review the current AI diagnostic testing procedure and efficiency in April in Guangxi (by IZSVe).
- Follow up advanced training in Risk Analysis to be conducted by Royal Veterinary College in London (RVC) from 17 to 21 May 2010 in Qingdao and from 14 to 18 June 2010 in Chongqing.
- FETPV- Roadmap implementation and support of two national staff to attend the regional FETP-V training in Bangkok (June/July to August 2010).

Activity 2.2 Establish GIS-based system at provincial level to support HPAI surveillance activities.

Follow up training on GIS for provincial veterinary officials and staff in Guangxi, Chongqing (and possibly Yunnan) in June 2010.

Output 3: Improved knowledge of HPAI epidemiological and ecological risk factors

Activity 3.1 Assist national authorities in analysing national surveillance results and provide guidance on improving national and provincial surveillance policies. Identify additional risk factors and data to be collected at local, provincial and national levels to refine HPAI risk assessment at national and provincial level in order to better advice on priority surveillance and control activities.

Finalize the ongoing analysis on 1) HPAI environmental risk factors; 2) role of LBM in HPAI spread throughout first and second quarter of 2010.

Activity 3.2 Strengthen existing risk based surveillance approach through the longitudinal monitoring of selected Live Bird Markets (LBM) in order to identify seasonal changes in infection distribution in winter and define early warning indicators associated to HPAI emergence.

Continue longitudinal LBM survey in the Guangxi and Chongqing in April 2010.

Activity 3.3 Follow up socio-economic studies: compile key information on poultry sector and its structure, analyse product flow along the market chains and determine the implications for disease surveillance and control issues in selected provinces (Yunnan and Hunan).

Recruit two international epidemiologists to (1) review the results of the market chain analysis studies conducted in 2009 and guide the ECTAD China team in applying social network analysis techniques in disease risk assessment and management, and (2) provide guidance on disease risk mapping techniques and modelling during April to June 2010.

Main challenges encountered and responses provided

There are no major issues at present. The project team will continue to closely monitor the implementation of remaining activities of the work plan for the next two quarters in order to ensure completion of all planned activities by the completion date of the project.

Main progress made towards the achievement of project outcomes

Over the period from January to March 2010, the project has made noticeable progress towards achieving the expected outputs of the project. FAO's technical assistance through the support provided by USAID, particularly the training and capacity building activities designed for and organized in the provinces have fostered a positive spirit and strengthened the relationships between FAO and the Central Government of China as well as with the provincial veterinary authorities. Some of the main achievements are:

- (1) **Strengthened cross-sectoral coordination and collaboration among all partners:**
 - Increased MoA and national partners' involvement and support to the planning and implementation of field surveillance activities, reinforcing disease surveillance and disease outbreak investigation through promotion and understanding of the importance of animal epidemiology and common approach/practices in other regions and the world.
 - Improved project/activity planning process and increased involvement and support from the MoA and national partners, which have resulted in increased project delivery and better results for the various inputs.
 - Routine functioning of the working groups and project focal points, resulting in better coordination and collaboration on HPAI at national and provincial levels.
 - Consolidated coordination between MoA and SFA and among all the national partners, increased collaboration and improved relationship and trust with MoA through regular meetings.
 - Improved design and effective organization of HPAI studies, field missions, and training activities targeting local veterinarian (provincial and prefecture levels) and laboratory staff.

- (2) **Strengthened HPAI Disease Surveillance System and Capacity Building**
 - Key competencies and skills required for better HPAI detection and data analysis and the overall capacity of the provincial CDCs have been developed, providing future opportunity and collaboration with national partners during the next phase of the project.
 - Some changes and adaptation of provincial surveillance protocols and planning (strategy) were made in Guangxi and Hunan, following FAO trainings.
 - Initial success in the study around the Poyang Lake, which laid down a foundation for studies of similar nature to be carried out during the coming year.
 - Provincial veterinary authorities and staff learned new skills, obtained first hand data and information and gained the experience in organizing more complex LBM survey and socio-economic studies. More locations could be included and follow these patterns.
 - Participants involved in the targeted surveillance activities, training workshops and studies focusing on animal epidemiology and risk analysis (LBM, cross-border socio-economic study, disease outbreak investigation, risk analysis and biosafety in laboratories) gained better understanding of the need for quality information/data for the HPAI disease surveillance system.
 - MoA and national partners better understood and increased their interest/support for an FETPV programme in China.
 - Provincial laboratories and staff enhanced their skills through additional training on laboratory protocol and the provision of laboratory supplies and equipment.
 - Continued efforts to involve national research/academies and international centres

of excellence to help widen the horizon of the project as well as to improve quality of training, knowledge sharing, networking and to increase the interest and participation of local veterinary authorities and staff.

(3) Contribution to improve knowledge of HPAI epidemiological, ecological and socio-economic risk factors through enhanced skills/knowledge and the overall capacity of provincial veterinary authorities and their staff, in particular:

- the concept, contents and benefits of a FETPV in China;
- the role and use of GIS technology in HPAI surveillance and risk analysis;
- the skills and protocols involved in the LBM survey and importance of the studies;
- the skills of epidemiologists in disease risk analysis and modelling techniques;
- AI project team produced/published HPAI bulletins and monthly reports which were shared with national counterparts, FAO headquarters and the donor at a regular basis.

(4) Improved HPAI control strategy through focused control actions.

Better understanding of poultry production structure and socio-economic issues for further integration into national response plan.

Project Monitoring Sheet: **OSRO/GLO/705/USA**Project Title: **China and Viet Nam Forum on HPAI Risk Management and Control**Reporting period: **October 2010 – March 2011**

Country: China and Viet Nam
Project title: China and Viet Nam Forum on HPAI Risk Management and Control
Code: OSRO/GLO/705/USA
Budget: USD 60 000 ¹
Total budget: USD 735 848
Effective starting date: 1 October 2007
Planned end date: 30 April 2014
Context of the project
<p>A two-day “<i>Technical discussion on best practices for prevention and containment of H5N1 Highly Pathogenic Avian Influenza (HPAI)</i>” was organized by the United States Agency for International Development (USAID) in Bali, Indonesia, on 30 and 31 March 2010. Five countries (Bangladesh, China, Egypt, Indonesia and Viet Nam) were highlighted because of their extensive experience with H5N1 HPAI. This experience included the countries’ capacity in defining high-risk populations and geographic areas where H5N1 occurs and their efforts to continually readjust their prevention and containment strategies to manage the virus in both human and avian populations.</p> <p>During the meeting, experience and lessons learned were shared among the participants. There was a common agreement that H5N1 still posed a threat to animal/human health and sustainable rural livelihoods and that there was still a potential for a human influenza pandemic. Therefore, it was important to remain focused on the highly impacted countries and to continue targeted support with the goal of ultimately reducing circulating H5N1, leading to progressive eradication. One of the recommendations of the meeting was to share experiences among the target countries of many ‘good practices’ and lessons learned from controlling HPAI. These included:</p> <ul style="list-style-type: none"> • documentation and transfer of the good practices, e.g. health care in Egypt, market chain critical intervention point analysis, etc; • documentation and sharing of experiences of challenges and shortcomings; and • areas where best practices still needed to be developed. <ul style="list-style-type: none"> ○ full understanding of epidemiology; ○ identifying better tools to support behaviour change; ○ how best to engage with private sector and ensure biosecurity enhanced “farm to fork”; and ○ vaccination – most effective strategy(ies), effective vaccine for ducks. <p>The China and Viet Nam Forum is a direct result of the recommendations of the Bali meeting with a new approach of experience sharing, which is believed to be more beneficial to the participating countries than the conventional study tour programme. Initially, three possible study tours were considered: Viet Nam/China, Indonesia/Egypt and Bangladesh/? (Collaborating country was not selected). Owing to political problems in Egypt and subsequent budget constraints, only the study tour from Viet Nam to China was finalized and completed.</p>

¹ The amount of USD 60 000 was approved by the Donor for this specific activity.

<p>Objectives of the project</p> <p>To review the scientific progress made in HPAI H5N1 control and explore avenues for joint collaboration between China and Viet Nam in areas of mutual interest, covering the following topics: (i) disease and infection control along market chains and (ii) cost-effective, risk-based targeted vaccination.</p>
<p>Planned activities</p> <p>Output: Increased understanding of the successes, challenges and lessons learned in combating H5N1 HPAI under similar country contexts</p> <ul style="list-style-type: none"> • Conduct workshop on China and Viet Nam Forum on HPAI Risk Management and Control.
<p>Activities undertaken during the reporting period</p> <p>Output: Increased understanding of the successes, challenges, and lessons learned in combating H5N1 HPAI under similar country contexts</p> <p>A two-day workshop (8-9 March 2011) was held in Beijing China. This was a joint meeting between the governments of China and Viet Nam in order to assess the results of the past five years of mass vaccination and opportunities for transition to targeted, risk-based vaccination. The meeting was a follow-up of a technical discussion on best practices for prevention and containment of H5N1 HPAI that was held in Bali in March 2010 and hosted by USAID and the government of Indonesia to foster dialogue and experience sharing between countries highly impacted by H5N1 avian influenza. The meeting included presentations by international experts on the current scientific knowledge regarding influenza vaccines and new epidemiological approaches to assessing risk, reports on the national policies and programmes of both China and Viet Nam, as well as a special focus on the ongoing Food and Agriculture Organization of the United Nations (FAO)/USAID project in Viet Nam, called Gathering Evidence for Transitional Strategy (GETS) project. The GETS project is a pilot study conducted in three Vietnamese provinces.</p> <p>Participants included:</p> <ul style="list-style-type: none"> • China: Deputy Director General (DG) of Veterinary Bureau (VB), HPAI experts from VB, Center for Animal Disease Control (CADC), China Animal Health and Epidemiology Center (CAHEC), Harbin Veterinary Research Institute (HVRI), Shanghai Veterinary Research Institute (SVRI), CADC Hunan, CADC Guangxi, FAO China • Viet Nam: Deputy DG of Viet Nam Ministry of Agriculture and Rural Development (MARD), FAO Viet Nam ECTAD staff, USAID/RDMA and USAID in Viet Nam. • Other international guest experts: FAO Regional Office for Asia and the Pacific (RAP) staff, Laboratory Director, Southeast Poultry Research Laboratory (SEPRL) of the United States Department of Agriculture.
<p>Planned activities for the next six-month period</p> <p>No further activities are directly foreseen under this project.</p>
<p>Main challenges encountered and response provided</p> <ul style="list-style-type: none"> • Despite the reduction in reported HPAI H5N1 outbreaks and human cases, the risks for the

generation of new influenza pandemic strains still exist. Animal and human cases are still occurring, and the virus continues to circulate in the traditional live bird market (LBM) system. As a consequence, some challenges still remain to be addressed for better controlling the disease and drastically reducing the level of infection in high-risk areas and/or high-risk segments of the poultry industry.

- Maintaining human and financial resources for a massive vaccination programme over an extended time span is recognized.
- Traditional farming systems, including waterfowl and free ranging duck systems, still represent a challenge for HPAI control and the implementation of a successful vaccination programme. In addition, it is difficult to improve the biosecurity of these traditional farming systems.
- There is a need to better understand different farming systems and more specifically duck husbandry systems in China and Viet Nam.
- In addition, it is necessary to better understand the ecosystems and market chains which bring together domestic waterfowl, farmed wild birds and migratory birds.
- Policy should be developed to support farmer applying Good Animal Health Farming Practices.
- LBMs still represent a particularly high-risk part of the industry and serve as a possible mechanism by which infection is maintained for prolonged periods of time, posing additional risk for disease spread and human exposure. The meeting recommended that:
 - There is a need to better understand the structure and dynamics of these markets, and how they are intertwined, to define control measures geared towards interrupting the HPAI H5N1 infection perpetuating cycle. Techniques and approaches borrowed from social sciences applied to epidemiology can assist in identifying persistence of infection or points of concentration along poultry market chains.
 - In this regard, a better knowledge of market trade practices and an increased understanding of market networks through value chain analysis and social network analysis would allow the definition of targeted control interventions along market chains.
 - With a view of drastically reducing the level of infection, which is maintained through LBM networks, restructuring of LBMs should become a priority and should engage both the public and the private sector. This approach was adopted in the United States to control avian influenza infection in LBMs and has proven to be successful. Increased surveillance activities in LBMs are also required.
- In Viet Nam: Policy should be developed to reduce the number of LBMs and increase super markets systems to sell safer poultry products.
- Additional recommendations:
 - It is necessary to review the current strategy (which started in 2004) in light of new scientific development (availability of new vaccines, prospects for developing risk-based surveillance and vaccination strategy, innovative approaches offered by market chain analysis and social network analysis, etc.).
 - There is a need to know more about the HPAI H5N1 virus, where it is entrenched and how it circulates within and between both countries. Thus, one of the areas for joint action should be to enhance the information sharing by establishing a mechanism of regular and timely update on the epidemiological situation, as well as on the field circulating strains.
 - There is a need to maintain donor support in both countries to assist them in their transitional strategy towards targeted risk based surveillance and vaccination.
 - More training in epidemiology is required to raise the capacity and skills of field veterinarians in order for them to better understand basic concepts of epidemiology

including the notion of risk and risk-based surveillance and control techniques. In this regard the Field Epidemiology Training Programme for Veterinarians (FETPV) in China should be further supported to train a critical mass of veterinarians, who will be responsible for the design and monitoring of risk-based strategies for HPAI and other infectious diseases.

Main progress made towards the achievement of project outcomes

- The vaccination programme implemented in China and Viet Nam has contributed to the improvement of the HPAI H5N1 epidemiological situation in the countries as demonstrated by a significant reduction in the number of animal and human cases.
- China and Viet Nam have taken several important steps to confront and control outbreaks and respond to the occurrence of human cases. These steps include measures, such as stamping out, movement controls, cleaning and disinfection of infected premises and the adoption of a nationwide mass vaccination campaign combined with intensive post-vaccination monitoring efforts.
- The use of vaccination in Viet Nam and China in accordance with OIE and FAO guidelines has been coupled with other surveillance and control measures to allow a progressive control of the disease in both human and animals.
- Viet Nam is willing to share virus samples with China for genotyping and to ensure that vaccines match circulating strains. China has agreed in principle and will consult further with national authorities, such as the General Administration of Quality Supervision, Inspection and Quarantine (AQSIQ). Vietnamese technicians are also welcome to visit China Reference Laboratory for Avian Influenza and learn about new laboratory techniques.
- Owing to the success of the discussion during the meeting and the dialogue initiated during the forum, it was agreed that follow-up meetings of this kind are required. Smaller follow-up technical meetings could also be envisaged every six months.

Project Monitoring Sheet: OSRO/RAS/604/USA Baby 02

Project Title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza**Reporting Period: **April to September 2013**

Country: The People's Republic of China
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza
Code: OSRO/RAS/604/USA Baby 02
Budget: Phase I: USD 500 000 Phase II: USD 500 000 Phase III: USD 650 000 Phase IV: USD 1 150 000 Phase V: USD 1 250 000 Phase VI: USD 1 005 500 Phase VII: USD 670 000 Phase VIII: USD 781 000
Total budget: USD 6 506 500
Effective starting date: 1 August 2006
Planned end date: 30 September 2014
Context of the project Despite efforts by the Government of the People's Republic of China to improve the surveillance and control of Highly Pathogenic Avian Influenza (HPAI) through the commitment of resources and development of widespread and comprehensive programmes in both animal disease surveillance and preventive vaccination, the disease remains endemic in some areas of the country. More specifically, the virus is still circulating widely in agro-ecological zones and traditional production systems where the implementation of the control policy requires major effort and commitment of human and financial resources at national and provincial levels. This project was designed to improve the country's capacities to detect and control HPAI in identified high-risk ecological and production systems at an early stage, through the implementation of intensified surveillance activities, epidemiological studies, socio-economic activities, capacity building and training. Ultimately, the project aims to reduce the spread of H5N1 in poultry in the country, thus minimizing the risk of contagion to other mammals and humans and the possibility of a pandemic.
Objectives of the project The main objective under Phase VII of the project is to continue the improvement of China's capacities and capabilities to understand HPAI epidemiology, to acquire and analyse relevant information and, overall, to effectively prevent, prepare for, and respond to HPAI outbreaks in the animal population. A significant part of Phase VII of the project revolves around training and capacity building through the China Field Epidemiology Training Programme for Veterinarians (FETPV). The project also follows up on new activities and approaches that were initiated in previous phases, including improvement of public-private partnerships (PPPs), biosecurity in live bird markets (LBMs), improving knowledge of market chain dynamics and investigation and

reporting of outbreaks. Other activities include fostering exchanges of knowledge and good practices with neighboring countries on vaccination strategies, cross-border issues and controlling risks of transboundary animal diseases (TADs) using HPAI as a model, operationalizing the *One Health* concept, and addressing health issues at the human-animal-ecosystem interface with a special emphasis on a multi-disciplinary and cross-sectoral approach.

Planned activities for the reporting period (April to September 2013)

Output 1: Cross-sectoral coordination at the national and international levels strengthened

- 1.1 Support the country team including national and international consultants to assist in coordinating project implementation with the Government.
- 1.2 Ensure active participation as appropriate and facilitate coordination of the country programme with other projects or programmes including the Emerging Pandemic Threats Plus (EPT+) and EPT programmes.
- 1.3 Organize and attend meetings with United States Agency for International Development (USAID) partners and national Government partners to discuss project activities and implementation issues.
- 1.4 Strengthen the collaboration with border countries on prevention and control of transboundary animal diseases and safeguard animal production and public health.
- 1.5 Coordinate the United Nations Theme Group on Health (UNTHG) Sub-Working Group on diseases at the human-animal interface using avian influenza coordination as a model.

Output 2: Veterinary epidemiology capacity strengthened

- 2.1 Organize stakeholder meeting/mentors workshop/Steering Committee meeting for the second cohort of China FETPV.
- 2.2 Organize two training modules under the framework of the China FETPV for the second cohort.
- 2.3 Enhance practical *One Health* approaches in China FETPV training including promoting strengthening of working ties with China FETP.
- 2.4 Support the Veterinary Bureau and China Animal Health and Epidemiology Center (CAHEC) to organize epidemiology training at the national and provincial levels.

Output 3: Knowledge of HPAI epidemiological, ecological and socio-economic risk factors improved and shared

- 3.1 Produce the monthly bulletin, HPAI Disease Update, technical/scientific papers and analytical reports on the HPAI situation.
- 3.2 Discuss with the Ministry of Agriculture (MoA), State Forestry Administration (SFA) and other national implementing partners, means of supporting the implementation of surveillance and epidemiological studies.

Output 4: HPAI surveillance and control strategies improved

- 4.1 Assist in refining the strategic vision for the national vaccination campaign; provide guidance on improving the progressive control of H5N1 HPAI through vaccination and share views on establishing vaccination exit strategies where appropriate.
- 4.2 Assist the MoA and provincial partners to establish models of good practice for disease control.

Activities undertaken during the reporting period (April to September 2013)

Output 1: Cross-sectoral coordination at the national and international levels strengthened

Activity 1.1: Support by country team in coordinating project implementation:

- Recruitment of a national project coordinator under the EPT+ project (OSRO/INT/001/USA).
- Recruitment of a national consultation PPP to work for the promotion and roll-out of the PPP approach under project OSRO/GLO/302/USA.
- Recruitment of a national veterinary epidemiologist to carry out HPAI epidemiology research under project OSRO/RAS/604/USA B02.
- Contracts for the rest of office staff were extended to the new completion date of 31 December 2013 following the three-month no-cost extension of the project in order to ensure the successful completion of activities under the current phase and a smooth transition into the next phase.

Activity 1.2: Implementation of the EPT+ project in the country:

- Virus isolation and enzyme-linked immune-sorbent assay (ELISA) tests for two batches of samples were conducted in Harbin laboratory with preliminary results shared in the mid-term technical report.
- The EPT+ internal meeting attended by FAO's Emergency Centre for Transboundary Animal Diseases (ECTAD) China, Bangladesh and Vietnam country teams was held at the FAO's Regional Office for Asia and the Pacific (RAP) from 28 to 30 August 2013. The meeting was held to share information on project achievements and lessons learned during Phase I.
- The final report and payment based on the letter of agreement (LoA) with the Harbin Veterinary Research Institute (HVRI) on "Conducting field sampling and laboratory testing to characterize influenza viruses in the livestock sector" have been completed.
- An LoA on "Conducting genetic sequencing analysis of the swine influenza viruses from EPT+ project" with HVRI during the period from October to December 2013 was prepared and technically cleared by FAO RAP.
- The EPT+ project proposal for Phase II with an estimated budget was prepared for submission to USAID.

Activity 1.3: Meetings with USAID partners and national government partners for project implementation:

- From 6 to 7 May 2013, a USAID Partners Meeting was held in Guangzhou to review current projects and identify opportunities for future work and collaboration, and consider the ongoing influenza A(H7N9) situation. Representatives from USAID (Washington and Bangkok), relevant USAID projects (PREDICT/IDENTIFY), World Health Organization (WHO) China, United States Centers for Disease Control and Prevention (CDC), World Organization for Animal Health (OIE), FAO ECTAD and the Veterinary Bureau of the Chinese MoA attended.
- The implementation plan of the project, under FAO's Technical Cooperation Programme, entitled "Developing Prevention and Control Technologies for African swine fever (ASF) in China" has been approved by the Veterinary Bureau of the Chinese MoA. This is one of the important items specified in the memorandum of understanding (MoU) signed between the Veterinary Bureau and FAO owing to the huge pig population in China and the great risks of

ASF.

Activity 1.4: Strengthen the collaboration with border countries on prevention and control of transboundary animal diseases and safeguard animal production and public health:

- The Second China-Viet Nam bilateral meeting on collaboration to address transboundary animal diseases and diseases of public health concern was held from 22 to 24 August 2013 in Viet Nam. This meeting served as a comprehensive summary of China-Viet Nam veterinary cooperation in recent years and will promote practical and effective cooperation in the control of animal diseases in the future.
- Provided technical advice to the World Bank-funded Emerging Infectious Diseases (EIDs) project in the country and participated in the China-Mongolia joint exercises on the prevention and control of brucellosis in Inner Mongolia from 15 to 17 September 2013.

Activity 1.5: UNTGH Sub-Working Group meetings:

- The Executive Committee Meeting of the UNTGH Sub-Working Group on Diseases at the Human-Animal Interface was held on 8 July 2013 at the ECTAD Office in China.
- The event on 'Sharing Experiences on the Application of *One Health* Approaches in China' was successfully held from 8 to 9 August 2013 in Beijing. This event provided an opportunity for experts from multiple sectors to share their experiences with applying *One Health* approaches to the control and elimination of rabies and brucellosis, influenza A(H7N9) emergency response, as well as education, training and research. Good examples of the application of *One Health* approaches in China were identified, which can be used as models of good practice.

Output 2: Veterinary epidemiology capacity strengthened

Activity 2.1: The eighth Steering Committee of China FETPV was held on 21 June 2013 at the FAO ECTAD China Office, with the participation of representatives from the Veterinary Bureau, CAHEC, European Union (EU)-China Trade Project Phase II, CDC and other members. The meeting reviewed the progress of the past half year, finalized the Action Plan for the second half year of 2013 and also discussed the proposed activities and new initiatives for 2014. The members reached agreement on emphasizing the sustainability of the China FETPV programme as well as epidemiology capacity development in the coming year, e.g. roll out at provincial level and engagement with universities.

Activity 2.2: The activities of second cohort of the China FETPV are:

- A six-week training programme was delivered in Qingdao from 11 March to 19 April 2013. This was the first module of the second two-year China FETPV. The module mainly focused on the basic concepts of field epidemiology and application tools including biostatistics and geographic information systems (GIS). The trainees were comprised of 20 selected veterinarians from several governmental veterinary services and research centres across China.
- The second module of the China FETPV was held from 1 to 26 July 2013. A total of 20 trainees participated in the module. The module provided the trainees with expertise on outbreak investigation, risk assessment, advanced data analysis and disease control strategies.
- Trainees carried out the field practice assignments according to the programme framework.

Trainees completed 20 secondary data analyses, and 20 field epidemiological studies are ongoing. These field practice assignments helped the trainees to apply the epidemiology they have been learning into practice in a real context.

Activity 2.3: The training course “*One Health* for Veterinary and Medical Field Epidemiologists” sponsored by the EU-China Trade Project Phase II and co-organized by FAO ECTAD China Office, the Chinese Field Epidemiology Training Programme (CFETP) and the CAHEC was held from 15 to 19 July 2013 in Beijing. It was the first joint course between China FETPV and CFETP. There were a total of 43 participants, including 29 FETPV trainees and graduates plus 14 CFETP trainees.

Activity 2.4: The activities to strengthen the Chinese partners’ capacity were organized both at the national and provincial levels:

- The Good Emergency Management Practice (GEMP) Workshop on Strengthening Capacity to Respond to Animal Disease Emergencies, organized in conjunction with the China Center for Animal Diseases Control (CADC) and the Veterinary Bureau of the MoA, was held from 15 to 17 May 2013. The objectives of this workshop were to improve the capacity to respond to animal disease emergencies at provincial levels, and promote capabilities of veterinary authorities to prevent and control major animal diseases.
- The MoA designated six Chinese trainers for the China FETPV - three staff epidemiologists from CAHEC; two graduates of the first China FETPV cohort course and a PhD student from the University of Prince Edward Island. Each Chinese trainer took responsibility for three or four trainees and will act as a mentor for these students for the remainder of the course. This was seen as an important development and should enable close supervision and development of contacts between trainees and trainers.
- Training of trainers for the six Chinese trainers was delivered by two experts from the Royal Veterinary College in April 2013. The training focused on how to teach basic epidemiology and participatory teaching approaches.
- The Chinese trainers engaged with the China FETPV teaching activities; they delivered lectures and group-based exercises and provided the mentoring for the field practices. The international trainers provided guidance throughout the activities, which allowed the Chinese trainers to enhance their understanding of epidemiology and the teaching skills.

Output 3: Knowledge of HPAI epidemiological, ecological and socio-economic risk factors improved

Activity 3.1: In total, 12 issues of the monthly bulletin China HPAI Highlights (six in English and six in Chinese) and one HPAI Disease Update and analysis report on the HPAI situation were produced during the past six months. These products were disseminated to all relevant stakeholders on a regular basis.

Activity 3.2: Consultation with the MoA, SFA and provincial partners to carry out surveillance and epidemiological studies were continued through technical workshops/meetings.

Output 4: HPAI surveillance and control strategies improved

Activity 4.1: Work with national and provincial partners and provide support to facilitate trainees' field epidemiology surveillance and outbreak investigation under the second cohort of China FETPV.

Activity 4.2: Assist the MoA and provincial partners to establish models of good practice for disease control:

- On 14 May 2013, the Crisis Management Centre – Animal Health (CMC-AH) and ECTAD China met with representatives from the Veterinary Bureau and Zhejiang and Shanghai animal health authorities to discuss animal carcass disposal and farm waste management. CMC-AH assisted with the scoping of needs for further assistance on this topic.
- A seminar on strengthening biosecurity in LBMs was jointly held by the MoA and FAO on 23 July 2013 in Guangzhou, followed by a field visit to the Jiangcun Poultry Wholesale Market. Government representatives from the Veterinary Bureau, CADC, CAIIEC, FAO ECTAD China Office, the Agriculture, Fisheries and Conservation Department of Hong Kong, and local veterinary authorities from Shanghai, Jiangsu, Zhejiang, Hunan, Anhui provinces, where low pathogenic avian influenza A(H7N9) was experienced earlier this year. They were joined by stakeholders from market management, vendors and the private sector.
- With the company of local partners from the Veterinary Bureau and Animal Health & Inspection Institution, FAO ECTAD visited two of the largest poultry wholesale markets in Changsha on 23 September 2013 and attended a meeting chaired by the Director of Veterinary Bureau of Hunan Province, joined by the management of the LBMs, State Administration for Industry & Commerce of Changsha and Market System Construction Department of Changsha Commerce Bureau. The meeting identified the difficulties, challenges and opportunities of relocating and upgrading the new LBM in Changsha City, as well as FAO's possible involvements in strengthening the biosecurity of the market.

Activity 4.3: Following the outbreaks of influenza A(H7N9) that resulted in infection and human deaths in the eastern provinces of China in April 2013, FAO ECTAD China has been assisting the MoA's implementation of a large-scale national strategy for surveillance by providing information and participating in a joint epidemiological investigation along with four teams of graduates and trainees from FAO's FETPV. In particular, FAO's response included the following:

- An Incident Response Team was established with close linkages to FAO headquarters and RAP. Advice has been provided to the MoA and FAO on request. The Team worked very closely with WHO in China.
- FAO headquarters convened a workshop of international experts who have prepared detailed reports on risk assessment, surveillance and risk management. Chinese language versions have been prepared and shared with the MoA.
- FAO was invited by the MoA to participate in a joint FAO/MoA team to conduct an epidemiological study in the affected areas. This is underway – the first stage has been completed and a preliminary analysis has been prepared and shared with the MoA.
- A conference for information exchange on influenza A(H7N9) situation and sharing of experiences and lessons learned from the prevention and control of influenza A(H7N9) in China was held in Bangkok from 24 to 25 June 2013.

Activity 4.4: In coordination with Veterinary Bureau of the MoA, the FAO ECTAD China Office carried out influenza A(H7N9) research through market chain analysis with Jiangsu Province, the potential high-risk area, as the pilot province. In consultation with experts from CAHEC, a series of scientific investigation forms was designed and the local veterinary authority of Jiangsu Province was required to provide the information needed.

Main challenges encountered and responses provided

Due to the influenza A(H7N9) outbreaks, FAO ECTAD staff worked long hours to assist the MoA. FAO ECTAD staff were able to maintain a high level of completion of agreed activities by working hard, prioritizing and adjusting schedules. The MoA has recognized the significant contribution made by FAO ECTAD staff.

The vacant National Epidemiologist position was filled and an international consultant was employed on emergency funding to assist with the response.

Main progress made towards the achievement of project outcomes

The project has made considerable progress towards achieving the expected outcomes, which can be summarized as follows:

- There was a high level of achievement of planned activities. Highlights include good progress with the FETPV, collaboration with neighboring countries, application of *One Health* approaches, GEMP training, the recognition of the Animal Influenza Laboratory, HVRI as a FAO Reference Centre for Animal Influenza, and progress with the EPT+ project.
- The signing of the MoU on prevention and control of TADs and EIDs between FAO's Animal Production and Health Division and the Veterinary Bureau of China's MoA in May 2013 demonstrates the high-level commitment for bilateral cooperation on animal health issues. It was assisted by high-level visits and dialogues by both parties, who have agreed to continue such meeting and plan activities jointly.
- The promotion of the PPP project in Guangzhou through the demonstration of model market is the first time that FAO China has introduced the PPP approach to address veterinary and animal health issues, with a special focus on LBMs in China. Winning the support from both public and private sectors, the seminar and field visit provided an opportunity for all interested stakeholders to participate in the scaling up of existing experience to other LBMs in the future.
- Following the visits by the FAO Chief Technical Adviser and the National Technical Adviser to the Veterinary College of Huazhong Agricultural University in Wuhan, the University has agreed to participate in FAO activities to promote veterinary epidemiology education.

Project Monitoring Sheet: **OSRO/INT/604/USA Baby 1**

Project title: **Support for FAO/OIE/WHO collaboration on HPAI rapid response and containment**

Reporting period: **October 2010 – March 2011**

Regional:	Global
Project title:	Support for FAO/OIE/WHO collaboration on HPAI rapid response and containment
Code:	OSRO/INT/604/USA Baby 1
Budget:	USD 5 000 000 ¹
Planned end date:	30 April 2014
Effective starting date:	January 2007
Context of the project:	<p>The Crisis Management Centre – Animal Health (CMC-AH) of the Food and Agriculture Organization of the United Nations (FAO) and the World Organisation for Animal Health (OIE) is mandated to respond to new outbreaks and critical epidemiologic situations involving Highly Pathogenic Avian Influenza (HPAI) and other transboundary animal diseases (TADs) upon official government request. Within the framework of the Emergency Centre for Transboundary Animal Diseases (ECTAD), the CMC-AH provides assistance where local governmental capacity may be insufficient to respond effectively and where the spread of the virus may pose a broader regional or global risk.</p> <p>In support of this mandate, and within the context of the mandates of OIE to improve animal health worldwide and the World Health Organization (WHO) to lead global human health initiatives, the United States Agency for International Development (USAID) has provided to date a total of USD 5 million to FAO in support of the CMC-AH for sustained emergency preparedness, rapid assessment and response in the field and at headquarters to suspected or confirmed outbreaks of HPAI and other zoonoses in collaboration with OIE and WHO.</p> <p>Under this project the CMC-AH continues to carry out its mandate while working to combine efforts, avoid overlaps and build synergies between FAO, OIE and WHO, as the organizations work to facilitate the containment of HPAI and other zoonotic diseases at its source in animals, prevent its spread across international borders and mitigate the risk of a human pandemic.</p>
Objectives²:	<p>The purpose of the Grant is to provide funding to FAO to support activities to prevent and control HPAI worldwide and reduce the risk of a human pandemic. In this general context and in the specific context of Amendments 1 and 2, the objective of the project is to support CMC-AH operations and missions for: (i) enhanced core team capacity; (ii) improved FAO/OIE/WHO linkages at regional and country level; (iii) increased immediate capacity building; and (iv) strengthened risk communication support (provided to affected/at-risk countries) and overall communication activities (targeting donor, partner and other audiences).</p>

¹ The budget allocation amounts to USD 2 000 000 (Phase I), USD 2 000 000 (Phase II) and USD 2 000 000 (Phase III). The total budget takes into account the reallocation of USD 1 million of CMC-AH funds to the surveillance and response component of the USAID grant as agreed with the Donor.

² These objectives represent a synthesis of the main Grant Objectives contained in the Grant Agreement and Amendments 1 and 2 (i.e. the project document). They have been presented in summarized form in compliance with the Progress Monitoring Sheet format. Detailed reporting on objectives and activities will be included in the final narrative report upon project completion.

Planned activities of the project:

- planning, deploying and following up CMC-AH rapid response missions;
- developing tools in support of CMC-AH operations and response capacity;
- defining cooperation mechanisms between WHO and the CMC-AH;
- exchanging information and regularizing communications;
- developing standard operating procedures (SOPs) for FAO, WHO and OIE; and
- coordinating missions at headquarters and field levels.

Activities implemented during the reporting period (October 2010 – March 2011):

- **Missions for HPAI³**

No missions were deployed for HPAI during the reporting period.

- **Missions for zoonoses or unknown disease crises**

Bangladesh, Anthrax, 23 October – 3 November 2010

After anthrax outbreaks in humans and animals came to prominence in the country, the Government of the People's Republic of Bangladesh requested FAO support to: (i) conduct an in-depth assessment of the anthrax situation; and (ii) increase anthrax prevention and control capacities. The CMC-AH deployed a team of four experts, including an anthrax expert, suggested by the OIE as a recognized expert, and provided in-kind from the Canadian Food Inspection Agency, to provide technical and operational assistance. The team provided detailed recommendations, including the proposal of a control strategy to break the cycle of anthrax infection in the animal and human population.

Azerbaijan, Rabies, 10–17 December 2010

Building on discussions between the Azerbaijan authorities, FAO and the Asian Development Bank – which resulted in the allocation of USD 50 000 for rabies prevention and control – the Ministry of Agriculture of the Government of Azerbaijan requested additional support from the CMC-AH for technical assistance. In response, the Centre deployed a disease control expert to support the Government's response to an apparent increase of rabies cases in dogs and livestock. The increase was postulated to have arisen as a result of congregation of animals following an exceptional flooding event. The mission provided detailed recommendations, including raising awareness of technical assistance requirements and led to WHO follow-up for public health protection.

Mauritania, Rift Valley fever (RVF), 7–17 January 2011

In light of RVF outbreaks occurring in-country in late 2010, the Mauritanian authorities requested FAO assistance to respond to the epidemic that was causing human deaths, livestock losses and dramatic economic challenges. The CMC-AH deployed a team of four experts with specialities in: (i) vector-borne diseases; (ii) diagnostics; (iii) epidemiology and risk management; and (iv) laboratory networks. In addition to augmenting information on the ground and recommending next steps, the mission helped secure from the Central Emergency Response Fund of the United Nations: (i) USD 400 000 for WHO to assist with epidemiological surveillance, human case detection and management and disease awareness raising; and (ii) USD 280 000 for FAO to assist with veterinary equipment, training, risk assessment, epidemic control and RVF information dissemination.

- **FAO-OIE Memorandum of Understanding (MoU)**

The MoU was signed and confirmed by FAO and OIE in late 2010.

- **Strengthening coordination and building awareness of CMC-AH and its services**

³ During the reporting period and with alternate funds, the CMC-AH deployed missions to Mongolia (December 2010) and the Democratic Republic of Korea (February–March 2011) in support of Foot-and-Mouth Disease assessment and control efforts.

- The CMC-AH briefed 14 FAO Representatives to strengthen collaboration with response missions.
- CMC-AH hosted a visit by WHO focal points to enhance coordination methodologies.
- A CMC-AH Administration Coordinator and the Response Veterinary Officer seconded from France met with the French Agency for Food, Environmental and Occupational Health Safety and *France Vétérinaire International* in Paris for two days to discuss expert availability for future CMC-AH missions.
- Visits to WHO Headquarters in Geneva for other purposes provided the opportunity for two separate discussions to be held with WHO officers engaged in emergency response work. This ensured briefings and information exchange between CMC-AH and WHO officers and resulted in plans for: (i) the key WHO focal point for CMC-AH to visit FAO headquarters; and (ii) WHO and FAO to explore opportunities for joint exercises and information products.
- FAO produced three publications during the reporting period to raise awareness among the international community of the: (i) Centre's work on animal disease response; (ii) ongoing disease threats facing the world's most vulnerable; and (iii) challenges those threats pose to animal health, human health and livestock-related livelihoods.
 - **Activity Report (2008–2010)**: The updated Activity Report described the continued evolution of the CMC-AH platform and its activities at the conclusion of its fourth year of existence. The report highlighted the long-term vision of FAO and partners like USDA in providing in-kind and cash support to maintain the Centre's capacity to assist member countries in a changing disease landscape. Available [online](#).
 - **Rapid Mission Update (2008–2010)**: This chronology of missions over the past two years provides a detailed account of each mission's activities and outputs in support of governments working to reduce public health and animal health risks and protect livestock-related livelihoods. It is available [online](#).
 - **Sida and the CMC-AH (2008–2010)**: This brochure was produced to highlight the positive impacts that CMC-AH rapid response can have on vulnerable, smallholder livelihoods, especially those affected by TADs other than HPAL. Available [online](#).
- From 7 to 11 February 2011, the CMC-AH Administration Coordinator participated in the "Tanzanian National Government Civ-Mil Pandemic Disaster Response Tabletop Exercise" hosted by the United Republic of Tanzania and funded by USAID. The exercise provided the CMC-AH with the opportunity to: (i) contribute its experience to the simulation in an observer/coordinator role; (ii) make contact with focal points potentially important toward future responses in the region; and (iii) review specific emergency management principles for continued strengthening of the Centre's response capacity. Noting the utility of the exercise, the CMC-AH plans to send the newly recruited Operations Officer (see below) to a similar exercise planned for May 2011 in Senegal.
- **Revision and update of FAO's Good Emergency Management Practices (GEMP)**
The initial, draft version of GEMP was completed and is undergoing expert/peer review. The coming version will emphasize preparedness supported by prevention, detection, response and recovery.
- **Event Tracking and Management System (ETMS)**
ETMS went live in February 2010; the system is currently the Centre's main tool for event management and action planning. Entry of previous event and mission data is scheduled for completion during the next reporting period.
- **Staffing**
The CMC-AH recruited a new Operations Officer during the reporting period.

<ul style="list-style-type: none"> • Fourth Steering Committee, 22 November 2010 The Fourth meeting of the CMC-AH Steering Committee provided a renewed opportunity to review and discuss CMC-AH initiatives and implementation with key stakeholders. New arrangements for the meeting included the invitation of a beneficiary country (i.e. the Togolese Republic) to participate and provide direct feedback on CMC-AH assistance and added value. Meeting constituents provided positive feedback on results and progress while emphasizing the need for FAO, OIE, WHO and their partners to find new ways to: (i) prioritize and plan response activities; (ii) seek feedback from recipient countries; and (iii) collaborate with third-party actions where appropriate.
<p>Planned activities for April to September 2011:</p> <ul style="list-style-type: none"> • continued monitoring of high-risk countries and situations; • mission planning and deployment upon request for or acceptance of assistance; • data entry and training using ETMS; • continued CMC-AH awareness building activities; • finalization and promotion of GEMP and publication of the core GEMP documents; and • continued contact with OIE regarding the implementation of FAO-OIE MoU.
<p>Main challenges encountered and response provided: None</p>
<p>Main progress made towards project objective, listed by activity⁴ (since project start):</p> <ul style="list-style-type: none"> • Mission planning, deployment and follow-up HPAI missions: 24 Total missions: 51 Total countries: 33 • Development of tools supporting CMC-AH response capacity <ul style="list-style-type: none"> ○ Reagent contingency stock implemented for HPAI ○ HPAI stocks stored under cold chain at the United Nations Humanitarian Response Depot in Brindisi, Italy ○ HPAI reagent stock successfully utilized to support government response efforts ○ Technical SOPs revised as part of overall GEMP efforts • Refining cooperation mechanisms between WHO and CMC-AH <ul style="list-style-type: none"> ○ Standard lines of interagency communication defined ○ Information focal points established ○ Coordinated missions (human and animal health) deployed and followed up • Exchanging information and regularizing communications <ul style="list-style-type: none"> ○ WHO's Emergency Management System analysed for applicability to CMC-AH ○ Development of ETMS final version complete; training/data entry underway ○ Regular information exchange through regular meetings and staff visits ○ FAO/OIE/WHO coordination methodologies confirmed through standardized information sharing methods and focal points • SOP development for FAO, WHO and OIE <ul style="list-style-type: none"> ○ Initial SOPs defined: 21 ○ Consolidated SOPs: 4 • Strengthening mission coordination and field-level cooperation <ul style="list-style-type: none"> ○ After action review processes implemented to capture lessons learned ○ Headquarter- and field-level contacts established and disseminated ○ Coordination mechanisms strengthened through mission experience ○ Field-level SOPs under development for enhanced national response

⁴ Due to the nature of the CMC-AH concept and the project's main aim to support FAO's capacity for rapid response, the majority of activities are to be considered as ongoing initiatives.

Project Monitoring Sheet: OSRO/INT/604/USA Baby 01

**Project title: Support for FAO/OIE/WHO collaboration on
HPAI rapid response and containment**

Reporting period: April 2013 to September 2013

Regional: Global
Project title: Support for FAO/OIE/WHO collaboration on HPAI rapid response and containment
Code: OSRO/INT/604/USA Baby 01
Budget: USD 5 000 000 The budget allocation amounts to USD 2 000 000 (Phase I), USD 2 000 000 (Phase II) and USD 2 000 000 (Phase III). The total budget takes into account the reallocation of USD 1 million of the Crisis Management Centre – Animal Health (CMC-AH) funds to the surveillance and response component of the USAID grant as agreed to with the Donor.
Effective starting date: 1 January 2007
Planned end date: 30 April 2014
Context of the project: The CMC-AH of the Food and Agriculture Organization of the United Nations (FAO) and the World Organisation for Animal Health (OIE) is mandated to respond to new outbreaks and critical epidemiologic situations involving Highly Pathogenic Avian Influenza (HPAI) and other transboundary animal diseases (TADs) upon official government request. Within the framework of the Emergency Centre for Transboundary Animal Diseases (ECTAD), the CMC-AH provides assistance when local governmental capacity may be insufficient to respond effectively, and when the spread of the virus may pose a broader regional or global threat. In support of this mandate, within the context of OIE's mandate to improve animal health worldwide, and with the World Health Organization (WHO) to lead global human health initiatives, the United States Agency for International Development (USAID) has provided, to date, a total of USD 5 million to FAO in support of the CMC-AH for sustained emergency preparedness, rapid assessment and response in the field and at headquarters, to suspected or confirmed outbreaks of HPAI and other zoonoses, in collaboration with OIE and WHO. Under this project, the CMC-AH continues to carry out its mandate while working to combine efforts, avoid overlaps and build synergies between FAO, OIE and WHO, as the organizations work to facilitate the containment of HPAI and other zoonotic diseases at their source, in animals, prevent their spread across international borders and mitigate the risk of a human pandemic.
Objectives¹: The purpose of the grant is to provide funding to FAO to support activities in preventing and controlling HPAI worldwide, and reducing the risk of a human pandemic. In this general context, and in the specific context of Amendments 1 and 2, the objective of the project is to support CMC-AH operations and missions for: (i) enhanced core team capacity; (ii) improved FAO/OIE/WHO linkages at regional and country level; (iii) increased immediate capacity building; and (iv) strengthened risk communication support (provided to affected/at-risk countries) and overall communication activities (targeting donor, partner and other audiences).

¹ These objectives represent a synthesis of the main Grant Objectives contained in the Grant Agreement and Amendments 1 and 2 (i.e. the Project Document). They have been presented in summarized form in compliance with the Progress Monitoring Sheet format. Detailed reporting on objectives and activities will be included in the final narrative report upon project completion.

Planned activities of the project:

- coordinating missions at headquarters and field levels (decentralized offices);
- planning, deploying and following up on CMC-AH rapid response missions;
- developing tools in support of CMC-AH operations and response capacity;
- defining cooperation mechanisms between WHO and the CMC-AH;
- exchanging information and regularizing communications; and
- developing standard operating procedures (SOPs) for interagency cooperation between FAO, WHO and OIE.

Activities implemented during the reporting period (April 2013 to September 2013)

- **Assistance to respond to emergency situations linked to HPAI**

FAO (jointly CMC-AH, EMPRES Animal Health, and ECTAD China Team) is closely monitoring and assessing the situation on a new avian influenza A(H7N9) through its wide network of decentralized offices, together with the Chinese Authorities, and liaising with key partners including WHO and OIE.

The Democratic People's Republic of Korea (DPRK), H5N1 HPAI, 2-10 June 2013

A state-owned duck farm located ten kilometres from Pyongyang observed symptoms that led to a suspicion of HPAI, with a subsequent tentative local diagnosis of H5N1. A CMC-AH mission was deployed in order to: (i) assess the diagnostic capabilities of the country and advise officials on specific requirements for effective laboratory diagnosis and confirmation of influenza viruses; (ii) assess the extent of the H5N1 outbreak and advise the DPRK officials in drafting an action plan; (iii) assist DPRK officials with virus molecular characterization by facilitating sample submission to a reference laboratory; and (iv) liaise with partners and potential donors to consider funding needs for enhanced avian influenza control programmes.

At the debriefing session, the mission team recommended that the DPRK should: (i) increase its disease surveillance capacity via technical trainings; (ii) obtain necessary equipment for vaccine production and diagnostic laboratories; and (iii) join the ongoing FAO regional cooperation programme on TADs (along with the People's Republic of China, Mongolia, the Russian Federation and others).

- **Missions for other disease emergencies**

The Socialist Republic of Viet Nam, Rabies, 5-16 May 2013

An increase of human and animal cases of rabies in the Northern Provinces of Viet Nam led the government to request assistance from the CMC-AH. The mission team addressed the rabies situation with national representatives, meeting objectives to: (i) provide assistance and support in assessing the epidemiological situation of the ongoing rabies events in Viet Nam; (ii) identify possible risk factors that may further amplify and disseminate the disease; (iii) provide advice on priority intervention approaches to decrease rabies events in the country; and (iv) encourage local government employees to engage in feral dog capture and vaccination, as well as encourage responsible pet ownership among Viet Nam's residents.

The mission made a number of recommendations to the government of Viet Nam: (i) conduct nationwide synchronized dog vaccination; (ii) enhance the communication and awareness campaign, targeted at specific at-risk populations; (iii) increase sample collection and establish working relations with reference laboratories for rabies; and

(iv) coordinate rabies surveillance and investigations through linking animal and human health information systems (internet based), beneficial in assessing information for decision-making to prevent the further spread of the disease.

Libya, Newcastle disease, 13-18 May 2013

On 17 April 2013, an official request for assistance was sent by the Deputy Minister of Agriculture, Animal and Marine Wealth to the FAO Director-General. As a result, the CMC-AH fielded a rapid response mission with the main objectives to: (i) review the ongoing poultry Newcastle disease situation in Libya and assist the veterinary services of the country in disease diagnosis, including laboratory diagnostic procedures; (ii) advise and assist in the drafting of an action plan to guide a timely poultry disease response and future prevention measures; (iii) consider means of identifying and addressing funding needs for enhanced control programmes; and (iv) suggest ways in which future activity regarding containment and control can be integrated to further strengthen and support other initiatives related to poultry disease surveillance.

A number of recommendations associated with the response were provided, including: (i) the reinforcement of basic biosecurity measures in order to limit the spread of the disease; (ii) stamping out, in addition to vaccination; (iii) drafting of a communication strategy and an operational plan targeting main stakeholders; and (iv) strengthening virology capacities of laboratories and enabling the production of the appropriate reference materials.

The Kingdom of Saudi Arabia, Middle East respiratory syndrome coronavirus (MERS-CoV), 14-25 September 2013

The first known human case of MERS-CoV occurred in April 2012 in Jordan. Since then, the disease has spread to eight other countries, with 60 confirmed human deaths and 133 confirmed cases (as of 24 September 2013). During the course of this mission, the team's goal was to: (i) assist the country in the disease investigations of human cases of MERS-CoV by considering animal species as potential sources of human exposure, and assisting the veterinary authorities in developing a surveillance programme to identify potential sources of animal origin; (ii) collaborate with experts to develop a carefully designed study into potential MERS-CoV exposures, in coordination with epidemiological studies in humans; and (iii) support the country on preparedness, contingency planning, and risk mitigation.

- **Good Emergency Management Practice (GEMP) Workshops**

The GEMP manual in French has been printed. The GEMP manual in Arabic, Chinese and Spanish are ready for printing. A second printing of the English version has taken place. These manuals were distributed to participants attending the GEMP workshop.

Abidjan, Côte d'Ivoire, 20-24 April 2013

Animal health officials from the Republic of Benin, Burkina Faso, Côte d'Ivoire, the Republic of Mali, the Republic of Senegal and the Togolese Republic convened in Abidjan on 20 April 2013 for a presentation of GEMP principles. Over the course of the workshop, seven modules of the GEMP manual were presented and working group discussions took place. Attendees participated in a simulation exercise where two neighbouring countries experienced a theoretical outbreak of avian influenza A(H7N9), with human deaths reported.

Morogoro, the United Republic of Tanzania, 2-4 May 2013

The workshop was jointly organized by the CMC-AH and ECTAD Eastern Africa, in collaboration with the Department of Veterinary Services of Tanzania. Focus was placed on a participatory forum, making use of presentations and group discussions. In order to strengthen the country's capacity in responding to animal disease emergencies, the participants agreed that appropriate national emergency contingency plans for *peste des petits ruminants* (PPR), brucellosis and African swine fever are needed.

Nakuru, the Republic of Kenya, 7-9 May 2013

For this workshop, the CMC-AH worked with ECTAD Eastern Africa and the Department of Veterinary Services of Kenya to bring together 31 senior veterinary officers from the country. The sessions focused around different phases of emergency disease management, key matters in preparedness planning and principles of infectious disease control as well as the role of veterinary services in outbreak situations and recovery and more. The participants also discussed and agreed upon priority actions that ought to be taken in disease emergency situations.

Beijing, the People's Republic of China, 15-18 May 2013

Among the 40 participants, four groups were arranged, based on geographic distribution in the country, and then cross-provincial border issues were discussed. They were able to share their own experiences and difficulties with disease control and prevention strategies used in each province, region and municipality. Most importantly, it was noted that existing plans did not address many of the issues that were encountered with the country's actual H7N9 response. This led to a discussion on the need for preparedness plans targeted at specific locations, accounting for diversity of cultures, geography and industry throughout the country.

While the CMC-AH team was in Beijing, the Chinese government asked to convene a meeting to discuss the issue of animal carcass disposal including emergency disease disposal and normal death disposal, particularly in relation to pig mortalities. China farms approximately one-half of the world's pigs, and that which can be regarded as normal mortality associated with pig production presents major logistical and pollution problems. Emergency disease outbreaks will exacerbate this problem and it is important that practical options exist. The CMC-AH agreed to assist in supporting ECTAD China in further defining the issues and seeking solutions.

• **CMC-AH 7th Steering Committee (SC7), 24 October 2013 in Rome, FAO headquarters**

The SC7 is in the planning stage, scheduled to be held on 24 October 2013. The SC7 will bring together representatives of FAO, OIE, and WHO, and those representing donors and beneficiary countries. In addition to presenting CMC-AH missions and activities, the CMC-AH will continue the precedent of receiving direct feedback from beneficiary countries and donors.

The SC7 will feature a segment entitled, 'Voices from the field,' with videos provided by the FAO Representative of the Democratic Republic of the Congo, Ndiaga Gueye, and the former FAO Representative of the Republic of the Gambia, Ahmadu Babagana (FAO Representative at the time of the Gambia mission).

- **Revision of internal SOPs for CMC-AH operations**

A CMC-AH working group is continuing to work on updated internal SOPs for rapid deployment mission activities.

- **Partnership building**

In February 2013, a meeting was held at the French Ministry of Agriculture with the Chief Veterinary Officer and other key participants regarding support to the CMC-AH through a loaned expert. This meeting led to the extension of the availability of the French expert for an additional year, until November 2014.

The finalization of the re-drafted Standard Operating Guidelines (SOGs) with OIE is ongoing.

A Letter of Agreement (LoA) between FAO and *France Vétérinaire International* (FVI) was signed in June 2013 and amended on 4 October 2013. The LoA enables the rapid deployment of experts from FVI to participate in CMC-AH missions. FVI has designated a focal point in direct contact with the CMC-AH. This focal point is in charge of all FVI administrative tasks on and is responsible for liaising with potential experts. A meeting with CMC-AH and FVI will be convened on 23 October 2013 to facilitate cooperation between the two organizations.

A new partnership between FAO and the Ministry of Agriculture, Forestry and Fisheries (MAFF) of Japan was established in August 2013. CMC-AH will receive one Veterinary Expert from the MAFF, Tokyo, starting 1 October 2013, for a period of three months.

As the USDA-funded project OSRO/INT/602/USA and its associated programme agreement was due to terminate at the end of September 2013, a new Programme Agreement (between the USDA and FAO), for the loan of USDA experts to FAO was negotiated and signed on 4 September 2013. This new Programme Agreement for the loan of USDA experts to FAO will come into force on 1 October 2013, for a duration of five years.

From 12-13 September 2013, an H7N9 technical and programmatic meeting was held in FAO headquarters between USAID, the Centers for Disease Control and Prevention (CDC) and FAO staff from regional and country offices. At a side meeting, the CMC-AH discussed future activity projections with the USAID representatives regarding: i) a multidisciplinary approach to unknown diseases at early stages; ii) the proposed renaming of the CMC-AH to Centre for Preparedness and Rapid Response – Animal Health; and iii) current project funding forecasts and future project funding availability.

- **CMC-AH methodology**

CMC-AH emergency response methodologies are being adapted by other parts of FAO for use with other response activities (humanitarian responses) carried out by the organization. The CMC-AH has provided advice and access to relevant tools.

In August 2013, a CMC-AH veterinary intern developed guidelines for the efficient use of the CMC-AH's electronic records and of the Event Tracking Management System (ETMS). The intern also developed a short document aimed at informing experts on FAO's position in animal disease prevention and control using Rift Valley fever as an example.

<ul style="list-style-type: none"> • FAO Representatives <p>Outreach to FAO Representatives remained a core activity in the framework of the decentralization process by corporate initiative at headquarters, regional, sub-regional and national levels, with the CMC-AH continuing to brief newly appointed country and regional FAO Representatives as standard practice.</p>
<p>Planned activities for the next six-month period (October 2013 to March 2014)</p> <ul style="list-style-type: none"> • discussion on the renewal of the LoA with FVI on 23 October 2013; • SC7 to be held on 24 October 2013; • continued monitoring of high-risk countries and situations; • mission planning and deployment upon request for, or acceptance of, assistance; • continued discussions with OIE and WIIO on working methodologies; • continued promotion of GEMP principles through a workshop in Jordan; • mission follow-up to maximize impact; • further development of SOPs for rapid deployment mission activities; • no-cost extension of project OSRO/INT/604/USA (baby 01 and baby 02) will be requested from April to September 2014 with budget revision ; and • finalization of common FAO/OIE SOGs.
<p>Main challenges encountered and response provided: None</p>
<p>Main progress made towards project objective, listed by activity¹ (from project start)</p> <ul style="list-style-type: none"> • Mission planning, deployment and follow-up <ul style="list-style-type: none"> HPAI missions: 26 <u>Total missions:</u> 66 <u>Total countries:</u> 43 • Development and securing of tools and supplies to support CMC-AH response capacity <ul style="list-style-type: none"> ○ technical SOPs revised; ○ development of GEMP. • Refined cooperation mechanisms between WHO and CMC-AH <ul style="list-style-type: none"> ○ standard lines of interagency communication defined; ○ information focal points established; ○ coordinated missions (human health and animal health) deployed and followed up; and ○ CMC-AH participation in WHO's initiatives to improve its emergency preparedness and management. • Exchanging information and regularizing communications <ul style="list-style-type: none"> ○ regular information exchange through regular meetings and staff visits; and ○ FAO/OIE/WIIO coordination methodologies confirmed through standardized information sharing methods and focal points. • SOP development for FAO, WHO and OIE <ul style="list-style-type: none"> ○ Initial, internal SOPs defined: 21 ○ Consolidated, internal SOPs: 4 ○ Further streamlined SOPs: 3

¹ Owing to the nature of the CMC-AH concept and the project's main aim to support FAO's capacity for rapid response, the majority of activities are to be considered as ongoing initiatives.

- **Strengthening mission coordination and field-level cooperation**
 - after-action review processes implemented to capture lessons learned;
 - headquarters- and field-level contacts established and disseminated;
 - coordination mechanisms strengthened through mission experience; and
 - field-level SOPs completed and printed for enhanced national response to HPAI and other transboundary animal and zoonotic diseases.

2nd Quarter 2010Project Monitoring Sheet: **OSRO/RAF/718/USA Phase II**Project title: **Strengthening capacity of the Eastern Africa Sub-region to prevent and control HPAI**Reporting period: **April – June 2010**

Regional component: Eastern Africa (Burundi, Djibouti, Ethiopia, Kenya, Rwanda, South Sudan, Tanzania and Uganda)
Project title: Strengthening capacity of the Eastern Africa Sub-region to prevent and control HPAI. Code: OSRO/RAF/718/USA Phase II
Budget : USD 1 209 601 (Phase I), USD 650 000 (Phase II) Total budget: USD 1 859 601
Effective starting date: 01 October 2009
Planned end date: 30 September 2010
Context of the project The confirmation of outbreaks of the Highly Pathogenic Avian Influenza (HPAI) in Africa in 2006 called for concerted efforts on the part of national and international agencies to assist countries in stopping the spread of the disease throughout the continent. Currently, eleven African countries have reported outbreaks of HPAI. There is an elevated risk that the disease will spread throughout eastern Africa due to the occurrence of the disease in Sudan and Djibouti in 2006 and unregulated intra-regional trade in poultry and poultry products. In addition, many of the countries of this region trade with other regions outside Africa and also lie in the pathways of migratory birds, some of which are thought to play a role in the spread of HPAI.
Objectives of the project The overall objective of the project is to assist eastern African countries (Burundi, Djibouti, Ethiopia, Kenya, Rwanda, South Sudan, Tanzania and Uganda) to develop and implement robust and effective plans for the prevention and control of HPAI and other transboundary animal diseases (TADs) through the strengthening of epidemiology and laboratory networks for improved surveillance. The prevention and control of HPAI and other TADs requires regional cooperation/collaboration. Such cooperation could be strengthened through networking and inter-country interactions among disease surveillance and diagnosis teams. Increased collaboration also would help to coordinate efforts against emerging zoonotic diseases, which are increasing due to climatic changes, human population dynamics and livestock/human/wildlife interactions. The principal objective of the project will be achieved through a regional and multidisciplinary approach implemented by the Food and Agriculture Organization of the United Nations (FAO) Emergency Centre for Transboundary Animal Diseases Operations (ECTAD) Unit of the Regional Animal Health Centre (RAHC) in Nairobi, facilitated by staff at FAO headquarters in Rome, and by working in close collaboration with national governments, regional economic communities (East African Community (EAC) and Intergovernmental Authority on Development (IGAD)), institutions of higher learning, other United Nations (UN) agencies such as the World Health Organization (WHO), non-governmental organizations (NGOs), African Union/Inter-African Bureau for Animal Resources (AU-IBAR) and the private sector. The project implementation will embrace the One Health (OH) concept particularly when addressing zoonosis.
The outcome of the project Strengthening of the coordination mechanisms for epidemio-surveillance, diagnostic laboratory improvements, socio-economic and production analysis and sharing of information through strategic and

appropriate communication channels.

Successful implementation of the project will result in the following major outputs:

1. Laboratory capacity and networks are strengthened and consolidated to improve the management of HPAI and other TADs.

The various diagnostic laboratory systems in each country will be assessed and documented to enable harmonization of protocols and guidelines for surveillance, reporting, diagnoses, prevention and control of priority diseases.

2. Epidemiology capacity and networks are strengthened and consolidated to improve the management of HPAI and other TADs.

Different systems of operation of the epidemio-surveillance systems in different countries will be assessed and documented to enable harmonization at regional level. The project will assist the network to define terms of reference and operational frameworks, including detailed description of relationships, roles and responsibilities of stakeholders, such as the private sector, research institutions, universities, AU-IBAR, FAO, World Organization for Animal Health (OIE), WHO and other NGO's. In order to ensure sustainability, the network plans will be presented for endorsement by regional and national leaders, with financial commitments for specific national requirements.

3. Animal health interventions used as entry points in analysis and improvement of poultry/livestock value chains.

Policy makers, governments and network experts will be provided with evidence-based information to better understand the dynamics of poultry value chains as they relate to disease control and food safety. Evidence will be provided on cost-effectiveness, costs and benefits, suitability and appropriateness of disease control measures. The project will educate and develop best practices along the poultry value chain and strengthen partnerships between private and public sector through consultations, working with national governments and regional economic communities (RECs) to develop and implement policies.

Activities that were planned for this quarter

Output 1: Laboratory capacity and networks are strengthened and consolidated to improve the management of HPAI and other TADs.

Activity 1.1: Assessment of diagnostic capacity of central veterinary laboratories (CVL) for HPAI and other TADs.

Activity 1.2: Assist national laboratories in implementation of quality management systems (QMS).

Activity 1.3: Organize targeted training courses on disease recognition and diagnostic techniques for emerging zoonotic diseases so as to facilitate prevention and control actions.

Activity 1.4: Hold a joint five-day Epidemiology and Laboratory Networks meeting to share regional information including reaching a consensus on a list of priority TADs for targeted prevention and control in line with the Global Framework for Transboundary Animal Diseases (GF-TADs) in Africa.

Activity 1.5: Hold a meeting with Chief Veterinary Officers (CVOs)/Heads of CVL, RECs, AU-IBAR and development partners. The agenda of the meeting is to discuss the findings of laboratory assessments, select regional laboratories for the network and promote integration of the network into the RECs structures.

Activity 1.6: Supply critical equipment, materials and reagents for diagnosis of HPAI and other priority TADs at the national laboratories.

Activity 1.7: Strengthen regional laboratory network web page and link it with other existing (epidemiology) and proposed thematic networks to increase the information sharing capacity.

Output 2: Epidemiology capacity and networks are strengthened and consolidated to improve the management of HPAI and other TADs.

Activity 2.1: Assess national epidemio-surveillance systems for HPAI and other TADs.

Activity 2.2: Hold a joint five-day annual Epidemiology and Laboratory Networks meeting to share regional information including reaching a consensus on list of priority TADs for targeted prevention and control.

Activity 2.3: Supply critical equipment, materials and reagents for field surveillance of HPAI and other priority TADs at the national laboratories.

Activity 2.4: Prioritize transboundary animal disease detection, reporting and preparedness in the region through structured qualitative national risk assessments, including probable impacts of the disease.

Output 3: Animal health interventions are used as entry points in analysis and improvement of poultry/livestock value chains.

Activity 3.1: Consolidate information on cross-border trade in poultry and poultry products to provide better targeted disease surveillance and monitoring through review of country poultry value chain analysis.

Activity 3.2: Conduct a benefit-cost analysis of functional laboratory and epidemiology surveillance systems as a policy tool to lobby national governments to adopt and mainstream funding for the systems into their annual budgets.

Activity 3.3: Commission a study to identify and quantify the key drivers in private sector adoption of biosecurity and poultry health interventions along the poultry value chains. The study is to be conducted in Sudan and Kenya in consultation with the International Livestock Research Institute (ILRI) and Winrock International non-profit organization.

Activity 3.4: Facilitate a stakeholders' workshop to enable policy dialogue between public and private sector operators on restructuring the poultry industry and improving poultry health management in the region.

Activities undertaken during the reporting period

Output 1: Laboratory capacity and networks are strengthened and consolidated to improve the management of HPAI and other TADs.

Activity 1.1: Assessment of diagnostic capacity of CVL for HPAI and other TADs.

- The Central Veterinary Laboratories of Rwanda and Uganda were assessed by experts from the Tri-Veneto Region Experimental Animal Health Care Institute (IZSVE), Padova, Italy, the FAO/OIE Reference Laboratory for Avian Influenza (AI) and Newcastle disease (ND). Assessment of the CVL in Uganda was also conducted by IZSVE from 14 April to 18 April 2010.

Activity 1.2: Assist national laboratories in implementation of quality management systems (QMS).

- Act. 1.2.a: A five-day regional training workshop on QMS was held in Debre Zeit, Ethiopia from 31 May to 4 June 2010. Some 20 laboratory personnel from Ethiopia, the Democratic Republic of Congo, Sudan, Kenya, Somalia, Tanzania and Uganda were trained. The workshop was successful as evidenced by positive evaluation feedback from the trained persons. In addition, a one-year work plan on the implementation of quality assurance system for the laboratories was approved at the end of the training. Progress on the implementation of the work plan will be monitored by the ECTAD Regional Office for Eastern Africa.
- Act.1.2.b: Analysis of Questionnaires that were submitted by beneficiary countries has been conducted, and the level of implementation of QMS in these countries' diagnostic laboratory units is better understood. The outcome of the analysis will be presented and discussed during an annual laboratory coordination meeting to be held in Dar es Salaam, Tanzania in July 2010.
- Act.1.2.c: Proficiency testing on serological and molecular techniques for AI and ND was carried out by CVL in Ethiopia, Kenya, Rwanda and Tanzania in November 2009. There was a marked improvement in the execution of such tests by the participating laboratories. A Letter of Agreement (LoA) is being finalized with IZSVE to carry out proficiency ring tests for CVL in the region.

Activity 1.3: Organize targeted training courses on disease recognition and diagnostic techniques for

emerging zoonotic diseases, so as to facilitate prevention and control actions.

- A ten-day training on the laboratory diagnosis of AI and ND was conducted from 7 to 20 April 2010 at CVL Dar es Salaam for four laboratory personnel from Burundi and South Sudan.

Activity 1.6: Supply critical equipment, materials and reagents for field surveillance of HPAI and other priority TADs at the national laboratories.

- Procurement procedures have been initiated for countries that have provided lists of necessary equipment/material.

Activity 1.7: Strengthen regional laboratory network web page and link it with other existing (epidemiology) and proposed thematic networks to increase the information sharing capacity.

- A communications consultant was recruited in April to update information on the webpage. The consultant also provided training to the FAO ECTAD staff on how to update the web page.

Output 2: Epidemiology capacity and networks are strengthened and consolidated to improve the management of HPAI and other TADs.

Activity 2.1: Assess national epidemio-surveillance systems for HPAI and other priority TADs.

- Act. 2.1.a: Responses were received for questionnaires which had been sent to national epidemiology units (to establish the levels of epidemiology activities in the countries). Actions are being developed for intra and inter-regional collaboration
- Act. 2.1.b: A three-day workshop on Regional Animal Health Information Systems was held in Entebbe, Uganda from 18 to 20 May 2010 to review the current information systems and discuss sustainable harmonization and increased information sharing in the region.
- Act. 2.1.c: A three-day workshop was held from 21 to 23 June 2010 in Kigali, Rwanda. Within the framework of the East Africa Regional Epidemiology Network (EAREN), the workshop brought together representatives of the national epidemiology and wildlife units and other network initiatives to discuss the results of the assessments carried out and to make recommendations for the adoption of harmonized surveillance systems.

Activity 2.3: Supply critical equipment, materials and reagents for field surveillance of HPAI and other priority TADs at the national laboratories.

- Procurement procedures have been initiated for countries that have provided lists of necessary equipment/material.

Output 3: Animal health interventions are used as entry points in analysis and improvement of poultry/livestock value chains.

Activity 3.1: Consolidate information on cross-border trade in poultry and poultry products to provide better targeted disease surveillance and monitoring through review of country poultry value chain analysis.

- Experts have been identified to undertake trade flow mapping in Kenya and Rwanda. The recruitment is ongoing.

Activity 3.2: Conduct a cost-benefit analysis of functional laboratory and epidemiology surveillance systems as a policy tool to lobby national governments to adopt and mainstream funding for the systems into their annual budgets.

- Terms of Reference (TOR) have been drafted. Participation of national governments in the study has been agreed on. Study experts have been identified to undertake cost-benefit analyses of the epidemio-surveillance networks in Kenya and Uganda. The recruitment process is being initiated.

Activity 3.3: Commission a study to identify private sector drivers of adoption of biosecurity and poultry health interventions along the poultry value chains in Sudan and Kenya in consultation with ILRI and Winrock.

- A meeting between Winrock International (Partnership for safe poultry in Kenya project manager)

and FAO-ECTAD was held on 26 May 2010 at Winrock Kenya Office Nairobi to discuss collaboration on the activity. Winrock has trained several sector 4 (free range) poultry farmer groups on several biosecurity packages. The study by FAO will draw part of the sample from the Winrock supported farmers as well as others not covered by Winrock's project. Study TORs have been agreed upon and recruitment process has begun.

Planned activities for the next quarter (up to 30/09/2010) and future proposed actions

Output 1: Surveillance and diagnostic capacity is strengthened.

Activity 1.1: Assessment of diagnostic capacity of CVL for HPAI and other TADs.

- An LoA is being finalized with IZSVe to carry out the assessments. This activity is scheduled for July 2010.
- Act.1.1.c: Proficiency ring tests will be carried out (through an LoA in preparation at HQ with IZSVe).

Activity 1.4: A joint Epidemiology and Laboratory network meeting is planned from 14 to 16 September 2010 to share regional information including reaching a consensus on a list of priority TADs for targeted prevention and control.

Activity 1.5: A meeting with the CVOs/Heads of CVL is planned from 24 to 26 August 2010 to discuss the findings of laboratory assessments, select regional laboratories for the network and promote integration of the network into the RECs' structures.

Activity 1.6: Supply critical equipment, materials and reagents for field surveillance of HPAI and other priority TADs at the national laboratories.

- Countries that have not yet responded will be requested again to provide lists of necessary equipment/material. Procurement procedures will then be initiated to procure and distribute the equipment/material.
- The annual coordination meeting for Eastern Africa Laboratory network will be held in July 2010 in Dar es Salaam, Tanzania.

Output 2: Epidemiology capacity and networks are strengthened and consolidated to improve the management of HPAI and other TADs.

Activity 2.2: Hold a joint five-day annual Epidemiology and Laboratory Networks meeting to share regional information including reaching a consensus on list of priority TADs for targeted prevention and control.

- This workshop is planned from 14 September to 16 September 2010. The tentative venue is Djibouti.

Activity 2.4: Prioritize TADs detection, reporting and preparedness in the region through structured qualitative national risk assessments including probable impacts of the disease.

- This will be carried out through selected in-country risk analysis studies using local available consultants on prioritized TADs.

Output 3: Animal health interventions are used as entry points in analysis and improvement of poultry/livestock value chains.

Activity 3.3: Commission a study to identify and quantify private sector drivers of adoption of biosecurity and poultry health interventions along the poultry value chains in Ethiopia and Tanzania in consultation with ILRI and Winrock.

- Finalize the cost-benefit analysis study and present results at a meeting attended by CVO in August 2010.
- Finalize the trade flow mapping in Kenya and Uganda.

<ul style="list-style-type: none">▪ Undertake study on drivers of biosecurity in collaboration with Winrock.▪ Support Kenya Ministry of Livestock in holding a workshop on the poultry sector in collaboration with Winrock.
All outputs <ul style="list-style-type: none">▪ Carry out activities as proposed in the three outputs enumerated above.
Reports <ul style="list-style-type: none">▪ Continue preparing project progress reports on the implementation of activities.

A workshop report has been prepared and technically cleared by the ECTAD Regional Manager.▪ Assessment of questionnaires on the status of CVL and national epidemiology units.▪ Successful conducting of a three-day regional animal health information systems workshop and a regional epidemiology network meeting.▪ Successful conducting of a five-day training workshop on diagnostic laboratory quality management systems.▪ Conducting of a 3-day annual coordination meeting of the EAREN.▪ Assessment of the diagnostic capacity for AI and other TADs was undertaken in three national laboratories in the region.

Quarter III 2010

Project Monitoring Sheet: **OSRO/INT/704/USA**

Title: Enhancing preparedness and response capacity to Highly Pathogenic Avian Influenza (and other emerging/re-emerging zoonotic diseases) in Eastern Europe and Central Asia countries

Reporting period: **July – September 2010**

Regional component: Europe and Central Asia

Title: Enhancing preparedness and response capacity to Highly Pathogenic Avian Influenza (and other emerging/re-emerging zoonotic diseases) in Eastern Europe and Central Asia countries

Code: OSRO/INT/704/USA

Budget: USD 370 000

Effective starting date: 1 July 2008

Planned end date: 31 December 2010

Context of the project

Although most of the countries within Eastern Europe and Central Asia (EEACA) region have developed a preparedness and contingency plan for the Highly Pathogenic Avian Influenza (HPAI), there still remains a need to devise generic standard operating procedures (SOPs) in order to minimize the potential spread of the HPAI virus and to reduce the risk of human infection.

The aim of this project, therefore, is to develop the SOPs that are applicable in the countries (or districts within countries) of different socio-economical, cultural and geographical structures and capacities in the EEACA regions. In line with the set project objective, this project also promotes improvement of the understanding of epidemiology and surveillance information in minimizing human health risks and reducing the livelihood impacts posed by HPAI through its effective prevention and control.

In addition, the project specifically aims at enhancing the coordination and collaboration between veterinary services, Ministries of Forestry, Ministries of Environment and/or Departments of Ornithology, which often have jurisdictional authority over wildlife management.

The risk of disease introduction and spread within domestic poultry through exposure to migrating wild water birds remains high in these regions. In the rural poultry sector, mainly involved in backyard poultry breeding, the disease can be introduced through the movement of hunted wild birds that might have been previously infected with the virus. This calls for a need for harmonized multi-sectoral coordination and management of risks and outbreaks and a greater attention to the epidemiological intelligence in the regions.

International sharing of wild bird epidemiology and surveillance information, as well as developing and implementing SOPs on risk reduction in backyard poultry breeding in the areas of the Black Sea and the Caspian Sea regions, would have a direct impact on reducing the risk of the spread of the virus.

Objectives of the project

The main goal of the project is to reduce the H5N1 viral spread from wild birds to domestic poultry and among domestic poultry by delivering enhanced wild bird disease management and providing generic operational guidance and procedures to the veterinary services within the EEACA regions. The ultimate goal of this project is to promote long-term veterinary service capacity building that will promote both public health improvement and better economic impact on poultry and livestock production in the future.

The main outputs expected from the project are:

1. development of generic SOPs for HPAI and improvement of epidemiology understanding within the veterinary services;
2. improvement of multi-sectoral coordination and management of risks and outbreaks involving wild birds and free range domestic duck, goose and chicken populations in the Black Sea and Caspian Sea regions.

Planned activities for the reporting period

1. Development of generic standard operating procedures (SOPs) for HPAI and improvement of epidemiology understanding within the veterinary services

1.5. Disseminate SOPs to Ministries, Task Forces, veterinary services and eventually donors and make them available for global access through FAO website.

Activities undertaken during the reporting period

The following SOPs have been revised and finalized by FAO in-house experts:

- Provisional diagnosis of HPAI and disease tracing;
- sampling procedures;
- disposal of sampled carcasses, sampling materials and equipment used while sampling;
- culling of animals;
- mass disposal of bird carcasses and potential contaminated materials; and
- safe handling of hunted wildfowl (HPAI risk reduction).

Planned activities for the next reporting period

- Finalization of remaining SOPs by FAO in-house experts, including:
 - control of disease using zones
 - decontamination of an infected farm;
- publication and dissemination of SOPs;
- participation in a “final lessons learned” meeting to be organized by USAID tentatively in December 2010 in order to build on the experiences of the USAID projects implemented by FAO and other implementing agencies within a wider donor community.

Main challenges encountered and response provided

As FAO has also developed SOPs for other regions, the main challenge has been to streamline the different SOPs into a common format.

Main progress made towards the achievement of project outcomes

The project is expected to achieve its set objectives and will make a substantial contribution to HPAI prevention and control, especially through the development of generic SOPs and enhanced cooperation between sectors. Thus far, an extensive consultation and clearing process of SOPs has been undertaken within FAO. The final layout is being finalized, and a dissemination strategy is being elaborated.

Semester I 2010

Project monitoring sheet: **OSRO/EGY/801/USA**Project title: **Vaccine efficacy for the control of Avian Influenza in Egypt**Reporting period: **October 2010 – March 2011**

<p>Country: Egypt Title: Vaccine efficacy for the control of Avian Influenza in Egypt Code: OSRO/EGY/801/USA</p>
<p>Budget: USD 2 416 500</p>
<p>Effective Starting Date: June 2008</p>
<p>Planned End Date: June 2011</p>
<p>Context of the Project</p> <p>Outbreaks of Highly Pathogenic Avian Influenza (HPAI) spread in 18 governorates in Egypt within less than three months after the disease was originally diagnosed in three governorates on 17 February 2006. The Government attempted to control the outbreak through a stamping out procedure, which included culling of all poultry within a 1 km radius of positively confirmed areas. By the end of 2006, nearly 30 million birds had been culled. Outbreaks continue to be reported in 23 of the 29 governorates in the country and the disease has become endemic.</p> <p>In response to the continued threat of HPAI to Egypt, the Food and Agriculture Organization of the United Nations (FAO) and the World Organisation for Animal Health (OIE) have been providing technical assistance through the joint OIE/FAO Influenza Network (OFFLU) and other initiatives. Specifically, FAO has been providing the Ministry of Agriculture and Land Reclamation (MoALR) with major technical assistance through the implementation of this project, also called Avian Influenza Vaccine Efficacy Project (AIVEP) and Strengthening Avian Influenza Detection and Response (SAIDR) project, both funded by the United States Agency for International Development (USAID).</p> <p>Working in collaboration with the Government of the Arab Republic of Egypt, FAO, OFFLU and USAID are working together to conduct virus characterization and mapping of Egyptian antigenic variants with intensified HPAI field isolate collection and analyses. Through antigenic mapping, challenge testing and transmission studies, these projects have been developing strategic recommendations for Egypt, including the development of clear criteria for the selection of vaccinal strains.</p> <p>FAO is providing key technical support through AIVEP, as vaccination is considered as part of the overall efforts to reduce HPAI infections and spread of the virus in Egypt, with the potential to benefit other countries in the region and worldwide.</p>

Objectives of the Project

The overall project objective is to assist the Government of the Arab Republic of Egypt in its efforts to control HPAI in the domestic poultry population and avoid the risk of human infection.

The specific project objectives are to conduct:

1. screening and evaluation of genetic and antigenic variants among existing H5N1 HPAI field strains previously collected from 2006 until early 2008;
2. intensified collection of H5N1 HPAI field isolates from newly confirmed outbreaks (since mid-2008);
3. challenge testing of antigenic variants in Specific Pathogen Free (SPF) birds and currently used Avian Influenza (AI) vaccines in Egypt; and
4. controlled transmission trials in the laboratory on birds raised and vaccinated in commercial poultry farms.

Planned Activities

Output 1.1: Screening and evaluation of genetic and antigenic variants among existing field strains previously collected from 2006 until early 2008

- Activity 1.a: Screening and evaluation of genetic and antigenic variants among existing field strains (2006 – early 2008 collections)
- Activity 1.b: Carry out sequencing and phylogenetic analysis
- Activity 1.c: Conduct antigenic profiling
- Activity 1.d: Perform antigenic cartography
- Activity 1.e: Selection of variants for challenge studies as specified under Output 1.3 below
- Activity 1.f: Assessment of biosecurity and biosafety of the National Laboratory for Veterinary Quality Control on Poultry Production (NLQP) and laboratory operations
- Activity 1.g: Capacity building (i.e. training of Egyptian scientists)

Output 1.2: Intensified collection of H5N1 HPAI field isolates from newly confirmed outbreaks (since mid-2008)

- Activity 2.a: Intensified HPAI field isolate collection
- Activity 2.b: Conduct real-time polymerase chain reaction (RT-PCR) analysis (Support for laboratory consumables provided through SAIDR project)
- Activity 2.c: Identify all H5N1 HPAI isolates collected since mid 2008 to 2009
- Activity 2.d: Sequencing and analysis of 100 isolates by NLQP under the supervision of and assessment by the Southeast Poultry Research Laboratory (SEPRL) of USDA
- Activity 2.e: Perform antigenic profiling and cartography

Output 1.3: Challenge testing of antigenic variants in SPF birds and currently used AI vaccines in Egypt

- Activity 3.a: Safety, Purity and Potency testing of currently used AI vaccines in Egypt conducted at the Central laboratory for Evaluation of Veterinary Biologics (CLEVB)
- Activity 3.b: Selection and testing of vaccinal seed strains for challenge testing (Planned to test six vaccinal seed strains against four challenge viruses (requiring a total of 24 isolation units) carried out at SEPRL (USA).
- Activity 3.c: Second year challenge testing carried out at NLQP (Egypt)
- Activity 3d: Capacity building (refurbishing one of existing NLQP units to BSL2 + animal facility)

Output 1.4:	Controlled transmission trials in the laboratory on birds raised and vaccinated in commercial poultry farms
Activities:	Organize and provide support through training and workshop (during the last quarter of the project) to enhance skills of NLQP staff in transmission trials.

Activities Undertaken during the Reporting Period

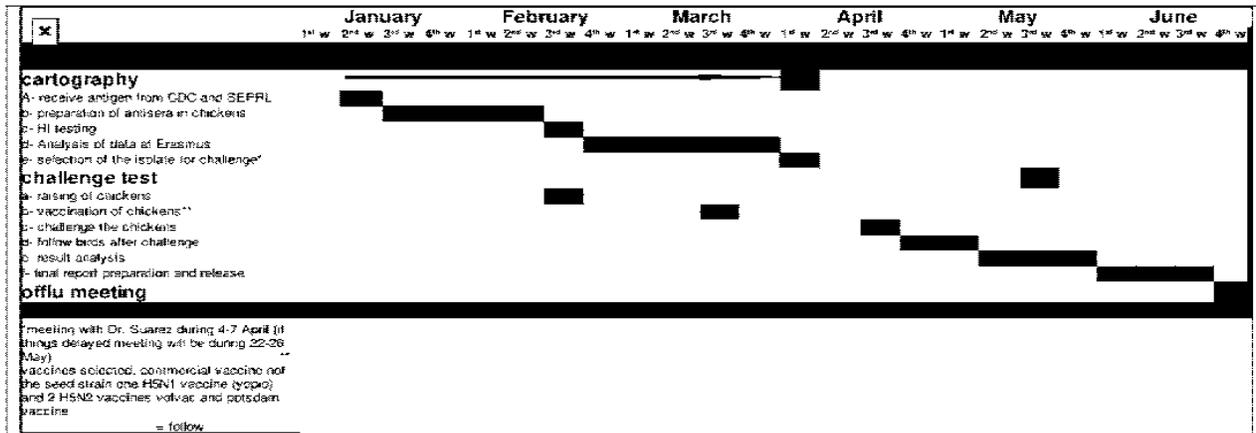

Challenge Testing of Antigenic Variants and Existing Vaccines

- First year challenge test was done at SEPRL and some groups of birds were in need of re-testing. This was scheduled to be done during September 2010, and a scientist from NLQP was selected to attend this study and visited SEPRL from 1/9/2010 to 15/9/2010, but the test had been cancelled as the renovation of the BSL3 lab at SEPRL was still running. Subsequently, the re-testing of the groups was carried out and finalized during February 2011. The results from SEPRL are still pending.

Second year testing

NLQP, SEPRL and Erasmus University Rotterdam examine antigenic, genetic, potency, efficacy; make recommendations to GOE

- Two scientists from Erasmus University Rotterdam visited NLQP in November 2010 and held extensive discussions with NLQP and the FAO Emergency Centre for Transboundary Animal Diseases (ECTAD) staff on the progress made so far on the project, challenges and way forward. As a result, a no-cost extension of the project until the end of June 2011 was agreed upon. Technical issues related to conjugates and antisera were discussed and solutions recommended. The revised work plan was approved by SEPRL and NLQP for the implementation of the remaining project activities during the extension period (see table below).
- The Hemagglutination-inhibition (HI) test for cartography analysis was stopped based on the advice received from SEPRL and OFFLU colleagues, as the test requires the use of new conjugate for the preparation of antisera of the reference antigen and selected new Egyptian AI strains from year 2009-10. The new conjugate was procured and received by NLQP during the second week of January 2011.
- We were also advised to use new (additional) reference antigens for HI testing. Accordingly, one reference antigen from SEPRL and two from CDC were sent to NLQP and received during the last week of February 2011 (see below for the details of the antisera received). The shipment of the antisera was delayed by five weeks due to the recent civil unrest in Egypt. On 2 March 2011, the antigens were prepared and injected into chickens for the production of antisera. The latter will be harvested after three weeks, then the HI testing will follow during the first week of April 2011.

The following antigen and antisera were selected for HI testing:

antigens

- A/chicken/Egypt/06959-NLQP/2006 (H5N1) (new)

Non-intermediate Results (IRs) Activities:

- Two expert scientists visited SEPRL from 26 October to 2 November 2010 and held discussions on the challenge test results and related issues.
- From 9 to 14 January 2011, three NLQP staff received training on LIMS programme at the Veterinary Laboratory Agency (VLA, England))

Planned Activities for the Next Reporting Period:

The project will continue according to the agreed timeline between NLQP and SEPRL. This includes:

- preparation of reference antisera in SPF chicken (three weeks) to be completed in the first week of April 2011;
- HI testing required for cartography analysis (one week) to be completed in the second week of April 2011;
- cartography analysis to be carried out at Erasmus University Rotterdam (one month) to be completed in the second week of May 2011;
- selection of viral isolates for challenge test (one week) to be completed in the third week of May 2011;
- challenge testing (involving vaccination of experimental chicken [three weeks]), challenge with selected virus isolates (three weeks) to be completed in the third week of June 2011;

- data analysis from the challenge test (three weeks) to be completed in the second week of July 2011; and
- final project review (OFFLU) meeting will take place in the third week of July 2011.

Main Challenges Encountered and Solutions

- There was a delay in the shipment of the reference antigen and antisera owing to the recent civil unrest in Egypt. This has resulted in a delay of the HI testing and cartography analysis. The antigens are now received and were inoculated into SPF chickens for antisera production. The HI testing will start in April 2011. As a result of the above-mentioned delay, the project activities will be completed one month behind the original plan.

Semester I 2010Project monitoring sheet: **OSRO/EGY/701/USA**

Project title: **Strengthening Avian Influenza Detection and Response (SAIDR) in Egypt**
 Reporting period: **October 2010 – March 2011**

Country: Egypt
Title: Strengthening Avian Influenza Detection and Response (SAIDR) in Egypt
Code: OSRO/EGY/701/USA
Budget: USD 2 000 000 (Phase IV) ¹
Effective starting date: October 2010
Planned end date: September 2011
<p>Context of the Project</p> <p>Outbreaks of Highly Pathogenic Avian Influenza (HPAI) spread in Egypt since February 2006 and the disease has become endemic. The Food and Agriculture Organization of the United Nations (FAO) has been providing technical assistance to the Ministry of Agriculture and Land Reclamation (MoALR) through the implementation of the animal health component of SAIDR project funded by the United States Agency for International Development (USAID).</p>
<p>Objectives of the project</p> <p>The overall objective of this project is to minimize the risk of H5N1 HPAI to poultry in Egypt, such that the disease no longer represents a significant threat to human health, through strengthening institutional capacities to ensure progressive HPAI control, protection of producers' livelihoods and viability of the Egyptian poultry industry through sustained implementation of risk reduction measures along the poultry value chain.</p>
<p>Planned outputs and activities</p> <p>Remaining activities of SAIDR Year 3:</p> <ul style="list-style-type: none"> • continue the process of refurbishment of 120 decentralized epidemiology units and distribution of purchased items; • follow up on procurements in progress and deliver the items to concerned beneficiary organization; and • closure of various Letters of Agreement (LoAs) signed with national and international partners. <p>SAIDR Year 4:</p> <ul style="list-style-type: none"> • finalize SAIDR Year 4 project activities and follow up on the clearance process both from FAO and USAID sides and start with the implementation. <p>SAIDR Year 3: Activities undertaken during the reporting period</p> <ul style="list-style-type: none"> • The process for the refurbishment of 120 decentralized epidemiology units is still ongoing. The local needs were assessed, specifications prepared, contractors identified and tender launched. • FAO and the General Organization of Veterinary Services (GOVS), in collaboration with the International Livestock Research Institute (ILRI), finalized a draft Community Animal Health Outreach (CAHO) manual for practitioners (in English). The purpose of this manual is to serve as a reference for veterinarians during and after CAHO training. The main focus of the manual is on HPAI, but the methods can be easily adapted and applied to address other livestock diseases. The process for the Arabic translation of the manual has been initiated. • A total of 21 out of 30 (70 percent) of the LoAs signed with various governorates veterinary services have been closed. The closure of nine LoAs is still pending because of final progress and financial reports not having been submitted. ILRI submitted the last narrative report as part of the FAO-ILRI collaboration for the project "Introduction of PE to strengthen animal disease surveillance and control for

¹ The final budget amount is divided as follows : USD 1 700 000 from the "Pipeline funds" and USD 300 000 as part of the new contribution.

HPAI H5N1", initiated in August 2008, including clear recommendations for improvement. The report has been approved and the LoA with ILRI has been closed.

SAIDR Year 4: Activities undertaken during the reporting period (October 2010 – March 2011)

- In close consultation with the government counterparts and USAID country mission, SAIDR Year 4 project proposal was prepared, cleared at FAO headquarters, submitted to USAID and approved on time. The project duration is from 1 October 2010 to 30 September 2011.

Objective 1: Strengthen elements of government veterinary services

- The process of desktop review of legislation has started on movement of poultry and poultry products, live bird markets (LBM) operation, outbreak response and compensation schemes. This involves collection and sorting of all legislations concerning HPAI control measures, identification of gaps, assessing levels of enforcement and formulating recommendations to overcome challenges. The initial report has been drafted and will serve as the basis for the planned review process following the completion of the value chain analysis work.
- A simplified guide for minimum biosecurity practices was developed and submitted to GOVS. The guide was extensively discussed and approved by the Animal Health Technical Committee for the Control of Avian Influenza. The guide will serve as a basis for communication of biosecurity messages to commercial poultry producers and as self-assessment tool.
- The FAO Emergency Centre for Transboundary Animal Diseases (ECTAD) provided support to GOVS in facilitating the transfer of the SAIDR Web site from the USAID-funded Communication for Healthy Living (CHL) project to GOVS. In response to capacity strengthening needs, ECTAD provided the following:
 - a software programme required for the operation of the Web site (two users License Win Dream Weaver and one Media CD);
 - a one-day technical training courses (12 October 2010) for six GOVS staff; and
 - a one-day on-the-job training (31 December 2010) for the same staff to ensure that the system is fully functional.
- First meeting of the Animal Health Technical Committee was held on 12 October 2010. The meeting included an extensive discussion and approved the FAO proposed minimum biosecurity guidelines for commercial poultry farms. In addition, the technical committee discussed the critical gap in sharing vital HPAI-related information, and ECTAD was designated to bridge this gap until local capacity is created in the future. Since then, FAO has established an electronic address database of Technical Committee members and shares all national and international information on animal health in general and HPAI in particular. The feedback received so far on the effectiveness of this recent communication platform is very encouraging.
- In consultations with GOVS, specifications for 75 desktops, 75 UPS, 75 air conditioners, 150 chairs and 75 computer tables were prepared and the procurement process initiated. These materials are needed for the planned expansion of epidemiology units in governorates and districts that have not been covered during previous SAIDR project years.
- A stakeholders workshop on "Strategic HPAI Surveillance Planning" was organized on 8 November 2010. Relevant staff from GOVS, the National Laboratory of Veterinary Quality Control on Poultry Production (NLQP), local veterinary directorates and USAID participated, where a thorough Strengths, Weaknesses, Opportunities, and Threats (SWOT) profiling and analysis of the existing HPAI surveillance plan was carried out.
- A revised HPAI epidemio-surveillance plan finalized in a follow-up workshop was conducted on 29 December 2010. Participants were key actors directly involved in day-to-day HPAI surveillance activities and were drawn from GOVS, NLQP and FAO. Based on the SWOT analysis output and considering the essence of the revised HPAI control strategy, the existing surveillance plan was streamlined and consolidated. The newly revised surveillance plan has four subcomponents (active, targeted, passive and syndromic) each with defined objectives, scope and geographic coverage and elaborated information gathering instruments (formats).
- A series of meetings were held between ECTAD consultants and staff of epidemiology unit in GOVS and NLQP to strengthen the current epidemiological network at both central and governorate levels to enhance timely flow of epidemiological information and setting of mechanisms to support provision of feedback.

- ECTAD continues to regularly provide technical support to GOVS and NLQP units involved in the analysis of surveillance data. Needs were assessed and areas of intervention jointly identified. Joint analysis and management of available for HPAI surveillance have been initiated.
- ECTAD continues facilitating ongoing efforts for the establishment of “Fourway Linking” of animal and public health sectors to enhance sound epidemiological information exchange.
- The preparation of specifications for laboratory reagents and consumables, including those required for real-time polymerase chain reaction (RT-PCR) and that are adequate for testing 2 000 pooled samples from HPAI suspected cases, was carried out in close consultation with NLQP staff. The procurement process has been initiated and the delivery of goods is expected to be completed in the coming months.
- Preparation of specifications for 125 000 swabs was completed and the procurement process initiated. The swabs will be delivered to GOVS and used in HPAI surveillance activities.
- FAO has made an official request to NLQP requesting collaboration for joint analysis of historical laboratory data on HPAI. NLQP, in turn, accepted the request and preparation for data analysis by NLQP and FAO staff is underway.
- A number of meetings and missions were carried out by FAO and GOVS staff working under the Veterinary Public Health (VPH) department. The aim was to assess the needs to provide capacity strengthening support to the VPH department of GOVS. A draft SWOT analysis report dealing with the operations of poultry slaughterhouses in Egypt was prepared. A consultative workshop involving all relevant stakeholders will be organized in April 2011 to discuss the SWOT analysis outputs.
- A laboratory consultant has been recruited to perform a controlled study on the detection of viral residues in different organs of vaccinated chickens. An experimental protocol was designed by FAO and NLQP staff. The trial taking place in NLQP began in early January and will be completed in two months.

Objective 2: Define epidemiological parameters of HPAI

- Various technical supports were provided to GOVS through compiling all existing disease reporting forms and elaboration of flow chart for disease reporting, identification of links and actors involved in HPAI surveillance, reviewing of proposed notification forms and database systems (data entry, analysis of outputs, dissemination) and recommendations to improve the surveillance system.
- In close consultation with relevant staff from GOVS and NLQP, simplified formats for collection of epidemiological data in various HPAI surveillance activities were developed.
- On 20 October 2010, a coordination meeting was organized to discuss the mechanism of collaboration between GOVS and NLQP to enhance operational efficiency and improve epidemiological data quality. The meeting involved relevant staff from various GOVS departments (Epidemiology Unit, Preventive Medicine, AIEMU), NLQP and FAO, including the backstopping officer from FAO headquarters.
- In consultation with GOVS and USAID country mission, the purchase of HPAI Rapid Field Test in GOVS was cancelled because of availability of adequate stock. This procurement budget line was substituted by materials for strengthening the epidemiological network at district levels.
- Data collection sheets for passive, active and syndromic and targeted surveillance were developed and detailed implementation modalities of the surveillance plan discussed. These actions allowed the programme to overcome constraints faced and harmonize field operations.
- The CAHO programme has been administratively integrated into the regular GOVS structure and technically into the passive surveillance system.
- The development of a web-based surveillance system for consolidation of participatory epidemiological data collection through enhanced CAHO activities was completed. Currently CAHO practitioners in the field can access and directly enter data into the programme.

Objective 3: Understand economic and cultural elements of poultry production and improve hygienic measures along the value chain to enhance HPAI control in Egypt

- FAO international consultant undertook a review of prior socioeconomic and related works on HPAI in the Egyptian household poultry sector and its linkages to other stakeholders along the poultry value chain.
- With a backstopping support at FAO headquarters, during October and November 2010, the consultant carried out household producers’ value chain assessment study in various piloted governorates in Egypt. She also identified/described specific hygienic and disease prevention measures (bird confinement, general cleaning and hygiene) practiced by household poultry producers.

- The consultant made a presentation of her study at a workshop specifically organized by FAO for this purpose and wherein all key stakeholders and relevant partners were invited. She also submitted a comprehensive report.
- FAO international consultant undertook a value chain study with an emphasis on the identification of the major poultry value chains, to identify and provide an overview of the linkages between the different chains and the critical control points for highly pathogenic disease control. In addition, the study attempted to develop participatory options to deal with the critical control points.
- On 27 January 2011, the consultant made a presentation of his study at a workshop specifically organized by FAO for this purpose and wherein all key stakeholders and relevant partners were invited. He also submitted a comprehensive report including an overview of the chains and linkages, and quantitative data, as well as a proposal for options to deal with the critical control points from a systems management point of view.

Objective 4: Improve biosecurity in the context of improved poultry production

- From October to November 2010, FAO international consultant, conducted a financial feasibility analysis of biosecurity measures in the household poultry production sector in Egypt. The study revealed that biosecurity implementation in the household was at least 8.5 times financially more beneficial than doing nothing to reduce the risks and costs associated with major poultry diseases.
- For the purpose of the study and in an attempt to identify most appropriate social, practical and cost-effective measures, 191 individual and group interviews were conducted in Qalubia, Menoufia and Gharbia governorates with focus on various biosecurity measures adopted by households.
- ECTAD organized a video conference on 9 December 2010 wherein experts at FAO headquarters, GOVS, NLQP, CLEVB, CHL, UNDP and USAID staff discussed the findings of the study and the way forward.
- The consultant has submitted an end-of-assignment report (cleared at FAO headquarters) and two draft manuscripts for publication in international peer-reviewed journals.
- In December 2010, evaluation of the impacts of previous biosecurity training programmes carried out by FAO in seven high HPAI risk governorates was carried out. The evaluation was performed through the administration of questionnaire and visual inspection of premises of sampled commercial farms using an FAO prepared checklist. Analysis of the evaluation output was made by comparing farm biosecurity levels in relation to farming types, capacity, species of birds, etc. Based on the analysis outputs, farms were categorized as low-, moderate- or high-risk classes whereby the evaluation of the impacts of previous biosecurity trainings was measured through disaggregation of training beneficiary and non-beneficiary farms.
- A comprehensive report was submitted and is currently under review for formal clearance and further dissemination.

Objective 5: Improve AI vaccination in commercial poultry production units

- Previous assessment vaccination reports and SOPs developed in 2009 were discussed with GOVS authorities to assist GOVS in designing and implementing a strategy for clinical, serological and virological surveillance in vaccinated poultry flocks.
- A consultant from Agricultural Research for Development (CIRAD) was recruited by FAO and started her first mission by reviewing and updating the current AI vaccination plan. Her work covers the various poultry production sectors. In addition, it entails developing SOPs for effective monitoring of vaccinated flocks, and assessing the cost-effectiveness and impact of AI vaccination in Egypt. The first mission was carried out between 18 and 26 January 2011. The second mission will take place in a couple of months after the collection of required data is completed

Objective 6: Increase incident reporting through outbreak response measures

- Identification of high-risk practices and behaviours as applied to HPAI surveillance and outbreak response was started. The field work was interrupted owing to the recent civil unrest in Egypt. The security situation is now improving and the work will be completed within eight weeks.
- The preparation of specifications for 250 mobile phones, 250 mobile lines and 50 GPS devices were completed. GOVS was consulted throughout as these materials are meant to provide capacity support to field veterinary staff engaged in surveillance and outbreak response activities. The procurement process

has been initiated.

Component 7. Setting up and implementing efficient monitoring and evaluation

- A Detailed Implementation Plan (DIP) describing timelines and budget for all project activities has been set up. The DIP was thoroughly discussed among FAO staff and project partners. Work plans for each FAO consultant were developed, discussed at ECTAD regular meetings and agreed by staff.
- Various meeting were held with project partners to set up and identify the mechanism of project implementation is such a way to suit upcoming monitoring and evaluation activities.
- Monthly programme team meetings were held to allow periodical monitoring of project implementation and overcome any constraints encountered.

Planned Activities for the Next Quarter:

- Prepare Terms of Reference (ToR), identify potential candidates and recruit an international consultant who will undertake review of current legislation on HPAI control and make proposals based on the outputs of the ongoing value chain analysis.
- Organize a workshop to discuss revised proposal of HPAI legislation based on the outputs of the ongoing value chain analysis and produce a comprehensive report with recommendations.
- Undertake an assessment study, organize a consultative workshop involving key stakeholders and produce a report on a proposed mechanism for licensing and registration of commercial poultry farms.
- Review OIE gap analysis report and identify and liaise with GOVS to identify key areas that require FAO's support and modus operandi.
- Provision of additional on the job training on SAIDR Web site management.
- Organize two coordination workshops for HPAI task force in governorate and head of local veterinary services to discuss activities and implementation of HPAI strategic action plan.
- Continue to provide support to the Animal Health Technical Committees and the new veterinary administration in order to revamp field level HPAI activities that slowed down due to the recent civil unrest in Egypt.
- Selection of governorates, districts and villages to target Community Development Associations (CDAs) that will closely work with GOVS and be involved in HPAI detection and awareness creation.
- Enhance the establishment of formal links between GOVS and CDAs and organize orientation days for CDAs in selected villages.
- Follow up on the implementation of the surveillance plan and regularly review and update the plan in accordance with the field situation analysis and upcoming value chain analysis outputs.
- Organize four refresher training sessions involving 104 CAHO practitioners on the new scope of work and field operations.
- Conduct two consultative workshops to develop a system that ensures harmonization of Epidemiology Unit functions with other relevant structures.
- Prepare ToR and recruit an international consultant to conduct a pilot study on the feasibility of poultry sector restructuring in Egypt.
- Organize two technical training courses on food safety and public health as part of the technical assistance to support the veterinary public health department.
- Finalize SWOT analysis of the operations of poultry slaughterhouses in Egypt.
- Support the establishment of a nation-wide epidemiological networking at governorate and district levels.
- Identify the further epidemiological information needs that could be gathered through the CAHO programme.
- Assign field teams to implement biosecurity messages for Sector 3 farms using the newly developed simplified guide.
- Improve epidemiological data quality, management, analysis and sharing through:
 - provision of continuous technical assistance to the partners involved in surveillance;
 - joint analysis and management of existing HPAI surveillance data; and
 - four-way linking of animal and public health sectors and other means.
- Conduct an assessment of outbreak response measures and provide recommendations for further improvement.
- Compile an elaborated assessment report on the current disease information system in Egypt.

<ul style="list-style-type: none"> ○ continue joint FAO-NLQP collaboration for laboratory analysis. The work entails holding of regular support/meetings, develop and agree on methodology for data analysis, consolidate epidemiological data describing HPAI and support coordination and information sharing between NLQP and other partners. ● Processing a second consultancy mission for a consultant from CIRAD and organizing a stakeholder workshop where she will present and discuss the findings of her study. <p>Other planned activities:</p> <ul style="list-style-type: none"> ● Finalize the process of refurbishment of 120 decentralized epidemiology units and distribution of purchased items. ● Closure of the remaining nine LoAs signed with governorate veterinary services in the context of SAIDR III project.
<p>Main challenges encountered and solutions:</p> <ul style="list-style-type: none"> ● Frequent changes in the veterinary administration in general and the CVOs in particular. The new appointees lack proper understanding of the national HPAI situation and the complex issues they are purported to handle. During the reporting period, two new CVOs as well as the Head of Preventive Medicine were appointed. The Animal Health Technical Committee was also newly established. In response to these changes, ECTAD organized a workshop (15 December 2010) and separate briefing meetings with all those concerned. These allowed us to systematically describe the status of HPAI in the country, past and current efforts, evaluation of outputs, lessons learned and the way forward. ● The recent generalized civil unrest in Egypt led to a dramatic slowdown of government-led field activities related to HPAI. Thanks to the initial smooth progress, the crisis did not result in any delay in the implementation of FAO project activities. However, it has to be noted that, unfortunately, the crisis occurred during the peak HPAI outbreak season. Available data suggest a decline in reported poultry cases and apparent increase in human infections and deaths. There is also an apparent delay in the admission to hospital of suspected human cases and reporting of confirmed infections. FAO is closely working with relevant government counterparts encouraging them to revitalize field-level operations on HPAI.
<p>Main progress made towards the achievement of project outcomes</p> <ul style="list-style-type: none"> ● FAO has implemented, analysed and compiled numerous field level studies on livelihoods, poultry value chains and disease control constraints for use by GOVS. Project outputs have strengthened institutional capacities (manpower, infrastructure, etc.) of veterinary services at both central and governorate levels. ● The assessment study on Ai vaccination of poultry in Egypt indicated that vaccination coverage and flock immunity level is low. The organization of vaccination campaigns is poorly managed. The study suggested that vaccination should be seen as only one of the many efforts required to make significant improvements to HPAI control and prevention in the country. FAO has developed and handed over to GOVS a risk-based, targeted vaccination scheme for the different production sectors, as well as an operational plan with an exit strategy. ● FAO continually assesses its project implementation status and attempts to capture views of beneficiaries. Government counterparts operating at various levels and private sector players expressed the highest level of appreciation of and confidence in ECTAD approaches and value of the different project interventions. ● FAO led the review of the animal health component of the integrated national plan. The revised <i>Animal Health and Sustainable Livelihood Strategy</i> reflects the endemicity of HPAI and the risk reduction measures needed for longer term. FAO was also instrumental in assisting GOVS to develop a three-year elaborated action plan based up on the revised HPAI strategy. ● The current SAIDR IV project is based on the three-year action plan of the government and in line with the OIE Performance of the Veterinary Services (PVS) gap analysis report. ● FAO and USAID provided advice to the veterinary authorities in the establishment of dedicated HPAI units at various levels and making the epidemiological information network functional.

Project Monitoring Sheet: **OSRO/GLO/707/USA**

Project Title: Continued support to the FAO/ECTAD Advocacy and Communication Unit to provide strategic technical assistance and strengthen in-country capacities, competencies and leadership in advocacy and advocacy-related communication against Highly Pathogenic Avian Influenza and other Emerging Infectious Diseases

Reporting period: **October 2010 – March 2011**

Country: Bangladesh, Egypt, Indonesia and Viet Nam
Project title: Continued support to the FAO/ECTAD Advocacy and Communication Unit to provide strategic technical assistance and strengthen in-country capacities, competencies and leadership in advocacy and advocacy-related communication against Highly Pathogenic Avian Influenza and other Emerging Infectious Diseases
Code: OSRO/GLO/707/USA
Budget: USD 1 500 000 (Phase I); USD 1 000 000 (Phase II)
Total budget: USD 2 500 000
Effective starting date: 1 October 2007
Planned end date: 30 September 2011
<p>Context of the project</p> <p>The current project is an extension of OSR/GLO/707/USA which commenced in October 2007. The project was initiated – and extended – to address the issue of limited core skills in advocacy and contemporary approaches to strategic communication planning within livestock departments/veterinary services of Ministries of Agriculture (MoA). Thus, they require capacity development to be able to provide leadership and coordination in developing and implementing evidence-based advocacy, strategic communication and extension campaigns.</p>
<p>Objectives of the project</p> <p>The core objectives which remain unchanged for the extension period are:</p> <ul style="list-style-type: none"> • Building in-country advocacy, communication and extension capacities, competencies and leadership. • Developing effective and evidence-based advocacy, communication and extension strategies and interventions. • Strengthening in-country collaboration and coordination. <p>These core objectives translate into the following key components of the project extension:</p> <ul style="list-style-type: none"> • Development, utilization and dissemination of advocacy training and capacity development modules/materials for veterinary services, epidemiology staff, extension staff, as well as FAO and civil society organizations, with a focus on HPAI/EIDs; • Production and dissemination of HPAI/EIDs advocacy and community extension and mobilization materials; • Production and dissemination of regional advocacy strategy and networking materials, and support in developing national advocacy strategies and plans; • Capacity development for Advocacy Extension Officers to provide in-country support for implementation of advocacy activities.
<p>Planned activities</p> <p>The project comprises three components with specific outputs and activities for each. This report contains implementation details only on those components/outputs, where activities have been implemented. Where components/outputs are not reported it can be assumed that no activities were conducted – as per the project timetable/workplan – during the reporting period.</p>

Component 1: Building in-country capacity, competencies and leadership in strategic advocacy and advocacy-related communication.

Output 1.1: Training and capacity development materials focusing on advocacy and advocacy-related strategic communication and planning/leadership for prevention and control of HPAI and EIDs are developed for training of and use by Ministry of Agriculture's Livestock departments, and veterinary services communication, extension and technical staff

Activity 1.1.1: Develop comprehensive, multi-disciplinary training and capacity development modules and materials on risk and outbreak communication for HPAI and EIDs preparedness, prevention and control for MoAs, livestock departments, and veterinary services

Activity 1.1.2: Develop and disseminate multi-media advocacy and community mobilization materials, for use by MoAs, livestock departments, and veterinary services in preparedness, prevention and control of HPAI and EIDs

Component 2: Developing effective and evidence-based regional and national advocacy strategies and a regional strategic communication framework for preparedness, prevention and control of HPAI and other EIDs.

Output 2.1: FAO Regional Advocacy Strategy is developed and disseminated

Activity 2.1.1: Conduct desk-based policy review

Activity 2.1.2: Conduct 15-20 Key Informant interviews across the region

Activity 2.1.4: Develop draft advocacy strategy

Output 2.2: National level communication and advocacy strategies are developed in Bangladesh, Indonesia and Vietnam

Activity 2.2.1 Conduct three communication and advocacy strategy development workshops in Bangladesh, Indonesia and Viet Nam (for five days, with 25 local participants)

Output 2.5: Regional Strategic Framework for Communication developed and disseminated (through DVD, website, presentations)

Activity 2.5.1: Conduct two-day dissemination workshop in Bangkok for 35-40 officials from EPT countries and others in the region to launch the strategic framework

Activity 2.5.2: Develop localization and adaptation guidelines and handbook

Output 2.6: The capacity of FAO Advocacy and Community Engagement Officers to provide in-country support for implementation of advocacy activities is developed.

Activity 2.6.1: Support FAO Advocacy Extension officers in developing national advocacy strategies; collaborate in capacity development workshops/mentor local capacity development

Activity 2.6.2: Develop local advocacy materials.

Output 2.7: New tools, processes and approaches are developed for communicating technical information on EIDs effectively.

Activity 2.7.1: Conduct three pilot workshops (in Egypt, Indonesia and Viet Nam) to develop curriculum modules for communicating technical information on EIDs to non-technical audiences; and to develop the outputs from the workshop already conducted in Bangladesh.

Activity 2.7.2: Conduct pre- and post-evaluation exercises to evaluate the effectiveness of the tools, processes, and approaches.

Activity 2.7.3: Share new tools with communication partners, government ministries and departments, CSOs and others, including through a local workshop for dissemination of curriculum processes for communicating on HPAI/EIDs/animal diseases, and engaging risk audiences in dialogue.

Output 2.8: *New multi-disciplinary data gathering protocols are developed to inform community communication interventions*

Activity 2.8.1: Conduct consultations with collaborators and partners: through a national workshop to develop new guidelines/SOPs for designing multi-disciplinary research protocols for gathering data about knowledge, culture, attitudes, practice, socio-economics and other aspects of affected communities.

Activities undertaken during the reporting period

All activities as indicated under Planned Activities above have been carried out except for Egypt (please see explanation under “Main Challenges encountered”). Full details of activities implemented and progress made are also listed under Section “Main progress made towards the achievement of project outcomes”.

Planned activities for the next six-month period

Component 1: Building in-country capacity, competencies and leadership in strategic advocacy and advocacy-related communication.

Output 1.1: *Training and capacity development materials focusing on advocacy and advocacy-related strategic communication and planning/leadership for prevention and control of HPAI and EIDs are developed for training of and use by Ministry of Agriculture’s Livestock departments, and veterinary services communication, extension and technical staff*

Activity 1.1.2: Disseminate multi-media advocacy and community mobilization materials, for use by MoAs, livestock departments, and veterinary services in preparedness, prevention and control of HPAI and EIDs

Activity 1.1.3 Disseminate training/capacity development materials on strategic advocacy and advocacy-related communication and planning for HPAI/EIDs

Output 1.2: *Technical capacities and capabilities of Ministry of Agriculture’s Livestock departments and veterinary services to plan and mount effective interventions in strategic advocacy and strategic communication interventions are strengthened*

Activity 1.2.1 Conduct six training workshops in four countries (Bangladesh, Egypt, Indonesia and Viet Nam) on strategic advocacy and advocacy-related communication planning and leadership for the prevention and control of HPAI and other EIDs

Component 2: Developing effective and evidence-based regional and national advocacy strategies and a regional strategic communication framework for preparedness, prevention and control of HPAI and other EIDs.

Output 2.2: *National level advocacy strategies are developed in Indonesia and Vietnam*

Activity 2.2.1 Conduct two advocacy strategy development workshops in Indonesia and Viet Nam (for five days, with 25 local participants)

Output 2.3: *Develop capacity in advocacy among veterinary, field epidemiology and extension staff, as well as FAO and civil society organisations, etc.*

Activity 2.3.1 Conduct four 4-day workshops in 4 countries to build capacity in advocacy, and communication planning and leadership for 20 persons per workshop (workshops to be used to develop national advocacy plans with goals, timeframes and related interventions).

Output 2.4: *Advocacy materials are developed, utilised and disseminated during the workshops outlined in Output 2.3/Activity 2.3.*

Activity 2.4.1 Develop advocacy material as identified and utilize in four 4-day workshops in four countries.

Output 2.6: *The capacity of FAO Advocacy Extension Officers to provide in-country support for implementation of advocacy activities is developed.*

Activity 2.6.1 Support FAO Advocacy Extension officers in developing national advocacy strategies; collaborate in capacity development workshops; and mentor local capacity development

Activity 2.6.2 Develop local advocacy materials

Output 2.7 New tools, processes and approaches are developed for communicating technical information on EIDs effectively.

Activity 2.7.1: Conduct three pilot workshops (in Egypt, Indonesia and Viet Nam) to develop curriculum modules for communicating technical information on EIDs to non-technical audiences; and to develop the outputs from the workshop already conducted in Bangladesh.

Activity 2.7.2: Conduct pre- and post-evaluation exercises to evaluate the effectiveness of the tools, processes, and approaches.

Activity 2.7.3: Share new tools with communication partners, government ministries and departments, CSOs and others, including through a local workshop for dissemination of curriculum processes for communicating on HPAI/EIDs/animal diseases, and engaging risk audiences in dialogue.

Component 3: Strengthening in-country collaboration and coordination.

Output 3.1: *Best practices are documented and disseminated*

Activity 3.1.2: Collect lessons learned and best practices from countries of the region

Main challenges encountered and response provided

No activities were undertaken in Egypt (one of the four project countries) due to the political situation in the country during the reporting period. The project activities have been rescheduled, with the first activities due to take place in May 2011. Preparations have already taken place, which include a mission in May to undertake filming of advocacy materials for the prevention of HPAI and other animal diseases.

Main progress made towards the achievement of project outcomes

In relation to the core objectives of the project, implementation to date has focused on the development of advocacy training and capacity development modules/materials for veterinary services, animal health officers, epidemiology staff, etc; community extension and mobilization materials; regional advocacy strategy and networking materials support in developing national advocacy strategies and plans; and capacity development for personnel to provide in-country support for implementation of advocacy activities. The methodologies developed are encapsulated in the materials produced within the project to date (see below). These key methodologies and materials form the basis of the project and its implementation, and represent new thinking, approaches and planning in addressing the threat of HPAI in endemic countries, together with that from EIDs and high-impact animal diseases.

In addition to ensuring the participation of stakeholders and beneficiaries in the planning of the project, the development of the novel approaches and strategies to advocacy/communication, and in developing materials, a series of capacity development workshops have been planned and organized in Bangladesh, Indonesia and Vietnam, for multidisciplinary and multisectoral stakeholders from Ministries of Agriculture and Health, international agencies, together with communication specialists, veterinarians, animal health officers, etc. The workshops aim to develop the capacity and capabilities of these stakeholders to plan and lead advocacy and communication interventions which impact upon the ultimate project beneficiaries – farmers, poultry/animal producers, bird/animal market workers, transporters, and other community-level stakeholders – through implementation of biosecurity and risk reduction measures to minimize the threat of HPAI and other high-impact animal diseases. The full details of achievements are:

Component 1: Building in-country capacity, competencies and leadership in strategic advocacy and advocacy-related communication.

Output 1.1 Training and capacity development materials focusing on advocacy and advocacy-related strategic communication and planning/leadership for prevention and control of HPAI and EIDs are developed for training of and use by Ministry of Agriculture's Livestock departments, and veterinary services communication, extension and technical staff

A final draft of the *FAO Outbreak Communication Guidelines* was produced following a consultative process. The publication is for the use of animal health and communication professionals to prepare for and respond to animal disease emergencies. The consultant based in FAO headquarters in Rome, under the USA project, organized the drafting of a policy 'White Paper' on *Risk Communication* during the reporting period, and which will be completed in mid-April. The 'White Paper' contributes to FAO's global and regional frameworks for communication against HPAI/EIDs and to capacity development materials. The consultant organized a consultative process for the 'White Paper', which will culminate in a seminar to be held in FAO Rome on 14 April 2011, with participants from AED, FAO, OIE, UNICEF, the World Food Programme (WFP), WHO and others. The FAO consultant further began developing community mobilization and advocacy materials for use by animal health and communication professionals. The completion date of the materials is scheduled for June 2011.

Component 2: Developing effective and evidence-based regional and national advocacy strategies and a regional strategic communication framework for preparedness, prevention and control of HPAI and other EIDs.

Output 2.1 FAO Regional Advocacy Strategy is developed and disseminated

A consultative workshop for FAO-ECTAD Country Team Leaders identified gaps in the area of regional advocacy apparent during the course of HPAI project implementation since 2003. Following this and other consultative processes an FAO Regional Advocacy Strategy is now in draft stage, and is expected to be ready in June 2011 for review and finalization. Based on the consultations above, a set of regional guidelines for developing a national level advocacy strategy is now at draft stage. This will be shared with individual countries at workshops scheduled in Bangladesh, Indonesia and Viet Nam.

Output 2.2 National level communication and advocacy strategies are developed in Bangladesh, Indonesia and Vietnam

Implementation update: Multidisciplinary, multisectoral workshops for stakeholders from Ministries of Agriculture and Health, as well as international agencies and communication specialists, are scheduled for April 26-27 in Bangladesh, and for April 29-30 in Indonesia, with four objectives: (a) to launch the *Regional Framework for a Communication Strategy against EIDs in Asia and the Pacific 2011-2016*; (b) to share the *Localization Guide* for developing a communication strategy based on the *Regional Framework*; (c) to share regional guidelines for developing a national advocacy strategy; and (d) to conduct a review of available advocacy materials, and new needs in the light of adopting the One Health approach.

Output 2.5 Regional Strategic Framework for Communication developed and disseminated

A draft *Regional Framework for a Communication Strategy against EIDs in Asia and the Pacific 2011-2016* was completed in February 2011, by an FAO-led collaboration that included inputs from AED, UNICEF, UNSIC and WHO-South East Asia Regional Office (SEARO). The document was the product of a consultative process and a literature review of communication evaluations conducted in relation to HPAI-related communication interventions. The *Regional Framework* was informed by the experiences of issues and gaps

identified by FAO Team Leaders of ECTAD-RAP in the area of communication since 2003. The literature review and recommendations were a key component and were informed by a consultative process involving AED, CARE, FAO, OIE, UNICEF, UNSIC, and senior veterinarians and livestock officers from MoAs/Livestock Departments (from Cambodia, India, Indonesia, Nepal, Philippines, Thailand and Viet Nam). The process recognized the need for a regional framework to harmonize strategic communication approaches across the region, for use by communication and non-communication professionals; and that international agencies/NGOs with communication expertise should work together on the framework with FAO taking the lead. A core group was formed comprising representatives from AED, CARE, FAO, UNICEF and WHO SEARO to implement the process. The *Regional Framework* will be introduced at the Bangladesh and Indonesia workshops scheduled for April 26-27 in Dhaka, and for April 29-30 in Jakarta; and at a regional event in Bangkok, May 2011.

Output 2.6 The capacity of FAO Advocacy and Community Engagement Officers to provide in-country support for implementation of advocacy activities is developed.

Three FAO Advocacy and Community Engagement (ACE) officers were appointed, in Bangladesh, Indonesia and Viet Nam, and participated in a meeting in Bangkok from 19-21 January 2011 (together with project funded FAO consultants from Bangkok and Rome) which included capacity building sessions, work planning, review of current activities, and documentation of success stories. Additional meetings are scheduled for May 2011 in Bangkok, to review project implementation progress, and July to plan the end phase of the project.

Output 2.7 New tools, processes and approaches are developed for communicating technical information on EIDs effectively.

Implementation update: Two process tools (Figureheads, Storytelling) and five dialogue-based session guides for communicating scientific knowledge to lay audiences have been developed and translated into Bangla for field testing in Bangladesh in the last week of April. The Figureheads process tool has been translated into Vietnamese and is being field tested in April. The complete set of new tools will be translated and field-tested in Indonesia in June.

Output 2.8 New multi-disciplinary data gathering protocols are developed to inform community communication interventions

FAO convened an interagency meeting (including AED, UNICEF, UNSIC and WHO SEARO) to discuss the updating of communication research protocols in order to make them more multidisciplinary, and incorporate community insights from anthropological, sociological and socio-economic perspectives. Recommendations included:

- FAO should commission desk research to identify available tools and protocols for community research, and identify their strengths and weaknesses, as well as gaps.
- A meeting should be convened to review these findings, and develop terms of reference for a new community research protocol.
- New data gathering and research protocol and process tools should be developed.
- New tools should be introduced regionally at a suitable regional meeting in Bangkok, as well as during project interactions in Bangladesh, Indonesia, and Viet Nam.

Component 3: Strengthening in-country collaboration and coordination.

Output 3.1 Best practices are documented and disseminated

The ACE meeting in Bangkok in January, developed criteria for defining and identifying success stories and best practices. These were consolidated into a data-gathering format which was then circulated back to the country teams to help them propose success stories for documentation through video and print. Stories identified include: **Bangladesh:** use of the SMS Gateway to speed up reporting; and the live bird market clean-up project in Dhaka; **Viet Nam:** Farmers' Clubs, which have proven self-sustaining and effective after

the end of project funding. More possible stories are being researched; **Indonesia:** Currently researching story possibilities. A reconnaissance visit has been scheduled in Bangladesh from mid-April to conduct still photography, as well as develop a video production schedule and identify individuals to be interviewed on camera. A visit is being scheduled in Viet Nam for filming in end May.

Project Monitoring Sheet: OSRO/INT/001/USA

Project title: EPT+ Characterizing influenza viruses posing risks as the next global pandemic

Reporting period: April 2013 to September 2013

Country: Bangladesh, China and Viet Nam
Project title: EPT+ Characterizing influenza viruses posing risks as the next global pandemic
Code: OSRO/INT/001/USA
Budget: Phase I: USD 2.75 million Phase II: USD 1 million
Total: USD 3.75 million
Effective starting date: 1 November 2011
Planned end date: Phase I: 30 September 2013 Phase II: 30 September 2014
<p>Context of the project</p> <p>To improve our understanding of the role livestock play in serving as reservoirs for potential pandemic influenza viruses in Southeast, East and Southern Asia, the United States Agency for International Development (USAID) has provided funding to the Food and Agriculture Organization of the United Nations (FAO) to expand influenza surveillance activities through the EPT+ project, part of the broader emerging pandemic threat (EPT) programme. Approval of the initial EPT+ project proposal from USAID was received in November of 2011, and project activities were initiated by FAO in December 2011. The project contains four components: (1) improving the understanding of the fundamental drivers of influenza emergence through risk assessments and risk modelling; (2) conducting influenza surveillance in farm animals (swine and ducks) to improve knowledge about circulating viruses of pandemic potential in livestock; (3) developing and implementing questionnaires to improve the understanding of the risk for influenza transmission throughout multiple sectors; and (4) sharing information and contributing to major global influenza initiatives. The geographic scope of EPT+ initially included Viet Nam, China, and Bangladesh. The largest portion of the EPT+ project focuses on livestock surveillance activities and aims to detect and characterize animal influenza viruses circulating in targeted livestock systems.</p>
<p>Objective of the project</p> <p>The EPT+ project will contribute to the improvement of food security through the prevention, detection and control of, as well as the response to, animal and public health risks attributable to zoonoses and animal diseases. The main objective of the project is to improve characterization and surveillance of influenza-related pandemic threats at national and regional levels in livestock populations.</p>

Planned activities for the reporting period (April 2013 to September 2013)

OUTPUT 1: Fundamental drivers of influenza emergence refined, mapped and included in the risk analyses to improve geolocalization of potential pandemic emergence sites

- No activities during this period.

OUTPUT 2: Robust influenza surveillance strategy implemented at national/regional level to improve knowledge about circulating viruses of pandemic potential in livestock

- continue field sampling collection for the longitudinal study in Bangladesh;
- coordinate with FAO headquarters staff responsible for the Global Animal Disease Information System (EMPRES-i) in the implementation and use of the programme by the EPT+ field staff in all three recipient countries for analysis of test results of samples collected and questionnaires;
- coordinate with all partner laboratories from the three recipient countries in the timely submission of laboratory test results for influenza surveillance in livestock;
- conduct a national laboratory capacity assessment after the purchase and delivery of equipment and supplies necessary for handling and diagnosis of EPT+ samples;
- analyse field questionnaire data and laboratory test results that will be submitted by partner laboratories from all three recipient countries.

OUTPUT 3: Understanding of risk for influenza transmission improved among sectors

- Refer to Output 2.

OUTPUT 4: Information exchange and coordination improved among major global influenza initiatives

- coordinate contributions from EPT+ coordinators and other FAO Emergency Centre for Transboundary Animal Diseases (ECTAD) staff responsible for the EPT+ project in the analysis of both field and laboratory surveillance data for the final report;
- write up the EPT+ project final report; and
- conduct Closing Project Workshop.

Activities undertaken during the reporting period (April 2013 to September 2013)

OUTPUT 1: Fundamental drivers of influenza emergence refined, mapped and included in the risk analyses to improve geolocalization of potential pandemic emergence sites

- There were no activities related to this output during this period.

OUTPUT 2: Robust influenza surveillance strategy implemented at national/regional level to improve knowledge about circulating viruses of pandemic potential in livestock

- Continued influenza virus surveillance (virological and sero-surveillance) in all three recipient countries.
- Procured additional expendable laboratory supplies and materials needed for laboratory diagnosis of EPT+ field samples collected in all three countries.
- Samples collected from pigs and ducks during surveillance activities in the three countries were tested for influenza viruses (by real time reverse transcription-polymerase chain reaction (RT-PCR) and virus isolation using MDCK cell lines and embryonated eggs) and for influenza antibodies (using IDEXX Laboratories enzyme-linked immunosorbent assay (ELISA) kits). The resulting data was then analysed by respective laboratory experts and epidemiologists. See Annex 1 for a summary of laboratory testing results from the three target countries.

- Preliminary results of the laboratory test data analyses from all countries were shared via power point presentation with the epidemiologist of the global component of the EPT+ project to facilitate a comprehensive analysis of the regional influenza surveillance. Viet Nam has shared data from the field questionnaires and laboratory results, while China has shared laboratory results.
- Full genome sequencing results from some Swine Influenza Virus (SIV) positive samples in Viet Nam were likewise included in the analysis. Full genome sequencing on the remaining influenza positive samples in all three countries is ongoing and expected to be completed in December 2013.
- An EPT+ project internal meeting was attended by the project national coordinators and FAO country staff in Bangladesh, China and Viet Nam who were directly involved in the EPT+ project. Progress in both regional and global components of the project was discussed, as well as work plans for EPT+ Phase II.

National programme progress in support of Output 2

Bangladesh

- Three of the five laboratory partners have completed laboratory activities.
- 62.86 percent of the 6 429 duck blood serum samples tested by ELISA were positive for antibodies against influenza A virus.
- 16.45 percent of the 4 234 pig blood serum samples tested were positive for antibodies against influenza A virus.
- Only 11 (1.55 percent) of the samples from ducks tested positive (M-gene) for influenza A virus by real time RT-PCR, while in pigs there were no virological positive samples reported.
- All M-gene positive samples were sent to the Bangladesh Livestock Research Institute for virus isolation and sub-typing. Testing is ongoing.
- The EPT+ project generated information on the current status and distribution of influenza viruses in ducks and swine, and identified hotspots in tested areas.
- The project also assisted in facilitating collaboration and networking of national animal diagnostic laboratories and other EPT partners' programmes in the country.
- The EPT+ project initiated the first nationwide pig disease surveillance in Bangladesh. The project also provided a platform for surveillance, including retrospective samples for H7N9 testing.

China

- Eleven pig farms from two provinces (Guangdong and Hunan) were chosen as sampling sites, and 10 of the 11 farms were positive for SIV.
- Random samples traced from 52 farms were collected in Guangdong slaughterhouses, and all 52 farms were positive for SIV.
- Random samples traced from 99 farms were collected in Hunan slaughterhouses, and 78 farms were positive for SIV.
- Fifty-five strains (0.55 percent) of SIVs were isolated from the total number of pig

samples collected in China for the EPT+ project; from the 55 strains isolated, 40 were Eurasian avian-like (H1N1) viruses (EA) H1N1 subtype; 12 were subtyped as 2009 pandemic H1N1 influenza virus (pH1N1/2009); three were subtyped as H1N2 SIVs.

- In Hunan province, 34.9 percent of pigs sampled were positive for antibodies against influenza A virus, while in Guangdong province, 36.1 percent of pigs sampled were positive. The overall sero-prevalence of Influenza A in the two provinces was 35.5 percent.
- Based on the above laboratory test results, multiple influenza virus subtypes were detected among pigs in China.
- The co-existence of 2009 pandemic H1N1 influenza virus and other subtypes viruses (e.g. avian-like H1N1 and H1N2) in pigs may cause new virus assortment with pandemic potential.
- The EPT+ project enabled collaboration with the PREDICT project China office. A joint sampling between animal health and public health sectors was established. Collaboration between the two sectors was established at national and provincial level with the agreement that samples will be shared by both sectors.
- The LoA for full genome sequencing work was cleared by the FAO Emergency Centre for Transboundary Animal Diseases (ECTAD) Regional Office for Asia and the Pacific. The second LoA stipulates that the partner laboratory will provide services for full genome sequencing for 30 EPT+ samples, and that data on the sequences will be made available in FAO's Global Animal Disease Information System (EMPRES-i) domain.

Viet Nam

- 12 Provinces (six in the north, six in the south) were selected as sampling sites.
- Large-scale pig farms (breeding and fattening) with low biosecurity were chosen as sampling farms.
- An EPT+ surveillance field questionnaire was translated into Vietnamese and implemented.
- A total of 8 640 pig samples were collected in 12 provinces from January 2013 to August 2013.
- Of the 60 farms sampled, four breeding farms and five fattening farms were positive for SIVs.
- 31.5 percent of the samples collected in 12 provinces were seropositive against influenza A virus.
- 103 SIVs were isolated from nine SIV-positive farms.
- According to results from the EPT+ influenza surveillance project, SIV is prevalent in breeding and fattening farms with low biosecurity levels.
- Genetic variation (different subtypes and lineages) of SIVs was present in Viet Nam pig populations sampled.
- An amendment to the original LoA was approved and signed between FAO and the Department of Animal Health (DAH), Ministry of Agriculture and Rural Development, Viet Nam. The amended LoA covers additional sample collection for the EPT+ study in

Viet Nam. Sampling was conducted in August and September 2013. Laboratory testing is ongoing.

OUTPUT 3: Understanding of risk for influenza transmission improved among sectors.

- Processing and analyses of data gathered through questionnaires administered in Viet Nam and Bangladesh is ongoing.

OUTPUT 4: Information exchange and coordination improved among major global influenza initiatives.

- Data was shared with international influenza networks, such as FAO's Network of Expertise on Animal Influenza (OFFLU) and the OFFLU Swine Influenza Group.
- Identification of gaps between various genetic databases and epidemiological data was completed.

Global activities in support of Output 4

Regional workshop to review EPT+ activities in Bangkok, August 2013

A closing workshop was conducted in Bangkok with EPT+ national teams and the regional and global coordinators. During the workshop, each country focal point provided details on the number of samples collected, production systems targeted and preliminary results obtained from laboratory testing (serology, virus isolation and sequencing). The results in China and Viet Nam imply the presence of genetic variation (different subtypes and lineages) among SIV in swine production systems. Virological testing of samples in Bangladesh is ongoing, with an expected completion date of December 2013.

Owing to budget restrictions in Phase II of EPT+, it was decided that follow-up activities to complete the risk modelling work will require exploration of alternative sources of funding. Potential sources include H7N9 projects and collaboration with the PREDICT component of the EPT programme.

Country teams presented their work plans for Phase II of the EPT+ project. Viet Nam will conduct surveillance in production systems found positive for SIV during Phase I, and expand surveillance to other areas in the country. In China, longitudinal studies will be conducted on all SIV-positive farms identified during Phase I in order to monitor virus evolution over time.

Based on these activities, during the workshop it was agreed that EPT+ Phase II will focus on: 1) identifying and fully characterizing progenitor influenza viruses detected in livestock; and 2) understanding factors of virus emergence and evolution in Asia through specific longitudinal studies and value chain analysis.

Planned activities for Phase II in support of Output 2

National Programme

- Contribute to the EPT+ Phase II proposal by providing surveillance plans for Phase II.
- Undertake the full sequencing of influenza virus isolates collected during Phase I EPT+ in China, Bangladesh and Viet Nam and share resulting data.

- Follow-up and coordinate with the EPT+ national coordinators in China and Viet Nam for updates on the activities and results of the services stated in the amended EPT+ Phase I LoAs.
- Organize a national stakeholder meeting to plan EPT+ surveillance activities in Viet Nam and China

Global Programme

- Coordinate the writing and submission of the EPT+ Phase II proposal. Obtain input from national EPT+ coordinators from each country, and other FAO ECTAD technical staff who are directly involved with the EPT+ project.
- Collect all raw data gathered during Phase I EPT+ from surveillance and questionnaires from all three countries (Bangladesh, China and Viet Nam) for collation and data analyses. Coordinate the preparation of a technical report of data gathered from surveillance activities in the three countries.
- Conduct a regional project workshop with regional stakeholders to share results of EPT+ Phases I and II. The purpose of the meeting is to share the results of country consultations in Bangladesh, China and Viet Nam, and to improve coordination among FAO, other EPT partners, World Health Organization, World Organisation for Animal Health, and the United States Centers for Disease Control and Prevention to address the animal-human interface (month six of Phase II).

Main challenges encountered and responses provided

1. Information sharing on EPT+ project laboratory test results will have to be cleared by the Governments of target countries.

- In Bangladesh, laboratory test results and data generated from the field questionnaires will be made available as agreed in the signed LoA. Results from virological and sero-surveillance, and some data generated from the questionnaires have been shared internally among FAO technical staff who are directly involved in the EPT+ project. However, the official release and sharing of results to all partners will still need clearance from national authorities. The FAO ECTAD Bangladesh team leader will communicate and seek clearance from the Chief Veterinary Officer for the official release of all laboratory test results that are generated by the five laboratory partners.
- In China, project partners (the national coordinator and one Harbin laboratory staff) participated and shared laboratory test results during the EPT+ project internal discussion meeting from 28 to 30 August 2013. The amended LoA for full genome sequencing services provided by the partner laboratory (Harbin) states that “the partner laboratory will write a report on the analysis of laboratory diagnostic testing results; will provide service to neighbouring countries for gene sequencing; and the full genome sequencing data should be available in FAO EMPRES-i.” Levels of confidentiality of the data can be agreed and implemented.
- In Viet Nam, as stated in the signed LoA, all laboratory test results (including data that will be generated from the surveillance field questionnaires) will be made available to all partners. However, clearance from the DAH will still be needed for the official release and sharing of the information. The FAO ECTAD Viet Nam senior technical coordinator

will communicate and seek clearance from the Chief Veterinary Officer for the official release of all laboratory test results that are generated by both the National Center of Veterinary Diagnosis and Regional Animal Health Office Number 6 laboratories.

2. Delayed testing of field samples by some EPT+ laboratory partners in Bangladesh.

- All possible actions – including coordination, requests for assistance in troubleshooting lab equipment, and guidance on the use of EPT+ diagnostic protocols from other partner laboratories – are being taken to expedite the testing and submission of the EPT+ reports to national coordinators.

3. Difficulty collecting true information about disease status by interviewing farmers.

- Field questionnaires were translated into the local language in Bangladesh, China and Viet Nam.

4. Swine surveillance for influenza is not a priority for every EPT+ recipient country.

- At the stakeholders meeting and during field sample collection activities, EPT+ national coordinators explained the following information to national authorities and farmers in each country: the EPT+ project's main objectives; the possible role that pigs can play as a virus reservoir, and as a mixing vessel of the virus which could result in reassortment of a pandemic strain.

5. In Bangladesh, the Department of Livestock Services (DLS) had no previous experience in swine surveillance, including maintaining sample quality while in the field.

- The FAO ECTAD country team conducted training on swine surveillance (sample collection and management) for some DLS technical staff, together with 31 new local veterinarians hired for the EPT+ project field sample collections. Dry shipper boxes were purchased by Bangladesh FAO ECTAD for use by the field collection teams to transport field samples to laboratories.

Main progress made towards the achievement of EPT+ project outcomes

- Implemented influenza surveillance in livestock for each country, as agreed in the approved LoA between FAO and the respective national animal health institutions.
- The EPT+ influenza surveillance protocol was adapted and implemented in each country.
- All activities stated in the LoA have been completed in China and Viet Nam. In Bangladesh, reports are expected from two of the five partner laboratories on the results of the remaining EPT+ samples submitted by field collection teams.
- In Bangladesh, laboratory coordination and networking among the five government laboratories and other EPT partners were established through close coordination with the IDENTIFY project.
- In China, a second LoA was written and approved by FAO for the partner laboratory to provide services on full genome sequencing for 30 SIV positive samples. Results of the sequencing are expected in December 2013.
- In Viet Nam, an amendment to the original LoA was made for additional sampling in pigs. The reason for the additional sampling was to cover more sampling areas/farms in order to determine the extent of the genetic variation (different subtypes and lineages) of

SIVs in Viet Nam.

- An internal discussion meeting was attended by all FAO ECTAD country team staff, and some staff from partner laboratories that are directly involved in the EPT+ project.
- In Viet Nam, questionnaires were developed and a database was established.
- Coordination and information sharing was improved with partners and stakeholders in Viet Nam, and some international partners.
- In Bangladesh, the EPT+ project supported capacity building (diagnostic and surveillance activities, especially for pigs).

Annex 1. Results obtained from surveillance activities in Bangladesh, China and Viet Nam during Phase 1. Data presented represent only the results from the samples that have so far been tested.

I Quarter 2010

Project Monitoring Sheet: **OSRO/INT/803/USA**

Project Title: **Development of Integrated Desktop Simulation Exercise on Avian Influenza in Animal and Human Population in Europe and Eurasia**

Reporting period: **January – March 2010**

<p>Regional component: Eastern Europe and Central Asia Project Title: Development of Integrated Desktop Simulation Exercise on Avian Influenza in Animal and Human Population in Europe and Eurasia. Code: OSRO/INT/803/USA</p>
<p>Budget: USD 130 000 (Phase I) Total budget: USD 130 000</p>
<p>Effective starting date: 1 November 2008</p>
<p>Planned end date: 30 June 2010</p>
<p>Context of the project</p> <p>Emergency preparedness planning is crucial for the successful management of outbreaks of Highly Pathogenic Avian Influenza (HPAI) and for minimizing the outbreak's impact. Preparedness encompasses the development of contingency plans, operational procedures and engagement of national and local authorities in capacity building.</p> <p>The basis for the adequate implementation of measures and operations considering HPAI is a developed integrated action (contingency) plan that will clarify technical procedures, operational activities and the lines of command and communication channels. However, to test its efficiency the implementing capacity of the contingency plan should be monitored from time to time by conducting, for example, integrated desktop simulation exercises. These exercises provide an opportunity for the authorities to identify areas where cooperation and coordination needs to be improved as well as to test internal and external roles and responsibilities. Measurable outcomes need to reflect the technical and operational improvements, training and capacity building, the transparency of communication and the level of coordination between different government sectors and agencies involved. The Food and Agriculture Organization of the United Nations (FAO) and World Health Organization - Regional Office for Europe (WHO-EURO) are the focal points for the technical cooperation for animal and human cases of HPAI. Both organizations are involved in assisting UN Member States in enhancing their emergency preparedness and response capacity. The United States Government through the United States Agency for International Development (USAID) is one of the leading donors in strengthening the national capacity to respond to the risk of avian and pandemic influenza.</p> <p>The starting point of WHO's pandemic preparedness plan is to strengthen the capacity of countries to respond to seasonal influenza epidemic. FAO's activities in the field of avian influenza have targeted prevention, early detection and control of HPAI in animal populations. So far, the FAO, the World Organisation for Animal Health (OIE) and the WHO, are encouraging countries to develop or enhance existing national preparedness plans to fully consider an integrated approach by addressing animal and human health aspects as well as other sectors needed for the control of HPAI.</p>

This integrated approach allows:

- to improve the cooperation and communication of different sectors involved in HPAI emergency preparedness and response;
- To develop and implement integrated epidemiological surveillance and early warning systems for HPAI; and
- to ensure the most efficient implementation of measures and operations during an HPAI outbreak.

From December 2006, the FAO and WHO EURO have been developing and implementing integrated desktop simulation exercises within the ongoing OSRO/INT/603/USA B02 project. However, emergency preparedness is a continuous process, which needs to be adapted to prevailing conditions in a country and to new scientific insights.

The geographical scope of this project is limited to countries within the Eastern Europe and Central Asia regions of the FAO Headquarters (FAO/HQ) and WHO EURO, excluding the countries that have joined the European Union.

In the Central Asia region, during the beginning of 2006, two outbreaks of HPAI in humans have been observed in Turkey and Azerbaijan. The WHO and FAO missions to the region have indicated that the animal and human health sectors needed urgent strengthening. As in most countries, the relationship between the human and animal health sectors is fragmented, as is the cooperation in response to outbreaks. This leads to delays, thus increasing the impact of the disease in the poultry industry as well as the risk for human infection.

Since the first HPAI outbreaks, the Eastern Europe and Central Asia countries, with the guidance of FAO and WHO, have established Avian Influenza task forces or inter-ministerial AI working groups with the aim to prepare the country to face HPAI outbreaks. Furthermore, the development of contingency plans for HPAI and pandemic influenza preparedness plans has been promoted. However, only a limited number of countries have developed integrated multi-sectoral HPAI contingency plans or have tested their plans, while some of the existing plans still need to be revised or approved by their government.

Objectives of the project

This project ensures a continuous contribution to enhance the preparedness of targeted countries to respond when facing outbreaks of HPAI through testing the coordination and communication mechanisms amongst all involved in HPAI control, at national as well as at regional level. The project activities are conceived to reduce the risk of viral introduction or spread by improving coordination of actions to be taken. The ultimate goal of this proposal is to further develop and adapt an optimal model for HPAI desktop simulation exercises that could in the long-term strengthen the capacities of the veterinary and public health services as well as serve as a template for testing the preparedness for other emerging and re-emerging zoonotic diseases.

The expected outcomes of the project:

- inter-sectoral coordination and communication of stakeholders involved in the control of HPAI outbreaks improved;
- strengths and weaknesses of existing plans and response mechanisms for avian influenza in animals and humans identified;
- understanding and practice of command and coordination to respond to avian influenza identified;

<ul style="list-style-type: none"> • existing national contingency plans for HPAI enhanced; • veterinary and public health preparedness capacities for HPAI and other emerging and re-emerging animal and human diseases strengthened.
<p>Planned activities</p> <p>Output 1: Development and implementation of two national integrated tables top simulation exercise for HPAI</p> <p>Activities for the national integrated table top simulation exercise for HPAI:</p> <ul style="list-style-type: none"> • defining with FAO and WHO local offices to recruit national focal points for logistical and administrative support (venue, dates, translations and letters); • identifying possible participants including the scenario writers and facilitators; • developing the exercise scenario, handbook materials for players and observers, printing and copying the materials (at least in two languages); • preparing the exercise.
<p>Activities undertaken during the reporting period</p> <ul style="list-style-type: none"> • The hybrid simulation exercise planned to be conducted in Ukraine in April was prepared during this reporting period. The venue and all the logistical arrangements as well as the elaboration of the scenarios and the required material were elaborated during this period. • There was a close cooperation and regular communication between FAO and STOP AI in charge of conducting the field exercise. All the planned activities for this period were successfully undertaken.
<p>Planned activities for the next quarter</p> <ul style="list-style-type: none"> • Integrated hybrid national desktop/field simulation exercise for avian influenza in animal and human populations, Kiev, Ukraine, from 12 to 16 April 2010.
<p>Main challenges encountered and response provided</p> <ul style="list-style-type: none"> • A hybrid table-top and field exercise had been planned for November 2009, but the exercise had to be postponed in view of the occurrence of severe outbreaks of H1N1 in Ukraine.
<p>Main progress made towards the achievement of project outputs</p> <ul style="list-style-type: none"> • All the preparations for the hybrid simulation exercise were undertaken.

Quarter III 2010

Project Monitoring Sheet: OSRO/INT/803/USA

Project Title: **Development of integrated desktop simulation exercise on Avian Influenza in animal and human population in Europe and Eurasia**

Reporting period: **April – June 2010**

<p>Regional component: Eastern Europe and Central Asia</p> <p>Project Title: Development of integrated desktop simulation exercise on Avian Influenza in animal and human population in Europe and Eurasia.</p> <p>Code: OSRO/INT/803/USA</p>
<p>Budget: USD 130 000</p>
<p>Effective starting date: 1 November 2008</p>
<p>Planned end date: 31 December 2010</p>
<p>Context of the project</p> <p>Emergency preparedness planning is crucial for the successful management of outbreaks of Highly Pathogenic Avian Influenza (HPAI) and for minimizing the outbreak's impact. Preparedness encompasses the development of contingency plans, operational procedures and engagement of national and local authorities in capacity building.</p> <p>The basis for an adequate implementation of measures and operations considering HPAI is a developed contingency plan that preferably integrates animal and human health aspects. The contingency plan should further specify technical procedures, operational activities, lines of command and communication channels.</p> <p>The efficiency and capacity of the country in implementing the contingency plan should be tested from time to time by conducting, for example, integrated desktop simulation exercises. These exercises provide an opportunity for the authorities to identify areas where cooperation and coordination need to be improved, as well as test internal and external roles and responsibilities and the existing procedures. Measurable outcomes need to reflect the technical and operational improvements, training and capacity building needs, the effectiveness and transparency of communication and coordination mechanisms between different government sectors and agencies involved. The Food and Agriculture Organization of the United Nations (FAO) and World Health Organization - Regional Office for Europe (WHO-EURO) are the focal points for the technical cooperation for animal and human health aspects of HPAI. Both organizations are involved in assisting UN Member States in enhancing their emergency preparedness and response capacity. The United States Government through the United States Agency for International Development (USAID) is one of the leading donors in strengthening the national capacity to respond to the risk of avian and pandemic influenza.</p> <p>The starting point of WHO's pandemic preparedness plan is to strengthen the capacity of countries to respond to seasonal influenza epidemic. FAO's activities in the field of HPAI have focused on prevention, early detection and rapid response to control HPAI in animal populations. So far, FAO, the World Organisation for Animal Health (OIE) and WHO are encouraging countries to develop or enhance existing national preparedness plans to fully consider an integrated approach by addressing animal and human health aspects, as well as other sectors needed for the control of HPAI (e.g. wildbirds).</p>

This integrated approach allows:

- to improve the cooperation and communication of different sectors involved in HPAI emergency preparedness and response;
- to develop and implement integrated epidemiological surveillance and early warning systems for HPAI; and
- to ensure the most efficient implementation of measures and operations during an HPAI outbreak.

From December 2006, FAO and WHO EURO have been developing and implementing integrated desktop simulation exercises within the ongoing OSRO/INT/603/USA B02 project. However, emergency preparedness is a continuous process, which needs to be adapted to prevailing/changing conditions in a country and to new scientific insights.

The geographical scope of this project is limited to countries within the Eastern Europe and Central Asia (EEACA) regions of the FAO Headquarters (FAO/HQ) and WHO EURO, excluding the countries that have joined the European Union.

In the Central Asia region, during the beginning of 2006, two outbreaks of HPAI in humans have been observed in Turkey and Azerbaijan. The WHO and FAO missions to the region have indicated that the animal and human health sectors needed urgent strengthening. As in most countries, the relationship between the human and animal health (domestic as well as wild animals) sectors is fragmented, as is the cooperation in response to outbreaks. This leads to delays, thus increasing the impact of the disease in the poultry industry as well as the risk for human infection.

Since the first HPAI outbreaks, the EEACA countries, with the guidance of FAO and WHO, have established Avian Influenza (AI) Task Forces or inter-ministerial AI working groups with the aim to prepare the country to face HPAI outbreaks. Furthermore, the development of contingency plans for HPAI and pandemic influenza preparedness plans has been promoted. However, only a limited number of countries have developed integrated multi-sectoral HPAI contingency plans or have tested their plans, while some of the existing plans still need to be revised or approved by their government.

Objectives of the project

The aim of this project is to enhance the preparedness of EEACA countries to respond to the outbreaks of HPAI through testing the coordination and communication mechanisms among all involved in HPAI control at national as well as regional level. The project activities were conceived to reduce the risk of viral introduction or spread by improving the coordination of actions to be taken. The ultimate goal of this proposal was to further develop and adapt an optimal model for HPAI desktop simulation exercises that could in the long-term strengthen the capacities of the veterinary and public health services and serve as a template for testing the preparedness for other emerging and re-emerging zoonotic diseases.

The expected outcomes of the project:

- Inter-sectoral coordination and communication of stakeholders involved in the control of HPAI outbreaks improved;
- strengths and weaknesses of existing plans and response mechanisms for HPAI in animals and humans identified;
- understanding and practice of command and coordination to respond to HPAI identified;
- existing national contingency plans for HPAI enhanced; and

- veterinary and public health preparedness capacities for HPAI and other emerging and re-emerging animal and human diseases strengthened.

Planned activities

Output 1: Development and implementation of two national integrated table-top simulation exercises for HPAI

Activities for the national integrated table-top simulation exercise for HPAI:

- Liaising with FAO and WHO local offices to recruit national focal points for logistical and administrative support (venue, dates, translations and letters);
- identifying prospective participants including scenario writers and facilitators;
- developing the exercise scenario and handbook materials for players and observers;
- developing a large map to visualize the outbreak scenario;
- printing the respective materials (at least in two languages); and
- preparing and holding the desktop and field exercises.

Activities undertaken during the reporting period

- The hybrid simulation exercise in Kiev, Ukraine was carried out from 13 April to 15 April 2010. The exercise, carried out in collaboration with Stamping Out Pandemic and Avian Influenza (STOP AI) project, consisted of both tabletop and field components. This was the first time that FAO combined the tabletop with a field exercise, and it was regarded as a very useful combination as reflected in the participant feedback/evaluation received after the exercise.

Planned activities for the next reporting period

- Finalization of the simulation exercise report;
- translation and dissemination of the simulation exercise report; and
- participation in a final lessons learned meeting to be organized by USAID, tentatively in December 2010, to build on the experiences of the USAID projects implemented by FAO and other implementing agencies with the participation of a wider donor community.

Main challenges encountered and response provided

- A hybrid desktop and field exercise had been planned for November 2009, but the exercise had to be postponed in view of the occurrence of severe outbreaks of H1N1 in Ukraine.
- Thanks to a good relationship with an FAO national consultant, a producer in the Kiev area, agreed to provide his farm as a location for the field exercise. The task of finding a suitable location, however, has proven to be challenging because of the biosecurity considerations and the effect that the teams dressed in personal protective equipment (PPE) might have.

Main progress made towards the achievement of project outputs

- The conducting of the hybrid simulation exercise further contributed to the preparedness of the country to face HPAI outbreaks. The lessons learned during the exercise are communicated to the authorities, and it is expected that the contingency plan will be enhanced.

Project Monitoring Sheet: OSRO/BGD/902/USA

Project Title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) in Bangladesh, including active surveillance

Reporting period: October 2010 – March 2011

Country: Bangladesh
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) in Bangladesh, including active surveillance
Code: OSRO/BGD/902/USA + OSRO/RAS/605/USA Baby 01
Effective starting date: October 2009
Planned end date: September 2010
Budget OSRO/BGD/902/USA: USD 3 082 800 (Phase I)
Total budget: USD 3 082 800
Budget OSRO/RAS/605/USA Baby 01: USD 515 000 (Phase I), USD 1 365 000 (Phase II), USD 1 225 000 (Phase III)
Total Budget: USD 3 105 000
Effective starting date: July 2006
Planned end date: September 2011
Context of the project
<p>At present, there are five high-risk countries that are still considered endemic for Highly Pathogenic Avian Influenza (HPAI) H5N1: Bangladesh, China, Egypt, Indonesia and Viet Nam. Since the first outbreak in March 2007, Bangladesh has experienced a total of 493 outbreaks (437 commercial and 56 backyard). Fifty one out of 64 districts and 170 out of 492 Upazilas/Thanas (subdistricts) have been affected thus far, resulting in the culling of over 2.2 million birds. Following the peak of HPAI H5N1 incidence in 2008, the number of annual outbreaks remains at around 30 in 2009 and 2010 respectively. However, as of January 2011 and after an absence of over six months, the number of outbreaks among poultry started to rise. The situation is compounded by the occurrence of crow die-offs and detection of a non-fatal second and a third human infection with H5N1 virus and a fourth one with H9N2 virus.</p>
Objectives of the project
<p>The primary objective of the project is to improve control of infectious diseases by enhancing outbreak responses for preventing poultry diseases and developing awareness of HPAI in Bangladesh.</p> <p>Specific immediate objective is to improve the HPAI surveillance capacity of the Government of Bangladesh to respond more effectively to HPAI outbreaks and thereby reduce economic losses and a global human pandemic threat. Specifically, the project aimed to achieve the following:</p> <ul style="list-style-type: none"> • increasing the capacity of the Department of Livestock Services (DLS) to manage the surveillance programme without technical or operational help from the Food and Agriculture Organization of the United Nations (FAO); • early reporting of poultry diseases by door-to-door surveillance; • early HPAI detection by diagnostic specimen collection and testing to ensure a rapid and effective disease response to control HPAI;

- increasing awareness among the surveyed farmers and villagers to strengthen passive surveillance; and
- improving and monitoring minimum biosecurity standards in commercial farms.

Planned activities:

Output 1: Improved coordination and management for disease detection, diagnosis, control and prevention

- Continue to provide expertise to the Government of Bangladesh, facilitate contacts between the Government and Donors and coordinate projects and regional activities.
- Increase coordination role to cover activities funded by the World Bank (WB) and the United States Agency for International Development (USAID).
- Complete geospatial farm mapping project and use the system for facilitating outbreak responses.

Output 2: Enhanced outbreak response by effective Outbreak Response Management Centre

- Support the Government in conducting outbreak investigation on avian influenza (AI).
- Improve post-outbreak investigation by collecting samples from free-ranging ducks in backyards in the vicinity of affected farms and inoculate samples into embryonated eggs to attempt virus isolation.
- Support the Government to design and conduct case control study to ascertain the risk factors.
- Conduct a longitudinal study in a selected district.
- Conduct 'simulation' or 'drill' to examine the standard operating procedures (SOPs) and train field staff for practicing SOPs during operations.
- Support the Government on any disease response and control efforts.
- Enhance collaboration between the USAID-supported staff and WB-supported staff according to the matrix developed in discussion between the two organizations.

Output 3: Improved biosecurity status in poultry sectors through biosecurity campaigns in the target areas

- Conduct biosecurity campaigns across the country targeting the large-, medium- and small-scale poultry farmers through Additional Veterinary Surgeons (AVSs)/ Community Animal Health Workers (CAHWs), expanding from 260 up to 306 Upazilas.
- Provide continuous assistance to Public-Private Partnership (PPP) and Cleaning and Disinfection (C&D) of LBM project (OSRO/INT/805/USA)
- Conduct training for farm managers to improve biosecurity of commercial farms.

Output 4: Provision of assistance to the Government of Bangladesh to implement the National Avian Influenza and Human Pandemic Influenza Preparedness Plan

- Support continuously the Government in the execution of National Avian Influenza and Human Pandemic Influenza Preparedness Plan.

Output 5: Active surveillance of HPAI

- Assist in the implementation of the active surveillance programme in 306 Upazilas/ Metrothanas under the programme financed by WB under the Avian Influenza Preparedness and Response Project (AIPRP). Carry out active surveillance through 88 AVSs.
- Awareness building among school children in selected areas to encourage reporting of sickness and death in poultry.

Activities undertaken during the reporting period**Output 1: Improved coordination and management for disease detection, diagnosis, control and prevention.**

- The Team Leader (TL)/Chief Technical Adviser (CTA) and FAO Representative visited the Japanese Ambassador to update him on the progress and explore possibilities for future funding.
- The TL/CTA liaised with the World Organisation for Animal Health (OIE) headquarters, OIE Representation for Asia and the Pacific to facilitate information sharing initiatives.
- Provided expertise on various issues, including vaccinations by attending national technical committee meetings or in direct consultation with the Director General (DG) DLS, the Secretary and the Minister for Fisheries and Livestock.
- Assisted the Chief Veterinary Officer (CVO) (Director Animal Health Administration) to attend “Regional Cooperation Programme on Highly Pathogenic and Emerging Diseases (HPED) in South Asia”, held on 30 September and 1 October 2010 in Colombo, Sri Lanka. Operationalization of a number of activities including the establishment of the Regional Support Unit (RSU), Regional Epidemiology Centre (REC) and the three Regional Reference Diagnostic Laboratories on priority transboundary animal diseases (TADs) was discussed.
- An international expert on AI was recruited in order to provide Technical Assistance Services (TAS) for AIPRP, Project Coordination Unit (PCU), DLS, supported by WB along with other national and international staff.
- Assisted the Secretary of the Ministry of Fisheries and Livestock to attend the “36th Session World Food Security Committee” held from 11 to 14 October 2010 in Rome.
- Assisted CVO (Director Animal Health Administration) to attend the Global Rinderpest Eradication Programme (GREP) held on 13 and 14 October 2010 in Rome.
- In the “USAID/Bangladesh” Lessons Learned and Disseminated Workshop: H5N1 Virus” held on 13 October 2010 in Dhaka, a national consultant presented the paper “Improved biosecurity and hygiene at production, collection points and live bird markets including decontamination”. The workshop was attended by the Minister for Fisheries and Livestock and the Mission Director of USAID.
- Co-organized the “Workshop on orientation of cross-border preparedness to HPAI control” with the Emergency Centre for Transboundary Animal Diseases (ECTAD) South Asian Association for Regional Cooperation (SAARC) component, FAO Nepal on 29 and 30 December 2010, and on 2 and 3 January 2011.
- A relevant government high official of Bangladesh and CTA participated in “High level regional consultation on the control of priority transboundary animal and other emerging infectious diseases in South Asia” held on 13 and 14 January 2011, Bangkok, Thailand. Both policy and technical issues related to a concerted and coordinated action plan for improved control of priority TADs in South Asia were

discussed.

- Co-organized with ECTAD/SAARC component the “Workshop on evaluation of Foot-and-Mouth Disease (FMD)-progressive Control Pathway” on 5 January 2011 to understand the current status of FMD control programmes in Bangladesh, India and Nepal.
- Co-organized with ECTAD/SAARC component “Sensitization workshop for media in Bangladesh for prevention and control of HPAI” held on 15 February 2011 in Dhaka. The TL/CTA presented a paper on the status of H5N1 HPAI outbreaks in Bangladesh. The opening ceremony was attended by the Minister for Fisheries and Livestock, Secretary of the Ministry of Fisheries and Livestock, DG and CVO, DLS.
- “AI situation report” was frequently updated and distributed among stakeholders, donors and others for sharing up-to-date information on AI in Bangladesh.
- Collaborated with other organizations including the United States Geological Survey (USGS), the International Centre for Diarrhoeal Disease Research Bangladesh (ICDDRDB), in assisting wild birds surveillance in relation with H5N1 HPAI.
- Maintained close contact with public health sectors such as DG Health, the Institute of Epidemiology, Disease Control and Research (IEDCR) and the World Health Organization (WHO) in sharing information on H5N1 infection in humans as well as other diseases, such as Nipah virus infection and anthrax.
- One oral and three poster presentations were held during the event “Vet2011” at Bangladesh Agriculture University, Mymensingh, held on 9 and 10 February 2011.
- The AI Technical Unit (TU) team actively participated in the 7th International Poultry Show and Seminar organized by the World’s Poultry Science Association-Bangladesh Branch (WAPSA-BB), and one consultant chaired a scientific session.
- CTA and other consultants investigated the decontamination status of several HPAI outbreaks.

Output 2: Enhanced outbreak response by effective Outbreak Response Management Centre

- A number of SOPs were updated/developed as follows:
 1. Culling and disposal
 2. Decontamination
 3. Restocking
 4. Outbreak investigation
 5. Post-outbreak/Infected place management (comments need to be incorporated)
 6. Laboratory and biosafety
- Assisted the national reference laboratory for AI, the Bangladesh Livestock Research Institute (BLRI), and the Central Disease Investigation Laboratory (CDIL) to be assessed for their biosafety by international expert to ensure laboratory safety.
- To facilitate outbreak response management, geo-spatial information from all commercial farms and major LBMs in the country was entered into a computer. The data was being further processed to compute the density of farms as well as LBMs in relation to affected farms to strengthen ongoing countrywide HPAI surveillance programme.

Output 3: Improved biosecurity status in poultry sectors through biosecurity campaigns in the targeted areas.

- Workshops on “Record keeping and biosecurity auditing in commercial poultry farm”

were held on 20 and 27 October 2010 and 23 December 2010. A record keeping template was developed in the workshop.

- “Biosecurity SOP’s writing workshop for poultry producers and service providers” was held from 19 to 21 January 2011.
- “Training on farm biosecurity and decontamination for poultry farm managers in HPAI affected areas” was held on 22 and 23 March 2011.
- In “Biosecurity training for poultry industry suppliers”, a total of 838 poultry industry suppliers were trained on biosecurity. The trained industry suppliers transferred their biosecurity knowledge to 5 500 poultry farmers.
- “Training of trainers (ToT) on biosecurity auditing for the Department of Livestock Services (DLS) officials”, 26 DLS officials at the District Livestock Office level were trained.

Output 4: Provision of assistance to the Government of Bangladesh to implement the National Avian Influenza and Human Pandemic Influenza Preparedness Plan

- In response to an urgent request from the Government of Bangladesh, FAO Mission on “In-depth assessment of the present and past situation of the anthrax outbreak in Bangladesh” was dispatched to Bangladesh from 25 October to 3 November 2010.
- One of the FAO Mission members, FAO Representative and CTA of AI TU/Country Team Leader of ECTAD appeared in a TV talk show to disseminate evidence-based information to the general public, and the TV programme was repeatedly broadcast.
- Upon request from DLS, SOPs on culling and disposal, decontamination, restocking, outbreak investigation, post-outbreak/infected place were provided to be distributed to all District Livestock Offices in the country.

Output 5: Active surveillance on HPAI

- Assisted AIPRP in training on active surveillance using SMS Gateway for Avian Influenza Workers (AIWs; previously called “CAHWs”).
- Assisted AIPRP in refresher training for AVSs on active surveillance using SMS Gateway on 30 and 31 March 2011.
- “Training in HPAI active surveillance network programme” was conducted on 7 November and 27 December 2010.
- Technical Meeting on HPAI active surveillance programme was held on 6 January 2011 for AVSs.
- Assisted AIPRP in training AVSs on culling, safe disposal, biocontainment and biosecurity on HPAI (March 2011).
- Maintained the system receiving approximately 1 000 SMS messages per day from 1 035 AIWs in 306 Upazilas.
- Maintained the network of 88 AVSs supervising AIWs.
- Supported installation of transmitters in migratory birds in Hakaluki Haor in February 2011.
- An international expert was employed to integrate existing databases to design integrated and effective data entry and analysis.

Planned activities for the next six-month period

Output 1: Improved coordination and management for disease detection, diagnosis, control and prevention

- Continue to provide expertise to the Government of Bangladesh, facilitate contacts between the Government and donors and coordinate projects and regional activities.
- Increase coordination role in activities funded by WB and USAID.
- Using geospatial farm mapping data, develop a system to enable outbreak responses to be carried out more efficiently.
- Collaborate and coordinate with public health and wild life sectors to develop a more holistic approach in line with the One Health initiative.

Output 2: Enhanced outbreak response by effective Outbreak Response Management Centre

- Support the Government in conducting outbreak investigation on AI.
- Ensure that affected farms are properly and repeatedly decontaminated after immediate post-outbreak decontaminations.
- Improve post-outbreak investigation by collecting samples from free-ranging ducks in backyards in the vicinity of affected farms and inoculate samples into embryonated eggs to attempt virus isolation.
- Develop a system to support the Government in any disease response and control efforts.
- Enhance collaboration between the USAID-supported staff and WB-supported staff according to the matrix developed in discussion between the two organizations.
- Further strengthen search for reservoirs of H5N1 HPAI as well as LPAI among free-ranging, scavenging ducks in backyards in the proximity of affected farms.
- Reduce the risk of re-occurrence of H5N1 HPAI outbreaks by removing hidden reservoirs, as well as by rapid disposal of dead wild birds.

Output 3: Improved biosecurity status in poultry sectors through biosecurity campaigns in the target areas

- Conduct biosecurity campaigns across the country targeting the large-, medium- and small-scale poultry farmers through AVSS/CAHWs, expanding from 306 up to 492 Upazilas.
- Continue to provide assistance to the Public-Private-Partnership (PPP) and C&D of LBM project (OSRO/INT/805/USA).

Output 4: Provision of assistance to the Government of Bangladesh in implementing the National Avian Influenza and Human Pandemic Influenza Preparedness Plan

- Continue to provide support to the Government in the implementation of National Avian Influenza and Human Pandemic Influenza Preparedness Plan.

Output 5: Active Surveillance on HPAI

- Assist in the implementation of the active surveillance programme across 306 Upazilas/Metrothanas under the programme financed by WB AIPRP.
- Assist in providing necessary refresher training to Avian Influenza Workers on the Active Surveillance using SMS Gateway system.
- Carry out active surveillance through 88 AVSS.

Main challenges encountered and response provided

- The post-outbreak decontamination and improvement of biosecurity are two main challenges encountered during the implementation of the project. Decontamination of affected sheds and premises need to be intensified as a part of post-outbreak responses. To ensure the chain of transmission is broken, decontamination needs to be repeated after immediate post-outbreak decontaminations. Further, FAO has developed Standard Operating Procedures (SOPs) for post outbreak decontamination and submitted to government for implementation in the field. FAO has already flagged the issue in different meetings with the government.
- Backyard poultry was considered secondary to the poultry on commercial farms. Awareness needs to be heightened among backyard farmers that they play critical roles in prevention of HPAI outbreaks in commercial farms in the vicinity. FAO has piloted school training programme for raising awareness for reporting poultry sickness and death. Technical support has been provided to develop communication materials to sensitize backyard farmers for disease reporting.
- Most of the backyard poultry are free-ranging and are allowed to scavenge in the environment. Risk of intermingling with wild migratory birds, as well as free-ranging ducks, need to be acknowledged by backyard farmers. Training of backyard farmers are needed. FAO has supported development of communication material to encourage separating terrestrial birds from aquatic fowls in backyards. Advocacy is also needed.
- Owing to a shortage of human and material resources at the field level, quick and appropriate response to disease events was lacking at times. Additional Veterinary Surgeons need to be advised to provide assistance to ascertain quick and appropriate response and to complement the veterinary services. FAO has raised the issue with the government and government is planning to reorganize DLS with more human and material resources.
- Motivation was weak among DLS staff to capture every disease event at the earliest stage. Awareness of DLS staff needs to be heightened by training.
- Compliance to animal disease regulation is weak. Compliance needs to be reinforced by training veterinary officers, raising public awareness, communication and farmer education. FAO has recruited one consultant to review legislation to recommend mitigation options of implementation bottlenecks.
- Registration of farms is not established. Farmers need to be encouraged to register their farms. Benefits of being registered need to be widely known through advocacy.
- Movement control in densely populated areas is difficult. Cooperation from communities needs to be sought by deploying community leaders. FAO has developed SOPs where directives have been given for implementation of movement control.
- Properties are often not easily accessible. Farms in remote places nevertheless need to be visited in an event of unusual mortality. Unwilling farmers need to be persuaded.

Main progress made towards the achievement of project outcomes

- FAO TU was established at DLS comprising a team of international and national experts and support staff.
- The office for the TU at DLS was refurbished including the provision of standby power supply. TU is fully computerized with high-speed reliable internet services.
- AI TU is technically and logistically supporting the DLS.
- Biosecurity and awareness of HPAI are reinforced and strengthened by: the Active Surveillance Programme, teachers training and dissemination of 50 000 leaflets, posters and stickers to schools and at various national and regional meetings.
- Door-to-door/farm-to-farm surveillance was initiated using a network of 1 035 AIWs (CAHWs). The CAHWs, 103 AVSs and respective 306 supervising Upazila livestock officers (ULOs), 32 veterinary officers of the “Strengthening of support service for combating avian influenza” (SSCAIB) project received the necessary training. As a result, disease surveillance enhanced disease reporting. Better surveillance combined with increased awareness and constant reinforcing of biosecurity messages helped to reduce the number of HPAI outbreaks.
- All 1 035 recruited AIWs (CAHWs) received training and refresher training by FAO consultants on basic communication skills, specifically on those related to HPAI and SMS gateway.
- Various laboratory supplies including polymerase chain reaction (PCR) kits, RNA extraction kits, primers and other consumables were provided to BLRI laboratory to support the increase in diagnostic workload.
- SOPs for laboratory tests for AI diagnosis were drafted and submitted to the Government.
- SOPs for outbreak response, disease investigation, culling, C&D were drafted and are being reviewed.
- FAO team facilitated the Laboratory Working Group meetings attended by BLRI, CDIL and the Field Disease Investigation Laboratory (FDIL) to provide advice on laboratory design and procurement.
- Technical officers of eight leading farms and selected government veterinarians received training on biosecurity and routine disinfection for poultry raising establishments.
- Two hundred government veterinarians received training on post-outbreak decontamination.
- FAO contributed to the development of the Second Communication Strategy for Avian and Pandemic Influenza.
- Web-based SMS gateway improved the early reporting system.
- Lowering of the number of HPAI H5N1 outbreaks was achieved without resorting to vaccination during the last three years.
- Strong partnership was established between the DLS and FAO allowing for smooth transmission of information and collective action.
- With the support of USAID and WB, a team was formed consisting of four international staff and 11 national staff members.
- All of the 780 CAHWs involved in the active surveillance programme using SMS Gateway were transferred from FAO to AIPRP, DLS as a part of the process of ownership transfer by the end of September 2010.
- For the improvement of LBMs, a solid collaboration was established with AIPRP, DLS.

Project Monitoring Sheet: **OSRO/RAS/604/USA Baby 01**Project Title: **Support to Highly Pathogenic Avian Influenza Surveillance Programme in Cambodia**Reporting period: **October 2010 – March 2011**

Country: Cambodia
Project title: Support to Highly Pathogenic Avian Influenza Surveillance Programme in Cambodia
Code: OSRO/RAS/604/USA Baby 01
Budget: USD 1 150 000 (Phase I), USD 1 900 000 (Amendment I), USD 600 000 (Amendment II), USD 400 000 (Amendment III), USD 400 000 (Amendment IV)
Total budget: USD 4 450 000
Effective starting date: 1 October 2006
Planned end date: 30 September 2011
<p>Context of the project</p> <p>The sporadic outbreaks of Highly Pathogenic Avian Influenza (HPAI) in poultry and humans indicate that the H5N1 virus is still circulating in Cambodia. Therefore, it is necessary to detect the outbreaks as early as possible and ensure that immediate and appropriate containment measures are taken to prevent the spread of the disease. The continued improvement of capacities and capabilities in Cambodia to prevent and control HPAI in animal population is necessary to limit its impacts in poultry sectors and minimize the risk of an infection in humans. The Food and Agriculture Organization of the United Nations (FAO) Avian Influenza (AI) Programme in Cambodia is currently funded by the United States Agency for International Development (USAID) in Cambodia for surveillance activities and a World Bank funded project for Village Animal Health Workers' (VAHWs) training and strengthening of the laboratory capacities and capabilities.</p>
<p>Objectives of the project</p> <p>The main objective of the project is to reduce and stop the spread of H5N1 among and between flocks of birds in Cambodia and between Cambodia and the neighboring countries (Viet Nam, Thailand and the Lao People's Democratic Republic), thus reducing the risks of the pathogen spread to mammals and humans and of the emergence of pandemic influenza.</p>
<p>Planned activities</p> <p>Output: Surveillance activities in the cross-bordering area between Cambodia and neighbouring countries (especially Viet Nam and Thailand) strengthened.</p> <p>Activity 1: Promote (whenever and if possible) a pre-notification system for trade purpose between Cambodia and neighboring countries.</p> <p>Activity 2: Continue active surveillance activities focusing on sentinel flocks, live bird markets (LBMs) and border inspection posts in targeted provinces following a risk assessment approach.</p> <p>Activity 3: Continue to improve the diagnosis service for poultry diseases and provide laboratory supplies to further enhance laboratory diagnostic capacity at national and regional levels in order to complete the surveillance activities.</p> <p>Activity 4: Continue to improve and facilitate sample dispatch from surveillance activities to national laboratory at the National Veterinary Institute (NaVRI) and in case of discovered outbreaks to national and/or regional and/or international reference laboratories.</p>

Activities undertaken during the reporting period

Output: Surveillance activities in the cross-bordering area between Cambodia and neighbouring countries (especially Viet Nam and Thailand) strengthened.

Activity 1: Promote (whenever and if possible) a pre-notification system for trade purpose between Cambodia and neighboring countries.

No major action has been taken under Activity 1 during the reporting period. In coordination with the World Bank-funded project, Avian and Human Influenza Preparedness and Response Project, this activity will be summarized into the study of poultry market chain, which is going to be conducted later in 2011.

Activity 2: Continue active surveillance activities focusing on sentinel flocks, LBMs and border inspection posts in targeted provinces following a risk assessment approach.

- LBM Surveillance of AI in ducks in eight markets of Phnom Penh, Kampong Cham, Kampot, Prey Veng, Siem Reap and Takeo and the Sentinel Flock Surveillance in 12 commercial duck farms of Battambang, Kampong Cham, Kampot, Preah Sihanouk Prey Veng and Takeo were set up through Letters of Agreement (LOAs) with NaVRI to determine the presence of HPAI/H5N1 in the major duck producing regions of Cambodia as part of the national AI surveillance programme and to estimate the level of risk that ducks pose to poultry (chickens and ducks) in traditional and commercial enterprises.
- From 1 September 2010 to 31 March 2011, 3 325 cloacal, 3 325 tracheal swabs and 3 228 sera were collected from the above-mentioned markets, and all of them were found negative for A/H5N1 virus by egg-inoculation test and antibody of AI by haemagglutination (HA) and haemagglutination inhibition (HI) tests.
- From 1 September 2010 to 31 March 2011, 1 440 cloacal, 1 440 tracheal swabs and 1 440 sera were collected from sentinel duck flocks, and all of them were found negative for A/H5N1 virus by egg-inoculation test and antibody of AI by HA and HI tests.
- Both LOA with NaVRI were reviewed and renewed for a six-month period from January to June 2011.
- The contract on supplying fertilized eggs with Celagrid was extended for three months at no-cost from October to December 2010 and renewed for six months in support to the LOAs of surveillance signed with NaVRI.
- A new LOA with the Institut Pasteur du Cambodge (IPC) was signed, aimed at two months of environmental surveillance in two Phnom Penh markets (Deumkor and Orisey) to determine the presence of HPAI-H5N1 in the environment of the two LBMs as part of the national AI surveillance programme. In addition, the aim was to assess the risks that the virus poses to the humans (sellers and consumers) in surrounding markets and to enhance the public awareness of AI at LBMs. The outcomes of the surveillance activities could also be useful in the restructuring of the poultry selling places in LBMs.
- Following the first HPAI field simulation exercise organized in Svay Rieng in early September, two others were conducted during November and December in Kampong Cham and Preah Sihanouk provinces. The Chief of Office of Animal Health and Production of the 24 provinces, four officers from NaVRI and two officers from the Department of Animal Health and Production (DAHP) participated in the field simulation exercise.

Activity 3: Continue to improve the diagnosis service for poultry diseases and provide laboratory supplies to further enhance laboratory diagnostic capacity at national and regional levels in order to complete the surveillance activities.

- Two officers in the epidemiology unit of NaVRI/DAHP were sent to the Department of Livestock Development (DLD) Thailand, to attend a one-month training in Field Epidemiology Training Programme for Veterinarians (FETPV). The coming country FETPV is being discussed by the Emergency Centre for Transboundary Animal Diseases (ECTAD) in Cambodia.
- Coordinated the collection of weekly AI inputs from NaVRI for the United Nations Resident Coordination Office, which has the lead on AI update from the Ministry of Agriculture, Fisheries and Forestry (MAFF), the Ministry of Health (MOH), FAO and the World Health Organization (WHO), as well as other partners in Cambodia, to be included in AI bulletin and circulated to all concerned agencies.

Activity 4: Continue to improve and facilitate sample dispatch from surveillance activities to national laboratory at NaVRI and in case of discovered outbreaks to national and/or regional and/or international reference laboratories.

- The 27th HPAI outbreak occurred in a small poultry farm of Kandal province on 4 January 2011. The veterinary measures were applied, including investigation, culling, disinfection, banned animal movement and education.
- The 12th human case, a five-year old boy, and the 13th human case, a 19-year old mother with an 11-month old baby, were the three human cases that occurred respectively in the outskirts of Phnom Penh (Sang Kat Prek Leap) on 4 February 2011 and in Banteay Meanchey Province on 12 and 17 February 2011. The three cases were fatal and were experienced previously in contact with poultry. Following the human H5N1 cases, the animal health authorities carried out the investigation and collected samples from occurring and neighbouring locations. Preliminary results of 90 samples from Sangkat Prek Leap, 12 from Banteay Meanchey and ten from Prey Veng were negative. Further investigations and sample collections are still ongoing and were expanded to a 5 to 10 km radius.

Other related activities funded under the project

- A legislation mission was fielded in February 2011. The mission examined the chapters which did not conform to the World Organisation on Animal Health (OIE) and the World Trade Organisation (WTO) guidelines and requested further adjustments.
- A joint mission for the National Medium Term Priority Plan for Animal Health (NMTTP-AH) and the Strategy for Animal Production were fielded from 24 January to 4 February 2011. A full Cambodian Animal Production and Health Strategy will be ready for the country in mid-2011 after a completion of series of missions for the animal production strategy. More detailed information will be made available in the next progress report.
- The first Zoonotic Technical Working Group was held in December 2010 with the participation from NaVRI/DAHP, FAO, MOH and WHO. The working group is focusing on, not only HPAI-H5N1, but also zoonotic diseases in general.
- A Workshop on Human and Animal Health Collaboration on Zoonosis Diseases was co-organized by MAFF and MOH and co-financed by FAO and WHO. It is a first workshop aiming at sharing surveillance and response system of human and animal health and at designing the Terms of Reference (TOR) for the Human and Animal

Health Technical Committee and its roles and responsibilities. The technical working committee is composed of existing AI technical working group committee members (MAFF, MOH, FAO, WHO and IPC) and two prospective members, the Forestry Administration (FA) and the Wildlife Conservation Society (WCS).

- The certification of the biosafety cabinets in NaVRI was done under the Emerging Pandemic Threat (EPT) Identify Component of a FAO regional and USAID-funded programme, in collaboration with the Asia-Pacific Biosafety Association (APBA). The APBA organized the Biosafety Management Training in Singapore in mid October 2010 where two laboratory experts were sent to certify the four biosafety cabinets of NaVRI. The three of the four safety cabinets were certified by the team, and the fourth safety cabinet did not obtain certification in accordance with the regional standards.
- Three regulator auto voltages and electricity cables were installed in NaVRI building in order to ensure stable electricity power and therefore to reduce the risks of breakage for the laboratory equipment.

Planned activities for the next six-month period

Output: Surveillance activities in the cross-bordering area between Cambodia and neighbouring countries (especially Viet Nam and Thailand) strengthened.

Activity 1: Promote (whenever and if possible) a pre-notification system for trade purpose between Cambodia and neighboring countries.

Activity 2: Continue active surveillance activities focusing on sentinel flocks, LBMs and border inspection posts in targeted provinces following a risk assessment approach.

Activity 3: Continue to improve the diagnosis service for poultry diseases and provide laboratory supplies to further enhance laboratory diagnostic capacity at national and regional levels in order to complete the surveillance activities.

Activity 4: Continue to improve and facilitate sample dispatch from surveillance activities to national laboratory at NaVRI and in case of discovered outbreaks to national and/or regional and/or international reference laboratories.

Main challenges encountered and response provided

As the communication component is not any more supported by this project because of reduced funding, a gap has been perceived in the AI Programme in Cambodia. The public awareness which is considered as an essential component in the AI control efforts has been neglected by the different stakeholders working in the country. It is important to maintain the momentum for the farmers, poultry traders and animal health authorities to understand the risks of transmission and continue funding public arenas/communication component.

Main progress made towards the achievement of project outcomes

Output: Surveillance activities in the cross-bordering area between Cambodia and neighbouring countries (especially Viet Nam and Thailand) strengthened.

- Eight LBMs and twelve duck commercial farms are being surveyed in six provinces.
- 4 765 cloacal, 4 765 tracheal and 4 668 sera collected were negative for H5N1.
- Signed new LOA for environmental surveillance in two LBMs of Phnom Penh with IPC.
- Produced an educational training video on HPAI field simulation, which was widely distributed in the country.
- Organized two more HPAI field simulations in Kampong Cham and Preah Sihanouk

Province, which covered all the provinces of Cambodia.

- Established zoonosis committee and regular monthly zoonosis technical working group meetings.
- Organized the workshop on human and animal health collaboration on zoonotic disease in January 2011.
- The Permanent Representatives of Bangladesh, Congo, Denmark, Finland, the United States of America and Uruguay to FAO headquarters visited NaVRI's facilities.

Project Monitoring Sheet: **OSRO/RAS/604/USA Baby 01**

Project Title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) in Cambodia**

Reporting period: **April – September 2011**

Country: Cambodia
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) in Cambodia
Code: OSRO/RAS/604/USA Baby 01
Budget: USD 1 150 000 (Phase I), USD 1 900 000 (Amendment I), USD 600 000 (Amendment II), USD 400 000 (Amendment III), USD 400 000 (Amendment IV)
Total budget: USD 4 450 000
Effective starting date: 1 August 2006
Planned end date: 30 September 2012
<p>Context of the project</p> <p>The sporadic outbreaks of Highly Pathogenic Avian Influenza (HPAI) in poultry and humans indicate that the H5N1 virus is still circulating in Cambodia. Therefore, it is necessary to detect the outbreaks as early as possible and ensure that immediate and appropriate containment measures are taken to prevent the spread of the disease. The continued improvement of capacities and capabilities in Cambodia to prevent and control HPAI in animal population is necessary to limit its impacts in poultry sectors and minimize the risk of infection in humans. The Food and Agriculture Organization of the United Nations (FAO) Avian Influenza (AI) Programme in Cambodia is currently funded by the United States Agency for International Development (USAID) in Cambodia for surveillance activities and a World Bank-funded project for Village Animal Health Workers' (VAHWs) training and strengthening of the laboratory capacities and capabilities.</p>
<p>Objectives of the project</p> <p>The main objective of the project is to reduce and stop the spread of H5N1 among and between flocks of birds in Cambodia and between Cambodia and the neighboring countries (Viet Nam, Thailand and the Lao People's Democratic Republic), thus reducing the risks of the pathogen spread to mammals and humans and of the emergence of pandemic influenza.</p>
<p>Planned activities</p> <p>Output: Surveillance activities in the cross-bordering area between Cambodia and neighbouring countries (especially Viet Nam and Thailand) strengthened.</p> <p>Activity 1: Promote (whenever and if possible) a pre-notification system for trade purposes between Cambodia and neighboring countries.</p> <p>Activity 2: Continue active surveillance activities focusing on sentinel flocks, live bird markets (LBMs) and border inspection posts in targeted provinces following a risk assessment approach.</p> <p>Activity 3: Continue to improve the diagnosis service for poultry diseases and provide laboratory supplies to further enhance laboratory diagnostic capacity at national and regional levels in order to complete the surveillance activities.</p> <p>Activity 4: Continue to improve and facilitate sample dispatch from surveillance activities to national laboratory at the National Veterinary Institute (NaVRI) and in case of discovered outbreaks to national and/or regional and/or international reference laboratories.</p>

Activities undertaken during the reporting period

Output: Surveillance activities in the cross-bordering area between Cambodia and neighbouring countries (especially Viet Nam and Thailand) strengthened.

Activity 1: Promote (whenever and if possible) a pre-notification system for trade purposes between Cambodia and neighboring countries.

- No major action has been taken under Activity 1 during the reporting period. In coordination with the World Bank-funded project, Avian and Human Influenza Preparedness and Response Project are conducting the study of poultry value chain analysis for the Phnom Penh market. Information on traded poultry products, volumes, sources and disease transmission-related trading behavior was collected from vendors in three different poultry wholesale/retail markets in Phnom Penh. A preliminary data analysis identified the region where the poultry is sourced and the middleman who supplies poultry to markets. Questionnaires for middlemen supplying poultry and poultry products to market vendors in Phnom Penh markets were subsequently developed and used for data collection.
- USAID and FAO convened a meeting with the Department of Animal Health and Production (DAHP) in early September 2011 to explore the possibility of using the existing mechanism (Governmental bilateral meeting between Cambodia and Viet Nam) to improve the trade and to minimize the risk of spreading diseases.

Activity 2: Continue active surveillance activities focusing on sentinel flocks, LBMs and border inspection posts in targeted provinces following a risk assessment approach.

- Environmental Sampling Surveillance from LBM in Cambodia with IPC
From 22 March to 4 May 2011, a total of 502 specimens were collected from four markets (Kampong Cham [1], Phnom Penh [2] and Takeo [1]). Among these, 147 were water specimens, 120 feather samples, 117 feces specimens and 118 mud or soil specimens. The primary result showing that 396 out of 502 specimens were tested by real-time polymerase chain reaction (RT-PCR). Among them, 107 samples were positive for H5N1 virus by RT-PCR and had to be further tested for virus isolation. The positivity rate was higher in water samples (37%), followed by poultry feather specimens (25%) and feces (14.5%). The remaining samples to be tested are soil and mud specimens.
- LBM Surveillance of AI in ducks in eight markets of Phnom Penh, Kampong Cham, Kampot, Prey Veng, Siem Reap and Takeo, and the Sentinel Flock Surveillance in 12 commercial duck farms of Battambang, Kampong Cham, Kampot, Preah Sihanouk Prey Veng and Takeo were set up through Letters of Agreement (LoAs) with NaVRI to determine the presence of HPAI/H5N1 in the major duck producing regions of Cambodia as part of the national AI surveillance programme and to estimate the level of risk that ducks pose to poultry (chickens and ducks) in traditional and commercial enterprises.
- From 1 April 2011 to 30 June 2011, 2 280 cloacal, 2 280 tracheal swabs and 2 182 sera were collected from the above-mentioned markets, and all of cloacals and tracheal swabs were found negative for A/H5N1 virus by egg-inoculation test and RT-PCR. Some 175 of 2 182 (8%) serum samples were antibody positive for AI by haemagglutination (HA) and haemagglutination inhibition (HI) tests.
- The FAO signed a local purchasing order (LPO) with a local chicken producer in Takeo province for the supply of 3 360 fertilized eggs to the Institut Pasteur du Cambodge (IPC) from 27 June to 8 September 2011 under Environment Sampling Surveillance.

Activity 3: Continue to improve the diagnosis service for poultry diseases and provide laboratory supplies to further enhance laboratory diagnostic capacity at national and regional levels in order to complete the surveillance activities

- Apart from technical support to NaVRI's laboratory, FAO launched the procurement of reagents of antiserum subtype H1, H2, H3, H5, H7, H9 and the Newcastle Disease Virus (NDV) to be supplied to NaVRI in early October 2011.
- To have a better HPAI active surveillance system, FAO is processing the recruitment of an Epidemiologist to review the in-place surveillance system.
- FAO supported the participation of a laboratory officer of NaVRI in a joint regional laboratory network training on quality assurance and standardization of diagnostic reagent in the Australian Animal Health Laboratory (AAHL).

Activity 4: Continue to improve and facilitate sample dispatch from surveillance activities to national laboratory at NaVRI and in case of discovered outbreaks to national and/or regional and/or international reference laboratories.

- During the reporting period, five AI outbreaks in humans took place in the province of Bateay Mean Chey (1), Kampong Cham (2) and Preyveng (2), which caused five human deaths. From animal side, three AI outbreaks took place in Phnom Tamao zoo (waterfowl zone 1) of Takeo (1) and Banteay Mean Chey (2) Province. FAO team closely worked with NaVRI/DAHP to grant technical expertise and logistics as part of the veterinary measures, including investigation, culling, disinfection, banned animal movement and education. Distance support from FAO Regional Office was provided to the country during the two latest outbreaks in poultry.
- FAO sought DAHP's written consent for NaVRI participation in the regional proficiency testing programme for priority animal disease.

Other related activities funded under the project

- The comments of FAO Legal Officers on the Cambodian Legislation were addressed to the Ministry of Agriculture, Forestry and Fisheries (MAFF) Legislation Committee. MAFF hosted a consultative workshop with concerned stakeholders in June 2011 to gather their perspectives.
- The National Medium-term Priority Plan for Animal Health was completed and is being translated into the national language. The two versions are expected to be submitted to the Government counterpart in October 2011.
- FAO plans to upgrade the LBM of Chbar Ampov to minimize the risk of contamination of HPAI as a model market in Cambodia. Three meetings with the Market Committee, poultry sellers and municipality veterinarians were convened to set up the Committee for Improved Biosecurity in LBM and to examine the priority activities to be addressed for this purpose.
- The Zoonotic Diseases Technical Planning workshop of the USAID Emerging Pandemic Threat (EPT) programme is jointly organized by MAFF and the Ministry of Health (MOH) with the financial support of the USAID. This workshop is aiming at launching EPT programme to the Government of Cambodia, building on the progress made during the first workshop on Human and Animal Health Collaboration on the zoonotic diseases and strengthening partnerships between the Government of Cambodia, the United States Government and other organizations working in the field of zoonotic diseases.

Planned activities for the next six-month period

Output 1: Strengthened planning and cross-sectoral coordination at national and international levels

- Activity 1.1. Support the Emergency Centre for Transboundary Animal Diseases (ECTAD) Country Team Leader (CTL) and the team to provide inputs for planning the coordination required at country level
- Activity 1.2. Support national and international coordination related to disease control

Output 2: Strengthened laboratory capacity

- Activity 2.1. Strengthen laboratory management through technical and management advice
- Activity 2.2. Support Cambodia to participate in laboratory quality assurance and quality control system (QA/QC) for HPAI and regional HPAI laboratory network which includes support of sample sharing with the International Reference Laboratory and support proficiency testing
- Activity 2.3. Procure necessary laboratory supplies (when needed).

Output 3: Strengthened veterinary epidemiology capacity

- Activity 3.1. Support veterinary epidemiology training at regional and country levels
- Activity 3.2. Support community-based surveillance and response activities

Output 4: Improved surveillance system

- Activity 4.1. Review disease surveillance strategy in collaboration with human health sector.
- Activity 4.2. Support risk-based surveillance activities focusing on where human cases are reported and along the areas identified as high-risk supply chains
- Activity 4.3. Conduct workshops and training exercises to follow up on new surveillance modalities and facilitate planning of field work
- Activity 4.4. Organize forums and media spots on TV or radio to communicate the risks being identified by the results of surveillance through public awareness campaign particularly during festivals period
- Activity 4.5. Provide logistic support to field activities (when needed)

Output 5: Improved policy and legislation for trade purposes between Cambodia and its neighbouring countries

- Activity 5.1. Support activities related to policy and legislation for trade purposes between Cambodia and neighbouring countries through the expertise to be provided to finalize the international animal trade component of the main law

Main challenges encountered and response provided

While overall coordination is shared between MOH and MAFF, FAO still plays an important role during the outbreak investigation and response in advising DAHP on the best approach. The World Health Organization (WHO) and FAO are the two United Nations agencies still involved in the disease surveillance on H5N1. However, the public awareness component of the national programme is not being addressed fully, as no donor is supporting it, therefore creating a gap vis-à-vis the strategy.

Main progress made towards the achievement of project outcomes

Output: Surveillance activities in the cross-bordering area between Cambodia and neighbouring countries (especially Viet Nam and Thailand) strengthened.

- From 1 April to 30 June 2011, 2 280 cloacal, 2 280 tracheal swabs and 2 182 sera were collected from the above-mentioned markets, and all of cloacal and tracheal swabs were found negative for A/H5N1 virus by egg-inoculation test and RT-PCR. Some 175 of 2 182 (8%) serum samples were antibody positive for AI by HA and HI tests.
- From 22 March to 4 May 2011, a total of 502 specimens were collected from four

markets (Kampong Cham [1], Phnom Penh [2] and Takeo [1]). Among these, 147 were water specimens, 120 feather samples, 117 feces specimens and 118 mud or soil specimens. The primary results showed that 396 out of 502 specimens were tested by RT-PCR. Among them, 107 samples were positive for H5N1 virus by RT-PCR and had to be further tested for virus isolation. The positivity rate was higher in the water sample (37%), followed by poultry feather specimens (25%) and feces (14.5%). The remaining samples to be tested were soil and mud specimens.

- A joint training workshop was organized between DAHP, FAO and the United States Department of Agriculture (USDA) on AI Biosecurity for 24 chiefs of provincial Animal Health and Production Office, two lecturers from the Royal University of Agriculture and the Kampong Cham Agricultural School, four district veterinarians of Preah Sihanouk province and six duck flock owners (Takeo, Kampot, Preah Sihanouk, Kampong Cham, Prey Veng and Battambang) who were expected to pass on the key messages of biosecurity to district veterinarians, VAHWs and stock keepers of their respective province.
- Joint investigation and response were conducted in three AI outbreaks in poultry and five AI outbreaks in humans with NaVRI/DAHP.
- Four Zoonotic Technical Working Group Meetings were held.

Project Monitoring Sheet: **OSRO/RAS/604/USA Baby 02**

Project title: **Immediate technical assistance to strengthen the surveillance and response capacity for Highly Pathogenic Avian Influenza (HPAI)**

Reporting period: **April 2011 – September 2011**

Country: People's Republic of China
Project title: Immediate technical assistance to strengthen the surveillance and response capacity for Highly Pathogenic Avian Influenza (HPAI)
Code: OSRO/RAS/604/USA Baby 02
Budget: USD 500 000 (Phase I), USD 500 000 (Phase II), USD 650 000 (Phase III), USD 1 150 000 (Phase IV), USD 1 250 000 (Phase V) Total budget: USD 4 050 000
Effective starting date: 1 August 2006
Planned end date: 30 September 2012
Context of the project Despite efforts by the Government of the People's Republic of China to improve the surveillance and control of Highly Pathogenic Avian Influenza (HPAI), the disease is still endemic in some areas of the country. Some basic understanding of the disease, including key ecological risk factors, is still lacking. Vaccination has been widely used throughout the country to dampen down the infection and bring the disease under control. However, the virus is still circulating in some production systems where the implementation of the vaccination policy requires major effort and where regulation enforcement is difficult. This project was designed to improve the country's capacities to detect and control HPAI infection and disease in identified high-risk ecological and production systems at an early stage, through the implementation of intensified surveillance activities, epidemiological studies, socio-economic activities, capacity building and training.
Objectives of the project The main objectives under Phase V of the United States Agency for International Development (USAID)-funded project are to continue working in Hunan, Yunnan, Guangxi and Chongqing while extending activities to Guangdong province in order to increase the scope and impact of project activities in Southern China and provide technical assistance and support in the areas of HPAI epidemiological investigation, disease risk analysis and control strategy. In addition, Phase V of the project is expected to increase support to training activities under the China Field Epidemiology Training Programme for Veterinarians (FETPV) umbrella and provide a significant leap in understanding of HPAI ecology. Through project activities, the Government's early detection and response capacity will be strengthened, thereby minimizing production losses and risk to human health and safety. The immediate objective of the project is to improve the understanding of HPAI infection and disease distribution, assist the country in defining high-risk areas for targeted control activities in order to minimize the risk to human health and produce skilled and experienced veterinary field epidemiologists, who can provide the Government of China with expertise and service to address transboundary animal diseases (TADs) and emerging infectious diseases (EIDs).
Planned activities (Phase V) Output 1: Strengthened cross-sectoral coordination at the national and international level Activity 1.1 Support national consultants to assist in coordinating project implementation with the Government Activity 1.2 Organize regular meetings with the Ministry of Agriculture (MoA), the Veterinary Bureau, the State Forestry Administration (SFA), and the Department of International Cooperation (DIC) to discuss project activities

Activity 1.3 Contribute to and facilitate the coordination of surveillance and research activities at the wild bird/domestic poultry interface at Poyang Lake Reserve including joint meeting with SFA, provincial veterinary and wildlife authorities to discuss, plan and coordinate field activities

Activity 1.4 Strengthen cooperation with the Food Agriculture Organization of the United Nations (FAO)/the World Organisation for Animal Health (OIE) Network of Expertise on Animal Influenza (OFFLU) and other laboratories and epidemiology networks - discuss and define joint scientific collaboration perspectives and opportunities

Activity 1.5 Organize project steering committee meetings and inception workshop (involving MoA, the Veterinary Bureau, China Animal Health and Epidemiology Center (CAHEC), Harbin National Reference Laboratory (HNRL), provincial Centres for Animal Disease Prevention and Control (ACDCs) and other project partners and stakeholders)

Activity 1.6 Coordinate the newly created United Nations sub-working group on diseases at the human-animal interface

Activity 1.7 Foster exchange of experiences with Viet Nam and Indonesia on vaccination strategy and market chain analysis

Activity 1.8 Improve public-private partnership cooperation through case-study activities (e.g. live bird market [LBM] restructuring) and missions of the international experts on Public-Private Partnership (PPP)/biosecurity

Activity 1.9 Engage in joint collaboration activities with Guangdong Province and use the province as a model for PPP activities; engage Guangdong province in China FETPV

Output 2: Capacity building in epidemiology: implementation of the China FETPV programme

Activity 2.1 The first module of FETPV: short-term training course in basic epidemiology

Activity 2.2 Training through services (TTS): field surveillance and outbreak investigation

Activity 2.3 The second module of FETPV: short-term training course in the geographic information system (GIS) and participatory epidemiology

Activity 2.4 International expert in veterinary epidemiology from the Netherlands will develop case studies for outbreak investigation during the third module of the China FETPV

Activity 2.5 Introduce and promote the concepts of diseases at the human-animal interface through training and multidisciplinary approach to disease surveillance and control

Activity 2.6 The third module of FETPV: advanced training on epidemiology, socio-economic studies, risk assessment and understanding diseases at the human-animal interface

Activity 2.7 Support the participation of one Chinese national to the regional FETPV training in Bangkok in August 2011

Output 3: Improved knowledge of HPAI epidemiological, ecological and socio-economic risk factors

Activity 3.1 Assist national authorities in analysing national surveillance results and provide guidance on improving national and provincial surveillance policies

Activity 3.2 Strengthen existing risk-based surveillance approach through the longitudinal monitoring of selected LBMs in order to identify seasonal changes in infection distribution in winter and define early warning indicators associated to HPAI emergence

Activity 3.3 Follow-up socio-economic studies in Guangdong province: compile key information on poultry sector and its structure, analyse product flow among the market chains and determine the implications for disease surveillance and control issues

Activity 3.4 Facilitate the implementation of epidemiological studies at the domestic poultry/wildlife interface in Poyang Lake Reserve to uncover risk factors associated with the emergence of new virus strains and their subsequent spread

Output 4: Improved HPAI surveillance and control strategy through focused control actions

Activity 4.1 Assist in refining the strategic vision for the national vaccination campaign, provide guidance on improving the progressive control of HPAI H5N1 through vaccination and share views on establishing a vaccination exit strategy

Activity 4.2 Organize training on biosafety, management and test validation for laboratories in project provinces

Activity 4.3 Organize ring trial between provincial laboratories and HNRL

Activity 4.4 Establish GIS-based system at provincial level (Chongqing municipality) to support HPAI surveillance activities

Activity 4.5 Procurement of necessary laboratory equipment and supplies for HPAI diagnosis, data analysis and information sharing for provincial laboratories

Activity 4.6 Organize the PPP stakeholder meeting and group discussion for the development of minimum biosecurity standards for LBMs

Activities undertaken during the reporting period (April 2011 – September 2011)

Output 1: Strengthened cross-sectoral coordination at the national and international level

Activity 1.1: Initiated the recruitment of National Programme/Operations Officer in March 2011. The new National Programme/Operations Officer joined the team on 5 July 2011.

Activity 1.2 :

- Several meetings with MoA, SFA, UN agencies, embassies and donors based in Beijing were held during the reporting period.
- An internal discussion meeting was held with MoA on 4 August 2011, during which planned activities of the second year of China FETPV were discussed. The initial findings of the PPP project in Guangdong and the subsequent plan of action were also shared.
- Further discussion meeting with MoA and CAHEC was held in Qingdao on 16 August 2011 to discuss further coordination and implementation of TTS for China FETPV.

Activity 1.5:

- The fourth FETPV Steering Committee Meeting was held in June 2011 to discuss the progress of and other key issues pertaining to China FETPV.
- A Mentor Workshop will be held on 23 September 2011 to define the roles and responsibilities of mentors in assisting trainees to conduct field surveillance and outbreak investigation in the framework of the TTS activities.

Activity 1.8:

- One PPP expert from Canada visited China from 11 to 27 April 2011 and initiated the PPP activities in Guangdong.
- Three PPPs and biosecurity experts visited China in July-August 2011 to assist the Emergency Centre for Transboundary Animal Diseases (ECTAD) China in launching the project activities. The PPP Launching Workshop was held on 18 July 2011 in Beijing.

Activity 1.9:

- Guangzhou Animal Health Inspection Institute and local agencies actively joined PPP project's activities; Technicians/experts from Guangdong Province were also invited to participate in the next two training modules of China FETPV. A laboratory expert from Guangdong province also participated in the biosafety laboratory training that was organized in Chongqing from 13 to 16 September 2011.

Output 2: Capacity building in epidemiology: the China FETPV programme

Activity 2.2:

- Trainees' field surveillance plans for the first Phase of TTS activities were submitted and reviewed by MoA and national mentors in August. The TTS activities will be carried out by trainee's locally from August 2011 until the end of March 2012.

Activity 2.3:

- The second module of FETPV was organized from 28 March to 29 April 2011, and focused on participatory epidemiology, risk analysis, basic statistical analysis, data management and applied surveillance as well as outbreak investigation.

Activity 2.4:

- Real case-studies on rabies surveillance in China were developed by an expert from the Netherlands during the third module of China FETPV in July 2011; Two qualified trainees were selected and approved by MoA to attend a 10-day exchange visit under the International Fellowship provided by the Netherlands in October 2011.

Activity 2.5:

- A one-week workshop on the concept of “One Health (OH)” was held from 20 to 24 June 2011 for 15 FETPV trainees within the framework of the third module of the programme. Participants from the Chinese Academy of Sciences, the Public Health Institute and SFA also joined this one-week training.
- An UN China OH event was organized to sensitize different national agencies, ministries and institutes about the OH concept and suggest a framework of implementation of OH activities in the country. The meeting was held on 29 and 30 June 2011 and gathered more than 70 participants. The OH meeting had a great impact and not only attracted the attention of the international and national scientific communities, but also generated interest among policy makers. In addition, an UN position paper on OH implementation in China is being produced.

Activity 2.6:

- The third module started from June 20 to July 16 2011 and focused on the management and analysis of epidemiological data, spatial data management and analysis and outbreak investigation demonstration.

Activity 2.7:

- One national veterinarian attended the regional FETPV training from 1 to 26 August 2011 (26 days).

Output 3: Improved knowledge of HPAI epidemiological and ecological and socio-economic risk factors**Activity 3.1:**

- HNRL finished the analysis of 1 190 samples collected from three provinces during the LBM survey conducted in January 2010 and identified six viruses of subtype H6 and H4 (no H5N1 detected). It also finished the sequencing analysis of H5, H6 and H9 subtype viruses isolated from the LBM survey conducted in 2009.

Activity 3.3:

- A preliminary market chain analysis was conducted in Guangdong province during the mission of PPP experts and ECTAD China staff in July 2011, which led to the production of a series of maps describing LBM networks in the province.

Output 4: Improved HPAI surveillance and control strategy through focused control actions**Activity 4.2:**

- A four-day training workshop on laboratory biosafety was organized from 13 to 16 September 2011 in Chongqing ACDC for provincial laboratories, and 30 national staff members were trained.

Activity 4.3:

- Reagents for ring trail were procured by HNRL in May 2011 and distributed to Chongqing, Hunan and Guangxi in July 2011. All experiment from provincial laboratories will be finished before the end of September 2011 and results will be analysed in October 2011.

Activity 4.4:

- A training on GIS techniques applied to epidemiology was organized during the third module of the China FETPV for 15 trainees and 10 additional participants from other provinces.

Activity 4.5:

- Biosecurity equipment and supplies were procured for Guangzhou Animal Health Inspection Institute and Jiangcun Poultry Wholesale Market to facilitate the training and LBM restructuring in October 2011 under the PPP project.

Activity 4.6:

- Formal Action Plan was presented to all stakeholders during the PPP Stakeholder Meeting held on 2 August 2011.

Planned activities for the next six-month period**Output 1: Strengthened cross-sectoral coordination at the national and international level**

- Organize regular meetings with MoA to discuss China FETPV and other programmatic/operational matters of the new phase
- Foster experience exchange and dialogue with Viet Nam through joint forum, study tours, or missions
- Coordinate and organize the UN Team Group on Health meetings every two months
- Further enhance the translation of the OH concept into a concrete action plan within the country by coordinating with other national and international stakeholders.

Output 2: Capacity building in epidemiology: the China FETPV programme

- Organize the fourth training module of China FETPV in November 2011.
- Two trainees will be sent to the Netherlands for a 10-day exchange visit under the International Fellowship in October 2011.
- The first phase of TTS activities on field surveillance will be carried out by trainees locally from August 2011 and finished before the end of March 2012.

Output 3: Improved knowledge of HPAI epidemiological and ecological and socio-economic risk factors

- Produce the China HPAI Quarterly Bulletin-update on HPAI situation
- Discuss with MoA, SFA, provincial veterinary, and wildlife authorities the implementation of epidemiological studies in Poyang Lake Reserve.

Output 4: Improved HPAI surveillance and control strategy through focused control actions

- Finalize the analysis of ring trials between provincial laboratories
- Further support the implementation of the PPP project in Guangdong Province

Main challenges encountered and responses provided

There are no major issues at present.

Main progress made towards the achievement of project outcomes

The project has made noticeable progress towards achieving the expected outcomes, which can be summarized as follows:

- Increased MoA's involvement and support in the implementation of current and future project activities pertaining to policy support and financial and technical inputs.
- Strengthened communication and cooperation among national, provincial and international partners. International partners, such as Canada, the Netherlands, the United States Center for Disease Control (USCDC), other UN agencies and the European Union contributed to the successful rollout of the FETPV training.
- Fifteen key veterinary staff from national and provincial veterinary services were systematically trained through China FETPV. Moreover, 10 additional technicians from eight provincial ACDCs (Shandong, Qingdao, Henan, Guangdong, Zhejiang, Xinjiang, Heilongjiang and Qinghai) were invited to participate in the third training module of

China FETPV in July 2011, which demonstrated the importance of China FETPV for education and training of veterinary staff in China.

- The capacities of field surveillance and outbreak investigation of national and provincial veterinarians were enhanced as a result of the TTS activities under China FETPV.
- The bilateral dialogue offered by the China-Viet Nam discussion forum was considered as a major step forward in sharing data and information on HPAI H5N1 and the use of vaccination in an endemic situation;
- The linkages and opportunities for collaboration between the animal health sector and the public health sector through the OH approach were strengthened as a result of the organization of the UN OH event; and
- Reduced virus circulation and improved food safety were noted in Guangdong, where the PPP project assisted in establishing a model market. This activity has resulted in tangible and applicable outcomes that can be reproduced in other LBMs.

Project Monitoring Sheet: **OSRO/RAS/604/USA Baby 02**

Project title: **Immediate technical assistance to strengthen the surveillance and response capacity for Highly Pathogenic Avian Influenza (HPAI)**

Reporting period: **October 2010 – March 2011**

Country: People's Republic of China
Project title: Immediate technical assistance to strengthen the surveillance and response capacity for Highly Pathogenic Avian Influenza (HPAI)
Code: OSRO/RAS/604/USA Baby 02
Budget: USD 500 000 (Phase I), USD 500 000 (Phase II), USD 650 000 (Phase III), USD 1 150 000 (Phase IV), USD 1 250 000 (Phase V) Total budget: USD 4 050 000
Effective starting date: October 2010
Planned end date: September 2011
Context of the project Despite efforts by the Government of the People's Republic of China to improve the surveillance and control of Highly Pathogenic Avian Influenza (HPAI), the disease is still endemic in some parts of the country, and some basic understanding about the disease and key ecological risk factors is still lacking. Vaccination has been used widely throughout the country to dampen down the infection and bring the disease under control. However, the virus is still circulating in some production systems where the implementation of the vaccination policy requires major effort and where regulation enforcement is difficult. This project was designed to improve the country's ability to detect and control HPAI infection and disease in identified high-risk ecological and production systems at an early stage, through the implementation of intensified surveillance activities, epidemiological studies, socio-economic activities, capacity building and training.
Objectives of the project The main objectives of the assistance under Phase V of the United States Agency for International Development (USAID) project are to continue working in Hunan, Yunnan, Guangxi and Chongqing while extending activities to Guangdong province in order to increase the scope and impact of project activities in Southern China and provide technical assistance and support in the areas of HPAI epidemiological investigation, disease risk analysis and control strategy. In addition, Phase V of the project is expected to increase support to training activities under the China Field Epidemiology Training Programme for Veterinarians (FETPV) umbrella and provide a significant leap in understanding of HPAI ecology. Through project activities, a strengthened early detection and response mechanism will enable China to increase its capacity to detect and eliminate the disease in a timely manner, thereby minimizing production losses and risk to human safety. The immediate objective of the project is to improve the understanding of HPAI infection and disease distribution, assist the country in defining high-risk areas for targeted control activities in order to minimize the risk to human health and produce skilled and experienced veterinary field epidemiologists who can provide China with expertise and service to address transboundary and emerging infectious diseases among animals.
Planned activities (Phase V)
Output 1: Strengthened cross-sectoral coordination at the national and international level
Activity 1.1 Support national consultants to assist in coordinating project implementation with the Government

Activity 1.2 Organize regular meetings with the Ministry of Agriculture (MoA), the Veterinary Bureau, the State Forestry Administration and the Department of International Cooperation (DIC) to discuss project activities

Activity 1.3 Contribute to and facilitate the coordination of surveillance and applied research activities at the wild bird/domestic poultry interface at Poyang Lake reserve including joint meeting with the State Forest Administration (SFA), provincial veterinary and wildlife authorities to discuss, plan and coordinate field activities

Activity 1.4 Strengthen cooperation with the FAO/ the World Organization for Animal Health (OIE) Network of Expertise on Animal Influenza (OFFLU) and other laboratory and epidemiology networks - discuss and define joint scientific collaboration perspectives and opportunities

Activity 1.5 Organize steering committee workshop and inception workshop (involving MoA, the Veterinary Bureau, the China Animal Health Epidemiology Center (CAHEC), Harbin, provincial Centres for Animal Disease Prevention and Control (CDCs) and other project partners and stakeholders)

Activity 1.6 Coordinate the newly created United Nations subworking group on diseases at the human-animal interface

Activity 1.7 Foster exchange of experiences with Viet Nam and Indonesia on vaccination strategy and market chain analysis

Activity 1.8 Improve public-private partnership cooperation through case-study activities (e.g. live bird market [LBM] restructuring) and missions of the international expert on public private partnership (PPP)/biosecurity

Activity 1.9 Engage in joint collaboration activities with Guangdong Province and use the province as a model for PPP activities; engage Guangdong in FETPV

Output 2: Capacity building in epidemiology: implementation of the China FETPV programme

Activity 2.1 1st module of FETPV: short-term basic training course in epidemiology

Activity 2.2 Training through services

Activity 2.3 2nd module of FETPV: short-term training course in the geographic information system (GIS) and epidemiology. Presentation of investigations and research activities performed in the framework of the training through services (see 2.2)

Activity 2.4 International experts in veterinary epidemiology from the Netherlands will develop case studies for outbreak investigation during March-April

Activity 2.5 Introduce and promote the concepts of diseases at the human-animal interface through training and multidisciplinary approach to disease surveillance and control

Activity 2.6 3rd module of FETPV: advanced training on epidemiology, socio-economic studies, risk assessment and understanding diseases at the human-animal interface

Activity 2.7 Support the participation of two Chinese national to the regional FETPV training in Bangkok

Output 3: Improved knowledge of HPAI epidemiological, ecological and socio-economic risk factors

Activity 3.1 Assist national authorities in analysing national surveillance results and provide guidance on improving national and provincial surveillance policies

Activity 3.2 Strengthen existing risk based surveillance approach through the longitudinal monitoring of selected LBMs in order to identify seasonal changes in infection distribution in winter and define early warning indicators associated to HPAI emergence

Activity 3.3 Facilitate the implementation of epidemiological studies at the domestic poultry/wildlife interface in Poyang Lake Reserve to uncover risk factors associated with the emergence of new virus strains and their subsequent spread

Output 4: Improved HPAI surveillance and control strategy through focused control actions

Activity 4.1 Assist in refining the strategic vision for the national vaccination campaign, provide guidance on improving the progressive control of HPAI, H5N1 through vaccination and share views on establishing a vaccination exit strategy

Activity 4.2 Organize training on biosafety, management and test validation for project province laboratories

Activity 4.3 Organize ring trial between provincial laboratory and Harbin National Reference laboratory

Activity 4.4 Establish GIS-based system at provincial level (Chongqing municipality) to support HPAI surveillance activities

Activity 4.5 Procurement of necessary laboratory equipment and supplies for HPAI diagnosis, data analysis and information sharing including for Guangxi CDC laboratory

Activity 4.6 In the framework of the PPP activities, organize a stakeholder meeting and group discussion for the development of minimum biosecurity standards for LBMs

Activities undertaken during the reporting period (October 2010 – March 2011)

Output 1: Strengthened cross-sectoral coordination at the national level

Activity 1.1 Support national consultants to assist in coordinating project implementation with the government

- Initiated the recruitment of National Programme/Operations Officer in March. The new Programme/Operations Officer is expected to join the team in April.

Activity 1.2 Organize regular meetings with MoA, the Veterinary Bureau, the State Forestry Administration and DIC to discuss project activities

- Maintained close contact/communication with MoA, the project team ensured smooth implementation of the planned activities during the first six months.

Activity 1.5 Organize steering committee workshop and inception workshop (involving MoA, Veterinary Bureau, CAHEC, Harbin, provincial CDCs and other project partners and stakeholders)

- Hold three Steering Committee Meetings in September, November and January. These meetings discussed progress and other key issues regarding FETPV at regular intervals.

Activity 1.6 Coordinate the newly created UN sub-working group on diseases at the human-animal interface

- Coordinated the United Nations Theme Group on Health (UNTGH) 4th Subworking group meetings (diseases at the human-animal interface) in October, December and March. The newly created subworking group will be used as a forum of exchange of scientific information on animal and human health related issues.

Activity 1.7 Foster exchange of experiences with Viet Nam and Indonesia on vaccination-strategy and market chain analysis

- Organized the China-Vietnam Discussion Forum on HPAI Risk Management and Control on 8 and 9 March. The meeting reviewed the scientific progress made in HPAI H5N1 control and explored avenues for joint collaborations.

Output 2: Strengthened HPAI Disease Surveillance System and capacity building

Activity 2.1 1st module of FETPV: short-term basic training course in epidemiology

- 15 trainees from the national institutions and provincial veterinary departments attended the first module of FETPV. The focus of the training was mainly on basic concepts of field epidemiology was held from 29 November to 23 December 2010.

Activity 2.2 Training through Services

- FETPV trainees' surveillance plans of first Phase of training through services (TTS)

were reviewed by MoA. Three trainees' surveillance plans are under improvement, the rest of the trainees' surveillance plans have been submitted to their international mentors for review and comments.

Activity 2.3 2nd module of FETPV

- The second module of FETPV which focuses on participatory epidemiology, risk analysis, basic statistical analysis, data management and applied surveillance, as well as outbreak investigation started on 28 March 2011. An English communication training was provided to the 15 trainees on 26 and 27 2011 March to enhance their language abilities and presentation skills.

Activity 2.4 International experts in veterinary epidemiology from the Netherlands will develop case studies for outbreak investigation during March-April 2011.

- Two Dutch experts conducted their first mission to China from 21 to 25 March 2011. Field mission to Guangxi Province was implemented to discuss with local China Animal Disease Control Centre (CADC) officials about work plan for the next step.

Activity 2.5 Introduce and promote the concepts of diseases at the human-animal interface through training and multidisciplinary approach to disease surveillance and control

- Addressed the One Health concept at the human-animal interface in the framework of FETPV.

Activity 2.7 Support the participation of two Chinese nationals to the regional FETPV training in Bangkok

- One Chinese national expert from CAHEC, Qingdao participated in the third annual regional training course from 17 January to 11 February 2011 in Bangkok.

Output 3: Improved knowledge of HPAI epidemiological and ecological and socio-economic risk factors

Activity 3.1 Assist national authorities in analysing national surveillance results and provide guidance on improving national and provincial surveillance policies.

- Produced and disseminated China HPAI highlights to donors, animal health units at FAO RAP, headquarters and MoA.

Output 4: Improved HPAI surveillance and control strategy through focused control actions

Activity 4.1 Assist in refining the strategic vision for the national vaccination campaign, provide guidance on improving the progressive control of HPAI, H5N1 through vaccination and share views on establishing a vaccination exit strategy.

- Recommendations on how best to sustain the efforts to control HPAI H5N1 in China and Vietnam were provided during the China-Vietnam Discussion Forum in March.

Activity 4.5 Procurement of necessary laboratory equipment and supplies for HPAI diagnosis, data analysis and information sharing including for Guangxi CDC laboratory.

- Procured laboratory equipment and materials for Guangxi CACD, the National Harbin Reference Laboratory (NHRL) and CAHEC; 15 laptop computers were also procured for FETPV trainees.

Planned activities for the next six-month period

Output 1: Strengthened cross-sectoral coordination at the national level

Activity 1.2 Organize regular meetings with MoA, the Veterinary Bureau, the State Forestry Administration and DIC to discuss project activities

- Regular meetings with MoA to discuss China FETPV and other programmatic/operational matters of Phase V.

Activity 1.4 Strengthen cooperation with OFFLU and other laboratory and epidemiology networks - discuss and define joint scientific collaboration perspectives and opportunities

- Organize a ring trial between Harbin National laboratory and provincial laboratories under the guidance of the Istituto Zooprofilattico Sperimentale (IZS), Padova Reference Laboratory on AI.

Activity 1.6 Coordinate the newly created UN subworking group on diseases at the human-animal interface

- Regular working group meeting will be held every two months.

Activity 1.8 Improve public private partnership cooperation through case-study activities (e.g LBM restructuring) and missions of the international expert on PPP/biosecurity

- The PPP expert will visit Guangdong Province in April.

Output 2: Capacity building in epidemiology: implementation of the China FETPV program

Activity 2.2 Training through services

- The first Phase of TTS activities will be implemented from May to August.

Activity 2.6 3rd module of FETPV

- 3rd module of FETPV will start at the end of June.

Output 4: Improved HPAI surveillance and control strategy through focused control actions

Activity 4.2 Organize training on biosafety, management and test validation for project province laboratories

- Organize the biosafety laboratory training for provincial laboratory staff in May.

Activity 4.6 In the framework of the PPP activities, organize a stakeholder meeting and group discussion for the development of minimum biosecurity standards for LBMs.

- Conducted field mission to Guangdong Province in April with the PPP expert.

Main challenges encountered and responses provided

There are no major issues at present.

Main progress made towards the achievement of project outcomes

The project has made noticeable progress towards achieving the expected outputs of the project. Main progress can be summarized as follows:

- Increased MoA's involvement and support to the implementation of project activities of the current phase. MoA has shown strong commitment to FETPV programme and has allocated resources (RMB 500 000) to this programme in both 2010 and 2011.
- Strengthened the cooperation with MoA, provincial partners and international partners. International partners such as Canada, the Netherlands, the United States Center for Disease Control (USCDC) and the European Union have contributed to the successful rollout of the FETPV training.
- Trained 15 key veterinary staff from national institutions and provincial veterinary departments through China FETPV.
- Promoted exchange of experiences on HPAI H5N1 control, especially on the use of vaccination in endemic situation through the organization of China-Vietnam Discussion Forum of HPAI Risk Management and Control.
- Strengthened the link and collaboration between the animal health sector and public health sector, addressed the One Health approach at the human-animal interface through regular meetings involving a wide range of disciplines and scientific communities.
- More project information/event sharing with MoA, national counterparts, RAP, headquarters and donors through the production of China HPAI Highlights.

Project Monitoring Sheet: **OSRO/RAS/604/USA Baby 02**

Project title: **Immediate technical assistance to strengthen the surveillance and response capacity for Highly Pathogenic Avian Influenza (HPAI)**

Reporting period: **April 2011 – September 2011**

Country: People's Republic of China
Project title: Immediate technical assistance to strengthen the surveillance and response capacity for Highly Pathogenic Avian Influenza (HPAI)
Code: OSRO/RAS/604/USA Baby 02
Budget: USD 500 000 (Phase I), USD 500 000 (Phase II), USD 650 000 (Phase III), USD 1 150 000 (Phase IV), USD 1 250 000 (Phase V) Total budget: USD 4 050 000
Effective starting date: 1 August 2006
Planned end date: 30 September 2012
<p>Context of the project</p> <p>Despite efforts by the Government of the People's Republic of China to improve the surveillance and control of Highly Pathogenic Avian Influenza (HPAI), the disease is still endemic in some areas of the country. Some basic understanding of the disease, including key ecological risk factors, is still lacking. Vaccination has been widely used throughout the country to dampen down the infection and bring the disease under control. However, the virus is still circulating in some production systems where the implementation of the vaccination policy requires major effort and where regulation enforcement is difficult. This project was designed to improve the country's capacities to detect and control HPAI infection and disease in identified high-risk ecological and production systems at an early stage, through the implementation of intensified surveillance activities, epidemiological studies, socio-economic activities, capacity building and training.</p>
<p>Objectives of the project</p> <p>The main objectives under Phase V of the United States Agency for International Development (USAID)-funded project are to continue working in Hunan, Yunnan, Guangxi and Chongqing while extending activities to Guangdong province in order to increase the scope and impact of project activities in Southern China and provide technical assistance and support in the areas of HPAI epidemiological investigation, disease risk analysis and control strategy. In addition, Phase V of the project is expected to increase support to training activities under the China Field Epidemiology Training Programme for Veterinarians (FETPV) umbrella and provide a significant leap in understanding of HPAI ecology.</p> <p>Through project activities, the Government's early detection and response capacity will be strengthened, thereby minimizing production losses and risk to human health and safety. The immediate objective of the project is to improve the understanding of HPAI infection and disease distribution, assist the country in defining high-risk areas for targeted control activities in order to minimize the risk to human health and produce skilled and experienced veterinary field epidemiologists, who can provide the Government of China with expertise and service to address transboundary animal diseases (TADs) and emerging infectious diseases (EIDs).</p>
<p>Planned activities (Phase V)</p> <p>Output 1: Strengthened cross-sectoral coordination at the national and international level</p> <p>Activity 1.1 Support national consultants to assist in coordinating project implementation with the Government</p> <p>Activity 1.2 Organize regular meetings with the Ministry of Agriculture (MoA), the Veterinary Bureau, the State Forestry Administration (SFA), and the Department of International Cooperation (DIC) to discuss project activities</p>

Activity 1.3 Contribute to and facilitate the coordination of surveillance and research activities at the wild bird/domestic poultry interface at Poyang Lake Reserve including joint meeting with SFA, provincial veterinary and wildlife authorities to discuss, plan and coordinate field activities

Activity 1.4 Strengthen cooperation with the Food Agriculture Organization of the United Nations (FAO)/the World Organisation for Animal Health (OIE) Network of Expertise on Animal Influenza (OFFLU) and other laboratories and epidemiology networks - discuss and define joint scientific collaboration perspectives and opportunities

Activity 1.5 Organize project steering committee meetings and inception workshop (involving MoA, the Veterinary Bureau, China Animal Health and Epidemiology Center (CAHEC), Harbin National Reference Laboratory (HNRL), provincial Centres for Animal Disease Prevention and Control (ACDCs) and other project partners and stakeholders)

Activity 1.6 Coordinate the newly created United Nations sub-working group on diseases at the human-animal interface

Activity 1.7 Foster exchange of experiences with Viet Nam and Indonesia on vaccination strategy and market chain analysis

Activity 1.8 Improve public-private partnership cooperation through case-study activities (e.g. live bird market [LBM] restructuring) and missions of the international experts on Public-Private Partnership (PPP)/biosecurity

Activity 1.9 Engage in joint collaboration activities with Guangdong Province and use the province as a model for PPP activities; engage Guangdong province in China FETPV

Output 2: Capacity building in epidemiology: implementation of the China FETPV programme

Activity 2.1 The first module of FETPV: short-term training course in basic epidemiology

Activity 2.2 Training through services (TTS): field surveillance and outbreak investigation

Activity 2.3 The second module of FETPV: short-term training course in the geographic information system (GIS) and participatory epidemiology

Activity 2.4 International expert in veterinary epidemiology from the Netherlands will develop case studies for outbreak investigation during the third module of the China FETPV

Activity 2.5 Introduce and promote the concepts of diseases at the human-animal interface through training and multidisciplinary approach to disease surveillance and control

Activity 2.6 The third module of FETPV: advanced training on epidemiology, socio-economic studies, risk assessment and understanding diseases at the human-animal interface

Activity 2.7 Support the participation of one Chinese national to the regional FETPV training in Bangkok in August 2011

Output 3: Improved knowledge of HPAI epidemiological, ecological and socio-economic risk factors

Activity 3.1 Assist national authorities in analysing national surveillance results and provide guidance on improving national and provincial surveillance policies

Activity 3.2 Strengthen existing risk-based surveillance approach through the longitudinal monitoring of selected LBMs in order to identify seasonal changes in infection distribution in winter and define early warning indicators associated to HPAI emergence

Activity 3.3 Follow-up socio-economic studies in Guangdong province: compile key information on poultry sector and its structure, analyse product flow among the market chains and determine the implications for disease surveillance and control issues

Activity 3.4 Facilitate the implementation of epidemiological studies at the domestic poultry/wildlife interface in Poyang Lake Reserve to uncover risk factors associated with the emergence of new virus strains and their subsequent spread

Output 4: Improved HPAI surveillance and control strategy through focused control actions

Activity 4.1 Assist in refining the strategic vision for the national vaccination campaign, provide guidance on improving the progressive control of HPAI H5N1 through vaccination and share views on establishing a vaccination exit strategy

Activity 4.2 Organize training on biosafety, management and test validation for laboratories in project provinces

Activity 4.3 Organize ring trial between provincial laboratories and HNRL

Activity 4.4 Establish GIS-based system at provincial level (Chongqing municipality) to support HPAI surveillance activities

Activity 4.5 Procurement of necessary laboratory equipment and supplies for HPAI diagnosis, data analysis and information sharing for provincial laboratories

Activity 4.6 Organize the PPP stakeholder meeting and group discussion for the development of minimum biosecurity standards for LBMs

Activities undertaken during the reporting period (April 2011 – September 2011)

Output 1: Strengthened cross-sectoral coordination at the national and international level

Activity 1.1: Initiated the recruitment of National Programme/Operations Officer in March 2011. The new National Programme/Operations Officer joined the team on 5 July 2011.

Activity 1.2 :

- Several meetings with MoA, SFA, UN agencies, embassies and donors based in Beijing were held during the reporting period.
- An internal discussion meeting was held with MoA on 4 August 2011, during which planned activities of the second year of China FETPV were discussed. The initial findings of the PPP project in Guangdong and the subsequent plan of action were also shared.
- Further discussion meeting with MoA and CAHEC was held in Qingdao on 16 August 2011 to discuss further coordination and implementation of TTS for China FETPV.

Activity 1.5:

- The fourth FETPV Steering Committee Meeting was held in June 2011 to discuss the progress of and other key issues pertaining to China FETPV.
- A Mentor Workshop will be held on 23 September 2011 to define the roles and responsibilities of mentors in assisting trainees to conduct field surveillance and outbreak investigation in the framework of the TTS activities.

Activity 1.8:

- One PPP expert from Canada visited China from 11 to 27 April 2011 and initiated the PPP activities in Guangdong.
- Three PPPs and biosecurity experts visited China in July-August 2011 to assist the Emergency Centre for Transboundary Animal Diseases (ECTAD) China in launching the project activities. The PPP Launching Workshop was held on 18 July 2011 in Beijing.

Activity 1.9:

- Guangzhou Animal Health Inspection Institute and local agencies actively joined PPP project's activities; Technicians/experts from Guangdong Province were also invited to participate in the next two training modules of China FETPV. A laboratory expert from Guangdong province also participated in the biosafety laboratory training that was organized in Chongqing from 13 to 16 September 2011.

Output 2: Capacity building in epidemiology: the China FETPV programme

Activity 2.2:

- Trainees' field surveillance plans for the first Phase of TTS activities were submitted and reviewed by MoA and national mentors in August. The TTS activities will be carried out by trainee's locally from August 2011 until the end of March 2012.

Activity 2.3:

- The second module of FETPV was organized from 28 March to 29 April 2011, and focused on participatory epidemiology, risk analysis, basic statistical analysis, data management and applied surveillance as well as outbreak investigation.

Activity 2.4:

- Real case-studies on rabies surveillance in China were developed by an expert from the Netherlands during the third module of China FETPV in July 2011; Two qualified trainees were selected and approved by MoA to attend a 10-day exchange visit under the International Fellowship provided by the Netherlands in October 2011.

Activity 2.5:

- A one-week workshop on the concept of “One Health (OH)” was held from 20 to 24 June 2011 for 15 FETPV trainees within the framework of the third module of the programme. Participants from the Chinese Academy of Sciences, the Public Health Institute and SFA also joined this one-week training.
- An UN China OH event was organized to sensitize different national agencies, ministries and institutes about the OH concept and suggest a framework of implementation of OH activities in the country. The meeting was held on 29 and 30 June 2011 and gathered more than 70 participants. The OH meeting had a great impact and not only attracted the attention of the international and national scientific communities, but also generated interest among policy makers. In addition, an UN position paper on OH implementation in China is being produced.

Activity 2.6:

- The third module started from June 20 to July 16 2011 and focused on the management and analysis of epidemiological data, spatial data management and analysis and outbreak investigation demonstration.

Activity 2.7:

- One national veterinarian attended the regional FETPV training from 1 to 26 August 2011 (26 days).

Output 3: Improved knowledge of HPAI epidemiological and ecological and socio-economic risk factors**Activity 3.1:**

- HNRL finished the analysis of 1 190 samples collected from three provinces during the LBM survey conducted in January 2010 and identified six viruses of subtype H6 and H4 (no H5N1 detected). It also finished the sequencing analysis of H5, H6 and H9 subtype viruses isolated from the LBM survey conducted in 2009.

Activity 3.3:

- A preliminary market chain analysis was conducted in Guangdong province during the mission of PPP experts and ECTAD China staff in July 2011, which led to the production of a series of maps describing LBM networks in the province.

Output 4: Improved HPAI surveillance and control strategy through focused control actions**Activity 4.2:**

- A four-day training workshop on laboratory biosafety was organized from 13 to 16 September 2011 in Chongqing ACDC for provincial laboratories, and 30 national staff members were trained.

Activity 4.3:

- Reagents for ring trail were procured by HNRL in May 2011 and distributed to Chongqing, Hunan and Guangxi in July 2011. All experiment from provincial laboratories will be finished before the end of September 2011 and results will be analysed in October 2011.

Activity 4.4:

- A training on GIS techniques applied to epidemiology was organized during the third module of the China FETPV for 15 trainees and 10 additional participants from other provinces.

Activity 4.5:

- Biosecurity equipment and supplies were procured for Guangzhou Animal Health Inspection Institute and Jiangcun Poultry Wholesale Market to facilitate the training and LBM restructuring in October 2011 under the PPP project.

Activity 4.6:

- Formal Action Plan was presented to all stakeholders during the PPP Stakeholder Meeting held on 2 August 2011.

Planned activities for the next six-month period**Output 1: Strengthened cross-sectoral coordination at the national and international level**

- Organize regular meetings with MoA to discuss China FETPV and other programmatic/operational matters of the new phase
- Foster experience exchange and dialogue with Viet Nam through joint forum, study tours, or missions
- Coordinate and organize the UN Team Group on Health meetings every two months
- Further enhance the translation of the OH concept into a concrete action plan within the country by coordinating with other national and international stakeholders.

Output 2: Capacity building in epidemiology: the China FETPV programme

- Organize the fourth training module of China FETPV in November 2011.
- Two trainees will be sent to the Netherlands for a 10-day exchange visit under the International Fellowship in October 2011.
- The first phase of TTS activities on field surveillance will be carried out by trainees locally from August 2011 and finished before the end of March 2012.

Output 3: Improved knowledge of HPAI epidemiological and ecological and socio-economic risk factors

- Produce the China HPAI Quarterly Bulletin-update on HPAI situation
- Discuss with MoA, SFA, provincial veterinary, and wildlife authorities the implementation of epidemiological studies in Poyang Lake Reserve.

Output 4: Improved HPAI surveillance and control strategy through focused control actions

- Finalize the analysis of ring trials between provincial laboratories
- Further support the implementation of the PPP project in Guangdong Province

Main challenges encountered and responses provided

There are no major issues at present.

Main progress made towards the achievement of project outcomes

The project has made noticeable progress towards achieving the expected outcomes, which can be summarized as follows:

- Increased MoA's involvement and support in the implementation of current and future project activities pertaining to policy support and financial and technical inputs.
- Strengthened communication and cooperation among national, provincial and international partners. International partners, such as Canada, the Netherlands, the United States Center for Disease Control (USCDC), other UN agencies and the European Union contributed to the successful rollout of the FETPV training.
- Fifteen key veterinary staff from national and provincial veterinary services were systematically trained through China FETPV. Moreover, 10 additional technicians from eight provincial ACDCs (Shandong, Qingdao, Henan, Guangdong, Zhejiang, Xinjiang, Heilongjiang and Qinghai) were invited to participate in the third training module of

China FETPV in July 2011, which demonstrated the importance of China FETPV for education and training of veterinary staff in China.

- The capacities of field surveillance and outbreak investigation of national and provincial veterinarians were enhanced as a result of the TTS activities under China FETPV.
- The bilateral dialogue offered by the China-Viet Nam discussion forum was considered as a major step forward in sharing data and information on HPAI H5N1 and the use of vaccination in an endemic situation;
- The linkages and opportunities for collaboration between the animal health sector and the public health sector through the OH approach were strengthened as a result of the organization of the UN OH event; and
- Reduced virus circulation and improved food safety were noted in Guangdong, where the PPP project assisted in establishing a model market. This activity has resulted in tangible and applicable outcomes that can be reproduced in other LBMs.

Project Monitoring Sheet: **OSRO/INT/805/USA**Project title: **Developing and maintaining public-private partnerships for the prevention and control of Highly Pathogenic Avian Influenza H5N1**Reporting period: **March 2011 to September 2011**

Global component: Global cross-country
Countries: Bangladesh, Cambodia, China, Indonesia, Lao People's Democratic Republic (PDR), Myanmar, Nepal and Viet Nam
Project title: Developing and maintaining public-private partnerships for the prevention and control of Highly Pathogenic Avian Influenza (HPAI) H5N1
Code: OSRO/INT/805/USA
Budget: USD 765 690 ¹
Effective starting date: 1 January 2009
Planned end date: 31 March 2012
Context of the project The Public-Private Partnership (PPP)-Biosecurity Project (October 2010-September 2011) is a no-cost extension of two projects: OSRO/INT/805/USA - <i>Developing and Maintaining Public-Private Partnerships for the Prevention and Control of HPAI H5N1 and other Emerging Infectious Animal Diseases (EIADs) (PPP Project)</i> and OSRO/GLO/802/USA - <i>Improved biosecurity and hygiene at production, collection points and live bird markets (LBMs), including decontamination (Decon Project)</i> . The current no-cost extension had a duration of 12 months, from 1 October 2010 to 30 September 2011 with a total budget of USD 765 690. While USAID continued to support activities related to PPP and biosecurity, it had requested that new funding be provided at the country level. As a result, countries have integrated PPP and biosecurity-related activities in their 2010-2011 proposals for the period from October 2010 to September 2011. The no-cost extension allowed technical expertise to be provided to high-burden countries in Asia, and to a smaller extent to the high-risk countries in Asia, for their activities involving collaboration between the public and private sector and involving work on biosecurity/good hygiene practices on farm and along marketing chains. The no-cost extension also allowed implementation of a limited number of activities that have not been included in country proposals in Bangladesh, China, Lao PDR, Myanmar and Nepal for a total amount of USD 255 000, distributed in the following way: Bangladesh (USD 80 000), Cambodia (USD 20 000), China (USD 100 000), Lao PDR (USD 25 000), Myanmar (USD 25 000) and Nepal (USD 25 000).

¹ The Government of the United States of America contributed in Financial Year 2009 to FAO a total of USD 1 600 000 through project OSRO/INT/805/USA and a total of USD 2 500 000 through project OSRO/GLO/802/USA; the unspent balances of these two projects amounting to USD 115 341 and USD 650 349 constitute the budget of the no-cost extension.

Objectives of the project

To create, strengthen and maintain Public Private Partnerships and promote Biosecurity to support poultry health and production systems in countries affected by Highly Pathogenic Avian Influenza (HPAI), within a functional animal health system led by official veterinary services.

Planned activities

Output A: Expertise, technical advice and organizational support on PPPs and biosecurity will be available to countries for implementation of activities funded under Amendment 6 (country project proposals).

An expert in commercial poultry production and biosecurity will operate from FAO headquarters. Consultant time for a PPP specialist will be available. They will:

- provide information and guidance on PPPs to government departments, the private sector and Food and Agriculture Organization of the United Nations (FAO) country teams; and
- assist in the improvement of biosecurity (including C&D) in commercial production and marketing chains, as biosecurity has proven to be a major area of interest to the private commercial poultry sector, as well as the public sector.

Output B: PPPs for safer poultry production will be supported. Poultry production and marketing will be made safer in high-burden and high-risk countries.

VIET NAM

Output A - Activities:

- Participate in a review of a pilot poultry supply chain strengthening project as part of a multi-project biosecurity review process implemented by FAO and the Department of Livestock Production (DLP). This will also serve as an orientation to the field situation and current situation in Viet Nam and highlight the challenges of upgrading poultry supply chains.
- Provide technical support to a collaborative approach to hatchery strengthening in two select provinces (in close collaboration with FAO's implementing partner Abt Associates). This will include the review of existing hatchery management and biosecurity training materials and the development of a province-level training programme for hatcheries.
- Develop a training-of-trainers (TOT) biosecurity training course for public and private sector veterinarians to strengthen biosecurity practices in small-scale commercial farms.
- Develop an approach to strengthen technical support provided to small-scale commercial poultry farmers through strengthening technical and advisory capacity of private agrivet store owners in two/three pilot districts of Ha Nam Province.
- Conduct a rapid assessment of two to three key live bird markets (LBMs) in Quang Tri province including a stakeholder mapping analysis and develop options for risk reduction control measures in those markets (the potential control options will be reviewed through a stakeholder process, finalized into an action plan and implemented over the next seven months).
- Participate in a technical consultation meeting on experiences and lessons learned on upgrading LBMs, focusing on Viet Nam, and provide additional lessons learned from Bangladesh and Egypt, where considerable progress has been made.
- Support the establishment of a National Poultry Quality Improvement Plan.

LAO PDR**Output A - Activities:**

- Assess the biosecurity situation in selected LBMs in Vientiane capital and Savanaket.
- Provide recommendations for biosecurity improvements at LBMs.
- Train LBM authorities and traders associations on biosecurity.
- Training workshop for the public and private sectors on poultry production and biosecurity measures to be implemented in commercial poultry farms in Vientiane and Savanaket areas for better production and profitability.

CAMBODIA**Output A - Activities:**

- Assess the biosecurity situation in selected LBMs in Phnom Penh.
- Provide recommendations for biosecurity improvements or restructuring of LBMs.
- Train LBM traders in the Phnom Penh area on biosecurity.
- Assess the biosecurity situation of housed duck farms in Sihanouk Ville.
- Provide recommendations for farm biosecurity improvements.

NEPAL**Output A - Activities:**

- Facilitate the development of national biosecurity guidelines.
- Train private and the Department of Livestock Services (DLS) veterinarians and poultry producers on farm biosecurity.
- Train selected veterinarians on biosecurity auditing and reviews.
- Assess the biosecurity situation in LBMs in eastern provinces (their gaps and needs) and provide recommendations for biosecurity improvements.

BANGLADESH**Output A - Activities:**

- Assist in the improvement, organize and facilitate a workshop for the development of biosecurity standard operating procedures (SOPs) that will support the implementation of the national biosecurity guidelines.
- Develop, update and revise training materials on biosecurity for layer farms and LBMs.
- Support the establishment of National Poultry Improvement Plans.
- Facilitate and extend the process related to farm registration and licensing, including the revision of the existing farm registration protocol and link the farm registration system with the geospatial database of commercial farms and LBMs.
- Facilitate dialogue on compartmentalization and develop SOPs for the implementation of disease-free compartments.
- Support the upgrade of selected LBMs.
- Support biosecurity (including C&D) in commercial production and marketing chains, as biosecurity has proven to be the major area of interest to the private commercial poultry sector, as well as the public sector.
- Develop a new and equitable compensation plan.

INDONESIA

Indonesia has not requested any assistance from the project.

CHINA

Output A – Activities: as planned.

Output B - Activities:

- Map stakeholders in selected LBMs, analyse existing platforms to establish a dialogue among the public and private stakeholders, propose platform improvements if required, use the platform to plan the restructuring of the markets.
- Develop monitoring and evaluation tools and indicators of the impact of restructuring on livelihoods of producers, sellers, as well as on virus circulation and spread.
- Provide training to public sector staff on PPPs and explore opportunities to work on compartmentalization.

MYANMAR**Output A - Activities:**

- Review biosecurity practice in poultry production areas in Yangon, Monywa and Shwebo Districts and provide recommendations for biosecurity improvement in poultry production areas in Myanmar.
- Review biosecurity practice at the live poultry wholesale market in Yangon and provide recommendations for biosecurity improvement.
- Develop and deliver biosecurity TOT for government veterinarians and poultry producers.

Activities undertaken during the reporting period

Output A: Expertise, technical advice and organizational support on PPPs and biosecurity will be available to countries for implementation of activities funded under Amendment 6 (country projects proposals).

An expert in commercial poultry production and biosecurity will operate from the headquarters. Consultant time for a PPP specialist will be available. They will:

- provide information and guidance on PPPs to government departments, the private sector and FAO country teams; and
- assist in the improvement of biosecurity (including C&D) in commercial production and marketing chains, as biosecurity has proven to be a major area of interest to the private commercial poultry sector, as well as the public sector.

BANGLADESH**Output A - Activity 1:**

- Technical support was provided to the national consultant in developing a *Standard Operating Procedures Manual* for biosecurity on the farm that will facilitate the implementation of the existing *national biosecurity guidelines*. An earlier workshop was organized in Sirajganj and was facilitated by the project, with the participation of members from the DLS and the private sector, including broiler and layer producers, breeding farm managers, feed and poultry dealers. During the workshop the methodology and templates for the development of these SOPs were introduced. Following to the workshop a selected

group of participants was recruited and completed the SOPs. In the near future the newly developed SOPs will be tested in selected farms.

Output A - Activity 2:

- Since the first HPAI outbreak in Bangladesh in March 2007, the previously active export of poultry and poultry products to Middle Eastern countries has stopped. During this semester, numerous meetings with stakeholders from the public and private sectors took place, and the concept of establishing disease free compartments, in accordance with the World Organisation for Animal Health (OIE) Terrestrial Code, was introduced. The establishment of compartments would enable the resumption of export of fertile eggs and day old chicks. The owners of the three largest poultry companies in Bangladesh, namely, Kazzi farms, Paragon poultry and M.M. Agha Poultry, expressed great interest in joining this initiative and the Director General of the Department of Livestock also expressed his interest in and support for this project. *Guidelines for compartmentalization in Bangladesh* were drafted, containing components of compartment management, enhanced biosecurity plan, surveillance and auditing plan. The guideline was developed with reference to the *National biosecurity guidelines for the commercial poultry industry in Bangladesh* (April 2010) developed during an earlier phase of this project; the relevant chapters in the OIE 'Terrestrial Animal Health Code' (Terrestrial Code) and 'Manual of Diagnostic Tests and Vaccines for Terrestrial Animals' (Terrestrial Manual) (2010). The structure of the guidelines is based on the 'Compartments for protection against avian influenza and Newcastle disease in poultry breeding companies in Great Britain' (DEFRA, 2010).

CAMBODIA

Output A - Activity 1:

- The Chbar Ampov LBM in Phnom Penh is a combined wholesale and retail market that operate under two managerial structures. The wholesale market is the largest in Phnom Penh, and supplies live poultry to the Chbar Ampov retail section and to many other retail markets in the capital. In recent surveillance activities on markets, environmental samples were collected, and a significant number was found positive to HPAI, which put this market in high risk category in terms of potential bird-bird and bird-human transmission.
- Following a market visit for risk assessment and stakeholders' interviews, an *intervention strategy for biosecurity improvement* was developed, for both, the wholesale and retail sections of the market. The intervention includes a) infrastructure improvement such as the installation of water points, birds' holding cages and washable working benches; b) setting procedures, such as daily market C&D programme, traffic control within the market during certain hours of the day, etc.; and c) training and education about biosecurity for traders and authorities, and the formation of a committee, composed of all stakeholders' representatives, that will guide the market improvement process.

NEPAL

Output A - Activity 1:

A two-days workshop was held in Kathmandu on 3 and 4 May 2011 to develop *Biosecurity Guidelines for Nepal*. Thirty-five participants from the public sector, DLS and the private sector, including poultry producers, poultry associations, hatchery and feed operators, and representatives from the veterinary school and research institute, took part in the workshop. These *national biosecurity guidelines* provide minimum biosecurity standards to be

implemented by the different segments of poultry production, such as breeding, laying and broiler farms.

- The *national biosecurity guidelines* include the following components:
 - principles of biosecurity guidelines;
 - policy application of the biosecurity guidelines;
 - operational application of the biosecurity guidelines;
 - roles and responsibilities of all stakeholders involved;
 - biosecurity implementing committee and workgroups structure.

A copy of the final version of the *national biosecurity guidelines* was presented to the DG of DLS for approval and endorsement. Once the guidelines are agreed upon by all stakeholders and endorsed by the veterinary services and the ministry of agriculture, their promotion will require the formation of an overseeing *biosecurity committee*, and additional three working groups to ensure the development of *biosecurity SOPs, communication and training materials, and a biosecurity auditing programme*.

Output A - Activity 2:

- A three-days TOT on Biosecurity was conducted in the Chitwan District, which is the largest poultry production area in Nepal (About 70 percent of the national eggs and poultry meat production). Eighteen veterinarians from the DLS, diagnostic laboratory, veterinary school and private practitioners with strong poultry health and production skills were trained on the principles of biosecurity, C&D, and safe disposal of dead chickens and manure by composting. Farm *biosecurity auditing* was discussed in depth and was practiced on a poultry farm by using a *biosecurity check-list*.
- Following to the above mentioned TOT, two participants were selected to be part of the FAO training team and took part in the two days biosecurity training programme for 22 poultry producers from breeding, layer and broiler farms in the Chitwan district. The participants were trained on the principles of biosecurity, C&D, and safe disposal of dead chickens and manure by composting. Farm biosecurity risk assessment was practiced by all participants during a farm visit, using the provided *biosecurity check-list*, and suggestions for risk mitigation were discussed.
The selected trainers delivered one presentation each on farm C&D procedures and led the discussions within small producers' groups.

Output A - Activity 3:

- Two LBMs and three collection yards in the town of Damak at the eastern province of Jhapa were visited for an assessment of biosecurity gaps. All of them showed very little evidence of implementation of any biosecurity measures, as no running water, drainage or solid waste disposal facilities are available, and no washing and disinfection procedures are implemented in these sites, equipment or vehicles used for the transportation of poultry are implemented.
- Three sites were assessed for their suitability for the establishment of a centralized collection point with a birds' inspection and vehicle and crates washing facilities, to ensure that only certified healthy poultry (native chickens) are sent in a safe manner from the Damak district to Kathmandu and Pokhara. The three proposed sites were visited and one site was recommended for the construction of the collection point, based on the topographic location and relative isolation from residential area. It was agreed that no birds will be slaughtered for local consumption at this site.

LAO PDR**Output A - Activity 1:**

A two-days workshop for the development of *Biosecurity Guidelines for the Commercial Poultry Industry in Lao PDR* was held in the Lanxang hotel in Vientiane on 15 and 16 June 2011. Thirty-two participants from the public sector, DLF, PAFO and DAFO, and the private sector, including poultry producers and poultry associations, attended the workshop.

The content and approach for approval and implementation of these guidelines are the same as the ones used for the *National Biosecurity Guidelines for Nepal (see above)*

The *national biosecurity guidelines* were translated and presented to the Director General of the Department of Livestock and Fisheries (DLF) and to the Secretary of the Minister for Agriculture and Forestry for approval and endorsement. After approval, 3000 copies in Lao and 1000 copies in English were printed and circulated across the country to all poultry producers and partners.

Output A - Activity 2:

Two sessions of a two-days biosecurity training programmes, targeting provincial and district livestock officers (PAFO and DAFO), poultry producers, veterinary and feed shop owners, were conducted in Vang-vieng (22 participants) and in Savannaketh (25 participants). The participants were trained on the principles of biosecurity, C&D, and safe disposal of dead chickens and manure by composting. Farm biosecurity risk assessment was practiced by all participants during the farm visit, using the provided biosecurity check list, and suggestions for risk mitigation were discussed.

VIET NAM**Output A - Activity 1:**

A two-days workshop on development of *biosecurity guideline for small poultry production sites of up to 300 birds (chickens and ducks) in Viet Nam* was held at the Army hotel in Hanoi, including participants from the public and private sectors. These guidelines were developed through a consultative process to complement the already existing *farm biosecurity legislation and standards in Viet Nam - Decision 1405-QD-TTg* of 2007 and its amendment, Circular 60/2008/TT-BNN of 2008, and the *Standards and SOPs for biosecurity in large industrial poultry production farms* that was developed by the Viet Nam Avian and Human Influenza Control and Preparedness (VAHIP) project. The set of guidelines is still in draft form and will be finalized in the near future.

Output A - Activity 2:

Two farm biosecurity training sessions in the Kien Giang and Quang Tri provinces were attended by the participants from the public sector, provincial and district veterinary officers, and from the private sector, duck and chicken producers, Agri-vet shop owners and poultry clubs members. The two-day programme included the following modules: introduction to biosecurity, C&D, correct calculation and application of disinfectants and safe disposal of dead birds and manure by composting. The in-class training session was followed by a field trip to duck farms, where the participants conducted a biosecurity risk assessment to identify and quantify the risk points present at those farms. The participants also provided suggestions on

how to mitigate those risks.

Output A - Activity 3:

A *hatchery biosecurity auditing check list* was developed and tested in two traditional hatcheries in Hung Yen province. This auditing checklist will enable a trained auditor to perform a rapid and effective assessment of the biosecurity status of a hatchery. A training programme for auditors, DLP and DAH provincial or district officers, is in the process of development.

Additionally, a set of *biosecurity guidelines for hatcheries* was drafted and circulated to stakeholders for comments and adoption; these guidelines will complement the existing *legislation and standards for biosecurity in hatcheries in Viet Nam - Decision 1405-QD-TTg of 2007* and its amendment, Circular 60/2008/TT-BNN of 2008.

CHINA

Output A - Activity 1:

A series of missions have been undertaken by PPP experts to Beijing, Guangdong and Hong Kong during the past six months, and several meetings/workshops were held with MoA, local veterinary services of Guangdong province and other relevant stakeholders, covering both the public and the private sectors. Each and all these activities have produced concrete action plans or results as below:

The first mission of the PPP expert took place from 11 to 27 April 2011 to kick-start the PPP activities in the country. During this mission, meetings were held with several representatives from both the public and the private sectors in Beijing, Guangzhou and Hong Kong to introduce the PPP concept and to assess the local situation. Based upon the initial findings and discussions, following documents were produced:

- A project concept note and a work plan, outlining the critical elements in the process of the engagement of all stakeholders in a structured way; and
- A detailed Action Plan serving as a proposed roadmap for consideration of MoA, FAO and other potential stakeholders.

On 18 July 2011, a PPP Project Launching Workshop was organized in Beijing by The Emergency Centre for Transboundary Animal Diseases (ECTAD) China, with the participation of three international experts (the PPP expert, a Biosecurity Technical Advisor and an Animal Disease Management expert), ECTAD China staff, representatives from the World Health Organization (WHO), MoA, Guangdong Provincial Veterinary Services and Guangzhou Animal Health Inspection Institute. During the meeting, the PPP concept note and its application in LBMs were presented and discussed. A formal Action Plan was shared with the participants, and a wholesale LBM (the Jiangcun Poultry Wholesale Market in Guangzhou) was identified in Guangdong province as a pilot site for the PPP project.

From 19 to 22 July 2011, the PPP experts and ECTAD China staff conducted a field mission to Guangzhou. A market visit was carried out to identify the biosecurity, animal health and human health issues of the targeted market following a critical control point (CCP) analysis. Discussions were held with the Guangzhou Jiangcun Poultry Wholesales Market management and traders as well as with the Guangzhou Administration for Industry and Commerce to obtain more detailed information about the market management, institutional framework and bio-

security issues; Additional information was gathered about the poultry flow into and out of the market as a basis for social networking mapping; The mission ended with a PPP Stakeholder Meeting on 22 July, which involved the PPP mission team, staff from Guangdong Provincial Veterinary Services and Guangzhou Animal Health Inspection Institute, and stakeholders from Jiangcun Poultry Wholesales Market. Findings and recommendations as well as a proposed business model for changes in the market were shared with the various stakeholders.

In late July, based on discussions in Guangzhou, the PPP team developed an action plan with a proposed time frame and estimated costing to be further discussed with the stakeholders and to agree on the different roles and shares between public and private partners.

In early August, the PPP mission team visited Guangdong again to collect additional information on the market flow and to present the action plan to the veterinary authorities and relevant stakeholders:

In a meeting held on 2 August, the Action Plan for LBM restructuring was presented, including the seven biosecurity critical control points (CCPs) to be addressed:

1. Single entry and single exit-one way flow;
2. Establish a vehicle cleaning and disinfection(C&D) station;
3. Training on biosecurity and C&D practices;
4. Bamboo crate decommissioning;
5. C&D of market sheds;
6. Introduction of SOPs for water testing and improve waste water flow in the waterfowl area;
7. Improve waste disposal management.

ECTAD China staff also conducted a market survey using social network analysis method, collected questionnaires related to market chain in order to obtain baseline information about vendor's trading practices, which led to the production of a series of maps describing LBM networks in the province.

On 4 August 2011, a meeting was held in MoA, with the participation of the PPP Expert, ECTAD China team and the Veterinary Bureaus of MoA. The project results and findings from Jiangcun Poultry Wholesales Market were shared and discussed. The feedback for PPP project from MoA were positive; MoA recognized that the PPP project enables to involve more stakeholders into the planned activities, which benefits not only the public but also the private sector; MoA also agreed that a collaborative mechanism can be established through joint project activities, and the relationships between the public and private sectors will be harmonized and enhanced. Both national and provincial authorities agreed to support this activity and actively contribute to the project activities. In addition, Guangdong province already promised to contribute financially to the project and MoA also mentioned it will include some funding for next year's work plan.

Biosecurity equipment and supplies for Jiangcun Poultry Wholesales Market were confirmed by PPP experts and were procured by ECTAD China in September 2011.

Planned activities for the next six-month period**BANGLADESH****Output A - Activities:**

- Facilitate the implementation of a *compartmentalization plan* that will enable the resumption of export of fertile eggs and day old chicks by the Bangladeshi poultry industry. The establishment of disease free compartments, using the developed guidelines, will require a close collaboration between the DLS, large poultry companies and reference laboratories.
- Support the establishment of *National Poultry Improvement Plans*.
- Facilitate and extend the process related to farm registration and licensing, including the revision of the existing farm registration protocol and link the farm registration system with the geospatial database of commercial farms and LBMs and the implementation of minimum biosecurity standards.

NEPAL**Output A - Activities:**

- No additional activities are anticipated to take place in Nepal.

LAO PDR**Output A - Activities:**

- No additional activities are anticipated to take place in Lao PDR.

CAMBODIA**Output A - Activities:**

- No additional activities are anticipated to take place in Cambodia.

CHINA**Output A - Activities:**

- Biosecurity equipment and suppliers will be procured and delivered to Guangzhou Health Inspection Institute and Jiangcun Poultry Wholesales Market in October before training.
- A four-day training on biosecurity and cleaning and disinfection practices will be organized for market supervisors and cleaners (total 30 person) in late October 2011.
- A vehicle cleaning station at the exit of the Jiangcun market will be designed, and possible companies for the construction identified.
- Laboratory testing issues in the market as well as improvements of the slaughter area will be discussed further.
- Jiangcun Poultry Wholesales Market will be set as a model in the pilot province.
- Finalize the PPP project and submit the final project report to MoA and other stakeholders.

MYANMAR**Output A - Activities:**

- Develop and deliver TOT on biosecurity for private and public veterinarians and leading producers at poultry production zones.
- Support the establishment of washing station at the wholesale LBM of Yangon.
- Support the establishment of a model farm for better temperature control and improved performances.

VIET NAM**Output A - Activities:**

- Conduct hatchery biosecurity and management training programme for traditional hatcheries owners and DLP and DAH officers, in Quang Tri province and possibly also in Hung Yen province.
- Finalize the development of the *biosecurity guidelines for hatcheries* and support the implementation.
- Develop and deliver biosecurity auditing training programme for hatcheries DLP and DAH officers.
- Support the implementation of the *biosecurity guidelines for small poultry production sites*.
- Support the establishment of biosecured model farm/s and hatchery in Quang Tri province.
- Develop a set of *fact sheets about biosecurity and good farming practices* to be delivered to poultry producers by Agri-vet shops, as part of a strengthening technical and advisory capacity of private Agri-vet store owners in Quang Tri Province.
- Develop a simplified *field "Farm C&D manual"* for poultry producers and DLP and DAH officers.

Main challenges encountered and response provided

The candidate for the PPP consultancy position declined the offer, which left the project without a dedicated person to coordinate activities and support the countries in this area. The biosecurity consultant fills this role in biosecurity activities that overlap with PPP activities.

CHINA

In China the following challenges were encountered:

- LBMs in China are being jointly supervised by the State Administration of Industry and Commerce (SAIC), the Ministry of Health (MoH) and the Ministry of Agriculture (MoA) under the Central Government and departments of industry and commerce administration, health and agriculture from the local government. After consultation with MoA and local authorities in Guangzhou, the pilot project was proposed to be carried out in a wholesale poultry market instead of a regular retail LBM.
- Challenges encountered in the wholesale market are related to the potential negative impact of changes in the market on the sales process, and thus on the buy-in of the vendors: some proposed changes will therefore be implemented on a trial basis, such as the substitution of bamboo crates by plastic crates. The proposed one-way traffic flow in the market was not accepted owing to the negative impact on the sales for the vendors.

Main progress made towards the achievement of project outcomes**BANGLADESH**

- A full set of *biosecurity SOPs* has been developed and is currently being field tested. These SOPs will support the implementation of the *national biosecurity guidelines* for the commercial poultry industry.
- A series of meetings with stakeholders from the public and private sectors took place in Dhaka, regarding the establishment of disease-free compartments. These compartments will enable the resumption of export of fertile eggs and day old chicks.
- A *set of guidelines for compartmentalization* (based on the OIE manuals) which outlines all the requirements for the establishment of compartments has been developed.

MYANMAR

- Biosecurity practices at production zones in *three districts were reviewed and recommendations for biosecurity improvements* provided.
- Biosecurity practices at the Yangon wholesale market were reviewed and recommendations for biosecurity improvements were provided, including the support in establishment of a washing station for the departing vehicles and crates. This will greatly reduce the risk of disease transmission (HPAI) from markets to farms.

NEPAL

- *National guidelines for biosecurity in the commercial poultry industry* have been developed.
- Two farm biosecurity training sessions were delivered in Chitwan district, where 70% of all poultry in Nepal is reared. The first session was a TOT programme, while the second session targeted poultry producers.
- A suitable site for the establishment of poultry health inspection yard was identified in the Dhanu district which supply large amount of native type chickens to Kathmandu and Pokhara.

LAO PDR

- A national biosecurity guideline for the commercial poultry industry has been developed.
- Two farm biosecurity training sessions for producers, livestock officers, feed suppliers and traders were delivered in Vang-vieng and Savanaket.

CAMBODIA

- Supported by the project, the Chbar Ampov LBM in Phnom Penh has gone through a biosecurity improvement plan which includes improvements in infrastructure, such as the installations of water points, holding cages and work benches, and procedural improvements, such as new C&D programme and restricted traffic through the market.

VIET NAM

- A set of *guidelines for biosecurity on small poultry production sites of chickens and ducks* has been developed with the participation of stakeholders from the public and private sectors.
- Two farm biosecurity training sessions for participants from the public sector, provincial and district veterinary officers and from the private sector, duck and chicken producers, agri-vet shop owners and poultry clubs members were delivered in the Kien Giang and Quang Tri provinces.
- A set of *guidelines for biosecurity in hatcheries* has been developed
- A *hatchery biosecurity auditing checklist* has been developed and tested in Hung Yen province.

CHINA

- The launching of PPP project in Guangdong province has further increased the scope and impact of USAID funded project activities in Southern China, which has already significantly contributed to the prevention and control of HPAI within the country.
- MoA recognized that both the public and the private sectors can benefit from this project.
- The involvement and commitment of various stakeholders from both the public and the private sectors towards the elimination of H5NI HPAI viruses has been reaffirmed. Both national and provincial support for this project is currently available. Guangdong Province is ready to provide financial support and to actively participate in the coordination and organization of several project missions and activities; MoA is also considering to fund LBM restructuring in the future.
- The implementation of the PPP project will increase the understanding of risk factors in the poultry sector through market/value chain analysis and LBMs restructuring.

Project Monitoring Sheet: **OSRO/GLO/707/USA**

Project Title: Continued support to the FAO/ECTAD Advocacy and Communication Unit to provide strategic technical assistance and strengthen in-country capacities, competencies and leadership in advocacy and advocacy-related communication against Highly Pathogenic Avian Influenza and other Emerging Infectious Diseases

Reporting period: **April – September 2011**

Country: Bangladesh, Egypt, Indonesia and Viet Nam
Project title: Continued support to the FAO/ECTAD Advocacy and Communication Unit to provide strategic technical assistance and strengthen in-country capacities, competencies and leadership in advocacy and advocacy-related communication against Highly Pathogenic Avian Influenza and other Emerging Infectious Diseases
Code: OSRO/GLO/707/USA
Budget: USD 1 500 000 (Phase I); USD 1 000 000 (Phase II)
Total budget: USD 2 500 000
Effective starting date: 1 October 2007
Planned end date: 31 December 2011
<p>Context of the project</p> <p>The current project is an extension, which commenced in October 2007. The project was initiated and extended to address the issue of limited core skills in advocacy and contemporary approaches to strategic communication planning within livestock departments/veterinary services of the Ministries of Agriculture (MoAs). Thus, they require capacity development in order to be able to provide leadership and coordination in developing and implementing evidence-based advocacy, strategic communication and extension campaigns.</p>
<p>Objectives of the project</p> <p>The core objectives which remain unchanged for the extension period are:</p> <ul style="list-style-type: none"> • Building in-country advocacy, communication and extension capacities, competencies and leadership. • Developing effective and evidence-based advocacy, communication and extension strategies and interventions. • Strengthening in-country collaboration and coordination. <p>These core objectives translate into the following key components of the project extension:</p> <ul style="list-style-type: none"> • Development, utilization and dissemination of advocacy training and capacity development modules/materials for veterinary services, epidemiology staff, extension staff, as well as the Food and Agriculture Organization of the United Nations (FAO) and civil society organizations, with a focus on Highly Pathogenic Avian Influenza (HPAI)/Emerging Infectious Diseases (EIDs); • Production and dissemination of HPAI/EIDs advocacy and community extension and mobilization materials; • Production and dissemination of regional advocacy strategy and networking materials, and support in developing national advocacy strategies and plans; and • Capacity development for Advocacy Extension Officers (AEOs) to provide in-country support for implementation of advocacy activities.
<p>Planned activities</p> <p>The project comprises three components with specific outputs and activities for each. This report contains implementation details only on those components/outputs, where activities have been implemented. Where components/outputs are not reported, it can be assumed that no activities were conducted as per the project timetable/work plan during this reporting period.</p>

Component 1: Building in-country capacity, competencies and leadership in strategic advocacy and advocacy-related communication

Output 1.1: Training and capacity development materials focusing on advocacy and advocacy-related strategic communication and planning/leadership for prevention and control of HPAI and EIDs are developed for training of and use by MoA's livestock departments and veterinary services communication, extension and technical staff

Activity 1.1.2: Disseminate multi-media advocacy and community mobilization materials for use by MoAs livestock departments and veterinary services in preparedness, prevention and control of HPAI and EIDs

Activity 1.1.3 Disseminate training/capacity development materials on strategic advocacy and advocacy-related communication and planning for HPAI/EIDs

Output 1.2: Technical capacities and capabilities of MoA's livestock departments and veterinary services to plan and mount effective interventions in strategic advocacy and strategic communication interventions are strengthened

Activity 1.2.1 Conduct six training workshops in four countries (Bangladesh, Egypt, Indonesia and Viet Nam) on strategic advocacy and advocacy-related communication planning and leadership for the prevention and control of HPAI and other EIDs

Component 2: Developing effective and evidence-based regional and national advocacy strategies and a regional strategic communication framework for preparedness, prevention and control of HPAI and other EIDs

Output 2.1: FAO Regional Advocacy Strategy is developed and disseminated

Activity 2.1.6 Conduct two-day stakeholder workshop with 30 participants involved in the 12-monthly advocacy strategy review

Output 2.2: National level advocacy strategies are developed in Indonesia and Viet Nam

Activity 2.2.1 Conduct two five-day advocacy strategy development workshops in Indonesia and Viet Nam with 25 local participants

Output 2.3: Develop capacity in advocacy among veterinary, field epidemiology and extension staff, as well as FAO and civil society organizations, etc.

Activity 2.3.1 Conduct four four-day workshops in four countries to build capacity in advocacy and communication planning and leadership for 20 persons per workshop (workshops to be used to develop national advocacy plans with goals, timeframes and related interventions)

Output 2.4: Advocacy materials are developed, utilized and disseminated during the workshops outlined in Output 2.3/Activity 2.3

Activity 2.4.1 Develop advocacy material as identified and utilized in four four-day workshops in four countries

Output 2.6: The capacity of FAO AEOs to provide in-country support for implementation of advocacy activities is developed

Activity 2.6.1 Support FAO AEOs in developing national advocacy strategies, collaborate in capacity development workshops and mentor local capacity development

Activity 2.6.2 Develop local advocacy materials

Output 2.7 New tools, processes and approaches are developed for communicating technical information on EIDs effectively

Activity 2.7.1 Conduct three pilot workshops (in Egypt, Indonesia and Viet Nam) to develop curriculum modules for communicating technical information on EIDs to non-technical audiences and to develop the outputs from the workshop already conducted in Bangladesh

Activity 2.7.2 Conduct pre- and post-evaluation exercises to evaluate the effectiveness of the tools, processes and approaches

Activity 2.7.3 Share new tools with communication partners, government ministries and departments, community service organizations (CSOs) and others, including through a local workshop for dissemination of curriculum processes for communicating on HPAI/EIDs/animal diseases and engaging risk audiences in dialogue

Output 2.8 New multi-disciplinary data gathering protocols are developed to inform community communication interventions

Activity 2.8.1 Conduct consultations with collaborators and partners: through a national workshop to develop new guidelines/standard operating procedures (SOPs) for designing multi-disciplinary research protocols for gathering data about knowledge, culture, attitudes, practice, socio-economics and other aspects of affected communities

Component 3: Strengthening in-country collaboration and coordination

Output 3.1 Best practices are documented and disseminated

Activity 3.1.2 Collect lessons learned and best practices from countries of the region

Activity 3.1.3 Develop a dissemination format that enables other countries to replicate practices in their own setting

Activities undertaken during the reporting period

Component 1: Building in-country capacity, competencies and leadership in strategic advocacy and advocacy-related communication

Output 1.1: Training and capacity development materials focusing on advocacy and advocacy-related strategic communication and planning/leadership for prevention and control of HPAI and EIDs are developed for training of and use by MoA's livestock departments and veterinary services communication, extension and technical staff

Activity 1.1.2: Disseminate multi-media advocacy and community mobilization materials for use by MoAs, livestock departments and veterinary services in preparedness, prevention and control of HPAI and EIDs

Activity 1.1.3 Disseminate training/capacity development materials on strategic advocacy and advocacy-related communication and planning for HPAI/EIDs

- A dissemination platform to enable MoAs, livestock departments and veterinary services involved in preparedness, prevention and control of HPAI and EIDs was developed to access advocacy and community mobilization materials. The platform will be launched on the FAO Web site during the next reporting period. The platform is web-based, incorporating audio-visual materials including video, photography and audio and constituting a unique training and capacity development resource for animal health/veterinary services personnel. The resource will support the personnel in combating animal diseases and EIDs by advocating for innovative participatory approaches to disease prevention and in providing tools and replicable methodologies. The FAO consultant based at Rome headquarters, funded under the United States Agency for International Development (USAID) project, produced the capacity development for community mobilization and advocacy materials for use by animal health and communication personnel. The materials comprise: an advocacy process guide on social mobilization interventions to enhance biosecurity for the prevention of animal diseases; a case study on the effectiveness of utilizing advocacy and social mobilization processes to enhance the implementation of biosecurity measures in at-risk farming communities; and an advocacy guide to partnerships with the media for livestock and veterinary services.

Output 1.2: Technical capacities and capabilities of FAO's livestock departments and veterinary services to plan and mount effective interventions in strategic advocacy and strategic communication interventions are strengthened

Activity 1.2.1 Conduct six training workshops in four countries (Bangladesh, Egypt, Indonesia and Viet Nam) on strategic advocacy and advocacy-related communication planning and leadership for the prevention and control of HPAI and other EIDs

- This activity was integrated into outputs 2.2 and 2.3 in order to reduce the number of workshops in each country. No workshop activity was carried out in Egypt owing to the political situation.

Component 2: Developing effective and evidence-based regional and national advocacy strategies and a regional strategic communication framework for preparedness, prevention and control of HPAI and other EIDs

Output 2.1 FAO Regional Advocacy Strategy is developed and disseminated

Activity 2.1.6 Conduct two-day stakeholder workshop with 30 participants to conduct 12-monthly advocacy strategy review

- This activity evolved beyond the original expectations of the project, leading to a regional advocacy initiative involving all countries of the region. Regional advocacy gaps were discussed at a meeting in Bangkok on 9 and 10 August 2011, involving senior public/animal health officials from seven countries (and Bangladesh), with a view to developing a regional advocacy plan. The importance of the subject attracted over 70 senior participants (instead of the planned 35). Additional collaborative funding was leveraged from USAID RESPOND initiative through Development Associates International, Bangkok. The regional discussion focused on operationalizing the One Health approach and exploring opportunities and mechanisms for greater collaboration between human health, animal health and the wildlife sectors. The Bangkok meeting in August 2011 further consolidated the process of building an advocacy action plan for promoting One Health at the national level through gaining consensus on four major issues important at the national and regional levels: One Health coordination, joint planning, understanding of One Health and sustainability of One Health initiatives. It was agreed that all four areas would be developed further at the national levels, with FAO's technical support if required, into a country-level action plan. The meeting also launched "Seeing around corners", the regional communication strategy framework against EIDs in Asia and the Pacific, 2011–2016, developed by FAO with inputs from the United Nations Children's Fund (UNICEF), the World Health Organization (WHO), the Academy for Educational Development (AED) and others.

Output 2.2 National level communication and advocacy strategies are developed in Bangladesh, Indonesia and Viet Nam

Activity 2.2.1 Conduct two five-day advocacy strategy development workshops in Indonesia and Viet Nam with 25 local participants

- The Viet Nam workshop was conducted on 12 and 13 July 2011 with the objectives of: (i) reviewing/assessing existing communication strategies for HPAI and other EIDs to identify gaps, strengths and opportunities; (ii) reviewing and assessing existing needs in advocacy; (iii) introducing the FAO Regional Framework for a Communication Strategy against EIDs, 2011–2016; and (iv) creating an understanding of strategic new advocacy and communication needs and challenges in the context of One Health. It was attended by 26 participants from the human health, animal health and wildlife sectors, together with the United Nations and other partner agencies. The meeting concluded with an agreement on the need for Viet Nam to develop a One Health-based communication and advocacy strategy against infectious diseases.

Output 2.3 Develop capacity in advocacy among veterinary, field epidemiology and extension staff, as well as FAO and civil society organizations

Activity 2.3.1 Conduct four four-day workshops in four countries to build capacity in advocacy and communication planning and leadership for 20 persons per workshop (workshops to be used to develop national advocacy plans with goals, timeframes and related interventions)

- No workshop activity was carried out in Egypt owing to the political situation in the country. Capacity development workshops are planned for Bangladesh (December 2011), Indonesia (December 2011) and Viet Nam (October 2011) on the subjects of advocacy and advocacy-related communication building. The three planned workshops were reduced to a duration of three days following requests from national governments, who did not wish to lend staff for a longer duration. They were postponed to October–December 2011 to allow the participation of senior government officials from various ministries and departments in each country.

Output 2.4 Advocacy materials are developed, utilized and disseminated during the workshops outlined in Output 2.3/Activity 2.3

Activity 2.4.1 Develop advocacy materials as identified and utilize in four four-day workshops in four countries

- The following advocacy materials were developed during the project period and will be shared during the upcoming workshops: (i) Seeing around corners, the regional communication strategy framework. Already shared and will be revisited during the workshop; (ii) two video films, Messages from the farm and Farmers in dialogue, representing best identified practices from Bangladesh and Viet Nam; (iii) two eight-page A4-sized brochures, Messages from the farm and Farmers in dialogue, representing best identified practices from Bangladesh and Viet Nam; (iv) a 13-session curricular module for introducing a basic technical framework for understanding health, disease transmission and prevention in socially and culturally acceptable terms for non-technical audiences; and (v) a draft report of a One Health advocacy action plan to be developed further by the countries in the region.

Output 2.6 The capacity of FAO AEOs to provide in-country support for implementation of advocacy activities is developed

Activity 2.6.1 Support FAO AEOs in developing national advocacy strategies; collaborate in capacity development workshops; and mentor local capacity development

Activity 2.6.2 Develop local advocacy materials

- A second capacity development workshop for FAO AEOs from Bangladesh, Indonesia and Viet Nam was conducted on 11 August 2011 at FAO in Bangkok. The meeting included detailed discussions and demonstrations of dialogue processes and tools, including the curricular tools to be tested in Bangladesh (see Output 2.7). There was also a discussion of advocacy and a demonstration of the Figureheads discussion tool.

Output 2.7 New tools, processes and approaches are developed for communicating technical information on EIDs effectively

Activity 2.7.2 Conduct pre- and post-evaluation exercises to evaluate the effectiveness of the tools, processes and approaches

Activity 2.7.3 Share new tools with communication partners, government ministries and departments, CSOs and others, including through a local workshop for dissemination of curriculum processes for communicating on HPAI/EIDs/animal diseases and engaging risk audiences in dialogue

- A curricular module to impart a basic conceptual framework on microorganisms and their roles in human and animal disease was developed for testing in the field. The objectives of developing these tools were to: (i) develop socially and culturally

acceptable processes for communicating information about health, disease and prevention to lay audiences; (ii) develop dialogue-based approaches to increase participation in and ownership by audiences; and (iii) develop an integrated, multi-disciplinary approach from the outset, so that future modules could avoid a narrow single-disease focus. The first of the tool testing workshops was conducted from 13 to 16 September 2011 in Bangladesh and attended by 25 community members, comprised of backyard farmers, commercial farmers, community animal health workers, public health assistants, vendors and market committee members. The FAO Technical Team from Bangladesh served as observers and co-facilitators of the workshop. Participants were tested in a field exercise involving visiting farms and markets and developing a risk map and recommending safety measures. There were quantitative pre- and post-tests of knowledge as well qualitative assessments based on the final risk map output by participants. The quantitative test methodology was later found to have flaws, and recommendations were made for changing the testing process in the remaining two tests (in Viet Nam and Indonesia) which will be carried out in December 2011. The qualitative assessments by the FAO Technical Team and participants indicated that the new tools were effective in imparting a comprehensive conceptual framework for a deeper understanding of microorganisms, infection and prevention. The curricular modules are currently being designed and will be printed and ready for further testing by the end of October 2011.

Output 2.8 New multi-disciplinary data gathering protocols are developed to inform community communication interventions

Activity 2.8.1 Conduct consultations with collaborators and partners: through a national workshop to develop new guidelines/SOPs for designing multi-disciplinary research protocols for gathering data about knowledge, culture, attitudes, practice, socio-economics and other aspects of affected communities

- The exercise for developing new data gathering protocols was postponed partly because of insufficient collaboration. The closure of the United Nations System Influenza Coordination (UNSIC), as well as the dissolution of AED made it difficult to convene further collaborative meetings in the absence of key partners. This exercise will be continued and developed as soon as a more stable quorum of partners are identified.

Component 3: Strengthening in-country collaboration and coordination

Output 3.1 Best practices are documented and disseminated

Activity 3.1.2 Collect lessons learned and best practices from countries of the region

Activity 3.1.3 Develop a dissemination format that enables other countries to replicate practices in their own setting

- Two outstanding best practices, Farmers Clubs in Viet Nam and the SMS Gateway in Bangladesh for fighting HPAI, were researched thoroughly. A print presentation format was developed that helped readers quickly grasp the salient features and benefits of the practice. Based on this format, two video films have been produced, *Farmers in dialogue* (in Viet Nam) and *Messages from the farm* (in Bangladesh). They will be available to partners and donors for use and dissemination by the end of October 2011 and posted on FAO Web site. Both films will be translated and dubbed in Vietnamese, Bangla and Bahasa Indonesia for sharing with community audiences in those countries. In addition, two booklets were printed on the above practices and will be available as part of the advocacy package. The booklets, bearing the same name as the films, are eight pages, A4-sized and in full color, and will be available in English, Bangla, Bahasa Indonesia and Vietnamese.

Planned activities for the next three-month period (the project will be completed on 31 December 2011)

309

Component 1: Building in-country capacity, competencies and leadership in strategic advocacy and advocacy-related communication

Output 1.1: Training and capacity development materials focusing on advocacy and advocacy-related strategic communication and planning/leadership for prevention and control of HPAI and EIDs are developed for training of and use by MoA's livestock departments and veterinary services communication, extension and technical staff

Activity 1.1.2: Disseminate multi-media advocacy and community mobilization materials for use by MoAs, livestock departments and veterinary services in preparedness, prevention and control of HPAI and EIDs

Activity 1.1.3 Disseminate training/capacity development materials on strategic advocacy and advocacy-related communication and planning for HPAI/EIDs

Component 2: Developing effective and evidence-based regional and national advocacy strategies and a regional strategic communication framework for preparedness, prevention and control of HPAI and other EIDs

Output 2.3 Develop capacity in advocacy among veterinary, field epidemiology and extension staff, as well as FAO and civil society organizations

Activity 2.3.1 Conduct four four-day workshops in four countries to build capacity in advocacy and communication planning and leadership for 20 persons per workshop (workshops to be used to develop national advocacy plans with goals, timeframes and related interventions)

- Conduct capacity development workshops in Bangladesh (December 2011), Indonesia (December 2011) and Viet Nam (October 2011) on the subjects of advocacy and advocacy-related communication building.

Output 2.4 Advocacy materials are developed, utilized and disseminated during the workshops outlined in Output 2.3/Activity 2.3

Activity 2.4.1 Develop advocacy material as identified and utilized in four four-day workshops in four countries

- No workshop activity will be carried out in Egypt. Share the advocacy materials described in 'Main progress made towards the achievement of project outcomes' under Output 2.4 in workshops taking place during October–December 2011.

Output 2.7 New tools, processes and approaches are developed for communicating technical information on EIDs effectively

Activity 2.7.1 Conduct three pilot workshops (in Indonesia and Viet Nam) to develop curriculum modules for communicating technical information on EIDs to non-technical audiences; and to develop the outputs from the workshop already conducted in Bangladesh

Activity 2.7.2 Conduct pre- and post-evaluation exercises to evaluate the effectiveness of the tools, processes and approaches

Activity 2.7.3 Share new tools with communication partners, government ministries and departments, CSOs and others, including through a local workshop for dissemination of curriculum processes for communicating on HPAI/EIDs/animal diseases and engaging risk audiences in dialogue

- Conduct tools testing workshops in Indonesia and Viet Nam in December 2011. Design of curricular modules is currently in process; print and prepare curricular modules for further testing by the end of October 2011.

Output 2.8 New multi-disciplinary data gathering protocols are developed to inform community communication interventions

Activity 2.8.1 Conduct consultations with collaborators and partners through a national workshop to develop new guidelines/SOPs for designing multi-disciplinary research protocols for gathering data about knowledge, culture, attitudes, practice, socio-economics and other aspects of affected communities.

- Continue and develop as soon as a more stable quorum of partners are identified, following the closure of UNSIC and AED.

Component 3: Strengthening in-country collaboration and coordination

Output 3.1: Best practices are documented and disseminated

- Make available two outstanding best practices, Farmers Clubs in Viet Nam and the SMS Gateway in Bangladesh for fighting HPAI, for dissemination via video/DVDs, FAO Web site and printed booklets during October 2011. Make the materials available in English, Bangla, Bahasa Indonesia and Vietnamese languages.

Main challenges encountered and response provided

During the reporting period, delays were experienced in Egypt owing to the political situation in the country. For this reason, a mission to undertake the production of advocacy materials for the prevention of HPAI and other animal diseases could not take place in May 2011. However, project activities commenced during the reporting period and will continue. Furthermore, government-related delays occurred in Bangladesh, Indonesia and Viet Nam, which affected the timing of the final project workshops. The workshops required the participation of senior government officials from various ministries and departments in each country, and the organization of such workshops depended on their availability. Consequently, the timing of the workshops was postponed from September 2011 to October December 2011.

Main progress made towards the achievement of project outcomes

Component 1: Building in-country capacity, competencies and leadership in strategic advocacy and advocacy-related communication

- The following training/capacity development materials on strategic advocacy and advocacy-related communication and planning for HPAI/EIDs were developed for use by animal health and communication personnel: an advocacy process guide on social mobilization interventions enhancing biosecurity; a case study on the effectiveness of utilizing advocacy and social mobilization processes to enhance the implementation of biosecurity measures in at-risk farming communities; and an advocacy guide on partnerships with the media for livestock and veterinary services.
- An innovative multi-media, web-based dissemination platform was developed to enable MoAs, livestock departments and veterinary services involved in preparedness, prevention and control of HPAI and EIDs to access the advocacy and community mobilization materials and serve as a training and capacity development resource. It advocates for participatory approaches to disease prevention and provides tools and replicable methodologies.

Component 2: Developing effective and evidence-based regional and national advocacy strategies and a regional strategic communication framework for preparedness, prevention and control of HPAI and other EIDs

- Regional Advocacy Strategy was discussed at a two-day stakeholder workshop in Bangkok on 9 and 10 August 2011 with 70 participants (instead of the initially planned

involving senior public/animal health officials from seven countries (and Bangladesh) with a view to developing a regional advocacy plan. Consensus was gained on four major issues of the advocacy plan important at national and regional levels to be developed further, with FAO's technical support, into a country-level action plan. The meeting also launched "Seeing around corners", the regional communication strategy framework against EIDs in Asia and the Pacific, 2011–2016, developed by FAO with inputs from UNICEF, WHO, AED and others.

- A five-day communication/advocacy strategy development workshop was conducted in Viet Nam on 12 and 13 July 2011 with 26 local participants from the human health, animal health and wildlife sectors, together with United Nations and other partner agencies. It was agreed that there was the need for Viet Nam to develop a One Health-based communication and advocacy strategy against infectious diseases.
- The following advocacy materials were developed during the project period and will be shared during the upcoming workshops: (i) *Seeing around corners*, the regional communication strategy framework; (ii) two video films, *Messages from the farm* and *Farmers in dialogue*, representing best identified practices from Bangladesh and Viet Nam; (iii) two eight-page A4-sized brochures, *Messages from the farm* and *Farmers in dialogue*, representing best identified practices from Bangladesh and Viet Nam; (iv) a 13-session curricular module for introducing a basic technical framework for understanding health, disease transmission and prevention in socially and culturally acceptable terms for non-technical audiences; and (v) a draft report of a One Health advocacy action plan to be developed further by the countries in the region.
- A second capacity development workshop for FAO AEOs from Bangladesh, Indonesia and Viet Nam was conducted on 11 August 2011 at FAO in Bangkok. The meeting included detailed discussions and demonstrations of dialogue processes and tools, including the curricular tools to be tested in Bangladesh (see Output 2.7). There was also a discussion of advocacy and a demonstration of the Figureheads discussion tool.
- A curricular module to impart a basic conceptual framework on microorganisms and their roles in human and animal disease was developed for testing in the field. The first of the tools testing workshops was conducted from 13 to 16 September 2011 in Bangladesh and attended by 25 community members, comprised of backyard and commercial farmers, community animal health workers, public health assistants, vendors and market committee members. The FAO Technical Team from Bangladesh served as observers and co-facilitators of the workshop. Participants were tested at the end in a field exercise involving visiting farms and markets and developing a risk map and recommending safety measures. The qualitative assessments by the FAO Technical Team and participants indicated that the new tools were effective in imparting a comprehensive conceptual framework for a deeper understanding of microorganisms, infection and prevention.
- Two outstanding best practices, Farmers Clubs in Viet Nam and the SMS Gateway in Bangladesh for fighting HPAI, were researched thoroughly. A print presentation format was developed helping readers to quickly grasp the salient features and benefits of the practice. Based on this format, two videos were produced, *Farmers in dialogue* (in Viet Nam) and *Messages from the farm* (in Bangladesh). In addition, two booklets of eight pages and A4-sized were printed on the above practices and will be available as part of the advocacy package.

Project Monitoring Sheet: **OSRO/IND/802/USA**

Project Title: **Immediate technical Assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) to India**

Reporting period: **October 2010 – March 2011**

Country: India
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) to India
Code: OSRO/IND/802/USA
Budget: USD 1 220 000 (Phase I)
Total budget: USD 3 000 000 ¹
Effective starting date: 28 June 2010
Planned end date: 30 June 2013 (current NTE of Phase I – 30 September 2011)
<p>Context of the project</p> <p>This project will focus on the eastern Indian states of Assam and West Bengal in the short-term with a longer term capacity building of animal health personnel, especially in the field of surveillance, epidemiological analysis and in-depth disease investigation. The project focuses on understanding the dynamic patterns of the poultry production systems, value/supply chains and trade in poultry and poultry products within India.</p> <p>The project is expected to provide information on infection and transmission dynamics of the virus in the local environment where the virus persists and to consolidate the capacity to establish and conduct risk-based surveillance programmes. The aim of building capacity to strengthen surveillance and epidemiological analysis will lead to an improved tracking of the virus movement, greater virus isolations and better molecular information on the virus evolution. Such information is critical for rational and targeted control of the disease. With the strategic inputs in the project, the country would be better placed to take a leadership role in supporting regional efforts to control HPAI.</p>
<p>Objectives of the project</p> <p>The project aims to build capacity to improve surveillance and epidemiological analysis in both domestic and wild birds. The overall objective of the programme is to contribute to the elimination of the threat posed by HPAI by controlling the disease in poultry, to ensure that India no longer presents a risk for the development of human pandemic influenza from the H5N1 virus.</p>
<p>Planned activities</p> <p>Output 1: Establishment of an HPAI (Epidemiology) Unit in India</p> <p>Activity 1.1 Establishment of an HPAI (Epidemiology) Unit.</p> <p>Activity 1.2 Coordination of the country programme.</p> <p>Activity 1.3 Management and operations support.</p> <p>Activity 1.4 Capacity building in project/programme management.</p> <p>Output 2: Improved epidemiological capacity within the Department of Animal Husbandry, Dairying and Fisheries (DADF), Ministry of Agriculture (MoA) of India</p> <p>Activity 2.1 Conduct Field Epidemiology Training Programme for Veterinarians (FETPV).</p> <p>Activity 2.2 Conduct outbreak investigation courses for Field/District Veterinary Officers.</p> <p>Activity 2.3 Country visits to study best practices for surveillance (in Thailand for X-ray</p>

¹ This project has a three year duration. Total budget of USD 3 000 000 is subdivided as follows: USD 1 220 000 for year I, USD 948 134 for year II and USD 831 866 for year III. Funds have been committed for year I only; activities planned for years II and III will be implemented based on project performance and fund availability.

surveillance, Indonesia for participatory disease surveillance and response (PDSR) and Viet Nam for grassroots level surveillance).

Activity 2.4 Conduct trainings for grassroots level disease detection and reporting (e.g. community based animal health workers).

Activity 2.5 Provide overseas training in advanced epidemiology and surveillance to the technical staff of DADF.

Output 3: Establishment of a risk-based surveillance programme

Activity 3.1 Develop a grassroots level surveillance programme.

Activity 3.2 Undertake structured virus isolation and characterization.

Activity 3.3 Establish a disease information system dedicated to HPAI.

Output 4: Improved understanding of epidemiology of HPAI in India for rational and targeted control of the disease

Activity 4.1 Study the poultry value chains to include wet markets.

Activity 4.2 Map the farming sectors and socio-economic background along the market and value chains.

Activity 4.3 Conduct data analysis for mapping disease outbreaks and distribution of virus clades.

Activity 4.4 Define infection and transmission dynamics in the context of the various poultry farming systems and socio-economic background.

Activity 4.5 Identify critical points for intervention to control HPAI.

Activities undertaken during the reporting period

Output 1: Establishment of an HPAI (Epidemiology) Unit in India

Activity 1.1: Establishment of an HPAI (Epidemiology) Unit.

Recruitment of national and international staff

- The Chief Technical Advisor (CTA)/Team Leader/international Epidemiology Expert was recruited in October 2010.
- A temporary International Operations Officer worked for the project from October until the end of December 2010. A permanent International Operations Officer was identified, and the recruitment is pending governmental clearance; the anticipated starting date is April 2011.
- The International Geographic Information System (GIS) Expert is expected to commence duties on 3 April 2011.
- A National Operations Officer (finance/administration assistant) was recruited on 1 January 2011.
- Initially, MoA nominated a candidate for the position of national Project Coordinator, but after a new Joint Secretary was appointed at DADF, this nomination was withdrawn. DADF has now requested to fill the post with a mutually agreed candidate.
- Two national staff candidates (HPAI Epidemiology and HPAI Surveillance) received an offer for this position, but they were unable to obtain the necessary release from their current Government positions and had to decline the offer. The project is considering other candidates for these positions.

Renovation of the building at the Animal Quarantine Certification and Service Station, Kapashera

- All the preparatory work required for renovation of the premises assigned to the project by the Government of India is completed. The necessary budget revision was cleared by the United States Agency for International Development (USAID) in November 2010. All technical specifications were cleared by FAO Rome in March 2011. The renovation work was retendered mid-March 2011. It is anticipated that a contract with preferred bidder will be

signed in April 2011. The renovation should be completed by August 2011.

- The HPAI (Epidemiology) Unit will commence working from the Animal Quarantine and Certification Services (AQCS) station in April in a temporary office space. Procedures to purchase equipment for the office commenced in late February 2011.

Activity 1.2 Coordination of the country programme.

- To ensure full cooperation and collaboration with the Government of India, regular contact was maintained with all the officials of DADF. The new Joint Secretary of DADF was updated on the progress of the project regularly. The Joint Secretary was also invited by FAO to represent India at a regional ECTAD meeting in Bangkok in January 2011. Meetings were held with USAID India to inform about the status of the project, the animal disease situation and the Government Veterinary Service capacities.

Activity 1.3 Management and operations support.

- Frequent meetings were held and technical meetings and workshops attended to provide support to the Government of India.

Activity 1.4 Capacity building in project/programme management.

- The Joint Secretary was supported with managerial and technical matters in India and during an overseas meeting.

Output 2: Improved epidemiological capacity within DADF, MoA of India

Activity 2.1 Conduct FETPV.

- The senior regional epidemiologist in charge of the regional FETPV programme visited India twice in the reporting period. Meetings were held with ten stakeholders and organizations to explore future partnerships.

Activity 2.3 Country visits to study best practices for surveillance (in Thailand for X-ray surveillance, Indonesia for PDSR and Viet Nam for grassroots level surveillance).

- The Government of India was officially contacted to nominate eight policy makers and technical staff to visit Viet Nam and Thailand in May 2011. The Governments of Thailand and Viet Nam were contacted and agreed to the visit. In both Thailand and Viet Nam, a national coordinator was appointed.

Activity 2.4 Conduct trainings for grassroots level disease detection and reporting (e.g. community based animal health workers).

- In March 2011, the CTA/TL and national operations manager visited Agartala and Tripura and studied the outbreak response of the HPAI outbreaks in the area. The findings will aid in identifying gaps in the current disease surveillance, which will be addressed in future trainings.

Activity 2.5 Provide overseas training in advanced epidemiology and surveillance to the technical staff of DADF.

- The Government of India was officially contacted to nominate two technical staff to undergo an advanced 3-month epidemiology training in New Zealand from June until August 2011.

Output 3: Establishment of a risk-based surveillance programme

Activity 3.1 Develop a grassroots level surveillance programme.

- FAO studied the three currently existing surveillance programmes in India and recommendations for improvement are forthcoming. Assistance was provided in the process

of preparing for a Government official to travel to Thailand to learn about the Thai X-ray surveillance programme.

Activity 3.2 Undertake structured virus isolation and characterization.

- FAO had requested from the Government of India to undertake structured virus isolation and characterization at the High Security Animal Disease Laboratory, Bhopal of the isolates from the Agartala HPAI H5N1 outbreaks.

Output 4: Improved understanding of epidemiology of HPAI in India for rational and targeted control of the disease

Activity 4.3 Conduct data analysis for mapping disease outbreaks and distribution of virus clades.

- Current and past HPAI outbreaks were mapped. Virus clade identification and phylogenetic tree analysis is pending.

Activity 4.4 Define infection and transmission dynamics in the context of the various poultry farming systems and socio-economic background.

- This research was initiated and will continue.

Activity 4.5 Identify critical points for intervention to control HPAI.

- Report was submitted for technical clearance.

Planned activities for the next six-month period

Output 1: Establishment of an HPAI (Epidemiology) Unit in India

Activity 1.1 Establishment of an HPAI (Epidemiology) Unit.

- Complete the recruitment of international/national staff and the renovation of the building at AQCS station, Kapashera. Move the Epidemiology Unit from its current building to AQCS station and launch its official opening.

Output 2: Improved epidemiological capacity within DADF, MoA of India

Activity 2.1 Conduct FETPV.

- A third visit by the regional senior epidemiologist is planned for May 2011, to recruit trainers and lectures. The first one month training course will be held in August for 30 participants.

Activity 2.2 Conduct outbreak investigation courses for Field/District Veterinary Officers.

- Develop the curriculum and training materials.

Activity 2.3 Country visits to study best practices for surveillance (in Thailand for X-ray surveillance, Indonesia for PDSR and Viet Nam for grassroots level surveillance).

- Conduct a study tour to Thailand and Viet Nam with eight government officials.

Activity 2.4 Conduct trainings for grassroots level disease detection and reporting (e.g. community based animal health workers).

- Develop the curriculum.

Activity 2.5 Provide overseas training in advanced epidemiology and surveillance to the technical staff of DADF.

- Provide training to two technical staff from MoA in advanced epidemiology at Massey University, New Zealand, from June until August 2011.

Output 3: Establishment of a risk-based surveillance programme

Activity 3.1 Develop a grassroots level surveillance programme.

Activity 3.2 Undertake structured virus isolation and characterization.

- Undertake structured virus isolation and characterization for the HPAI outbreaks from Agartala.

Activity 3.3 Establish a disease information system dedicated to HPAI.

- Organize an expert visit to the Project Directorate on Animal Disease Monitoring and Surveillance in Bangalore to assess the current disease information system and recommend enhancements. Assess the need for a disease information system dedicated to HPAI, based on the existing systems and the frequency of HPAI outbreaks.

Output 4: Improved understanding of epidemiology of HPAI in India for rational and targeted control of the disease

Activity 4.3 Conduct data analysis for mapping disease outbreaks and distribution of virus clades.

- Depending on the HPAI situation, conduct this activity at the national or regional level at the Epidemiology Unit.

Activity 4.4 Define infection and transmission dynamics in the context of the various poultry farming systems and socio-economic background.

- Depending on the HPAI situation, undertake this activity at the national or regional level at the Epidemiology Unit.

Activity 4.5 Identify critical points for intervention to control HPAI.

- Depending on the HPAI situation in the reporting period, perform analysis using data gathered prior to this reporting period and the current data.

Main challenges encountered and response provided

- Delay in the clearances for recruitment of international staff from the Government of India was resolved after productive meetings with the Regional Manager and renewed correspondence with the FAO Representative. Government clearance for the international Operations Officer is expected in April 2011.
- Delays in the renovation process of the AQCS station Kapashera owing to the pending FAO technical clearance were resolved.
- Delays in national staff hiring, owing to selected candidates not been released from their Government positions. Other candidates are being considered for the positions.
- Activity 4.1 (Study the poultry value chains to include wet markets) and Activity 4.2 (Map the farming sectors and socio-economic background along the market and value chains) could not be carried out in the reporting period, as the money allocated for this project will be used for the renovation of the AQCS Kapashera offices. These studies are expected to be conducted during the next funding cycle.

Main progress made towards the achievement of project outcomes (from the start of the project activities)

- Signing of the project document of the USAID project OSRO/IND/802/USA.
- Government support in the establishment of an HPAI Epidemiology Unit received.
- Recruitment of international staff.
- Research in HPAI started.

Project Monitoring Sheet: **OSRO/IND/802/USA**

Project Title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) to India

Reporting period: March 2011 - September 2011

Country: India
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) to India
Code: OSRO/IND/802/USA
Budget: USD 1 220 000 (Phase I) Total budget: USD 3 000 000 ¹
Effective starting date: 28 June 2010
Planned end date: 30 June 2013
<p>Context of the project</p> <p>This project will focus on the eastern Indian states of Assam and West Bengal in the short term with a longer-term capacity building of animal health personnel, especially in the field of surveillance, epidemiological analysis and in-depth disease investigation. The project focuses on understanding the dynamic patterns of the poultry production systems, value/supply chains and trade in poultry and poultry products within India.</p> <p>The project is expected to provide information on infection and transmission dynamics of the Highly Pathogenic Avian Influenza (HPAI) virus in the local environment where the virus persists and to consolidate the capacity to establish and conduct risk-based surveillance programmes. The aim of building capacity to strengthen surveillance and epidemiological analysis will lead to an improved tracking of the HPAI virus movement, greater virus isolations and better molecular information on the HPAI virus evolution. Activity 2.2 Conduct outbreak investigation courses for Field/District Veterinary Officers. Activity 2.3 Country visits to study best practices for surveillance (in Thailand for X-ray surveillance, Indonesia for participatory disease surveillance and response [PDSR] and Viet Nam for grassroots level surveillance).</p>

¹ This project has a three year duration. Total budget of USD 3 000 000 is subdivided as follows: USD 1 220 000 for year I, USD 948 134 for year II and USD 831 866 for year III. Funds have been committed for year I only; activities planned for years II and III will be implemented based on project performance and fund availability.

Activity 2.4 Conduct training for grassroots level disease detection and reporting (e.g. community based animal health workers).

Activity 2.5 Provide overseas training in advanced epidemiology and surveillance to the technical staff of DADF.

Output 3: Establishment of a risk-based surveillance programme

Activity 3.1 Develop a grassroots level surveillance programme.

Activity 3.2 Undertake structured virus isolation and characterization.

Activity 3.3 Establish a disease information system dedicated to HPAI.

Output 4: Improved understanding of epidemiology of HPAI in India for rational and targeted control of the disease

Activity 4.1 Study the poultry value chains to include wet markets.

Activity 4.2 Map the farming sectors and socio-economic background along the market and value chains.

Activity 4.3 Conduct data analysis for mapping disease outbreaks and distribution of virus clades.

Activity 4.4 Define infection and transmission dynamics in the context of the various poultry farming systems and socio-economic background.

Activity 4.5 Identify critical points for intervention to control HPAI.

Activities undertaken during the reporting period

Output 1: Establishment of an HPAI (Epidemiology) Unit in India

Activity 1.1: Establishment of an HPAI (Epidemiology) Unit.

Recruitment of national and international staff

- The International Geographic Information System (GIS) expert was recruited and commenced his duties on 3 April 2011.
- The International Operations officer was recruited in April 2011, working from the Food and Agriculture Organization of the United Nations (FAO) office in Rome and joined the team in India on 9 August 2011 upon receipt of Government clearance.
- Three national staff candidates (national Project Coordinator, HPAI Epidemiology and HPAI Surveillance) were selected and received an offer to join FAO. It is expected that they will be released from their current Government position early October.

The complete team is expected to be fully functional from October 2011.

Renovation of the building at the Animal Quarantine Certification and Service Station, Kapashera

- All the preparatory work required for renovation of the premises was completed during the reporting period. The renovation work was retendered mid-March 2011. The local procurement committee approved procedures and the contract with the preferred bidder was signed on 16 September 2011. The renovation should be completed by January 2012.
- The HPAI (Epidemiology) Unit started working from the Animal Quarantine and Certification Services (AQCS) station in April 2011 in a temporary office. Procedures to purchase office and specialized epidemiology equipment are continuing.

Activity 1.2 Coordination of the country programme.

- To ensure full cooperation and collaboration with the Government of India, regular contact was maintained with all the officials of DADF. The new Joint Secretary of DADF was updated on the progress of the project regularly. Meetings were held with the United States Agency for International Development (USAID) India to inform about the status of the project, the animal disease situation, the upcoming FETPV and the Government Veterinary Service capacities.

Activity 1.3 Management and operations support.

- The project ensured alignment of national animal disease control strategies at the local level under the regional and global frameworks: by interacting with local partners (MoA), regional partners -the South Asian Association for Regional Cooperation (SAARC) and the FAO

regional support unit, and globally with the World Organisation for Animal Health (OIE) under the Global Framework for Transboundary Animal Diseases (GF-TADs).

Activity 1.4 Capacity building in project/programme management.

- The Joint Secretary and the Animal Husbandry Commissioner were technically supported in India and before overseas meetings.
- There was continued collaboration with partners (the Centre for Disease Control (CDC), the World Health Organization (WHO) and the International Livestock Research Institute [ILRI]) regarding issues of reduction of recurring highly pathogenic emerging diseases (including HPAI) and transboundary animal diseases threats.

Output 2: Improved epidemiological capacity within DADF, MoA of India

Activity 2.1 Conduct FETPV.

- The senior regional epidemiologist in charge of the regional FETPV programme visited India three times in the reporting period.
- The National Institute of Epidemiology at Chennai has been selected as partner to implement FETPV with FAO and the DADF.
- The DADF nominated 70 veterinarians to be enrolled in the programme.
- A high-level consultation meeting was held to inform and obtain endorsement of participants of the MoA, the Veterinary Council and other human and public health institutions.
- The first three-week FETPV will be conducted in February 2012 for 20 students from the Eastern States.

Activity 2.2 Conduct outbreak investigation courses for Field/District Veterinary Officers.

- The FETPV will conduct outbreak investigation field training starting in February 2012.
- HPAI surveillance training for 400 state veterinarians will be conducted in October and November 2011.

Activity 2.3 Country visits to study best practices for surveillance (in Thailand for X-ray surveillance, Indonesia for PDSR and Viet Nam for grassroots level surveillance).

- Two policy makers, nominated by the MoA, conducted country visits to study best practices for surveillance (in Thailand for X-ray surveillance and Viet Nam for surveillance and vaccination). A report of the mission is available.

Activity 2.5 Provide overseas training in advanced epidemiology and surveillance to the technical staff of DADF.

- Two technical staff, nominated by the MoA, received advanced epidemiology training at Massey University in New Zealand for three months from June until September 2011.

Output 3: Establishment of a risk-based surveillance programme

Activity 3.1 Develop a grassroots-level surveillance programme.

- FAO studied the existing surveillance programme at Project Directorate on Animal Disease Monitoring and Surveillance at Bangalore. A FAO expert from Rome was recruited to assist in improving the animal disease database system. A one-week training was provided for all staff in Spatial Epidemiology.
- Grassroots level surveillance training will be conducted for 400 state veterinarians in October and November 2011.

Activity 3.2 Undertake structured virus isolation and characterization.

- FAO has requested the Government of India to undertake structured virus isolation and characterization at the High Security Animal Disease Laboratory (HSADL) in Bhopal of the isolates from the Assam and West Bengal HPAI H5N1 outbreaks in August and September

2011. Results are pending.

Activity 3.3 Establish a disease information system dedicated to HPAI.

- An expert visit was conducted to the Project Directorate on Animal Disease Monitoring and Surveillance in Bangalore to assess the current disease information system and recommend enhancements.
- The MOA is developing a computer network surveillance system linking all 60 000 state veterinarians at block level. This system will be functional at the end of 2011. FAO will assess this system and decide if it is still necessary to establish a disease information system dedicated to HPAI.

Output 4: Improved understanding of epidemiology of HPAI in India for rational and targeted control of the disease

- No major improvements in understanding of the epidemiology of HPAI were made in the reporting period owing to:
 - o delays in hiring specialized staff; and
 - o lack of funding to employ socio-economist to conduct value chain studies.

Planned activities for the next six-month period

Output 1: Establishment of an HPAI (Epidemiology) Unit in India

Activity 1.1 Establishment of an HPAI (Epidemiology) Unit.

- Complete the recruitment of national staff and the renovation of the building at AQCS station, Kapashera. Move the Epidemiology Unit from its current temporary accommodations to the designated renovated building and launch its official opening.
- Continue constructive interaction and technical support with the Government, partners, SAARC, sub-regional and regional FAO offices.

Output 2: Improved epidemiological capacity within DADF, MoA of India

Activity 2.1 Conduct FETPV.

- The first three-week training course will be held in February 2012 for 20 participants at the National Institute of Epidemiology at Chennai. The second course will be held later that year at the National Centre for Disease Control in New Delhi.

Activity 2.2 Conduct outbreak investigation courses for Field/District Veterinary Officers.

- HPAI surveillance training will be held for 50 veterinarians of each of the eight Eastern States of India in October and November 2011.

Activity 2.3 Country visits to study best practices for surveillance (in Thailand for X-ray surveillance, Indonesia for PDSR and Viet Nam for grassroots level surveillance).

- A study tour will be organized for 12 technical staff of the DADF and state veterinarians to Thailand and Viet Nam.

Activity 2.5 Provide overseas training in advanced epidemiology and surveillance to the technical staff of DADF.

- The project will provide training to two technical staff from MoA in advanced epidemiology at an overseas University in 2012.

Output 3: Establishment of a risk-based surveillance programme

Activity 3.2 Undertake structured virus isolation and characterization.

- Undertake virus characterization for the HPAI outbreaks from Assam (August 2011) and West Bengal (September 2012) and all other HPAI events in the reporting period.

Activity 3.3 Establish a disease information system dedicated to HPAI.

- Assess the need for a disease information system dedicated to HPAI depending on the existing

systems (PD ADMAS), the newly State Veterinarian Computer linked system and the frequency of HPAI outbreaks.

Output 4: Improved understanding of epidemiology of HPAI in India for rational and targeted control of the disease

Activity 4.1 Study the poultry value chains to include wet markets.

- In 2012, a socio-economic consultant will conduct a poultry value chains and wet market study.

Activity 4.2 Map the farming sectors and socio-economic background along the market and value chains.

- Under the guidance of the international spatial epidemiologist and with technical inputs from the socio-economic consultant, the national surveillance manager and the national epidemiologist will collect data and map farms and markets.

Activity 4.3 Conduct data analysis for mapping disease outbreaks and distribution of virus clades.

- Depending on the willingness of the Government of India to share data, the Government requests and the HPAI situation, data analysis for mapping disease outbreaks and distribution of virus clades at the national or regional level will be conducted at the Epidemiology Unit.

Activity 4.4 Define infection and transmission dynamics in the context of the various poultry farming systems and socio-economic background.

- At completion of activities 4.1, 4.2 and 4.3, further analytical research will be conducted at the Epidemiology Unit to define infection and transmission dynamics.

Activity 4.5 Identify critical points for intervention to control HPAI.

- Depending on the HPAI situation in the reporting period and the progress of completing the activities 4.1, 4.2, 4.3 and 4.4, further analysis will identify critical points for intervention to control HPAI.

Main challenges encountered and response provided

- Communication with the DADF has been improved through frequent meetings and assistance from the FAO Representative.
- Delays in the renovation process of the AQCS station Kapashera, owing to the pending FAO technical clearance, were resolved.
- Delays in national staff hiring have been experienced, as the selected candidates had not been released from their Government positions. The three candidates who are still awaiting clearance or lien are expected to start work in October 2011.

Main progress made towards the achievement of project outcomes (from the start of the project activities)

- Signing of the project document of the USAID project OSRO/IND/802/USA.
- Government support in the establishment of an HPAI Epidemiology Unit received.
- Recruitment of international staff.
- Research on HPAI started.
- Enhancement of epidemiology capacity in India.

Project Monitoring Sheet: **OSRO/INS/604/USA**

Project Title: **Reinforcement and expansion of the avian influenza participatory disease surveillance and response programme in Indonesia**

Period: **April 2011 - September 2011**

Country: Indonesia
Project title: Reinforcement and expansion of the avian influenza participatory disease surveillance and response programme in Indonesia
Code: OSRO/INS/604/USA
Budget: USD 44.2 million ¹
Effective starting date: 9 June 2006
Planned end date: 31 December 2011
Context of the project The purpose of the project is to enhance the capacity and ability of the Government of Indonesia and partners to control Highly Pathogenic Avian Influenza (HPAI) in order to help safeguard the health and livelihoods of the Indonesian population by providing broadbased support to the Food and Agriculture Organization of the United Nations (FAO) Indonesia HPAI Control Programme, implemented by the Emergency Centre for Transboundary Animal Diseases (ECTAD) Indonesia.
Objectives of the project Output A: Sustainable surveillance, prevention and control of HPAI in village poultry Output B: Improved biosecurity and vaccination practices in commercial sectors Output C: Improved HPAI surveillance and control along the poultry marketing chain Output D: Engagement with duck producers for improved control of HPAI Output E: Sustainable virus monitoring and vaccine development Output F: Coordinated and enhanced management of the HPAI control programme
Planned Activities Output A: Sustainable surveillance, prevention and control of HPAI in village poultry <i>A.1 Maintain, develop and adapt local government prevention, passive surveillance and outbreak control capacity for village poultry across endemic areas of Indonesia, prioritized by level of HPAI risk; manage a staged transition of costs to local government</i> <i>A.2 Strengthen the capacity of Puskesmas (animal health centres) by integrating the Participatory Disease Surveillance and Response (PDSR) approach; pilot system first in ten Puskesmas animal centres</i> <i>A.3 Increase local government veterinary service competency to detect, diagnose, report and control other animal diseases of zoonotic and economic importance in villages</i> <i>A.4 Develop locally-realistic methods and communication materials for prevention and control of HPAI and other animal diseases of zoonotic and economic importance to enable communities to make informed decisions together and supported by local government</i> Output B: Improved biosecurity and vaccination practices in commercial sectors <i>B.1 Provide specialized technical support to selected layer farmers to enhance production efficiency and quality of layer vaccination and biosecurity measures</i> <i>B.2 Support local government veterinary and laboratory services to engage more effectively with poultry farmers on disease prevention and outbreak investigations (a local government commercial poultry veterinary programme [PVUK])</i> <i>B.3 Facilitate trial of private sector-funded compensation programme</i> <i>B.4 Facilitate government and industry to establish a functional public-private partnership via the National</i>

¹ The breakdown of the total contribution is as follows: USD 4 million for first year (June 2006–May 2007), USD 11 million for second year (June 2007–May 2008), USD 2.7 million for interim extension (June –September 2008), USD 7.5 million for third year (October 2008–May 2009), USD 11 million (June 2009–September 2010) and USD 8 million (October 2010–September 2011).

Poultry Quality Improvement Programme (NPQIP), including regular Biosecurity Coordination meetings
B.5 Evaluate effectiveness of biosecurity measures implemented by poultry producers
B.6 Facilitate design of local government-implemented poultry farm profiling and certification system
B.7 Assist central government to monitor commercial poultry producer compliance with avian influenza (AI) vaccination regulations

Output C: Improved HPAI surveillance and control along the poultry marketing chain

C.1 Support local government to conduct longitudinal surveillance and trace-back for H5 subtype virus and HPAI in live bird markets (LBMs), collector yards and slaughterhouses
C.2 Support implementation of minimum standards of biosecurity and sanitation in selected LBMs, collector yards and slaughterhouses
C.3 Facilitate poultry market restructuring with emphasis on food safety in DKI Jakarta and surrounding areas
C.4 Explore mechanisms to improve interprovincial movement control out of HPAI high-risk provinces

Output D: Engagement with duck producers for improved control of HPAI

D.1 Assess role of ducks in the epidemiology of HPAI in selected areas of Java
D.2 Conduct duck vaccination field trial in one identified high-risk HPAI-endemic area

Output E: Sustainable virus monitoring and vaccine development

E.1 Assist public and private sectors to develop a centrally-managed system to monitor circulating viruses and sustain vaccine efficacy
E.2 Increase knowledge of best practices for AI vaccination in poultry

Output F: Coordinated and enhanced management of the HPAI control programme

F.1 Facilitate implementation of integrated HPAI control plan on one island where the HPAI situation is considered readily controllable
F.2 Strengthen government capacity to conduct veterinary services training and continuing education
F.3 Improve competencies of local government decision-makers to manage sustainable and effective HPAI control programmes and to promote understanding of the economic impact of animal diseases on livelihoods and public health
F.4 Assist central and local governments to design and implement a national veterinary service strategy
F.5 Develop and integrate emerging databases into the national veterinary information system
F.6 Provide technical assistance for establishment of local cold chain capacity
F.7 Increase public visibility of the HPAI control programme
F.8 Provide operational support to enable implementation of the ECTAD Indonesia programme

Activities undertaken during the reporting period

Output A: Sustainable surveillance, prevention and control of HPAI in village poultry

A.1 Maintain, develop and adapt local government prevention, passive surveillance and outbreak control capacity for village poultry across endemic areas of Indonesia, prioritized by level of HPAI risk; manage a staged transition of costs to local government

- A modified PDSR approach for low HPAI incidence areas was developed for Papua and the Introductory I training was carried out in March 2011. As a follow up, the Introductory II training was carried out for 21 participants in July 2011. This training equipped the PDSR to recognize and control an HPAI outbreak, but they were also given guidance on how to recognize hog cholera (a priority disease locally) in order to sustain surveillance in the absence of HPAI. All training costs were funded by the Papua provincial government.
- Introductory I and II trainings (14 persons) and Continuing Education A and B (13 persons) took place in Samarinda, East Kalimantan. All training costs were covered by the local government.
- West Bandung district continued to support PDSR officers from its own budget: Introductory I and II training for 15 participants, and Continuing Education B for 10 participants were carried out.
- PDSR refresher training for 29 participants in DKI Jakarta reviewed experiences and introduced the Participatory Community Engagement (PCE) communication modules.
- The Local Government (LG) team worked with the Market team to carry out a training-of-trainers

(ToT) for 15 Market Surveillance Private Sector Partnership (PSP) and Cleaning and Disinfection (C&D) Officers in Jabodetabek who were trained as facilitators.

- Master Trainers (MTs) assisted in all trainings. This included the three MTs working at the national level, and requests were sent to the respective local government offices for several local MTs to assist in the various trainings. This strengthened the training skills of the MTs and improved their understanding of the broader HPAI control programme.

A.2 Strengthen the capacity of Puskesmas (animal health centers) by integrating PDSR techniques; pilot system first in ten Puskesmas

- The development of *Puskesmas*-focused training was delayed while awaiting clear guidance from the Directorate of Animal Health (DAH). However, the required PCE material was developed and tested and is now ready to train *Puskesmas* veterinarians in communication and participation. The PCE modules were used in PVUK training, rapid response training of PDSR in Bali and with the DKI Jakarta refresher training in Bogor.

A.3 Increase local government veterinary service competency to detect, diagnose, report and control other animal diseases of zoonotic and economic importance in villages

- Seven standard operating procedures (SOPs) to guide the rabies control programme were drafted with stakeholders in Bali and subsequently approved by the Directorate General of Livestock and Animal Health Services (DGLAHS). PDSR expertise developed through the HPAI control programme was leveraged to strengthen the rapid response and post-vaccination surveillance components of the rabies control programme.
- Building on the PDSR and Local Disease Control Centre (LDCC) systems used for HPAI control, a model for rabies eradication in Indonesia is being gradually developed based on the experiences in Bali.
- Assisted DAH to develop a draft work plan to support implementation of the new National Veterinary Service (NVS) system. Components of the NVS system were piloted in the Bali rabies control programme.
- Based on the HPAI control strategy and lessons learned from field implementation, specific parameters were proposed by ECTAD Indonesia for revising the PDSR system to enable more effective control of HPAI in village poultry and the ability to detect and report other animal diseases of importance. The proposal will be discussed further with DAH before moving to the next phase of information system and training programme revision.

A.4 Develop locally-realistic methods and communication materials for prevention and control of HPAI and other animal diseases of zoonotic and economic importance to enable communities to make informed decisions together and supported by local government

- Discussed the development of communication strategy to pass information from the central government to commercial poultry farmers through the LDCC system with the Commercial Poultry Health team. It was concluded that there was a need for increased mutual trust first between the Government and the poultry farmers before such strategy can be developed.
- Completed and distributed Information, Education and Communication (IEC) material as part of piloting the NVS concept in Bali. The NVS concept in Bali was shifted to rabies, as it is the main zoonosis there and the most appropriate disease to target for NVS pilot implementation. IEC work in Bali included:
 - Developed and produced 110 sets of “Vaccination helps to prevent rabies” flipchart to support rapid response team and extension workers in conducting community education sessions on rabies awareness.
 - Developed and produced 6 000 “Have you vaccinated your dogs?” posters to promote the second round of mass dog vaccination.
 - Developed and produced 2 000 rabies factsheets, both in Bahasa Indonesia and English, to help raise community awareness on rabies and its control.
 - Developed and produced three radio announcements on rabies and the mass dog vaccination campaign in Bali, working together with a private local radio station.
- Reviewed the existing communication materials with the Local Government/PVUK team in relation to the proposed changes in PDSR and development of NVS. It was agreed that some of the existing materials also addressed problems in commercial poultry, and were therefore still relevant. The need

to develop new materials would be determined through direct discussion with commercial farmers and PVUK officers.

- Production of a disease transmission video for sector 3 layer farm workers was discussed with the commercial poultry health team; the video would be based on the interviews conducted in January 2011 with farmers. A listing of transmission risks in such farms was compiled, and the format of the film determined. The storyboard for the video will be developed, pending the approval of SOPs for good practices to control disease transmission.

Output B: Improved biosecurity and vaccination practices in commercial sectors

B.1 Provide specialized technical support to selected layer farmers to enhance production efficiency and quality of layer vaccination and biosecurity measures

- Assessment report for each farm was completed and reviewed with each farmer individually.
- A management plan meeting was conducted in Solo. Each farmer's top priorities were identified and approved. A technical management and health plan (non-biosecurity issues) for each farm was developed and approved.
- Specific technical support and advice were provided to participating layer farmers to resolve inconsistencies in vaccination and management practices.
- In response to the weak data management encountered on each farm, a poultry production management database was designed, tested, trained and installed in computers on each farm.
- The Commercial Poultry Health (CPH) team engaged with farmers and other stakeholders in the commercial poultry industry at industry workshops and conferences by giving presentations and distributing materials on best practices for vaccination against HPAI in poultry.

B.2 Support local government veterinary and laboratory services to engage more effectively with poultry farmers on disease prevention and outbreak investigations (PVUK programme)

- Three levels of PVUK training for government staff to support commercial poultry farmers were developed and tested. All 40 PVUK officers were trained in Levels 1 and 2 and commenced working in the field. In general, the poultry farming community was very positive towards the programme. Twenty-five PVUK officers from Lampung and Central Java were trained in the advanced poultry health skills of Level 3 and commenced conducting poultry health problem investigations and support to poultry vaccination programmes.
- To establish the relationship between PVUK staff and the commercial sector, representatives of poultry associations and commercial farmers were invited to the opening and closing ceremonies, as well as to observe many of the PVUK training courses. A stakeholder meeting was held in Lampung for 19 farmers following the training to discuss future opportunities for the PVUK programme.
- The technical modules were developed with the assistance of the CPH team, who have also assisted with the Level 3 training.
- Twenty-three data managers for PVUK, representing all provinces and districts in the pilot programme, were trained in data entry from the PVUK forms and general usage of the PVUK database.
- Two joint mentoring visits were conducted by FAO and the Campaign Management Unit (CMU) to observe and support the PVUK officers, as they implement the pilot programme.

B.3 Facilitate trial of private sector-funded compensation programme

- The newly established National Poultry Health Committee (see below) includes a compensation trial as a component of the national programme; however, partner private sector participants have not yet been identified.
- During FAO's HPAI programme planning workshops with stakeholders, it was agreed that efforts to establish a private sector-funded compensation programme must continue as a disease control priority despite limited progress thus far. Efforts to establish a pilot under the umbrella of the National Poultry Health Committee will continue during the next project cycle.

B.4 Facilitate government and industry to establish a functional public-private partnership via NPQIP, including regular Biosecurity Coordination meetings

- This activity was implemented in close collaboration with the United States Department of Agriculture (USDA). To facilitate collaboration between the public and private sectors, NPQIP was taken forward

by the *Asosiasi Dokter Hewan Perunggasan Indonesia* (Indonesian Poultry Veterinary Association [ADHPI]) and further developed into the *Komite Kesehatan Unggas Nasional* (National Poultry Health Committee [KKUN]) following an agreement between the DGLAHS and the commercial poultry industry. KKUN is comprised of the commercial poultry industry, government and academia with the vision of strengthening and increasing the competitiveness of national poultry production. The committee aims to coordinate the interests and promote collaboration between the fields of the poultry industry, government and academia; provide recommendations to policy-makers on regulations, standards and solutions of national poultry health problems; and encourage stakeholders to improve poultry health so that the resulting poultry products will be of higher quality in terms of both production efficiency and safety. KKUN also aims to oversee continuing education for private sector poultry veterinarians and test the private sector-funded culling compensation programme as described above.

- During FAO's HPAI programme planning workshops, stakeholders agreed to establish an MT development programme for private-sector based veterinarians. This new activity will be supported in the next project cycle under the auspices of the National Poultry Health Committee.

B.5 Evaluate effectiveness of biosecurity measures implemented by poultry producers

- Continued monitoring the implementation of management plans as agreed on each farm for Phase I of the cost-effectiveness study.
- Continued monitoring the implementation of the study of farmer's perception and decision-making (Phase I).
- Analysed data and finalized draft baseline report on biosecurity cost-effectiveness study.
- Finalized report on farmers' perception and decision-making study. Findings from this study are now being taught in the PVUK training program and are also being used to inform the design of outreach materials for poultry farmers.
- Conducted bacteriological sampling of participating farms to complete Phase I sample collection.
- Polymerase chain reaction (PCR) testing for influenza viruses was conducted at all participating farms with all samples negative. Owing to these results, PCR testing for influenza viruses will not be conducted in subsequent phases of the study.

B.6 Facilitate design of local government-implemented poultry farm profiling and certification system

- This activity was integrated within the pilot of the PVUK programme as reported in the previous project progress report. Additional commercial farm profiling was implemented by local governments in western Java with support from the Indonesia Dutch Partnership (IDP) project, however data from this profiling is not yet available at the national level.

B.7 Assist central government to monitor commercial poultry producer compliance with AI vaccination regulations

- This activity has been underway in collaboration with the joint World Organization for Animal Health (OIE)/FAO worldwide scientific network for the control of AI (OFFLU)-related activities. The CPH team actively participated in the Indonesian Livestock Exposition 2011 in Surabaya, sharing best practices for vaccination with farmers and gathering feedback on vaccine usage on farms.
- Level 3 training for the PVUK pilot programme included guidance from DAH on DGLAHS vaccination regulations, as well as best practices for vaccination identified by the CPH team. PVUK will continue to support vaccination policy compliance via increased competence and stronger communication with commercial poultry farmers during the next project phase.

Output C: Improved HPAI surveillance and control along the poultry marketing chain

C.1 Support local government to conduct longitudinal surveillance and trace-back for H5 subtype virus and HPAI in LBMs, collector yards and slaughterhouses

- Conducted monthly LBM surveillance in Jabodetabek area and collected 201 samples from 262 listed markets.
- Identified and selected the best H5-positive samples from the LBM surveillance study for virus isolation and sequencing.
- Coordinated with the Disease Investigation Centre (DIC) Subang on the technical and logistic aspects of shipment of LBM surveillance samples for virus isolation.

- Epidemiology consultant was successfully recruited to complete analysis of collector yard surveillance study. Identified samples from the collector yard study which needed to be retested by the laboratory.
- Updated LBM profiling database for the revision of the LBM surveillance design planned for the next project cycle.
- Provided recapitulation and complete analysis of C&D activities at collector yards in Jabodetabek based on monitoring forms collected by the market surveillance officers.
- Conducted site inspection at LBMs as a basis for developing a monitoring form on C&D activities in LBMs.
- Conducted monthly coordination and monitoring visits to market surveillance officers and the animal health laboratory in Jabodetabek in order to improve their activity in the field.
- Developed a monitoring form for markets with C&D activities and determined the samples.

C.2 Support implementation of minimum standards of biosecurity and sanitation in selected LBMs, collector yards and slaughterhouses

- Improved facilities at Anyar Market (Tangerang City) and Bonang Market (Tangerang District), followed by training and awareness raising on hygienic carcass processing for poultry vendors at those markets.
- Conducted further supervision of hygienic carcass processing activities at Bonang and Anyar Markets and C&D station operations at Barokah Pitikku Slaughterhouse (Bekasi City), a small private truck cleaning station at Ciseeng (Bogor District), Pulo Gadung and Rawa Keping collector yards in collaboration with PD Pasar and district livestock services.
- Conducted C&D training in collaboration with the World Health Organization (WHO) at eight pilot LBMs: Gunung Kidul DKI Yogyakarta Province, Payakumbuh West Sumatera Province, Malang East Java Province, Pekalongan Central Java Province, Metro City Lampung Province, Sragen Central Java Province, Bontang East Kalimantan Province and Gianyar Bali Province.
- Conducted C&D training for C&D workers at Cibinong and Ciseeng slaughterhouses (Bogor District), Grogol Market (West Jakarta) and HEK Kramatjati Collector Yards (East Jakarta).
- Prepared C&D station designs for Cibinong and Ciseeng slaughterhouses (Bogor district) and Petukangan slaughterhouse (South Jakarta).
- Rehabilitated facilities at poultry markets in Kranggan (Bekasi City), Parung Panjang (Bogor District) and Anyar (Bogor City) markets.
- Conducted a ToT on C&D activities for livestock service officers and cleaning workers for sustainable C&D activities in each district throughout the Jabodetabek area.
- Supported local government to conduct monitoring visits to assess C&D activities at C&D stations, small collector yards and LBMs in Jabodetabek.
- Assisted the CPH team in providing design and analysis of biosecurity practices at selected layer farms in Central Java.
- Conducted site inspection at LBMs as a basis for revising the monitoring form for C&D activities in LBMs.

C.3 Facilitate poultry market restructuring with emphasis on food safety in DKI Jakarta and surrounding areas

- Identified new locations for promotion of “healthy chicken meat” (*ayam ASUH*), cold chain techniques and market activation at Petojo (Central Jakarta) and Grogol (West Jakarta) Markets; a pilot was initiated with selected poultry vendors at Grogol market.
- Conducted an awareness raising workshop on healthy chicken meat (*ayam ASUH*) for 50 participants from the family welfare association at Grogol village in collaboration with the West Jakarta Livestock and Fisheries service.
- Held a workshop and provided recommendations on cold chain design from slaughterhouses to traditional markets based on the Jakarta situation assessment. The findings were validated by representatives of the different stakeholder groups. Research and a trial were also conducted along the cold chain system from poultry relocation centres to traditional markets to determine the cost-effectiveness of small-scale cooling systems for the relocation centres. Cool-box equipment for poultry carcass transportation was adapted, and carcass display systems were introduced in the traditional markets, including trials of high density polyethylene resins (HPDE) plastic insulation and acrylic displays.

- Conducted a training on the importance of good cold chain system design for poultry vendors in Kopro Market and Grogol village (West Jakarta), Petukangan Utara Slaughterhouse (South Jakarta) and a training on proper poultry carcass storage using chilled storage, cold storage and blast freezing in Rawa Kepiting slaughterhouse.
- Established forums and related focus group discussions (FGDs) with key actors and stakeholders to promote additional relocation centres in line with the recommendations made by the Governor of DKI Jakarta.
- Provided technical assistance to local government on how to upgrade the Rawa Kepiting and HEK Kramatjati (East Jakarta) collection yard/slaughterhouse to meet national food safety standards; defined basic layout and adapted national standards to local conditions.
- Conducted the food safety control and inspection pilot programme at seven markets in DKI Jakarta. This included training on food safety for 134 poultry vendors from these markets.
- Facilitated a workshop with public and private stakeholders on the Future of a Healthy Poultry Sector 2011–2015 in Jabodetabek. The workshop indicated the commitment of the Government and private stakeholders to continue with Jakarta market restructuring.
- Provided technical assistance to local government on identification and selection of three collector yards at Pintu Air and HEK Kramatjati (East Jakarta) and five markets at Grogol (West Jakarta), Sukapura and Kelapa Gading (North Jakarta), Ciracas and Klender Perumnas (East Jakarta) as additional relocation centres for the market restructuring programme.
- Conducted communication skills' training for field officers to increase their knowledge and skills on how to communicate intensively as the frontline staff, both of the government and the poultry business stakeholders.

C.4 Explore mechanisms to improve interprovincial movement control out of HPAI high-risk provinces

- Finalized recommendations to local government for redesign of Semanggi collector yard in Surakarta city to reduce risks of native chickens transported to Jakarta.
- Conducted follow-up meeting with Surakarta City Agricultural Service regarding feasibility study results for upgrading of Semanggi collector yard.
- Held an advocacy meeting with the Mayor of Surakarta City to increase local government support for upgrading of the Semanggi collector yard.

Output D: Engagement with duck producers for improved control of HPAI

D.1 Assess role of ducks in the epidemiology of HPAI in selected areas of Java

- Final report produced and circulated to relevant stakeholders.

D.2 Conduct duck vaccination field trial in one identified high-risk HPAI-endemic area

- Based on the results of the Java duck study (Activity D.1), vaccination of ducks is not justified at this time. Therefore, this vaccination trial was cancelled in agreement with CMU.

Output E: Sustainable virus monitoring and vaccine development

E.1 Assist public and private sectors to develop a centrally-managed system to monitor circulating viruses and sustain vaccine efficacy

- Completed biological and molecular virus characterization of 32 isolates (including sequencing and high-resolution haemagglutination inhibition data for antigenic cartography) from viruses selected from the Round 1 national pre-screening results. Influenza virus data was analysed between the Australian Animal Health Laboratory (AAHL) and with the Indonesian laboratories in support of the continued capacity building efforts and quality assurance. This activity will be ongoing as part of the Influenza Virus Monitoring Laboratory Network in Indonesia. The upload of haemagglutinin gene sequences into the public domain was initiated by AAHL/OFFLU following the confirmation by DGLAHS.
- DICs continue the virus pre-screening process, submitting raw data for the haemagglutination inhibition (HI) assay conducted using cartography antisera on H5-positive fluids isolated from their ongoing diagnostic activities. Round 3 analyses were conducted in August 2011 with identification of ~60 potential candidates representing six of the eight labs for further antigenic characterization. DIC Subang's participation in the AI Laboratory Network was formalized, and on-site support visits for

data analysis and evaluation of procedures for virus isolation, pre-screening and high-resolution HI data for cartography (DIC Wates) were conducted in May and August 2011.

- A Laboratory Network meeting with bench side work and joint data analysis was jointly conducted (FAO-OFFLU/AAHL) for sequencing partners in support of the effort to monitor antigenic variation of circulating viruses. Major outcomes include: evaluation of capacity by laboratories, identification of limiting factors, ability to generate comparable sequence data between AAHL and partner participating laboratories and identification of reagent requirements. DAH confirmed the selection of Pusvetma as the primary laboratory for sequencing of viruses identified through the AI Laboratory Network in July 2011.
- Supported participation of the DIC Representative at the Regional Training Course on Advanced Bioinformatics and Laboratory Data Management for Enhanced Quality Assurance and Quality Control at the International Atomic Energy Agency (IAEA) and FAO Agriculture and Biotechnology Laboratory in Vienna/Seibersdorf, Austria, in July 2011.
- Contributed to the development of a free-standing web-based module for the recoding, sharing and networking of all DIC results for antigenic analysis (to be called: Infolab Pre-screen); and engaged a working group of DIC staff to contribute to the interface in June 2011.
- Training in Excel and user group development for Infolab Pre-screen conducted for 30 DIC, DKI, Pusvetma, the National Veterinary Drug Assay Laboratory for Indonesia (BPM SOH) and Bbalitvet staff in June 2011.
- The National OFFLU Technical Facilitator coordinated OFFLU activities with representatives from DAH-CMU and other relevant public sector structures and private sector stakeholders. Outputs included: technical support visits to AI network laboratories, assistance with preparing a Material Transfer Agreement (MTA) between DGLAHS and vaccine industry, presentation of OFFLU-related activities at a meeting sponsored by Trobos and the Indonesian Poultry Veterinary Association (ADPHI), compilation of documents required for biological material importation and assistance with joint workshops and meetings.
- Backstopping and ongoing support for the transfer of technology to Indonesia provided by the FAO-OFFLU scientist from July to August 2011. Outputs included technical support visits to AI Network Laboratories and project partners, project planning meetings for evolution of the ECTAD laboratory component, meetings with the DAH and other relevant government officials as needed and with partners for coordination of ongoing activities and preparation of documents needed for importation of reverse-genetic strains to Indonesia.

E.2 Increase knowledge of best practices for AI vaccination in poultry

- Following the DGLAHS announcement in November 2010, characterized isolates selected as candidate vaccines (n=4 from Pusvetma) and challenge viruses (n=2 from BPM SOH) were distributed to each of four national vaccine manufacturers (Sanbio, Caprifarmindo, Vaksindo and Medion) under an MTA between each of the companies and the Ministry of Agriculture (MOA).
- Preparations were made for a focus group meeting on vaccines and vaccination to be held during the next project cycle in November 2011.
- Preparation was ongoing for documents in support of importing reverse genetic virus strains generated at the USDA's Southeast Poultry Research Laboratory (SEPRL) (which generate protective titres, significantly reduce virus shedding and provide equivalent protection against challenge viruses selected in the November 2009 Technical Meeting as compared to conventional inactivated vaccines generated using the same seed strains). This included planning for SEPRL to provide assistance to MOA designated laboratories for the preparation of vaccine master seeds from reverse genetic (RG) H5N1 AI constructs provided through the project and to provide didactic and on-site challenge test training for efficacy and potency determination in order to demonstrate efficacy and potency of vaccines for the purposes of registration and licensing.
- Preparations continued to update the recommended antigen for serosurveillance in coordination with DGLAHS.

Output F: Coordinated and enhanced management of the HPAI control programme

F.1 Facilitate implementation of integrated HPAI control plan on one island where the HPAI situation is considered readily controllable

- Recommendations for HPAI control were developed and will be discussed with Bali authorities to

develop an integrated HPAI control plan during the next project cycle.

F.2 Strengthen government capacity to conduct veterinary services training and continuing education

- The programme worked closely with the three national MTs allocated to work with the LG team and CMU. These MTs significantly improved their training skills by learning new teaching methods and the processes involved in the development of modules and post-training mentoring.
- Modules to improve training skills were developed and tested. Eight MTs were trained to conduct rabies vaccination campaigns, bringing the number of MTs with improved training skills to 15. These MTs were crucial in the trainings carried out by the FAO LG team for PDSR, PCE and NVS programmes. An additional refresher training for seven MTs was held in Bali to improve confidence in dog handling and management, and this increased their confidence in training others.
- Selection of ten to eleven MTs to assist the LG team in the forthcoming year commenced, and names and performance were assessed for final selection.

F.3 Improve competencies of local government decision-makers to manage sustainable and effective HPAI control programmes and to promote understanding of the economic impact of animal diseases on livelihoods and public health

- Following a consultation meeting with stakeholders from central and local governments, FAO technical advisors met and agreed on the design of a new module for Decision-maker Meetings (DMM) which will assist disease controllers in the local government to make more evidence-based and efficient decisions for allocation of limited resources for HPAI control activities. Development of the new module is now underway and will be introduced in DMMs during the next project cycle.
- No DMMs were held during this reporting period, however they will continue during the next project phase with the inclusion of the new module described above.
- A national meeting of LDCC Coordinators was held in May 2011 to review current disease control strategy, future training plans, proposals for increasing local government funding of HPAI control activities and strategic reduction of FAO-based financial support for PDSR activities in line with HPAI risk in village poultry. Following agreement of all coordinators, FAO officially announced to DGLAHS that DSA for PDSR would be reduced by 33 percent and that support to PDSR field activities would be reduced during low-risk times of the year in areas with seasonal HPAI outbreaks.

F.4 Assist central and local governments to design and implement a national veterinary service strategy

- Guidelines on NVS, establishment by the Veterinary Authority, and the appointment of the Authorized Veterinarian were discussed between DGLAHS and the Ministry of Internal Affairs (MOIA). The content of the guidelines was approved in principle by MOIA. The next step is for the technical team to finalize the guidelines.
- Guidelines for the Control Strategy for rabies, anthrax, brucellosis and hog cholera were drafted and discussed between the DGLAHS NVS Task Force and FAO. The plan is to stipulate the guidelines in a DGLAHS Decree.
- Guidelines for the Issuance of Veterinary Certificates were drafted and discussed by the DGLAHS NVS Task Force and FAO. The plan is to discuss further with representatives of Dinas Peternakan West Java and Jabodetabek and stipulate the guidelines in a MOA Decree.

F.5 Develop and integrate emerging databases into the national veterinary information system

- The single page surveillance form (Animal Disease Surveillance) was developed and is being field tested in PVUK and rabies programmes.
- Participated in DAH workshop on development of the updated clinical surveillance database of the National Animal Health Information System (SIKHNAS) in Bandung.
- Further progress on this task is pending further development of the SIKHNAS system and results of field testing.

F.6 Provide technical assistance for establishment of local cold chain capacity

- Continued to provide technical support for cold chain training to local government staff and capacity strengthening in Bali province.
- Provided advice to cold chain MTs on best practices for maintaining optimal vaccine temperature in cooler boxes during field vaccination activities.
- Assisted with coordination between WHO, JSI-Deliver and provincial government for delivery of cold chain equipment for Bali local authorities.

F.7 Increase public visibility of the HPAI control programme

- Completed content and design for the ECTAD Indonesia Annual Report.
- Participated in the Indonesia Livestock Exposition 2011 in Surabaya. The Communication team and CPH teams displayed supporting materials, project photos and videos at the exhibition, as well as presented two technical sessions for the visitors on updates of the HPAI situation in Indonesia and poultry health consultations.

F.8 Provide operational support to enable implementation of the ECTAD Indonesia programme

- Letters of Agreement and Service Contracts were signed with partner organizations and vendors to facilitate various project activities, which included market rehabilitation works in Anyer, Parung Panjang and Kranggan located within the Jabodetabek area, laboratory testing of samples in support of market surveillance activities and commercial poultry health studies, and training of government officials in implementing SOPs for poultry collection and slaughtering.
- The renewal process for vehicle registration for 632 motorcycles and 39 cars continued.
- In line with technical activities implemented during the period, project personnel were recruited, and various project equipment/supplies were procured and distributed.

Main challenges encountered and response provided

The most significant challenge faced this reporting period was planning for implementation of the next project cycle despite delays in project clearance by the Indonesian Government and transfer of funds from the new project, as well as the increased technical and operational support required for the new Bali rabies control programme. This core challenge was addressed in the following ways: (1) recruitment of additional national staff and one international advisor to support the rabies control programme; (2) empowering and supporting central and local government staff to assume greater responsibility for management of HPAI and rabies programme activities; (3) ensuring that field activities for HPAI control activities continue into the next project cycle, while official clearance of the project document by the Indonesian Government is pending; and (4) enabling national staff to continue supporting HPAI control programme activities despite international advisors being absent at the onset of the next project cycle. The delay of funds transfer is more challenging to overcome; without funds from the new project being made available to the field in a timely manner, some field activities will have to be suspended. Considering that HPAI control prevention efforts during the month of October are critical for reducing the subsequent surge of cases at the onset of the influenza season in Indonesia, delay in project approval by the Indonesian Government, fund transfer and activity implementation will likely have immediate detrimental impacts for both public health and poultry production in Indonesia with a concomitant increase in pandemic risk.

Main progress made towards the achievement of project outcomes (from the start of the current project phase)**Output A: Sustainable surveillance, prevention and control of HPAI in village poultry**

- Activities have been designed to increase passive surveillance of HPAI. As active surveillance activities will be reduced, the PDSR and other local government staff will be trained to work closely with villages to encourage village-based solutions to HPAI prevention and control.
- There is now strong commitment, support and integration at the local government level (e.g. between the LDCC and provincial/district livestock services) in animal health and HPAI disease control programmes as a direct result of the FAO project.
- The PDSR programme has strengthened veterinary services capacity to detect and respond to HPAI outbreaks in village poultry throughout HPAI-endemic areas of Indonesia.
- The LDCC system has enabled more effective communication and coordination between central and local governments within the highly decentralized Indonesian governance system.
- Additional local governments have allocated funding specifically to support the establishment and operations of LDCC and PDSR activities, thereby contributing to sustainable disease control.
- Parameters for the next version of the PDSR system design were developed based on current HPAI control strategy and lessons learned.

Output B: Improved biosecurity and vaccination practices in commercial sectors

- The commercial poultry health programme team has built rapport and trust with participating farmers, ensuring a healthy veterinarian-client relationship required for further progress in improving biosecurity and vaccination practices in commercial sectors.

- The understanding of the role of commercial poultry production in the maintenance and spread of HPAI has improved.
- The PVUK pilot programme has been developed in close collaboration with farmers, central and local governments in order to improve communication and cooperation between farmers and local government animal health services.
- Government-farmer communication and cooperation have improved in PVUK pilot areas.
- Databases profiling the commercial poultry farms in each pilot district have been established by district livestock services.
- Public sector collaboration with commercial poultry producers has been accelerated. In particular, public sector disease controllers and international agencies are both more aware of the complexity of commercial poultry production in Indonesia and more engaged with private sector stakeholders involved in commercial poultry production.
- As CPH programme activities have shown, one of the key constraints poultry farmers are facing is a very limited capacity to track and interpret their farm's productivity and profit. Training and engagement activities are being adjusted to directly address this fundamental weakness.
- Best practices for commercial poultry vaccination have been identified based on both technical and practical field considerations. These best practices are being advocated regularly to farmers and other commercial poultry stakeholders.

Output C: Improved HPAI surveillance and control along the poultry marketing chain

- Test results from the DKI Jakarta category B animal health laboratory were distributed to all livestock services at district level throughout Jabodetabek to increase local government awareness and responsiveness to market chain contamination and veterinary public health issues.
- A targeted research activity to test collector yard-based surveillance methods to assess relative risk of poultry production areas and poultry type was developed and successfully implemented.
- Improved understanding of poultry market dynamics in DKI Jakarta by the public sector.
- Increased private and public sector C&D capacity and increased implementation of C&D practices along the poultry market chain in greater Jakarta.
- Critical weaknesses in the DKI Jakarta market restructuring preparations were identified and corrective measures proposed and subsequently implemented by the Government.
- A specific high-risk poultry market system has been identified as a result of project-implemented surveillance activities and is now being addressed with the relevant government stakeholders.

Output D: Engagement with duck producers for improved control of HPAI

- The database of duck flocks developed from the study area provides a sample frame for the prevalence study and other future activities to be undertaken in duck populations by animal health authorities; knowledge of locations of high-density duck populations is a critical first step to identifying critical control points for targeted interventions to control HPAI.
- According to the research implemented by the project, the ducks did not appear to be the immediate disease control priority in HPAI-endemic areas of Indonesia. The role of ducks in other areas of Indonesia is still unclear.

Output E: Sustainable virus monitoring and vaccine development

- Development of a safe and efficacious vaccine for use in Indonesia.
- Characterization of AI viruses circulating in Indonesia.
- Increased capacity of Indonesian laboratories to perform antigenic and genetic characterization of viruses and analyse results.
- Improved collaboration between Indonesian private and public sectors on field virus monitoring.

Output F: Coordinated and enhanced management of the HPAI control programme

- The human resource capacity of the local government livestock services has been improved through PDSR training and preparation of MTs to lead training and continuing education activities within the HPAI control programme.
- Improved knowledge of factors associated with outbreaks of HPAI in village poultry to be used to inform and refine surveillance and control strategies.
- Critical control points identified. Data and subsequent analysis leading to identification of further

points for disease control efforts to be targeted.

- Significant improvement in technical capacity and management of local government human resources working in the field throughout all known HPAI-endemic areas.
- Guidelines for the implementation of the NVS have been prepared by DGLAHS under the direction of the NVS Task Force with technical advice provided by ECTAD Indonesia.
- The NVS approach has been made operational via the rabies control programme in Bali, allowing capacities developed by the project to be utilized for other major Indonesian public health priorities in addition to H5N1 HPAI.
- As a result of both increased local government funding support and more efficiently allocated support from the project, external funding support to maintain the PDSR system has progressively and significantly decreased over the course of the OSRO/INS/604/USA project.

Project Title: Expansion of the avian influenza participatory disease surveillance and response program in Indonesia

Extension Title: Reinforcement and expansion of the avian influenza participatory disease surveillance and response program in Indonesia

Period: October 2010 - March 2011

Country: Indonesia
Project title: Reinforcement and expansion of the avian influenza participatory disease surveillance and response program in Indonesia
Code: OSRO/INS/604/USA
Budget: USD 44.2 million ¹
Effective starting date: 9 June 2006
Planned end date: 30 September 2011
<p>Context of the project</p> <p>The purpose of the project is to enhance the capacity and ability of the Government of Indonesia and partners to control HPAI in order to help safeguard the health and livelihoods of the Indonesian population by providing broad-based support to the FAO Indonesia HPAI Control Programme implemented by ECTAD Indonesia.</p>
<p>Objectives of the project</p> <p>Output A: Sustainable surveillance, prevention and control of HPAI in village poultry</p> <p>Output B: Improved biosecurity and vaccination practices in commercial sectors</p> <p>Output C: Improved HPAI surveillance and control along the poultry marketing chain</p> <p>Output D: Engagement with duck producers for improved control of HPAI</p> <p>Output E: Sustainable virus monitoring and vaccine development</p> <p>Output F: Coordinated and enhanced management of the HPAI control programme</p>
<p>Planned Activities</p> <p>Output A: Sustainable surveillance, prevention and control of HPAI in village poultry</p> <p><i>A.1 Maintain, develop and adapt local government prevention, passive surveillance and outbreak control capacity for village poultry across endemic areas of Indonesia, prioritized by level of HPAI risk; manage a staged transition of costs to local government</i></p> <p><i>A.2 Strengthen the capacity of Puskesmas (animal health centres) by integrating participatory diseases surveillance and response techniques; pilot system first in ten Puskesmas animal centres</i></p> <p><i>A.3 Increase local government veterinary service competency to detect, diagnose, report and control other animal diseases of zoonotic and economic importance in villages</i></p> <p><i>A.4 Develop locally-realistic methods and communication materials for prevention and control of HPAI and other animal diseases of zoonotic and economic importance to enable communities to make informed decisions together and supported by local government</i></p> <p>Output B: Improved biosecurity and vaccination practices in commercial sectors</p> <p><i>B.1 Provide specialized technical support to selected layer farmers to enhance production efficiency and quality of layer vaccination and biosecurity measures</i></p> <p><i>B.2 Support local government veterinary and laboratory services to engage more effectively with poultry farmers on disease prevention and outbreak investigations (PVUK programme)</i></p> <p><i>B.3 Facilitate trial of private sector-funded compensation programme</i></p> <p><i>B.4 Facilitate government and industry to establish a functional public-private partnership via a</i></p>

¹ The breakdown of the total contribution is as follows: USD 4 million for first year (June 2006-May 2007), USD 11 million for second year (June 2007-May 2008), USD 2.7 million for interim extension (June -September 2008), USD 7.5 million for third year (October 2008-May 2009), USD 11 million (June 2009-September 2010) and USD 8 million (October 2010-September 2011).

National Poultry Quality Improvement Programme, including regular Biosecurity Coordination meetings

B.5 Evaluate effectiveness of biosecurity measures implemented by poultry producers

B.6 Facilitate design of local government-implemented poultry farm profiling and certification system

B.7 Assist central government to monitor commercial poultry producer compliance with avian influenza vaccination regulations

Output C: Improved HPAI surveillance and control along the poultry marketing chain

C.1 Support local government to conduct longitudinal surveillance and trace-back for H5 subtype virus and HPAI in live bird markets, collector yards and slaughterhouses

C.2 Support implementation of minimum standards of biosecurity and sanitation in selected live bird markets, collector yards and slaughterhouses

C.3 Facilitate poultry market restructuring with emphasis on food safety in DKI Jakarta and surrounding areas

C.4 Explore mechanisms to improve inter-provincial movement control out of HPAI high risk provinces

Output D: Engagement with duck producers for improved control of HPAI

D.1 Assess role of ducks in the epidemiology of HPAI in selected areas of Java

D.2 Conduct duck vaccination field trial in one identified high risk HPAI-endemic area

Output E: Sustainable virus monitoring and vaccine development

E.1 Assist public and private sectors to develop a centrally-managed system to monitor circulating viruses and sustain vaccine efficacy

E.2 Increase knowledge of best practices for avian influenza vaccination in poultry

Output F: Coordinated and enhanced management of the HPAI control programme

F.1 Facilitate implementation of integrated HPAI control plan on one island where the HPAI situation is considered readily controllable

F.2 Strengthen government capacity to conduct veterinary services training and continuing education

F.3 Improve competencies of local government decision-makers to manage sustainable and effective HPAI control programmes and to promote understanding of the economic impact of animal diseases on livelihoods and public health

F.4 Assist central and local governments to design and implement a national veterinary service strategy

F.5 Develop and integrate emerging databases into the national veterinary information system

F.6 Provide technical assistance for establishment of local cold chain capacity

F.7 Increase public visibility of the HPAI control programme

F.8 Provide operational support to enable implementation of the ECTAD Indonesia programme

Activities undertaken during the reporting period

Output A: Sustainable surveillance, prevention and control of HPAI in village poultry

A.1 Maintain, develop and adapt local government prevention, passive surveillance and outbreak control capacity for village poultry across endemic areas of Indonesia, prioritized by level of HPAI risk; manage a staged transition of costs to local government

- A meeting was held on the initial design to improve village-based decision making for the prevention and control of HPAI in sector 4 poultry.
- Local government capacity was strengthened through the training of 25 PDSR officers in West Bandung; initial training for these officers was carried out in August 2010 and this training, Continuing Education A and the training of ten PDSR officers in Continuing Education B, reinforced the skills learned in the introductory training.
- A modified PDSR training module was developed for low risk areas to focus on HPAI rapid response and control and 20 local government livestock service staff in Papua Province were trained in the Introductory I module in February 2011.
- Cost-sharing methods between FAO and local government to ensure sustainability of the PDSR programme were developed and presented at the Yogyakarta Decision Makers' Meeting (DMM) in December 2010; the concept of cost-sharing was agreed to during the meeting by the

participants present.

- A draft plan for rewarding the districts which are early-adopters of cost-sharing agreements was developed and discussed at the LDCC Coordinators' meeting held in October 2010 in Semarang. West Bandung, Papua and Samarinda districts have allocated funds to cover the costs of PDSR officers.

A.2 Strengthen the capacity of Puskesmas (animal health centres) by integrating participatory diseases surveillance and response techniques; pilot system first in ten Puskesmas

- Individual reports on structured active surveillance for HPAI in village poultry conducted in 6 selected districts on Java were completed.
- The Participatory Community Engagement (PCE) training course, which uses elements of PDSR training and will underpin training for the National Veterinary Service (NVS), was developed and the curriculum for three levels of training agreed. Ten modules have been prepared for levels 1 and 2 and tested as part of the pilot PVUK training programme.
- An evaluation of human and capital resources of all NVS Puskesmas has been carried out based on Government information.

A.3 Increase local government veterinary service competency to detect, diagnose, report and control other animal diseases of zoonotic and economic importance in villages

- The USDA/Cornell University Sample Collection and Necropsy Videos with narration in Bahasa Indonesia were produced. These videos were distributed to 40 PVUK trainees as a training aid and to assist them with their field work.
- The Directorate General of Livestock and Animal Health Services (DGLAHS) NVS Task Force agreed on a tiered training approach for all local government veterinarians, including those who have received PDSR training.
- The NVS Task Force also agreed to pilot the new approach with the rabies control programme in Bali.
- Seven draft SOPs, work flow and technical guidelines and training curricula have been developed to train PDSR staff in the detection and control of rabies as a pilot of the NVS concept. These will be tested in Bali and linked to PCE training.
- Avian Influenza Bulletin Vol. 7, in Bahasa Indonesia and English, was produced and distributed to PDSR officers, laboratories and government offices.

A.4 Develop locally-realistic methods and communication materials for prevention and control of HPAI and other animal diseases of zoonotic and economic importance to enable communities to make informed decisions together and supported by local government

- Plans developed for biosecurity communication material based on experience in South Sulawesi.
- Overview video of FAO Indonesia communication activities produced and shared with DGLAHS during Technical Briefing Meeting in December.
- With the proposed changes in PDSR and development of NVS, the existing communication material is being reviewed for relevance in the new system. Material on rabies in Bali is being developed.
- Development of communication material for farmers to complement PVUK training is ongoing.
- Interviewed farmers and workers at commercial poultry farms in Central Java to get better understanding on the communication needs and methods/materials suitable for commercial poultry farms.

Output B: Improved biosecurity and vaccination practices in commercial sectors

B.1 Provide specialized technical support to selected layer farmers to enhance production efficiency and quality of layer vaccination and biosecurity measures

- Farm profiling of six participating layer farms was completed.
- Farm flock health status was tested in collaboration with participating farmers.
- Feed and water samples were quality tested in collaboration with participating farmers.
- Farm assessments for each participating farm were completed.

- Meetings were held with each farmer to identify their top priorities and a Phase I management plan was agreed to address non-biosecurity issues for each participating farm.
- Assistance was provided to each farm to implement their Phase I management plan.
- Baseline bird and environmental sampling was carried out to determine the presence of H5-subtype virus on each farm.

B.2 Support local government veterinary and laboratory services to engage more effectively with poultry farmers on disease prevention and outbreak investigations (PVUK programme)

- PVUK teams were established in eight districts from four provinces.
- The training module outlines and methodologies were agreed. The curriculum for three levels of training was agreed and modules were prepared for the three levels.
- Ten PVUK trainees were given level 1 and 2 training in Lampung and the remaining 30 participants received level 1 training in Solo.
- The ten trainees in Lampung commenced work and are being backstopped by the training team as they begin to implement the pilot project. Data collection forms were tested and refined to produce final formats.

B.3 Facilitate trial of private sector-funded compensation programme

- Agreed with ADPHI (Indonesian Poultry Veterinary Association) to include a private-sector compensation pilot as a signature activity of the National Poultry Quality Improvement Programme (NPQIP).
- Met with GOPAN-associated broiler farmers to further discuss the opportunities and constraints to establishing a private-sector funded compensation programme.

B.4 Facilitate government and industry to establish a functional public-private partnership via a National Poultry Quality Improvement Programme, including regular Biosecurity Coordination meetings

- Responsibility for NPQIP development has now been assumed by ADPHI with USDA and FAO providing technical support.
- Agreed with ADPHI to focus on five signature activities, including a compensation scheme for producers and a continuing education programme for poultry veterinarians, on which immediate progress can be made in order to increase farmer support and enthusiasm for the NPQIP.
- Draft Terms of Reference (TOR) for Commercial Poultry Health Master Trainers were developed.
- The NPQIP concept was discussed with the DGLAHS and is now fully supported by the Director-General.

B.5 Evaluate effectiveness of biosecurity measures implemented by poultry producers

- The baseline collection of economic data on six layer farms was completed
- A farmers' feedback meeting was conducted to discuss the baseline findings and to present the findings of production cost data analysis and the overall productivity assessment
- The farmers' perception and decision-making study on the commercial layer chicken production system was drafted.

B.6 Facilitate design of local government-implemented poultry farm profiling and certification system

- Twenty-four data managers, assisted in the training and supervision of 358 enumerators to collect profiling data on commercial farms in the eight PVUK districts. Profiling information from a total of 11,130 farms was collected and entered into district-level databases.
- Draft maps showing the distribution of poultry farms were produced for each district.
- Vector layers were installed on the PVUK computers in all districts and refresher training for data managers was carried out in all districts.

B.7 Assist central government to monitor commercial poultry producer compliance with avian influenza vaccination regulations

- To complete this activity, FAO ECTAD's Commercial Poultry Health programme is reviewing

the vaccine selection and vaccination practices of layer farmers participating in the programme.

Output C: Improved HPAI surveillance and control along the poultry marketing chain

C.1 Support local government to conduct longitudinal surveillance and trace-back for H5 subtype virus and HPAI in live bird markets, collector yards and slaughterhouses

- Local government market surveillance officers (PSP) collected and tested environmental samples from 260 LBMs every month in the Jabodetabek area as part of the live bird market surveillance programme.
- A National Technical Advisor for Market Chain Surveillance was successfully recruited.
- The analysis of collector yard surveillance and targeted research data was continued (Phase II).
- A rapid field assessment of the Semanggi Collector Yard in Central Java was carried out.
- The LBM database was evaluated to improve LBM surveillance in Jabodetabek by holding meetings with the Jakarta category B Animal Health Laboratory and with Data Encoders (DE) from LDCC Jakarta, Bogor and Serang.
- The new list of LBMs to participate in the surveillance programme was finalized.
- A coordination meeting was held with PSP, LDCC and the Jakarta category B animal health laboratory to evaluate the implementation of LBM surveillance in Jabodetabek.
- Refresher training was conducted for all PSP staff and additional training of new PSP officers in Jabodetabek was carried out.

C.2 Support implementation of minimum standards of biosecurity and sanitation in selected live bird markets, collector yards and slaughterhouses

- Conducted field assessment to introduce improved cleaning and disinfection (C&D) practices in 21 collection yards, 17 LBMs and three vehicle C&D stations in Jabodetabek.
- Conducted training on C&D practices and public awareness activities for cleaning workers and owners of 21 collector yards, 17 LBMs and three vehicle C&D stations. Local Agricultural Dinas officials were also included in the trainings.
- Distributed 41 high pressure washers, 163 metal cages as well as C&D tools and materials to 21 collector yards, three C&D stations and 17 live bird markets in Jabodetabek.
- FAO supported local government monitoring and evaluation of market chain C&D activities in 31 collector yards in Jabodetabek.
- Focus group discussions were held at five LBMs in Jabodetabek to develop appropriate market rehabilitation designs.
- The design and budget estimates were finalized for the establishment of two vehicle C&D stations and the rehabilitation of five LBMs in Jabodetabek.
- Training materials were prepared and a schedule for collaboration with WHO and MOH on live bird market C&D training was agreed.
- Two vehicle C&D stations were established in Bekasi and Bogor.
- The construction of two rehabilitated LBMs in Tangerang was supervised.
- On-site refresher training was conducted for staff at 21 collector yards and 17 LBMs previously equipped with high pressure washer machines.
- Recruitment for the National Engineer and Assistant National Engineer positions was completed
- The DKI market restructuring programme supported market C&D training and a food safety inspection workshop in accordance with DKI Jakarta regulation No. 5/1992.
- Meetings were held with the West Java Agriculture Service in Bandung regarding an assessment plan for C&D activities and field assessments at collector yards/ slaughterhouses in high-risk areas in Western Java were carried out.

C.3 Facilitate poultry market restructuring with emphasis on food safety in DKI Jakarta and surrounding areas

- Assistance was provided in the adaptation of the Jakarta poultry markets restructuring strategy, moving towards an increase in the number of designated relocation / slaughtering centres.
- A targeted public awareness campaign for the promotion of "healthy chicken meat" was continued via editorials in Jakarta newspapers similar to the previous semester and the publicity

campaign in markets was continued. A comprehensive promotion campaign for "healthy chicken meat" was successfully implemented with consumers and traders in two traditional markets (Klender, November 2010 and Kramat Jati, February 2011) selling poultry meat.

- The market programme continued its close collaboration with the private sector and the local government administration in the development of adapted cold chain equipment and restructuring of distribution channels, including the cold chain. The distribution channel from one of the five collection yards/ slaughterhouses to two traditional markets (Rawa Kepiting to Klender & Kramat Jati) was trialed this semester.
- Technical support was provided to local government to strengthen food safety measures and government structures. The national food safety expert assessed the situation and formulated a number of recommendations for food safety and meat inspection improvements and tried them out during the pilot activity in the slaughterhouse and traditional market. In February 2011 a workshop was held to validate the assessment of the capacity of the Jakarta Livestock Service staff and the law enforcement structures on food safety and proposing the gradual strengthening of food safety information, inspection and law enforcement in relocation centres and traditional markets.
- Plans for collaboration on the establishment and promotion of relocation centres (collection yards with slaughtering facilities) in the sub-districts of Tangerang Kota, Tangerang Kabupaten, Tangerang Selatan and Depok were downsized because of delays in the implementation of the Jakarta poultry restructuring process and expected programme budget constraints.

C.4 Explore mechanisms to improve inter-provincial movement control out of HPAI high risk provinces

- Recommendations were developed to renovate the Semanggi collector yard in Surakarta city in order to reduce the risk of viral amplification along the native chicken market chain.
- A technical meeting was conducted with Central Java provincial Dinas and the Agricultural Dinas and Market Dinas of Surakarta city regarding the epidemiological situation of the native chicken trade originating at the Semanggi collector yard and the high priority need to renovate the collector yard in order to reduce risk.
- An initial meeting was held with Jabodetabek agricultural Dinas and DAH on improving Animal Health Certification (SKKH) for poultry entering Jabodetabek.
- Meetings were held with the West Java Agriculture Dinas in Bandung regarding an assessment plan for checkpoint operation and Animal Health Certification (SKKH).
- In collaboration with DAH, a meeting was held with the mayor of Surakarta city to advocate for support for the initiation of high-priority renovations to the Semanggi collector yard.

Output D: Engagement with duck producers for improved control of HPAI

D.1 Assess role of ducks in the epidemiology of HPAI in selected areas of Java

- The Java duck survey was re-analysed.
- The PCR test results produced by the DKI laboratory on samples from the Java duck survey were verified
- The conclusions were completed and the draft final report produced.

D.2 Conduct duck vaccination field trial in one identified high risk HPAI-endemic area

- Further progress on this task is pending finalization of the Java duck study (Activity D.1).

Output E: Sustainable virus monitoring and vaccine development

E.1 Assist public and private sectors to develop a centrally-managed system to monitor circulating viruses and sustain vaccine efficacy

- The characterization of 244 H5N1 isolates (total of 266 viruses) from 317 samples representing approximately 90 districts predominantly from backyard chickens during 2007-08 was reported upon during the final OFFLU technical review meeting Oct 2010. This contributed to the ongoing efforts to monitor field viruses.
- Backstopping and ongoing support for the transfer of technology to Indonesia was provided by the FAO-OFFLU scientist in October-November 2010. Outputs included the following:

facilitating meeting with DGLS, CMU, BPM SOH, Pusvetma, FAO, OFFLU to discuss disposition of candidate vaccine and challenge strains, the status of avian influenza vaccine registration in Indonesia and the provision of reverse genetics constructs to Indonesia; prepared and conducted workshops for the laboratory network and the Final Technical Review meeting; meetings with the DAH and other relevant government officials as needed and with partners for coordination of ongoing activities.

- Laboratory Network meetings with bench-side work were jointly conducted (FAO-OFFLU /AAHL) for sequencing (25-27 October) and pre-screen HI partners (1-3 November) in support of the effort to monitor antigenic variation of circulating viruses. Standardized reagents were provided to all collaborating laboratories.
- Viruses selected from the Round 1 national pre-screen results were sent to AAHL for parallel generation of antigenic and genetic data for capacity building purposes (Feb 2010). The DIC Wates produced full panel antigenic cartography data on these 32 isolates with support from an AAHL scientist (March 2011). The DICs continued the pre-screening process, submitting raw data for the haemagglutination inhibition (HI) assay conducted using cartography sera on H5-positive fluids isolated through their ongoing diagnostic activities. Round 2 analysis was conducted in March 2011.
- Six Indonesian scientists participated in bench-side sequencing training at AAHL during November 2010.
- The national OFFLU technical facilitator coordinated OFFLU activities with representatives from the DAH/National HPAI Campaign Management Unit (CMU) and other relevant public sector units and private sector stakeholders. Outputs included the following: receipt of letter from the DG to release virus sequences characterized by the project into the public domain; approval to receive the reverse genetic construct viruses at the Pusvetma laboratory; securing the material transfer agreement and ensuring shipment of selected viruses to AAHL; and assisting in preparations for the workshops and meetings.
- A proposal was received from the three sequencing partners on continued molecular sequencing activities in addition to support of HPAI monitoring to include a more strategic approach, communication and sharing of biologic materials between partners. This will contribute to recommendations on establishing the mechanism for sustainable virus characterization.
- A paper titled "Initial study of antigenic diversities of avian influenza virus H5N1 in Indonesia using reference antisera produced for antigenic cartography" was presented by a national scientist at the National Scientific Conference organized by the Indonesian Veterinary Medical Association in Semarang, October 2010.
- A presentation on "OFFLU: Contributions toward improved vaccine strain selection for poultry" was made by an international scientist in collaboration with OFFLU at the 1st International One Health Congress in Melbourne, Australia, February 2011.

E.2 Increase knowledge of best practices for avian influenza vaccination in poultry

- The final OFFLU project technical review meeting was conducted 28-29 October 2010 and recommendations were produced including guidance on registration and licensing for efficacious poultry vaccines.
- Clearance was received from the Director General to deliver the reverse genetics (RG) virus seed strains, generated at SEPRL, to Pusvetma.
- Following a meeting on 5 November 2010 facilitated by FAO/OFFLU, the DGLAHS informed vaccine manufacturers of the availability of the candidate vaccine and challenge viruses and invited them to retrieve the viruses from Pusvetma and BPM SOH. However, these strains have still not been released.

Output F: Coordinated and enhanced management of the HPAI control programme

F.1 Facilitate implementation of integrated HPAI control plan on one island where the HPAI situation is considered readily controllable

- The analysis of the market chain network study on Bali was completed. This was the last piece of work for phase I of the Bali project.

F.2 Strengthen government capacity to conduct veterinary services training and continuing education

- The curriculum for communication and improved training skills for Master Trainers (MT) has been developed and was approved and nine modules were prepared and tested. Linked to the Improved Training Skills, three Training of Trainers (TOT) sessions (GPS, sample submission and SMS gateway) have been developed so that the MTs can carry out these trainings at the provincial or district levels.
- Three national MTs have developed TOT skills and a further four MTs have been trained in Improved Training Skills.
- Three National MTs have returned to Jakarta and are learning how to develop training modules and have developed their abilities in module preparation and training. Two MTs in Bandung were given on-the-job support to improve their training skills. Data managers trained for the PVUK programme were supported to train enumerators in data collection.
- A need has been identified for a training module on understanding data which will build skills in data analysis and culminate in Quantum GIS training for Provincial and District staff. The curriculum for this training has been developed and module preparation commenced.

F.3 Improve competencies of local government decision-makers to manage sustainable and effective HPAI control programmes and to promote understanding of the economic impact of animal diseases on livelihoods and public health

- One Decision Makers' Meeting (DMM) for Yogyakarta was held on 21 and 22 December 2010. The meeting underlined the fact that backyard chickens are the main livestock species of the majority of people in Yogyakarta and are kept traditionally as an additional economic source or as a source of animal protein for the household. In addition, there are still many traditional markets in the province selling live chickens or birds.
- The meeting further highlighted the efforts made by the provincial and district Livestock Services (included PDSR-trained staff) in implementing effective HPAI control programmes with community participation and the need to implement more IEC activities to raise public awareness and to build off existing community cadres / volunteers at the village level. There is also a need to improve disease surveillance, control poultry movements in the market chain and build the capacity of Livestock Service officers (to be funded by local government).
- The output of this DMM meeting was a document signed by local government decision makers, stating that the provincial and district governments are ready with their 2011 and 2012 local government budgets to continue operational support of the PDSR programme.

F.4 Assist central and local governments to design and implement a national veterinary service strategy

- The NVS workplan was completed and approved by the Director of Animal Health.
- Guidelines on National Veterinary Services, establishment of Veterinary Authority and appointment of the Authorized Veterinarian were drafted and the content has been agreed in principle by DGLAHS NVS Task Force.
- Guidelines for the Control Strategy for rabies, anthrax, brucellosis and hog cholera were drafted by the DGLAHS NVS Task Force.

F.5 Develop and integrate emerging databases into the national veterinary information system

- The draft plan for the national animal disease surveillance system was completed.
- Database design for a generic animal disease surveillance system was initiated.
- Work on standardization of data collection to ensure compatibility of databases was continued.

F.6 Provide technical assistance for establishment of local cold chain capacity

- Inclusion of Bali in USAID-funded cold chain capacity strengthening activities was promoted
- Technical support was provided for the cold chain TOT implemented by JSI-Deliver.
- In collaboration with DAH/CMU and JSI-Deliver, a field assessment of the cold chain in Bali province was conducted.

F.7 Increase public visibility of the HPAI control programme

- FAO participated in the Indonesian Veterinary Medical Association conference and exhibition

in October 2010, establishing the programme's booth and disseminating public materials related to the project.

- The 2009 ECTAD Indonesia Annual Report (Indonesian version) distributed to partners and government offices.
- A Media Gathering on Market Restructuring was held in February 2011.
- Work has started on preparation of the 2010 ECTAD Indonesia Annual Report.

F.8 Provide operational support to enable implementation of the ECTAD Indonesia programme

- Service contracts were signed with vendors and partner organizations to facilitate various project activities, including the establishment of four cleaning and disinfection stations in East Jakarta, Bekasi and Tangerang, renovation of two markets in Tangerang, laboratory testing of samples for surveillance activities and a publicity campaign to promote "Ayam ASUH" (healthy chicken meat) in the Jabodetabek area.
- 355 IT equipment packages were procured and distributed to 29 provincial livestock service offices.
- The renewal of vehicle registration for 632 motorcycles and 38 cars was initiated.
- A Memorandum of Understanding (MOU) for testing of samples from layer farms participating in the biosecurity cost-effectiveness study was signed.
- In line with technical activities undertaken during the quarter, project personnel were recruited, project equipment and supplies were procured and distributed and Letters of Agreement (LOA) were signed with partner organizations.

Planned activities for the next six-month period

Output A: Sustainable surveillance, prevention and control of HPAI in village poultry

A.1 Maintain, develop and adapt local government prevention, passive surveillance and outbreak control capacity for village poultry across endemic areas of Indonesia, prioritized by level of HPAI risk; manage a staged transition of costs to local government

- Village empowerment strategies to be developed for incorporation into a modified version of PDSR that will evolve over the semester to focus on improving passive reporting and reducing amount of time spent on active reporting. New and simplified reporting methods will be developed to allow PDSR staff to work to empower the village community to take a greater role in decision-making. Strategies to develop village decision-making skills will be developed.
- Fourteen new PDSR staff will be trained in West Bandung and 39 officers in Samarinda. A review of existing PDSR coverage will be carried out to determine future needs for ongoing training. Twenty livestock service officers in Papua will be given Intro II training.
- Further DMMS will be held in Banten, West and Central Java to discuss cost-sharing.

A.2 Strengthen the capacity of Puskesmas by integrating participatory diseases surveillance and response techniques; pilot system first in ten Puskesmas

- Implementation of PCE field training will be linked to the development of the NVS. Initially this will take place in Bali to control rabies and this will serve as a model for other areas affected by rabies that are included within the NVS programme.

A.3 Increase local government veterinary service competency to detect, diagnose, report and control other animal diseases of zoonotic and economic importance in villages

- Eleven SOPs for the prevention and control of rabies will be completed and used in the NVS rabies eradication programme in Bali.
- Sixty-nine PDSR staff will be trained to carry out vaccination, rapid response and vaccination to control rabies in Bali.
- A system will be developed to increase passive reporting of suspect rabies cases and increase the communities' understanding of herd immunity amongst vaccinated dogs.
- PDSR Disease Transmission Video will be transitioned to commercial poultry and PVUK programmes following further discussion with the CPH and Local Government teams.
- SOP, workflow and technical guidelines and training will be developed for detection and control of rabies as a pilot of the NVS concept. These will be tested in Bali and linked to PCE

training.

A.4 Develop locally-realistic methods and communication materials for prevention and control of HPAI and other animal diseases of zoonotic and economic importance to enable communities to make informed decisions together and supported by local government

- An overall communication strategy will be developed to pass information from central government to commercial farmers through the LDCC system.
- Completion and distribution of IEC material as part of piloting the NVS concept in Bali.
- With the proposed changes in PDSR and development of NVS, the existing communication material will be reviewed for relevance in the new system.
- Development of communication material for farmers and farm workers to complement PVUK training and the CPH programme.

Output B: Improved biosecurity and vaccination practices in commercial sectors

B.1 Provide specialized technical support to selected layer farmers to enhance production efficiency and quality of layer vaccination and biosecurity measures

- Meet with each farmer to identify the farmer's top priorities and agree on a management plan to address biosecurity issues for each participating farm (phase-2 period).
- Continue to assist each farm to implement management plan phase-1 and phase-2.
- Sample birds and environment to determine presence of H5-subtype virus at end of phase 1 and 2 periods.
- Begin implementation study of farmers' perceptions and decision-making.

B.2 Support local government veterinary and laboratory services to engage more effectively with poultry farmers on disease prevention and outbreak investigations (PVUK programme)

- Complete final introductory level (level 3) training of pilot PVUK officers so they can formally begin to work as PVUK officers.
- Conduct Knowledge, Attitudes and Practices (KAP) study in selected districts as a baseline to later assess changes attributable to PVUK activities.
- A project evaluation will be carried out to document the impact of the PVUK pilot and make recommendations for scale-up.
- The PVUK database will be developed and managed at the district level.

B.3 Facilitate trial of private sector-funded compensation programme

- Further discuss opportunities to pilot a compensation system with GOPAN-associated broiler farmers.
- Identify early adopter farmers based on discussions above and initiate design.

B.4 Facilitate government and industry to establish a functional public-private partnership via a National Poultry Quality Improvement Programme, including regular Biosecurity Coordination meetings

- Continue development of the NPQIP document.
- Hold consultation meeting with farmers in collaboration with ADPHI, USDA and DGLAHS.
- Finalize TOR for Commercial Poultry Health Master Trainers in collaboration with ADPHI and USDA.

B.5 Evaluate effectiveness of biosecurity measures implemented by poultry producers

- Continue monitoring the implementation of the cost-effectiveness study.
- Analyze data from study and begin preparing preliminary report.
- Meet the farmers and key stakeholders to share study analyses and findings.
- Provide farmers with digital production cost data management system (database).
- Continue monitoring farmer decision-making patterns and conduct preliminary analysis.

B.6 Facilitate design of local government-implemented poultry farm profiling and certification system

- Further training for data managers on encoding the data generated by the PVUK officers will be carried out.
- Data managers will be given “understanding data” training to enable them to make best use of the profiling data.

B.7 Assist central government to monitor commercial poultry producer compliance with avian influenza vaccination regulations

- Prepare report to DGLAHS on findings of vaccination practices of farmers participating in CPH programme.

Output C: Improved HPAI surveillance and control along the poultry marketing chain

C.1 Support local government to conduct longitudinal surveillance and trace-back for H5 subtype virus and HPAI in live bird markets, collector yards and slaughterhouses

- Continue to support monthly LBM surveillance by local government in Jabodetabek.
- Conduct coordination meeting with Provincial Livestock Services of West Java, Jakarta and Banten, district/city livestock services and PSP in Jabodetabek.
- Complete analysis of collector yard surveillance data (Phase II) once PCR results are verified and then design Phase III market chain surveillance based on Phase II findings.
- Prepare training for Phase III market chain surveillance.
- Conduct Phase III market chain surveillance.

C.2 Support implementation of minimum standards of biosecurity and sanitation in selected live bird markets, collector yards and slaughterhouses

- Conduct market C&D training at ten pilot LBMs in collaboration with the MOH-WHO healthy markets programme.
- Supervise the operation of the new C&D stations in Bekasi and Bogor.
- Continue to develop C&D station design, budget estimation and contractor selection for 3 slaughterhouses in Jabodetabek.
- Develop minimum standards guidelines for sanitation along the poultry market chain.
- Support ongoing local government monitoring and evaluation of market chain C&D activities in Jabodetabek.
- Continue to oversee construction works at Anyar market in Tangerang City and Bonang market in Tangerang District.
- Develop and supervise the bidding process and contractor selection for Parung Panjang market (Bogor district), Anyar market (Bogor city) and Kranggan Market (Bekasi city).
- Conduct monitoring and evaluation of the implementation of cleaning day at LBMs in Jabodetabek.
- Provide documented lessons learned and recommendations to improve implementation of C&D activities.

C.3 Facilitate poultry market restructuring with emphasis on food safety in DKI Jakarta and surrounding areas

- Continue to provide assistance in the consolidation of the Jakarta poultry market restructuring strategy, which has agreed an increase in the number of designated relocation centres as a more accommodating approach towards the poultry operators.
- Help identify and assess potential locations proposed by collectors and slaughterers that can become official relocation centers.
- Continue to implement comprehensive promotion campaigns for “healthy chicken meat” with consumers and traders in other traditional markets selling poultry meat.
- Continue to collaborate closely with the private sector and the local administration in the restructuring of distribution channels, including the cold chain; continue the trial of a new distribution channel from one of the five collection yards to the traditional markets (Rawa Keping to four more traditional markets) and adoption of adapted cold chain equipment.
- Continue to collaborate closely with local government to strengthen food safety measures by ensuring the government relocation centres comply by food safety standards, develop training

programmes for meat inspectors and enforce specific inspection for the markets and slaughterhouses.

- Continue to assist provincial government to identify alternative income-generating activities for poultry stakeholders who may become unemployed by the market restructuring programme and design support programmes accordingly.

C.4 Explore mechanisms to improve inter-provincial movement control out of HPAI high risk provinces

- Hold focus group discussions with traders and vendors in Semanggi collector yard once the requisite support has been obtained from local government.
- Explore the possibility of establishing a poultry health monitoring system for all poultry entering Semanggi collector yard.
- Conduct follow-up meetings with central and local government on Animal Health Certification (SKKH) and field assessment to check points in Western Java.
- Follow up the agreement between FAO, DAH and local government of Surakarta city regarding Semanggi collector yard upgrading plan.
- Provide inputs to the local government of Western Java regarding checkpoint operation improvement.

Output D: Engagement with duck producers for improved control of HPAI

D.1 Assess role of ducks in the epidemiology of HPAI in selected areas of Java

- Clear and circulate the final report to partner organizations.
- Review the potential value and feasibility of AI vaccination of ducks in Indonesia.

D.2 Conduct duck vaccination field trial in one identified high risk HPAI-endemic area

- Further investigate decrease in detected HPAI cases in Yogyakarta province during the 2009-2010 influenza season.
- Reassess value of targeted duck vaccination trial once Java duck study and Yogyakarta assessment complete.

Output E: Sustainable virus monitoring and vaccine development

E.1 Assist public and private sectors to develop a centrally-managed system to monitor circulating viruses and sustain vaccine efficacy

- Facilitate ongoing Laboratory Network meetings in support of the effort to monitor antigenic variation in circulating viruses (May - Sequencing Network; Jul-Aug Pre-screening Network); and follow-up on the characterization of isolates selected based upon pre-screen data from DIC Wates as part of the parallel data generation for capacity building.
- Conduct "Communicating Science - Scientific Writing Workshop".
- The FAO-OFFLU Scientist will continue to provide support to the ongoing transfer of technology to Indonesia. The next inputs are scheduled for July-August 2011.
- Conduct workshop for improvement of laboratory data management including Excel, EMPRES-i Asia and InfoLabPlus.
- Assist AAHL to conduct workshop on quality reagent production at Pusvetma.
- Expand pre-screen effort to partner labs (e.g. industry/university) with DAH approval.
- Develop a module for InfoLabPlus to record and network all DIC results for the pre-screening and antigenic cartography (to be called Infolab Cartography) and provide training for DIC staff in the use of this new module (contingent upon DAFF support for InfoLabPlus).

E.2 Increase knowledge of best practices for avian influenza vaccination in poultry

- Confirm disposition of candidate vaccine and challenge strains returned to Indonesia for vaccine industry to develop updated vaccines.
- Support SEPRL to provide assistance to MoA designated laboratories for the preparation of vaccine master seeds from RG H5N1 avian influenza constructs provided through the project and to provide didactic and on-site challenge test training for efficacy and potency

determination to demonstrate efficacy and potency of vaccines for purposes of registration/licensing.

- Facilitate workshop on practical aspects of vaccines and vaccination. This workshop will increase the knowledge of poultry veterinarians and industry representatives on all practical aspects of vaccines and vaccination in poultry for improved control of avian influenza.
- Provide technical support for serosurveillance using homologous vaccine antigen and Wates-1 antigen and coordinate with existing vaccination efforts when possible.
- Prepare updated technical recommendations on vaccination strategy based upon recent field vaccine trials, continued epidemiological analysis of the disease situation in Indonesia and global epidemiological knowledge on HPAI.

Output F: Coordinated and enhanced management of the HPAI control programme

F.1 Facilitate implementation of integrated HPAI control plan on one island where the HPAI situation is considered readily controllable

- Write the report for phase 1 of the Bali project.
- Plan activities for phase 2 (intervention phase) of the project.
- Develop the plan with the Bali authorities.
- Start interventions depending on funds availability.

F.2 Strengthen government capacity to conduct veterinary services training and continuing education

- Provide the remaining 49 MTs with Improved Training Skills training and TOT training in GPS, SMS gateway and sample submission. They will then be able to carry out trainings of PDSR-trained staff at the local level.
- Assist DAH to recruit more National MTs to participate in the in-service training programme in Jakarta.
- Complete the “understanding data” modules, field test and begin field implementation.
- Hold DMM in the provinces of Banten, Lampung and East Java.

F.3 Improve competencies of local government decision-makers to manage sustainable and effective HPAI control programmes and to promote understanding of the economic impact of animal diseases on livelihoods and public health

- Revise DMM model to incorporate epidemiology and disease management training and NVS development, as well as the redesigning of the PDSR system. Conduct at least two newly designed DMMs in the next reporting period.
- Plan three DMMs to be attended by local government decision makers [representatives of provincial planning authorities (BAPPEDA), provincial parliaments (DPRD I and II) and the Assistant Governor for economic development] for Lampung, Banten and East Java provinces.

F.4 Assist central and local governments to design and implement a national veterinary service strategy

- Revise PDSR system to incorporate the NVS approach.
- Complete development of PCE training module.
- Implement pilot PCE training in Bali province.
- Facilitate meeting between MoA and Ministry of Internal Affairs to discuss NVS and the issuing of Joint Circular Letter.
- Finalize Joint Circular Letter of Minister of Agriculture and Minister of Internal Affairs on Guidelines on National Veterinary Services.
- Finalize guidelines for control strategy for rabies, anthrax, brucellosis and hog cholera.
- Develop reporting forms for rabies, anthrax, brucellosis and hog cholera.
- Advocate with Local Government on National Veterinary Services plan in pilot areas.

F.5 Develop and integrate emerging databases into the national veterinary information system

- Complete version 1.0 of the database for the animal disease surveillance system.
- Continue work on standardization of data collection to ensure compatibility of databases.
- Commence training on the new animal disease surveillance system in NVS pilot areas.

- Commence field trial of the new animal disease surveillance system in NVS pilot areas.

F.6 Provide technical assistance for establishment of local cold chain capacity

- In collaboration with DAH/CMU and JSI-Deliver, provide technical support for cold chain training to local government staff and capacity strengthening in Bali province.

F.7 Increase public visibility of the HPAI control programme

- Produce and distribute the Programme's Promotional Video Vol. 2.
- Produce and distribute the 2010 FAO ECTAD Indonesia Annual Report.

F.8 Provide operational support to enable implementation of the ECTAD Indonesia programme

- Facilitate service contracts and provide operational support to activities, such as the establishment of three cleaning and disinfection stations in South Jakarta, West Java and Tangerang and renovation of three markets in Bekasi and Bogor.
- Complete renewal of vehicle registrations for project vehicles and motorcycles.
- Complete distribution of 355 IT equipment packages to district livestock service offices.
- In line with planned technical activities for the next quarter, continue to recruit project personnel, procure and distribute project equipment and supplies and facilitate signing of Letters of Agreements (LOA) with partner organizations.
- Commence transfer of OSRO/INS/604/USA project assets to government.

Main challenges encountered and response provided

The most significant challenge faced this quarter was moving forward with timely implementation of multiple programmes and close collaboration with and in support of, our government counterparts. By combining timely technical expertise with experience facilitating cooperation between the Government of Indonesia and the international community, as well as intra-governmental cooperation, ECTAD Indonesia has been successful in making progress in all major areas of the HPAI Control Programme. Specific technical difficulties continue to be encountered with data management and diagnostic testing procedures in partner laboratories. As previously reported, these difficulties have caused delays in finalizing analyses for target research on collector yard surveillance, as well as the epidemiology of HPAI in ducks. Better progress in this area can be expected with more focused technical support tailored to the individual needs of each laboratory, as well as a greater focus on improving data management practices in general. Finally, the FAO programme is now facing the challenge of increasing the positive impact of activities, while faced with a significant budget reduction for FY 12 budget. ECTAD Indonesia is working closely with the DGLAHS and USAID to conduct a programme review and planning exercise for 2011-2012, which should enable the limited funds available to be focused on those activities which will have greatest impact in terms of both H5N1 risk reduction and long-term sustainability. Consultation on activities to be included in a new follow-on HPAI project will take place this semester and a project document will be drafted.

Main progress made towards the achievement of project outcomes (from the start of the current project phase)

Output A: Sustainable surveillance, prevention and control of HPAI in village poultry

- Activities have been designed to increase passive surveillance of HPAI. As active surveillance activities will be reduced, the PDSR and other local government staff will be trained to work closely with villages to encourage village-based solutions to HPAI prevention and control.
- There is now strong commitment, support and integration at the local government level (e.g. between the LDCC and provincial/district livestock services) in animal health and HPAI disease control programmes as a direct result of the FAO project.
- The PDSR programme has strengthened veterinary services capacity to detect and respond to HPAI outbreaks in village poultry throughout HPAI-endemic areas of Indonesia.
- The LDCC system has enabled more effective communication and coordination between central and local governments within the highly decentralized Indonesian governance system.
- Additional local governments have allocated funding specifically to support the establishment and operations of LDCC and PDSR activities, thereby contributing to sustainable disease control.

Output B: Improved biosecurity and vaccination practices in commercial sectors

- The commercial poultry health programme team has built rapport and trust with participating farmers, ensuring a healthy veterinarian-client relationship required for further progress in improving biosecurity and vaccination practices in commercial sectors.
- The understanding of the role of commercial poultry production in the maintenance and spread of HPAI has improved.
- The PVUK pilot programme has been developed in close collaboration with farmers, central and local governments in order to improve communication and cooperation between farmers and local government animal health services.
- Databases profiling the commercial poultry farms in each pilot district have been established by district livestock services.
- Public sector collaboration with commercial poultry producers has been accelerated. In particular, public sector disease controllers and international agencies are both more aware of the complexity of commercial poultry production in Indonesia and more engaged with private sector stakeholders involved in commercial poultry production.
- As a result of CPH programme activities, the HPAI Control Programme now understands that one of the key constraints poultry farmers are facing is a very limited capacity to track and interpret their farm's productivity and profit. Training and engagement activities are being adjusted to directly address this fundamental need.

Output C: Improved HPAI surveillance and control along the poultry marketing chain

- Test results from the DKI Jakarta category B animal health laboratory were distributed to all livestock services at district level throughout Jabodetabek to increase local government awareness and responsiveness to market chain contamination and veterinary public health issues.
- A targeted research activity to test collector yard-based surveillance methods to assess relative risk of poultry production areas and poultry type was developed and successfully implemented.
- Improved understanding of poultry market dynamics in DKI Jakarta by the public sector.
- Increased private and public sector C&D capacity and increased implementation of C&D practices along the poultry market chain in greater Jakarta.
- Critical weaknesses in the DKI Jakarta market restructuring preparations were identified and corrective measures proposed and subsequently implemented by the Government.
- A specific high-risk poultry market system has been identified as a result of project-implemented surveillance activities and is now being addressed with the relevant government stakeholders.

Output D: Engagement with duck producers for improved control of HPAI

- The database of duck flocks developed from the study area provides a sample frame for the prevalence study and other future activities to be undertaken in duck populations by animal health authorities; knowledge of locations of high density duck populations is a critical first step to identifying critical control points for targeted interventions to control HPAI.

Output E: Sustainable virus monitoring and vaccine development

- Development of a safe and efficacious vaccine for use in Indonesia.
- Characterization of AI viruses circulating in Indonesia.
- Increased capacity of Indonesian laboratories to perform antigenic and genetic characterization of viruses and analyse results.
- Improved collaboration between Indonesian private sector and public sector on field virus monitoring.

Output F: Coordinated and enhanced management of the HPAI control programme

- The human resource capacity of local government livestock services has been improved through PDSR training and preparation of Master Trainers to lead training and continuing education activities within the HPAI Control Programme.
- Improved knowledge of factors associated with outbreaks of HPAI in village poultry to be used to inform and refine surveillance and control strategies.

- Critical control points identified. Data and subsequent analysis leading to identification of further points for disease control efforts to be targeted.
- Significant improvement in technical capacity and management of local government human resources working in the field throughout all known HPAI-endemic areas.
- Guidelines for the implementation of the NVS have been prepared by DGLAHS under the direction of the NVS Task Force with technical advice provided by ECTAD Indonesia.
- The NVS approach has been made operational via the rabies eradication programme in Bali, allowing capacities developed by the project to be utilized for other major Indonesian public health priorities in addition to H5N1 HPAI.

Project Monitoring Sheet: **OSRO/RAS/604/USA Baby 03**

Project title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)**

Reporting period: **April 2011 – September 2011**

Country: Lao People's Democratic Republic
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)
Code: OSRO/RAS/604/USA Baby 03
Budget: USD 1 000 000 (Phase I), 1 284 990 (Phase II), 900 000 (Phase III), 800 000 (Phase IV), 550 000 (Phase V), USD 372 000 (Phase VI)
Total budget: USD 4 906 000
Effective starting date: 1 August 2006
Planned end date: 30 September 2012
<p>Context of the project</p> <p>The project assists the Government in responding to the consequences of a possible poultry disease epidemic that could not only cause serious damage to the poultry sector, but also cause serious consequences to human health and household livelihoods.</p>
<p>Objectives of the project</p> <p>The specific objectives of the project are to:</p> <ul style="list-style-type: none"> • strengthen coordination of and support avian influenza (AI) control policy development; • strengthen risk-based surveillance for Highly Pathogenic Avian Influenza (HPAI) in target provinces; • improve disease response capability; and • strengthen risk management measures, including biosecurity measures and cross-border movement.
<p>Planned activities</p> <p>Output 1: Coordinated project implementation and policy support</p> <ul style="list-style-type: none"> • Continue the weekly meetings among the HPAI project staff • Conduct two backstopping missions: the first for a month in April 2011 and the second for three months from July to September 2011 • Support bilateral meetings with Thailand and Viet Nam • Continue to participate in the discussion meetings coordinated by the National Emerging Infectious Disease Coordination Office (NEIDCO) for the development of Zoonosis Collaboration Mechanism (ZCM) concept • Participate at the NEIDCO final wrap-up meeting of the National Five Year Work Plan (2011-2015) for emerging infectious diseases (EID) and Public Health Emergency Preparedness and Response on 21 April 2011 • Participate in the United States Agency for International Development (USAID) Emerging Pandemic Threats (EPT) programme for Lao People's Democratic Republic (PDR) on 26 April 2011 • Recruitment of an International Consultant on Veterinary Legislation for one month in June-July 2011 to assist the Department of Livestock and Fisheries (DLF) in completing the veterinary legislation framework based on the gap analysis carried out in phase IV • Organize final wrap-up meeting at the end of the project and develop and produce HPAI booklet on the achievement of the project from phase I to V

Output 2: Strengthened surveillance and response

- Participate at the Surveillance Working Group (SWG) meeting for sharing surveillance data and updating on surveillance issues with other partners on 5 April 2011
- Continue to conduct the second round of active surveillance in ten provinces for phase V from 20 June to 1 July 2011
- Recruitment of an International Consultant on Veterinary Epidemiology for one month in May 2011 to provide recommendations on surveillance activities and data management
- Conduct two training courses for outbreak investigation for the Provincial Agriculture and Forestry Office (PAFO) and District Agriculture and Forestry Office (DAFO) staff in the provinces of Xayabouly and Bolikhamxay in May 2011
- Continue to support the Field Veterinary Epidemiology in Action training in Khon Kaen University of Thailand in June 2011
- Provide laboratory diagnostic training in Phongsaly province for laboratory staff from northern provinces in August 2011
- Support two National Animal Health Centre (NAHC) laboratory staff to learn the laboratory management and operational strategy of the Bio-Safety Level 3 facility at the Virology Research Institute (VRI) in Pakchong, Thailand on June-July 2011
- Provide necessary equipment and supplies for surveillance and rapid response

Output 3: Strengthened risk management measures, including biosecurity improvement among the high-risk poultry populations

- Conduct a workshop to review the pilot implementation of biosecurity improvement at the live bird market (LBM) in Oudomxay province in April 2011
- Start the activities relating to the pilot implementation of biosecurity improvement in Luang Namtha province in May 2011 by conducting:
 - training on biosecurity for PAFO and DAFO officers in May 2011;
 - training for market manager, vendors and cullers/slaughterers in May 2011;
 - construction of stall at selected LBM as a prototype for biosecurity improvement in June 2011; and
 - monitoring of progress of pilot activities in July 2011
- Organize training for LBM authorities and trader associations on biosecurity
- Organize training workshop for the public and private sectors on poultry production and biosecurity measures in Vientiane Capital and Savannakhet

Output 5: Strengthening capabilities to manage cross-border trade

- Organize a scoping workshop in Vientiane Capital in April 2011 to map out the domestic poultry value chain to link with the cross-border trade for HPAI risk assessment
- Continue to support a study to be conducted in Vientiane Capital to link the Thai cross-border poultry trade to in-country poultry production profile and its market chain
- Recruit an International Consultant for Cross-border Activities for one month in July 2011 to prepare and supervise cross-border activities
- Organize training to improve capabilities of border check points staff in July 2011
- Organize evaluation workshop to discuss the effectiveness of measures introduced and currently implemented at the border check points in July 2011
- Make provision of equipment and supplies for border check points

Activities undertaken during the reporting period**Output 1: Coordinated project implementation and policy support**

- The International Operation Officer has concluded his five-month backstopping mission to

assist in daily operation of the project from 5 May 2011 to 30 September 2011

- The project AI weekly meetings with staff to discuss technical and operational issues has continued.
- A no-cost extension of the project ending in 31 December 2011 was approved.
- During project's no-cost extension period, project staff was reduced by 50 percent. New contracts until 31 December 2011 were issued for two National Consultants, one National Operations Assistant, one Administrative Assistant and two drivers
- The Team Leader (TL) and National Project Coordinator (NPC) participated in the USAID Emerging Pandemic Threat (EPT) meeting organized on 27 April 2011 to discuss the EPT work plan 2011-2015
- The final concept on ZCM as part of the National Five Year Work Plan for EIDs and Public Health Preparedness and Response was jointly developed by the human and animal health sector from the Government of Lao PDR and development agencies
- The Team Leader attended the Team Leader meeting in FAO headquarters in Rome, Italy from 9 to 11 May 2011
- The TL and NPC participated in the European Union Highly Pathogenic and Emerging Diseases (HPED) project on anthrax organized by NEIDCO on 23 May 2011
- The Final Joint Implementation Review (JIR) of the National Avian Influenza Control and Pandemic Preparedness Plan 2006-2010 was undertaken from 6 to 14 June 2011 and FAO is the leading agency in Strategy 1
- The International Consultant on Veterinary Legislation completed the one-month assignment from 16 June to 12 July 2011 to review and advise on the development of the secondary legislation under the umbrella of Livestock and Veterinary Law
- A workshop on the development of secondary legislation under the Livestock Production and Veterinary Law was organized in Vientiane province on 7 and 8 July 2011 and attended by 17 participants
- The project supported the participation of 20 Lao PDR's delegation to the bilateral meeting with Viet Nam on disease control and Sanitary and Phytosanitary (SPS) matters on 25 and 26 August 2011 in Luang Prabang
- The National Mid-Term Priority Plan for Animal Health (NMTPP-AH) document was cleared by the FAO Regional Office for Asia and the Pacific (RAP), and the TL delivered a short presentation for DLF staff on 14 September 2011
- One Health symposium was organized on 21 September 2011 by NEIDCO in collaboration with the World Health Organization (WHO) and FAO
- World Rabies Day was celebrated in Lao PDR on 30 September 2011 and FAO supported DLF with 300 doses of rabies vaccines for free vaccination campaign

Output 2: Strengthened surveillance and response

- The second sampling of active surveillance in ten provinces (Vientiane Capital, Vientiane, Savannakhet, Champasak, Luang Prabang, Luang Namtha, Xayabouly, Xiengkhouang, Oudomxay and Phongsaly) was conducted from 20 June to 1 July 2011
- The third Field Veterinary Epidemiology in Action course in collaboration with the Faculty of Veterinary Medicine Khon Kaen University (KKU) Thailand was organized for ten provincial officers from 17 May to 8 June 2011
- Training on Animal Disease Diagnosis to improve the capabilities of 13 staff from provincial animal disease diagnostic laboratories of Phongsaly, Oudomxay, Luang Namtha and Luang Prabang was organized in Phongsaly from 16 to 19 May 2011
- The International Consultant on Veterinary Epidemiology completed the three-week assignment from 9 to 27 May 2011 to review the active surveillance programme and advise

on data management and analysis

- Training on outbreak investigation for HPAI and other transboundary animal diseases (TADs) was organized in Vientiane province for 15 district staff from seven provinces from 28 to 30 June 2011
- The TL and two National Consultants participated at the Surveillance Working Group (SWG) meeting for sharing surveillance data and updating on surveillance issues with human health sectors and other partners on 27 July 2011
- An overseas training on laboratory biosafety for two laboratory staff members was conducted at the Thailand Regional Reference Laboratory Pakchong from 1 to 12 August 2011 in order to support the management of the new NAHC's laboratory with a higher level of biosafety

Output 3: Strengthened risk management measures, including biosecurity improvement among the high-risk poultry population

- The construction of the prototype stall model for live poultry marketing as part of the pilot activity on biosecurity improvement at Nongleng LBM in Oudomxay province was completed in November 2010 and the poultry vendors are utilizing the new stall since December 2010
- A workshop to evaluate the pilot activity on biosecurity improvement in Oudomxay province was organized on 25 and 26 April 2011
- Training on the introduction of biosecurity guidelines for LBM for 13 participants was organized in Luang Namtha on 3 and 4 May 2011
- The Biosecurity Expert from FAO headquarters conducted a three-week mission from 31 May to 17 June 2011
- Under OSRO/INT/805/USA no-cost extension projects, three activities were carried out:
 - biosecurity training in Vientiane province on 6 and 7 June 2011
 - biosecurity training in Savannakhet province on 9 and 10 June 2011
 - workshop on the development of biosecurity guidelines for Lao PDR in Vientiane Capital on 15 and 16 June 2011
- 3 000 copies of the manual on biosecurity guidelines for poultry commercial farm were printed in the Lao language and 1 000 copies in the English language

Output 4: Strengthening capabilities to manage cross-border trade

- The International Consultant for Cross-border Activities completed the three-week assignment from 4 to 22 July 2011 to assist in strengthening the cross-border control capacity of Lao PDR
- The second training workshop for 26 staff at the international and national border check point was organized in Savannakhet province on 19 and 20 July 2011

Planned activities for the next six-month period

Output 1: Planning, Coordination and policy support

- Continue the weekly meetings among the HPAI project staff
- Process the Government of Lao PDR approval for the phase VI of the project
- Extend contract of the national consultants and other project staff until 30 September 2012
- Organize an inception workshop to formally start the activities of the phase VI of the project
- Continue to support bilateral meeting with Thailand
- Participate at the NEIDCO final meeting of the National 5 Year Work Plan for EID and Public Health Emergency Preparedness and Response on 10 October 2011

- Participate at the USAID EPT program meeting for Lao PDR on 23 November 2011
- Develop and produce HPAI booklet on the project achievements from phase I to V

Output 2: Strengthen veterinary legislation for animal disease control

- Recruit a National Consultant on Veterinary Legislation
- Continue to develop the draft decree of animal and animal commodities movement and control and temporary seizures of animal commodities and animal quarantine

Output 3: Strengthen laboratory capacity

- Under EPT IDENTIFY project, two biosafety cabinets of NAHC laboratory which failed the testing conducted by Asia-Pacific Biosafety Association (APBA) will be replaced, and the delivery is expected before the end of 2011
- Under EPT IDENTIFY project, a backstopping mission by the Australian Animal Health Laboratory (AAHL) expert is planned on 6 and 7 October 2011
- Under EPT IDENTIFY project, conduct a training for DLF staff on the Laboratory Information Management System (LIMS)

Output 4: Strengthen veterinary epidemiology capacity

- Recruit National Consultant on Veterinary Epidemiology
- Organize a planning workshop to support risk-based active surveillance in high-risk provinces and longitudinal surveillance in one province
- Conduct the first sampling of risk-based active surveillance in high risk provinces
- Conduct the monthly sampling of the longitudinal active surveillance in one province
- Participate at the SWG meeting for sharing surveillance data and updating on surveillance issues with human health sector and other partners
- Provide necessary equipment and supplies for surveillance and rapid response

Main challenges encountered and response provided

- Failure to report HPAI outbreak early and insufficient outbreak investigation are still gaps that need to be overcome in order to improve the capacity to respond to HPAI outbreak and other TADs.
- The limited availability of national veterinary human resources is a constraint to the absorption capacity of the governmental services in the country. The activities carried out under Output 2 in phase III, IV and V of this project addressed some of the capacity building needed.
- There are gaps in knowledge on the process by which H5N1 virus enters Lao PDR and how it remains and spreads within the country owing to insufficient outbreak investigation. More evidence is being gathered through active surveillance, but this needs to be reinforced by the specific socio-economic studies planned on cross-border movements and value chains.
- There is a very limited local capacity to manage and analyse data. The limited capacity of an effective epidemiology unit at the central level and the heavy workload of the technical staff at the provincial level have exacerbated the problem. Phase VI of the project should help to address this issue.
- Legislative support to animal health control still remains a challenge - although progress is being made in this area.

Main progress made towards the achievement of project outcomes**Output 1: Coordinated project implementation and policy support**

- A proposal for phase VI was developed taking into account the other related projects (i.e. EPT Identify, EU HPED, Asian Development Bank SPS).
- The NMTTPP-AH was finalized, cleared by RAP and presented to DLF for comments and endorsement; It is currently in the process of being co-signed by FAO Representative and the Director-General/DLF.
- Six new drafts of sub-laws/decrees under the new Law on Livestock and Animal Health were developed.
- The agreement on the slaughter of animals and meat hygiene inspection was signed by the MAFF and is in force.

Output 2: Strengthened surveillance and response

- Letters of Agreement (LoAs) for two rounds of active surveillance between the project and the ten provinces were finalized.
- LoA for laboratory testing of active surveillance samples between the project and the NAHC laboratory was finalized.
- The implementation of risk-based active surveillance with similar design as of 2010, but only in two samplings in phase V produced significant results.
- The global positioning system (GPS) tools provided by the project were utilized for recording the geo-coordinates of the active surveillance sites.
- The central and provincial staff capabilities in conducting field surveillance were improved.

Output 3: Strengthened risk management measures, including biosecurity improvement among the high-risk poultry populations

- A prototype stall model for biosecurity improvement was successfully operating in one LBM in Oudomxay province.
- Biosecurity guidelines for poultry commercial farm for Lao PDR were developed and printed.

Output 4: Strengthening capabilities to manage cross-border trade

- The international and national border check point staff have a better understanding and awareness of the country's needs to satisfy the requirements of the SPS agreement in order to obtain the accession to the WTO membership.

Project Monitoring Sheet: **OSRO/RAS/604/USA Baby 03**

Project title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)**

Reporting period: **October 2010 – March 2011**

Country: Lao People's Democratic Republic
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)
Code: OSRO/RAS/604/USA Baby 03
Budget: USD 1 000 000 (Phase I), USD 1 284 990 (Phase II), USD 900 000 (Phase III), USD 800 000 (Phase IV), 550 000 (Phase V) Total budget: USD 4 534 990
Effective starting date: 1 August 2006
Planned end date: 30 September 2011
Context of the project The project assists the Government in responding to the consequences of a possible poultry disease epidemic that could not only cause serious damage to the poultry sector, but also cause serious consequences to human health and household livelihoods.
Objectives of the project The specific objectives of the project are to: <ul style="list-style-type: none"> • strengthen coordination of and support avian influenza (AI) control policy development; • strengthen risk-based surveillance for Highly Pathogenic Avian Influenza (HPAI) in target provinces; • improve disease response capability; and • strengthen risk management measures, including biosecurity measures and cross-border movement.
Planned activities Output 1: Coordinated project implementation and policy support <ul style="list-style-type: none"> • continue the weekly meetings among the HPAI project staff • extend the contracts of the project staff until 30 September 2011 • support the bilateral meeting between Lao People's Democratic Republic (PDR) and People's Republic of China • support the development of the National Five Year Plan (2011-2015) on communicable diseases organized and coordinated by the National Emerging Infectious Disease Coordination Office (NEIDCO) • support the United States Agency for International Development (USAID) Partners' meeting from 3 to 5 November 2010 in Luang Prabang province Output 2: Strengthened surveillance and response <ul style="list-style-type: none"> • continue to conduct the fourth round of active surveillance in nine provinces from 29 November to 12 December 2010 • conduct training for laboratory staff to improve HPAI and other basic diagnostic capacity in Champasak province in November 2010 • Standard Operating Procedures (SOPs) and sublaws/decrees approved by the Government, printed and disseminated

Output 4: Strengthened risk management measures, including biosecurity improvement among the high-risk poultry populations

- construction of the stall at the live bird market (LBM) as part of the pilot implementation on biosecurity improvement in Oudomxay province to start in October 2010
- monitor pilot activities by project staff together with the Provincial Agriculture and Forestry Office (PAFO) and District Agriculture and Forestry Office (DAFO) staff to follow up on the progress of the biosecurity improvement at LBM in Oudomxay province

Output 5: Strengthening capabilities to manage cross-border trade

- international consultant on cross-border activities together with the national Project Director will undertake two visits to Boten, Luang Namtha province and to Kaysone, Savannakhet province to meet and liaise with PAFO/DAFO and the check point staff
- organize training for staff at border check points

Activities undertaken during the reporting period

Output 1: Coordinated project implementation and policy support

- The International Operations Officer concluded his backstopping mission to assist in daily operation of the project from 20 October 2010 to 16 January 2011.
- Continued conducting of the AI weekly meetings staff to discuss technical, as well as operational issues.
- All contracts of national consultant and other project staff were extended until 30 September 2011.
- The Government of Lao PDR's approval for the Phase V of the project was received on 11 November 2010.
- An inception workshop to evaluate the activities implemented during Phase IV and to plan the activities to be implemented during Phase V of the project was organized on 9 and 10 December 2010.
- The project team revised the 2011 work plan, based on the inputs during the inception workshop.
- The Team Leader attended the Ecohealth Emerging Infectious Diseases Research Proposal Development workshop in Siem Reap, Cambodia, from 18 to 22 October 2010, supported and organized by the Canada's International Development Research Centre (IDRC).
- The Team Leader and the National Project Coordinator participated at the Tripartite Review Mission meeting organized by the Food and Agriculture Organization of the United Nations (FAO) Environmental Animal Health Initiative Management for Enhanced Smallholder Production (EAHMI) project on 25 October 2010.
- The Team Leader and the National Project Coordinator were in Bangkok on 29 and 30 November 2010 to attend:
 - inception workshop for the Regional Cooperation Programme on Highly Pathogenic and Emerging Diseases (HPED) in Southeast Asia on 29 November 2010; and
 - closing workshop on Technical Cooperation Project (TCP) on Emergency assistance for Surveillance of Novel Influenza A Subtype H1N1 Viruses in Pig and Poultry Production Sectors in High Risk Southeast Asian Countries on 30 November 2010.
- The Team Leader delivered a lecture on the application of the One Health approach to control zoonoses at the Study Conference for One Health Master programme at Massey University, New Zealand, on 14 December 2010. This visit was sponsored by Massey University.
- The Team Leader (sponsored by IDRC and the International Livestock Research Institute [ILRI]) and the National Project Coordinator (sponsored by the European Union)

participated at the One Health Congress 2011 in Melbourne, Australia, from 14 to 16 February 2011.

- The Team Leader attended the 5th Annual Regional Emergency Centre for Transboundary Animal Diseases (ECTAD) meeting for Asia and the Pacific in Bangkok from 22 to 24 February 2011 and participated in the PEMS training on 25 February 2011.
- The Team Leader and the National Project Coordinator attended the Preparation Meeting Emerging Pandemic Threats (EPT) Program coordinated by NEIDCO in collaboration with USAID in Vientiane on 28 February 2011.
- The Team Leader and the National Project Coordinator participated in several discussion meetings for the development of Zoonosis Collaboration Mechanism (ZCM) concept as part of the National 5-Year Work Plan for the emerging infectious diseases (EID) and Public Health Emergency Preparedness and Response during February to March 2011.

Output 2: Strengthened surveillance and response

- A Field Veterinary Epidemiology in Action course in collaboration with the Faculty of Veterinary Medicine Khon Kaen University (KKU) Thailand was organized for ten provincial officers from 4 to 22 October 2010.
- Training for Animal Disease Diagnosis to improve the capabilities of 12 staff from provincial animal disease diagnostic laboratories of Champasak and Savannakhet was organized in Champasak from 22 to 26 November 2010.
- The fourth sampling of active surveillance in nine provinces (Vientiane Capital, Vientiane, Savannakhet, Champasak, Luang Prabang, Luang Namtha, Xiengkhouang, Oudomxay and Phongsaly) was conducted from 29 November to 12 December 2010.
- The Team Leader and the Director of NAHC attended the Regional workshop on Surveillance Network Analysis Tool (SNAT) organized by the Agricultural Research for Development Centre (CIRAD) in Hanoi, Vietnam, on 4 to 5 October 2010.
- A Zoonosis Risk Assessment workshop was organized jointly by the World Health Organization (WHO) and FAO in Vientiane province from 27 to 29 October 2010.
- The project supported five follow-up outbreak investigations carried out by PAFO as part of the passive surveillance to Xiengkhouang (19 October 2010 and 29 and 30 November 2010); Xayabouly (from 13 to 16 December 2010); Phongsaly (14 December 2010); and Luang Namtha (10 January 2011).
- The Regional Project Coordinator carried out two missions to assist in data management and analysis of the active surveillance; the first mission was on 30 and 31 August 2010 and the second mission from 20 to 24 December 2010.
- Under the TCP project on H1N1, the National Animal Health Center (HC) staff conducted training and cross-sectional studies in pig population in four provinces (Vientiane Capital, Luang Prabang, Savannakhet and Champasak) between 28 September and 19 October 2010. Also bi-weekly visits and disease investigations to monitor suspected cases of swine influenza conducted in two provinces (Bolikhamxay and Khammouane) between 20 September and 22 November 2010.
- Under the IDENTIFY regional project, two biosafety experts from Asia-Pacific Biosafety Association (APBA) conducted two missions to the NAHC laboratory to demonstrate the correct use of biosafety equipments and supplies; the first mission was on 13 and 14 December 2010 and the second mission on 26 to 28 January 2011.
- One Department of Livestock and Fisheries (DLF) staff member was supported to attend a short training course on 'Veterinary Epidemiology in Action' under the Field Epidemiology Training Programme for Veterinarians (FETPV) from 17 January to 11 February 2011.

- The Evaluation and Planning workshop for HPAI surveillance to better understand the active surveillance plan, improve data and sample collection and improve coordination at all levels was organized from 3 to 5 February 2011 and attended by 45 participants.
- A field simulation exercise for HPAI rapid response team was conducted in Xiengkhouang province from 7 to 10 March 2011 with a total of 48 participants. The risk communication activity in this simulation exercise carried out in collaboration with the Academy for Educational Development (AED).
- The first round of active surveillance in ten provinces (previous nine provinces in phase IV plus Xayabouly province) was conducted from 22 March to 2 April 2011.
- Four missions were conducted by the national consultants to monitor the implementation of data and sampling collection process by PAFOs and DAFOs during the active surveillance activities in ten provinces from 22 March to 2 April 2011.

Output 3: Strengthened risk management measures, including biosecurity improvement among the high-risk poultry population

- The construction of the stall at LBM Nongleng as part of the pilot implementation on biosecurity improvement in Oudomxay province was completed by 29 November 2010.
- Two project staff together with PAFO/DAFO staff monitored the progress of the pilot implementation of the biosecurity improvement and inspected the new stall construction at LBM Nongleng in Oudomxay province from 2 to 5 December 2010.

Output 4: Strengthening capabilities to manage cross-border trade

- The International Consultant for Cross-border Activities completed a two-month mission from 27 September to 26 November 2010 and submitted his recommendations for improvement of cross-border capacity.
- The International Consultant for Cross-border Activities carried out visit to Boten, Luang Namtha province from 9 to 15 October 2010 and to Kaysone, Savannakhet province from 17 to 20 October 2010 to meet and liaise with PAFO/DAFO and the check point staff.
- Training workshop for 28 staff at the International and National Border Check-point was organized in Vientiane province from 9 to 11 November 2010.

Planned activities for the next six-month period

Output 1: Coordinated project implementation and policy support

- continue the weekly meetings of the HPAI project staff
- conduct two backstopping missions, first for a month in April 2011 and then for three months, from July to September 2011
- support bilateral meetings with Thailand and Viet Nam
- continue to participate in the discussion meetings coordinated by NEIDCO for the development of ZCM concept
- participate at the NEIDCO final wrap-up meeting of the National 5-Year Work Plan for EID and the Public Health Emergency Preparedness and Response on 21 April 2011
- participate in the USAID EPT programme for Lao PDR on 26 April 2011
- recruit an International Consultant on Veterinary Legislation for one month in June-July 2011 to assist DLF in completion of the veterinary legislation framework based on the gap analysis carried out in Phase IV
- organize final wrap-up meeting at the end of the project
- develop and produce an HPAI booklet on the achievement of the project from Phase I to V

Output 2: Strengthened surveillance and response

- participate in the Surveillance Working Group (SWG) meeting for sharing surveillance data and updating surveillance issues with other partners on 5 April 2011
- continue to conduct the second round of active surveillance in ten provinces for Phase V, from 20 June to 1 July 2011
- recruit an International Consultant on Veterinary Epidemiology for one month in May 2011 to provide recommendations on surveillance activities and data management
- conduct two training courses for outbreak investigation for PAFO and DAFO staff in the provinces of Xayabouly and Bolikhamxay in May 2011
- continue to support the Field Veterinary Epidemiology in Action training in Khon Kaen University of Thailand in June 2011
- provide laboratory diagnostic training in Phongsaly province for laboratory staff from northern provinces in August 2011
- support two NAHC laboratory staffs to learn the laboratory management and operational strategy of BSL3 facility at the Virology Research Institute (VRI) in Pakchong, Thailand on June-July 2011
- provide necessary equipment and supplies for surveillance and rapid response

Output 3: Strengthened risk management measures, including biosecurity improvement among the high-risk poultry population

- conduct the workshop to review the pilot implementation of biosecurity improvement at LBM in Oudomxay province in April 2011
- start the activities relating to the pilot implementation of biosecurity improvement in Luang Namtha province in May 2011 by conducting:
 - training on biosecurity for PAFO and DAFO officers in May 2011;
 - training for market managers, vendors and cullers/slaughterers in May 2011;
 - construction of stall at selected LBM as a prototype for biosecurity improvement in June 2011;
 - monitor progress of pilot activities in July 2011
- organize training for LBM authorities and traders associations about biosecurity
- organize training workshop for the public and private sectors on poultry production and biosecurity measures in Vientiane Capital and Savannakhet

Output 4: Strengthening capabilities to manage cross-border trade

- organize a scoping workshop in Vientiane Capital in April 2011 to map out the domestic poultry value chain to link with the cross-border trade for HPAI risk assessment
- continue to support a study to be conducted in Vientiane Capital to link the Thai cross-border poultry trade to in-country poultry production profile and its market chain
- recruit an International Consultant for Cross-border Activities for one month in July 2011 to prepare and supervise cross-border activities
- organize training to improve capabilities of border check points staff in July 2011
- organize evaluation workshop to discuss the effectiveness of measures introduced to and currently implemented at the border check points in July 2011
- provide equipment and supplies for border check points

Main challenges encountered and response provided

- Limited early reports on HPAI outbreak and insufficient outbreak investigation still need to be overcome in order to improve the capacity to respond to HPAI outbreaks and other

TADs.

- The limited availability of national veterinary human resources is a constraint to the absorption capacity of the governmental services in the country. The activities carried out under Output 2 in Phase III, IV and V of this project have addressed some of the capacity building needed.
- Gaps in knowledge have been identified regarding the process by which the H5N1 virus enters Lao PDR and how it remains and spreads within the country, owing to insufficient outbreak investigation. More evidence is being gathered through active surveillance, but this needs to be reinforced by the specific socio-economic studies planned on cross-border movements and value chains.
- There is a very limited local capacity to manage and analyse data. The absence of an effective epidemiology unit at the central level and the heavy workload of the technical staff at the provincial level have exacerbated the problem. Phase IV and V of the project should help to address this issue.
- Legislative support to animal health control still remains a challenge, although progress is being made in this area.

Main progress made towards the achievement of project outcomes

Output 1: Coordinated project implementation and policy support

- The project team revised the work plan for 2010 and reached an agreement with the Government on the schedule of implementation of the work plan.
- The draft of sublaws/decrees under the new legislation Law on Livestock and Animal Health Matters was developed and finalized.
- The National Animal Health Roadmap (NAHR) for Lao PDR was drafted based on the inputs from the veterinary services staff.
- The HPAI Prevention and Control Programme is incorporated into Strategy 1 of the National Avian Influenza Control and Pandemic Preparedness Plan 2006-2010 and will be further developed and expanded for the next five years.

Output 2: Strengthened surveillance and response

- LoAs for two rounds of active surveillance during phase V were signed between the project and the ten provinces.
- The improved risk-based active surveillance design, which incorporated the spatial and temporal distribution of HPAI and focused on duck species and LBM, was implemented and produced significant results.
- The global positioning system (GPS) tools provided by the project were utilized for recording the geo-coordinates of the active surveillance sites.
- The central and provincial staff capabilities in animal virus influenza diagnosis were improved.
- SOPs were completed and are ready to be used for control zones, culling, disease investigation in backyard poultry and commercial poultry farms and sample collection.

Output 3: Strengthened risk management measures, including biosecurity improvement among the high-risk poultry populations

- Practical biosecurity guidelines for LBMs, slaughter point and duck farms were developed with regard to the local situation. This was used as operational guidance for pilot implementation in Oudomxay province.

- A prototype stall model for biosecurity improvement was constructed and operated in one LBM in Oudomxay province.

Output 4: Strengthening capabilities to manage cross-border trade

- Cross-border trade flows and their links to domestic poultry value chain were mapped and documented for selected borders, such as with China (Luang Namtha and Oudomxay) and with Thailand and Viet Nam (Savannakhet). In Phase V, similar activity will be carried out in Vientiane Capital.
- Legislative support and technical inputs provided to revise the current decree on inspection of animal, animal products and other related products imported to and in transit through Lao PDR.

Project Monitoring Sheet: **OSRO/MYA/702/USA**

Project title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)**

Reporting period: **October 2010 – March 2011**

Country: Myanmar
Project: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)
Code: OSRO/MYA/702/USA
Budget: USD 500 000 (Phase I), USD 750 000 (Phase II), USD 375 000 (Phase III), USD 150 000 (Phase IV)
Total budget: USD 1 775 000
Effective starting date: January 2008
Planned end date: 30 September 2011
<p>Context of the Project</p> <p>Myanmar experienced four waves of Highly Pathogenic Avian Influenza (HPAI) outbreaks in 2006, 2007, 2010 and 2011. The most recent, in January-March 2011, occurred in four separate locations and required the culling of over 100 000 poultry as part of control measures. While the Myanmar Government has responded promptly to outbreaks, the country remains at-risk from duck populations in which the virus is endemic, migrating wild birds and trade with neighbouring countries. The Food and Agriculture Organization of the United Nations (FAO) is implementing an integrated AI control programme, consisting of three projects with complementary activities: OSRO/MYA/702/USA, OSRO/MYA/801/WBK and OSRO/MYA/601/AUL. The programme is being implemented in collaboration with the Livestock Breeding and Veterinary Department (LBVD) of the Ministry of Livestock and Fisheries. The report describes activities funded or co-funded by the project in the context of the overall programme.</p>
<p>Objectives of the project</p> <p>The major objective of the project is to address the urgent short-term actions to strengthen Myanmar's capacity to rapidly detect HPAI and minimize its spread. Specifically, the project aims to provide necessary assistance in:</p> <ul style="list-style-type: none"> • strengthening HPAI prevention and control in Myanmar, particularly the capacity to effectively contain the outbreak, including animal surveillance, collaboration and communication between the animal and human health sectors; • strengthening the capacity of the veterinary services at the field level; and • mobilizing stakeholders towards building a community-based rapid warning and response system to meet the challenge of an avian influenza (AI) outbreak in Myanmar.
<p>Planned Activities</p> <p>Output 1: Strengthened cross-sectoral coordination at the national level</p> <p><i>Activity 1.1: Recruit an International Technical Advisor (CTA) to assist in coordinating the project implementation with the Government.</i></p> <ul style="list-style-type: none"> • The entire project team will continue its work, and the project will support one national consultant for Animal Health Management. <p><i>Activity 1.2: Organize coordination meetings of the working groups related to HPAI control in animals.</i></p> <ul style="list-style-type: none"> • The operational work plan for 2011 will be agreed upon with the World Health Organization (WHO) and the Ministry of Health (MoH) on cross-sectoral collaboration.

- Two joint workshops will take place in the next six months.

Activity 1.3: Support the review and revision of the National Strategy, Contingency plan and Standard Operating Procedures (SOPs) related to HPAI control measures.

- Ongoing review of SOPs on compensation and surveillance and outbreak guidelines.

Activity 1.4: Support national staff of LBVD to participate and give presentations/share information in international conferences, meetings or workshops.

- No activities planned.

Output 2: Strengthened capacity in HPAI disease surveillance and response at the field level

Activity 2.1: Recruit an international short term consultant (epidemiologist).

- No activities planned.

Activity 2.2: Surveillance Rapid Response Team (SRRT) refresher training courses and cooperation between animal and human health sectors.

- National consultants continue to provide support to the expanded surveillance and outbreak investigation programme.

Activity 2.3: Strengthen SRRTs on effective investigation of AI outbreaks and response.

- Ongoing implementation of a Letter of Agreement (LoA) providing epidemiology support to the expanded surveillance and outbreak investigation programme.

Activity 2.4: Procure necessary equipment and supplies for surveillance and response.

- No activities planned.

Activity 2.5: Support national staff to participate in Regional Field Epidemiology Training Programme for Veterinarians (FETPV).

- The two LBVD staff will continue their FEPTV.

Activity 2.6: Support passive and active surveillance for the high-risk areas including wetlands, duck-raising and border areas.

- See 2.3.

Output 3: Strengthened capacity in HPAI laboratory diagnosis

Activity 3.1: Organize local training by trainees previously trained overseas.

- Ongoing on-the-job training.

Activity 3.2: Conduct semi-annual proficiency testing (PT) and quality assessment (QA) for serological and rapid tests by linking national labs with the Australian Animal Health Laboratory (AAHL).

- No planned activities.

Activity 3.3: Manage a local quality assessment/quality control (QA/QC) programme for the national laboratory network.

- Ongoing laboratory support to the expanded surveillance programme and to the ongoing domestic QA/QC programmes.
- Undertake field visits to the laboratories to monitor sample testing and post-mortem examination.
- QA/QC proficiency testing samples among laboratories in the country to be completed by the end of the year.

Activity 3.4: Procure necessary laboratory equipment and supplies.

- Delivery of required supplies and equipment.

Output 4: Enhanced risk management measures including biosecurity improvement among the high-risk poultry population and selected live bird markets (LBMs)

Activity 4.1: Organize meetings/workshops among the stakeholders to discuss risk management for poultry production zone and cross-border trade.

- Meetings and workshops will be held related to the Yangon-Mandalay market risk assessment and the production zone biosecurity studies.

Activity 4.2: Support activities related to biosecurity improvement in selected LBMs and production zones.

- Finalize the Yangon-Mandalay LoA and implement stakeholder feedback meetings.
- Finalize and begin implementation of an LoA on production zone/biosecurity.

Activity 4.3: Recruit an international consultant (epidemiology).

- No activities planned.

Activity 4.4: Conduct studies to assess risk along the poultry supply chain.

- See 4.2.

Activities undertaken during the reporting period October 2010 – March 2011

Output 1: Strengthened cross-sectoral coordination at the national level

Activity 1.1: Recruit an International Technical Advisor (CTA) to assist in coordinating the project implementation with the Government.

- The project team, including the CTA, the International Programme Officer and the national consultants, was in place throughout the reporting period.
- The project team facilitated a USAID monitoring mission in December 2010. The project team briefed the mission in Yangon and accompanied the mission on a field trip to Mandalay and Sagaing. The mission visited production zones, observed a duck survey in the field, observed a township meeting of Community Animal Health Workers (CAHWs), met with regional LBVD officers and visited a diagnostic lab in Mandalay.

Activity 1.2: Organize coordination meetings of the working groups related to HPAI control in animals

- The 6th National Steering Committee (NSC) meeting was held in January 2011. The meeting reviewed progress and work plans and provided recommendations for future actions. In addition to LBVD senior officials, staff from the Department of Health (DoH), WHO, the United Nations Children's Fund (UNICEF), Myanmar Livestock Federation and Yangon City Development Council also participated.
- The project facilitated the completion of a final draft of the operational work plan on "Integrated Diseases Surveillance and Human and Animal Pandemic Influenza Preparedness and Response for Myanmar 2011-12" between FAO, WHO and UNICEF. The plan describes activities and funding gaps for AI control for the next two years.
- A joint animal-human health sector technical meeting was held in October with WHO, FAO and LBVD.

Activity 1.3: Support the review and revision of the National Strategy, Contingency plan and Standard Operating Procedures (SOPs) related to HPAI control measures.

- Guidelines on compensation were delivered to LBVD in October 2010 and discussion within the Government is ongoing taking into account the recent outbreaks.
- Surveillance and outbreak investigation guidelines were drafted.
- Contingency plan has been tested in the recent outbreaks, and suggestions for updates have been made.

Activity 1.4: Support national staff of the Livestock Breeding and Veterinary Department (LBVD) to participate and give presentations/share information in international conferences, meetings or workshops.

- LBVD staff participated in several international conferences and shared information related to the project. For example, the project briefed the Deputy Director-General of LBVD in advance of the Federation of Asian Veterinarians Association conference in March in the Philippines.
- The project provided technical support to the 2009 FETPV trainee who participated in the One Health conference in Melbourne in February.

Output 2: Strengthened capacity in HPAI disease surveillance and response at the field level.

Activity 2.1: Recruit an international short term consultant (epidemiologist).

- No activities were foreseen.

Activity 2.2: Surveillance Rapid Response Team (SRRT) refresher training courses and cooperation between animal and human health sectors.

- Surveillance review workshops were held in Upper and Lower Myanmar in September.
- Surveillance planning workshops were held in Upper and Lower Myanmar in December.
- A total of 228 LBVD staff were trained on outbreak response in March.
- Staff from LBVD epidemiology and laboratory sections received training on data management in November.

Activity 2.3: Strengthen SRRTs on effective investigation of AI outbreaks and response.

- Technical support was provided to the four HPAI outbreak responses in January-March. The national commercial farm global positioning system (GPS) database established in 2010 was a significant source of assistance for the outbreak response.

Activity 2.4: Procure necessary equipment and supplies for surveillance and response.

- Supplies for CAHWs training (posters, booklets) and software licenses were procured.

Activity 2.5: Support national staff to participate in Regional Field Epidemiology Training Programme for Veterinarians (FETPV).

- The 2009-enrolled FETPV trainee completed his final session in Bangkok and completed outbreak investigations and field studies on Foot-and-Mouth Disease (FMD). He presented the result of his secondary data study on HPAI outbreaks during the One Health conference in Melbourne.
- The 2010-enrolled FETPV trainee finished his second session and conducted an investigation of the HPAI Sittwe outbreak.
- The 2011-enrolled FETPV trainee completed the epidemiology short course and conducted an investigation of the Porcine Reproductive and Respiratory Syndrome outbreak in Mandalay. Further field studies and secondary data analysis related to pigs and PRRS are planned.

Activity 2.6: Support passive and active surveillance for the high-risk areas including wetlands, duck-raising and border areas

- The surveillance programme in 78 townships was completed in March.
- Epidemiology and laboratory support to the surveillance programme is finalized, and the progress report has been received.
- Laboratory support to the surveillance programme is finalized, and the progress report has been received.
- The epidemiology activity improvement LoA is ongoing, and the progress report has been received.

Output 3: Strengthened capacity in HPAI laboratory diagnosis

Activity 3.1: Organize local training by trainees previously trained overseas.

- Ongoing through on-the-job training.

Activity 3.2: Conduct semi-annual PT and QA for serological and rapid tests by linking national labs with AAHL.

- Samples from the Sittwe outbreak were submitted to the National Institute of Animal Health, Thailand (NIAH) and AAHL, Geelong, Australia.
- The project supported LBVD linkages with AAHL and discussed future activities with AAHL experts during their mission to Myanmar.

Activity 3.3: Manage a local QA/QC programme for the national laboratory network.

- Domestic QA/QC programme is ongoing. National consultant travelled to Mandalay to

conduct QA/QC on serology, virology and poultry post-mortem.

Activity 3.4: Procure necessary laboratory equipment and supplies.

- Laboratory supplies (primers and probes, QRT-PCR, filters) were purchased under the project.

Output 4: Enhanced risk management measures including biosecurity improvement among the high-risk poultry population and LBMs

Activity 4.1: Organize meetings/workshops among the stakeholders to discuss risk management for poultry production zone and cross-border trade.

- The LoA on risk assessment in Yangon and Mandalay was completed.
- The LoA on risk assessment on Inle and Ayerwadday was completed.
- A feedback meeting on HPAI risk assessment study in Inle and Ayerwadday areas was conducted in November.
- A feedback workshop on biosecurity improvement in production zones was held in October.
- A rapid risk assessment meeting was held with district LBVD staff in Sittwe in December.
- An international consultant from the global project visited production zones in Yangon and Sagaing and LBMs in Yangon in March to review and make recommendations on biosecurity.
- Several meetings with duck hatchery owners from Bago division were held in October.

Activity 4.2: Support activities related to biosecurity improvement in selected LBMs and production zones.

- Several planning meeting were held for the design of a new LoA aimed at improving biosecurity in production zones.

Activity 4.3: Recruit an international consultant (epidemiology).

- No planned activities.

Activity 4.4: Conduct studies to assess risk along the poultry supply chain.

- See 4.1.

Planned activities for the next six-month period

Output 1: Strengthened cross-sectoral coordination at the national level

Activity 1.1: Recruit an International Technical Advisor (CTA) to assist in coordinating the project implementation with the Government.

- Management team in place.
- Three national consultants will be either funded or co-funded.

Activity 1.2: Organize coordination meetings of the working groups related to HPAI control in animals.

- The 7th NSC meeting will be organized with participation from private sector partners, DoH and WHO.

Activity 1.3: Support the review and revision of the National Strategy, Contingency plan and SOPs related to HPAI control measures.

- Review the contingency plan and SOPs in light of the recent outbreaks and conduct an assessment on outbreak management in backyard or duck farms.

Activity 1.4: Support national staff of LBVD to participate and give presentations/share information in international conferences, meetings or workshops.

- FAO staff will support LBVD staff as required.

Output 2: Strengthened capacity in HPAI disease surveillance and response at the field level

Activity 2.1: Recruit an international short term consultant (epidemiologist).

- No activities planned.

Activity 2.2: Surveillance Rapid Response Team (SRRT) refresher training courses and cooperation between animal and human health sectors.

- Finalize LoA on HPAI surveillance in Upper Myanmar

Activity 2.3: Strengthen SRRTs on effective investigation of AI outbreaks and response.

- Conduct a workshop on outbreak response if there continue to be outbreaks during the period March-September

Activity 2.4: Procure necessary equipment and supplies for surveillance and response.

- Supplies for surveillance and response will be procured

Activity 2.5: Support national staff to participate in Regional FETPV.

- The 2009 FETPV trainee will participate in an International Fellowship study tour.
- The 2010 LBVD staff member will attend third session of the FETPV in Bangkok in August for one month and be involved in HPAI outbreak investigations, field studies and data analysis.
- The 2011 FETPV will continue outbreak investigation, field studies and data analysis on pigs and PRRS. She will attend the two-month course session.
- The project will launch the in-country field epidemiology training programme.

Activity 2.6: Support passive and active surveillance for the high-risk areas including wetlands, duck-raising and border areas.

- Finalize LoAs on HPAI surveillance in Upper Myanmar, surveillance and outbreak investigation technical assistance and epidemiology activity improvement.

Output 3: Strengthened capacity in HPAI laboratory diagnosis

Activity 3.1: Organize local training by trainees previously trained overseas.

- Ongoing through on-the-job training.

Activity 3.2: Conduct semi-annual PT and QA for serological and rapid tests by linking national labs with AAHL.

- Finalize the LoA on laboratory support to field surveillance programmes.

Activity 3.3: Manage a local quality assessment/quality control (QA/QC) programme for the national laboratory network.

- Domestic QA/QC programme is ongoing as part of the LoAs on laboratory and technical support to surveillance (see 3.2).

Activity 3.4: Procure necessary laboratory equipment and supplies.

- Procurement of laboratory supplies (primers and probes for AI).

Output 4: Enhanced risk management measures including biosecurity improvement among the high risk poultry population and selected LBMs

Activity 4.1: Organize meetings/workshops among the stakeholders to discuss risk management for poultry production zone and cross-border trade.

- Conduct small group training on biosecurity based on the recommendations of the expert from the global project. These trainings will be conducted in areas that have experienced recent outbreaks, as well as other high-risk areas.

Activity 4.2: Support activities related to biosecurity improvement in selected LBMs and production zones.

- Implement the follow-up LoA on production zones biosecurity improvement.

Activity 4.3: Recruit an international consultant (epidemiology).

- Recruitment of a Risk Management expert to provide training based on advice from the expert from the global project.

Activity 4.4: Conduct studies to assess risk along the poultry supply chain.

- The field studies to be conducted under the in-country epidemiology training programme will encompass poultry chain risk assessment.

Main challenges encountered and response provided

The main challenge has been to provide support to LBVD in responding effectively to the wave of outbreaks from January-March. The emphasis of the project has been on the epidemiological and reporting aspects of the outbreaks themselves, while ensuring that lessons learned from the outbreaks are communicated effectively to a wide group of LBVD staff. The lack of a compensation scheme is an ongoing issue, and with the formation of a new government in the next quarter, this is expected to be on the agenda.

Previous to the outbreaks, the main challenge in the period October-December was to evaluate the effectiveness of the large-scale surveillance programme and determine the shape of future control and surveillance strategies.

The project's response to the changing situation is to continue to focus more on the smallholder layer sector as the high-risk group and decrease emphasis on duck and backyard systems.

Main progress made towards the achievement of project outcomes (*from the start of the project activities*)

Overall, the project is considered to be progressing well, with a list of major achievements in capacity building. However, what appears to be an upswing in the number of outbreaks is of concern and this highlights the need for ongoing support.

Output 1: Strengthened cross-sectoral coordination at the national level

There continue to be good relations with the Government. The coordination between the animal-human sectors has further improved with additional meetings, but further work needs to be done.

Output 2: Strengthened capacity in HPAI disease surveillance and response at the field level.

There is now a much better understanding of the epidemiology of HPAI based on the national duck survey, which was a major achievement. Added to this, the national surveillance programme involving CAHWs was implemented on such a scale for the first time and offered valuable insights into the epidemiology of the disease and the nature of surveillance programmes. The national commercial farm database proved to be an invaluable tool, when it came to responding to the outbreaks and identifying high-risk areas. Response capacity has developed well. In the recent outbreaks in Sagaing, it appears that the virus spread from the initial outbreak site through poultry movements; however, two more outbreak sites have been well contained as of the time of this report. Reporting of response activities has improved considerably. The establishment of an in-country epidemiology training programme is a major step forward.

Output 3: Strengthened capacity in HPAI laboratory diagnosis

The laboratory system is operating well, with recent outbreaks rapidly diagnosed and samples from field surveys being processed effectively.

Output 4: Enhanced risk management measures including biosecurity improvement among the high-risk poultry population and selected LBMs

The LBVD now has a good understanding of the concept of risk and of the interaction between supply chains and disease spread. The LBVD has a better understanding of risks associated with LBMs. The biosecurity in production zones has increased, although further work needs to be done in this area.

Project Monitoring Sheet: **OSRO/MYA/702/USA**

Project title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)**

Reporting period: **April – September 2011**

Country: Myanmar
Project: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)
Code: OSRO/MYA/702/USA
Budget: USD 500 000 (Phase I), USD 750 000 (Phase II), USD 375 000 (Phase III), USD 150 000 (Phase IV), 279 000 (Phase V)
Total budget: USD 2 054 000
Effective starting date: January 2008
Planned end date: 30 September 2012
<p>Context of the Project</p> <p>Myanmar experienced four waves of Highly Pathogenic Avian Influenza (HPAI) outbreaks in 2006, 2007, 2010 and 2011. The most recent, in January-March 2011, occurred in four separate locations and required the culling of over 100 000 poultry as part of control measures. While the Myanmar Government has responded promptly to outbreaks, the country remains at-risk from duck populations in which the virus is endemic, migrating wild birds and trade with neighbouring countries. The Food and Agriculture Organization of the United Nations (FAO) is implementing an integrated avian influenza (AI) control programme, consisting of three projects with complementary activities: OSRO/MYA/702/USA, OSRO/MYA/801/WBK and OSRO/MYA/601/AUL. The programme is being implemented in collaboration with the Livestock Breeding and Veterinary Department (LBVD) of the Ministry of Livestock and Fisheries. The report describes activities funded or co-funded by the project in the context of the overall programme. The section on “Planned Activities for the next six-month period” follows the outputs and activities of the recently approved amendment, which extended the project to September 2012.</p>
<p>Objectives of the project</p> <p>The major objective of the project is to address the urgent short-term actions to strengthen Myanmar’s capacity to rapidly detect HPAI and minimize its spread. Specifically, the project aims to provide necessary assistance in:</p> <ul style="list-style-type: none"> • strengthening HPAI prevention and control in Myanmar, particularly the capacity to effectively contain the outbreak, including animal surveillance, collaboration and communication between the animal and human health sectors; • strengthening the capacity of the veterinary services at the field level; and • mobilizing stakeholders towards building a community-based rapid warning and response system to meet the challenge of an AI outbreak in Myanmar.
<p>Planned activities</p> <p>Output 1: Strengthened cross-sectoral coordination at the national level</p> <p><i>Activity 1.1: Recruit an International Technical Advisor (CTA) to assist in coordinating the project implementation with the Government.</i></p> <ul style="list-style-type: none"> • Management team in place. • Three national consultants will be either funded or co-funded. <p><i>Activity 1.2: Organize coordination meetings of the working groups related to HPAI control in animals.</i></p> <ul style="list-style-type: none"> • The 7th National Steering Committee (NSC) meeting will be organized with participation

from private sector partners, the Department of Health (DoH) and the World Health Organization.

Activity 1.3: Support the review and revision of the National Strategy, Contingency plan and standard operating procedures (SOPs) related to HPAI control measures.

- Review the contingency plan and SOPs in light of the recent outbreaks and conduct an assessment on outbreak management in backyard or duck farms.

Activity 1.4: Support national staff of LBVD to participate and give presentations/share information in international conferences, meetings or workshops.

- FAO staff will support LBVD staff as required.

Output 2: Strengthened capacity in HPAI disease surveillance and response at the field level

Activity 2.1: Recruit an international short term consultant (epidemiologist).

- No activities planned.

Activity 2.2: Surveillance Rapid Response Team (SRRT) refresher training courses and cooperation between animal and human health sectors.

- Finalize the Letter of Agreement (LoA) on HPAI surveillance in Upper Myanmar

Activity 2.3: Strengthen SRRTs on effective investigation of AI outbreaks and response.

- Conduct a workshop on outbreak response if there continue to be outbreaks during the period March-September

Activity 2.4: Procure necessary equipment and supplies for surveillance and response.

- Supplies for surveillance and response will be procured

Activity 2.5: Support national staff to participate in Regional Field Epidemiology Training Programme for Veterinarians (FETPV).

- The 2009 FETPV trainee will participate in an International Fellowship study tour.
- The 2010 LBVD staff member will attend third session of the FETPV in Bangkok in August for one month and be involved in HPAI outbreak investigations, field studies and data analysis.
- The 2011 FETPV will continue outbreak investigation, field studies and data analysis on pigs and Highly Pathogenic Porcine Reproductive and Respiratory Syndrome (PRRS). She will attend the two-month course session.
- The project will launch the in-country field epidemiology training programme.

Activity 2.6: Support passive and active surveillance for the high-risk areas including wetlands, duck-raising and border areas.

- Finalize LoAs on HPAI surveillance in Upper Myanmar, surveillance and outbreak investigation technical assistance and epidemiology activity improvement.

Output 3: Strengthened capacity in HPAI laboratory diagnosis

Activity 3.1: Organize local training by trainees previously trained overseas.

- Ongoing through on-the-job training.

Activity 3.2: Conduct semi-annual proficiency training (PT) and quality assessment (QA) for serological and rapid tests by linking national labs with the Australian Animal Health Laboratory (AAHL).

- Finalize the LoA on laboratory support to field surveillance programmes.

Activity 3.3: Manage a local quality assessment/quality control (QA/QC) programme for the national laboratory network.

- Domestic QA/QC programme is ongoing as part of the LoAs on laboratory and technical support to surveillance (see 3.2).

Activity 3.4: Procure necessary laboratory equipment and supplies.

- Procurement of laboratory supplies (primers and probes for AI).

Output 4: Enhanced risk management measures including biosecurity improvement among the high risk poultry population and selected live bird markets (LBMs)

Activity 4.1: Organize meetings/workshops among the stakeholders to discuss risk management for poultry production zone and cross-border trade.

- Conduct small group training on biosecurity based on the recommendations of the expert from the global project. These trainings will be conducted in areas that have experienced recent outbreaks, as well as other high-risk areas.

Activity 4.2: Support activities related to biosecurity improvement in selected LBMs and production zones.

- Implement the follow-up LoA on production zones biosecurity improvement.

Activity 4.3: Recruit an international consultant (epidemiology).

- Recruitment of a Risk Management expert to provide training based on advice from the expert from the global project.

Activity 4.4: Conduct studies to assess risk along the poultry supply chain.

- The field studies to be conducted under the in-country epidemiology training programme will encompass poultry chain risk assessment.

Activities undertaken during the reporting period April –September 2011

Output 1: Strengthened cross-sectoral coordination at the national level

Activity 1.1: Recruit an International Technical Advisor (CTA) to assist in coordinating the project implementation with the Government.

- The project team, including the CTA, and the national operations and technical consultants, were in place throughout the reporting period, co-funded by other projects.
- The CTA attended a planning session in Rome in May 2011 where plans were presented and discussed for the next year United States Agency for International Development (USAID) country projects.

Activity 1.2: Organize coordination meetings of the working groups related to HPAI control in animals

- The 7th NSC meeting was held in August 2011. The meeting reviewed progress and work plans and provided recommendations for future actions. The meeting approved an expansion of the mandate of the NSC to cover all animal diseases and zoonoses. The NSC therefore becomes the “Animal Health Programme Steering Committee” giving strategic oversight to implementation of the FAO-LBVD Animal Health Priority Plan (2011-15) through a series of task forces on specific animal health and zoonoses issues, including HPAI and cattle and pig diseases. The NSC meeting was chaired by the Deputy Minister of the Ministry of Livestock and Fisheries. In addition to LBVD senior officials, staff from DoH, the Myanmar Livestock Federation (MLF) and the Livestock Feedstuffs and Milk Products Enterprises (LFME).

Activity 1.3: Support the review and revision of the National Strategy, Contingency plan and SOPs related to HPAI control measures.

- The outbreaks in 2011 may have had some involvement of wild birds, and agreement was reached at the NSC meeting that staff with wild bird experience from the Ministry of Forestry would be involved in surveillance in two of the 2011 outbreak areas.
- After due consideration and discussion with FAO and senior government officials, the government will not be providing compensation to farmers affected by HPAI.

Activity 1.4: Support national staff of LBVD to participate and give presentations/share information in international conferences, meetings or workshops.

- The project provided technical support to LBVD staff participating in workshops on One Health (Thailand, May and August 2011), laboratory quality assurance (Australia, September 2011) laboratory networking (Malaysia, September 2011).

Output 2: Strengthened capacity in HPAI disease surveillance and response at the field level

Activity 2.1: Recruit an international short term consultant (epidemiologist).

- No activity.

Activity 2.2: Surveillance Rapid Response Team (SRRT) refresher training courses and cooperation between animal and human health sectors.

- Project staff and staff from the central epidemiology unit of LBVD visited the 2011 outbreak sites and gave local LBVD staff, health authorities and local authorities updated training on outbreak management procedures, funded by other projects.
- The CTA made a presentation at a World Rabies Day event organized by the LBVD in September 2011.

Activity 2.3: Strengthen SRRTs on effective investigation of AI outbreaks and response.

- Project and LBVD staff provided awareness training to farmers in the 2011 outbreaks areas during four meetings in September 2011, funded by other projects. (see 2.2)

Activity 2.4: Procure necessary equipment and supplies for surveillance and response.

- No supplies were procured

Activity 2.5: Support national staff to participate in Regional FETPV.

- The 2009 FETPV trainee travelled to Thailand in May 2011 to graduate from the two-year programme.
- The 2010 LBVD staff member attended the third session of the FETPV in Bangkok in August 2011 and returned to continue his secondary data analysis and prepare final reports of the outbreak investigation and to design the field study.
- The 2011 FETPV was in Bangkok for two months over June to August 2011. She returned and began her secondary data study on reported outbreaks in cattle and buffalo.
- The project continued planning for the Integrated Disease Control (IDC) on-the-job training programme involving epidemiology, lab and planning staff.

Activity 2.6: Support passive and active surveillance for the high-risk areas including wetlands, duck-raising and border areas.

- The LoA on epidemiology support to the active surveillance programme was completed in July 2011. Under this LoA, staff of the epidemiology unit conducted field trips to support field activities and managed data generated from the active surveillance programme.
- The reporting period is the low-risk period for HPAI, so only passive surveillance was conducted during this period.

Output 3: Strengthened capacity in HPAI laboratory diagnosis

Activity 3.1: Organize local training by trainees previously trained overseas.

- Ongoing through on-the-job training.

Activity 3.2: Conduct semi-annual PT and QA for serological and rapid tests by linking national labs with AAHL.

- The LoA on laboratory support to field surveillance programmes was completed in July 2011. Under this LoA, laboratory staff provided field support to field surveillance teams and processed samples collected by the teams.

Activity 3.3: Manage a local quality assessment/quality control (QA/QC) programme for the national laboratory network.

- Domestic QA/QC programme was part of the LoA support to surveillance, which was completed in July 2011 (see 3.2).

Activity 3.4: Procure necessary laboratory equipment and supplies.

- No laboratory supplies were procured.

Output 4: Enhanced risk management measures including biosecurity improvement among the high-risk poultry population and selected LBMs

Activity 4.1: Organize meetings/workshops among the stakeholders to discuss risk management for poultry production zone and cross-border trade.

- A series of four small group meetings were held in August 2011 to update information on border livestock trade, supported by other projects.

Activity 4.2: Support activities related to biosecurity improvement in selected LBMs and production zones.

- Plans were made to hold small group meetings and trainings on biosecurity during October 2011, during the planned mission of an international biosecurity expert who would focus on production zones and LBMs.

Activity 4.3: Recruit an international consultant (epidemiology).

- The project began recruitment of a biosecurity expert to undertake a mission in October 2011.

Activity 4.4: Conduct studies to assess risk along the poultry supply chain.

- The field studies to be conducted under the in-country epidemiology training programme will encompass poultry chain risk assessment.

Planned Activities for the next six-month period (October 2011–March 2012):

Output 1: Strengthened Planning and Cross-Sectoral Coordination:

Activity 1.1: Support the Emergency Centre for Transboundary Animal Diseases (ECTAD) Country Team Leader and the team to provide inputs for planning coordination required at country level

- The project team will be in place, consisting of CTA, national operations and technical consultants, co-funded by other projects.
- The Animal Health Programme Steering Committee (successor to National HPAI Steering Committee) will be held. This meeting will incorporate the HPAI Task Force report and give strategic direction on progress and plans.

Activity 1.2 Support national and international coordination related to disease control

- The project will link to regional FAO programmes on animal health issues, through participation in regional workshops, trainings and networking.

Activity 1.3 Support in-country linkages between public-private and animal-human health sectors relevant to HPAI control

- The project will continue to link to farmers groups in the poultry production zones and will link to the human health authorities through their involvement in relevant trainings and through their participation in the Animal Health Programme Steering Committee Meeting.

Output 2: Strengthened laboratory capacity:

Activity 2.1 Support improvement of laboratory management, including through technical advice of international experts to be provided through other regional projects related to regional laboratory networks

- The project will provide administrative support to international expert missions and coordinate in-country training and follow up as required.

Activity 2.2 Support development of a laboratory QA/QC for HPAI, including through regional HPAI laboratory networks and through support of sample submissions to an International Reference Laboratory as part of the proficiency testing

- Samples will be submitted according to the advice received from regional projects
- The project will support improved data management of domestic QA/QC activities and progress.

Activity 2.3 Procurement of necessary laboratory equipment and supplies for HPAI activities as necessary

- Requirements for supplies and equipment will be reviewed and procured as necessary.

Output 3: Strengthened disease control management capacity:

Activity 3.1 Support regional veterinary epidemiology trainees through in-country training and field work

- The 2010 trainee will complete the secondary data and outbreak investigation studies and present a poster on the outbreak investigation at an international conference in the United States in December 2011.
- The 2011 trainee will continue her secondary data study and finalize the field study plans.
- The project team will provide ongoing support to the FETPV trainees for field trips and technical meetings in conjunction with the in-country mentor

Activity 3.2 Support Integrated Disease Control Training Programme (IDC-TP) in Myanmar, encompassing application of epidemiology, supply chain and institutional aspects to field disease control

- The project will formalize the IDC-TP for endorsement by both the LBVD and the Animal Health Programme Steering Committee

Activity 3.3 Support risk-based biosecurity and surveillance activities

- The project will provide updated HPAI reporting and outbreak management training to LBVD staff in high-risk areas, and this will be followed up by training to key stakeholder groups including farmers, traders and private veterinarians as required.
- Project and LBVD staff will conduct missions to 2011 outbreaks areas for specific active surveillance in November-December 2011, as the high-risk season approaches.
- An international biosecurity expert will make a two-week mission to Myanmar in October 2011 to visit LBMs and production zones and provide training on disinfection practices.
- Training on disinfection practices and other biosecurity practices will be provided to farmers, zone committee as a follow-up to the biosecurity expert mission.
- The project will link to the global biosecurity project to upgrade key infrastructure at the LBM in Yangon and at the largest poultry production zone in Sagaing.

Activity 3.4 Support response activities

- In the event of outbreaks, the project will provide support for outbreak investigations and management of data arising from the outbreak and for follow-up on biosecurity issues.

Main challenges encountered and response provided

Challenges to project implementation were related to the general context of Myanmar during the reporting period, the sectoral context and to some particular issues related to HPAI control. In the general context, political changes brought new institutional arrangements to which LBVD had to adapt. At a sectoral level, the outbreak of PRRS in pigs challenged the capacity of LBVD, as it is a new disease for the country and control policies and programmes needed to be rapidly developed. With respect to HPAI, after lengthy discussions with LBVD, it was decided by the Government that a compensation scheme would not be established. In terms of disease risk in the farming systems prevalent in Myanmar, the question remains as to the extent that ducks pose a threat to chicken flocks or humans and under which conditions the threat can increase. Also, the possibility that wild birds were the source of the virus in the first outbreak (on the Bay of Bengal, isolated from the rest of Myanmar, and in areas where ducks had previously been found to be seronegative) raised the challenge of how to engage with agencies dealing with wild birds. The significance of the appearance of Clade 2.3.2 as potentially the

dominant strain in Myanmar is yet to be determined. Functional linkages with the human health sector are a challenge. Given that the last human case was in 2007, and that there have been relatively few outbreaks since that year, maintaining a close linkage based only on HPAI is not easy. The linkages established under the HPAI programme were, however, invaluable when H1N1 appeared as a pandemic strain in 2009, as they can be activated quickly when required. The mutual understanding between the two sectors was improved.

Main progress made towards the achievement of project outcomes (*from the start of the project activities*)

Overall, the project is considered to be progressing well, with a list of major achievements in capacity building. However, what appears to be an upswing in the number of outbreaks is of concern, and this highlights the need for ongoing support.

Output 1: Strengthened cross-sectoral coordination at the national level

There continue to be good relations with the Government. The coordination between the animal-human sectors has further improved with additional meetings, but further work needs to be undertaken.

Output 2: Strengthened capacity in HPAI disease surveillance and response at the field level

There is now a much better understanding of the epidemiology of HPAI based on the national duck survey and national surveillance programme, both of which were major achievements. The national commercial farm database proved to be an invaluable tool in responding to the outbreaks and identifying high-risk areas. Response capacity has developed well. In the recent outbreaks in Sagaing, it appears that the virus spread from the initial outbreak site through poultry movements; however, two more outbreak sites have been well contained as of the time of this report. Reporting of response activities has improved considerably. The establishment of an in-country IDC-TP is a major step forward.

Output 3: Strengthened capacity in HPAI laboratory diagnosis

The laboratory system is operating well, with recent outbreaks rapidly diagnosed and samples from field surveys being processed effectively.

Output 4: Enhanced risk management measures including biosecurity improvement among the high-risk poultry population and selected LBMs

The LBVD now has a good understanding of the concept of risk and of the interaction between supply chains and disease spread. The LBVD has a better understanding of risks associated with LBMs. The biosecurity in production zones has increased, although further work needs to be undertaken in this area.

Project Monitoring Sheet: **OSRO/RAS/605/USA Baby 03**Project Title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)**Reporting period: **April – September 2011**

Country: Nepal
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)
Code: OSRO/RAS/605/USA Baby 03
Budget: USD 965 000 (Phases I-IV) and USD 250 000 (Phase V)
Total budget: USD 1 215 000
Effective Starting Date: 1 October 2006
Planned End Date: 30 September 2012
<p>Context of the Project</p> <p>The project is addressing the short- and medium-term actions of the Government of Nepal required to strengthen its capacity in preventing the introduction of Highly Pathogenic Avian Influenza (HPAI) and minimize its spread in the event of its occurrence. During the first quarter of 2009, the first outbreaks in Nepal were recorded. After a disease-free period of ten months, multiple outbreaks occurred during the period of January to March 2010. In contrast to the previous year, the 2010 outbreaks were attributed to clade 2.3.2 of the H5N1 virus, previously unrecorded in South Asia, suggesting an introduction through infected migrating wildfowl, rather than a cross-border one. In October 2010, the clade 2.3.2 virus reappeared in a previously infected district, indicating its persistence in reservoir species. The Government's resources, including those provided by international donors, have been severely stretched. The project has provided essential capacity building for preparedness and response. However, the scenario of declining international support for HPAI control is alarming, coupled with an increasing danger of the disease becoming endemic in Nepal, with negative consequences for the livelihoods of smallholder farmers and the control efforts of neighbouring countries.</p>
<p>Objectives of the Project</p> <p>The project has assisted the Ministry of Agriculture and Cooperatives (MOAC) in the implementation of the National Contingency Plan for HPAI. The main objective of the project is to contribute to rural development in the country by preventing and controlling the detrimental consequences of HPAI and raising awareness of other emerging infectious diseases in poultry. The expected outcome of the project is to create an effective mechanism for planning and coordination across sectors and key stakeholders involved in HPAI control activities, particularly with the United States Agency for International Development (USAID)-supported projects in Nepal and the South and Southeast Asia region.</p>
<p>Planned activities for April 2011 – September 2011</p> <p>Output 1: Support the Department of Livestock Services (DLS) in planning, coordinating and managing strategies to prevent, control and eliminate outbreaks of HPAI.</p> <p><i>Activity 1.1. Conduct regular meetings with DLS and MOAC.</i></p> <ul style="list-style-type: none"> • Continue close collaboration with DLS and its relevant directorates. Changing epidemiological status of HPAI in Nepal may have an impact on the currently adopted measures for early detection and rapid response, such that standard operating procedures (SOPs) and the existing legal framework may need to be updated. <p><i>Activity 1.2. Maintain and further develop linkages with all avian influenza (AI)-related projects operating in Nepal.</i></p> <ul style="list-style-type: none"> • Maintain contacts with AI-related initiatives and possible future Asian Development

Bank (ADB)-funded Technical Assistance (TA) projects. The major funding source for the government interventions in the field of AI control, the World Bank-funded Avian Influenza Control Project (AICP) concludes in July 2011. No other AI-specific projects are extant at this time, or envisaged in the midterm. As the disease is now well entrenched in Nepal, there is a concern over future support to this sector. Some support may become available through programmes dedicated to emerging pandemic threats (EPT), such as the USAID EPT programme, and the Highly Pathogenic Emerging and Re-emerging Animal Diseases (HPED) project funded by the European Union (EU).

Activity 1.3. Advise and support the DLS in planning and implementing AI-related activities through conferences, meetings and seminars.

- Conduct three workshops in the period June-August 2011 to examine the progress made on the prevention of HPAI and other emerging diseases, the gaps remaining and the way ahead as part of the process of project conclusion and handover.

Activity 1.4. Update and distribute relevant AI documentation, bulletins and reports including updated compendium of AI documents.

- Complete the updating and translation of the final edition of the compendium of key AI documents to produce and distribute to the target audience.

Output 2: Strengthen HPAI emergency preparedness and response capacity in Nepal.

Activity 2.1. Review the AI strategy and SOPs to keep up-to-date with the changing disease situation in the country and in the region and lessons learned from previous outbreaks.

- Encourage further debate on this issue through working group meetings and relevant workshops. The re-occurrence of HPAI owing to H5N1 clade 2.3.2 after a gap of seven months suggests that the virus is established in at least some parts of Nepal, most probably with ducks acting as a reservoir species. Efforts should be made to confirm this situation, and initial results of a duck antibody survey are already lending support to this hypothesis. This has major implications for targeted surveillance and disease risk management.

Activity 2.2. RRT to field staff in high/medium risk districts.

- Organize two further training sessions in order to maintain the outbreak response capacity and assist in the disease detection efforts.

Activity 2.3. Plan, train, conduct and evaluate a further simulation exercise.

- Complete the final AI outbreak simulation exercise during the next semester.

Activity 2.4. Encourage and guide the development of the emergency disease investigation concept.

- Develop a more structured approach with the Directorate of Animal Health (DAH). The Department has been slow in adopting this concept, but now greater emphasis is given to this area.

Output 3: Strengthen disease surveillance.

Activity 3.1. Enhance surveillance in high-risk zones.

- Continue as planned for the remaining month of the high-risk period and evaluate the outcome and performance of the programme. Address the ways in which known weaknesses in the implementation of the programme may be overcome, while at the same time seeking to increase its efficiency by making it more sustainable without losing effectiveness.

Activity 3.2. Surveillance in buffer zones around migratory bird stop-over points, markets and

resident duck populations.

- Resources remain insufficient to carry out this element of the surveillance programme in a comprehensive manner. Consideration will be given to targeting key markets and ensuring that the active surveillance programme is working effectively in those districts where the disease has surfaced in the past, prioritizing them where possible.

Output 4: Safe live bird market (LBM) development.

Activity 4.1 Expand model market concept.

- Complete this first initiative together with the training of market stall operators and inspectors. The slow progress of this programme in association with the Kathmandu municipality was not an encouraging approach in the Kathmandu valley.
- Continue to build on preliminary proposals to address the issue of inspection and certification and onward transportation of live birds, particularly backyard raised birds, from the high-risk district of Jhapa in Eastern Nepal. This will be coordinated with the no-cost extension phase of the OSRO 802 and OSRO 805 projects.

Activities undertaken during the reporting period (April 2011 – September 2011)

Output 1: Support DLS in planning, coordinating and managing strategies to prevent, control and eliminate outbreaks of HPAI.

Activity 1.1. Conduct regular meetings with DLS and MOAC.

- The project management team have continued to meet regularly at DAH to address issues arising and to plan and prepare for activities carried out jointly, including simulation exercises and training modules. The team leader has consistently and strongly advised that material submitted from the field or through regional laboratories from cases associated with mortality in poultry and giving a positive rapid antigen test should be routinely submitted to an international reference laboratory until CVL and reference laboratory results are consistently in conformity.

Activity 1.2. Maintain and further develop linkages with all AI-related projects operating in Nepal.

- Meetings were held with the World Bank AICP monitoring mission in June 2011. Although the AICP project has now terminated, the World Bank has shown a willingness to continue support to the livestock sector in Nepal, initially through a Technical Cooperation Programme (TCP) with the possibility of a larger Livestock project targeting extension services but including provision for animal health to follow. The project has functioned in a coordinated manner with the FAO/Government of Nepal technical assistance agreement in support of the AICP until the closure of that project. The project management maintains frequent contacts with the EU-funded, FAO implemented, HPED project. No other AI-specific projects are extant at this time, or envisaged in the midterm.

Activity 1.3. Advise and support the DLS in planning and implementing AI-related activities through conferences, meetings and seminars.

- During the period the following workshops, meetings, seminars and field visits were conducted during which the project team interacted with the participants and other stakeholders and which provided opportunities to share information relating to HPAI.

Field Visits:

- 25-27 April: Simulation planning in Gaighat with regional and district livestock department staff and other public and private sector stakeholders was held.
- 15 May: Damak municipality and poultry market to discuss the way forward for live bird marketing from Jhapa district. Damak municipality authorities, poultry

entrepreneurs, poultry traders and the District Livestock Service Office (DLSO) Jhapa staff met.

- 1-3 September: Surveillance sensitization programme in Tanahu and Kaski districts. Meetings with surveillance teams, DLSO and Regional Veterinary Laboratory (RVL) staff.
- 11-17 September: Surveillance sensitization programme in remaining five districts (Kailali, Banka, Rupandhi, Nawalparasi and Kaski).

Workshops:

- 15 June: Workshop to evaluate current HPAI status in Nepal and identify key issues to be addressed in modifying SOPs and guidelines. 45 participants, mainly DLS officers.
- 6-8 July: Workshop on upgrading SOPs with 15-member working group and nine evaluators.
- 14 July: Seminar in Pokhara on project progress and key outcomes. Attended by 26 participants from district, regional and central offices and colleagues from HPED Regional Support Unit (RSU).
- 21 July: Second workshop on upgrading SOPs with 14-member working group.
- 18-19 Aug: Working group (13 members) session on updating AI order.

Meetings:

- 9-11 May: Team Leaders meeting at FAO headquarters focusing on planning for the next USAID fiscal year. During this time, side meetings were held with several FAO staff members on project issues and operations.
- 5 June: Meeting with the World Bank monitoring mission on project progress.
- 17 Aug: Meeting with the South Asia Association for Regional Cooperation (SAARC) Secretariat in Kathmandu on HPED project issues (with FAO Representative).
- 22 Aug: United States Armed Forces Research Institution of Medical Sciences to discuss zoonotic diseases in Nepal.

Activity 1.4. Update and distribute relevant AI documentation, bulletins and reports including updated compendium of AI documents.

- The training film on simulation exercises continued to be aired on national television on a number of occasions and shown at workshops organized by the project team.
- There is considerable demand for the compendium of HPAI-related documents that the project has assembled and updated. However, further printings are on hold until current in-progress updates of the SOPs, guidelines and legislation have been completed, and the sections presently in English are translated into Nepali language so as to widen the readership.

Output 2: Strengthen HPAI emergency preparedness and response capacity in Nepal.

Activity 2.1. Review the AI strategy and SOPs to keep up-to-date with the changing disease situation in the country and in the region and lessons learned from previous outbreaks.

- A workshop conducted on 15 June 2011 served to identify the main issues requiring updating and modification.
- Two working group meetings were held in July 2011 for three days to develop proposals for submission to the Department and MOAC to bring the SOPs in line with updated strategies and practices reflecting practical experience and lessons learned.
- A two-day meeting of the technical legislation group in August 2011 finalized amendments proposed to the Bird Flu Order to be submitted to the DLS/MOAC and

subsequently to the cabinet for approval.

Activity 2.2. RRT to field staff in high/medium risk districts.

- Rapid response team (RRT) training modules (culling, disposal, decontamination, sampling and surveillance) were conducted in Pokhara for field technicians from Parbat, Baglung, Myagdi and Lamjung districts in the Western Region and in Kathmandu for Kavre, Rasuwa and Ramechhap districts with a total of 93 technicians attending.

Activity 2.3. Plan, train, conduct and evaluate a further simulation exercise.

- Jointly with DLS, the second of the two planned AI outbreak simulation exercises was carried out in Udayapur district in the Eastern Region over a five day period in May 2011 and involved 80 participants from technical offices and stakeholder groups from the Eastern Region districts.

Activity 2.4. Encourage and guide the development of the emergency disease investigation concept.

- The EDIT team was not active during this period, as no suspect outbreaks were reported.

Output 3: Strengthen disease surveillance.

Activity 3.1. Enhance surveillance in high-risk zones.

- Monitoring visits were made to the surveillance districts in the western and far western regions: Rupendehi, Kapilbastu and Nawalparasi districts were monitored on 10 and 11 April 2011, and Kailali and Kanchanpur from 29 April to 1 May 2011. Follow-up meetings were held in June 2011 with participating staff from each region to gain an overview of the six-month long surveillance programme. Meetings took place in the eastern region on 19 June, western region on 23 June, central region on 28 June and combined mid and far western regions on 30 June.
- The project team met with the Veterinary Epidemiology Centre (VEC) chief to draw up a plan for the next period focusing on those districts where clade 2.3.2 has been detected during the outbreaks of 2010, taking into account duck populations and the results of duck sero-surveys for AI antibodies.

Activity 3.2. Surveillance in buffer zones around migratory bird stop-over points, markets and resident duck populations.

- Resources remain insufficient to carry out this element of the surveillance programme in a comprehensive manner. This aspect has been given more prominence in the updated national surveillance guidelines.

Output 4: Safe LBM development.

Activity 4.1 Expand model market concept.

- The Kathmandu Metropolitan City (KMC) council continued to confront difficulties with the construction at the alternative site. However, some progress is now evident. No further payments will be made by the project unless and until the construction is completed and the unit operational within the end date of this phase of the project. The Public Health Department continues to be positive and continually urges KMC management to act.

Planned activities for the next six-month period

Output 1: Planning and coordination

Activity 1.1. Ensure effective planning and coordination at country level.

- Continue close collaboration with DLS and its relevant directorates. Having completed

the updating of the SOPs, guidelines and legislation, the project management will press for these documents to be formally approved and/or gazetted in order to become effective.

Activity 1.2. Support national and international coordination related to disease control.

- Maintain contacts with the USAID EPT programme and particularly the activities under the IDENTIFY component, and continue the close linkages with the HPED project funded by the EU and implemented by FAO.

Activity 1.3. Update and distribute relevant AI documentation, bulletins and reports including updated compendium of AI documents.

- Complete the updating and translation of the final edition of the compendium of key AI documents to produce and distribute to the target audience.

Activity 1.4. Advise and support the DLS in planning and implementing AI-related activities through conferences, meetings and seminars.

- Encourage and facilitate public-private partnerships including consideration of cost sharing of disease control in order to enhance sustainability.

Output 2: Strengthen surveillance and response in the light of changing disease situation in Nepal.

Activity 2.1. Keep the AI strategy and SOPs in view to ensure appropriateness to the changing disease situation in the country and in the region and lessons learned from previous outbreaks.

- Ensure proper awareness of this issue through working group meetings and relevant workshops, particularly as evidence comes to light from further field investigations. While indications point to H5N1 clade 2.3.2 being established in at least some parts of Nepal, the role of H9N2 virus is less clear. Efforts will be made to clarify this situation through close collaboration with DAH, VEC and CVL on active and passive surveillance programmes.

Activity 2.2. Support risk-based surveillance activities focussing on districts where the disease has occurred.

- Initiate enhanced surveillance through a targeted disease searching programme in seven of the eight districts affected by clade 2.3.2 virus in 2010, operating from four service centres in each district and involving weekly contacts by the service centre technician with four to five contact persons along an agreed route, targeting Village Development Committees (VDCs) where outbreaks have been previously confirmed. Information will be gathered in a structured format, and, where disease is encountered, samples will be submitted to the laboratory service for investigation.

Activity 2.3. Conduct workshops and training exercises to follow up on new surveillance modalities.

- Organize two further rapid response training sessions in order to maintain the outbreak response capacity and assist in the disease detection efforts.
- Conduct two table-top exercises during the November-January 2011 period in regions judged most at risk of resurgence of HPAI.

Activity 2.4. Encourage and guide the development of the emergency disease investigation concept.

- Develop a more structured approach with DAH to respond promptly to suspect outbreaks, particularly those with significant mortality and a positive rapid antigen detection test result.

Main challenges encountered and response provided

- Cross-border trading practices continue to present a major risk for Nepal, as HPAI is entrenched in Bangladesh and parts of India. However, the introduction of the 2.3.2 clade of the virus last year and its apparent persistence in at least some parts of Nepal has called for a revision of the risk analysis and re-categorization of high-risk districts. To this end the project has facilitated workshops and meetings to update SOPs, guidelines and the legislative framework. The ability to manage outbreak situations has been strengthened through a programme of outbreak simulation exercises and training of field technicians in rapid response activities.
- The epidemiology of HPAI viruses in Nepal is not clear. It is evident that the country has moved away from an at-risk situation (where occasional introductions from adjacent territories could be contained and eliminated as in 2009) towards a situation similar to other Gangetic plain countries, where the virus is able to persist undetected for long periods of time and reappear under conditions that favour an enhanced viral load in the environment. The project is pursuing a programme to assist the Government in elucidating the true situation through effective surveillance and diagnostic capabilities.
- Although outbreaks of HPAI have been periodically occurring in Nepal since the first detected cases in January of 2009, the depth of knowledge of department field staff, civil authorities, producers and traders and other stakeholders is poor. To alleviate this deficiency, a compendium of key HPAI documents was produced and distributed by the project. The compendium will need to be updated to reflect the most recent changes to guidelines and SOPs.

Main progress made towards the achievement of project outcomes

Output 1: Monitor the AI situation in the country and update the national strategy and plans.

- The project has collaborated with DAH and taken advantage of FAO's involvement in the World Bank-funded AICP to develop a comprehensive HPAI surveillance programme, including country-wide passive surveillance supported by active surveillance targeting districts categorized as high risk. Combined with support to the veterinary diagnostic laboratories, this has provided a basis for monitoring the AI situation. The results from this programme have guided continued evaluation of national strategy and the mechanisms for its implementation.

Output 2: Improve communication between key stakeholders that share data, information and knowledge, including reports and publications on HPAI.

- Over the period of project implementation, the number of other projects directly involved with HPAI issues steadily decreased, with the AICP, which has been a major funding source for AI-related activities, having terminated on 31 July 2011. Inter-project coordination has been facilitated by FAO's role in both national projects and regional programmes, such as the EU-funded HPED project supporting SAARC member states and the USAID-funded EPT project. All HPAI programmes in Nepal fall under the oversight of the Director-General of the DLS. The project management's close working relationship has ensured fruitful collaboration. Communication with stakeholders has been facilitated through field activities, such as outbreak simulations and technician training courses, as well as the production and distribution of key documents and the national airing of AI video films produced by the project.

Project Monitoring Sheet: **OSRO/RAS/605/USA Baby 03**Project Title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)**Reporting period: **October 2010 – March 2011**

Country: Nepal
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)
Code: OSRO/RAS/605/USA Baby 03
Budget: USD 965 000 (Phases I-IV) and USD 250 000 (Phase V)
Total budget: USD 1 215 000
Effective Starting Date: 1 October 2006
Planned End Date: 30 September 2011
<p>Context of the Project</p> <p>The project is addressing the short- and medium-term actions of the Government of the Federal Democratic Republic of Nepal required to strengthen its capacity in preventing the introduction of Highly Pathogenic Avian Influenza (HPAI) and minimize its spread in the event of its occurrence. During the first quarter of 2009, the first outbreaks in Nepal were recorded. After a disease-free period of ten months, multiple outbreaks occurred during the period of January to March 2010. In contrast to the previous year, the 2010 outbreaks were attributed to clade 2.3.2 of the H5N1 virus, previously unrecorded in South Asia, suggesting an introduction through infected migrating wildfowl, rather than a cross-border one. In October 2010, the clade 2.3.2 virus reappeared in a previously infected district, indicating its persistence in reservoir species. The Government's resources, including those provided by international donors, have been severely stretched. The project has provided essential capacity building for preparedness and response. However, the scenario of declining international support for HPAI control is alarming, coupled with an increasing danger of the disease becoming endemic in Nepal, with negative consequences for the livelihoods of smallholder farmers and the control efforts of neighbouring countries.</p>
<p>Objectives of the Project</p> <p>The project has assisted the Ministry of Agriculture and Cooperatives (MOAC) in the implementation of the National Contingency Plan for HPAI. The main objective of the project is to contribute to rural development in the country by preventing and controlling the detrimental consequences of HPAI and raising awareness of other emerging infectious diseases in poultry. The expected outcome of the project is to create an effective mechanism for planning and coordination across sectors and key stakeholders involved in HPAI control activities, particularly with the United States Agency for International Development (USAID)-supported projects in Nepal and the South and Southeast Asia region.</p>
<p>Planned activities for October 2010 – March 2011</p> <p>Output 1: Monitor the avian influenza (AI) situation in the country and update the national strategy and plans.</p> <p><i>Activity 1.1. Provide working groups on Animal Health with appropriate guidance and technical assistance.</i></p> <p><i>Activity 1.2. Conduct workshops and training exercises in each region to explain surveillance modalities and facilitate planning of field work.</i></p>

Activity 1.3. Conduct outbreak response simulation exercises – at least one in each of the regions.

Activity 1.4. Support Emergency Disease Investigation Teams (EDIT) through material and logistical support.

Activity 1.5. Conduct a review of live bird markets (LBMs) and poultry value chain and establish model facilities.

Activity 1.6. Design and construct a new post-mortem facility at the central veterinary laboratory (CVL).

Activity 1.7. Develop an enhanced surveillance programme for high-risk districts.

Output 2: Improve communication between key stakeholders that share data, information and knowledge, including reports and publications on HPAI.

Activity 2.1. Strengthen functional linkages between projects funded by USAID and other key stakeholders.

Activity 2.2. Assist the Government in the improvement of the dissemination of information (i.e. bulletins, reports and updates).

Activities undertaken during the reporting period (October 2010 – March 2011)

Output 1: Monitor the AI situation in the country and update the national strategy and plans.

Activity 1.1. Provide working groups on Animal Health with appropriate guidance and technical assistance.

- The technical working group met regularly at the Directorate of Animal Health (DAH) to discuss and guide the project's implementation, focusing on the issue of reappearance of clade 2.3.2 virus in Tanahu district.
- The laboratory working group held two meetings dedicated to the topic of CVL's diagnostic capability.

Activity 1.2. Conduct workshops and training exercises in each region to explain new surveillance modalities and facilitate planning of field work.

- Rapid response team (RRT) training modules (culling, disposal, decontamination, sampling and surveillance) were conducted in Nepalgunj, Biratnagar and Bhairahawa for field technicians from Doti, Pyuthan, Salyan, Dailekh, Banke, Surkhet, Taplejung, Sankhuwasba, Bhojpur, Teratjhum, Gulmi, Sindhuli and Arghakhachi districts. Among the total of 173 trainees were ten female technicians.

Activity 1.3. Conduct simulation exercises – at least one in each of the regions.

- Jointly with the Department of Livestock Services (DLS), the first of the two planned AI outbreak simulation exercises was carried out in Dhankuta district in the Eastern Region over a five day period in March and involved some 85 participants from technical offices and stakeholder groups from the Eastern Region districts.

Activity 1.4. Support EDIT through material and logistical support.

- The central EDIT investigated suspect outbreaks in Chitwan (confirmed) and Kaski/Tanahu. Material collected by the EDIT from the two adjoining properties in Chitwan was forwarded to an international reference centre (VLA-UK), and both H5N1 and H9 AI viruses were isolated. Furthermore, material submitted from a commercial unit in Tanahu with 80 percent mortality was negative for Newcastle Disease but positive for H5 virus on rapid test and conventional polymerase chain reaction (PCR). However,

the reference lab only isolated the H9 virus.

Activity 1.5. Conduct a review of LBMs and establish model facilities.

- The project organized a workshop to examine the outcomes of the poultry value chain study completed by the SEEPOR consultancy and its implications for the risk management of the disease spread.
- Progress with the Kathmandu Municipality on construction of a market stall facility for the safe marketing of live and freshly slaughtered birds was slow. An alternative site had to be selected, and a contract was awarded for the necessary civil works. Several meetings with the concerned officers of the Municipality were necessary, and a final decision will be made by 31 March 2011.

Activity 1.6. Design and construct a new post-mortem facility at the CVL.

- The construction of a new post-mortem facility and incinerator room at the CVL to allow safe and efficient handling of potentially infected poultry carcasses is in its final stage, and the handover to the Department is being planned by 31 March 2011.

Activity 1.7. Develop an enhanced surveillance programme for high-risk districts.

- The enhanced surveillance programme covering 12 high-risk districts has been active since November 2010 and will run during the period of a perceived high risk from HPAI until the end of April 2011.
- In each participating high-risk district, eight surveillance sites were set up, each consisting of four to six contact points. Because of the number of sites, an additional monitoring layer was interposed, and district office-based focal officers and technicians provided immediate supervision.
- National consultants provided orientation and overall supervision to 150 field staff involved in the programme.

Output 2: Improve communication between key stakeholders that share data, information and knowledge, including reports and publications on HPAI.

Activity 2.1. Strengthen functional linkages between projects funded by USAID and other key stakeholders.

- In addition to the routine interactions maintained within the MOAC/DLS/DAH, the project benefited from the following opportunities to gather and share information:
 - 13-14 October 2010: CTA attended the Global Rinderpest Eradication Programme (GREP) meeting held in Rome.
 - 22 November 2010: An inception workshop was organized to update partners and implementing stakeholders on key issues relating to the project implementation.
 - Information sharing with the USAID-funded cross-border project (OSRO/RAS/701/USA) and the EU-funded SAARC regional support unit is maintained.
 - 17 December 2010: CTA participated in a workshop on the progressive control of foot-and-mouth disease (FMD), organized by the Regional Support Unit under the Highly Pathogenic Emerging and Re-Emerging Animal Diseases (HPED) programme.
 - 11 February 2011: A media sensitization workshop offered an opportunity to share information on the project's activities with media representatives.
 - 2-4 March 2011: A regional consultation on laboratory networks facilitated the regional exchange of information with colleagues working on AI control.
 - 10 January 2011: CTA attended a regional workshop on biosecurity and public private partnerships (OSRO 802 and OSRO 805), sharing information on the status of these areas in Nepal with a view to further collaboration.
 - 24-28 January: Interaction with the World Bank implementation support mission to the Avian Influenza Control Project (AICP) and AICP coordination were routinely

maintained.

- 2 February 2011: CTA and national consultant met with a group of commercial poultry producers in Chitwan district to discuss issues of biosecurity in commercial units and possible FAO interventions in this area.
- 22-24 February 2011: CTA attended the fifth annual ECTAD meeting held in Bangkok and shared information and views on AI surveillance programmes.

Activity 2.2. Assist the Government in the improvement of the dissemination of information (i.e. bulletins, reports and updates).

- The training film on simulation exercises was aired on national television on a number of occasions.
- Translation of SOPs into Nepali and of other key documents that are currently in English is forthcoming, and a further edition of the valued AI compendium to include a wider audience is in progress. A workshop was held on 3 February 2011 to collate and share the information gathered under three overseas observation tours of border controls and quarantine service operations.

Planned activities for the next six-month period

Output 1: Support DLS in planning, coordinating and managing strategies to prevent, control and eliminate outbreaks of HPAI.

Activity 1.1. Conduct regular meetings with DLS and MOAC.

- Continue close collaboration with DLS and its relevant directorates. Changing epidemiological status of HPAI in Nepal may have an impact on the currently adopted measures for early detection and rapid response, such that SOPs and the existing legal framework may need to be updated.

Activity 1.2. Maintain and further develop linkages with all AI-related projects operating in Nepal.

- The major funding source for the government interventions in the field of AI control, the World Bank-funded AICP concludes in July of this year. No other AI-specific projects are extant at this time, or envisaged in the mid-term. As the disease is now well entrenched in Nepal, there is a concern over future support to this sector. Some support may become available through programmes dedicated to emerging pandemic threats (EPT), such as the USAID EPT programme, and the HPED project funded by the European Union (EU).

Activity 1.3. Advise and support the DLS in planning and implementing AI-related activities through conferences, meetings and seminars.

- Conduct three workshops in the period June-August to examine the progress made on the prevention of HPAI and other emerging diseases, the gaps remaining and the way ahead as part of the process of project conclusion and handover.

Activity 1.4. Update and distribute relevant AI documentation, bulletins and reports including updated compendium of AI documents.

- Complete the updating and translation of the final edition of the compendium of key AI documents to produce and distribute to the target audience.

Output 2: Strengthen HPAI emergency preparedness and response capacity in Nepal.

Activity 2.1. Review the AI strategy and SOPs to keep up-to-date with the changing disease situation in the country and in the region and lessons learned from previous outbreaks.

- Encourage further debate on this issue through working group meetings and relevant workshops. The re-occurrence of HPAI owing to H5N1 clade 2.3.2 after a gap of seven months suggests that the virus is established in at least some parts of Nepal, most

probably with ducks acting as a reservoir species. Efforts should be made to confirm this situation, and initial results of a duck antibody survey are already lending support to this hypothesis. This has major implications for targeted surveillance and disease risk management.

Activity 2.2. RRT to field staff in high/medium risk districts.

- Organize two further training sessions in order to maintain the outbreak response capacity and assist in the disease detection efforts.

Activity 2.3. Plan, train, conduct and evaluate a further simulation exercise.

- Complete the final AI outbreak simulation exercise during the next semester.

Activity 2.4. Encourage and guide the development of the emergency disease investigation concept.

- Develop a more structured approach with DAH. The Department has been slow in adopting this concept, but now greater emphasis is given to this area.

Output 3: Strengthen disease surveillance.

Activity 3.1. Enhance surveillance in high-risk zones.

- Continue as planned for the remaining month of the high-risk period and evaluate the outcome and performance of the programme. Address the ways in which known weaknesses in the implementation of the programme may be overcome, while at the same time seeking to increase its efficiency by making it more sustainable without losing effectiveness.

Activity 3.2. Surveillance in buffer zones around migratory bird stop-over points, markets and resident duck populations.

- Resources remain insufficient to carry out this element of the surveillance programme in a comprehensive manner. Consideration will be given to targeting key markets and ensuring that the active surveillance programme is working effectively in those districts where the disease has surfaced in the past, prioritizing them where possible.

Output 4: Safe LBM development.

Activity 4.1 Expand model market concept.

- Complete this first initiative together with the training of market stall operators and inspectors. The slow progress of this programme in association with the Kathmandu municipality was not an encouraging approach in the Kathmandu valley.
- Continue to build on preliminary proposals to address the issue of inspection and certification and onward transportation of live birds, particularly backyard raised birds, from the high-risk district of Jhapa in Eastern Nepal. This will be coordinated with the no-cost extension phase of the OSRO INT 805 project.

Main challenges encountered and response provided

- Cross-border trading practices continue to present a major risk for Nepal, as HPAI is entrenched in Bangladesh and parts of neighbouring India. However, the introduction of the 2.3.2 clade of the virus last year and its apparent persistence in at least some parts of Nepal complicates the simplistic approach of having a high-risk belt of districts along the Indian border. The approach to risk management including targeted surveillance has to be revisited in the light of current information. The ability to manage outbreak situations has been strengthened through a programme of outbreak simulation exercises and training of field technicians in rapid response activities.

- The likely role of wild birds in the transmission of the 2010 HPAI epidemic posed an added challenge for the animal health authorities. While it may be impossible to prevent such transmission of HPAI to Nepal in the future, there is a need for the system to improve its capacity for detecting cases at the earliest instance and to take measures which prevent or limit further spread of HPAI.
- A complete understanding of the poultry market chain is essential in refining control measures. At the same time, the control measures adopted must be as efficient and cost effective as possible in order to be sustainable by the Government, and the role and participation of the private sector in developing and funding these controls addressed.
- During the 2010 epidemic, the major failings were the inability to prevent internal spread of the disease coupled with inadequate and tardy material and financial support to the affected districts (excepting Pokhara). These issues have been voiced in a lessons-learned workshop, and it is now critical that measures be taken to ensure that these issues are more effectively addressed in the future.
- Efforts to expand the knowledge base in veterinary epidemiology have so far only scratched the surface and need to be given further impetus.

Main progress made towards the achievement of project outcomes

Output 1: Monitor the AI situation in the country and update the national strategy and plans.

- Select project activities, involving capacity building of district staff in relation to disease identification, sampling, use of rapid tests, reporting, biosecurity and surveillance methodology, as well as the support given to the diagnostic services contributed significantly to the early detection of and effective response to the recent outbreaks. Table-top and field simulation exercises in particular strongly contributed to this progress.

Output 2: Improve communication between key stakeholders that share data, information and knowledge, including reports and publications on HPAI.

- Over the period of project's implementation, the number of other projects directly involved with HPAI issues steadily decreased, as for example, the AICP project, which will terminate in less than six months. The focus now is towards wider programmes, such as the HPED and EPT projects and the regional South Asian Association for Regional Cooperation (SAARC) programme, addressing transboundary animal diseases (TADs) as a whole. In light of this, the project management has avoided an insular approach and sought to place HPAI within the wider TADs environment in line with the One Health initiative.

Project Monitoring Sheet: **OSRO/RAS/701/USA**

Project title: **Strengthening cross-border activities among Bangladesh, India, Nepal and Myanmar to control possible cross-border spread of HPAI**

Reporting period: **October 2010 – March 2011**

Regional: Subregional cross-border activities in Bangladesh, India, Nepal and Myanmar
Project Title: Strengthening cross-border activities among Bangladesh, India, Nepal and Myanmar to control possible cross-border spread of HPAI
Code: OSRO/RAS/701/USA
Budget: USD 1 000 000 (Phase I), USD 1 000 000 (Phase II)
Total budget: USD 2 000 000
Effective starting date: October 2007
Planned end date: 30 September 2011
<p>Context of the project</p> <p>Porous, long and continuous land borders between the project's four countries (Bangladesh, India, Nepal and Myanmar), with minimal control points and quarantine facilities, continue to pose risks for the spread of Highly Pathogenic Avian Influenza (HPAI) in the region as a whole. Hence, it is necessary to have a better understanding of the pattern of the poultry supply chain and trade taking place across borders. There is also a lack of sufficient capacity both in terms of skilled human resources and also facilities to conduct effective management of transboundary movements of poultry and poultry products. Sharing expertise, information and biological samples among laboratories in the region is key for effective planning to prevent or prepare for cross-border outbreaks.</p> <p>It is envisaged that a longer-term national strategy will be drafted in consultation with various stakeholders during the implementation of this project to deal with the longer-term cross-border issues relevant to the avian influenza (AI) threat.</p>
<p>Objectives of the project</p> <p>The main goal of the project is to prevent HPAI spreading across borders because of the movements of poultry and poultry products. Specifically the project aims to: (i) develop a platform for dialogue and information exchange between countries in the region on issues related to potential cross-border spread of HPAI; (ii) strengthen capacities of institutions to deal with the threat of transboundary spread of HPAI; and (iii) increase the understanding of ways to manage cross-border trade to reduce the risk of HPAI outbreaks.</p>
<p>Planned activities for the reporting period</p> <p>Output 1: Project management and coordination mechanisms established and operating</p> <ul style="list-style-type: none"> • Retain key technical personnel until the end of project date (i.e. March 2011). • Further strengthen the modalities for better communication and dialogue to facilitate project coordination. • Continue to prepare bi-monthly information bulletins. • Participate in regional and global meetings. <p>Output 3: Increased capability for emergency response to HPAI outbreaks owing to cross-border spread of the disease</p> <ul style="list-style-type: none"> • Conduct trainings and workshops on how to rapidly confirm outbreaks for border control personnel in Bangladesh.

Phase II

Output 2: Strengthened production and market systems approach to improve cross-border movement management and reduce HPAI risks

- Finalize the reports of study on livestock marketing systems in high-risk corridors in Bangladesh, India and Nepal.

Output 3: Developed policy and harmonized risk management procedures

- Review and analyse country report on policy issues, legislative frameworks and the development of legislative instruments to fill key gaps related to cross-border trade and risk management from Bangladesh.
- Conduct a subregional workshop on gaps in legislative frameworks for cross-border trading.

Output 4: Improved capacity for response to cross-border emergencies

- Convene meetings of divisional and district officers in high-risk cross-border corridors in Bangladesh.
- Provide rapid response training to host government personnel of Bangladesh, at local levels, in the selected high-risk movement corridors.
- Conduct a special advocacy initiative in target border districts, as part of emergency response activities in Bangladesh, in order to mobilize and sensitize the following groups: (i) local, district-level and decentralized veterinarians; (ii) private and public news channels, journalists and media-persons; (iii) NGOs; (iv) farmers; (v) traders; and (vi) women's groups.
- Conduct sensitization workshops for print and electronic media in India's West Bengal State for the prevention and control of HPAI to strengthen cross-border emergency preparedness and response mechanisms.
- Conduct a table top preparatory simulation workshop for prevention and control of HPAI, in relation to strengthening Cross-Border Emergency Preparedness and Response Mechanism at a high risk corridor in West Bengal, India.

Activities undertaken during the reporting period

Output 1: Project management and coordination mechanisms established and operating

- The ninth and tenth volumes of Information Bulletins (August-September and October-December 2010) were circulated. The eleventh volume (January-February 2011) is under preparation.
- The Subregional Manager participated in the International Workshop on Challenges of Information Systems and Surveillance for major animal diseases and zoonoses from 23 to 26 November 2010 at FAO headquarters in Rome.
- The Subregional Manager and Emergency Programme Officer participated in a high level regional consultation on the control of priority transboundary animal and other emerging infectious diseases in South Asia held in collaboration with SAARC Secretariat in Bangkok on 13 and 14 January 2011.
- The Subregional Manager and Emergency Programme Officer participated in the Regional ECTAD Meeting held in Bangkok from 22 to 24 February 2011.

Output 3: Increased capability for emergency response to HPAI outbreaks owing to cross-border spread of the disease

- Two trainings/workshops in rapid confirmation of outbreaks in high-risk cross-border corridors were held in Bangladesh for district veterinarians and paraveterinarians. The trainings/workshops were held on 29 and 30 December 2010 in district Comilla and on 2 and 3 January 2011 in district Cox's Bazaar.

Phase II

Output 2: Strengthened production and market systems approach to improve cross-border movement management and reduce HPAI risks

- Two orientation/sensitization workshops on strengthening cross-border emergency preparedness and response mechanisms for HPAI were held for provincial and district officers in high-risk cross-border corridors of Bangladesh. The workshops were held in Comilla district on 29 and 30 December 2010 and on 2 and 3 January 2011 in Cox's Bazaar district. Approximately 100 persons participated in each workshop. The objectives of the workshops were to:
 - orient/sensitize participants on key issues of risk/outbreak communication and advocacy interventions to prevent and control HPAI outbreaks; and
 - present district-level findings of the poultry value-chain mapping exercise conducted by the project.

To strengthen emergency response preparedness, the workshops were also used as an advocacy platform to sensitize the following border-district groups: (i) local, district-level and decentralized veterinarians; (ii) private and public news channels; (iii) journalists and media-persons; (iv) NGOs; (v) farmers; (vi) traders; (vii) women's groups; and (viii) police and border forces.

- The study reports on livestock marketing systems in high-risk corridors of Bangladesh, India and Nepal are being finalized.

Output 3: Developed policy and harmonized risk management procedures

- The report from the hired consultant from Bangladesh to review and analyse policy issues, legislative frameworks and the development of legislative instruments to fill key gaps related to cross-border trade and risk management was not received despite repeated reminders. A new consultant was hired to complete the analysis.
- The subregional workshop on gaps in legislative frameworks in the context of cross-border trading will be organized in the next quarter, once the report from Bangladesh consultant is received and analysed.

Output 4: Improved capacity for response to cross-border emergencies

- Two workshops were held in Bangladesh (in Chittagong Division) to provide rapid response training to host government personnel at local levels in high-risk cross-border corridors of Bangladesh. The workshops took place on 29 and 30 December 2010 in Comilla and on 2 and 3 January 2011 in Cox's Bazaar district. Approximately 100 persons participated in each workshop. The objectives of the workshops were to:
 - determine which measures had been taken for the prevention and control of HPAI and provide sensitization on the clinical picture of HPAI;
 - provide technical guidance and training to veterinarians on the investigation of HPAI outbreaks; and
 - strengthen emergency response preparedness.

The workshop was also used as an advocacy platform to sensitize the specific border-district groups as outlined in Output 2 on page 4 of this progress report.

- Four media orientation/sensitization workshops were held between December 2010 and March 2011 in Bangladesh, India and Nepal. The first media orientation/sensitization workshop was held in Kolkata (West Bengal), India, on 6 and 7 December 2010. The second workshop was held on 11 February 2011 in Kathmandu, Nepal, and the third workshop was held on 15 February 2011 in Dhaka, Bangladesh. The last such workshop was held in Agartala, Tripura State of India on 7 March 2011, which coincided with an ongoing HPAI outbreak. Forty to 55 print and electronic media journalists from prominent English national/state dailies, as well as prominent local dailies, radio and television news channels, participated in each of these interactive workshops.
- A table top preparatory simulation workshop for prevention and control of HPAI, in relation to strengthening Cross-Border Emergency Preparedness and Response Mechanism was held at Dakshin Dinajpur district of West Bengal, India on 10 December 2010. The objectives of the preparatory workshop were
 - to examine the effectiveness and identify gaps of:
 - national plan documents to prevent the cross-border transmission of the diseases;
 - legal and administrative approaches for successful prevention of HPAI through cross-border trade;
 - current mechanism knowledge and information flow at cross-border among various agencies for pre-emptive action to prevent incursion of HPAI; and
 - cross-border Standard Operating Procedures (SOPs) under field situation.
 - to recommend a workable solution at policy and execution level to minimize the risk of cross-border transmission of the disease.

The workshop was attended by the representatives from the Animal Resources Development Department, Civil Administration, Department of Health, and other district level departments of state government, West Bengal Police, Border Security Force and Customs.

Planned activities for the next six-month period

Output 1: Project management and coordination mechanisms established and operating

- Retain key technical personnel until the end of project date (i.e. September 2011).
- Further strengthen the modalities for better communication and dialogue to facilitate project coordination.
- Continue to prepare bi-monthly information bulletins.
- Participate in regional and global meetings.

Phase II

Output 2: Strengthened production and market systems approach to improve cross-border movement management and reduce HPAI risks

- Finalize the reports of study on livestock marketing systems in high-risk corridors in Bangladesh, India and Nepal.

Output 3: Developed policy and harmonized risk management procedures

- Review and analyse country report on policy issues, legislative frameworks and the development of legislative instruments to fill key gaps related to cross-border trade and risk management from Bangladesh.

<ul style="list-style-type: none"> • Conduct a subregional workshop on gaps in legislative frameworks for cross-border trading.
<p>Output 4: Improved capacity for response to cross-border emergencies</p> <ul style="list-style-type: none"> • Conduct a table top preparatory simulation workshop for prevention and control of HPAI, in relation to strengthening Cross-Border Emergency Preparedness and Response Mechanism at a high risk Nepal-India corridor.
<p>Main challenges encountered and response provided</p> <ul style="list-style-type: none"> • None
<p>Progress made towards the achievement of project outcomes (from the start of the project activities)</p> <p>Output 1: Project management and coordination mechanisms established and operating</p> <ul style="list-style-type: none"> • All project staff were recruited, and the coordinating office in Kathmandu, Nepal was established and equipped. Coordinating units in Bangladesh, India and Myanmar were also equipped. A vehicle was procured for the project coordination unit in Kathmandu. • A project workshop, attended by high-level administrative and technical personnel from participating countries, was held on 24 and 25 March 2008. • The project inception workshop was held on 2 and 3 July 2008. A related report was provided to all countries and participants. • A United States Agency for International Development (USAID) partners' meeting, on HPAI in South Asia, was organized on 17 and 18 November 2008 in New Delhi, India to discuss the progress of Fiscal Year (FY) 2007 activities and a work plan for FY 2008 funding. • Technical and policy-level committees were constituted. A meeting of these committees to monitor the project progress was held on 17 April 2009 in Kolkata, India, on 28 and 29 January 2010 in Pokhara, Nepal and on 12 May 2010 in New Delhi, India. A meeting of a technical-level committee to monitor the project's progress was held on 19 July 2009 in Dhaka, Bangladesh. The Governments of the three countries were very appreciative of these meetings and wished to continue these in the future. • A poster prepared on the progress of the project was presented during the USAID Partners' Meeting held from 1 to 3 April 2009 in Bangkok. • Ten volumes of bi-monthly information bulletins were released, from May 2009 to December 2010 and circulated to ECTAD members, donors, countries and other agencies as an information sharing/knowledge management initiative. • Engagement with the South Asia Association for Regional Cooperation (SAARC) was continued through organization of a FAO/World Organisation for Animal Health (OIE) subregional meeting of the Global Framework for the Progressive Control of Transboundary Animal Diseases (for the SAARC Region) on 4 and 5 June 2009 in Kathmandu, Nepal. • The Subregional Manager participated in a meeting in Bangkok, on 16 and 17 July 2009, to develop a strategic framework, entitled "FAO regional strategy for Highly Pathogenic Avian Influenza and other emerging infectious diseases of animals in Asia and the Pacific: 2009 – 2014". • A report on the progress of the project, from April to September 2009, was presented at the USAID partners' meeting held on 24 and 25 September 2009 in Bangkok. • The Subregional Manager participated in the second real-time evaluation of FAO's

work on HPAI in the Asian region, held from 30 November to 1 December 2009 in Bangkok, Thailand. The evaluation team was briefed on the activities and impact of the South Asia cross-border project.

- The Subregional Manager and Subregional Advocacy Coordinator participated in the fourth regional ECTAD meeting, from 23 to 25 February 2010, and the ECTAD Asia information system workshop on 26 February 2010 in Bangkok, Thailand.
- The Subregional Manager participated in the inception workshop on the “Regional risk assessment of HPAI in South and Southeast Asia: a socio-economic perspective” on 28 and 29 April 2010 in Bangkok, Thailand.
- The Subregional Manager participated in the inception workshop of OSRO/IND/802/USA project “Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) to India” on 10 and 11 May 2010 in New Delhi, India.
- The Subregional Manager and Subregional Advocacy Coordinator participated in the regional communication workshop from 23 to 25 June 2010 in Bangkok, Thailand.
- The Subregional Manager participated in the First meeting of HPED Steering Committee on 1 July 2010 and the 4th Regional Steering Committee meeting of GF-TADs for Asia and Pacific Region on 2 July 2010 in Bangkok, Thailand.
- The Subregional Manager participated in the Regional Avian and Pandemic Influenza USAID Partners’ Meeting on 2 and 3 September, 2010 in Bangkok, Thailand and presented the progress of activities from October 2009 to September 2010.
- The Subregional Manager participated in the International Workshop on Challenges of Information Systems and Surveillance for major animal diseases and zoonoses from 23 to 26 November 2010 at FAO headquarters in Rome, Italy.
- The Subregional Manager and Emergency Programme Officer participated in a high level regional consultation on the control of priority transboundary animal and other emerging infectious diseases in South Asia held in collaboration with SAARC Secretariat in Bangkok, Thailand, on 13 and 14 January 2011.
- The Subregional Manager and Emergency Programme Officer participated in the Regional ECTAD Meeting held in Bangkok, Thailand, from 22 to 24 February 2011.

Output 2: High-risk areas for introduction of HPAI via cross-border routes identified and mapped

- The draft final report of the study on poultry value-chain analysis across Nepal and India’s border and mapping of high-risk areas was received and cleared.
- The draft final report of the study on poultry value-chain analysis across Bangladesh, India and Myanmar’s border and mapping of high-risk areas was received and cleared.
- The draft final report of the study on poultry value-chain analysis across Myanmar, India and Bangladesh’s borders and mapping of high-risk areas was received and cleared.
- The agency contracted to perform the poultry value chain mapping across India-Nepal, India-Bangladesh and India-Myanmar did not perform satisfactorily and did not submit the final report. The FAO office in India and the contractor decided to close the activities on 27 September 2010, as it was found difficult to make any further progress.

Output 3: Increased capability for emergency response to HPAI outbreaks owing to cross-border spread of the disease

- Laboratory training for participants from Bangladesh, India, Nepal and Myanmar was held from 19 to 24 January 2009 in Bhopal, India.

- A subregional workshop to develop SOPs for emergency response to disease in high-risk cross-border trade areas was held on 21 and 22 May 2009 in Kathmandu, Nepal. These SOPs were further discussed (and accepted by each party) in Bangladesh, India and Nepal through a series of brainstorming workshops from 4 to 6 November 2009 (in Nepal), on 4 December (in India) and on 10 December (in Bangladesh) and finally at the Technical and Policy Level Committees meeting on 28 and 29 January 2010 in Pokhara, Nepal. The finalized SOPs were circulated in the district level meetings held in the high risk corridors in India and Bangladesh.
- At the request of Government of the Republic of India, rapid antigen detection kits were procured and delivered for use in high-risk corridors for the rapid screening of outbreaks. Furthermore, in response to the Government's request, five cycles of laboratory trainings were conducted on the use of rapid antigen kits for 80 laboratory personnel. The kits were successfully used in the recent HPAI outbreaks in Murshidabad district, West Bengal, and were appreciated by the Government.
- Enzyme linked immunosorbent assay kits (ELISA) were procured and delivered to the Government of Federal Democratic Republic of Nepal for surveillance of HPAI in ducks in Nepal's far eastern region, which formed a part of the project study area.
- A study tour to West Bengal, India for government staff from Bangladesh, India, Nepal and Myanmar to strengthen emergency response capacity was conducted from 26 to 29 April 2010. Four participants each from Bangladesh and Myanmar, five from India and six from Nepal participated in the study tour.

Phase II

Output 2: Strengthened production and market systems approach to improve cross-border movement management and reduce HPAI risks

- Stakeholder meetings to present the results of poultry value-chain mapping across Nepal and India's border were held on 10 July 2009 in Kathmandu, Nepal, and for the Bangladesh-India and Bangladesh-Myanmar borders on 21 July 2009 in Dhaka, Bangladesh. The meetings were attended by senior staff representing DLS, including the Chief Veterinary Officer (CVO), private sector representatives, national and international non-governmental organizations (NGOs), Academy for Educational Development (AED) and FAO.
- A subregional workshop, entitled "Understanding and use of poultry value chain analysis in poultry production and marketing in the context of cross border trading", was held from 14 to 18 September 2009 in Kathmandu, Nepal. Delegates from Bangladesh, India and Nepal participated. The workshop was facilitated by FAO staff from headquarters, ECTAD-RAP Bangladesh and Nepal and also by the Royal Veterinary College, London.
- The studies on the livestock marketing system in high-risk corridors of Bangladesh, India and Nepal with a view to establishing monitoring processes of poultry production and market chains (linked with animal disease monitoring data), were concluded and draft reports received.

Output 3: Developed policy and harmonized risk management procedures

- Consultancy reports from consultants in India and Nepal to review and analyse policy issues, legislative frameworks and the development of legislative instruments to fill key gaps related to cross-border trade and risk management were received and technically cleared by ECTAD-RAP.

Output 4: Improved capacity for response to cross-border emergencies

- A series of orientation and sensitization workshops, on strengthening cross-border emergency preparedness and response mechanism for HPAI, were held for provincial and district officers in high-risk cross-border corridors of Nepal (Jhapa and Morang districts) and India (Araria/Kishanganj, Darjeeling, Cooch Behar, Dakshin Dinajpur, Malda, North 24 Parganas and West Tripura districts) between January and March 2010. Similar workshops were held in Bangladesh between June 2010 and January 2011 in Chapai Nababganj, Dinajpur, Lalmonirhat, Jessore, Comilla and Cox's Bazaar districts. Approximately 90 to 100 persons participated at each workshop. The workshops, which were part of the emergency response, were also used as a platform to sensitize local, district-level and decentralized veterinarians, private and public news channels, journalists, media-persons, NGOs, farmers, traders, border security personnel and women's groups in border districts.
- Three media orientation/sensitization workshops were held in West Bengal, India between July and December 2010. The first workshop was held on 6 July in Siliguri (Darjeeling district), the second workshop on 8 July in Berhampore (Murshidabad district) and the third State level workshop on 6 and 7 December 2010 in Kolkata. Similar workshops were held in Nepal (11 February 2011 in Kathmandu), Bangladesh (15 February 2011 in Dhaka) and Tripura state, India (7 March 2011 in Agartala).
- Two table top preparatory simulation workshops for prevention and control of HPAI, in relation to strengthening Cross-Border Emergency Preparedness and Response Mechanism were held in Dinajpur, Bangladesh, on 19 September 2010 and Dakshin Dinajpur (West Bengal), India on 10 December 2010.

Project Monitoring Sheet: **OSRO/RAS/701/USA**

Project title: **Strengthening cross-border activities among Bangladesh, India, Nepal and Myanmar to control possible cross-border spread of HPAI**

Reporting period: **April – September 2011**

Regional: Subregional cross-border activities in Bangladesh, India, Nepal and Myanmar
Project Title: Strengthening cross-border activities among Bangladesh, India, Nepal and Myanmar to control possible cross-border spread of HPAI
Code: OSRO/RAS/701/USA
Budget: USD 1 000 000 (Phase I), USD 1 000 000 (Phase II)
Total budget: USD 2 000 000
Effective starting date: 31 March 2008
Planned end date: 30 September 2011
<p>Context of the project</p> <p>Porous, long and continuous land borders between the project's four countries (Bangladesh, India, Nepal and Myanmar), with minimal control points and quarantine facilities, continue to pose risks for the spread of the Highly Pathogenic Avian Influenza (HPAI) in the region. Hence, it is necessary to have a better understanding of the pattern of the poultry supply chain and trade taking place across borders. There is also a lack of sufficient capacity, both in terms of skilled human resources and respective facilities, to conduct effective management of transboundary movements of poultry and poultry products. Sharing expertise, information and biological samples among laboratories in the region is key for effective planning to prevent or prepare for cross-border outbreaks. It is envisaged that a longer-term national strategy will be drafted in consultation with various stakeholders during the implementation of this project to deal with the longer-term cross-border issues relevant to the avian influenza (AI) threat.</p>
<p>Objectives of the project</p> <p>The main goal of the project is to prevent HPAI spreading across borders because of the movements of poultry and poultry products. Specifically, the project aims to: (i) develop a platform for dialogue and information exchange between countries in the region on issues related to potential cross-border spread of HPAI; (ii) strengthen capacities of institutions to deal with the threat of transboundary spread of HPAI; and (iii) increase the understanding of ways to manage cross-border trade to reduce the risk of HPAI outbreaks.</p>
<p>Planned activities for the reporting period</p> <p>Output 1: Project management and coordination mechanisms established and operating</p> <ul style="list-style-type: none"> • Retain key technical personnel until the end of project date (i.e. September 2011). • Further strengthen the modalities for better communication and dialogue to facilitate project coordination. • Continue to prepare bi-monthly information bulletins. • Participate in regional and global meetings. <p>Phase II</p> <p>Output 2: Strengthened production and market systems approach to improve cross-border movement management and reduce HPAI risks</p> <ul style="list-style-type: none"> • Finalize the reports of study on livestock marketing systems in high-risk corridors in Bangladesh, India and Nepal. <p>Output 3: Developed policy and harmonized risk management procedures</p>

<ul style="list-style-type: none"> • Review and analyse country report on policy issues, legislative frameworks and the development of legislative instruments to fill key gaps related to cross-border trade and risk management from Bangladesh. • Conduct a subregional workshop on gaps in legislative frameworks for cross-border trading. <p>Output 4: Improved capacity for response to cross-border emergencies</p> <ul style="list-style-type: none"> • Conduct a table top preparatory simulation workshop for prevention and control of HPAI, in relation to strengthening Cross-Border Emergency Preparedness and Response Mechanism at a high-risk Nepal-India corridor.
<p>Activities undertaken during the reporting period</p> <p>Output 1: Project management and coordination mechanisms established and operating</p> <ul style="list-style-type: none"> • The eleventh, twelfth and thirteenth volumes of Information Bulletins (January-February; March-April; May-June 2011) were circulated. • The Subregional Manager participated in the Emergency Centre for Transboundary Animal Diseases (ECTAD) Team Leaders Planning meeting to discuss process towards institutionalization of the One Health approach from 9 to 11 May 2011 at the Food and Agriculture Organization of the United Nations (FAO) headquarters in Rome. The wrap-up meeting of the project was held on 16 September 2011 in Kathmandu with participation of delegates from Bangladesh, India, Nepal, FAO, the United States Agency for International Development (USAID) in Nepal and USAID/the Regional Development Mission for Asia (RDMA). <p>Phase II</p> <p>Output 2: Strengthened production and market systems approach to improve cross-border movement management and reduce HPAI risks</p> <ul style="list-style-type: none"> • The study reports on livestock marketing systems in high-risk corridors of Bangladesh, India and Nepal are being finalized. <p>Output 3: Developed policy and harmonized risk management procedures</p> <ul style="list-style-type: none"> • The report from the hired consultant from Bangladesh to review and analyse policy issues, legislative frameworks and development of legislative instruments to fill key gaps related to cross-border trade and risk management was received and cleared. • The subregional workshop on gaps in legislative frameworks in the context of cross-border trading could not be held owing to delayed receipt of report from Bangladesh. <p>Output 4: Improved capacity for response to cross-border emergencies</p> <ul style="list-style-type: none"> • The planned table top preparatory simulation workshop for prevention and control of HPAI, in relation to strengthening Cross-Border Emergency Preparedness and Response Mechanism at a high-risk Nepal-India corridor could not be held owing to non-availability of concurrence from the counterpart animal resources development department, West Bengal at Siliguri, Darjeeling district of India.
<p>Planned activities for the next six-month period</p> <p>Project completed. No further activities are envisaged.</p>
<p>Main challenges encountered and response provided</p> <ul style="list-style-type: none"> • None
<p>Progress made towards the achievement of project outcomes (from the start of the project activities)</p> <p>Output 1: Project management and coordination mechanisms established and operating</p> <ul style="list-style-type: none"> • All project staff were recruited, and the coordinating office in Kathmandu, Nepal was established and equipped. Coordinating units in Bangladesh, India and Myanmar were

- also equipped. A vehicle was procured for the project coordination unit in Kathmandu.
- A project workshop, attended by high-level administrative and technical personnel from participating countries, was held on 24 and 25 March 2008.
 - The project inception workshop was held on 2 and 3 July 2008. A related report was provided to all countries and participants.
 - The USAID partners' meeting on HPAI in South Asia was organized on 17 and 18 November 2008 in New Delhi, India to discuss the progress of Fiscal Year (FY) 2007 activities and a work plan for FY 2008 funding.
 - Technical and policy-level committees were formed. A meeting of these committees to monitor the project progress was held on 17 April 2009 in Kolkata, India, on 28 and 29 January 2010 in Pokhara, Nepal and on 12 May 2010 in New Delhi, India. A meeting of the technical-level committee to monitor the project's progress was held on 19 July 2009 in Dhaka, Bangladesh. The Governments of the three countries were very appreciative of these meetings and wished to continue these in the future.
 - A poster prepared on the progress of the project was presented during the USAID Partners' Meeting held from 1 to 3 April 2009 in Bangkok.
 - Thirteen volumes of bimonthly information bulletins were released, from May 2009 to June 2011, and circulated to ECTAD members, donors, countries and other agencies as an information sharing/knowledge management initiative.
 - Collaboration with the South Asia Association for Regional Cooperation (SAARC) was continued through organization of a FAO/World Organisation for Animal Health (OIE) subregional meeting of the Global Framework for the Progressive Control of Transboundary Animal Diseases (for the SAARC Region) on 4 and 5 June 2009 in Kathmandu, Nepal.
 - The Subregional Manager participated in a meeting in Bangkok, on 16 and 17 July 2009, to develop a Strategic Framework, entitled "FAO regional strategy for Highly Pathogenic Avian Influenza and other emerging infectious diseases of animals in Asia and the Pacific: 2009 – 2014".
 - The report on the progress of the project, from April to September 2009, was presented at the USAID partners' meeting held on 24 and 25 September 2009 in Bangkok.
 - The Subregional Manager participated in the second real-time evaluation of FAO's work on HPAI in the Asian region, held on 30 November and 1 December 2009 in Bangkok, Thailand. The evaluation team was briefed on the activities and impact of the South Asia cross-border project.
 - The Subregional Manager and Subregional Advocacy Coordinator participated in the fourth regional ECTAD meeting, from 23 to 25 February 2010, and the ECTAD Asia information system workshop on 26 February 2010 in Bangkok, Thailand.
 - The Subregional Manager participated in the inception workshop on the "Regional risk assessment of HPAI in South and Southeast Asia: a socio-economic perspective" in Bangkok, Thailand, on 28 and 29 April 2010.
 - The Subregional Manager participated in the inception workshop of OSRO/IND/802/USA project "Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) to India" on 10 and 11 May 2010 in New Delhi, India.
 - The Subregional Manager and Subregional Advocacy Coordinator participated in the regional communication workshop from 23 to 25 June 2010 in Bangkok, Thailand.
 - The Subregional Manager participated in the First meeting of the Highly Pathogenic and Emerging and Re-emerging Diseases (HPED) Steering Committee on 1 July 2010 and the 4th Regional Steering Committee meeting of the Global Framework for the

Progressive Control of Transboundary Animal Diseases (GF-TADs) for Asia and the Pacific Region on 2 July 2010 in Bangkok, Thailand.

- The Subregional Manager participated in the Regional Avian and Pandemic Influenza USAID Partners' Meeting on 2 and 3 September 2010 in Bangkok, Thailand, and presented the progress of activities from October 2009 to September 2010.
- The Subregional Manager participated in the International Workshop on Challenges of Information Systems and Surveillance for major animal diseases and zoonoses from 23 to 26 November 2010 at FAO headquarters in Rome, Italy.
- The Subregional Manager and Emergency Programme Officer participated in a high-level regional consultation on the control of priority transboundary animal and other emerging infectious diseases in South Asia held in collaboration with SAARC Secretariat in Bangkok, Thailand, on 13 and 14 January 2011.
- The Subregional Manager and Emergency Programme Officer participated in the Regional ECTAD Meeting held in Bangkok, Thailand, from 22 to 24 February 2011.
- The Subregional Manager participated in the ECTAD Team Leaders Planning meeting to discuss the process towards institutionalization of the One Health approach at FAO headquarters in Rome from 9 to 11 May 2011.
- The wrap-up meeting of the project was held on 16 September 2011 in Kathmandu with participation of delegates from Bangladesh, India, Nepal, FAO, USAID Nepal and USAID/RDMA.

Output 2: High-risk areas for introduction of HPAI via cross-border routes identified and mapped

- The draft final report of the study on poultry value-chain analysis across Nepal and India's border and mapping of high-risk areas was received and cleared.
- The draft final report of the study on poultry value-chain analysis across Bangladesh, India and Myanmar's border and mapping of high-risk areas was received and cleared.
- The draft final report of the study on poultry value-chain analysis across Myanmar, India and Bangladesh's borders and mapping of high-risk areas was received and cleared.
- The agency contracted to perform the poultry value chain mapping across India-Nepal, India-Bangladesh and India-Myanmar did not perform satisfactorily and did not submit the final report. The FAO office in India and the contractor decided to close the activities on 27 September 2010, as it was found difficult to make any further progress.

Output 3: Increased capability for emergency response to HPAI outbreaks owing to cross-border spread of the disease

- Laboratory training for participants from Bangladesh, India, Nepal and Myanmar was held from 19 to 24 January 2009 in Bhopal, India.
- A subregional workshop to develop standard operating procedures (SOPs) for emergency response to disease in high-risk cross-border trade areas was held on 21 and 22 May 2009 in Kathmandu, Nepal. These SOPs were further discussed (and accepted by each party) in Bangladesh, India and Nepal through a series of brainstorming workshops from 4 to 6 November 2009 (in Nepal), on 4 December (in India) and on 10 December (in Bangladesh) and finally at the Technical and Policy Level Committees meeting on 28 and 29 January 2010 in Pokhara, Nepal. The finalized SOPs were circulated in the district level meetings held in the high-risk corridors in India and Bangladesh.
- At the request of the Government of India, rapid antigen detection kits were procured and delivered for use in high-risk corridors for the rapid screening of outbreaks. Furthermore, in response to the Government's request, five cycles of laboratory

trainings were conducted on the use of rapid antigen kits for 80 laboratory personnel. The kits were successfully used in the recent HPAI outbreaks in Murshidabad district, West Bengal, and were appreciated by the Government.

- Enzyme-linked immunosorbent assay kits (ELISA) were procured and delivered to the Government of Nepal for surveillance of HPAI in ducks in Nepal's far eastern region, which formed a part of the project study area.
- A study tour to West Bengal, India for staff from Bangladesh, India, Nepal and Myanmar to strengthen emergency response capacity was conducted from 26 to 29 April 2010. Four participants each from Bangladesh and Myanmar, five from India and six from Nepal participated in the study tour.

Phase II

Output 2: Strengthened production and market systems approach to improve cross-border movement management and reduce HPAI risks

- Stakeholder meetings to present the results of poultry value-chain mapping across Nepal and India's border were held on 10 July 2009 in Kathmandu, Nepal; and for the Bangladesh-India and Bangladesh-Myanmar borders on 21 July 2009 in Dhaka, Bangladesh. The meetings were attended by senior staff representing DLS, including the Chief Veterinary Officer (CVO), private sector representatives, national and international non-governmental organizations (NGOs), Academy for Educational Development (AED) and FAO.
- A subregional workshop, entitled "Understanding and use of poultry value chain analysis in poultry production and marketing in the context of cross-border trading", was held from 14 to 18 September 2009 in Kathmandu, Nepal. Delegates from Bangladesh, India and Nepal participated. The workshop was facilitated by FAO staff from headquarters, ECTAD Bangladesh and Nepal and also by the Royal Veterinary College, London.
- The studies on the livestock marketing system in high-risk corridors of Bangladesh, India and Nepal with a view to establishing monitoring processes of poultry production and market chains (linked with animal disease monitoring data) were concluded and draft reports received.

Output 3: Developed policy and harmonized risk management procedures

- Consultancy reports from consultants in Bangladesh, India and Nepal to review and analyse policy issues, legislative frameworks and the development of legislative instruments to fill key gaps related to cross-border trade and risk management were received and technically cleared by ECTAD.

Output 4: Improved capacity for response to cross-border emergencies

- A series of orientation and sensitization workshops, on strengthening cross-border emergency preparedness and response mechanism for HPAI, were held for provincial and district officers in high-risk cross-border corridors of Nepal (Jhapa and Morang districts) and India (Araria/Kishanganj, Darjeeling, Cooch Behar, Dakshin Dinajpur, Malda, North 24 Parganas and West Tripura districts) between January and March 2010. Similar workshops were held in Bangladesh between June 2010 and January 2011 in Chapai Nababganj, Dinajpur, Lalmonirhat, Jessore, Comilla and Cox's Bazaar districts. Approximately 90 to 100 persons participated in each workshop. The workshops, which were part of the emergency response, were also used as a platform to sensitize local, district-level and decentralized veterinarians, private and public news channels, journalists, media-persons, NGOs, farmers, traders, border security personnel and women's groups in border districts.

- Three media orientation/sensitization workshops were held in West Bengal, India between July and December 2010. The first workshop was held on 6 July in Siliguri (Darjeeling district), the second workshop on 8 July at Berhampore (Murshidabad district), and the third state level workshop on 6 and 7 December 2010 in Kolkata. Similar workshops were held in Nepal (11 February 2011 in Kathmandu), Bangladesh (15 February 2011 in Dhaka) and Tripura state, India (7 March 2011 in Agartala).
- Two table top preparatory simulation workshops for prevention and control of HPAI, in relation to strengthening Cross-Border Emergency Preparedness and Response Mechanism were held at Dinajpur, Bangladesh on 19 September 2010 and Dakshin Dinajpur (west Bengal), India on 10 December 2010.

Project Monitoring Sheet: OSRO/RAS/604/USA Baby 05

Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)

Reporting period: October 2010–March 2011

<p>Regional Component: Southeast Asia Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) Code: OSRO/RAS/604/USA Baby 05</p>
<p>Budget: USD 600 000 (Phase I), USD 1 435 000 (Phase II), USD 1 172 700 (Phase III), USD 937 800 (Phase IV), USD 1 000 000 (Phase V), USD 30 667 (from Mongolia Balance) Total budget: USD 5 176 167</p>
<p>Effective starting date: 1 August 2006</p>
<p>Planned end date: 30 September 2011</p>
<p>Context of the project</p> <p>The Highly Pathogenic Avian Influenza (HPAI) epidemic, caused by H5N1 viruses, began in late 2003 and in early 2004 in Asia and Southeast Asia and spread to many countries in the region. The effects were particularly severe in Indonesia, Thailand and Viet Nam, which saw widespread outbreaks in poultry and also human cases of H5N1 infection. The Food and Agriculture Organization of the United Nations (FAO), through its Emergency Centre for Transboundary Animal Diseases (ECTAD), established a decentralized unit in Bangkok, Thailand, located in the Regional Office for Asia and the Pacific (RAP), to provide technical backstopping for countries in the Asia and the Pacific region that were experiencing outbreaks of the infection or were at risk of it. ECTAD RAP was supported through a preliminary, regional project (OSRO/RAS/505/USA) funded by the United States Agency for International Development (USAID). This support has continued under FAO's present project.</p>
<p>Objectives of the project</p> <p>The objective of this regional component is to coordinate project activities with the target countries and also to ensure continuity from the previous project (OSRO/RAS/505/USA) to the current one. The project also aims to strengthen regional level cross-sectoral coordination and communication for HPAI control.</p>
<p>Planned activities (for the reporting period)</p> <p>Output 1: Strengthened cross-sectoral coordination at regional level</p> <ul style="list-style-type: none"> • continue to provide technical and operational inputs to country-level projects in collaboration with country teams • continue to provide support to the Association of Southeast Asian Nations (ASEAN) to finalize the roadmap for HPAI Progressive Control and Eradication in Southeast Asia • continue to coordinate and collaborate with other agencies on activities related to HPAI control <p>Output 2: Strengthened regional and national human resources in epidemiology through regional Field Epidemiology Training Program for Veterinarians (FETPV)</p> <ul style="list-style-type: none"> • continue providing technical support to the Thai Department of Livestock Development (DLD), Ministry of Agriculture and Cooperatives (MoAC) in implementing regional Field Epidemiology Training Program for Veterinarians (FETPV)

- support the necessary operational research to be conducted by trainees of FETPV as part of the curriculum requirement and support the trainees to present their work at international conference/meeting/seminar
- support study visit conducted by regional FETPV trainees to international animal health centres or research institutes as part of the curriculum requirement
- continue to provide support to the development of China-FETPV, as well as related training programmes in Cambodia, Lao People's Democratic Republic (PDR) and Nepal

Output 3: Strengthened coordination of epidemiology and laboratory network

- provide coordination, in collaboration with other regional projects implemented by FAO, to strengthen existing epidemiology and laboratory networks
- continue to provide technical inputs for the establishment of a disease tracking system, the Global Animal Disease Information System (EMPRES-i) Asia, in collaboration with the senior technical adviser of FAO's HPAI programme in China and Information Technologies (IT) expert in FAO headquarters

Output 4: Conducting risk assessment for HPAI transmission through cross-border poultry trade

- continue to provide coordination for country teams conducting risk assessment studies on HPAI transmission through the cross-border poultry trade

Activities undertaken during reporting period

Output 1: Strengthened cross-sectoral coordination at regional level

- FAO continued to maintain international and national regional support staff for the project.
- The Regional Coordinator (RC) continued to coordinate and collaborate with other United Nations (UN) agencies, donors and international humanitarian actors by attending meetings in the region to ensure that support and approaches to HPAI control were harmonized at country and regional levels. Specifically, the RC:
 - attended UN system workshop on Animal and Pandemic Influenza in Asia and the Pacific organized by the United Nations System Influenza Coordination (UNSIC) on 3 and 4 February 2011 in Bangkok, Thailand. The objectives of the workshop were to provide a platform for UN country teams in Asia and the Pacific region to review the UN system response to animal and pandemic influenza since 2005, share lessons learned and experiences gained and identify ways for work in this area to continue in a coordinated and unified way in support of national governments.
- The regional team consisting of the RC, Regional Veterinary Epidemiologist (RVE) and operations team continued to provide technical and operational inputs to country-level projects in collaboration with country teams.
- The RC attended the side meeting of the 32nd ASEAN Ministerial of Agriculture and Forestry (AMAF) meeting. The theme for this meeting was "ASEAN cooperation on animal health and zoonosis: AI and beyond," which was held in Phnom Penh, Cambodia on 24 October 2010 to present the achievements of the HPAI campaign in ASEAN member countries. In addition, the ASEAN roadmap for HPAI prevention, control and eradication was launched during this side event.

- The RC attended “FAO- Animal Production and Health Commission for Asia (APHCA)- UK Department for International Development (DFID) pro-poor HPAI risk reductions: lessons from Southeast Asia and Africa workshop,” which was held in Phuket, Thailand from 25 to 28 October 2010.
- The ECTAD regional team organized an informal technical discussion among FAO technical staff at country levels and the World Organisation for Animal Health (OIE) experts on “HPAI vaccines and vaccination” on 11 and 12 January 2011.
- The ECTAD regional team organized the 5th annual regional ECTAD meeting among FAO technical country staff for information and experience sharing from 22 to 24 February 2011.
- The RC and RVE attended and provided technical inputs to the China and Viet Nam Forum on HPAI Risk Management and Control on 8 and 9 March 2011 in Beijing, China.
- The ECTAD team provided technical inputs to support the activities of USAID Emerging Pandemic Threat (EPT) program, which are conducted by various partners.
- The ECTAD team provided technical and operational inputs to country projects, in collaboration with FAO country teams and national counterparts, for the following activities:
 - recruitment of international consultants;
 - procurement of equipment and supplies; and
 - issuance of contracts to conduct field activities/research.

Output 2: Strengthened regional and national human resources in epidemiology through regional Field Epidemiology Training Program for Veterinarians (FETPV)

- The RVE and RC worked closely with DLD on activities related to FETPV. These included:
 - organizing the one-month course “Veterinary epidemiology in action” from 17 January to 11 February 2011;
 - organizing the second-round visit of the FETPV trainees who were enrolled in the class of 2010 in Thailand for a series of trainings and workshops; and
 - conducting a mission to Khon Kaen, Thailand to provide inputs to the Lao Country Team to organize a one-month course in collaboration with Khon Kaen University.
- The Letter of Agreement (LoA) was finalized to support Thai DLD to implement the regional FETPV during the year 2011.
- The RC and RVE provided technical support to the trainees of the regional FETPV to present the results of their operational research at the “One Health Congress” from 14 to 16 February 2011 in Melbourne, Australia.
- In collaboration with Thai DLD, the ECTAD team arranged a study visit to be conducted by regional FETPV trainees to the Center of Epidemiology and Animal Health, Colorado, USA as part of the curriculum requirements.
- The RVE continued to provide support to the development of China-FETPV and India-FETPV, as well as related training programmes in Cambodia, Lao PDR and Nepal.

Output 3: Strengthened coordination of epidemiology and laboratory network

- The RC continued to provide coordination, in collaboration with other regional projects implemented by FAO, to strengthen existing epidemiology and laboratory networks.
- ECTAD RAP continued to provide technical inputs to the disease tracking system, EMPRES-i Asia.

Output 4: Conducting risk assessment for HPAI transmission through cross-border poultry trade

- A joint work plan for a pilot project on management of HPAI risks along the market chain at the cross-border level between Thailand and Lao PDR was developed in collaboration with the Academy for Educational Development (AED) and Kenan Institute Asia (KIA). In addition, meetings were conducted to discuss joint activities in detail in November and December 2011.
- Methodology to monitor poultry and other livestock prices as an indicator for animal movement between Thailand and Lao PDR was developed by the Animal Health Economist based at ECTAD RAP.

Planned activities for the next six-month period

Output 1: Strengthened cross-sectoral coordination at regional level

- continue to provide technical and operational inputs to country-level projects in collaboration with country teams
- continue to provide technical inputs, resource persons or training support to the activities related to existing regional HPAI Control framework for ASEAN or existing network systems related to HPAI
- continue to coordinate and collaborate with other agencies on activities related to HPAI control
- continue to provide technical inputs to support the activities of the USAID EPT programme, which are conducted by various partners

Output 2: Strengthened regional and national human resources in epidemiology through regional FETPV

- continue activities to implement the two-year FETPV programme, including the seeking of additional support for the programme through other potential partners
- continue to provide support to the development of China-FETPV, as well as related training programmes in Cambodia, Lao PDR and Nepal
- organize a regional workshop to develop the regional strategy to assist the countries to improve animal disease control systems at the grassroots level focusing on the "Community Animal Health Worker System".

Output 3: Strengthened coordination of epidemiology and laboratory network

- continue to support the implementation of EMPRES-i-Asia to share expertise and information in a real-time manner across the network through meetings, workshops and on-line communication
- provide coordination, in collaboration with other regional projects implemented by FAO, to strengthen existing epidemiology and laboratory networks, as well as the epidemiology consortium
- continue to provide support for sample submission from member countries to international reference laboratories

Output 4: Conducting risk assessment for HPAI transmission through cross-border poultry trade

- continue to support the in-depth studies on the risks of HPAI spread along the poultry production and market chains at the border between Thailand and Lao PDR (Mukdaharn and Savannakhet Provinces)
- support the organization of a bilateral meeting between the Government of Thailand and

<p>Lao PDR to discuss cross-border risk management</p> <ul style="list-style-type: none"> organize regional coordination meetings on risk management at cross-border level among key potential partners including the representatives from participating governments
<p>Main challenges encountered and response provided</p> <ul style="list-style-type: none"> There were no major challenges during the reporting period.
<p>Progress made towards the achievement of project outcomes (from the start of activities)</p> <p>Output 1: Strengthened cross-sectoral coordination at regional level</p> <ul style="list-style-type: none"> Coordination and collaboration between FAO and other international organizations and agencies – as well as with regional political organizations such as ASEAN –continued and was strengthened. Linkages were established between the projects funded by USAID and the projects funded by other donors. <p>Output 2: Strengthened regional and national human resources in epidemiology through regional FETPV</p> <ul style="list-style-type: none"> FETPV continued smoothly with additional collaborations at national and international levels and approved joint funding for the programme. ASEAN member countries advocated for the importance of integrating veterinary epidemiology activities in the national veterinary services and approval by ASEAN working group on livestock, which is expected in the next six months. <p>Output 3: Strengthened coordination of the epidemiology and laboratory network</p> <ul style="list-style-type: none"> In order to facilitate collaboration among key international partners, a matrix was drafted with the aim of strengthening epidemiology and laboratory networks for HPAI in Southeast Asia. This matrix was adapted and endorsed as a Strategic Framework for Regional Laboratory Network for Southeast Asia. Approval by the ASEAN working group on livestock is expected in the next six months. <p>Output 4: Conducting risk assessment for HPAI transmission through cross-border poultry trade</p> <ul style="list-style-type: none"> A detailed work plan for AED, FAO and KIA for cross-border activities at Mukdahan Province was drafted and agreed upon by the three partners and USAID/Regional Development Mission for Asia (RDMA).

Project Monitoring Sheet: **OSRO/RAS/604/USA Baby 06**

Project title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) to Viet Nam**
 Reporting period: **October 2010 to March 2011**

Country: Viet Nam
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) to Viet Nam
Code: OSRO/RAS/604/USA Baby 06
Budget: USD 2 million (Phase I), USD 3.1 million (Phase II), USD 3.3 million (Phase III), USD 1.075 million (cost extension) ¹ , USD 2.2 million (Phase IV)
Total budget: USD 11.675 million
Effective starting date: August 2006
Planned end date: September 2011
Context of the project The control and elimination of H5N1 Highly Pathogenic Avian Influenza (HPAI) demands a long-term approach. Viet Nam is moving from the control phase to the consolidation phase, with an ongoing need for capacity building in the veterinary services and livestock production sectors and support for vaccination and other risk reduction measures. This regional project supported by the United States Agency for International Development (USAID) is currently in its fourth phase of implementation.
Objectives of the project The overall objective of the project is to address the urgent short-term actions that need to be undertaken by the country to strengthen its capacity to rapidly detect the introduction of HPAI into the country and minimize its spread in case of its occurrence.
Planned activities for this quarter
Component 1: Preparedness and Planning Component
Output 1: Strategy development for HPAI control
<i>Activity 1.1: Review of HPAI Control Strategy in Viet Nam</i>
<ul style="list-style-type: none"> Attend the National Workshop on Developing a One Health Approach for 2011-2015, addressing high impact infectious diseases at the Animal Human Interface before the OPI review.
<i>Activity 1.2: Transforming the HPAI Contingency Plan</i>
<ul style="list-style-type: none"> Review of the H5N1 drafting animal disease emergency preparedness plan.
Output 2: Coordination and communication with donors and other HPAI implementing partners
<i>Activity 2.1: Core FAO Viet Nam team supported</i>
<ul style="list-style-type: none"> Extend and renew contract of the current personnel, as and when necessary.
<i>Activity 2.2: Annual project meetings supported</i>
<ul style="list-style-type: none"> Organize a strategic Planning Meeting with all stakeholders in November 2010.
<i>Activity 2.3: Team Meetings from Provincial to National level</i>
<ul style="list-style-type: none"> Hold one meeting will be held with provincial and national stakeholders.
<i>Activity 2.4: Coordination and sharing of information with other players engaged in HPAI surveillance, risk assessment and value chain and risk mitigation in poultry sector</i>
<ul style="list-style-type: none"> Initiate a national workshop with stakeholders to exchange information on surveillance and risk analysis; and Initiate the preparation of a DAH bulletin by November 2010 for the first volume.
Component 2: Animal Surveillance Component
Output 3: Animal surveillance at the national, provincial, district and community level enhanced
<i>Activity 3.1: Strengthening of veterinary laboratories, specifically biosafety and quality assurance supported</i>
<ul style="list-style-type: none"> Continue providing technical inputs by national and international laboratory experts; continue providing support to the LabNet server and tele-hosting maintenance; organize the maintenance of the laboratory equipment (refer to section 4.1); initiate a working plan to develop a roadmap for animal disease diagnostics;

¹ Project Cost Extension Request from October 2009 to September 2010.

- hold a laboratory workshop at the National Centre for Veterinary Diagnosis (NCVD) and the Regional Animal Health Office (RAHO) 6 to build capacity for microbial and pathological investigation of animal disease;
- initiate activities in gene sequencing for more AI virus isolates; and
- initiate small laboratory based research component on HPAI virus survivability and host factors associated with the virus.

Activity 3.2: Strengthening of core capacities for animal health in 5 focus provinces, including surveillance activities supported

- Extend the letter of Agreement (LoA) extension with the DAH to monitor the implementation of the active surveillance (CBS);
- consult with DAH to review the CAHW guidelines;
- continue coordination with USAID implementing partner Avian Pandemic Influenza Initiative (APII); and
- conduct an evaluation of awareness campaign for enhanced reporting from previous year.

Activity 3.3: Further development of Monitoring and Evaluation (M&E) expertise in animal health

- Continue to support M&E activities as outlined in the 2009 USAID Viet Nam Highly Pathogenic Avian Influenza and Emerging Pandemic Threats Performance Management Plan.

Activity 3.4: Veterinary epidemiology network supported

- Review AVET curriculum;
- initiate fifth and sixth AVET programme;
- exchange information with other epidemiological trainings (Field Epidemiology Training Programme [FETP], Field Epidemiology Training Programme for Veterinarians [FETPV], etc.); and
- continue providing support to TADinfo and support hosting the server.

Activity 3.5: Piloting surveillance for animal influenza in poultry and pig production interface

- Initiate activity with national counterpart.

Activity 3.6: Active surveillance programme in a selected poultry marketing system

- Initiate a plan for analysis of a market catchment area in a particular zone.

Output 4: Priority procurement for animal surveillance and laboratory supported

Activity 4.1: Procurement and maintenance

- Carry out personal protection equipment (PPE) needs assessment in five pilot provinces;
- Continue procurement of laboratory consumables HPAI diagnosis and surveillance, as required; and
- Continue to maintain equipment, as required.

Component 3: Animal Response Component

Output 5: Effective and timely animal response efforts promoted

Activity 5.1: HPAI risk-mapping and risk analysis updated at national level

- Carry out poultry sub-sector profiling and training on spatial analysis.

Activity 5.2: Outbreak investigation capacity strengthened in focus provinces

- Provide support for carrying out investigation in the event of HPAI outbreaks occurring in the pilot provinces or in the neighbouring provinces (field trips);
- continue support for lab diagnosis; and
- continue training of CAHW for improved reporting.

Activity 5.3: Cross-border analysis using a value chain methodology in three border areas

- Initiate northwest cross-border trade analysis for HPAI.

Activity 5.4: Vaccine efficacy monitoring and virus surveillance supported at national level

- initiate PVM and the H5 VCS among poultry for round two of 2010; and
- initiate vaccine efficacy trial of new vaccine strains against 2.3.2 clade virus.

Activity 5.5: Support public private partnership (PPP) and institutional strengthening in poultry production and health care system

- Initiate the setting up of a regulatory board for monitoring veterinary service delivery and quality of veterinary education; and
- initiate a poultry price monitoring structure in three major cities in Viet Nam; and

<ul style="list-style-type: none"> • support creation of a PPP working group for development and restructuring of the poultry sector. <p>Output 6: Improved bio-security and market hygiene practices in commercial and scavenging poultry raising settings supported</p> <p><i>Activity 6.1: Support biosecurity strengthening in pilot provinces</i></p> <ul style="list-style-type: none"> • Continue with the stakeholder process to develop local risk reduction action plans. This activity will support the completion of those plans; and • Conduct mapping of hatcheries in two provinces. <p><i>Activity 6.2: Develop biosecurity guidelines and training for DAH and DLP</i></p> <ul style="list-style-type: none"> • Continue to support two working groups in biosecurity. The first is planned for October 2010. <p>Activities undertaken during the reporting period (October 2010 to March 2011)</p> <p>Component 1: Preparedness and Planning Component</p> <p>Output 1: Strategy development for HPAI control</p> <p><i>Activity 1.1: Review of HPAI Control Strategy in Viet Nam</i></p> <ul style="list-style-type: none"> • None . <p><i>Activity 1.2: Transforming the HPAI Contingency Plan</i></p> <ul style="list-style-type: none"> • On-going mission for the drafting of an Animal Disease Emergency Preparedness Plan to improve national preparedness to respond to an incursion of a transboundary disease, the emergence of a new disease or an epidemic of a disease already in the country. Animal Disease Emergency Preparedness Plan technical meeting held with DAH on 25 March 2011. <p>Output 2: Coordination and communication with donors and other HPAI implementing partners</p> <p><i>Activity 2.1: Core FAO Viet Nam team supported</i></p> <ul style="list-style-type: none"> • All key staff recruited and in place for the project implementation period. <p><i>Activity 2.2: Annual project meetings supported</i></p> <ul style="list-style-type: none"> • Annual Planning Workshop took place in November 2010. Participants from USAID, WHI, DAH, DLP, VAHIP, RUDEC, HAU, FAO, AVET, pilot province SDAH, Abt and NCVD attended. 43 Participants, 28 males and 15 females). • Initiated preparation of a FAO/DAH Information Sharing Workshop on “Recent advances in the knowledge of the epidemiology of HPAI in Viet Nam and identification of research priorities” proposed for 28-29 April 2011, in Hanoi. <p><i>Activity 2.3: Team Meetings from Provincial to National level</i></p> <ul style="list-style-type: none"> • FAO delegation undertook missions to the 5 pilot provinces in December 2010 and January 2011 for meetings with provincial Sub-DAH and DARD officials. Project achievements of the last year and the plan for the current year were jointly reviewed, discussed and feed-back obtained. • A Quarterly FAO Abt meeting took place in Hanoi to explain the Risk Reduction in the Market Chain jointly showing the FAO and APII activities in a Provincial Matrix format including the surveillance activities and give the field an opportunity to share information, discuss bottlenecks and propose solutions (21 participants, 11 males, 10 females). <p><i>Activity 2.4: Coordination and sharing of information with other players engaged in HPAI surveillance, risk assessment and value chain and risk mitigation in poultry sector</i></p> <ul style="list-style-type: none"> • FAO provides a weekly report which is submitted to USAID and USAID partners. • Update the Google Viet Nam PPI calendar regularly. • FAO finalized and submitted detailed work plan and logical framework for all key outputs of this project to USAID and USAID partners. • Two coordination meetings with FAO and Abt took place to discuss and design the Work-Plans for market surveillance and risk mitigation measures in the poultry value chain in the pilot provinces. • FAO Participated in FAO-Abt joint meeting to review the proposed BCC plan and provided additional technical input. • FAO participated to the BCC Working group in December 2010. • Development of a shared supply chain risk reduction working strategy between FAO and Abt Associates. • Technical meetings held with Abt Associates relating to risk assessment, risk reduction within the market chain and linkages between communication activities, technical interventions and supply
--

chain strengthening (including technical support to DLP on supply chain risk reduction approaches) (approach also presented at regional ECTAD meeting and a bilateral meeting between China and Viet Nam).

- Participated in Abt led technical consultation on implementation of recent slaughter-house legislation and practical issues to be tested through the USA project.
- National Vaccination Strategy Meeting was held on 22 October 2011 (participants included USAID, FAO, Abt, DAH, NCVD, RAHOS, NIVR, MARD, MONRE, VAPM, MPI, MoF, Gov office, PAHI, HUA, VAHIP and National Center for VET drugs and bio-products control No1; 48 participants, 29 males and 19 females). Government of Viet Nam incorporated lessons learnt from active and passive surveillance based on work done under this project, along with key recommendations under the GETs project.
- DAH bulletin underway, but first volume will be delayed until May 2011.
- FAO participated in AI partners' coordination meeting in USAID office on 24 January, 2011 and USAID Partner's Meeting on March 29th.

Component 2: Animal Surveillance Component

Output 3: Animal surveillance at the national, provincial, district and community level enhanced

Activity 3.1: Strengthening of veterinary laboratories, specifically biosafety and quality assurance supported

- The Manual for Biosafety in Veterinary Laboratories in Viet Nam and the SOP for adoption of Biosafety and Biosecurity in the laboratories have been finalized. These documents were developed through a National Consultancy and with technical inputs from FAO country team. Both these documents have been submitted to the Department of Animal Health in December 2010. FAO is strongly advocating the DAH to adopt appropriate biosafety and biosecurity measures in the laboratories, particularly those, handling highly infectious and pathogenic microbes and also those organisms having zoonotic potential.
- The Labnet software for creating a network among the HPAI reference laboratories for on-line and data-entry and submission of results to the Central Hub has been created. It was developed earlier but had a glitch for which it failed to work. Now it is ready for use in the laboratories, which will be taken up after two sets of one-day training, one in NCVD and the other in RAHO 6 in HCMC.
- Epidemiological Lab network workshop was carried out in December 2010 for capacity building for microbial and pathogenic investigation of animal diseases (participants included USAID, CDC, FAO, WCS, VAHIP, DAH, NCVD, NIVR, RAHO3,4,5,6,7. Total participants 47, 30 males and 17 females).

Activity 3.2: Strengthening of core capacities for animal health in 5 focus provinces, including surveillance activities supported

- Final reports of Active and Passive Surveillance carried out in the year 2009-10 were received, reviewed and finalized.
- Final report on the Cost-effectiveness of Surveillance was reviewed, finalized and formally handed over to the DAH in December 2010 for information which is expected to help develop policy directives for future surveillance activities against HPAI and possibly other Trans-boundary Animal Diseases.
- SOPs and Job Cards for HPAI outbreak investigation and response were completed, translated in Vietnamese and formally handed over to the DAH for information which is expected to be nationally adopted.
- Evaluation mission of awareness campaign for enhanced reporting from previous year completed.
- FAO participated in an Abt meeting for the launching of the CBS model in Ha Nam and Can Tho provinces.
- FAO attend the Abt meeting for the review of CBS activities done from August 2010 to December 2010 and plan for next step.
- LoAs for the strengthening the passive surveillance system and the routine active disease surveillance, initiated in Q1 and Q2 2010 extended until May 2011.
- In consultation with DAH and taking into account the CAHW guidelines, an additional approach has been launched for the active surveillance model with an event-based component taking place whenever there is a new HPAI outbreak reported in a pilot province or in a district neighbouring a

pilot province. During 1 month, CAHWs of 50 communes neighbouring the infected commune carry out field visits to early detect any potential secondary outbreak. LoA has been launched early March and will run until end of May.

- Briefing to provincial SDAH authorities on supply chain risk reduction approach
- Updating of provincial animal health authorities on developments in epidemiology of HPAI (through provincial risk analysis meetings).
- With a new HPAI outbreak reported in Hai Que commune, Hai Lang district, the event-based active disease surveillance model has been launched. Increased surveillance will be carried over during one month in 50 neighbouring communes.

Activity 3.3: Further development of Monitoring and Evaluation (M&E) expertise in animal health

- FAO provided training to Provincial Coordinators and Focal Points on PMP indicator data collection in February 2011 under subIR-1 and subIR-3.
- FAO completed and submitted the annual PMP report, along with key recommendations to MEASURE in March 2011.

Activity 3.4: Veterinary epidemiology network supported

- Technical reports for AVET courses 1 to 4 were finalized.
- A technical meeting between FAO and NZAID took place to discuss the epidemiological data gathering and analysis and also epidemiological training programmes being carried out by the two agencies in Viet Nam. Training materials of AVET and NZAID were respectively shared.
- A review of the AVET Chapters was undertaken to include more examples and practical exercises and avoid overlaps between chapters. Additionally, the set of questions for the pre & post-course tests was revised.
- A short course on public health epidemiology is now included in the AVET curriculum and is delivered by Dr Nguyen Tran Minh (Topi), the Course Coordinator of the FETP.
- The 5th AVET course was launched on 28th February with 13 trainees involved from DAH, RAHOs and Universities.
- A TAG meeting was held for preparing the 6th AVET course which will be launched on 13 April 2011.

Activity 3.5: Piloting surveillance for animal influenza in poultry and pig production interface

- Deferred

Activity 3.6: Active surveillance programme in a selected poultry marketing system

- A field assessment was carried out of the 10 LBMs in Quang Tri province including information on the markets and based on this and the risk assessment key markets in the network selected.
- A protocol for the approach including sampling, processing and testing of samples has been drafted together with an experience sharing consultation with GETS and Word Bank (VAHIP) projects.

Output 4: Priority procurement for animal surveillance and laboratory supported

Activity 4.1: Procurement and maintenance

- Procurement and PPE needs assessment was carried out in each of the pilot studies to determine procurement, stocking and maintenance requirements. Results are currently with the Department of Animal Health to review the provincial requests and ensure there is no overlap with contribution from other potential sources.
- Field missions to all laboratories completed to review inventory and ensure USAID visibility with correct labelling.
- 20 new car stickers ordered and received on 5 December (2 per car) to be sent to the 10 provinces (GETS and 604) to replace any damaged/lost car stickers.
- 2 Printer , 2 Computer Dell Optiplex 380DT, 2 Fax machine ,02 Santax UPS offline 500VA, 02 Fax modem have been provided to 2DVSs in Kien Giang province, as a result of new districts set up.

Component 3: Animal Response Component

Output 5: Effective and timely animal response efforts promoted

Activity 5.1: HPAI risk-mapping and risk analysis updated at national level

- Outbreaks have been spatially and temporarily mapped and together with molecular epidemiological evidence, understanding of risk factors and HPAI epidemiology have been

significantly strengthened.

- Poultry profiling technical reports completed in 5 pilot provinces.
- Risk analyses have been carried out in Ha Nam and Hung Yen (through UNJP), completing risk analysis exercises in all 5 provinces.
- A regional risk analysis has been planned and technical material prepared for central provinces (to be held Apr 6-8) and material also developed for the Red River Delta.
- Post test evaluation on the Risk Assessment carried out in Kien Giang and Can Tho were completed on 25 and 26 October 2011. The relevancy of training activities with actual works, content of training activities, training methods and guidance, documents and materials, overall logistics were highly appreciated by informants. Many of the informants confirmed that they benefitted from the training workshops and they could apply what they have learnt into their areas of operation. 66 percent of the total participants said that they have been involved in the coordination or organization of risk analysis activities after the training workshops.

Activity 5.2: Outbreak investigation capacity strengthened in focus provinces

- Mapping temporal and spatial distribution outbreaks of HPAI in poultry in Viet Nam and dissemination to other stakeholders (includes translation of DAH and Ministry of Health (MoH) reports disseminated via email, updating excel list of HPAI outbreaks, reporting any new outbreaks, and analyses of epidemiological data and mapping).
- Evaluation on hotline, calendars, stickers and roadshow in Ha Nam and Can Tho were completed on 28 Dec 2010. It was recommended that the hotline should be used not only to report HPAI suspicious cases but also for other diseases such as PRRS, FMD and for other purpose such as providing advice on animal production and vaccination to farmers, etc.

Activity 5.3: Cross-border analysis using a value chain methodology in three border areas

- Technical support provided to a bilateral meeting between Chinese and Vietnamese authorities at which value-chain approaches and results from studies were presented and important future recommendations made
- Implementing partner identified for future study on *cross border trade and study outline developed emphasising movement and assimilation of spent hens into Vietnamese domestic markets*

Activity 5.4: Vaccine efficacy monitoring and virus surveillance supported at national level

- Technical report of the LoA for the Round I of 2010 of Post-vaccination monitoring and virus circulation surveillance was reviewed, finalized and cleared.
- Round II of 2010 of Post-vaccination monitoring and virus circulation surveillance cancelled by DAH as a result of Circular No. 136/2010/TT-BTC dated 13 September, 2010, which proposed revised rates of various laboratory tests. As the newly proposed cost norms were debated by Government, FAO was requested by DAH to defer post-vaccination monitoring until Round I 2011.
- Detailed description of sub-optimal performance of vaccination in selective districts, provinces and regions requirements complete for planned activities.
- In the current set of trials on the vaccine efficacy against the circulating virus strains, it was observed that with one shot of Re-1 vaccine, chickens were protected 100 percent when challenged with a recently isolated H5N2 virus (of slightly lesser virulence) and 80 percent when challenged with the currently circulating H5N1 HPAI virus clade 2.3.2, predominantly in North Viet Nam. Since the recommended procedure is to inoculate two doses of the vaccine three weeks apart, the next phase of the trial is looking into the efficacy of Re-1 vaccine against the above two virus stains in chickens, vaccinated with two doses of the vaccine as per the manufacturer's instruction.

Activity 5.5: Support public private partnership (PPP) and institutional strengthening in poultry production and health care system

- Scoping study on PPP carried out (under UNJP) in anticipation of project extension approval.

Output 6: Improved bio-security and market hygiene practices in commercial and scavenging poultry raising settings supported

Activity 6.1: Support biosecurity strengthening in pilot provinces

- Training materials and approaches for hatchery hygiene, public and private sector adviser Training of Trainers (ToT) technically reviewed.
- Bio-security risk communication DVD developed for inclusion into training/awareness raising packages.
- Hatchery mapping has been undertaken in Can Tho and Kien Giang provinces and preparation for GPS marking activities are in place. Hatchery data collection and GPS marking has also been organised to initiate in Ha Nam, Hung Yen and Quang Tri.

Activity 6.2: Develop biosecurity guidelines and training for DAH and DLP

- A bio-security working group annual strategic planning meeting was held in October 2010 and an action plan developed through stakeholder consultation. Participants included Phu Tho SDAH, Viet Nam Veterinary Association, VSF-CICDA, PAHI, RUCED, NAFEC, AFAP, Hung Yen DARD, Institute of Animal Husbandry, DLP, Abt, FAO, USAID. Total participants 25, 15 males and 10 females. (Training for provincial technical officers: see public sector training of trainers programme 6.1)

Planned activities for the next six-month period

Component 1: Preparedness and Planning Component

Output 1: Strategy development for HPAI control

Activity 1.1: Review of HPAI Control Strategy in Viet Nam

- The consultancy for this review will be initiated when the DAH road map and the new “green book” are finalized.
- Additional technical inputs and advice will be provided by FAO technical officers. This will emanate from outputs of field work, technical meetings (such as risk assessments, HPAI epidemiology consultation etc).

Activity 1.2: Transforming the HPAI Contingency Plan

- Framework for the Animal Disease Emergencies Preparedness plan will be reviewed, finalized, translated in Vietnamese and formally handed over to DAH.

Output 2: Coordination and communication with donors and other HPAI implementing partners

Activity 2.1: Core FAO Viet Nam team supported

- Continue to ensure that all staff is in place.

Activity 2.2: Annual project meetings supported

- FAO/DAH Information Sharing Workshop on “Recent advances in the knowledge of the epidemiology of HPAI in Viet Nam and identification of research priorities” completed.

Activity 2.3: Team Meetings from Provincial to National level

- Hold quarterly FAO-Abt meeting with field staff in third and fourth quarter of the project.

Activity 2.4: Coordination and sharing of information with other players engaged in HPAI surveillance, risk assessment and value chain and risk mitigation in poultry sector

- Regular technical and coordination meetings will be held with implementing partner Abt Associates providing support to project implementation and monitoring, support and benefit from technical consultancies of mutual interest and exchange experiences including through additional technical resources (Rome based)
- Ad hoc technical meetings with government counterpart agencies and implementing partners to share results and disease control developments and to conduct expert analysis
- Continue to provide a weekly report which is submitted to USAID and USAID partners.
- Continue to update the Google Viet NamPPI calendar regularly.
- Release first volume of DAH bulletin by May 2011.

Component 2: Animal Surveillance Component

Output 3: Animal surveillance at the national, provincial, district and community level enhanced

Activity 3.1: Strengthening of veterinary laboratories, specifically biosafety and quality assurance supported

- Carry out two sets of one-day training for Tad-Info, one in NCVD and the other in RAHO 6 in HCMC.

Activity 3.2: Strengthening of core capacities for animal health in 5 focus provinces, including surveillance activities supported

- Support provided through LoAs for passive and active surveillance will end by May 2011.
- A review of the project support for the passive surveillance system is planned in June 2011.
- An evaluation of the active disease surveillance model (Routine and event-based component) will be conducted in August 2011.
- When the SOPs for HPAI Outbreak Investigation and Response are officially adopted, FAO will support on DAH's request the adequate awareness and dissemination of SOPs on HPAI OIR (adoption and implementation) and will implement SOPs training of local authorities / AISC leaders in the 5 pilot province following Government Adoption.
- Support to provinces to develop HPAI disease control plans based on risk assessments and risk analysis exercises and technical support to package USAID programme and regular provincial resources into coherent province-level disease control action plans (also linked to activity 1.1)

Activity 3.3: Further development of Monitoring and Evaluation (M&E) expertise in animal health

- FAO complete and submit the bi-annual PMP report (01 October 2010 to 31 March 2011), along with key recommendations to MEASURE in April 2011.

Activity 3.4: Veterinary epidemiology network supported

- Three more AVET courses will be carried out targeting trainees from the remaining SDAH that were not involved in previous AVET courses.
- Two Alumni Workshop of AVET Trainees will be organised for strengthening the animal health epidemiologist network in Viet Nam and improve the sharing of information.
- Preparation of risk assessment training materials and case studies to be accessible to AVET trainees and DAH epidemiology core team

Activity 3.5: Piloting surveillance for animal influenza in poultry and pig production interface

- Deferred at the request of USAID.

Activity 3.6: Active surveillance programme in a selected poultry marketing system

- This active live bird market surveillance programme will be carried out in 1 or 2 markets of Quang Tri province.

Output 4: Priority procurement for animal surveillance and laboratory supported

Activity 4.1: Procurement and maintenance

- To decide on procurement and maintenance needs based on needs assessment.

Component 3: Animal Response Component

Output 5: Effective and timely animal response efforts promoted

Activity 5.1: HPAI risk-mapping and risk analysis updated at national level

- Training course for Provincial DARD and sDAH staff on value chain analysis and practical techniques for sub-sector mapping and analysis
- Technical update/refresher training on risk assessment approaches for provincial and national epidemiologists
- Regional risk assessments/ analyses will be carried out covering the central and Red river Delta areas of Viet Nam and involving provincial sDAH and DARD offices in those areas beyond the pilot provinces
- A meeting will present the findings of the risk analysis studies and capacity building approaches carried out by the project.

Activity 5.2: Outbreak investigation capacity strengthened in focus provinces

- Continue mapping temporal and spatial distribution outbreaks of HPAI in poultry in Viet Nam and dissemination to other stakeholders as outlined above.

Activity 5.3: Cross-border analysis using a value chain methodology in three border areas

- A risk analysis study will be carried out focusing on the north-western cross-border trade corridor between Viet Nam and China and also analysing the integration of Chinese poultry into the market chains of northern Viet Nam.
- Study to propose options for managed safe cross-border poultry trade conducted and finding presented in a policy meeting

Activity 5.4: Vaccine efficacy monitoring and virus surveillance supported at national level

- Round I 2011 of PVM and VCS will be prepared in consultation with DAH with potentially a

revised protocol for the sampling based on the new vaccination programme for 2011-2012.

- A consultancy will be conducted for investigating the sub-optimal performance of vaccination in selective districts, provinces and regions.
- Experimental infection of ducks with H5N1 and H5N2 will be initiated in April 2011 to determine pathogenicity of these viruses.
- Vaccine efficacy test (Re-1, Re-5 vs. H5N1 2-3-2, H5N2 2-3-2) will continue.

Activity 5.5: Support public private partnership (PPP) and institutional strengthening in poultry production and health care system

- Design appropriate PPP action plans in target areas (PPPs will be implemented in areas where existing market chain risk reduction activities are being carried out)
- Conduct an analysis of the poultry sub-sector, identifying medium and long term trends and drivers affecting the sector with an emphasis on related veterinary public health issues.
- Area-based action plans to be implemented.

Output 6: Improved bio-security and market hygiene practices in commercial and scavenging poultry raising settings supported

Activity 6.1: Support biosecurity strengthening in pilot provinces

- Implement bio-security capacity strengthening programmes in 5 provinces (focusing on the private sector advisers) (Abt Associates to focus on the government advisory services)

Activity 6.2: Develop biosecurity guidelines and training for DAH and DLP

- Review and adapt National Guidelines developed for Industrial poultry producers under the VAHIP into a version more appropriately targeting the small holder sector.
- Training for government officers on the standards and guidelines developed (delivered at the province level).
- Carry-out evaluation of bio-security initiatives to develop good bio-security practices and ensure consolidation of lessons learned
- Hatchery data collection will be completed in Ha Nam, Hung Yen and Quang Tri. GPS marking will be completed in all five pilot provinces, including hatchery mapping.

Main challenges encountered and response provided

Government approval for the extension of this project was received on 14 February 2011, which was 4.5 months after planned start date of 01 October 2010. FAO was able to continue implementation of on-going activities related to the previous work plan but not able to initiate the new activities proposed in the project proposal covering the period 01 October 2010 to 30 September 2011.

Main progress made towards the achievement of project outcomes (from the start of the project)

Output 1: Strategy development for HPAI control in 2006-2010 supported

- Consideration of a regional approach to HPAI control rather than a provincial one has been promoted and is attracting interest as featured in the Green Book Review and several International Ministerial Conference on Avian and Pandemic Influenza (IMCAPI) documents.
- Provincial poultry sub-sector profiling has been effective in describing provincial poultry populations (including the Poultry Atlas) and DLP is considering adopting such an approach more widely.
- Risk assessment and risk-based targeting of control measures are increasingly being included in technical and policy development (however still largely restricted to the control of HPAI).

Output 2: Coordination and communication with donors and other HPAI implementing partners

- Programme management and planning and coordination of activities with USAID and other partners have been maintained. FAO has made 11 major recommendations for the Green Book Review, were well received by the Government of Viet Nam.
- FAO and Abt have a common strategy to risk reduction across the supply chain with a shared activity matrix consolidating the agencies activities into a single overall approach.

Output 3: Animal surveillance at the national, district and community level enhanced

- The project is carrying out animal surveillance activities which include support in relation to the upgrading of TAD-info and the Laboratory Information System (LabNet), development of Geographic Information Systems (GIS) at RAHO. So far, 210 officers from SDAH, 14 RAHO staff and five DAH Epidemiology staff have increased their capacity to use this software through training. Seven units of Global Positioning System (GPS) and seven licenses of mapping software

(ArcView/ArcGIS 9.2) have been provided to seven RAHOs (I-VII). A total of 55 SDAH/DAH staff have been trained on its use.

- The project has also developed a database system software for laboratory diagnostic management within the DAH's LabNet through the services of a local firm in Viet Nam. Laboratory biosafety and quality assurance are being supported and pursued.
- The SOPs for H5N1 real-time PCR have been developed and adopted. Genetic analysis of haemagglutination (HA) gene of the new virus isolates of 2009-10 showed that besides clade 1 and clade 2.3.4, there is increasing evidence of involvement of clade 2.3.2.
- A revised and updated SOP for HPAI outbreak investigation and control has been developed comprising 19 sections and 14 job cards for various officials involved in HPAI outbreak management. The English and Vietnamese versions of the SOP have been handed over to DAH for transmission to MARD for adoption as a national strategy.
- The campaign to encourage poultry farmers to report any unusual occurrences in poultry flocks, arising suspicion of an infectious disease, through TV spots and loudspeakers during the risk period (e.g. the TẾT festival), has created an increased awareness on the necessity to report diseases on time.
- The AVET initiative, to build up basic epidemiological investigation capacity in the country through Viet Nam-specific, tailor-made course curricula of nine weeks duration resulted in training of 52 veterinarians in four cohorts in 2010 and of 13 veterinarians so far in 2011.
- Active surveillance for HPAI and other poultry diseases has been launched on a pilot scale in project provinces, which will complement the community-based surveillance of Abt Associates.
- In addition, an new component has been launched in March 2011 in the event of an outbreak to early detect any potential secondary outbreaks in the neighbouring area of the index case.
- A cost effectiveness study on surveillance for HPAI has been completed. Preliminary findings suggest that there is a qualitative value in surveillance, but the cost of surveillance per outbreak reported is going up with a decrease in the number of outbreaks of HPAI in Viet Nam.
- More than 300 copies of the Wild Bird Manual have been translated into Vietnamese and distributed to 63 provinces.
- Live bird market active surveillance approaches are for the first time being adopted under the USA project approach in Viet Nam in keeping with emerging best international practices

Output 4: Priority procurement for animal surveillance and laboratory supported

- Procurement of vehicles, Information Technologies (IT) equipment, equipment sprayers and most lab consumables is complete to support AS3 and AR2, and all are in use.

Output 5: Effective and timely animal response efforts promoted

- A cross-border study in the north of Viet Nam concluded that as a result of a high financial return for poultry, smuggling across the border has not decreased but has become more elaborate, which will pose a constant risk of disease transmission. The market chain is increasingly being recognized as critical to the control of HPAI, particularly in northern Viet Nam and FAO's strategic targeting of LBMs has been validated.
- Post-vaccination monitoring and virus circulating surveillance for influenza A/H5N1, supported by this project, shows that vaccinated poultry have a protection rate of 72.10 percent at bird level. The protection rates of Muscovy ducks, Turkey, other ducks, chickens and geese were 80 percent, 80 percent, 78.90 percent, 68.05 percent and 50 percent, respectively. Prevalences of Type A and H5N1 avian influenza viruses in ducks were 0.94 percent and 0.67 percent respectively while in chickens, respective prevalences were 0.54 percent and 0 percent. There was no evidence of AI virus persistence found with the samples taken from Muscovy ducks. The AI positive samples were from Khanh Hoa and Quang Ngai provinces (Center).

Output carried over from Year II: Vaccine production

- A training course on good management practices (GMP) to key stakeholders, National Veterinary Company (NAVETCO), Viet Nam's Veterinary Vaccine Company (VETVACO) and DAH was conducted, which covered introductory-level Good Manufacturing Practice (according to the 2009 Pharmaceutical Inspection Convention / Pharmaceutical Inspection Co-operation Scheme [PIC/S] Code of GMP) and quality systems applicable to the manufacture of AI H5N1 vaccines.
- The operational appraisal of cold chain integrity is complete, and 39 provinces were provided with walk-

in cold rooms. A software for inventory maintenance of vaccine banks in provinces has been developed.

Output 6: Improved biosecurity practices in commercial and scavenging poultry raising settings supported

- Poultry sector profiling provides important tools for risk-analysis and strategic disease control planning. A guide to provincial poultry sector profiling has been developed. Poultry sector profiling has been completed for four of the five project provinces. The guidelines are currently being tested externally by an implementing partner in three non-USAID pilot provinces.
- A Biosecurity Working Group has been established which provides a forum to network information and lessons learned and build technical understanding among a peer group of agencies working to strengthen biosecurity.
- A framework for a database on biosecurity materials has been developed and its consolidation is in progress. By now, over 100 documents have been compiled in a searchable format. This is now ready for dissemination. Biosecurity activities of all agencies engaged in related work have also been mapped.
- The working group reviewed work on hatchery biosecurity, and training on the principles of biosecurity and on biosecurity auditing was provided to 16 members of the biosecurity working group. Conventional approaches to biosecurity strengthening have been reviewed and evidence gathered to support adoption of a supplementary approach focusing on private sector driven activities and adopting social marketing techniques from the human health sector.
- FAO and Abt Associates have liaised on hatchery technical training and registration schemes.
- A regional risk analysis exercise was conducted, which provided information on the character of poultry movement and production in the lower Mekong Region, identifying poultry movements and risk pathways for inter-provincial transmission of infection.

Output 7: Communication capacity supported at DAH and technical inputs to communications activities of other USAID implementing partners are provided

- FAO is supporting the calendar and sticker production and distribution for pre-TÊT festival 2010, sending out the message to call the hotline or the SDAH landline to report ill and dead poultry under the Enhanced Reporting component.
- Under the Gathering Evidence for a Transitional Strategy (GETS) project, the Academy for Educational Development (AED) produced a commercial in which the second part encouraged poultry owners to report ill and dead poultry to SDAH via a hotline or SDAH phone numbers. This has been effectively used in this project for awareness-raising purposes.
- Support to DAH communications has been maintained.
- Technical support to Abt Associates in implementing the field activities has been maintained.

Project Monitoring Sheet: **OSRO/RAS/604/USA Baby 06**

Project title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) in Viet Nam**

Reporting period: **April 2011–September 2011**

Country: Viet Nam
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) in Viet Nam
Code: OSRO/RAS/604/USA Baby 06
Budget: USD 2 million (Phase I), USD 3.1 million (Phase II), USD 3.3 million (Phase III), USD 1.075 million (cost extension) ¹ , USD 2.2 million (Phase IV)
Total budget: USD 11.675 million
Effective starting date: August 2006
Planned end date: September 2012
Context of the project The control and elimination of H5N1 Highly Pathogenic Avian Influenza (HPAI) demands a long-term approach. Viet Nam is moving from the control phase to the consolidation phase, with an ongoing need for capacity building in the veterinary services and livestock production sectors and support for vaccination and other risk reduction measures. This regional project supported by the United States Agency for International Development (USAID) is currently in its fourth phase of implementation.
Objectives of the project The overall objective of the project is to address the urgent short-term actions that need to be undertaken by the country to strengthen its capacity to rapidly detect the introduction of HPAI into the country and minimize its spread in case of its occurrence.
Planned activities for this reporting period
Component 1: Preparedness and Planning Component
Output 1: Strategy development for HPAI control
<i>Activity 1.1: Review of HPAI Control Strategy in Viet Nam</i>
<ul style="list-style-type: none"> • Initiate the consultancy for this review when the Department of Animal Health (DAH) road map and the new Green Book are finalized. • Provide additional technical inputs and advice emanating from outputs of field work, technical meetings (such as risk assessments, HPAI epidemiology consultation, etc.).
<i>Activity 1.2: Transforming the HPAI Contingency Plan</i>
<ul style="list-style-type: none"> • Review and finalize the Framework for the Animal Disease Emergencies Preparedness plan, translate it into Vietnamese and formally hand over to DAH.
Output 2: Coordination and communication with donors and other HPAI implementing partners
<i>Activity 2.1: Core FAO Viet Nam team supported</i>
<ul style="list-style-type: none"> • Continue to ensure that all staff is in place.
<i>Activity 2.2: Annual project meetings supported</i>
<ul style="list-style-type: none"> • Complete FAO/DAH Information Sharing Workshop on “Recent advances in the knowledge of the epidemiology of HPAI in Viet Nam and identification of research priorities”.
<i>Activity 2.3: Team meetings from provincial to national level</i>
<ul style="list-style-type: none"> • Hold quarterly FAO-Abt Associates meeting with field staff in third and fourth quarter of the project.
<i>Activity 2.4: Coordination and sharing of information with other players engaged in HPAI surveillance, risk assessment and value chain and risk mitigation in poultry sector</i>
<ul style="list-style-type: none"> • Hold regular technical and coordination meetings with the implementing partner Abt Associates to provide support to project implementation and monitoring, assist and benefit from technical consultancies of mutual interest, and exchange experiences through additional technical resources (Rome-based). • Hold ad hoc technical meetings with government counterpart agencies and implementing partners

¹ Project Cost Extension Request from October 2009 to September 2010.

to share results and disease control developments and to conduct expert analysis.

- Continue to provide a weekly report which is submitted to USAID and USAID partners.
- Release the first volume of the DAH bulletin by May 2011.

Component 2: Animal Surveillance Component

Output 3: Animal surveillance at the national, provincial, district and community level enhanced

Activity 3.1: Strengthening of veterinary laboratories, specifically biosafety and quality assurance supported

- Carry out two sets of one-day training for the Transboundary Animal Disease Information System (TADInfo), one in the National Centre for Veterinary Diagnosis (NCVD) and the Regional Animal Health Office (RAHO) 6 in Ho Chi Minh City.

Activity 3.2: Strengthening of core capacities for animal health in five focus provinces, including surveillance activities supported

- Support provided through Letters of Agreement (LoAs) for passive and active surveillance to end by May 2011.
- Plan a review of the project support for the passive surveillance system in June 2011.
- Conduct an evaluation of the active disease surveillance model (routine and event-based component) in August 2011.
- Once the standard operating procedures (SOPs) for HPAI Outbreak Investigation and Response are officially adopted, support DAH's request for adequate awareness and dissemination of SOPs on HPAI (adoption and implementation) and implement SOPs training of local authorities/ the Auditing and Informatics Services Company Limited (AISC) leaders in the five pilot provinces following the Government's adoption.
- Support the provinces to develop HPAI disease control plans based on risk assessments and risk analysis exercises and technical support to package USAID programme and regular provincial resources into coherent province-level disease control action plans (also linked to activity 1.1)

Activity 3.3: Further development of Monitoring and Evaluation (M&E) expertise in animal health

- Complete and submit the biannual Performance and Monitoring Plan (PMP) report (1 October 2010–31 March 2011), along with key recommendations to MEASURE in April 2011.

Activity 3.4: Veterinary epidemiology network supported

- Carry out three more Applied Veterinary Epidemiological Training (AVET) courses for the trainees from the remaining Sub-Department of Animal Health (SDAH) that were not involved in previous AVET courses.
- Organize two alumni workshops of AVET trainees for strengthening the animal health epidemiologist network in Viet Nam and improve the sharing of information.
- Prepare risk assessment training materials and case studies to be accessible to AVET trainees and DAH epidemiology core team.

Activity 3.5: Piloting surveillance for animal influenza in poultry and pig production interface

- Deferred at the request of USAID.

Activity 3.6: Active surveillance programme in a selected poultry marketing system

- Carry out the active live bird market (LBM) surveillance programme in one or two markets of Quang Tri province.

Output 4: Priority procurement for animal surveillance and laboratory supported

Activity 4.1: Procurement and maintenance

Component 3: Animal Response Component

Output 5: Effective and timely animal response efforts promoted

Activity 5.1: HPAI risk-mapping and risk analysis updated at national level

- Organize a training course for the Provincial Department of Agriculture and Rural Development (DARD) and SDAH staff on value chain analysis and practical techniques for subsector mapping and analysis.
- Carry out technical update/refresher training on risk assessment approaches for provincial and

national epidemiologists.

- Carry out regional risk assessments/analyses covering the central and Red river Delta areas of Viet Nam and involving provincial SDAH and DARD offices in those areas beyond the pilot provinces.
- Present the findings of the risk analysis studies and capacity building approaches in a meeting carried out by the project.

Activity 5.2: Outbreak investigation capacity strengthened in focus provinces

- Continue mapping temporal and spatial distribution outbreaks of HPAI in poultry in Viet Nam and disseminate to other stakeholders as outlined above.

Activity 5.3: Cross-border analysis using a value chain methodology in three border areas

- Carry out a risk analysis study focusing on the north-western cross-border trade corridor between Viet Nam and China and also analysing the integration of Chinese poultry into the market chains of northern Viet Nam.
- Conduct a study to propose options for managed safe cross-border poultry trade and present the findings in a policy meeting.

Activity 5.4: Vaccine efficacy monitoring and virus surveillance supported at national level

- Prepare round 1 2011 of the Post-Vaccination Monitoring (PVM) programme and virus circulation surveillance (VSC) in consultation with DAH with a revised protocol for the sampling based on the new vaccination programme for 2011-2012.
- Conduct a consultancy for investigating the suboptimal performance of vaccination in selective districts, provinces and regions.
- Initiate experimental infection of ducks with H5N1 and H5N2 in April 2011 to determine pathogenicity of these viruses.
- Continue vaccine efficacy test Re-1, Re-5 vs. H5N1 2-3-2, H5N2 2-3-2.

Activity 5.5: Support public private partnership (PPP) and institutional strengthening in poultry production and health care system

- Design appropriate PPP action plans in target areas (PPPs will be implemented in areas where existing market chain risk reduction activities are being carried out).
- Conduct an analysis of the poultry subsector, identifying medium- and long-term trends and drivers affecting the sector with an emphasis on related veterinary public health issues.
- Implement area-based action plans.

Output 6: Improved biosecurity and market hygiene practices in commercial and scavenging poultry raising settings supported

Activity 6.1: Support biosecurity strengthening in pilot provinces

- Implement biosecurity capacity strengthening programmes in five provinces focusing on the private sector advisers Abt Associates and the government advisory services.

Activity 6.2: Develop biosecurity guidelines and training for DAH and the Department of Livestock Production (DLP)

- Review and adopt National Guidelines developed for industrial poultry producers under the Viet Nam Avian and Human Influenza Control and Preparedness Project (VAHIP) into a version aimed at the smallholder sector.
- Develop training for government officers on the standards and guidelines (delivered at the province level).
- Carry-out evaluation of biosecurity initiatives to develop good biosecurity practices and ensure consolidation of lessons learned
- Complete hatchery data collection in Ha Nam, Hung Yen and Quang Tri. The global positioning system (GPS) marking will be completed in all five pilot provinces, including hatchery mapping.

Activities undertaken during the reporting period

Component 1: Preparedness and Planning Component

Output 1: Strategy development for HPAI control

Activity 1.1: Review of HPAI Control Strategy in Viet Nam

- Technical support was provided to the development of the new Green Book, entitled, "The Viet

Nam Integrated National Operational Program On Avian Influenza, Pandemic Preparedness And Emerging Infectious Diseases (AIPED), 2011-2015", by the Government of Viet Nam. Besides written materials, further support was provided through personal consultations, participations in workshops and meetings and interactions with other stakeholders including donors.

Activity 1.2: Transforming the HPAI Contingency Plan

- A National Animal Disease Emergency Preparedness Plan was prepared through wide stakeholder consultations. The Plan which also includes a possible structure for the Incident Command System (ICS) was forwarded to the Government of Viet Nam.

Output 2: Coordination and communication with donors and other HPAI implementing partners

Activity 2.1: Core FAO Viet Nam team supported

- Continued to ensure that all staff is in place.

Activity 2.2: Annual project meetings supported

- FAO/DAH Information Sharing Workshop on "Recent advances in the knowledge of the epidemiology of HPAI in Viet Nam and identification of research priorities" was completed. Information Sharing Meeting on 1 and 2 June 2011 with 51 participants (14 female and 37 male) from DAH, the *Centre de Cooperation Internationale en Recherche Agronomique* (CIRAD), the Centres for Disease Control and Prevention (CDC), the Field Epidemiology Training Programme for Veterinarians (FETPV) fellows, NCVI, the Oxford University Clinical Research Unit (OUCRU), the National Institute of Health and Epidemics (NIHE), Abt Associates, VAHIP, the Hanoi University of Agriculture (HUA), AVET, FAO, the New Zealand Agency for International Development (NZAID), the National Institute of Veterinary Research (NIVR), USAID, RAHO I-VII, the World Health Organization (WHO).

Activity 2.3: Team Meetings from Provincial to National level

- FAO-Abt Associates meeting was held on a quarterly basis for the field staff in Quang Tri on 12 August 2011, consisting of 23 participants (10 female and 13 male). The participants were from USAID, FAO, Abt Associates, Quang Tri SDAH and DAH.

Activity 2.4: Coordination and sharing of information with other players engaged in HPAI surveillance, risk assessment and value chain and risk mitigation in poultry sector

- Regular technical and coordination meetings were held with the implementing partner Abt Associates providing support to project implementation and monitoring, as well as engaging in technical consultancies of mutual interest and exchanging experiences through additional technical resources (Rome-based).
- Ad hoc technical meetings were held with government counterpart agencies and implementing partners to share results and disease control developments and to conduct expert analysis.
- The Google Viet Nam Producer Price Indices (PPI) calendar was updated regularly.
- The first volume of DAH bulletin was released in July 2011 (250 copies).
- Participated in the USAID planning meeting with the goal to develop USAID/Viet Nam's 2011-12 Strategic Frameworks for Avian Pandemic Influenza (API) programming in Nha Trang from 25 to 27 July 2011. This included several preparatory meetings with all partners (DAH, DLP, Avian Pandemic Influenza Initiative [APII], WHO, etc.).

Component 2: Animal Surveillance Component

Output 3: Animal surveillance at the national, provincial, district and community level enhanced

Activity 3.1: Strengthening of veterinary laboratories, specifically biosafety and quality assurance supported

- Representative virus isolates from outbreaks of HPAI in the north, central and south Viet Nam were sequenced and phylogeny prepared. The phylogenetic information reveals that clade 1 is entrenched in south Viet Nam; in the north, clade 2.3.4 was replaced by the newly emerging clade 2.3.2. Also a genetically different cluster of H5N1 virus was observed within clade 2.3.2 isolates from a small number of outbreaks in north Viet Nam.
- LoA was signed with DAH to organize the training on ISO 17025 on 18 August 2011. The training course was delivered from 23 to 27 August 2011 in Hanoi with 36 participants (10 female

and 26 male). The participants were from DAH, NCVD, RAHOs I-VII, the National Center for Veterinary Hygiene Inspection No.1, the Department of Science and Technology within the Ministry of Agriculture and Rural Development (MARD), and the National Center for Veterinary Medicine Control No.1.

Activity 3.2: Strengthening of core capacities for animal health in five focus provinces, including surveillance activities supported

- Support was provided through LoAs for passive and active surveillance (end by May 2011).
- A review of the project support for the passive surveillance system was completed in June 2011 and supported by a national and an international consultant. Missions on passive surveillance were undertaken in the following provinces: Quang Tri on 28 June 2011, Ha Nam on 24 June 2011 and Can Tho from 4 to 6 July 2011.
- A review of the active surveillance components implemented was carried out by engaging an international and a national consultant. The review included field visits by the consultants to Kien Giang (on 5 and 6 September 2011), Quang Tri (on 8 and 9 September 2011) and Hung Yen (on 12 and 13 September 2011) for an evaluation of the field activities related to the active surveillance for HPAI and other poultry diseases.
- Signed LoA on the Implementation of AI Market Surveillance National Programme in 2011 with DAH.

Activity 3.3: Further development of Monitoring and Evaluation (M&E) expertise in animal health

- FAO completed and submitted the biannual PMP report (1 October 2010 to 31 March 2011) along with key recommendations to MEASURE in April 2011.
- M&E indicators were reviewed with MEASURE and other implementing partners of USAID during the planning meeting in Nha Trang, Viet Nam, from 25 to 27 July 2011.

Activity 3.4: Veterinary epidemiology network supported

- The 5th AVET was completed on April 2011 with 13 participants (4 female and 9 male). The participants were from RAHO I-V, DAH, NIVR, NCVD, the Central Viet Nam Veterinary Institute, Thai Nguyen University, Hue University, Can Tho University, HUA.
- Completed the 6th AVET with 12 participants (3 female and 9 male). The participants were selected from SDAHs in 12 provinces (Dac lac, Kon Tum, Ninh Thuan, Lao Cai, Yen Bai, Son La, Hoa Binh, Bac Giang, Hai Phong, Dong Nai, Binh Dinh and Bac Kan). Pre-test and post-test activities were carried out.
- Completed the 7th AVET with 12 participants (3 female and 9 male). The participants were selected from SDAHs in 12 provinces (Bac Lieu, Long An, Dong Thap, Tuyen Quang, Da Nang, Vinh Long, Tien Giang, Soc Trang, An Giang, Ben Tre, Dac Nong and Binh Thuan). Pre-test and post-test activities were carried out.
- Completed the 8th AVET with 12 participants (3 female and 9 male). The participants were selected from SDAH in Lai Chau, Ha Giang, Lam Dong, Tay Ninh, Binh Phuoc, Phu Yen, DAH, NCVD, RAHO6, RAHO7, HUA, Pasteur Institute. The pre-test and post test were carried out.
- The alumni workshop of AVET trainees was organized on 19 and 20 September 2011 for strengthening the animal health epidemiologist network in Viet Nam and improving the sharing of information. Participants were trainees from AVET1-AVET 8, FAO, DAH, USAID, FETP-WHO, PREDICT, Pasteur Institute, NCVD, HUA with 102 (36 female and 66 male).
- Preparation of risk assessment training materials and case studies to be accessible to AVET trainees and DAH epidemiology core team is ongoing.

Activity 3.5: Piloting surveillance for animal influenza in poultry and pig production interface

- Deferred at the request of USAID.

Activity 3.6: Active surveillance programme in a selected poultry marketing system

- Baseline survey of LBM was carried out in Quang Tri province.
- An external consultant review of the *active surveillance* pilot of this project, was carried out in September 2011 along with the Community Based Surveillance (CBS) model of surveillance implemented by Abt Associates under the APII programme.

Output 4: Priority procurement for animal surveillance and laboratory supported

Activity 4.1: Procurement and maintenance

Component 3: Animal Response Component

Output 5: Effective and timely animal response efforts promoted

Activity 5.1: HPAI risk-mapping and risk analysis updated at national level

- Training course was carried out for provincial DARD and SDAH staff on value chain analysis and practical techniques for subsector mapping and analysis.
- Risk analysis on HPAI H5N1 for Central Zone was held in Quang Tri from 6 to 8 April 2011 with 24 participants (8 female and 16 male). The participants were from SDAHs (Nghe An, Ha Tinh, Thua Thien Hue, Da Nang Quang Nam SDAH, Quang Tri and Quang Binh), DARD (Ha Tinh and Quang Binh), the Quang Nam Centre for Extension Service, RAHO III, RAHO IV, RAHO VII, DAH and DLP.
- Risk Analysis for AI in the northern zone of Viet Nam was held in Hanoi from 4 to 6 July 2011 with 55 participants (18 female and 37 male). The participants were from DARDs and SDAHs from Hai Phong, Ha Nam, Lang Son, Quang Ninh, Ninh Binh, Phu Tho, Lao Cai, Vinh Phuc, Bac Giang, Thai Binh, Bac Ninh, Yen Bai, Hung Yen, Nam Dinh, Thanh Hoa, Hoa Binh, Hai Duong, Thai Nguyen and Hanoi; FAO, DLP, HUA, VAHIP, JAPFA, DAH, GreenVet, RAHO I, RAHO II, the National Agricultural Extension Centre (NAEC), ASVELIS.
- Hatchery data collection and mapping in five pilot provinces was completed (Kien Giang: 44 hatcheries, Ha Nam: 201, Hung Yen: 258, Quang Tri: 37 and Can Tho: 45).

Activity 5.2: Outbreak investigation capacity strengthened in focus provinces

- Continue mapping temporal and spatial distribution outbreaks of HPAI in poultry in Viet Nam and dissemination to other stakeholders as outlined above.

Activity 5.3: Cross-border analysis using a value chain methodology in three border areas

Activity 5.4: Vaccine efficacy monitoring and virus surveillance supported at national level

- Signing LoA with DAH on HPAI vaccine efficacy and pathogenicity test on recent HPAI H5 virus in the north Viet Nam.
- Vaccine efficacy trials revealed that the vaccines currently being used in Viet Nam are still effective against HPAI viruses belonging to clade 1, clade 2.3.4 and majority of the viruses belonging to clade 2.3.2. However, viruses isolated from outbreaks in five provinces were found to be of a variant type, and the vaccines in use were ineffective against this variant type.

Activity 5.5: Support public private partnership (PPP) and institutional strengthening in poultry production and health care system

- A price monitoring system is required to understand better the economic drivers, to ensure that market and performance information is widely available, and to reduce the risk of market failure. This system has been launched through collaboration with the Centre for Agriculture Policy of the Ministry of Agriculture in a pilot scale in three major cities of Viet Nam. The Web site for dissemination of the information has been launched by the Centre and the information on the study will be shown in a television programme on the National Channel on 6 and 7 October 2011.

Output 6: Improved biosecurity and market hygiene practices in commercial and scavenging poultry raising settings supported

Activity 6.1: Support biosecurity strengthening in pilot provinces

- Completed Biosecurity training in Quang Tri on 2 and 3 August 2011 with 24 participants (21 male and 3 female). The participants were from SDAH, DVSSs, hatchery owners, drug store owners and poultry producers in seven target districts.
- Completed Biosecurity training in Kien Giang on 26 and 27 July 2011 with 24 participants (23 male and 1 female).

Activity 6.2: Develop biosecurity guidelines and training for DAH and DLP

- Joint DLP-FAO workshop to develop Biosecurity guidelines for small-scale poultry producers held in Hanoi on 15 and 16 August with 37 participants (22 male and 15 female) from DLP, DAH, Abt Associates, the Livestock Competitiveness and Food Safety Project (LIFSAP), ASVELIS, AVSF Viet Nam, Viet Nam Poultry Association (VPA), the Feed Association, HUA, the Phu Thai Group, Thai Nguyen University, VAHIP, the Veterinary Association, Ha Nam SDAH, Ha Nam poultry producer, Phu Tho SDLP, FAO, Hung Yen SDAH, Dai Xuyen Duck Breeding and Research Centre.

- Biosecurity working group was held on 22 April 2011 with 13 participants (7 male and 6 female). The participants were from FAO, PAHI, Abt, NIAH, USAID, VSF-CICDA, DLP and VAHIP.
- Biosecurity working group was held on 12 July 2011 with total 18 participants (14 male and 4 female). They were from DLP, Phu Tho SDAH, FAO, Abt, AVSF, VIPA, ASVELIS, HUA, NAEC, Hung Yen DARD, PAHI.
- 15th Biosecurity Working Group meeting was held in HCM city on 30 September 2011.
- Good practice guidelines for waste management in the duck sector are being developed with focus groups in Can Tho Province.

Activities proposed for the next reporting period (October 2011 to March 2012)

Component 1: Preparedness and Planning Component

Output 1: Strategy development for HPAI control

Activity 1.1: Regional HPAI Control Strategy

- Develop and test the concept for a regional zoning approach to HPAI control. The initial focus will be on two regions: the lower Mekong (RAHO 7) and central Viet Nam (RAHO 3). This will be achieved through the regional value-chain mapping, risk planning and HPAI surveillance planning, spatial disease mapping and developing regional capacity for outbreak investigation and response.
- Hold training workshops to strengthen regional commitment and enhance coordination. Draft work plan for regional disease control will be discussed at the existing RAHO quarterly meetings, attended by senior provincial SDAH staff and representatives of DAH.
- Discuss draft regional control plans at the regional workshop involving all regional stakeholders.

Activity 1.2: Scenario planning to analyse the effects of cessation of vaccination

- Plan a range of probable, possible and worst-case scenarios with appropriate control options including the possibility of the reintroduction of vaccination.
- Develop stakeholder workshops on different case scenarios (from possible to worst-case) both at the national and regional level.
- Devise a matrix of control options by scenario, including the use of a range of vaccine types indicating best options, including an algorithm for the prompt and sensitive monitoring of the disease situation providing alerts of emerging threats.

Output 2: Coordination and communication with donors and other HPAI implementing partners

- Continue to have a regular exchange of information and integration of activities to the extent possible with USAID partners.

Activity 2.1: Core FAO Viet Nam team supported

- Continue to ensure that all required staff is in place.

Activity 2.2: Annual project meetings supported

- Organize a strategic meeting in October to discuss lessons learned during the 2010-2011 implementation periods and the new plan for the 2011-2012 implementation periods. This meeting will include national and provincial level government staff, project staff, USAID and USAID partners, as well as key stakeholders. For areas of coordinated activities, FAO will present jointly with the Government and Abt Associates.
- Hold an annual technical midterm project review and planning meeting with the DAH, DLP and other stakeholders in April 2012.

Activity 2.3: Team meetings from regional/provincial to national level

- Organize two quarterly meetings with field staff to share experiences and lessons learned with USAID partners related to project implementation and strategy guidelines in different operational regions.

Activity 2.4: Coordination and sharing of information with other players engaged in HPAI surveillance, risk assessment and value chain and risk mitigation in poultry sector

- Prepare one annual workshop (to be held in May 2012) to review the overall surveillance and epidemiological findings and provide recommendations for future surveillance and epidemiology.
- Hold consultative discussions and training on various technical working groups such as

biosecurity and risk assessment.

- Support DAH in developing a bulletin to consolidate and communicate all animal health related activities, projects and programmes implemented through DAH. The bulletin will be posted on the DAH Web site and printed copies distributed to RAHO and SDAH offices for wider dissemination.

Component 2: Animal Surveillance Component

Output 3: Animal surveillance at the national, regional/zonal, provincial, district and community level enhanced

Activity 3.1: Strengthening of veterinary laboratories, specifically biosafety and quality assurance supported

- Conduct biannual workshops, starting in March 2012, with the laboratory staff of the laboratory network to review SOPs related to laboratory and quality control matters as well as to any systemic problems identified.
- Continue to support server tele-hosting, storage and domain support.
- Continue to strengthen laboratory biosafety and quality assurance as an ongoing process including national proficiency testing at all diagnostic laboratories.
- Provide laboratory support to promote not only rapid diagnosis of HPAI but also differential diagnosis of other poultry diseases in any unusual death in poultry.
- Support laboratory capacity building in basic and advance microbiology by providing short and appropriate training and supply of consumables to benefit other components of the Emerging Pandemic Threats (EPT) programme.
- Provide small budgetary support in DAH identified laboratories for short-term need-based research projects on HPAI transmission and control strategies.
- Continue to support DAH in preparation of a strategic roadmap for the strengthening of diagnostic services of DAH laboratories for important animal diseases of both zoonotic and non-zoonotic nature.
- Encourage the laboratory network to gradually shift from testing to diagnosis by supporting the establishment of directional SOPs, trainings and workshops for laboratory personnel and assessment of user needs.
- Support DAH in capacity development to carry out full genomic and antigenic characterization, of viruses, where appropriate, thereby enhancing the sequence database for a better understanding of the HPAI epidemiology in the country/region.
- Carry out a review of the 'Labnet' software's utility and explore linkages with other WHO softwares.

Activity 3.2: Strengthening of core capacities for animal health and disease control planning in focus provinces and selected regional planning structure

- Initiate a gradual shift from province based piloting to regional planning with particular attention to value chain mapping, risk analysis, outbreak investigation and response and regional surveillance planning (see Activity 1.1). The regions agreed are the RAHO 3 and RAHO 7.
- Initiate piloting activities on hatchery improvement, promoting good poultry production practices and capacity building on outbreak investigation and response in the provinces.

Activity 3.3: Further development of Monitoring and Evaluation (M&E) expertise in animal health

- Focus on gathering sub-IR1 (Increased effectiveness of HPAI and EPT prevention and control in the animal health sector) and sub-IR3 (Strengthened policies and systems for improved implementation and management of services and programmes) indicators as listed in the USAID Viet Nam HPAI and EPT Performance Management Plan document.
- Ensure that biannual reporting requirements are met.
- Enhance data collection skills through training of regional and provincial staff.

Activity 3.4: Veterinary epidemiology network supported

- Continue to support TADinfo by hosting the server.
- Provide support to integrate suitable softwares (e.g. Decision Support System, developed by the

Massey University under the NZAID programme, etc.), or any other TADinfo compatible programme

- Carry out a needs assessment to determine further training requirements on the use of online disease data management.
- Provide organizational and technical support, in collaboration with DAH, to the AVET programme and carry out two more batches with 12 candidates per batch during the six-month period in coordination with HUA.
- Continue to support AVET alumni and the AVET Web site.
- Provide technical support to contribute to coordination building efforts between veterinary and human public health sectors at the field level by developing a special training programme under the RESPOND component of EPT to strengthen One Health epidemiological teams with focus on AVET training at selected provincial, district and commune levels.

Activity 3.6: Animal surveillance programme

- Continue to support passive surveillance in the pilot provinces and in the regional control plan with the following additional activities: (i) work with DAH to develop and present a policy paper on the need for adequate and timely compensation to MARD and Central Government; (ii) determine options and pilot a reward system, as permissible within the laws of the land, in the form of certificates of appreciation, publicity in the Animal Health Bulletin or similar incentives for encouraging reporting of unusual poultry deaths and suspect HPAI cases by Chief Animal Health Workers (CAHWs) and District Veterinary Officers (DVOs); (iii) provide differential diagnosis for poultry disease outbreaks at RAHOs including training staff in poultry health and zoonoses with differential diagnosis; and (iv) train CAHWs and DVOs on field investigation and data collection of a poultry health event.
- Support a broad market-based active surveillance for HPAI in identified risk provinces as determined by the Government. In view of the cessation of vaccination and change in the scenario of clade distribution, a wide area active surveillance for AI viruses is extremely important to obtain an early indication of adverse impacts of withdrawing routine HPAI vaccination campaign. At least two rounds of sampling will be required to understand the temporal pattern of distribution of AI virus besides spatial distribution. The first round will take place within this proposed six-month period.

Output 4: Priority procurement for animal surveillance and laboratory supported

Activity 4.1: Procurement and maintenance

- Procure laboratory consumables for HPAI diagnosis and surveillance including training courses and continue to maintain equipment as required.

Component 3: Animal Response Component [AIMEBA: AR2, 3]

Output 5: Effective and timely animal response efforts promoted

Activity 5.1: HPAI risk mapping and risk analysis updated at national level

Activity 5.1.1: Poultry subsector profiling

- Expand provincial profiling and value chain analysis work to cover production and marketing systems in the regional control zones (Regions 3 and 7).
- Undertake further studies on the cross-border trade to determine the quantity, timing and destination of product movement in collaboration with other FAO country teams in the region.
- Work closely with government counterparts, building their capacity through a 'learning-by-doing' approach to ensure that they have the necessary skills to undertake further regional assessments.

Activity 5.1.2: Applied risk analysis capacity building

- Continue to build capacity for risk analysis approaches within the state veterinary service through the extension of the mentored training programme at DAH and RAHO level.
- Develop skills in assessing contact structures and network analysis with changing emphasis from risk assessment to the development of risk planning and implementation of risk mitigation measures to reduce the greatest threats.

Activity 5.1.3: Updating risk assessment and mapping

- Provide additional support to develop mapping capacity within DAH, DLP and RAHOs based on

the existing risk assessments.

Activity 5.2: Outbreak investigation capacity strengthened under regional control strategy and in focus provinces

- Continue to support capacity building in outbreak response, sample collection and their dispatch to the designated laboratory.
- Improve regional capacity between intraregional provinces to advise on changing disease situation and notification of any control activities. Monitored, analysed and reported on data collection from suspected HPAI outbreaks, their investigation, diagnosis and response.
- Provide training of appropriate personnel on the implementation of the SOP for outbreak investigation and response pending the approval of the SOP, which was finalized in the current year and is under review by the Government.
- Develop suitable training material and organize training for DAH and SDAH staff on effective use of ICS for emergency responses. This material will build on activities already underway in Viet Nam, such as VAHIP and also international expertise from the Centre for Crisis Management – Animal Health (CMC-AH) in FAO, Rome. Include simulation desktop and field exercises in the training.

Activity 5.3: Cross border analysis using a value chain methodology and strengthening cross-border dialogue

- Investigate the value chains of high-risk commodities (spent hens and day-old birds) and carry out cross-sectional surveys to assess the prevalence of infection. Develop options for reducing the threat posed by high-risk trade.
- Continue cross-border dialogue building on the Viet Nam-China cross-border vaccination meeting in Beijing in March 2011. Priorities are to: (i) present technical and risk assessment findings from each country; and (ii) to develop and agree on a risk reduction plan. Support technical meetings/workshops between the representatives of the Governments of China and Viet Nam and facilitate bilateral meetings between the representatives of Viet Nam and Cambodia.

Activity 5.4: Vaccine efficacy monitoring and virus surveillance supported at national level

- Continue to support vaccine trials, as the national government needs to be certain of effective protect against circulating virus strains.
- Support studies to carry out pathogenicity testing in poultry with selected HPAI virus isolates from recent outbreaks to assess the dynamics of infection (severity of infection, age variability, species variability etc). This will provide early evidence for changes in virus infectivity.

Activity 5.5: Support public private partnership and institutional strengthening in poultry production and health care system

Activity 5.5.1: Strengthening veterinary service delivery

- DAH will be encouraged to set up minimum standards for veterinary service delivery, including the establishment of a Veterinary Statutory Body (VSB). The VSB will define standards for the education and training of Vietnamese veterinarians and professional ethics and integrity. FAO will support DAH to establish guidelines and recommendations for a VSB including its structure, function, mechanism, roles and responsibilities, and key stakeholders.

Activity 5.5.2: Setting up a private-public sector working group for promoting poultry production

- FAO will explore options as to how the private sector and Government can work well together. Options will include setting up industry forums nationally, regionally and or provincially and bringing the stakeholders together through meetings/workshops.

Activity 5.5.3: Poultry product price monitoring

- Ongoing poultry product price monitoring with the Centre for Agriculture Policy of MARD will continue to carry out the pilot. The information gathered will be distributed through the Information Centre of MARD and also through simple SMS gateways providing direct access to market price information.

Output 6: Improved biosecurity and market hygiene practices in commercial and scavenging poultry raising settings supported

Activity 6.1: Support biosecurity strengthening in pilot provinces

Activity 6.1.1: Pilot hatchery strengthening programme

- Hatchery certification will now be trialled in the pilot provinces and incrementally throughout the regional control zones using these minimum standards. This will involve inspection through an auditing process. This is linked to the previous work by FAO to develop national minimum operating standards for hatcheries and a code for good hatchery management: mapping of hatcheries has been completed in the five pilot provinces.
- Prepare national hatchery training materials, provide training to hatcheries and implement a programme of hatchery inspection and auditing/certification.

Activity 6.1.2: Reduce the risk of transmission along the value chain

- A strategic plan to reduce the risk posed by aggregation points (particularly live bird markets and slaughterhouses) will be developed in consultation with provincial and regional authorities.
- Guidelines and training materials on improving hygiene and biosecurity have been drafted with partners and these will be reviewed and finalised.
- A programme of training and extension will be implemented by FAO and its partners in the regional control zones.

Activity 6.1.3: Improving technical advice for poultry producers

- A provincial pilot will be implemented delivering technical training and providing factsheets and other materials to private veterinarians and CAHWs, agricultural and veterinary stores and feed companies and their representatives.

Activity 6.2: Develop good poultry production guidelines and training for DAH, DLP and Regions/Zones

Activity 6.2.1: Develop biosecurity good practices and minimum standards for market chain participants (including traders, transporters, slaughterers and other intermediaries)

- Continue to develop Good Practice Poultry Production (GPPP) with USAID partners including: guidelines for various agents in the supply chain; prepare guidelines and codes of practice for the effective and responsible use of disinfectants.
- Review the guidelines and submit them to DLP for approval.
- Develop appropriate training course and extension materials for the pilot provinces and regional control zones, especially the core technical staff at DARDs and other target groups.

Activity 6.2.2: Biosecurity Working Group

- Continue to focus on strengthening contributions to policy development and developing technical guidelines, as well as addressing the issues of motivation for change by broadening its mandate to cover best poultry production practices.
- Develop and promote materials on best production practices to be distributed by DARDs and made available on the MARD Web site for the purpose of strengthening outreach and dissemination of technical information.

Main challenges encountered and response provided

No major challenges were encountered during this reporting period.

Main progress made towards the achievement of project outcomes (from the start of the project)

Output 1: Strategy development for HPAI control in 2006-2010 supported

- Consideration of a regional approach to HPAI control rather than a provincial one has been promoted and is attracting interest as featured in the Green Book Review and several International Ministerial Conference on Avian and Pandemic Influenza (IMCAPI) documents.
- Provincial poultry subsector profiling has been effective in describing provincial poultry populations (including the Poultry Atlas) and DLP is considering adopting such an approach more widely.
- Risk assessment and risk-based targeting of control measures are increasingly being included in technical and policy development (however still largely restricted to the control of HPAI).

Output 2: Coordination and communication with donors and other HPAI implementing partners

- Programme management and planning and coordination of activities with USAID and other partners have been maintained. FAO has made 11 major recommendations for the Green Book review, which were well received by the Government of Viet Nam.
- FAO and Abt Associates have a common strategy to risk reduction across the supply chain with a shared activity matrix consolidating the agencies activities into a single overall approach.

Output 3: Animal surveillance at the national, district and community level enhanced

- The project is carrying out animal surveillance activities which include support in relation to the upgrading of TAD info and the Laboratory Information System (LabNet), development of Geographic Information Systems (GIS) at RAHO. So far, 210 officers from SDAH, 14 RAHO staff and five DAH Epidemiology staff have increased their capacity to use this software through training. Seven units of GPS and seven licenses of mapping software (ArcView/ArcGIS 9.2) have been provided to seven RAHOs (I-VII). A total of 55 SDAH/DAH staff have been trained on its use.
- The project has also developed database system software for laboratory diagnostic management within the DAH's LabNet through the services of a local firm in Viet Nam. Laboratory biosafety and quality assurance are being supported and pursued.
- The SOPs for H5N1 real-time PCR have been developed and adopted. Genetic analysis of the viruses isolated from HPAI outbreaks in poultry in Viet Nam over several years indicates that clade 1 is entrenched in south Viet Nam with sporadic forays i to central Viet Nam. Clade 2.3.4 used to be the predominate clade for many years in north and central Viet Nam until the winter of 2009-10. Recently however only clade 2.3.2 viruses have totally replaced the dominance of clade 2.3.4.
- A revised and updated SOP for HPAI outbreak investigation and control has been developed comprising 19 sections and 14 job cards for various officials involved in HPAI outbreak management. The English and Vietnamese versions of the SOP have been handed over to DAH for transmission to MARD for adoption as a national strategy.
- The campaign to encourage poultry farmers to report any unusual occurrences in poultry flocks, arising suspicion of an infectious disease, through TV spots and loudspeakers during the risk period (e.g. the TET festival), has created an increased awareness on the necessity to report diseases on time.
- The AVET initiative, to improve basic epidemiological investigation capacity through Viet Nam-specific, nine-week long tailor-made course curricula, resulted in the training of 103 veterinarians in eight cohorts in 2010 and 2011. At least one veterinarian of each of the 63 provinces of Viet Nam now have specialized basic skills in veterinary field epidemiology.
- Active surveillance for HPAI and other poultry diseases launched to complement the community-based surveillance of Abt Associates yielded valuable insight on the efficacy of the surveillance.
- In the event of an outbreak, a new component has been launched in March 2011 to early detect any potential secondary outbreaks in the neighbouring area of the index case.
- A cost effectiveness study on surveillance for HPAI has been completed. Preliminary findings suggest that there is a qualitative value in surveillance, but the cost of surveillance per outbreak reported is going up with a decrease in the number of outbreaks of HPAI in Viet Nam.
- More than 300 copies of the Wild Bird Manual have been translated into Vietnamese and distributed to 63 provinces.
- LBM active surveillance approaches are for the first time being adopted under the USA project approach in Viet Nam in keeping with emerging best international practices.

Output 4: Priority procurement for animal surveillance and laboratory supported

- Procurement of vehicles, Information Technologies (IT) equipment, equipment sprayers and most lab consumables is complete to support AS3 and AR2, and all are in use.

Output 5: Effective and timely animal response efforts promoted

- A cross-border study in the north of Viet Nam concluded that as a result of a high financial return for poultry, smuggling across the border has not decreased but has become more elaborate, which will pose a constant risk of disease transmission. The market chain is increasingly being recognized as critical to the control of HPAI, particularly in northern Viet Nam and FAO's strategic targeting of LBMs has been validated.
- Post-vaccination monitoring and virus circulating surveillance for influenza A/H5N1, supported by this project, shows that vaccinated poultry have a protection rate of 72.10 percent at bird level. The protection rates of Muscovy ducks, Turkey, other ducks, chickens and geese were 80 percent, 80 percent, 78.90 percent, 68.05 percent and 50 percent, respectively. Prevalences of Type A and H5N1 AI viruses in ducks were 0.94 percent and 0.67 percent respectively, while in chickens, respective

prevalences were 0.54 percent and 0 percent. There was no evidence of AI virus persistence found with the samples taken from Muscovy ducks. The AI positive samples were from Khanh Hoa and Quang Ngai provinces (Centre).

Output carried over from Year II: Vaccine production

- A training course on good management practices (GMP) to key stakeholders, National Veterinary Company (NAVETCO), Viet Nam's Veterinary Vaccine Company (VETVACO) and DAH was conducted, which covered introductory-level Good Manufacturing Practice (according to the 2009 Pharmaceutical Inspection Convention / Pharmaceutical Inspection Co-operation Scheme [PIC/S] Code of GMP) and quality systems applicable to the manufacture of AI H5N1 vaccines.
- The operational appraisal of cold chain integrity is complete, and 39 provinces were provided with walk-in cold rooms. Software for inventory maintenance of vaccine banks in provinces has been developed.

Output 6: Improved biosecurity practices in commercial and scavenging poultry raising settings supported

- Poultry sector profiling provides important tools for risk-analysis and strategic disease control planning. A guide to provincial poultry sector profiling has been developed. Poultry sector profiling has been completed for four of the five project provinces. The guidelines are currently being tested externally by an implementing partner in three non-USAID pilot provinces.
- A Biosecurity Working Group has been established which provides a forum to network information and lessons learned and build technical understanding among a peer group of agencies working to strengthen biosecurity.
- A framework for a database on biosecurity materials has been developed and its consolidation is in progress. By now, over 100 documents have been compiled in a searchable format. This is now ready for dissemination. Biosecurity activities of all agencies engaged in related work have also been mapped.
- The working group reviewed work on hatchery biosecurity, and training on the principles of biosecurity and on biosecurity auditing was provided to 16 members of the biosecurity working group. Conventional approaches to biosecurity strengthening have been reviewed and evidence gathered to support adoption of a supplementary approach focusing on private sector driven activities and adopting social marketing techniques from the human health sector.
- FAO and Abt Associates have liaised on hatchery technical training and registration schemes.
- A regional risk analysis exercise was conducted, which provided information on the character of poultry movement and production in the lower Mekong Region, identifying poultry movements and risk pathways for inter-provincial transmission of infection.

Output 7: Communication capacity supported at DAH and technical inputs to communications activities of other USAID implementing partners are provided

- FAO is supporting the calendar and sticker production and distribution for pre-TÊT festival 2010, sending out the message to call the hotline or the SDAH landline to report ill and dead poultry under the Enhanced Reporting component.
 - Under the Gathering Evidence for a Transitional Strategy (GETS) project, the Academy for Educational Development (AED) produced a commercial in which the second part encouraged poultry owners to report ill and dead poultry to SDAH via a hotline or SDAH phone numbers. This has been effectively used in this project for awareness-raising purposes.
- Support to DAH communications and technical support to Abt Associates in implementing the field activities has been maintained.

Project Monitoring Sheet: **OSRO/BGD/902/USA**

Project Title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) in Bangladesh, including active surveillance

Reporting period: April 2011 – September 2011

Country: Bangladesh
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) in Bangladesh, including active surveillance
Code: OSRO/BGD/902/USA + OSRO/RAS/605/USA Baby 01
Budget OSRO/BGD/902/USA: USD 3 082 800 (Phase I) USD 2 250 000 Total budget: USD 5 332 800
Budget OSRO/RAS/605/USA Baby 01: USD 515 000 (Phase I), USD 1 365 000 (Phase II), USD 1 225 000 (Phase III) Total Budget: USD 3 105 000
Effective starting date: July 2006
Planned end date: December 2011
<p>Context of the project</p> <p>Bangladesh is one of the five high-risk countries that are still considered endemic for Highly Pathogenic Avian Influenza (HPAI) H5N1: Since March 2007, Bangladesh has experienced a total of 524 outbreaks (467 commercial and 57 backyards). Some 52 out of 64 districts and 175 out of 492 Upazilas (subdistricts) have so far been affected. This resulted in the culling of over 2.4 million birds and destruction of over 3.1 million eggs. Following the peak of HPAI H5N1 incidence in 2008, the number of annual outbreaks remains at around 30 in 2009 and 2010. However, since January 2011, the number of outbreaks started to rise. The situation is compounded by the occurrence of crow die-offs and detection of a non-fatal second and a third human infection with H5N1 virus and a fourth one with H9N2 virus.</p>
<p>Objectives of the project</p> <p>The primary objective of the project is to contribute to strengthen the emergency preparedness to prevent and control HPAI in Bangladesh. The immediate objective is to improve the HPAI surveillance capacity of the Government of Bangladesh to respond more effectively to HPAI outbreaks and thereby reduce economic losses and a global human pandemic threat. Specifically, the project aimed to achieve the following:</p> <ul style="list-style-type: none"> • increased capacity of the Department of Livestock Services (DLS) to manage the surveillance programme. • identification and elimination of the sources of HPAI infection. • early reporting of poultry diseases and early HPAI detection. • increasing public awareness. • improved biosecurity and hygiene in poultry farms and markets.
<p>Planned activities:</p> <p>Output 1: Improved coordination and management for disease detection, diagnosis, control and prevention</p> <ul style="list-style-type: none"> • Provide technical support to the Government and facilitate its contacts with donors. • Establish effective coordination to ensure complementarities between the World Bank (WB) and the United States Agency for International Development(USAID)-funded activities. • Use geospatial farm mapping data to allow efficient outbreak responses. • Collaborate with public health and wild life sectors to develop a more holistic approach in line with the One Health initiative. <p>Output 2: Enhanced outbreak response by effective Outbreak Response Management Centre</p> <ul style="list-style-type: none"> • Support DLS to conduct HPAI outbreak investigations.

- Support DLS to design and conduct case control study to ascertain the risk factors.
- Improve post-outbreak investigation by collecting samples from free-ranging ducks in backyards in the vicinity of affected farms and inoculate samples into embryonated eggs to attempt virus isolation.
- Develop a system to support the Government in any disease response and control efforts.
- Strengthen search for reservoirs of H5N1 HPAI as well as Low Pathogenic Avian Influenza (LPAI) among free-ranging, scavenging ducks in backyards in the proximity of affected farms.
- Support removal of hidden reservoirs and rapid disposal of dead wild birds to reduce the risk of re-occurrence of H5N1 HPAI outbreaks.

Output 3: Improved biosecurity status in poultry sectors through biosecurity campaigns in the target areas

- Conduct biosecurity campaigns across the country targeting the large-, medium- and small-scale poultry farmers.
- Provide continuous assistance to Public-Private-Partnership (PPP) and train farm managers to improve biosecurity of commercial farms.

Output 4: Provision of assistance to the Government of Bangladesh to implement the National Avian Influenza and Human Pandemic Influenza Preparedness Plan

- Support the Government in the execution of the National Avian Influenza and Human Pandemic Influenza Preparedness Plan.

Output 5: Active surveillance of HPAI

- Assist in the implementation of the active surveillance programme through 88 additional veterinary surgeons (AVSs) recruited under the project.
- Build awareness among school children in selected areas to encourage reporting of sickness and death in poultry.

Activities undertaken during the reporting period

Output 1: Improved coordination and management for disease detection, diagnosis, control and prevention.

- Technical support was provided to the Government through regular meetings between the Chief Technical Advisor (CTA) and the Chief Veterinary Officer (CVO).
- National Technical Committee meetings on Avian Influenza (AI) Strategy and other issues were held on 13 April 2011 at the Ministry of Fisheries and Livestock (MoFL) in the presence of the Honourable Minister, on 8 June 2011 at DLS and on 11 September 2011 at MoFL.
- A workshop to assist the Government to develop the National Strategy Plan to progressively control Foot-and-Mouth Disease (FMD) was held at the Bangladesh Rural Advancement Committee Centre for Development Management (BCDM) in Gazipur on 17 and 18 June 2011.
- The Emergency Centre for Transboundary Animal Diseases (ECTAD) Unit of the Food and Agriculture Organization of the United Nations (FAO) participated in and technically contributed to the “Workshop on AI and its future perspective” held at the Bangladesh Agricultural Research Council (BARC) on 3 May 2011.
- DLS was supported to attend and contribute to the “Regional Expert Group Meeting for Implementation of the Programme on Surveillance of Wild Birds and Domestic Animals along Migratory Flyways” held in Tokyo on 21 and 22 June 2011.
- A web-based Livestock Disease Information System (LDIS) was developed and Upazila level officers were trained in prompt reporting from field to DLS headquarters.
- The Geographic Information System (GIS)-assisted mapping system for commercial farms and major live bird markets (LBMs) is operational.
- ECTAD participated in the consultative meeting organized by the United States Department for Agriculture (USDA) on “Beyond Control: Prevention of Avian Influenza in Bangladesh” on 31

March 2011.

- ECTAD assisted in assessing the biosafety of the national laboratories (the Bangladesh Livestock Research Institute [BLRI] and the Central Disease Investigation Laboratory of DLS [CDIL]).
- HPAI Laboratory Working Group meetings were held regularly.
- FAO/USAID/the European Union organized the meeting on “Putting One Health to Work” to promote the One Health approach held in Bangkok on 9 and 10 August 2011.
- A national consultant participated in the First One Health Congress on the impact of pathogens on the human-animal interface, limitations and needs in developing countries (ICOPHA) held in Addis Ababa, Ethiopia, from 15 to 17 September 2011.

Output 2: Enhanced outbreak response by effective Outbreak Response Management Centre

- FAO supported the Government in conducting outbreak investigation on AI.
- Prepared a separate HPAI affected Duck Outbreak Response Guideline for the approval by the National HPAI Technical Committee.
- Collected Samples during high mortality among ducks in Netrokona were shipped to the World Organisation for Animal Health (OIE)/FAO International Reference Laboratory for differential diagnosis and molecular characterization in an attempt to identify hidden reservoirs of HPAI.
- A new disease reporting system “Livestock Disease Information System (LDIS)” was developed to facilitate reporting related to response and control efforts.
- Outbreak response data was analysed to identify key parameters and risk factors for HPAI infection.
- Spatial analysis was conducted using outbreak data and the farms/LBM database to identify hot spots, high-risk districts and key risk factors.
- The geographic information system (GIS)-assisted location system for commercial farms and major LBMs became operational. It is being improved for more effective outbreak response management.
- Additional standard operating procedures (SOPs) were updated/developed for HPAI active surveillance, Cleaning and Disinfection (C&D) in LBMs, and biosecurity in small commercial farms and backyard poultry.

Output 3: Improved biosecurity status in poultry sectors through biosecurity campaigns in the targeted areas.

- 584 farm managers were trained on “Farm biosecurity and decontamination for poultry farm managers in HPAI affected areas (Arihazar, Narayanganj; Sadar, Narayanganj; Chittagong; Cox’s Bazar; Bandarban; Rangamati; Khagrachari; Sirajganj; Gazipur Sadar; Sreepur Gazipur; and Kapasia Gazipur)” between 22 March and 30 June 2011.
- Workshops on “Awareness Building in Improved Biosecurity and hygiene at LBMs including decontamination operations” were held between 16 July and 22 August 2011 in five project areas (Rangpur, Kushtia, Manikganj, Gopalganj and Chuadanga) for 70 participants including Upazila livestock officers, veterinary surgeons, municipality market inspectors and market committee chairmen.
- A total of 133 DLS/non-governmental organization (NGO) officials were trained as trainers (ToT) on backyard poultry rearing and biosecurity for 8 000 beneficiaries of cyclone affected areas between 3 August and 14 August 2011 in Barisal, Bagerhat and Faridpur.
- Training of 8 000 beneficiaries of cyclone affected areas in 15 Upazilas on biosecurity improvement is in progress through ToT module between 20 August and 24 September 2011.
- National biosecurity guidelines for commercial poultry farms in Bangladesh were developed and handed over to DLS.
- Draft biosecurity SOPs for commercial poultry farms in Bangladesh were developed.
- Decontamination commodities were provided to the last five project areas (Rangpur, Kushtia, Manikganj, Gopalganj and Chuadanga).

Output 4: Provision of assistance to the Government of Bangladesh to implement the National Avian Influenza and Human Pandemic Influenza Preparedness Plan

- FAO supported the implementation of the National Avian Influenza and Human Pandemic Influenza Preparedness Plan. The plan consisted of six main pillars, i.e. planning and coordination, surveillance, prevention and control, communication and operational research. FAO supported the Government for planning and coordination by routinely holding meetings or attending committee meetings as well as through any coordination mechanism. For surveillance, FAO supported the GoB by assisting implementation of the activities such as outbreak investigation, active surveillance, passive surveillance, SOP development, training, lab capacity development, Live Bird Market improvement, and AIPRP project. For operational research, FAO conducted chicken and duck sample collection for determining traits of the viruses as well as for searching hidden sources of infection.
- FAO assisted in development of the National Avian Influenza and Human Pandemic Influenza Preparedness Plan 2011-2016, which is ready for approval from the Government side.

Output 5: Active surveillance on HPAI

- An in-depth review of avian influenza worker (AIW) surveillance was carried out as well as concurrent SMS Gateway reporting for the District of Gaibandha, and further enhancements to surveillance protocols and reporting were recommended.
- Protocol for backyard surveillance and investigation of the causes of seasonal patterns of HPAI were drafted to be implemented between October 2011 and July 2012.
- The Avian Influenza Preparedness and Response Project (AIPRP) was assisted in training on active surveillance using SMS Gateway for AIWs (previously called community animal health workers [CAHWs]).
- The SMS Gateway system was maintained, receiving approximately 1 000 SMS messages per day from 1 035 AIWs and 88 AVSs in 306 Upazilas.
- Design of an integrated database for effective data entry and analysis is underway.
- A web-based LDIS software to collect disease information from Upazila level through Internet was developed.
- Ten Upazila Livestock Officers (ULOs), ten veterinary surgeons and ten compounders were trained on 2 July 2011 by selecting ten Upazilas from different Districts for the field test of LDIS.
- Maps produced by GIS for commercial poultry farms and LBMs were supplied to 64 District Livestock Officers (DLOs), seven Deputy Director offices, the FAO Representative, the Emergency and Rehabilitation Coordination Unit (ERCU), the Director-General (DG) and DLS offices to identify the exact geospatial location of all commercial poultry farms and poultry markets in Bangladesh.

Planned activities for the next six-month period

Output 1: Improved coordination and management for disease detection, diagnosis, control and prevention

- Provide technical support to the Government of Bangladesh, facilitate contacts between the Government and donors and coordinate projects and regional activities.
- Enrich geospatial farm mapping data and improve the system allowing outbreak responses to be carried out more efficiently.
- Collaborate and coordinate with public health and wild life sectors to develop a more holistic approach in line with the One Health initiative.

Output 2: Enhanced outbreak response by effective Outbreak Response Management Centre

- Collect and analyse outbreak investigation data using the newly commissioned investigations database.
- Support the Government in conducting outbreak investigation on AI.
- Improve post-outbreak investigation by collecting samples from free-ranging ducks in backyards

in the vicinity of affected farms and inoculate samples into embryonated eggs to attempt virus isolation.

- Continue search for reservoirs of H5N1 HPAI as well as LPAI among free-ranging, scavenging ducks in backyards as well as nomadic ducks.
- Reduce the risk of re-occurrence of H5N1 HPAI outbreaks by eliminating hidden reservoirs as well as by rapid disposal of dead wild birds.

Output 3: Improved biosecurity status in poultry sectors through biosecurity campaigns in the target areas

- Finalize biosecurity SOPs for commercial poultry farms in Bangladesh.
- Train 700 farm managers on “farm biosecurity and decontamination in HPAI affected areas”.
- Facilitate dialogue on compartmentalization and develop SOPs for the implementation of disease free compartments.
- Complete the training of 8 000 beneficiaries of cyclone affected areas on biosecurity improvement in progress through ToT module.

Output 4: Provision of assistance to the Government of Bangladesh in implementing the National Avian Influenza and Human Pandemic Influenza Preparedness Plan

- Support the Government in the implementation of National Avian Influenza and Human Pandemic Influenza Preparedness Plan.

Output 5: Active Surveillance on HPAI

- Ascertain smooth transfer of the active surveillance system from FAO to AIPRP.
- Intensify backyard outbreak investigations, including surveys of ducks, other potential hosts and the environment.
- Supply GIS to 64 DLO offices, seven Deputy Director offices, FAOR, ERCU, DG and DLS offices to identify the exact geospatial location of all commercial poultry farms and poultry markets in Bangladesh.
- Assist in active surveillance by analysing data collected through 88 AVSs and 15 Veterinary officers (VO) and 1 006 AIWs supported by AIPRP.

Main challenges encountered and response provided

- Irregular decontamination practices at LBMs were carried out by trained market cleaners owing to irregular payment to the market cleaners. Market Committee representatives were advised to pay the cleaners regularly through collection of money from the poultry traders.
- DLS Senior Management were advised to instruct field-level officers to monitor decontamination practices at LBMs .
- As backyard poultry was given less attention than commercial farms, awareness is being raised among backyard farmers.
- Most of the backyard poultry are free-ranging and are allowed to scavenge in the environment. Risk of intermingling with wild migratory birds, as well as free-ranging ducks, should be acknowledged by backyard farmers. Thirty five AVSs were hired in six districts including Netrokona in duck-raising areas to intensify duck surveillance and raise awareness on the risk of HPAI H5N1 infection associated with free-ranging ducks in backyards and/or open environments.
- Owing to a shortage of human and material resources at the field level, quick and appropriate response to disease events was lacking at times. Motivation is needed among DLS staff to capture every disease event at the earliest stage. A web-based reporting system, LDIS, was launched. This is meant for reducing time required for reporting disease information from the field as well as improving compliance of veterinary officers.
- Compliance with animal disease regulation is minimal, and farms registration is not practiced.
- Movement control of nomadic and free-ranging ducks is difficult. Care takers of nomadic ducks

and free-ranging ducks are to be advised by AVSS/AIW's (formerly called CAHW) to prevent their ducks from mingling with wild migratory birds in high-risk areas which serve as refuge for migratory birds. For this purpose, 35 Additional Veterinary surgeons (mentioned above) were hired for the duck-raising areas.

Main progress made towards the achievement of project outcomes

- The ECTAD Unit provided significant technical and logistic support to DLS.
- Biosecurity and HPAI awareness are reinforced and strengthened through active surveillance, training and dissemination of information.
- An active surveillance system was established, and the capacity of DLS was improved to conduct door-to-door/farm-to-farm surveillance. The system is now being transferred to DLS under its AIPRP with all AIWS (CAHWS) now recruited by the Government instead of FAO.
- All DLS surveillance staff received training and refresher training by FAO consultants on basic communication skills, specifically on those related to HPAI and SMS gateway.
- Laboratory supplies, including polymerase chain reaction (PCR) kits, RNA extraction kits, primers and other consumables, were provided to BLRI laboratory.
- SOPs for laboratory tests for AI diagnosis were drafted and submitted to the Government.
- SOPs for outbreak response, disease investigation, culling and C&D were drafted and are being reviewed.
- Biosecurity SOPs for commercial farms were drafted, and the process for field test is underway.
- National biosecurity guidelines for commercial poultry farms in Bangladesh were developed and submitted to DLS.
- Technical officers of eight leading farms and selected government veterinarians received training on biosecurity and routine disinfection for poultry raising establishments.
- Two hundred government veterinarians received training on post-outbreak decontamination.
- FAO contributed to the development of the Second Communication Strategy for Avian and Pandemic Influenza.
- Strong partnership was established between DLS and FAO allowing for smooth transmission of information and collective action.
- For the improvement of LBMs, a solid collaboration was established with AIPRP, DLS.
- National biosecurity guidelines for commercial poultry farms in Bangladesh were developed and submitted to DLS.

Project Monitoring Sheet: OSRO/INT/604/USA B1

Project title: Support for FAO/OIE/WHO collaboration on HPAI rapid response and containment

Reporting period: April – September 2011

Regional:	Global
Project title:	Support for FAO/OIE/WHO collaboration on HPAI rapid response and containment
Code:	OSRO/INT/604/USA B1
Budget:	USD 5 000 000 ¹
Planned end date:	30 April 2014
Effective starting date:	1 January 2007
Context of the project	<p>The Crisis Management Centre – Animal Health (CMC-AH) of the Food and Agriculture Organization of the United Nations (FAO) and the World Organisation for Animal Health (OIE) is mandated to respond to new outbreaks and critical epidemiologic situations involving Highly Pathogenic Avian Influenza (HPAI) and other transboundary animal diseases (TADs) upon official government request. Within the framework of the Emergency Centre for Transboundary Animal Disease Operations (ECTAD), the CMC-AH provides assistance where local governmental capacity may be insufficient to respond effectively and where the spread of the virus may pose a broader regional or global risk.</p> <p>In support of this mandate and within the context of the mandates of OIE to improve animal health worldwide and the World Health Organization (WHO) to lead global human health initiatives, the United States Agency for International Development (USAID) has provided to date a total of USD 5 million to FAO in support of the CMC-AH for sustained emergency preparedness, rapid assessment and response in the field and at headquarters to suspected or confirmed outbreaks of HPAI and other zoonoses in collaboration with OIE and WHO.</p> <p>Under this project the CMC-AH continues to carry out its mandate while working to combine efforts, avoid overlaps and build synergies between FAO, OIE and WHO, as the organizations work to facilitate the containment of HPAI and other zoonotic diseases at its source in animals, prevent its spread across international borders and mitigate the risk of a human pandemic.</p>
Objectives²	<p>The purpose of the Grant is to provide funding to FAO to support activities to prevent and control HPAI worldwide and reduce the risk of a human pandemic. In this general context and in the specific context of Amendments 1 and 2, the objective of the project is to support CMC-AH operations and missions for: (i) enhanced core team capacity; (ii) improved FAO/OIE/WHO linkages at regional and country level; (iii) increased immediate capacity building; and (iv) strengthened risk communication support (provided to affected/at-risk countries) and overall communication activities (targeting donor, partner and other audiences).</p>

¹ The budget allocation amounts to USD 2 000 000 (Phase I), USD 2 000 000 (II) USD 2 000 000 (III). The total budget takes into account the reallocation of USD 1 million of CMC-AH funds to the surveillance and response component of the USAID grant as agreed with the Donor.

² These objectives represent a synthesis of the main Grant Objectives contained in the Grant Agreement and Amendments 1 and 2 (i.e. the project document). They have been presented in summarized form in compliance with the Progress Monitoring Sheet format. Detailed reporting on objectives and activities will be included in the Final Narrative Report upon project completion.

Planned activities of the project

- planning, deploying and following up on CMC-AH rapid response missions;
- developing tools in support of CMC-AH operations and response capacity;
- defining cooperation mechanisms between WHO and the CMC-AH;
- exchanging information and regularizing communications;
- developing standard operating procedures (SOPs) for FAO, WHO and OIE; and
- coordinating missions at headquarters and field levels.

Activities implemented during the reporting period (April – September 2011)

- **Missions for HPAI³**

No missions were deployed for HPAI during the reporting period.

- **Missions for zoonoses or unknown disease crises**

Uganda, 5–10 June 2011

To date, Uganda has recorded three outbreaks of Ebola (Sudan species). While the first two involved multiple human cases, the 2011 occurrence resulted in the death of a single human. This, and recent experimental evidence of Ebola viruses spreading between pigs, raised the issue of how well the veterinary services and international agencies had been prepared for the disease had it involved agriculture. The mission investigated the situation and made significant links with various government and other groups (including USAID's RESPOND and PREDICT programmes, the African Field Epidemiology Network [AFENET] and the Centers for Disease Control and Prevention [CDC]). While no evidence of involvement of agriculture was found in this instance, the mission laid the groundwork for potential rollout of specific, regional training in FAO's Good Emergency Management Practice (GEMP), an initiative which will be shared with other international partners.

- **Other missions**

Viet Nam, 11–17 July 2011 and 11–17 September 2011

Shrimp represent a significant element of Vietnamese food security and livelihoods. The export value of shrimp in 2010 was USD 2.1 billion, and production essentially doubles each year. When this resource was threatened through large-scale mortality from an unknown cause, the CMC-AH were requested to utilize their methodologies and protocols to deploy a rapid response team to the field through alternate funding sources to support the Government of the Socialist Republic of Viet Nam with its response. CMC-AH assistance helped the Government to: (i) better understand the outbreak situation; (ii) outline targeted, short- and medium-term action plans to reduce further spread; and (iii) identify potential donors to assist in immediate, ongoing support actions and longer-term requirements to improve farming systems in the context of a rapidly growing industry.

While direct support for the CMC-AH response came from other donors, the added value of USAID support through this project was fundamental to ensuring that the structure, tools and methodologies were present and able to provide the knowhow for improved response to this emergency.

- **Revision, update and publication of FAO's GEMP**

The initial version of the revised GEMP was completed and published in September 2011 as FAO AGA manual n.11., entitled "GEMP: The Essentials", the new manual emphasizes preparedness supported by prevention, detection, response and recovery. To strengthen GEMP's use and application, the CMC-AH integrated its previously produced technical

³ During the reporting period and with alternate funds, the CMC-AH deployed an initial mission to Viet Nam for shrimp disease (11-17 July 2011) and a follow-up mission (11-17 September 2011) to support continued national response efforts.

guide to HPAI response into overall GEMP efforts. The new handbook, entitled “GEMP: Standard Operating Procedures (SOPs) for HPAI Response” was completed in September 2011 and is planned for printing in late 2011 early 2012.

- **Event Tracking and Management System (ETMS)**
From May through July 2011 the CMC-AH completed the final phase of data entry of current and previous mission data. Working with FAO subject matter experts and current and previous mission team members, the CMC-AH team researched, amassed and analysed historical data from since the Centre’s inception. Once amalgamated, this data was entered into ETMS for use. Now easily accessible through the system, this data serves the CMC-AH both when: (i) referencing past missions; and (ii) planning future actions based on previous experience.
- **Revision of internal SOPs for CMC-AH operations**
In order to further streamline CMC-AH activities and work flow, the Centre developed a working group on SOPs to review their current status and suggest improvements. Work is ongoing, but is expected to be completed by early October 2011 to be presented to the fifth meeting of the Steering Committee.
- **Strengthening coordination and building awareness of CMC-AH and its services**
 - **Steering Committee 5:** The CMC-AH engaged in extensive preparatory work for the fifth meeting of the Steering Committee, which was scheduled for 13 October 2011.
 - **Fifth Anniversary:** To mark the fifth anniversary of the Centre’s establishment in October 2011, the CMC-AH organized a celebratory event in coordination with FAO’s World Food Day/Week. The Centre produced a brief video, leaflets, banners, flash drives and other products. All materials were designed to be appropriate for raising CMC-AH visibility in both corporate and field/mission contexts. Details on some of the products:
 - **CMC-AH video:** Entitled “CMC-AH: Rapid response, today and tomorrow”, the brief, two minute video was created to raise interest in the Centre’s work and achievements. Planned dissemination channels included:
 - Screening at the CMC-AH Fifth Anniversary in October 2011;
 - display on FAO’s YouTube Channel: <http://youtu.be/2VJY0UkUzYo>;
 - promotion via FAO’s social media outputs (i.e. Facebook and Twitter); and
 - links via the CMC-AH Web site and the AGA Web site.
 - **USB flash drives:** Envisioned as both promotional materials and useful field tools, USB flash drives were designed and branded for CMC-AH use and distribution. The drives are planned for dissemination to key stakeholders and resource partners at the Fifth Anniversary Celebration and distribution to field partners by CMC-AH teams on mission. Each flash drive contains:
 - the latest CMC-AH informational materials;
 - GEMP: The Essentials; and
 - GEMP: SOPs for HPAI Response
 - **OIE and WHO coordination:** In light of the above-mentioned events, the Centre planned to take advantage of OIE and WHO presence in FAO headquarters to hold discussions on enhanced CMC-AH coordination and collaborative working methodologies.
 - **FAORs:** Outreach to FAO Representatives (FAORs) remained a core activity, with the CMC-AH continuing to brief all newly appointed country and regional FAORs continuing as standard practice.
 - **GEMP promotion:** The Centre continued to capitalize on opportunities to present CMC-AH services and GEMP principles to appropriate audiences. Occasions included: (i) visits of ministerial delegations; (ii) FAO regional coordination meetings;

(iii) interdivisional FAO workshops on risk reduction; and (iv) groups of veterinary students from multiple countries.
<p>Planned activities for October 2011 to March 2012</p> <ul style="list-style-type: none"> • continued monitoring of high-risk countries and situations; • mission planning and deployment upon request for or acceptance of assistance; • continued CMC-AH awareness building activities, including Steering Committee preparation and Fifth Anniversary planning; • continued discussions with OIE and WHO on working methodologies; and • continued promotion of GEMP publications and concepts.
<p>Main challenges encountered and response provided</p> <p>None</p>
<p>Main progress made towards project objective, listed by activity[†] (from project start)</p> <ul style="list-style-type: none"> • Mission planning, deployment and follow-up <u>HPAI missions: 24</u> <u>Total missions: 54</u> <u>Total countries: 35</u> • Development of tools supporting CMC-AH response capacity <ul style="list-style-type: none"> ○ Reagent contingency stock implemented for HPAI ○ HPAI stocks stored under cold chain at the United Nations Humanitarian Response Depot in Brindisi, Italy ○ HPAI reagent stock successfully utilized to support government response efforts ○ Technical SOPs revised as part of overall GEMP efforts • Refining cooperation mechanisms between WHO and CMC-AH <ul style="list-style-type: none"> ○ Standard lines of interagency communication defined ○ Information focal points established ○ Coordinated missions (human and animal health) deployed and followed up • Exchanging information and regularizing communications <ul style="list-style-type: none"> ○ WHO's Emergency Management System analysed for applicability to CMC-AH ○ ETMS development and data entry complete; final system online and in use ○ Regular information exchange through regular meetings and staff visits ○ FAO/OIE/WHO coordination methodologies confirmed through standardized information sharing methods and focal points • SOP development for FAO, WHO and OIE <ul style="list-style-type: none"> ○ Initial, internal SOPs defined: 21 ○ Consolidated, internal SOPs: 4 ○ Further streamlined SOPs: 3 • Strengthening mission coordination and field-level cooperation <ul style="list-style-type: none"> ○ After action review processes implemented to capture lessons learned ○ Headquarter- and field-level contacts established and disseminated ○ Coordination mechanisms strengthened through mission experience ○ Field-level SOPs completed for enhanced national response to HPAI; printing planned for late 2011 early 2012

[†] Owing to the nature of the CMC-AH concept and the project's main aim to support FAO's capacity for rapid response, the majority of activities are to be considered as ongoing initiatives.

Project Monitoring Sheet: OSRO/RAS/604/USA Baby 05

Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)

Reporting period: April – September 2011

<p>Regional Component: Southeast Asia Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) Code: OSRO/RAS/604/USA Baby 05</p>
<p>Budget: USD 600 000 (Phase I), USD 1 435 000 (Phase II), USD 1 172 700 (Phase III), USD 937 800 (Phase IV), USD 1 000 000 (Phase V), USD 30 667 (from Mongolia Balance) Total budget: USD 5 176 167</p>
<p>Effective starting date: 1 August 2006</p>
<p>Planned end date: 30 September 2012</p>
<p>Context of the project The Highly Pathogenic Avian Influenza (HPAI) epidemic, caused by H5N1 viruses, began in late 2003 and in early 2004 in Asia and Southeast Asia and spread to many countries in the region. The effects were particularly severe in Indonesia, Thailand and Viet Nam, which saw widespread outbreaks in poultry and also human cases of H5N1 infection. The Food and Agriculture Organization of the United Nations (FAO), through its Emergency Centre for Transboundary Animal Diseases (ECTAD), established a decentralized unit in Bangkok, Thailand, located in the Regional Office for Asia and the Pacific (RAP), to provide technical backstopping for countries in the Asia and the Pacific region that were experiencing outbreaks of the infection or were at risk of it. ECTAD RAP was supported through a preliminary, regional project (OSRO/RAS/505/USA) funded by the United States Agency for International Development (USAID). This support has continued under FAO's present project.</p>
<p>Objectives of the project The objective of this regional component is to coordinate project activities with the target countries and also to ensure continuity from the previous project (OSRO/RAS/505/USA) to the current one. The project also aims to strengthen regional level cross-sectoral coordination and communication for HPAI control.</p>
<p>Planned activities (for the reporting period)</p> <p>Output 1: Strengthened cross-sectoral coordination at regional level</p> <ul style="list-style-type: none"> • continue to provide technical and operational inputs to country-level projects in collaboration with country teams • continue to provide technical inputs, resource persons or training support to the activities related to existing regional HPAI Control framework for the Association of Southeast Asian Nations (ASEAN) or existing network systems related to HPAI • continue to coordinate and collaborate with other agencies on activities related to HPAI control • continue to provide technical inputs to support the activities of the USAID Emerging Pandemic Threats (EPT) programme, which are conducted by various partners <p>Output 2: Strengthened regional and national human resources in epidemiology through regional Field Epidemiology Training Programme for Veterinarians (FETPV)</p> <ul style="list-style-type: none"> • continue activities to implement the two-year FETPV programme, including the

seeking of additional support for the programme through other potential partners

- continue to provide support to the development of China-FETPV, as well as related training programmes in Cambodia, Lao PDR and Nepal
- organize a regional workshop to develop the regional strategy to assist the countries to improve animal disease control systems at the grassroots level focusing on the Community Animal Health Worker System

Output 3: Strengthened coordination of epidemiology and laboratory network

- continue to support the implementation of the Global Animal Disease Information System (EMPRES-i) Asia to share expertise and information in a real-time manner across the network through meetings, workshops and online communication
- provide coordination, in collaboration with other regional projects implemented by FAO, to strengthen existing epidemiology and laboratory networks, as well as the epidemiology consortium
- continue to provide support for sample submission from member countries to international reference laboratories

Output 4: Conducting risk assessment for HPAI transmission through cross-border poultry trade

- continue to support the in-depth studies on the risks of HPAI spread along the poultry production and market chains at the border between Thailand and Lao PDR (Mukdaharn and Savannakhet Provinces)
- support the organization of a bilateral meeting between the Government of Thailand and Lao PDR to discuss cross-border risk management
- organize regional coordination meetings on risk management at cross-border level among key potential partners including the representatives from participating governments

Activities undertaken during reporting period

Output 1: Strengthened cross-sectoral coordination at regional level

- The ECTAD team continued to maintain international and national regional support staff for the project.
- The ECTAD team continued to coordinate and collaborate with other United Nations (UN) agencies, donors and international organizations. Specifically, the Regional Coordinator (RC):
 - participated in FAO- the World Organisation for Animal Health (OIE)- the World Health Organization (WHO) tripartite events to strengthen collaboration and coordination among the three organizations. The tripartite events included teleconferences and meetings.
 - prepared to organize the “Second Regional Workshop on Collaboration Between Human and Animal Health Sectors on Zoonoses Prevention and Control”
- The regional team consisting of the Regional Manager, RC, Regional Veterinary Epidemiologist (RVE) and operations team continued to provide technical and operational inputs to country-level projects in collaboration with country teams.
- The ECTAD team provided technical inputs to support the activities of ASEAN including the organization of the Fourth Regional Coordination Mechanism Meeting which was organized under the financial support of the European Union (EU) Highly Pathogenic and Emerging and Re-emerging Diseases (HPED) project in Bangkok, Thailand in July 2011.

- The ECTAD team provided technical inputs to support the activities of USAID Emerging Pandemic Threat (EPT) program including attending the following events:
 - EPT Work Plan Review Meeting organized in Lao PDR in April 2011;
 - two-country planning sessions for the fiscal year 2012 for Thailand and Lao PDR organized by the Regional Development Mission for Asia (RDMA) in Bangkok, Thailand in June 2011; and
 - Regional EPT meeting organized by USAID in Bangkok from 12 to 14 July 2011.
- The ECTAD team provided technical and operational inputs to country projects, in collaboration with FAO country teams and national counterparts, for the following activities:
 - recruitment of international consultants;
 - procurement of equipment and supplies;
 - issuance of contracts to conduct field activities/research;
 - provision of clearance to technical reports prepared by staff of ECTAD country teams;
 - preparation of proposals for the new funding cycle in the year 2012; and
 - backstopping missions to Cambodia regarding the HPAI outbreaks reported in animals and human and preparing for a joint FAO-OIE-WHO mission to Cambodia to carry out an assessment of HPAI surveillance programme.

Output 2: Strengthened regional and national human resources in epidemiology through regional FETPV

- The RVE and RC continued to work closely with the Thai Department of Livestock Development (DLD) on activities related to FETPV. These included:
 - organizing the fourth-round visit of the FETPV trainees who were enrolled in the class of 2009 in Thailand for the final series of trainings and workshops. Three trainees from Indonesia, Myanmar and Thailand completed their assignments and were awarded with certificates in June 2011. Unfortunately, the trainee from China could not be awarded with the certificate, as one of his assignments on participating in the international fellowship programme was not completed;
 - organizing the first-round visit of the FETPV trainees who were enrolled in the class of 2011 in Thailand for a series of trainings and workshops in Bangkok;
 - serving as regional programme mentors to the trainees from China and Myanmar;
 - conducting missions to China, Indonesia, Myanmar and Viet Nam to advocate for the Regional FETPV programme to the Chief Veterinary Officers of the above-mentioned countries in order to gain relevant support for the trainees from these countries to complete their field assignments which were conducted at the country level;
 - preparing to organize a “TEPHINET Pre-Conference Roundtable Discussion on Sharing Experiences in Joint Epidemiology Capacity Building for Veterinarians” which will be organized on 8 November 2011 in Bali, Indonesia; and
 - seeking additional support for the programme including the collaboration with the Center of Veterinary Public Health, College of Veterinary Medicine, University of Minnesota.
- The RVE conducted a mission to Khon Kaen, Thailand to provide inputs to the Lao Country Team to organize a one-month course in collaboration with Khon Kaen University in May 2011.
- The RC and RVE provided their technical inputs to organize and facilitate the Second Consultative Meeting of Epidemiology Consortium and the Informal Discussion to Develop a Regional Strategy for Veterinary Capacity Building for Southeast Asian

Countries in August 2011 in Bangkok, Thailand.

- The RVE provided technical support to the trainees of the regional FETPV during a study visit to the Center of Epidemiology and Animal Health, Colorado, USA as part of the curriculum requirements.
- The RVE continued to provide support to the development of China FETPV and India FETPV, as well as related training programmes in Cambodia and Lao PDR.
- The fourth Letter of Agreement (LoA) is being finalized to support Thai DLD to implement the regional FETPV during the year 2012.

Output 3: Strengthened coordination of epidemiology and laboratory networks

- The RC continued to provide coordination, in collaboration with other regional projects implemented by FAO, to strengthen existing epidemiology and laboratory networks.
- The RC provided technical inputs as one of the keynote speakers at the International Conference of Animal Health Surveillance (ICAHS) giving a presentation on “Animal Health Surveillance in Asia: Issues, Gaps and Needs”. The main supporter of this Conference was the French Ministry of Food and Agriculture including the Agricultural Research for Development Centre (CIRAD), which comprises the Research Network for Animal Health Surveillance in Southeast Asia.
- The ECTAD team continued to provide technical inputs to the disease tracking system, EMPRES-i Asia.
- The RC attended and provided a facilitation role to “the 4th OIE Regional Meeting on Strengthening Animal Health Information Networking in Asia” which was organized by OIE experts in September 2011 in Chiang Mai.

Output 4: Conducting risk assessment for HPAI transmission through cross-border poultry trade

- The ECTAD team continues to support the “Price monitoring on livestock products at cross-border level between Mukdahan Province, Thailand and Savannakhet Province, Lao PDR”. The activities conducted during the reporting period included:
 - informing responsible public veterinary offices in Thailand and Lao PDR during April 2011;
 - identifying key informants in the two study provinces during April and May 2011;
 - training key informants in May 2011;
 - collecting prices of livestock on the weekly basis since June 2011, and such collection of prices will continue until the end of the year 2011;
 - organizing a feedback workshop with key informants at Mukdahan Province in September 2011.

Planned activities for the next six-month period

Output 1: Strengthened cross-sectoral coordination at regional level

- continue to provide technical and operational inputs to country-level projects in collaboration with country teams
- continue to provide technical inputs, resource persons or training support to the activities related to existing regional HPAI Control Framework for ASEAN or existing network systems or regional coordination mechanism related to HPAI and animal disease control
- continue to coordinate and collaborate with other agencies on activities related to HPAI control

- continue to provide technical inputs to support the activities of the USAID EPT programme, which are conducted by various partners

Output 2: Strengthened regional and national human resources in epidemiology through regional FETPV

- continue activities to implement the Regional FETPV programme, including the seeking of additional support for the programme through other potential partners
- continue to provide support to the development of China FETPV and India FETPV as well as related training programmes in Cambodia and Lao PDR.
- organize a regional workshop to develop the regional strategy to assist the countries to improve animal disease control systems at the grassroots level focusing on the “Community Animal Health Worker System”.

Output 3: Strengthened coordination of epidemiology and laboratory network

- continue to support the implementation of EMPRES-i Asia to share expertise and information in a real-time manner across the network through meetings, workshops and on-line communication
- provide coordination, in collaboration with other regional projects implemented by FAO, to strengthen existing epidemiology and laboratory networks, as well as the epidemiology consortium
- continue to provide support for sample submission from member countries to international reference laboratories

Output 4: Conducting risk assessment for HPAI transmission through cross-border poultry trade

- continue to support the in-depth studies on the risks of HPAI spread along the poultry production and market chains at the border between Thailand and Lao PDR (Mukdaharn and Savannakhet Provinces) including price monitoring of livestock products
- support the organization of a bilateral meeting between the Government of Thailand and Lao PDR to discuss cross-border risk management
- organize regional coordination meetings on risk management at cross-border level among key potential partners including the representatives from participating governments

Main challenges encountered and response provided

- The bilateral meeting between the Government of Thailand and Lao PDR to discuss cross-border risk management was planned, but had to be cancelled when the Thai DLD was called upon to urgently deal with a case involving several thousand dogs being smuggled out of Thailand. The meeting will be rescheduled, but this was not possible before the end of the current reporting period.

Progress made towards the achievement of project outcomes (from the start of activities)

Output 1: Strengthened cross-sectoral coordination at regional level

- Coordination and collaboration between FAO and other international organizations and agencies particularly with the regional political organizations, such as ASEAN, OIE and WHO was strengthened and continued. Linkages were established between the projects funded by USAID and the projects funded by other donors.

Output 2: Strengthened regional and national human resources in epidemiology through regional FETPV

- FETPV continued smoothly with additional collaborations at national and international levels and approved joint funding for the programme. ASEAN member countries recognized the importance of integrating veterinary epidemiology activities in the national veterinary services and noted the fact that the Thai Department of Livestock Development has been hosting the Regional FETPV since 2009.
- Three trainees from Indonesia, Myanmar and Thailand who were enrolled to the Regional FETPV program in 2009 completed their assignments and received certificates. All of them returned to their home countries and continued working as veterinary epidemiologists at the Animal Health Services of their countries.

Output 3: Strengthened coordination of the epidemiology and laboratory network

- In order to facilitate collaboration among key international partners for regional epidemiology network in Southeast Asia, a matrix of joint activities for the members of Epidemiology Consortium was developed using HPAI control activities and Regional FETPV in Southeast Asia as a model.
- The Strategic Framework for Regional Laboratory Networks for Southeast Asia was recognized by the ASEAN working group on livestock. The international partners for the regional laboratory network in Southeast Asia were recognized by the member countries as the Technical Advisory Group.

Output 4: Conducting risk assessment for HPAI transmission through cross-border poultry trade

- A system for “Price Monitoring for Livestock Products” was developed and tested at a study site at the border between Thailand and Lao PDR (Mukdahan - Savannakhet Provinces).

BIANNUAL REPORT

(SIX-MONTHLY PROGRESS REPORT)

REPORTING PERIOD: 1 APRIL 2012 - 30 SEPTEMBER 2012

PLANNED ACTIVITIES: 1 OCTOBER 2012 - 31 MARCH 2013

TO BE SUBMITTED TO:

UNITED STATES AGENCY FOR INTERNATIONAL DEVELOPMENT (USAID)

UNDER COOPERATIVE AGREEMENT

SUBMITTED BY

IDENTIFY PROJECT PARTNER: FOOD AND AGRICULTURE ORGANIZATION OF THE UNITED NATIONS (FAO)

Regional component: Global/Inter-regional
Three hot spot areas (with countries) :
<ul style="list-style-type: none"> • Congo Basin: Uganda, Democratic Republic of the Congo, Cameroon, Republic of Congo, Tanzania, Gabon, Equatorial Guinea, Rwanda, Central African Republic, South Sudan • Southeast Asia: Cambodia, China, Indonesia*, Lao People's Democratic Republic, Malaysia, Myanmar,* Philippines, Thailand, Viet Nam • South Asia: Bangladesh, India, Nepal (future activities pending)
Project title: Support for strengthening animal health laboratory capacities in hot spot regions to combat zoonotic diseases that pose a significant public health threat - IDENTIFY
Code: OSRO/INT/902/USA
Total budget: USD 15 419 371 (of which USD 11 919 371 were allocated for implementation of activities by FAO, and USD 3 500 000 were allocated for implementation of activities by OIE through funds transferred by FAO to OIE as per the Letter of Agreement). The activities of OIE will be reported on separately.
Effective starting date: 1 October 2009
Planned end date: 30 September 2012 (31 December 2012 for the FAO project)
Context of the project This project is part of a complex programme – Emerging Pandemic Threats (EPT) – designed by the United States Agency for International Development (USAID) and aimed to identify and implement mechanisms to detect disease emergencies, especially from wildlife. The One Health concept is an important component of the whole programme. The IDENTIFY project is implemented jointly by the Food and Agriculture Organization of the United Nations (FAO), the World Organisation for Animal Health (OIE) and the World Health Organization (WHO).
Objectives of the project
<ul style="list-style-type: none"> • Enhance laboratories' ability to detect – to the appropriate level of characterization for the laboratories' capability – IDENTIFY targeted diseases¹ • Enhance/support laboratories' timely reporting of IDENTIFY targeted diseases to national authorities, in support of their official notification to the appropriate regional and international organizations • Laboratories have adopted or improved Quality Assurance practices, inclusive of biosafety and biosecurity measures, and a comprehensive Quality Management System • Laboratories are participating in relevant regional and international laboratory networks according to their respective abilities, disease priorities and responsibilities
Short summary of main activities planned for the reporting period (1 April - 30 September 2012)
Main activity headings are as follows – for further details, please refer to the FAO IDENTIFY Year 3 work plan:
Output 1. Capacity of national animal health laboratories to detect and diagnose diseases under a quality management system enhanced
1.A Follow-up of laboratory mapping exercise activities
1.B Support to and participation in conferences, trainings or workshops related to laboratory capacity building, and national laboratory policies, guidelines and standards

*Indonesia and Myanmar are included in regional activities under separate funding.

¹ "IDENTIFY targeted disease" indicates those diseases selected at the regional level for support under IDENTIFY. Some IDENTIFY laboratories have no mandate/interest to detect all IDENTIFY targeted diseases, and data will not be reported for diseases in those cases.

- 1.C Develop and conduct trainings or workshops to build laboratory capacity and to promote national laboratory policies and guidelines
- 1.D Promote and support laboratory quality management
- 1.E Provide laboratory equipment and supplies in a coordinated manner

Output 2. Linkages and communication pathways across national, regional and global laboratory and epidemiologic networks for the management of emerging zoonotic pathogens strengthened

- 2.A Communication tool development and resource building
- 2.B Development of joint meetings and conferences to support networking and promote national laboratory policies
- 2.C Review and update of the tripartite Laboratory Networking Strategy (LNS) and future planning
- 2.D Engage with stakeholders to support the development of cross-sectoral approach(es) concerning laboratories
- 2.E Support and promote laboratory networks
- 2.F Support and promote laboratory partnerships

1 ACTIVITIES UNDERTAKEN DURING THE REPORTING PERIOD (1 APRIL - 30 SEPTEMBER 2012) AND PLANNED ACTIVITIES FOR THE NEXT REPORTING PERIOD (1 OCTOBER 2012 - 31 MARCH 2013)

1.1 ACTIVITIES GLOBAL COMPONENT (FAO HEADQUARTERS AND FAO/IAEA)

Output 1. Capacity of national animal health laboratories to detect and diagnose diseases under a quality management system enhanced

1.A.G Follow-up of laboratory mapping exercise activities

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- FAO laboratory mapping tool (LMT) exercise. *linked to regional activity 1.A.C:*
 - All data obtained with the LMT was compiled and analysed at headquarters for monitoring and evaluation ([M&E], *linked to 2.C.G*) purposes.
 - Overall report on the status of IDENTIFY laboratories supported by the Food and Agriculture Organization of the United Nations (FAO) finalized. *1.A.4.G*
 - Production of individual laboratory cards on the status of IDENTIFY laboratories in the Congo basin shared with the countries to provide feedback on the Year 3 LMT exercise and to receive feedback for the Year 4 planning process.
 - Regional profile of laboratories examined for status of regional support laboratories based on the outcomes of laboratory mapping. *1.A.5.G*
 - Article describing the LMT published in the FAO Emergency Prevention System (EMPRES) bulletin No 40-2012 <http://www.fao.org/docrep/015/i2811e/i2811e.pdf> (page 23). Final tool distributed to contributors for possible comments.
- Annual report format developed for designated FAO Reference Centres and first annual reports received and reviewed. Information on FAO Reference Centres made publicly available on the FAO Animal Production and Health Web site: http://www.fao.org/Ag/AGAInfo/partners/en/ref_centres.htm and its Global Animal Disease Information System (EMPRES-i) laboratory directory: <http://empres-i.fao.org/eipws3g/index.html?animalProdNetwork=yes>. *1.A.3.G*

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- Develop specific modules of the LMT to ease independent application of specific modules, for example, quality assurance, biosafety, specific disease testing, and to measure the project's impact on laboratory functionality. Compile and review all new data obtained with the LMT (through results of self and external assessments in both regions), and analyse the progress made.

1.B.G Support to and participation in conferences, trainings or workshops related to laboratory capacity building, and national laboratory policies, guidelines and standards

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- Support provided to four participants from South/Southeast Asia and the Congo Basin to attend the 13th Conference of the International Society for Veterinary Epidemiology and Economics (ISVEE XIII), from 20 to 24 August 2012 in Maastricht, the Netherlands. The conference focused on "Building bridges - crossing borders."

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- Support will be provided to four participants from South/Southeast Asia and the Congo Basin to attend the European Commission for the control of Foot-and-Mouth disease (EuFMD) Open Session from 29 to 31 October 2012 and the World Organisation for Animal Health (OIE)/FAO Reference Centres Network meeting on 1 and 2 November 2012, in Jerez de la Frontera, Spain.

1.C.G Develop and conduct trainings or workshops to build laboratory capacity and to promote national laboratory policies and guidelines

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- Contract (Letter of Agreement[LoA]) started with *France Vétérinaire Internationale* (FVI) to provide trainings in Africa in various fields of expertise (mostly trainings in French). See also *1.C.2.C, 1.C.5.C, 1.C.4.C and 1.C.7.C*
- Contract (LoA) started with Istituto Zooprofilattico Sperimentale delle Venezie (IZSve), Padova. OUTCOMES: (i) provide on-site technical assistance for rabies diagnosis (the Democratic Republic of the Congo [DRC], Cameroon and Rwanda) for testing services; and (ii) contribute to the work on provision of access of sub-Saharan African laboratories to sequencing services. *linked to regional activity 1.C.C*
- Organizational support provided for the three sessions of the regional training-of-trainers (TOT) pathology workshop "Basics of field and laboratory diagnosis" in both regions. *linked to 1.C.S and 1.C.C*
- Training for staff selected from the *Laboratoire National Vétérinaire* (LANAVET) (Cameroon) on the diagnosis and molecular epidemiology of the African Swine Fever (ASF) at the joint FAO/International Atomic Energy Agency (IAEA) division (since August 2012 and for seven months).
- Preparation of a joint FAO/IAEA division consultation on "Good laboratory practices for conducting multiple disease diagnosis" (*1.C.5.G*) - initially planned in September 2012. Terms of reference and prospectus finalized, location and date confirmed, experts contacted.
- Validation and transfer of new techniques for multiple disease diagnosis polymerase chain reaction (PCR) using the fluorescence resonance energy transfer (FRET) system) *1.C.6.G*
 - Several convention and real time PCR methods developed at the joint FAO/IAEA division for capripoxvirus detection and differentiation. OUTCOME: Methods presented to the participants of the regional training course on Major transboundary and zoonotic animal diseases: early detection, surveillance and epidemiology (*1.C.4.G*), held at LANAVET, Garoua (Cameroon) from 23 July to 3 August 2012.
 - Agreement was reached on the principle of the collaboration between the joint FAO/IAEA division and Pathofinder (Dutch company) to develop a multiple pathogens detection assay for the major pathogens causing respiratory diseases and symptoms in ruminants. A proposal on the role and the requirements of each partner is now under discussion. This initiative is partially sponsored by IDENTIFY.
 - A label-free method for the detection and genotyping of capripoxvirus was developed at the joint FAO/IAEA division, and is now ready for field validation.
 - The joint FAO/IAEA division currently working on the analytical validation of a pan-pox detection to simultaneously differentiate capripox, parapox and orthopox (camel-pox and cowpox).

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- Conduct the consultation on Good laboratory practices for conducting multiple disease diagnosis, from 16 to 18 October 2012, Vienna, Austria.
- Complete the training on ASF molecular epidemiology for staff from LANAVET (Cameroon) focusing on the molecular characterization of ASF from central African countries and the determination of the genotype responsible for the recent outbreaks by February 2013.
- Validate and transfer new techniques for multiple disease diagnosis (PCR using the FRET system) to Uganda and Ethiopia.
- Final validation of the pan-pox detection to simultaneously differentiate capripox, parapox and orthopox by March 2013.

1.D.G Promote and support laboratory quality management

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- Support to external quality assurance (QA) for targeted diseases.1.D.3.G for proficiency testing in Africa for Rift Valley fever (RVF), peste des petits ruminants (PPR) and avian influenza (AI)/Newcastle Disease (ND). *linked to regional activity 1.D.Congo*
- Support provided to the on-site audit/backstopping missions conducted under the LoA with FVI for: (i) assessing QA system implementation in DRC, the Central African Republic, the Republic of the Congo, Rwanda, Tanzania and Uganda; and (ii) assessing biosecurity and biosafety in Cameroon and DRC. *linked to regional activity 1.D.2.C*
- Discussions with the Institute G.Caporale, Teramo, Italy to support the implementation of laboratory information systems (LIMS) in targeted laboratories in the Congo Basin. An assessment mission conducted from 17 to 20 July 2012 to the Central Veterinary Laboratory (CVL). *linked with regional activity 1.D.Congo*

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- Support to external QA for targeted diseases (for RVF, PPR and AI/ND) for proficiency testing in Africa. *linked to regional activity 1.D.Congo*
- Provide support to the activities performed by FVI in Africa, four assessment missions to be conducted by FVI experts on QA (LACEVET/Bangui/the Central African Republic; the *Laboratoire Vétérinaire de Kinshasa* [LVK]/Kinshasa, DRC; and CVL/Temeke, Tanzania) and biosecurity/biosafety (in LVK/Kinshasa/DRC). *linked to regional activity 1.D.C*
- Develop and review the QA and biosafety roadmaps towards the objective 3 of IDENTIFY.
- Initiate the process for future work on laboratory policy (consultancy needs, outline, roadmap defined).
- Provide standardized veterinary diagnostic reagents and international standards in a coordinated manner to selected countries. *1.D.5.G*
- Support a one-month training for production of standardized RVF veterinary diagnostic reagents and international standard for two scientists from Kenya and Botswana. Upon request of the National Institute for Communicable Diseases (NICD), South Africa, this training was initially planned for the period between July and October 2012, but it was postponed to early 2013.
- Build the PPR serum bank based on the sera produced as part of the FAO/IAEA technical contract.
- Develop a concept note with the African Union - Pan African Veterinary Vaccine Centre (AU-PANVAC) to define the scope and activities for implementation related to the regional supply of

reagents, equipment maintenance and existing diagnostic laboratories network for the validation of reagents and assays already produced at AU-PANVAC.

- Prepare an LoA with the Institute G. Caporale, Teramo, Italy to support the establishment of LIMS in the two targeted laboratories in the Congo Basin (Tanzania and Botswana).

1.E.G Provide laboratory equipment and supplies in a coordinated manner

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- Tenders were launched for the procurement of equipment and consumables:
 - Foot-and-mouth disease (FMD) kits for 13 African countries and two Asian countries;
 - Numerous laboratory materials, supplies and goods for 13 African laboratories, divided into seven lots. Some items have already been shipped to the beneficiary countries (such as the microscopes and FMD kits); delivery of all items expected before the end of 2012; and
 - Purchase of dry ice machine for Uganda (to be shipped in October 2012 to the Uganda Virus Research Institute in Entebbe). *linked to regional activity 1.E. C and 1.E.5.*

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- Follow up on the safe delivery of items to all laboratories; and assist in organizing on-site missions to support the installation of procured equipment and identify the list of any items still missing that would be procured in Year 4 of the project.

Output 2. Linkages and communication pathways across national, regional and global laboratory and epidemiologic networks for the management of emerging zoonotic pathogens strengthened

2.A.G Communication tool development and resource building

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- Generic format of LabCards developed; AI LabCard finalized and posted on the Joint OIE/FAO Network of Expertise for Animal Influenza (OFFLU) Web site:
<http://www.offlu.net/fileadmin/home/en/guidance/pdf/LabCardAI.PDF> 2.A.3.G
- Brochures on FAO regional laboratory networking and the EMPRES Laboratory Unit revisited and currently in the finalization stage.
- EMPRES-i genetic module, 2.A.5.G:
 - Presented at the AI Symposium and OFFLU technical meeting (London, April 2012) for comments and future use by the scientific community.
 - Training period of a master's student from Viet Nam completed (March-September 2012, graduated). Title: *"Linking genetic and epidemiological data from Viet Nam for improved control and risk assessment of animal influenza"*.
 - Second phase of collaboration with the Swiss Institute of Bioinformatics closed (LoA, November 2011-June 2012). The module is functional: total amount of proposed links (as of September 2012) is in the range of 120 000. Most adjustments required prior to public release of the tool already made; assistance provided to the master's student, first real user of the tool and identified problems fixed. 2.A.5.G
- Initiative on the provision of access to sequencing services for African laboratories, 2.A.G:
 - Contract (LoA) signed with the French Agricultural Research for Development (CIRAD) and the *Centre d'Etude et de Recherches Vétérinaires et Agrochimiques* ([CERVA], Belgium) to

- provide trainings on the use of sequencing and to contribute to development of validated PCR protocols (including ring trials between the three partners).
- Available protocols for PCR diagnosis and sequencing for the priority pathogens targeted in the Congo Basin were compared across the three FAO Reference Centres with the aim to harmonize protocols for multiple disease testing. Beneficiary laboratories were invited to participate in this initiative, and baseline information on PCR testing and sequencing was requested (e.g. number of pathogens sequenced each year).
 - Sequencing training for epidemiologists and quality managers of the main vaccine manufacturing units in Africa prepared (facilitating team, preparation of the agenda and of a questionnaire, review of questionnaire results, preparation of scenarios) and held from 25 to 28 September 2012, Nairobi, Kenya. Countries that participated: Uganda, Nigeria, DRC, Cameroon, Ethiopia, Kenya, Tanzania, Botswana and Senegal.
 - Preparation of the workshop on “Sequencing and molecular biology of animal pathogens” for laboratory staff, planned from 5 to 16 November 2012, Vienna, Austria. Prospectus drafted and disseminated to countries, discussions (i.e. teleconferences and email exchanges) on the course content with the various trainers, selection of candidates through the Emergency Centre for Transboundary Animal Diseases (ECTAD) Bamako and Nairobi. Focus on PPR, contagious bovine pleuropneumonia, contagious caprine pleuropneumonia, AI, ND, FMD and capripox.
 - E-learning modules on bioinformatics (phylogeny and sequence analysis) reviewed by the joint FAO/IAEA division and FAO headquarters and finalized by the partner (Swiss Institute of Bioinformatics); to be released to the public shortly (http://viralzone.expasy.org/e_learning/index.html). To be validated during the “Training on sequencing and molecular epidemiology of animal pathogens” (5-16 November 2012). Discussions initiated for development of new modules (genetic databases, multiple alignments) 2.A.6.G

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- EMPRES-i genetic module:
 - Release of the module to the public (November 2012);
 - Link sequence-outbreak data for all H5N1 endemic countries (in addition to Viet Nam data already processed); three-month consultancy of the master’s student (October-December 2012);
 - Finalize articles for the next EMPRES bulletin and scientific papers; and
 - Prepare new LoA with the Swiss Institute of Bioinformatics for maintenance and further integration of phylogenetic tools in the genetic module.
- Finalize formatting of all chapters of the LabCards and disseminate them to laboratories.
- Continue the work on the provision of access to sequencing services to African laboratories:
 - Coordinate the work by the three partners (CERVA, IZSvE and CIRAD) to develop and test harmonized protocols for PCR diagnosis and sequencing; and to develop decision trees and sequencing strategy;
 - Launch a tender and select sequencing provider for provision of sequencing services;
 - Develop a moderator system for sequencing services;
 - Carry out the workshop on “Sequencing and molecular biology of animal pathogens” for laboratory staff, from 5 to 16 November 2012, Vienna, Austria.
- Coordinate the preparation of the disease cards and case definition book plus recommended test repertoire for IDENTIFY listed priority diseases, *linked to regional activity 2.A.C.*
- Develop with IZSvE (FAO Reference Centre for rabies) a “Rabies tool kit” to provide the methodology for the organization in a systematic approach to national trainings for rabies diagnosis and One Health seminars on rabies, *linked to regional activity 2.A.C.*

2.B.G Development of joint meetings and conferences to support networking and promote national laboratory policies

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- Preparation and co-funding of the Eastern Africa Veterinary and Epidemiology Laboratory Network (EARLN) supported, and participation of the IDENTIFY |FAO management team (on 27 and 28 July 2012, Mombasa, Kenya). *linked to regional 2.B.C*
- Participation of one epidemiologist from FAO headquarters in the Regional Network of National Epidemiosurveillance Systems for Transboundary Animal Diseases (RESEPI), held in Accra, Ghana, from 10 to 13 September 2012, to discuss opportunities of collaboration between laboratory and epidemiology related to ASF. *linked to regional 2.B.C*

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- Support to the preparation of the West and Central Africa Veterinary Laboratory Network for AI and other transboundary diseases (RESOLAB) meeting (scheduled from 3 to 7 December 2012, Dakar, Senegal). *linked to regional 2.B.C*

2.C.G Review and update of the tripartite LNS and future planning

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- Routine project management at headquarters and regional levels continued through conference calls/videoconferences as needed, daily email communication and tripartite face-to-face meetings between FAO, OIE and the World Health Organization (WHO) as well as the use of the IDENTIFY SharePoint.
- Continued rotating system of responsibility sharing on a monthly basis between the three partners to more effectively and rapidly handle communication with programme partners, day-to-day operations and logistic arrangements. This system also applies to document creation, revision and meeting hosting.
- Routine M&E system in place and constantly improved at FAO headquarters (dynamic process)
- IDENTIFY Year 4 project planning discussed and/or prepared during the following meetings, with participation of the IDENTIFY |FAO management team:
 - The United States Agency for International Development (USAID) and Tripartite Meeting, on 20 and 21 June 2012, Rome, Italy;
 - Congo basin and South/Southeast Asia Regional Emerging Pandemic Threat (EPT) Planning meetings, July 2012; and
 - IDENTIFY|FAO Year 4 Planning meeting (with the FAO/IAEA coordinator and the FAO regional coordinators from Bamako, Nairobi and Gaborone) in Addis Ababa on 12 and 13 July 2012.

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- Continue routine project management at headquarters and regional levels (including new LoA with OIE).
- Continue implementation of routine M&E; FAO headquarters M&E officer links with M&E focal points in both regions.
- Conduct project planning meeting between IDENTIFY|FAO regional coordinators from Bamako, Nairobi and Gaborone and the IDENTIFY headquarters team (date and venue TBD).

2.D.G Engage with stakeholders to support the development of cross-sectoral approach(es) concerning laboratories

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- Four-way linking for assessing health risks at the human-animal interface. 2.D.2.G:
- Possibility of four-way linking activities in two new pilot countries (Bangladesh and Indonesia) being explored with FAO and WHO country offices and the national authorities.

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- Conduct four-way linking activities in two pilot countries:
 - Bangladesh: review mission and workshop planned between November 2012 and April 2013; and
 - Indonesia: review mission scheduled from 3 to 14 December 2012 and workshop in March 2013.

2.E.G Support and promote laboratory networks

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- OFFLU technical meeting conducted back-to-back with the 8th International Symposium on AI, (4 and 5 April 2012, London, UK) (co-funding).
- OFFLU contribution to the WHO Vaccine Composition meeting (17-20 September 2012, Beijing, China) by FAO collecting and compiling epidemiological analysis, genetic and antigenic data from the OFFLU contributors (animal health laboratories). In September 2012, OFFLU contributed 42 percent of the AI viruses genetic data presented at the consultation. The genetic and antigenic data on Indonesian viruses provided by the Australian Animal Health Laboratory (AAHL) contributed to the decision to select a new vaccine seed for the 2.1.3.2 clade. Harmonization of testing procedures for the provision of the antigenic data was recently established, thus enabling comparison of results between the WHO and OFFLU laboratory networks, as well as among the OFFLU laboratories. Similarly, harmonized tools for the genetic analysis were in place since the last consultation, such as the H5N1 sequence alignment backbone to be used for the phylogenetic analysis.

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- Prepare an OFFLU conference on influenza vaccination (planned in June 2013)
- Circulate for review the OFFLU/FAO influenza vaccination handbook
- WHO Vaccine Composition meeting:
 - Prepare OFFLU's contribution (mid February 2013, Geneva); and
 - Continue harmonization work with WHO on antigenic data with standard reagents produced by WHO Collaborating Centres and distributed to selected OFFLU laboratories.

2.F.G Support and promote laboratory partnerships

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- Ten new FAO Reference Centres officially designated: for FMD (UK), Veterinary epidemiology (Italy, UK and USA), vectors and vector borne diseases (Kenya and South Africa), Veterinary Public Health (Germany), Tuberculosis/Paratuberculosis (USA) and animal/AI and ND (USA).

Progress was made towards the designation of FAO Reference Centres in China, India, Kenya, South Africa and Thailand (government endorsement pending). The designation of further 29 FAO Reference Centres and the evaluation of new applications is in progress.

- Support provided to the meeting aimed at defining the roles and responsibilities of regional support laboratories in sub-Saharan Africa (Addis Ababa, from 11 to 13 July 2012), including the linking with FAO and OIE Reference Centres. *2.F.2.G*

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- Continue the efforts on the status of regional support laboratories in sub-Saharan Africa by assisting in the preparation of the dossier for submission to the Regional Economic Communities (RECs) and supporting the preparation of the : (i) meeting with RECs to present the Regional Support Laboratory (RSL) initiative; and (ii) conclusive meeting with all partners. *link with regional activity 2.F.C*

2 ACTIVITIES UNDERTAKEN DURING THE REPORTING PERIOD (1 APRIL - 30 SEPTEMBER 2012) AND PLANNED ACTIVITIES FOR THE NEXT SIX-MONTH PERIOD (1 OCTOBER 2012 - 31 MARCH 2013)

2.1 ACTIVITIES SOUTH/SOUTHEAST ASIA COMPONENT

Output 1. Capacity of national animal health laboratories to detect and diagnose diseases under a quality management system enhanced

1.A.SSEA. Follow-up of laboratory mapping exercise activities

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- Laboratory assessment, using the Laboratory Mapping Tool, and Biosafety Risk assessment conducted in ten laboratories in Bangladesh (the Central Disease Investigation Laboratory and the Bangladesh Livestock Research Institute) from 29 July to 1 August; Cambodia (the National Veterinary Research Institute [NaVRI]) from 14 to 17 June; Lao People's Democratic Republic (PDR) (the National Animal Health Centre [NAHC]) from 9 to 12 September; Malaysia on 7 and 8 August (the Veterinary Research Institute [VRI]) and from 10 to 13 July (the Department of Wildlife and National Parks, commonly known as PERHILITAN, and the Sabah Wildlife Department [SWD]); Nepal (CVL) on 26 and 27 July; Philippines (the Philippine Animal Health Center [PAHC]) from 23 to 25 August; Thailand (the National Institute of Animal Health [NIAH]) from 21 to 23 June; and Viet Nam (Hanoi University of Agriculture [HUA]) from 28 to 31 May.

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- Compile/update relevant laboratory capacity data for the network and associated laboratories through the laboratory mapping exercise

1.B.SSEA. Support to and participation in conferences, trainings or workshops related to laboratory capacity building, and national laboratory policies, guidelines and standards

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- Support provided for three participants to attend the 8th AI International Symposium, from 1 to 4 April 2012, London, UK; IDENTIFY provided support for three participants: one from NIAH, Thailand, and two from the Department of Animal Health (DAH), Viet Nam to attend the conference <http://www.offlu.net/index.php?id=222>. Support was also provided to attend the OFFLU technical meeting conducted back-to-back with the symposium (on 4 and 5 April 2012, London, UK).
- The Asia-Pacific Biosafety Association's 7th Annual Biosafety Conference, Bali, Indonesia, 24 - 27 April 2012: IDENTIFY provided support for 2 participants from from VRI, Malaysia to attend the two-day preconference workshop on 24-25 April and a two-day conference on 26-27 April 2012. This regional conference aimed to generate a formal exchange on various developments in biosafety, ranging from the strategic coalition and road map for the Asia-Pacific region to biosafety capability and capacity building in the region.

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- The Asia-Pacific Biosafety Association Training, from 29 October to 2 November 2012, Singapore: IDENTIFY to provide support for two biosafety officers from HUA, Viet Nam to participate in the biosafety management training. The training course is to provide the participants with knowledge on general principles and good biosafety practices, the essentials and basic skills in laboratory risk assessment, and the knowledge and ability to design effective biosafety management and maintenance programme.

1.C.SSEA. Develop and conduct FAO/OIE/WHO trainings or workshops to build laboratory capacity and to promote national laboratory policies and guidelines

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- Regional TOT workshop conducted on "Basics of field and laboratory diagnosis", Chiang Mai, Thailand, from 21 to 25 May 2012; 1.C.4.SSEA. The training was attended by 22 participants from Cambodia, China, Indonesia, Lao PDR, Malaysia, Myanmar, the Philippines, Thailand and Viet Nam with priority given to the experienced veterinary officers who are responsible for diagnostic pathology or field diagnosis. The implementing partners were the University of Georgia and Chiang Mai University. OUTCOMES: (i) increased number of resource trainers to deliver the Basics of field and laboratory diagnosis workshop to national veterinarians (The trained participants would become regional resource trainers to provide technical support and training targeted at strengthening the laboratory to field linkage for animal health service authorities); and (ii) enhanced communication between the field and the laboratory veterinarians.
- Regional Laboratory Network training on Diagnosis of Rabies and ND at NIAH, Bangkok, Thailand, from 6 to 17 August 2012; 1.C.6.SSEA. Sixteen participants from the national animal health laboratories from Cambodia, Indonesia, Lao PDR, Malaysia, the Philippines, Thailand and Viet Nam attended the training course. The participants were responsible for diagnosis of rabies and ND at their National Veterinary Laboratories (NVLs). The regional trainings will be followed by the proficiency testing activity to ensure the quality diagnostic service of the priority diseases at the participating laboratories. The implementing partners were AAHL, NIAH, the Department of Livestock Development, Thailand. OUTCOMES: (i) experienced participants with knowledge and training on diagnoses of rabies and ND; and (ii) increased diagnostic capability for rabies and ND at the participating laboratories.
- Regional Laboratory Network Training on Diagnostics of Swine Disease (classical swine fever [CSF], PRRS, ASF) at the Regional Animal Health Office Number 6 (RAHO 6), Ho Chi Minh city, Viet Nam, from 27 to 31 August 2012; 1.C.6.SSEA. Nineteen veterinarians from Cambodia, China, Indonesia, Lao PDR, the Philippines, Malaysia, Myanmar, Thailand and Viet Nam attended the training course. These participants were responsible for diagnosis of swine diseases at their national veterinary laboratories. The regional trainings will be followed by the proficiency testing activity to ensure the quality of the diagnostic services of priority diseases at the participating laboratories. The implementing partners were: AAHL; RAHO 6; and DAH, Viet Nam. OUTCOMES: (i) experienced participants with knowledge and training on diagnoses of CSF, PRRS and ASF; and (ii) increased diagnostic capability for the priority swine diseases at the participating laboratories.
- Regional Laboratory Network Training conducted on QA and Standardization of Diagnostic Reagents at AAHL, Geelong, Australia, from 24 September to 5 October 2012; 1.C.2.SSEA. Seventeen participants from the national animal health laboratories from Indonesia, Malaysia, Pakistan, the Philippines, Thailand and Viet Nam attended this training. The implementing partner was AAHL. OUTCOMES: (i) participants trained in production of QA/Reference controls used in tests (Internal Quality Control [IQC]) and samples used in proficiency testing programmes to allow laboratories to produce their own test controls (IQC) and proficiency testing panels to be

used in-country for regional/province laboratories; (ii) participants with knowledge and training in the analysis and reporting of proficiency testing results and statistical analysis of the proficiency testing reports; and (iii) participants with a general overview of the requirements of ISO17025 and biosafety for the laboratory and refresher training building on previous activities; and (iv) improved good laboratory practices and quality services among the member laboratories in the region.

- One-day workshop on biosafety and sample management for PREDICT laboratory network in Viet Nam, 1 June 2012, HUA, Hanoi, Viet Nam. Twenty-seven participants from PREDICT partner laboratories across Viet Nam attended the workshop. The implementing partners were the World Conservatory Society (WCS)/PREDICT and HUA. OUTCOMES: (i) participants with knowledge and training on biosafety and PREDICT sample management; and (ii) improved good laboratory practices and biosafety management at the PREDICT laboratory network in Viet Nam.
- National training on biosafety and good laboratory practices, on 30 and 31 August 2012, HUA-CVL, Hanoi, Viet Nam. The training course was attended by 18 staff and students of HUA-CVL. The implementing partner was HUA-CVL. OUTCOME: (i) participants with knowledge and training on biosafety management and good laboratory practices; and (ii) improved good laboratory practices and biosafety management at HUA-CVL.

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- REGIONAL workshop, Laboratory and Field Epidemiology Linkage TOT: Strengthen Laboratory and Field Epidemiology Linkages. The scoping mission was conducted in July 2012. The course curriculum development is in process. Schedule is to be confirmed. Implementing partner: AAHL.
- REGIONAL training on the IATA hazardous materials shipping. Schedule is to be confirmed.
- Develop the REGIONAL TOT workshop and relevant training materials for Laboratory Biosafety officers.
- Facilitate and/or develop the REGIONAL training on the application of veterinary bioinformatics.
- Provide consultancy on risk assessment, standard operating procedures development and training on biosafety management to network laboratories; implementing partners: international/national consultants and PREDICT.
- Provide consultancy and assistance on the development of the meeting and training programmes to build laboratory capacity and to promote national laboratory policies and guidelines at the network and associated laboratories; implementing partners: international/national consultants, national veterinary laboratories.

1.D.SSEA. Promote and support laboratory quality management

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- Provided consultancy and technical assistance to activities related to the laboratory relocation and implementation of the Biosafety Level 3 (BSL3) facility, the laboratory quality and biosafety management at NAHC, Lao PDR (March-August 2012).
- Provided biosafety experts to visit participating laboratories, assess biosafety infrastructure, equipment and practices, and provide recommendations including remedial activities, in cases of non-compliance, based on international standard biosafety guidelines. The biosafety risk assessments were carried out at IDENTIFY-supported laboratories including Bangladesh (the Central Disease Investigation Laboratory and the Bangladesh Livestock Research Institute) from 29 July to 1 August; Cambodia (NaVRI) from 14 to 17 June; Lao PDR (NAHC) from 9 to 12 September; Malaysia on 7 and 8 August (VRI) and from 10 to 13 July (PERHILITAN and SWD); Nepal (CVL) on 26 and 27 July; the Philippines (PAHC) from 23 to 25 August; Thailand (NIAH) from 21 to 23 June; and Viet Nam (HUA) from 28 to 31 May; *1.D.1.SSEA*.

- Provided laboratory engineers to calibrate, certify, and where necessary and possible, provide correction measures to biosafety cabinets located in IDENTIFY-supported laboratories. The biosafety cabinet testing and certification have been conducted at the participating laboratories in Cambodia, Lao PDR, Malaysia, the Philippines, Thailand, Viet Nam, Bangladesh and Nepal during August-September 2012; *1.D.1.SSEA*.
- Provided consultation and facilitated the procurement/access of LIMS to the NIAH and its national network laboratories, Thailand; *1.D.4.SSEA*.
- Provided laboratory visit and technical consultation to assist development and implementation of laboratory quality management to the PREDICT laboratories in Malaysia (VRI, PERHILITAN and SWD) from 10 to 13 July 2012.

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- Continue to provide consultancy and technical assistance to activities related to improvement and implementation of the laboratory quality and biosafety management at NAHC, Lao PDR (October 2012-September 2013), and the network laboratories.
- Provide biosafety experts to perform biosafety risk assessment and laboratory engineers to conduct the biosafety cabinet testing and calibration to the network laboratories. *1.D.1.SSEA*
- Plan and provide backstopping missions and on-site trainings at the participating laboratories based on the recommendations obtained from the previous biosafety assessment activities.
- Continue to provide consultation and facilitate the procurement/access of LIMS to the network laboratories. *1.D.4.SSEA*.
- Continue to facilitate proficiency testing programme for diagnosis of selected regional priority diseases and provide backstopping missions to the participating laboratories to ensure implementation of appropriate diagnostic protocols under a QA system; implementing partner: AAHL. *1.D.6.SSEA*
- Carry out laboratory visits and technical consultation to assist development and implementation of laboratory quality management to the network laboratories. *1.D.2.SSEA*.

1.E.SSEA. Provide laboratory equipment and supplies in a coordinated manner

Activities undertaken during the current reporting period (1 April 2012 - 30 September 2012)

- Provided standardized veterinary diagnostic reagents including proficiency testing panels, supplies and equipment as requested by the network laboratories, or recommended in support of the proficiency testing programme for diagnosis of influenza, ND, CSF, PRRS, ASF and rabies.
- Provided the laboratory equipment, including two biosafety cabinets, PCR hood, fume hood to NAHC, Lao PDR. Two biosafety cabinets were delivered and installed at the new NAHC facility in August 2012. Fume hood was delivered to NAHC at the end of September 2012.
- Provided laboratory equipment, including biosafety cabinet, refrigerated centrifuge, microcentrifuge, ultracentrifuge and other laboratory supplies related to biosafety to NIAH, Thailand.
- Provided laboratory equipment, including refrigerated centrifuge, microcentrifuge and other laboratory supplies related to biosafety to NaVRI, Cambodia, based on the findings and recommendations from biosafety risk assessment.

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- Provide necessary supplies and equipment, based on the findings and recommendations of the biosafety assessment and cabinet testing activities to ensure the proper biosafety containment and practices in the network laboratories.

- Provide standardized veterinary diagnostic reagents including proficiency testing panels, supplies and equipment as requested by the network laboratories or recommended in support of the proficiency testing programme.

Output 2 Linkages and communication pathways across national, regional and global laboratory and epidemiologic networks for the management of emerging zoonotic pathogens strengthened

2.A.SSEA. Communication tool development and resource building

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- Provided manuals on "Field manual for collection of specimen to enhance diagnosis of animal diseases" to network laboratories; 2.A.1.SSEA.
- Provided technical inputs and supported the implementation of EMPRES-i Asia platform to share expertise and information across the network in a real-time manner.
- Provided administration and information update to the AI Network Asia email list.
- Established the transboundary animal diseases (TADs) Network Asia List. As of September 2012, this email list will replace the AI Network Asia to accommodate the expansion of disease focus to other important TADs and emerging infectious diseases in the region.

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- Continue to support the implementation of EMPRES-i and TADs Network Asia and sharing of expertise and disease information across the network.
- Provide the guidelines and documents related to diagnosis, management and control of TADs as requested.
- Distribution of Basics of Field Pathology Training manual for trainers.
- Develop training materials related to the Laboratory Field Epidemiology Linkage Training and Laboratory Biosafety Management.

2.B.SSEA. Development of joint meetings and conferences to support networking and promote national laboratory policies

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- The FAO/OIE Regional Laboratory Technical Advisory Group meeting on 30 and 31 July 2012, Bangkok, Thailand; 2.B.1.SSEA. The main objectives of the meeting is to update the partners on the ongoing activities related to laboratory policies, laboratory capacity building activities and laboratory networking in Southeast Asia. The meeting was attended by 25 representatives from key technical partners, the regional leading laboratories, international reference laboratories, major donors and implementing partners.

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- Regional Laboratory Directors Forum meeting, on 10 and 11 October 2012, Nha Trang, Viet Nam; 2.B.1.SSEA. The meeting will be jointly organized by DAH, Viet Nam, FAO and OIE. The objectives of the meeting include the updating of information on the laboratory policy and management issues to the member laboratory directors and the review of the activities undertaken under the Regional Laboratory Network and the Regional Leading/Reference Laboratories. It is expected that approximately 20 participants comprised of the laboratory directors from Southeast Asia

and China, international experts and representatives from international agencies will participate in this meeting.

- Regional laboratory network meeting to be held back-to-back with the FAO/OIE/WHO Meeting on Laboratory Strengthening for Emerging Infectious Diseases Diagnosis in Asia Pacific. Schedule is to be confirmed.

2.C.SSEA. Review and update of the tripartite LNS and future planning

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- The IDENTIFY|FAO Southeast Asia coordinator participated in the EPT country work plan review for Lao PDR (5 April and 12 June), Viet Nam (30-31 May), Cambodia (5-6 June), Thailand (11 June).
- The IDENTIFY|FAO Southeast Asia coordinator participated in the EPT Technical and Programmatic Discussions on IDENTIFY on 21 June 2012, FAO headquarters, Rome, Italy.
- The IDENTIFY|FAO Southeast Asia coordinator participated in the Regional EPT Planning Meeting, July 25-26, 2012, Bangkok, Thailand.

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- The IDENTIFY|FAO Southeast Asia coordinator to participate and provide input to the country and regional EPT planning meetings.

2.D.SSEA. Engage with stakeholders to support the development of cross-sectoral approach(es) concerning laboratories

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- Facilitated the development of Terms of Reference for roles and responsibilities of the regional leading laboratory for CSF (DAH, Viet Nam), FMD (Regional Reference Laboratory, Thailand), and Highly Pathogenic Avian Influenza (VRI, Malaysia).
- Coordinated with the Association of Southeast Asian Nations (ASEAN) Regional Support Unit based at FAO in preparing the draft Regional Framework for Animal Health Laboratory Capacity Building and Networking in Southeast Asia which was endorsed by ASEAN in August 2012.
- Reviewed and coordinated the work plan related to laboratory capacity building among the key implementing partners in alignment with the Regional Framework for Animal Health Laboratory Capacity Building and Networking in Southeast Asia during the FAO/OIE Regional Laboratory Technical Advisory Group meeting (30-31 July 2012).

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- Continue to facilitate the development of coordinated work plan among the key partners, aligned with the Regional Framework for Animal Health Laboratory Capacity Building and Networking in Southeast Asia.

2.E.SSEA. Support and promote laboratory networks

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- The IDENTIFY|FAO Southeast Asia coordinator participated the Technical and Policy Discussion on Improving the Prevention and Control of H5N1 Highly Pathogenic Avian Influenza in Highly-Affected and Neighbouring Countries, 23-25 April 2012, Ho Chi Minh City, Viet Nam.
- The IDENTIFY|FAO Southeast Asia coordinator participated and provided technical input at the Annual Review Workshop of the Cambodia Zoonotic Diseases Action Plan, 5-6 June 2012, Siem Reap, Cambodia.
- The IDENTIFY|FAO Southeast Asia coordinator provided technical input at the Field Epidemiology Training Programme for Veterinarians (FETPV), 6-8 August 2012, Bangkok, Thailand.
- The IDENTIFY|FAO Southeast Asia coordinator participated and provided technical input at the NaVRI, Strategic Planning Workshop, 10-14 September 2012, Kep, Cambodia.
- The IDENTIFY|FAO Southeast Asia coordinator participated in the Regional Avian and Pandemic Influenza USAID Partners' Meeting, 27-28 September 2012, Bangkok, Thailand.

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- Continue to provide inputs and support communication and interaction among the regional network laboratories, and support national laboratory networking activities.

2.F.SSEA. Support and promote laboratory partnerships

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- Continued to support and promote the roles and activities of the Regional Leading Laboratories 2.F.1.SSEA. Regional Leading laboratories co-organized regional trainings on diagnoses of rabies and ND (NIAH, Thailand), and swine diseases (DAH, Viet Nam).

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- Provide support to the Regional Leading/Reference Laboratory activities related to laboratory capacity building and networking at the national and regional levels.

3 ACTIVITIES UNDERTAKEN DURING THE REPORTING PERIOD (1 APRIL – 30 SEPTEMBER 2012) AND PLANNED ACTIVITIES FOR THE NEXT SIX-MONTH PERIOD (1 OCTOBER 2012 – 31 MARCH 2013)

3.1 ACTIVITIES CONGO BASIN COMPONENT

Output 1. Capacity of national animal health laboratories to detect and diagnose diseases under a quality management system enhanced

1.A.Congo. Follow-up of laboratory mapping exercise activities

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- Results of the FAO LMT exercise compiled in a report and outcomes presented during the laboratory directors and Chief Veterinary Officers (CVOs) meetings (Libreville and Entebbe meetings, April 2012). Translation of the report into French was carried out. *Linked to global activity 1.A.C*
- Individual Laboratory Cards on the overall and individual status of IDENTIFY laboratories, based on the outcomes of the LMT assessments, were shared with the countries as feedback, and the outcomes were used for the Year 4 planning process.
- Additional LMT data collected during trainings and audit missions conducted in some laboratories (LANAVET/Cameroon, LVK/DRC, the National Animal Disease Diagnostics and Epidemiology Centre [NADDEC]/Uganda, NVL/Rwanda, the Brazzaville Veterinary Laboratory [LDVB]/Republic of the Congo).

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- Compile new LMT data from laboratory self assessment (Year 4). Use of specific LMT modules, such as QA module, biosafety module, disease-targeted modules and a module to measure the project's impact on laboratory functionality. *linked to 1.A.G and 1.A.C*
- Compile comments and suggestions provided by the laboratories on the use of the LMT.
- Extend laboratory self assessments to RSLs. *linked to activity 2.F.C*

1.B.Congo. Support to and participation in conferences, trainings or workshops related to laboratory capacity building, and national laboratory policies, guidelines and standards

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- Two ECTAD personnel attended and gave presentations during East Africa's regional biosurveillance workshop from 12 to 15 June 2012 in Kampala, Uganda.
- Four laboratory technicians from Cameroun, Central African Republic, DRC and the Republic of Congo were sponsored to participate in the laboratory training on FMD diagnosis, organized with support from the FAO-based EuFMD, the European Commission and the Government of Ghana in Accra, Ghana from 17 to 21 September 2012 with other non-sponsored IDENTIFY countries (Ghana, Nigeria, Senegal and Togo). OUTCOMES: Opportunity given for the first time to trainees to type the circulating FMD virus in their countries.
http://www.fao.org/Ag/AGInfo/home/en/news_archive/2012_FMD_west_africa_training.html
- One quality/biosafety manager per country from Botswana, Cameroon and Uganda were sponsored to attend the 3rd Annual African Biological Safety Association (AfBSA) conference, from 24 to 27 June 2012 in Johannesburg, South Africa. Participants submitted abstracts and

presented veterinary perspectives in the meeting. The Uganda National Biosafety Association was created by Ugandan participants during the conference. *1.D.6.C*

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- First Participatory Epidemiology Network for Animal and Public health (PENAPH) Technical Workshop, from 11 to 13 December 2012 in Chiang Mai, Thailand: IDENTIFY to provide support for two participants from NADDEC/Uganda to attend the workshop.

1.C.Congo. Develop and conduct trainings or workshops to build laboratory capacity and to promote national laboratory policies and guidelines

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- Regional support provided to regional training course on Major Transboundary and Zoonotic Animal Diseases in the Region: Early Detection, Surveillance and Epidemiology, Garoua, Cameroon, from 18 to 29 June 2012, organized together with the joint division FAO/IAEA. Sixteen participants including 12 from IDENTIFY countries attended this course. The course was jointly funded by the IDENTIFY project and the African Renaissance Fund. *1.C.3.C (see also 1.C.4.G)*
- Regional TOT pathology workshops on the Basics of Field and Laboratory Diagnosis. *1.C.4.C*
 - Session 1 hosted by the University of Nairobi from 23 to 27 April 2012. The countries that were represented - trainees per country: Rwanda – 4, South Sudan – 4, Tanzania – 4, Uganda – 3. The training was conducted by experts from the host university, the Inter-States Veterinary School of Dakar (Senegal) and the University of Georgia, Athens, Georgia, USA. *Training report available upon request*
 - Session 2 hosted by LVK/DRC from 24 to 28 September 2012 for francophone countries (two trainees per country from Cameroon, the Central African Republic, Equatorial Guinea, the Republic of the Congo, DRC and Gabon). The training was conducted by experts from FVI and the Inter-States Veterinary School of Dakar (Senegal) *linked to global activity 2.A.2.G and 1.C.G*

OUTCOME: Each participant received a kit containing basic equipment needed to perform field necropsies, and each country represented prepared a plan to further conduct similar training at country level.
- Bench training by experts from IZSve on rabies Diagnosis at LVK, Kinshasa, DRC, from 21 to 25 May and LANAVET, Garoua, Cameroon, from 4 to 8 June 2012. OUTCOMES: Skills on Rabies diagnosis techniques, including PCR and IFAT, improved for 12 technicians of both LANAVET and LVK. *linked to 1.C.G (reports available upon request)*
- Hands-on training by one PPR laboratory expert at LVK (from 14 June to 2 July 2012) to assist the laboratory in PPR diagnosis and preparation for a massive vaccination campaign against PPR. OUTCOMES: (i) evaluation of technical and operational capacities to perform a high testing throughput in a short period of time; (ii) identification of operational and technical requirements for receipt, handling, storage, processing of samples, preparation and shipment of samples and isolates to international PPR reference laboratories; (iii) determination of supplies needed; and (iv) training on C-enzyme linked immunosorbent assay (ELISA) and PCR techniques. Report provided to FAO staff working on a technical cooperation programme on PPR vaccination. *(Report available upon request)*

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- National training on Basics of Field and Laboratory Diagnosis to be conducted by each beneficiary laboratory (except Equatorial Guinea) for field staff in their respective countries, based on LoA terms – before the end of December 2012.
- Bench training on rabies diagnosis at NVL, Kigali, Rwanda in November 2012.
- Assessment mission at the *Laboratoire vétérinaire de Goma* (DRC) to identify basic needs for laboratory work in serology, parasitology and bacteriology. (dates TBD)
- Assessment mission in Equatorial Guinea to identify a possible strategy for laboratory development based on the determined needs for testing in virology, parasitology and bacteriology.
- Conduct trainings listed above. *Concept notes provided in the previous six monthly report, available upon request*

1.D.Congo. Promote and support laboratory quality management

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- Regional workshop on Management of Laboratory Equipment and Basic Metrology from 25 to 29 June 2012 in Banjul, the Gambia. The workshop was co-funded with the United States Department of Agriculture (USDA)/Animal and Plant Health Inspection Service (APHIS). Two participants from each of the following countries participated in the workshop: the Gambia, Ghana, Liberia, Nigeria, Sierra Leone (supported by APHIS funding), Rwanda, the South Sudan, Tanzania and Uganda. OUTCOMES: (i) planning of maintenance operations through the development of a flowchart on equipment management, arithmetic operations used in metrology and hands-on exercises of calibration of scales; and (ii) roadmap to implement lessons learned collectively developed. 1.C.5.C
- Four on-site audit/backstopping missions conducted by FVI experts including: Three missions on QA system and development of quality documentation undertaken at (i) the NADDEC/Entebbe from 11 to 15 June 2012, Uganda; (ii) NVL/Kigali, Rwanda, from 16 to 19 July 2012; (iii) LDVB/Brazzaville, Congo, from 16 to 19 July 2012 respectively.
- One mission on Biosecurity/biosafety practices at LANAVET/Garoua, Cameroon, from 24 to 27 September 2012.
- External QA for targeted diseases.1.D.3.G; proficiency testing panels:
 - Proficiency testing for AI/ND (under LoA with IZSve, Padova) underway for all IDENTIFY beneficiary laboratories (except Equatorial Guinea) and regional laboratories.
 - For RFV: serology kits delivered to the FAO/IAEA joint Division; proficiency panels prepared and testing kits provided to all selected laboratories (Cameroon, the Central African Republic, the Republic of the Congo, DRC, Ethiopia, Gabon, Kenya, Rwanda, Tanzania and Uganda). A technical contract was granted to the Special Pathogen Unit of NICD (South Africa) to cover the cost for panel shipment to the targeted laboratories.
 - For PPR: proficiency panels were shipped by the FAO/IAEA Joint Division to the participating laboratories, the deadline to receive the results was 30 September 2012.
- Assessment mission by one expert from the Institute G. Caporale, Teramo, Italy to further implement LIMS in Tanzania, from 17 to 20 July 2012. *linked with global activity 1.D.G*

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- Four assessment missions to be conducted by FVI experts on:
 - QA (LACEVET/Bangui/CRA, from 15 to 18 October 2012; LVK/Kinshasa, DRC, from 8 to 11 October 2012; and CVL/Temeke, Tanzania, dates TBD); and
 - Biosecurity/biosafety (LVK/Kinshasa/DRC, from 8 to 11 October 2012). 1.D.5.C

- Regional training on biosecurity/biosafety scheduled at Kinshasa/DRC from 1 to 5 October 2012 for Cameroon, the Central African Republic, Congo, DRC, Equatorial Guinea and Gabon.
- Support to national biosecurity/biosafety improvement before the end of December 2012 (minor renovations in the laboratories for each beneficiary laboratory to be implemented through national LoAs).
- Regional training on QA in diagnostic laboratories: Process Control - Quality Control (sample management and quality control for quantitative and qualitative tests), Libreville/Gabon, from 8 to 12 October 2012. Participating countries are Cameroon, the Central African Republic, Congo, DRC, Equatorial Guinea and Gabon.
- Finalization of the Concept Note to address issues on waste management and reagents storage in NADDEC/Uganda and to determine collaboration arrangements with DELIVER, dates TBD.
- Develop LoA with Istituto G. Caporale, Teramo for the implementation of LIMS in Tanzania and Botswana (dates TBD). *linked to global activity 1.D.G*
- Provide to the nine beneficiary countries with validated standardized veterinary diagnostic reagents (antigens and antisera) targeting priority TAD laboratory diagnosis. *1.D.8.C, linked to Global activity 1.D*
- Develop a concept note on regional supply of reagents and equipment maintenance with AU-PANVAC, and implement related activities. *linked with global activity 1.D.G*
- Review of proficiency testing results (AI/ND, RFV, PPR) and presentation of results in Regional Network meetings.

1.E.Congo. Provide laboratory equipment and supplies in a coordinated manner

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- Equipment, reagents and consumables procured and currently being delivered to beneficiary laboratories according to needs identified and agreed upon, based on the results of the mapping exercise and the list provided by them. *1.E.1.C, linked to Global activity 1.E.G*

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- Follow up on the delivery to all laboratories of items from Year 3 procurement; organize on-site missions to support the installation of procured equipment; assist laboratories in organizing the work with the new set of equipment/reagents and contact the supplier if any problems arise with the supplied items; and identify the list of items for procurement under Year 4.

Output 2 Linkages and communication pathways across national, regional and global laboratory and epidemiologic networks for the management of emerging zoonotic pathogens strengthened

2.A.Congo. Communication tool development and resource building

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- Second phase of the study on the development of collaborations and/or partnerships between public veterinary laboratories and the animal industry initiated in the three pilot countries (Cameroon, DRC and Rwanda) - follow-up to the first study conducted by FAO in Year 2. OUTCOMES: The study identified alternative services that will potentially generate additional and sustainable financial resources for concerned laboratories - 2.A.3.C - Final report under preparation.

- Access to sequencing services to African laboratories (*linked to Global activity 2.A.G*): Held the training for epidemiologists and quality managers of main vaccine manufacturing units in Africa (Nairobi, from 25 to 28 September 2012). Uganda, Nigeria, DRC, Cameroon, Ethiopia, Kenya, Tanzania, Botswana and Senegal attended.

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- Production, printing and dissemination of public awareness and advocacy materials (brochures, leaflets, posters) to improve information sharing and the visibility of the IDENTIFY project at country level (through national LoAs). 2.A.1.C —before the end of December 2012.
- Initiate the preparation of the disease cards and case definition book plus recommended test repertoire for IDENTIFY listed priority diseases, and link with the headquarters (date TBD).
- Provide assistance to the development of a Rabies tool kit to provide the methodology for the organization in a systematic approach of national trainings for rabies diagnosis and One Health seminars on rabies (date TBD). *linked to Global activity 2.A.G*

2.B.Congo. Development of joint meetings and conferences to support networking and promote national laboratory policies

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- Joint EARLN and EAREN annual regional networking meeting on 27 and 28 July 2012 in Mombasa, Kenya, co-funded with Vet Governance project, with participation from national network focal points, representatives of RESOLAB and the Laboratory Network of the Southern African Development Community, FAO, OIE, the African Union-Interafrican Bureau for Animal Resources (AU-IBAR), AU-PANVAC and the Intergovernmental Authority on Development. OUTCOMES: (i) updates on each network, specific session on ASF regional strategy; (ii) decision to establish a Regional Animal Health Network that includes a laboratory subnetwork and is under the regional CVOs network which reports to the regional RECs. The purpose of the change is to harmonize the work and ensure the sustainability of all existing networks in the region.
- Six epidemiologists from Cameroon, the Central African Republic, the Republic of the Congo, DRC, Equatorial Guinea and Gabon were sponsored by the IDENTIFY project to attend RESEPI, held in Accra, Ghana, from 10 to 13 September 2012, with the participation of 21 countries in total. OUTCOME: Major recommendation to establish separate bodies of Directors of Animal Health and Animal Production Development in both West Africa (ECOWAS) and Central Africa (ECCAS). It is expected that all existing networks (epidemiology, laboratory, socioeconomic, communication and all disease-based working groups) shall report to these new entities. *linked to global 2.B.G*

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- Organization of open day events by each beneficiary laboratory to communicate on their activities - through national LoAs, before the end of December 2012.
- Hold RESOLAB annual coordination meeting from 3 to 7 December 2012, in Dakar, Senegal, cofunding with USDA and IAEA.

2.C.Congo. Review and update of the tripartite LNS and future planning

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- IDENTIFY|FAO Year 4 planning meeting with the FAO project management team, the FAO/IAEA coordinator and the FAO regional coordinators from Bamako, Nairobi and Gaborone (via teleconference) in Addis Ababa on 12 and 13 July 2012.
- IDENTIFY|FAO African liaison officer and subregional focal points participated in the Africa EPT partners meeting in Kampala, Uganda, from 18 to 20 July 2012.
- Tripartite consultations on Year 4 activities between IDENTIFY implementing organizations were held during the EPT partners meeting in Kampala in 18 July 2012.

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- Planning meeting between IDENTIFY|FAO regional coordinators from Bamako, Nairobi and Gaborone and the IDENTIFY headquarters team (date and venue TBD).
- Tripartite regional coordination meetings, date and venue TBD.

2.D.Congo. Engage with stakeholders to support the development of cross-sectoral approach(es) concerning laboratories

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- Year 3 work plan implementation meeting of IDENTIFY|FAO project with the Congo Basin NVLs' Directors and CVOs, from 3 to 5 April 2012, in Libreville, Gabon, and from 11 to 13 April 2012 in Entebbe, Uganda. OIE, WHO and AU-IBAR participated. OUTCOMES: (i) IDENTIFY target countries informed on all planned activities and able to comment and make suggestions on the implementation; and (ii) activities to be conducted by each laboratory under an LoA discussed and agreed upon.
- National seminars held in Kinshasa, DRC, on 31 May and 1 June 2012, and Yaoundé, Cameroon, on 13 and 14 June 2012 to address intersectoral issues and opportunities to improve collaboration on diagnosis, surveillance, control, prevention, education and research on rabies. Participants in both seminars were from the laboratory sector (animal and human laboratories), research institutes, veterinary and medicine faculties, field veterinary services, officials from central public health and veterinary services and non-governmental organizations. OUTCOMES: (i) The seminars focused on existing experiences on controlling rabies outbreaks, difficulties to access diagnosis centres and post-exposure prophylaxis, and lack of knowledge on rabies situation; and (ii) Needed actions were identified to strengthen intersectoral collaboration and establish fixed timelines.

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- Intersectoral discussions on One Health at national levels will be supported through national LoAs – before the end of December 2012.
- National seminar on rabies and intersectoral discussions on rabies to be held in Kigali, Rwanda, dates TBD.

2.E.Congo. Support and promote laboratory networks

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- EARLN/EAREN joint meeting. *see 2. B.C*

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- RESOLAB meeting. *see 2.B.C*

- Maintain the collaboration with the joint AU-IBAR/OIE/FAO Reinforcing Veterinary Governance project in supporting the regional networks (laboratory, epidemio-surveillance, etc.).

2.F.Congo. Support and promote laboratory partnerships

Activities undertaken during the current reporting period (1 April - 30 September 2012)

- Definition of the roles and responsibilities of regional support laboratories in sub-Saharan Africa: Meeting on RSLs from 9 to 11 July 2012 in Addis Ababa paved the way towards the institutionalization of regional laboratories. Participants consisted of the five RSLs and their respective CVOs or representatives – ARC-OVI (South Africa), BNVL (Botswana), LNERV (Senegal), NVRI (Nigeria) and NAHDIC (Ethiopia) – representatives of AU-IBAR, AU-PANVAC, OIE, IAEA, CIRAD, IZSVe, CVRL, and representatives of the three Regional Laboratory Networks (EARLN, the Laboratory Network of the Southern African Development Community and RESOLAB). OUTCOMES: (i) agreement on the status, roles and responsibilities of these RSLs within their respective region and their position regarding the OIE/FAO Reference Centres; and (ii) steps for RECs' endorsement defined. *linked to global activity 2.F.2.G*

Planned activities for the next reporting period (1 October 2012 - 31 March 2013)

- Define the roles and responsibilities of regional support laboratories in sub-Saharan Africa:
 - preparation of the dossier for submission to the RECs;
 - preparatory meeting with RECs to present the RSL initiative and prepare the conclusive meeting. This preparatory meeting is tentatively planned for late November/early December 2012; and
 - conclusive meeting with the beneficiary laboratories, RSLs, RECs, AU-IBAR, OIE and other technical partners such as OIE/FAO Reference Centres (Gaborone, January/February 2012).

4 MAIN CHALLENGES ENCOUNTERED AND RESPONSE PROVIDED

- The low priority given to animal health in country policies and development strategies often leads to difficulties in mobilizing technical, financial and human resources at national level, thus compromising the sustainability of activities implemented under the project. Therefore, there is a need to intensify advocacy at country level and increase sustainable financial resources.
- One of the findings from the recent laboratory assessment activities in Southeast Asia indicated that there are needs for improvement of the biosafety practices at the laboratory levels. This is mainly owing to the lack of awareness on biosafety practices among the laboratory staff. To reinforce the awareness and subsequent sustainable laboratory biosafety practice and management, an on-site biosafety training programme and a biosafety (TOT) training course for the laboratory biosafety manager will be conducted during the next year, through the Southeast Asia Regional Biosafety Programme. In addition, laboratory biosafety was placed as one of the priority topics to be discussed at the Laboratory Directors' Forum meeting to advocate for more support from the higher-level authorities.
- As most of the technical inputs have primarily focused on the key national veterinary laboratories across the Southeast Asia region, there are still needs to expand the capacity building activities to other laboratories at the subnational level and to improve the linkage of the laboratories and the field staff to ensure the sustainable quality of laboratory services. It is believed that such objectives can be achieved through supporting of the training/workshops at the national level, and assistance from the Regional Leading/Reference Laboratories, key national laboratories and other implementing partners. Several activities for enhancement of the laboratory quality service among the national laboratory networks were planned during the next year to fulfil the above needs.
- The low level of resources allocated to veterinary laboratories by the authorities in the Congo Basin is still a major challenge that the project is trying to address through the private-public partnership consultations conducted in Cameroon, DRC and Rwanda. Outcomes of the ongoing work include: (i) targeted identification of products and services (e.g. poultry/pig/dairy sectors, post-vaccination control, food safety analysis, etc.) that the laboratory could offer to the private sector and estimation of consequent additional resources; (ii) preparation of appropriate communication and promoting tools/activities (brochures of revised list of laboratory analyses and related costs, open days, participation to fairs, etc.) to initiate/improve client relationship and design complementary activities with other country veterinary laboratories (samples submission, training); and (iv) review of legal status (opening of bank accounts, strengthening/training of commercial staff, etc.). By supporting the extension/improvement of laboratory diagnosis services to the private sector and addressing internal functioning issues of laboratories, the private-public partnership consultations are expected to suggest solutions for sustainability of some activities of the project and, at the same time, provide contributory references to formulate a laboratory policy.
- Most beneficiary laboratories both in the Congo Basin and Southeast Asia still face the issue of low quality and quantity samples received from the field. To avoid the negative impact of this situation on their diagnosis capacities, the three regional TOT workshops explicitly addressed good practices on necropsies, good sampling, storage and shipment of samples. By mixing participants from laboratory and epidemiology staff from each participating countries, the training also helped in clarifying appropriate channels of communication between the two sectors and planning of trainings to extend good practices at country level.
- The proper development of laboratory strategy and sustainability of the skills and activities supported by IDENTIFY is hindered by weak laboratory policy and management (e.g. shortage of laboratory reagents that prevent from participation in proficiency tests, no bank accounts or possibility to generate income, etc.). Therefore, these complex issues will be addressed during Year 4 of the project.

5 MAIN PROGRESS MADE TOWARDS THE ACHIEVEMENT OF PROJECT OUTCOMES (FROM THE START OF THE PROJECT ACTIVITIES)

- The support provided by IDENTIFY to-date has contributed to a greater understanding of the regional animal health priorities, assessment of laboratory capacities and identification of regional and national gaps and resources.
- The direct support afforded to laboratories is substantial, and has allowed for an expansion of the activities to include: QA, biosafety, and maintenance and calibration of equipment, thus contributing to laboratories' capacity to conduct work in accordance with internationally accredited standards (e.g. ISO 17025). Many national laboratories never had the opportunity to consider these major issues. The support provided is neither isolated nor sequential; the project builds upon previous and current investments in laboratory networking and allows for a programmatic approach, proper approval of planned activities by countries and a regional approach to TADs.
- At present, the 2012 Southeast Asia Regional Biosafety Programme has covered the activities related to biosafety assessment and management in 23 national laboratories in ten countries. The 2012 Southeast Asia proficiency testing programme has expanded to diagnoses of five priority diseases, including influenza, ND, rabies, CSF, PRRS and ASF. The list of the priority diseases to be included in the proficiency testing programme was agreed upon and regularly reviewed by the Southeast Asia laboratory directors under the assistance of the Southeast Asia Regional Laboratory Network framework.
- Sharing the Year 3 work plan with CVOs and laboratory directors of the beneficiary countries in the Congo Basin during the two stakeholder meetings (Libreville and Kampala) has facilitated the ownership of the project with beneficiary laboratories and contributed to the preparation of implementing and assessment tools such as LoAs with M&E activities. This consultation process has facilitated the work plan preparation as well as the implementation of Year 3 activities in the Congo Basin. The same process will take place in Year 4.
- As many priority diseases are TADs, a regional approach (where agreed) allows for rapid disease detection/identification. Response measures can be coordinated regionally for more effective control. The networks in the West/Central, Eastern Africa and Southeast Asia regions have set a good example, with both the formal and informal exchange of information, collective effort and responsibility to build laboratories in the regions. Other partners, such as USDA/APHIS, EuFMD Commission and CIRAD have demonstrated an increased interest in and support for these laboratory networks. The growing confidence lends credence to the regional approach, and FAO has a comparative advantage in the coordination of such support and inputs. This project has provided support to regional laboratory networks, allowing networking and progress in the strategy of these networks, especially related to the status and mandate of regional service laboratories. For Southeast Asia, the Regional Framework for Animal Health Laboratory Capacity Building and Networking in Southeast Asia which has been drafted through the consultation with the Southeast Asia Laboratory Directors, was presented at the 20th ASEAN Sectoral Working Group on Livestock (ASWGL) meeting in Myanmar in May 2012. The framework was subsequently endorsed by ASEAN in August 2012. This progress represents the major progress in engagement of the key stakeholders to support the sustainable quality laboratory services across the region.
- The meeting held in July 2012 (Addis Ababa, Ethiopia) which resulted in defining the role and responsibilities of RSLs in the Congo Basin is a major step towards their institutionalization within their respective RECs and regional frameworks. RSLs have agreed to carry regional responsibilities, such as provision of services for disease confirmation, production of standardized reagents, harmonized protocols and capacity building. Outcomes of this meeting demonstrate the active contribution of the IDENTIFY project to improving sustainability and networking as to ensure quality laboratory diagnosis services.

- The FAO M&E framework has been finalized based upon the experience gained from the first data call (April 2012) and the tripartite discussions held with the Donor towards the IDENTIFY deliverables. This M&E framework is being routinely implemented by FAO|IDENTIFY team together with the implementing partners (laboratories and technical partners through LoAs).
- While laboratory capacities and national needs are heterogeneous within each region, the laboratory mapping tool developed by FAO is contributing to a regional perspective on laboratory capacities and gaps. This tool can serve for laboratories themselves, as well as decision-makers and technical partners, to identify the regional and individual support required. It is also an invaluable tool for FAO to tailor its capacity building support in line with the project's objectives, measuring the progress made and the impact of the project. This tool is also applicable in other contexts, or under other FAO projects in the future. It will continue to evolve, through the development of specific modules and according to the feedback received. In the Congo Basin region, the LMT has also been used by non IDENTIFY beneficiary laboratories since 2012. This will contribute to the dissemination of tools and best practices developed by the IDENTIFY project beyond the beneficiary laboratories.
- This project has enabled or will shortly enable the launching of innovative initiatives, such as the genetic module in the EMPRES-i database, the four-way linking framework, the laboratory mapping tool, the development of private-public partnerships between laboratories and the animal production sector and the provision of access of laboratories to sequencing services. The genetic module represents an ideal example of a multidisciplinary success, linking virology, epidemiology and bioinformatics, and is receiving increased interest from the scientific community and from policy makers.
- Building on the investments made with support under AI, this project sustains previously established mechanisms: collaborations and communication pathways between organizations, global OFFLU and regional networks, and benefits from the momentum gained through public goods concepts, such as the recognition of the importance of early detection and intervention and impacts of pathogens with pandemic potential. These investments are crucial to the continued development of technical laboratory capacities, especially molecular techniques, to respond to other transboundary and priority diseases.

IV Quarter 2010

Project Monitoring Sheet: IDENTIFY
Project Title: IDENTIFY
Reporting institutions: FAO/OIE/WHO
Reporting period: July-September 2010

Regional component: Global
Countries: 4 "hot spots": - Congo Basin: Uganda, Democratic Republic of Congo, Cameroon, Republic of Congo, Tanzania, Gabon, Equatorial Guinea, Rwanda, Central African Republic - Southeast Asia: Cambodia, China, Indonesia, Lao Peoples Democratic Republic, Malaysia, Myanmar, Philippines, Thailand, Vietnam - South Asia: Bangladesh, India, Nepal - Amazon Basin: Brazil, Bolivia, Peru, Colombia, Ecuador, Venezuela, Mexico
Project title: IDENTIFY
Budget: USD 21 000 000
Effective starting date: December 2009
Planned end date: 30 September 2011
Context of the project This project is part of a complex program--Emerging Pandemic Threats (EPT)--designed by USAID and aimed to find and implement mechanisms to detect disease emergencies, especially from wild life. The One Health concept is an important component of the whole program. The IDENTIFY project is implemented jointly by the Food and Agriculture Organization of the United Nations (FAO), the World Organisation for Animal Health (OIE), and the World Health Organization (WHO).
Objectives of the project The IDENTIFY project is intended to strengthen diagnostic capacities through the development of laboratory networks spanning animal and human sectors with the ultimate aim of enabling countries to meet international obligations for disease reporting. Accurate and timely detection of known pathogens should facilitate the rapid recognition of newly emerging pathogens. International reference laboratories capable of fully characterizing the emerging pathogens are an integral part of these networks. The project focuses on several parts of the world defined by the USAID as "hot spots" for emerging diseases where they are more likely to happen: Congo Basin, Southeast Asia, Amazon Basin and Gangetic Plains. The project will collaborate with the other arms of the EPT program: PREDICT, RESPOND, PREVENT, and USAID's DELIVER project. Collaborations are defined through the Lines of Work (LoW) defined by USAID: Pathogen Detection, Outbreak response, Risk determination, and Risk reduction. Each LoW has a defined workplan with activities and sub-activities to which every project team has agreed upon their level of participation (support, participate or lead).
Planned activities A tripartite work plan and a tripartite project steering committee have been established at the headquarters level. The approach to the project has been fully developed and agreed to among the three partners. The majority of activities will be conducted either jointly or in close coordination. <i>For the description of outputs, activities and sub-activities, refer to Work plan Year Two.</i>

Activities undertaken during the reporting period (July-September 2010):

Output 1. Coordination (Global and Regional)

Activity 1.1: *Ongoing tripartite project management responsible for continued coordination, definition of modus operandi, monitoring, governance, planning and procurement*

GLOBAL and activities across more than one region

- Regular teleconferences, in addition to daily email communication, between the three organizations were held to ensure good coordination among the project management teams at the headquarters levels (5 August & 22 Sept).
- Several face-to-face meetings between the three headquarters Focal Points were held during the quarter to discuss project activities and develop the year 2 work plan (9 July, Washington, D.C.; 23 July, Rome; 9-10 August, Rome; 22 Sept, Washington D.C.).
- Regular teleconferences with IDENTIFY AOTR at USAID were held (19 August & 22 Sept), the July teleconference being replaced by a face-to-face meeting on 9 July, on the occasion of the EPT Quarterly Partners meeting.
- The team also participated in a meeting with USAID in Rome on 22 July to discuss the concept of "EPT +", as well as IDENTIFY issues.
- The HQ team participated in the quarterly EPT meetings in Washington 8-9 July 2010 and 22-24 September 2010.
- The IDENTIFY project team submitted the 3rd quarterly report for the first year of the project on 30 July 2010.
- In the framework of the Letter of Agreement (LoA) and the pass-through funding mechanism between FAO and OIE, the OIE submitted its first expense and activities report to FAO on 15 July 2010. In addition, the OIE completed administrative requirements with FAO in order to extend the LoA in support of Year 2 activities. FAO prepared the amendment to the original LoA in liaison with the contact person at OIE-HQ. However, the final version of the LoA has not yet been presented to the Director General of the OIE for signature.
- Several teleconferences were held between FAO-HQ and FAO Amazon basin team and FAO Congo region for the preparation of each regional year 2 work plans, budgets and implementation of regional activities.
- Agreement of year 2 work plan between FAO HQ and the IAEA/FAO division for activities to be undertaken by the IAEA/FAO joint division in year 2.

CONGO

- Weekly teleconferences are held between OIE HQ and OIE Congo Basin
- The Congo Basin regional tripartite focal points held weekly teleconferences since mid-August in preparation for the stakeholders meeting (see activity 1.7).

SOUTH & SE ASIA

- WHO HQ met WHO SEARO/WPRO in Manila, Philippines, 2/07/2010, to discuss the implementation of IDENTIFY in the South East Asia region.
- OIE has frequent communication with SE Asia Focal Point.
- FAO HQ met the FAO Asia Focal Point in Rome (10 September), to discuss the implementation of the Year 2 work plan in South and South East Asia, results of the

FAO laboratory mapping in Asia and the first steps in the preparation for the Stakeholder meeting in Asia.

AMAZON

- The FAO ECTAD Unit in Panama was designated as the implementation team of the IDENTIFY project (in close collaboration with the FAO sub-regional office in Chile).

Activity 1.2 : *Recruitment of project staff (headquarters and regionally) to support IDENTIFY activities*

GLOBAL and activities across more than one region

- FAO HQ and regional staff already appointed in all regions, except in the Amazon Basin where 2 staff have been identified (ECTAD Panama) and will be fully hired under IDENTIFY starting from January 2011.
- 20 working days of an International Consultant working on designation of FAO Reference Centres according to the new FAO policy, on the new AGAH strategy for management of these Reference Centres and on possible synergies between the FAO and OIE systems of Reference Laboratories/Collaborating Centres.

CONGO

- Recruitments for the WHO Regional Office for Africa (AFRO) are in progress. In July and August, 2 IDENTIFY focal persons (in DRC and Uganda) have been recruited. Sensitization of 5 WHO country offices (DRC, Congo, Equatorial Guinea, Cameroon and Uganda) on the IDENTIFY/EPT project objectives.
- Dr Neo Mapitse was selected for the OIE Focal Point position, and began work 1 Aug 2010 (Gaborone, Botswana); Loise Ndungu was recruited to support IDENTIFY laboratory capacity building activities in the Nairobi, Kenya office and began work on 1 Sept 2010.
- National Consultant for FAO in July 2010 for desktop review of all existing data on laboratory capacity and networks from existing laboratory assessments available (see activity 1.6).
- International Consultant (20 working days, assigned in FAO HQ, expert in private/public labs) on a study on development of private source funding opportunities for West/Central African national veterinary laboratories and of partnerships between these laboratories and the animal industry (see activity 1.8).

SOUTH & SE ASIA

- Recruitments for the WHO South East Asia Regional Office (SEARO) and WHO Western Pacific Regional Office (WPRO) are in progress
- Recruitment projected for OIE Focal Point post (to manage activities in South and Southeast Asia regions, to be based in Bangkok, Thailand); position description to be published early next period; in the interim, existing OIE staff have assumed responsibilities to ensure that the project moves forward in Southeast Asia; potential candidates will be identified and interviewed for Focal Point post early next period
- Two international Consultants for the FAO laboratory mapping activity, respectively for twelve and four weeks (see activity 1.6).

Activity 1.3 :*Develop annual IDENTIFY work plan***GLOBAL and activities across more than one region**

- The Year 1 Work Plan has been approved in its entirety as of 22 Sept 2010. Headquarters and regional project teams from all three organisations worked diligently to reach internal and tripartite deadlines for the development and timely submission of the joint IDENTIFY Year 2 Work Plan. Regional work plans were elaborated and the activities were placed into the new, requested work plan format. The IDENTIFY Year 2 Work Plan was submitted on time (16 August 2010) to USAID. Initial feedback has been received.

Activity 1.4 :*To ensure circulation of information, coordination and harmonization of initiatives, implement standard methods of sharing critical project documents for access by project members***GLOBAL and activities across more than one region**

- The internal IDENTIFY SharePoint site (independent from EPT basecamp website) hosted by WHO was activated by the end of June 2010. User accounts were created and were attributed.
- Several documents have been uploaded to the site. The SharePoint also includes a discussion forum and will serve as resident location for common project documents.
- Access to the Basecamp website has been difficult for some focal points and while we attempted to restore access and report to the problem to the site host, the problem persists, and some focal points were without access at the end of the reporting period.
- Communication tools were drafted by FAO HQ, SE Asia and Congo region teams for discussion with other partners and tripartite validation (IDENTIFY slide masks and IDENTIFY flyer/briefer).

Activity 1.5 :*Development and adaptation of the global laboratory networking strategy under which the global and regional network of networks are created and maintained***GLOBAL and activities across more than one region**

- The global laboratory networking strategy submitted to USAID at the end of June has been approved. It has been distributed to regional counterparts for adaptation at the regional level and will serve as a basis for tripartite collaboration in each region.
- FAO (HQ, Congo region and Asia teams) initiated the review of available documents on approaches and initiatives already taken to the prioritization of diseases already developed by various organizations (national, regional or international, including pre-existing FAO work on the matter).

CONGO

- The global laboratory networking strategy will be a key component of the stakeholders meeting for the Congo Basin.
- Within the framework of this strategy, lists of animal and human diseases including zoonoses to be targeted were developed to be discussed and finalized at the Congo Basin regional stakeholders meeting (see activity 1.7).

SE ASIA

- The South East Asia regional laboratory network strategy, intended to serve as a framework for the tripartite approach in the region, was drafted by FAO SE Asia, discussed with OIE SE Asia and circulated for comments to all tripartite partners.

Output 2. Technical Capacity Building - General

Activity 1.6 : *Joint FAO/OIE/WHO mapping exercise of laboratory capacity and existing laboratory networks and platforms across animal, food and human health sectors in hot spot areas in order to identify gaps in laboratory capability and further detail future activities (refer to "Laboratory Networking Strategy" submitted to USAID 30 June 2010)*

GLOBAL and activities across more than one region

- Mapping of laboratory capacity in FAO/OIE/WHO networks in Congo Basin and SE Asia continues to progress and different phases of the activity will continue throughout the next reporting period.
- The 3 headquarters have defined a possible approach and list of criteria for the collection of data and review of the information in the two hotspots. Existing documents (assessment reports, reviews, presentations, meeting reports, etc.) accessible by each organization on laboratories in beneficiary countries have been gathered within each institution. Each organization is in the process of compiling data (e.g. analysis of OIE Reference Laboratory and Collaborating Centres annual reports, analysis of National Laboratories Annual Reports and FAO laboratory assessments/mission reports, analysis of data collected during IHR country capacity assessments for the Congo Basin region, etc).
- An international FAO Consultant developed a list of questions (leading to a template for 510 data entries) for the laboratory assessment and a tool based on the compilation of the 510 data entries. This mapping tool is based on 19 laboratory indicators that capture existing data. The mapping tool was presented internally in FAO for discussions and comments and was then shared with FAO Africa and Amazon regions. This FAO tool is complementary to the OIE Tool for the Evaluation of Performance of Veterinary Services (PVS) and to the WHO public health laboratory assessment tool.

CONGO

- FAO/OIE met to discuss, among other issues (see activity 1.7), the advancement of the animal health laboratory mapping exercise for the Congo region the week of 27-30 Sept 2010, in Bamako, Mali.

SE ASIA

- Existing documents (assessment reports, reviews, presentations, meeting reports, etc.) accessible by FAO on laboratories in Southeast Asia have been compiled as well as new data collected in 8 laboratories of the Asia region (Cambodia, Lao People's Democratic Republic, Philippines, Thailand and Vietnam as well as the China Animal Health and Epidemiology Center). The FAO mapping tool has been applied for those 8 visited laboratories to quantitatively and qualitatively assess the status and capacity of veterinary laboratories.

Activity 1.7 : *Plan and conduct key stakeholder meetings (awareness workshops) at regional level via ministries to support the development of cross-sectoral approach(es) concerning laboratories, including the possible creation/strengthening of national inter-sectoral/inter-ministerial coordination committees to organize, ensure, and monitor veterinary and human laboratory collaborations at the country level*

CONGO

- Planning for the stakeholder's meeting in the Congo Basin region (2-4 November 2010, Entebbe, Uganda) is proceeding at the regional and HQ levels. Plans on host country, venue, desired participant profiles and timelines of the meeting have been defined and invitations sent. WHO AFRO is coordinating the logistic arrangements for the meeting, while all partners (HQ and regional) have participated on the elaboration of the agenda, technical documents, and terms of reference. Lists of invitees were shared between the organizations.

SE ASIA

- As noted in the previous IDENTIFY report, participants representing all three organizations at the HQ and regional level (or at the country level for WHO) agreed to plan the regional stakeholders meeting for Southeast Asia 29 Nov-2 Dec 2010. In later communications with the WHO Regions these dates were not suitable and a date in late January has been suggested. Focal points from the WHO South East Asia and Western Pacific Regional Offices have been identified to improve the communication flow between the three organizations regionally.
- FAO and OIE held several planning meetings throughout the period for the stakeholders meeting, FAO is taking the logistics lead.

Output 3. Technical Capacity Building - Development of guidance, policy and training

Activity 1.8 : *Joint WHO/OIE/FAO participation in and/or organization of international meetings and conferences on laboratory capacity building*

GLOBAL and activities across more than one region

- Information on already planned trainings during year 1 of the project was shared between FAO/IAEA/OIE/WHO. Opportunities for joint trainings were discussed and training for public health professionals and veterinary scientists together will be explored.
- IDENTIFY funds were used by WHO to support the participation of delegates from African countries in a Global Foodborne Diseases Network (GFN) meeting in Copenhagen in August 2010 that considered training needs for laboratory staff and outbreak investigators.
- The OIE supported several experts and the IDENTIFY OIE Focal Point to attend the IAEA Consultation Meeting (Vienna, Austria, 6-8 Sept 2010) on the development a roadmap for the implementation of modern OIE principles and methods of diagnostic test validation. The IDENTIFY FAO Deputy Manager was also in attendance. The general objective of this consultant meeting was to discuss technical issues for the implementation of the OIE Principles and Methods of Diagnostic Test Validation and to develop for a module-type course manual based on the OIE concept, to develop an

implementation plan for regional training courses and workshops including possible funding mechanisms, and to identify regional laboratories and individuals who could serve as trainers. The potential to integrate this work under IDENTIFY was discussed by FAO and OIE IDENTIFY representatives during the meeting. The meeting report and experts' conclusions are currently under validation by FAO/IAEA/OIE and will be shared with partners once finalized.

- The IDENTIFY FAO Asia Regional Focal Point attended the Biosafety Advisory Group Meeting, conducted by WHO, in Montreux, Switzerland, 7-9 September 2010.
- The IAEA/FAO joint division conducted training on Molecular Diagnosis, Genotyping and Phylogenetic Analyses of Animal Influenza viruses (20 September - 4 October 2010). The Asia, Africa and Amazon FAO Regional offices selected and funded 2 participants per region (8 in total) to participate in this training.

CONGO

- Selection by FAO of two national laboratory experts from Botswana and Zambia to participate and bring laboratory perspectives to the training on 'Investigation, Livestock Disease and Public Health, Wildlife Health and the Human-Animal-Environmental Interface,' South Africa, 22-26 November 2010, organized by the FAO wildlife unit.

SE ASIA

- A letter of Agreement (LoA) with the Asia-Pacific Biosafety Association was drafted by FAO and is pending signature. Activities include a five-day biosafety management training curriculum with corresponding training materials.

Activity 1.9 : *Promote national laboratory policy in each country in each hot spot region through the development of joint international guidelines and/or standards for laboratories (e.g., biosafety/biosecurity, shipment of infectious material, laboratory testing, and related follow-up activities derived from previous laboratory assessments or workshops conducted by IDENTIFY partners)*

GLOBAL and activities across more than one region

- An OIE expert consultation technical project meeting in Paris planned at the end of September 2010 has been postponed until January 2011. The meeting's theme will be the challenges in detection and diagnosis of emerging diseases faced by countries, particularly in the "hot spot" regions. Its major goals are to inform OIE guidance and to determine the feasibility of developing routine procedures and algorithms for detection and diagnosis of unknown pathogens potentially serving as a human pandemic threat, in the context of background occurrence of routine diseases, for national Veterinary Services with differing levels of capability and resources.

CONGO

- The FAO Coordinator attended WHO teleconferences in preparation to the seven-day training to be conducted by the Global Food-borne Infections Network (GFN) on laboratory methods for detecting food-borne pathogens in Africa. The training will be held in Kenya 1-6 November 2010 and résumés have been collected to select four African candidates to attend.
- A "Laboratory Biosafety and Biosecurity" training was conducted by FAO Africa (July 2010, Dakar, Senegal) for the less advanced laboratories (group 1) of the West

and Central African Laboratory Network (RESOLAB).

- A study was initiated by FAO on the development of private source funding opportunities for West/Central African national veterinary laboratories and of partnerships between these laboratories and the animal industry. Part 1 of the study: collection of laboratory/animal production-related data, preparation and diffusion of a questionnaire (July-August 2010) to 23 West/Central African laboratories, grouping countries according to lab capacities/animal production context; one field mission to DRC in September 2010 to check hypothesis in one pilot country (out of 3). Part 2 of the study in the next reporting period.
- In response to the recent African Swine Fever (ASF) outbreaks in newly affected areas in Cameroon (only the Northern part was originally endemic) FAO has offered support for sample collection and shipment to an international reference laboratory (Spain) to the Cameroon veterinary authorities. The objective is to compare ASF strains from various parts of the country in order to better understand the spread of the disease, as well as to test national capacities to ensure proper coordination and logistics in samples collection and international shipment. Lessons will be drawn from this experience on strengths and weaknesses. Discussions are ongoing.
- FAO has initiated meetings with representatives of the African Biosafety Association for potential collaborations.

Output 4. Technical Capacity Building - Laboratory Quality Systems

Activity 1.10 : *Joint FAO/IAEA/OIE/WHO Global Survey on Laboratory Quality Standards and External Quality Assessment (proficiency testing) Schemes*

GLOBAL and activities across more than one region

- Gaps were identified in the data from the Global Survey and to address this, a short version of the questionnaire was used to gather additional information and the three agencies takes the opportunity of seeking information while attending international meetings or conducting Quality Assurance workshops (e.g. FAO Quality Assurance workshops conducted in Africa). Follow-up conference calls between FAO, OIE and WHO were held 6 Jul 2010 and 20 Sept 2010 to discuss next steps, dissemination of results, and how to use this information for capacity building. The FAO regional team assisted in resubmitting and collecting about 15 new questionnaires of the Global Survey on Laboratory Quality Systems (NQS) to the IDENTIFY beneficiary participating countries in order to address gaps in the data of the global survey.

Output 5. Technical Capacity Building - Building laboratory infrastructure

Activity 1.11 : *Provision of laboratory equipment and supplies in a coordinated fashion with IDENTIFY and other national, regional, and global partners with a focus on regional laboratories and regional laboratory networks*

CONGO

- Procurement has been initiated by FAO for calibration of measurement instruments (thermometers, ELISA plate calibration, range of mass, pH solutions, etc) to the nine national IDENTIFY beneficiary veterinary laboratories of Basin Congo.

Output 6. Technical Capacity Building - Laboratory Networking

Activity 1.12 : *Assess the role and activities of existing FAO/OIE/WHO networks in improving the laboratory capacity and networking in hot spot regions. Coordinate regional networking to test for normative diseases and detect emerging or unknown pathogens in wildlife, domestic animals and humans*

GLOBAL and activities across more than one region

- The WHO/FAO concept note on the 4 way linking influenza outbreaks and virus information was approved by the two organizations. Two pilot countries (out of three) have been selected (Vietnam in the SE Asia hot spot, and Egypt outside of IDENTIFY mandate). The HQ offices contacted their respective country offices to get approval from national public health and veterinary authorities and to start preparing the work to be conducted. The first assessment mission is planned in November/December 2010.
- A feasibility study for the development of a genetic virus module for the EMPRES-i database by integrating viral characteristics resulting from viral sequence analysis, such as virus clade designation and antiviral resistance, using data and tools available from the OpenFluDB database has been funded under a Letter of Agreement in August 2010 between FAO and the Swiss Institute of Bioinformatics (SIB). SIB has already established connections with the EMPRES-i web service to link the outbreak event number in EMPRES-i to 14 H5N1 isolates. These connections go in both directions.

CONGO

- FAO has been facilitating the selection of two regional laboratories for Eastern Africa (under another project) which is still pending (last meeting in August, Zanzibar). IDENTIFY will support the end of this process.

AMAZON

- The OIE requested and received approval from USAID to introduce IDENTIFY concepts at the Network of National Veterinary Services Laboratories in the Americas First International Meeting (3-5 November 2010) in advance of official regional USAID kick off.

Activity 1.13 : *FAO/OIE/WHO laboratory twinning initiatives and partnerships*

CONGO

- FAO together with "France Veterinaire International" (FVI) has been exploring interest on twinning projects between African laboratories and French provincial laboratories. Discussions are ongoing.

Planned activities for the next six-month period (1st October 2010-31 March 2010)

Output 1. Coordination (Global and Regional)

Activity 1.1 :*Ongoing tripartite project management responsible for continued coordination, definition of modus operandi, monitoring, governance, planning and procurement*

GLOBAL and activities across more than one region

- Routine project management at HQ level will be managed through weekly conference calls and frequent email communication between FAO, OIE and WHO.
- At the regional level, the Congo Basin and the Southeast Asia regional tripartite focal points will hold regular teleconferences and meetings concerning joint projects in the region.
- HQ and regional project meetings are projected annually, with the next meeting date TBD.
- Participation in monthly IDENTIFY project management team and AOTR teleconferences is planned, and the project team will attend the next EPT Quarterly Partners meeting, planned tentatively for January 2011.
- A representative of the HQ project team (WHO Focal Point will attend) was asked to participate in the One Health meeting planned by the Government of Vietnam on 20 October 2010. The representative will also attend an EPT Partners meeting prior to this meeting on 19 October.
- The IDENTIFY project team was also invited to the STOP AI Lessons Learned meeting 1-2 Dec 2010 Washington DC; the FAO Deputy Manager of IDENTIFY will attend on behalf of IDENTIFY.
- As was agreed by FAO, OIE, WHO, and USAID on 22 September 2010, the next IDENTIFY project report will be due on 30 April 2011, covering the six-month period of 1 October 2010-31 March 2011.

Activity 1.2 :*Recruitment of project staff (headquarters and regionally) to support IDENTIFY activities*

GLOBAL and activities across more than one region

- At HQ level, a WHO staff member will be recruited to assist the IDENTIFY responsible officer in the Lyon Office.
- In support of OIE and joint activities presented in the Year 2 work plan at the global and regional levels, the OIE will initiate conversations with experts.
- International Consultant to provide support to FAO Regional Offices for ongoing laboratory mapping activity to train laboratory experts in the use of the laboratory assessment tool and assist with data analysis. The International Consultant will also assist with the modification of the tool to track capacity building progress.
- International FAO Consultant to review available diagnostic assays for targeted diseases in collaboration with other experts to explore potential applications for large scale multiple disease screening.
- International FAO Consultant to develop training materials under the OIE FAO Network of Expertise for Animal Influenzas (OFFLU) Technical Activity on Capacity Building.

- International Consultant to support FAO Reference Centres and the coordination of IDENTIFY at FAO-HQ between November 2010 and March 2011.
- Technical Consultant for the development of the FAO virus genetic module within EMPRES-i database (half-time) and development of laboratory information system.

CONGO

- International FAO Consultant to finalize the study on development of private source funding opportunities for West/Central African national veterinary laboratories and of partnerships between these laboratories and the animal industry, and presentation for discussion at the annual RESOLAB meeting (6-10 Dec 2010, Mali).
- WHO AFRO is expecting to recruit staff specifically for IDENTIFY and to nominate focal points from existing staff in the various Country Offices and Intercountry Support Teams in the Region.
- Grace Omwega has been recruited by OIE to support IDENTIFY laboratory capacity building activities in the Nairobi, Kenya office and will begin work early next quarter.

SOUTH & SE ASIA

- Position description for OIE Focal Point post (to manage activities in South and Southeast Asia regions, to be based in Bangkok, Thailand) to be published early next period; potential candidates will be identified, interviewed, and selected, to begin work in first quarter of 2011.
- Recruitment of FAO laboratory expert to conduct site visit and identification of immediate needs in South Asia.
- SEARO will also recruit a staff member to conduct IDENTIFY activities in that WHO Region. This will cover the countries in geographic region of SE Asia and also the Gangetic plain for WHO.
- Recruitment of staff in WPRO and some country offices is proceeding.

AMAZON

- International FAO laboratory Consultant to conduct laboratory assessment and mapping.

Activity 1.3 :*Develop annual IDENTIFY work plan*

GLOBAL and activities across more than one region

- The IDENTIFY Year 2 Work Plan was submitted on 16 August 2010 to USAID. The project team will provide a revised budget at the regional level to the AOTR in the next quarter.

Activity 1.4 :*To ensure circulation of information, coordination and harmonization of initiatives, implement standard methods of sharing critical project documents for access by project members*

GLOBAL and activities across more than one region

- The project team will conduct an IDENTIFY SharePoint site training in mid-November to initiate the users, expand its use, and to introduce its range of functionalities. IDENTIFY partners will begin to post key IDENTIFY documents on the SharePoint site to ensure better communication and coordination. A first trial

phase will be conducted at the HQ level to detect bugs and develop a user's guide before roll-out in the regions, tentatively foreseen for early 2011. IDENTIFY partners will post key IDENTIFY documents on the EPT basecamp website to ensure better communication with the other EPT programs.

- Finalization of the development of IDENTIFY communication tools by FAO-HQ in close collaboration with partners and with regional project teams.

AMAZON

- FAO Regional team will develop communication tool(s) for different audiences, stakeholders and partners in the region, including the translation into Spanish and Portuguese.

Activity 1.5 : *Development and adaptation of the global laboratory networking strategy under which the global and regional network of networks are created and maintained*

CONGO

- Preparation of the Annual Regional Laboratory FAO-RESOLAB Network meeting 6-10 December, Bamako, Mali. Special sessions on rabies, FMD, results of Avian influenza/Newcastle proficiency test, funding sources, disease prioritization and outcomes of the IDENTIFY stakeholder meeting to be included.
- The global Laboratory Networking Strategy document will serve as the basis for tripartite collaboration in each region and will be a key component of the stakeholders meeting for the Congo Basin.
- Within the framework of this strategy, lists of animal and human diseases including zoonoses to be targeted by the IDENTIFY project will be discussed and finalized at the Congo Basin regional stakeholders meeting (see activity 1.6).

SOUTH & SE ASIA

- A Regional Strategy document will be presented at each region's stakeholders meeting. Within the framework of this strategy, lists of animal and human diseases including zoonoses to be targeted by the IDENTIFY project will also be discussed and finalized at the regional stakeholders meeting (see activity 1.6).
- Planning (for expert meeting) and preliminary development of the OIE PVS Pathway laboratory technical mission tool, to be piloted in the SE Asia region, focusing on laboratory management and strategic planning at the country level.

AMAZON

- Formulation of regional laboratory network strategy adapted from the global network strategy (January to March 2011).

Output 2. Technical Capacity Building - General

Activity 1.6 : *Joint FAO/OIE/WHO mapping exercise of laboratory capacity and existing laboratory networks and platforms across animal, food and human health sectors in hot spot areas in order to identify gaps in laboratory capability and further detail future activities (refer to "Laboratory Networking Strategy" submitted to USAID 30 June 2010)*

GLOBAL and activities across more than one region

- Mapping of laboratory capacity in FAO/OIE/WHO networks in Congo Basin and SE Asia is in progress and different phases of the activity will continue throughout the next reporting period.
- Integration of FAO and OIE animal health laboratory mapping data will occur during the next reporting period.
- International Consultant to provide support to FAO Regional Offices in Bangkok, Bamako and Panama for ongoing laboratory mapping activity to train laboratory experts in the use of the laboratory assessment tool and assist with data analysis. The International Consultant will also assist with the modification of the tool to track capacity building progress.

CONGO

- Current laboratory capacity and discussion of proposed lists of diseases to be targeted by the IDENTIFY project will be on the agenda at the upcoming stakeholders meeting (Entebbe, Uganda, 2-4 Nov 2010) and will complement existing data collection conducted by each organization. After the stakeholders meeting, the HQ and regional project teams will debrief and discuss the use of laboratory capacity data collected at the meeting and next steps for the mapping activity.
- Joint questionnaire for laboratory mapping to be presented during the Congo region Stakeholders meeting 2-4 November 2010 in Uganda
- The Integrated Disease Surveillance and Response (IDSR) guidelines list will serve as the basis for discussion on the human diseases to be targeted by the IDENTIFY project during the Stakeholders meeting in Entebbe, 2-4 November 2010.
- A proposal for disease prioritization for the IDENTIFY project based on regional animal disease lists for Central/Eastern/Western Africa has been drafted by FAO and discussed with OIE. Preparation of and feedback on group work session facilitation will be discussed prior to the Stakeholders meeting in Entebbe, 2-4 November 2010.
- Assessment of the quality assurance system in the National Veterinary laboratory of Cameroon to be conducted by FAO.

SOUTH & SE ASIA

- Proposal for mechanism of animal disease prioritization was reviewed and discussed between FAO and OIE. Further discussion will ensue to determine the way forward for disease prioritization for the Stakeholders meeting scheduled for late January 2011.
- Draft concept note for the SE Asia stakeholders meeting developed and discussed in October 2010 by FAO and OIE.
- Finalization and modification of the FAO laboratory mapping tool.
- Presentation of the initial FAO laboratory mapping results during the SE Asia Stakeholders meeting proposed for January 2011.
- FAO site visits assessment and identification of immediate needs of the national animal health laboratories (MoA) in Bangladesh and Nepal.
- Assessment of the biosafety infrastructure and biosafety cabinets in eight national animal health laboratories (MoA) in Cambodia, Lao People's Democratic Republic, Myanmar, Philippines, Thailand, Bangladesh and Nepal under the LoA between FAO and Asia-Pacific Biosafety Association.

AMAZON

- Desktop review in February and March 2011, to compile existing data and analysis of

National Laboratories Annual Reports and FAO laboratory assessments/mission reports.

Activity 1.7 : *Plan and conduct key stakeholder meetings (awareness workshops) at regional level via ministries to support the development of cross-sectoral approach(es) concerning laboratories, including the possible creation/strengthening of national inter-sectoral/inter-ministerial coordination committees to organize, ensure, and monitor veterinary and human laboratory collaborations at the country level*

CONGO

- The invitations to the Stakeholder's meeting in Africa scheduled for Entebbe, Uganda from 2-4 November have been sent and the planning among the three organizations at the regional and headquarters level for the meeting is continuing.

SE ASIA

- The Regional Stakeholder's meeting in South East Asia is now tentatively planned for late January 2011 with FAO taking the lead in logistics. FAO/OIE/WHO Regional Focal Points have been identified and all partners (HQ and regional) will participate on the elaboration of the agenda, technical documents, and terms of reference.
-

Output 3. Technical Capacity Building - Development of guidance, policy and training

Activity 1.8 : *Joint FAO/OIE/WHO participation in and/or organization of international meetings and conferences on laboratory capacity building*

GLOBAL and activities across more than one region

- The compilation of training opportunities for Year 1 and looking forward to Year 2 will continue. Training for public health and veterinary professionals together will be included when feasible.

CONGO

- OIE Support of participation of representatives to the bi-annual Congress of the Southern and Eastern Africa Rabies Group (SEARG) in Maputo, Mozambique, 25-27 January 2011
- OIE Support of participation of representatives to the OIE Global Conference on Wildlife Animal Health and Biodiversity - Preparing for the Future, Paris, France, 23-25 February 2011.
- Planning for trainings of laboratory personnel on quality assurance, laboratory information management systems, forwarding of biological samples and other topics in OIE Reference Laboratories to occur throughout 2011 in coordination with FAO and WHO, TBD.

SE ASIA

- FAO support of participants to the One Health Conference to be held in Melbourne, Australia in February 2011, and of the International Federation of Biosafety Association to be held in Bangkok, Thailand in February 2011.
- Planning for trainings of laboratory managers on OIE standards, strategic plan

development, laboratory management and other topics in OIE Reference and Twinning Laboratories to occur throughout 2011 in coordination with FAO and WHO, TBD.

Activity 1.9 : *Promote national laboratory policy in each country in each hot spot region through the development of joint international guidelines and/or standards for laboratories (e.g., biosafety/biosecurity, shipment of infectious material, laboratory testing, and related follow-up activities derived from previous laboratory assessments or workshops conducted by IDENTIFY partners)*

GLOBAL and activities across more than one region

- An OIE expert consultation technical project meeting in Paris is planned in January 2011. The meeting's theme will be the challenges in detection and diagnosis of emerging diseases faced by countries, particularly in the "hot spot" regions. Its major goals are to inform OIE guidance and to determine the feasibility of developing routine procedures and algorithms for detection and diagnosis of unknown pathogens potentially serving as a human pandemic threat, in the context of background occurrence of routine diseases, for national Veterinary Services with differing levels of capability and resources. FAO and WHO will be invited to the meeting as IDENTIFY Focal Points and/or participating experts.
- E-learning Training Module to be developed in coordination with OFFLU technical activity on capacity building (8 working days of an International Consultant from FAO).

CONGO

- Preparation of an FAO training on Quality Assurance, 15-20 November 2010, Douala, Cameroon, for six countries under IDENTIFY.
- Attendance of two national laboratory experts from Botswana and Zambia will be supported by FAO for training on "Investigation, Livestock Disease and Public Health, Wildlife Health and the Human-Animal-Environmental Interface," South Africa, 22-26 November 2010, organized by the FAO wildlife unit.
- Part 2 of the FAO study on development of private source funding opportunities for West/Central African national veterinary laboratories and of partnerships between these laboratories and the animal industry (2 field missions, review of data, reporting). Presentation and discussion of the outcomes at the RESOLAB meeting (6-10 Dec 2010).
-

SE ASIA

- Preparation for a WHO Global Foodborne infections Network (GFN) training course is under consideration for SE Asia.
- A 5-day biosafety management training will be conducted under the LoA between FAO and the Asia-Pacific Biosafety Association.

Output 4. Technical Capacity Building - Laboratory Quality Systems

Activity 1.10 : *Joint FAO/IAEA/OIE/WHO Global Survey on Laboratory Quality Standards*

and External Quality Assessment (proficiency testing) Schemes

GLOBAL and activities across more than one region

- The Global Survey of laboratory quality standards and external quality assessment schemes is organized in two parts. Once completed, data from the first part on National Quality Systems (NQS) could be used as a baseline for IDENTIFY to then measure progress made in the near future. Data from the second part on External Quality Assessment Schemes (proficiency testing) were decided to be published as an EQAS database on the websites of the four organizations (WHO, OIE, FAO and IAEA for the benefit of laboratories and Member States). This publication is planned to be released in the next months and will be the result of a joint activity and a common will to promote EQAS importance. More follow-up conference calls concerning EQAS and laboratory quality systems are expected in the next reporting period. FAO regional offices in each hot spot will take new opportunities of seeking additional information to address gaps in the data of the global survey while attending/holding international meetings and Quality Assurance workshops. The Global Survey results could help target support to national EQA programs in the Congo Basin region and participation in international EQAS including the existing WHO/NICD Microbiology EQA Programme in Africa organized by the National Institute for Communicable Diseases of Johannesburg, South Africa.

Output 5. Technical Capacity Building - Building laboratory infrastructure

Activity 1.11 : Provision of laboratory equipment and supplies in a coordinated fashion with IDENTIFY and other national, regional, and global partners with a focus on regional laboratories and regional laboratory networks

GLOBAL and activities across more than one region

- Procurement of laboratory equipment by FAO to address immediate needs already defined by countries for the National Veterinary Laboratories of Congo Basin and Southeast Asia countries will continue.

CONGO

- Calibration kits for measurement instruments procured by FAO will be delivered to nine National Veterinary Laboratories.
- Joint FAO/IAEA division: mission to Uganda for development of a Laboratory Information Management Software (LIMS) system. Provision of hardware/software.

SOUTH & SE ASIA

- Previously defined biosafety equipment and supplies procured by FAO will be delivered to the national animal health laboratories (MoA) in Cambodia, Lao People's Democratic Republic, Philippines, Thailand, Vietnam, Bangladesh and Nepal.
- Each biosafety cabinet assessed under the LoA between FAO and the Asia-Pacific Biosafety Association laboratories will be calibrated to meet internationally recognized standards (NSF49 or EN 12649). Certification and recommendations for maintenance of biosafety cabinets and in-house calibration will also be provided.

Output 6. Technical Capacity Building - Laboratory Networking

Activity 1.12 : *Assess the role and activities of existing FAO/OIE/WHO networks in improving the laboratory capacity and networking in hot spot regions. Coordinate regional networking to test for normative diseases and detect emerging or unknown pathogens in wildlife, domestic animals and humans*

GLOBAL and activities across more than one region

- Information concerning the role and activities of existing networks will still be collected in the framework of the Laboratory Network Strategy and Laboratory Mapping activity.
- For the first time, regional representatives will be able to attend the third annual OFFLU meeting (16-17th Nov 2010, Rome). This should enable the development of stronger linkages between OFFLU and regional networks.
- Two assessment missions are scheduled between November 2010 – January 2011 to support the WHO/FAO concept note on the 4-way linking of influenza outbreaks and virus information and preparation of national workshops has begun. Discussions between FAO HQ, WHO HQ, FAO and WHO national offices to be conducted soon.
- Under the LoA between FAO and the Swiss Institute of Bioinformatics (SIB) the following activities are planned: (1) the development of SOPs (Standard Operating Procedures) for quality virus sequence submissions; (2) exploration of the linkage of EMPRES-i outbreak data with sequences stored in the OpenFlu database; (3) evaluation of the feasibility of integrating data on virus characteristics using the data and tools available from the OpenFluDB; (4) generation of initial map layers to complement existing EMPRES i maps of animal disease distribution; and (5) recommendation of standardised procedure and techniques for analysis of data across OpenFluDB and EMPRES-i.

CONGO

- Eastern FAO Africa Region Laboratory Network (EARLN) Secretariat meeting to be held in Nairobi in February 2011.
- FAO RESOLAB Annual meeting 6-10 December 2010, Bamako, Mali

AMAZON

- Discussions between OIE and the Network of National Veterinary Services Laboratories in the Americas on how their goals align with the objectives of IDENTIFY and possible collaborations are in the process of being identified. The OIE Focal Point will attend the Network's First International Meeting (3-5 November 2010). While not an official IDENTIFY meeting, this represents an opportunity to briefly introduce the concepts of IDENTIFY to meeting participants. FAO will present their approach to regional lab networking and the WHO Regional Office for the Americas (PAHO) will also participate. The HQ USAID representative for Latin America will also be invited.

Activity 1.13 : *FAO/OIE/WHO laboratory twinning initiatives and partnerships*

GLOBAL and activities across more than one region

- The need for OIE Laboratory Twinning Projects to support the advancement of the laboratory networks and diagnostic capacity will be assessed based on an analysis of

the predominant endemic OIE listed diseases and the list of disease to be targeted by the IDENTIFY project outlined during each regional stakeholders meeting.

CONGO

- Following the OIE assessment listed above and the outcome of the stakeholders meeting, OIE expects to initiate discussions with potential candidate twinning laboratories in 2011.
- Planning for OIE Meeting with potential twinning candidate laboratory directors to discuss their role in meeting the diagnostic needs of the laboratory network in the Congo region
- Expert missions to initiate FAO twinning initiatives between three Congo Basin laboratories and French provincial laboratories is foreseen.

SE ASIA

- Following the OIE assessment listed above and the outcome of the stakeholders meeting, OIE expects to initiate discussions with potential candidate twinning laboratories in 2011.

Main challenges encountered and response provided

Existing joint FAO/OIE/WHO initiatives provide opportunities to benefit intersectoral collaboration. However, the reality is that while intersectoral collaboration and initiatives are increasing, it is not yet second nature between the international organizations, particularly at the regional level. As a result, constant effort is required to maintain the tripartite spirit at the global, regional, and national levels. It is often recommended that intersectoral collaboration efforts be nurtured in “peace time”—the absence of epidemiological events of international interest—however, the incentive to maintain collaboration is not as strong as during outbreaks or other emergency situations. As a project team, we are trying new strategies and management techniques to address this overarching challenge and to encourage more effective intersectoral collaboration together within the framework of the IDENTIFY project.

Regional offices of FAO, OIE and WHO are not always located in the same countries or cities in each hot spot region, which complicates interactions between the organizations. The IDENTIFY team is looking for ways to capitalize on common attendance at regional meetings and conferences in order to conduct project meetings at these times. In addition, as the HQ and regional project teams have moved forward with the planning of the stakeholders meeting in the Congo Basin, we have realized that communication and coordination on meeting planning between regional partners, between HQ partners, and between HQ and regional partners is an important challenge.

One struggle for OIE is the challenge of dual reporting streams. We must report to FAO at a particular frequency and to USAID through IDENTIFY at another frequency. This administrative load impinges upon time that OIE could be dedicating toward the technical activities of the IDENTIFY project.

For WHO, activities at the country level require coordination with the various Regional Offices. In the case of the SE Asia, this means dealing with 2 Regional Offices. This can lead to a prolonged decision-making process but provides HQ opportunity to build better relations with the Regional Offices. This process remains ongoing.

Unlike other EPT partners and staff, FAO, OIE and WHO counterparts have many other responsibilities outside of the EPT Program and specifically the IDENTIFY project. The FAO, OIE and WHO focal points at all levels have a massive amount of running activities which require intensive planning and coordination. USAID, along with EPT Partners, multiple requests to meet and short deadlines for documents submissions, missions, meetings, etc., this creates some conflicts with the important work that our three organizations need to carry out.

Main progress made towards the achievement of project outcomes *(since the start of the project activities)*

We continue to build a strong and collaborative tripartite IDENTIFY project team at the HQ level. Substantial planning has taken place both at the HQ and regional levels to accomplish project goals and it is clear that the momentum of the IDENTIFY project is building. We have accomplished significant goals in the reporting period: submitted the Year 2 work plan, began concrete planning for the Congo Basin regional stakeholder’s meetings, held project HQ team planning meetings, elaborated concrete strategies for the 5-year project, implemented new management mechanisms, and carried out work on the laboratory capacity mapping activity and the lists of IDENTIFY animal and human diseases including zoonoses. The FAO/OIE/WHO joint HQ project team invested a lot of resources in coordination with

the Congo Basin regional team because we know that the preparations for the meeting will be the groundwork for the other regional stakeholder's meetings. This increased involvement will help us to streamline the planning process in the other regions. The joint regional activities have set an important precedent for regional intersectoral collaboration with and among our organizations; tripartite regional activities have activated regional engagement and have encouraged increased communication.

For WHO, building a team at headquarters level and getting commitment from the various Regional Offices to be part of the project have been significant milestones.

For OIE, bringing the Regional Focal Point for the Congo Basin on board and building a close HQ and regional relationship has helped OIE to better prepare for the stakeholder's meeting and contribute meaningfully to the collaboration with regional counterparts.

For FAO, capitalizing on previous efforts and initiatives invested during Avian influenza projects is crucial. This includes regional laboratory networking dynamics that are in place in most hot spot regions. This Identify project is instrumental in maintaining these regional initiatives and linking them with international networking initiatives.

Project Monitoring Sheet: **OSRO/IND/802/USA**

Project Title: **Immediate technical Assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) to India**

Reporting period: **October 2010 – March 2011**

Country: India
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) to India
Code: OSRO/IND/802/USA
Budget: USD 1 220 000 (Phase I)
Total budget: USD 3 000 000 ¹
Effective starting date: 28 June 2010
Planned end date: 30 June 2013 (current NTE of Phase I – 30 September 2011)
<p>Context of the project</p> <p>This project will focus on the eastern Indian states of Assam and West Bengal in the short-term with a longer term capacity building of animal health personnel, especially in the field of surveillance, epidemiological analysis and in-depth disease investigation. The project focuses on understanding the dynamic patterns of the poultry production systems, value/supply chains and trade in poultry and poultry products within India.</p> <p>The project is expected to provide information on infection and transmission dynamics of the virus in the local environment where the virus persists and to consolidate the capacity to establish and conduct risk-based surveillance programmes. The aim of building capacity to strengthen surveillance and epidemiological analysis will lead to an improved tracking of the virus movement, greater virus isolations and better molecular information on the virus evolution. Such information is critical for rational and targeted control of the disease. With the strategic inputs in the project, the country would be better placed to take a leadership role in supporting regional efforts to control HPAI.</p>
<p>Objectives of the project</p> <p>The project aims to build capacity to improve surveillance and epidemiological analysis in both domestic and wild birds. The overall objective of the programme is to contribute to the elimination of the threat posed by HPAI by controlling the disease in poultry, to ensure that India no longer presents a risk for the development of human pandemic influenza from the H5N1 virus.</p>
<p>Planned activities</p> <p>Output 1: Establishment of an HPAI (Epidemiology) Unit in India</p> <p>Activity 1.1 Establishment of an HPAI (Epidemiology) Unit.</p> <p>Activity 1.2 Coordination of the country programme.</p> <p>Activity 1.3 Management and operations support.</p> <p>Activity 1.4 Capacity building in project/programme management.</p> <p>Output 2: Improved epidemiological capacity within the Department of Animal Husbandry, Dairying and Fisheries (DADF), Ministry of Agriculture (MoA) of India</p> <p>Activity 2.1 Conduct Field Epidemiology Training Programme for Veterinarians (FETPV).</p> <p>Activity 2.2 Conduct outbreak investigation courses for Field/District Veterinary Officers.</p> <p>Activity 2.3 Country visits to study best practices for surveillance (in Thailand for X-ray</p>

¹ This project has a three year duration. Total budget of USD 3 000 000 is subdivided as follows: USD 1 220 000 for year I, USD 948 134 for year II and USD 831 866 for year III. Funds have been committed for year I only; activities planned for years II and III will be implemented based on project performance and fund availability.

surveillance, Indonesia for participatory disease surveillance and response (PDSR) and Viet Nam for grassroots level surveillance).

Activity 2.4 Conduct trainings for grassroots level disease detection and reporting (e.g. community based animal health workers).

Activity 2.5 Provide overseas training in advanced epidemiology and surveillance to the technical staff of DADF.

Output 3: Establishment of a risk-based surveillance programme

Activity 3.1 Develop a grassroots level surveillance programme.

Activity 3.2 Undertake structured virus isolation and characterization.

Activity 3.3 Establish a disease information system dedicated to HPAI.

Output 4: Improved understanding of epidemiology of HPAI in India for rational and targeted control of the disease

Activity 4.1 Study the poultry value chains to include wet markets.

Activity 4.2 Map the farming sectors and socio-economic background along the market and value chains.

Activity 4.3 Conduct data analysis for mapping disease outbreaks and distribution of virus clades.

Activity 4.4 Define infection and transmission dynamics in the context of the various poultry farming systems and socio-economic background.

Activity 4.5 Identify critical points for intervention to control HPAI.

Activities undertaken during the reporting period

Output 1: Establishment of an HPAI (Epidemiology) Unit in India

Activity 1.1: Establishment of an HPAI (Epidemiology) Unit.

Recruitment of national and international staff

- The Chief Technical Advisor (CTA)/Team Leader/international Epidemiology Expert was recruited in October 2010.
- A temporary International Operations Officer worked for the project from October until the end of December 2010. A permanent International Operations Officer was identified, and the recruitment is pending governmental clearance; the anticipated starting date is April 2011.
- The International Geographic Information System (GIS) Expert is expected to commence duties on 3 April 2011.
- A National Operations Officer (finance/administration assistant) was recruited on 1 January 2011.
- Initially, MoA nominated a candidate for the position of national Project Coordinator, but after a new Joint Secretary was appointed at DADF, this nomination was withdrawn. DADF has now requested to fill the post with a mutually agreed candidate.
- Two national staff candidates (HPAI Epidemiology and HPAI Surveillance) received an offer for this position, but they were unable to obtain the necessary release from their current Government positions and had to decline the offer. The project is considering other candidates for these positions.

Renovation of the building at the Animal Quarantine Certification and Service Station, Kapashera

- All the preparatory work required for renovation of the premises assigned to the project by the Government of India is completed. The necessary budget revision was cleared by the United States Agency for International Development (USAID) in November 2010. All technical specifications were cleared by FAO Rome in March 2011. The renovation work was retendered mid-March 2011. It is anticipated that a contract with preferred bidder will be

signed in April 2011. The renovation should be completed by August 2011.

- The HPAI (Epidemiology) Unit will commence working from the Animal Quarantine and Certification Services (AQCS) station in April in a temporary office space. Procedures to purchase equipment for the office commenced in late February 2011.

Activity 1.2 Coordination of the country programme.

- To ensure full cooperation and collaboration with the Government of India, regular contact was maintained with all the officials of DADF. The new Joint Secretary of DADF was updated on the progress of the project regularly. The Joint Secretary was also invited by FAO to represent India at a regional ECTAD meeting in Bangkok in January 2011. Meetings were held with USAID India to inform about the status of the project, the animal disease situation and the Government Veterinary Service capacities.

Activity 1.3 Management and operations support.

- Frequent meetings were held and technical meetings and workshops attended to provide support to the Government of India.

Activity 1.4 Capacity building in project/programme management.

- The Joint Secretary was supported with managerial and technical matters in India and during an overseas meeting.

Output 2: Improved epidemiological capacity within DADF, MoA of India

Activity 2.1 Conduct FETPV.

- The senior regional epidemiologist in charge of the regional FETPV programme visited India twice in the reporting period. Meetings were held with ten stakeholders and organizations to explore future partnerships.

Activity 2.3 Country visits to study best practices for surveillance (in Thailand for X-ray surveillance, Indonesia for PDSR and Viet Nam for grassroots level surveillance).

- The Government of India was officially contacted to nominate eight policy makers and technical staff to visit Viet Nam and Thailand in May 2011. The Governments of Thailand and Viet Nam were contacted and agreed to the visit. In both Thailand and Viet Nam, a national coordinator was appointed.

Activity 2.4 Conduct trainings for grassroots level disease detection and reporting (e.g. community based animal health workers).

- In March 2011, the CTA/TL and national operations manager visited Agartala and Tripura and studied the outbreak response of the HPAI outbreaks in the area. The findings will aid in identifying gaps in the current disease surveillance, which will be addressed in future trainings.

Activity 2.5 Provide overseas training in advanced epidemiology and surveillance to the technical staff of DADF.

- The Government of India was officially contacted to nominate two technical staff to undergo an advanced 3-month epidemiology training in New Zealand from June until August 2011.

Output 3: Establishment of a risk-based surveillance programme

Activity 3.1 Develop a grassroots level surveillance programme.

- FAO studied the three currently existing surveillance programmes in India and recommendations for improvement are forthcoming. Assistance was provided in the process

of preparing for a Government official to travel to Thailand to learn about the Thai X-ray surveillance programme.

Activity 3.2 Undertake structured virus isolation and characterization.

- FAO had requested from the Government of India to undertake structured virus isolation and characterization at the High Security Animal Disease Laboratory, Bhopal of the isolates from the Agartala HPAI H5N1 outbreaks.

Output 4: Improved understanding of epidemiology of HPAI in India for rational and targeted control of the disease

Activity 4.3 Conduct data analysis for mapping disease outbreaks and distribution of virus clades.

- Current and past HPAI outbreaks were mapped. Virus clade identification and phylogenetic tree analysis is pending.

Activity 4.4 Define infection and transmission dynamics in the context of the various poultry farming systems and socio-economic background.

- This research was initiated and will continue.

Activity 4.5 Identify critical points for intervention to control HPAI.

- Report was submitted for technical clearance.

Planned activities for the next six-month period

Output 1: Establishment of an HPAI (Epidemiology) Unit in India

Activity 1.1 Establishment of an HPAI (Epidemiology) Unit.

- Complete the recruitment of international/national staff and the renovation of the building at AQCS station, Kapashera. Move the Epidemiology Unit from its current building to AQCS station and launch its official opening.

Output 2: Improved epidemiological capacity within DADF, MoA of India

Activity 2.1 Conduct FETPV.

- A third visit by the regional senior epidemiologist is planned for May 2011, to recruit trainers and lectures. The first one month training course will be held in August for 30 participants.

Activity 2.2 Conduct outbreak investigation courses for Field/District Veterinary Officers.

- Develop the curriculum and training materials.

Activity 2.3 Country visits to study best practices for surveillance (in Thailand for X-ray surveillance, Indonesia for PDSR and Viet Nam for grassroots level surveillance).

- Conduct a study tour to Thailand and Viet Nam with eight government officials.

Activity 2.4 Conduct trainings for grassroots level disease detection and reporting (e.g. community based animal health workers).

- Develop the curriculum.

Activity 2.5 Provide overseas training in advanced epidemiology and surveillance to the technical staff of DADF.

- Provide training to two technical staff from MoA in advanced epidemiology at Massey University, New Zealand, from June until August 2011.

Output 3: Establishment of a risk-based surveillance programme

Activity 3.1 Develop a grassroots level surveillance programme.

Activity 3.2 Undertake structured virus isolation and characterization.

- Undertake structured virus isolation and characterization for the HPAI outbreaks from Agartala.

Activity 3.3 Establish a disease information system dedicated to HPAI.

- Organize an expert visit to the Project Directorate on Animal Disease Monitoring and Surveillance in Bangalore to assess the current disease information system and recommend enhancements. Assess the need for a disease information system dedicated to HPAI, based on the existing systems and the frequency of HPAI outbreaks.

Output 4: Improved understanding of epidemiology of HPAI in India for rational and targeted control of the disease

Activity 4.3 Conduct data analysis for mapping disease outbreaks and distribution of virus clades.

- Depending on the HPAI situation, conduct this activity at the national or regional level at the Epidemiology Unit.

Activity 4.4 Define infection and transmission dynamics in the context of the various poultry farming systems and socio-economic background.

- Depending on the HPAI situation, undertake this activity at the national or regional level at the Epidemiology Unit.

Activity 4.5 Identify critical points for intervention to control HPAI.

- Depending on the HPAI situation in the reporting period, perform analysis using data gathered prior to this reporting period and the current data.

Main challenges encountered and response provided

- Delay in the clearances for recruitment of international staff from the Government of India was resolved after productive meetings with the Regional Manager and renewed correspondence with the FAO Representative. Government clearance for the international Operations Officer is expected in April 2011.
- Delays in the renovation process of the AQCS station Kapashera owing to the pending FAO technical clearance were resolved.
- Delays in national staff hiring, owing to selected candidates not been released from their Government positions. Other candidates are being considered for the positions.
- Activity 4.1 (Study the poultry value chains to include wet markets) and Activity 4.2 (Map the farming sectors and socio-economic background along the market and value chains) could not be carried out in the reporting period, as the money allocated for this project will be used for the renovation of the AQCS Kapashera offices. These studies are expected to be conducted during the next funding cycle.

Main progress made towards the achievement of project outcomes (from the start of the project activities)

- Signing of the project document of the USAID project OSRO/IND/802/USA.
- Government support in the establishment of an HPAI Epidemiology Unit received.
- Recruitment of international staff.
- Research in HPAI started.

Project Monitoring Sheet: **OSRO/IND/802/USA**

Project Title: “Immediate Technical Assistance to Strengthen Emergency Preparedness for Highly Pathogenic Avian Influenza to India”

Reporting period: April 2013 – September 2013

Country: India
Project title: Immediate Technical Assistance to Strengthen Emergency Preparedness for Highly Pathogenic Avian Influenza to India
Code: OSRO/IND/802/USA
Total budget: USD 2 220 000
Effective starting date: 28 June 2010
Planned end date: 30 September 2013
<p>Context of the project</p> <p>This project implemented by the Food and Agriculture Organization of the United Nations (FAO) focuses on establishing an epidemiology unit under the India department of animal husbandry, dairying and fisheries (DADF), capacity building of animal health personnel, especially in relation to surveillance, epidemiology and in-depth outbreak investigations. Porous and long land borders between neighbouring countries with minimal control points and quarantine facilities as well as diffused and low biosecurity poultry production and marketing chains continue to pose a risk for the spread of Highly Pathogenic Avian Influenza (HPAI) in India. It is necessary to develop an understanding of the dynamic structure of poultry production systems, supply chains and marketing of poultry and poultry products within India and internationally which drive the epidemiology of the disease. There is also lack of capacity of skilled human resources and facilities needed to develop sensitive surveillance systems as well as conducting effective epidemiological studies for the improved management of HPAI. Although there is an existing Preparedness, Control and Containment Plan for Avian Influenza, it is expected that, with the support of this project, the Government of India will be able to draft a long-term national strategy in consultation with various stakeholders to build necessary epidemiological capacity in order to deal with the longer term issues to control and prevent HPAI.</p>
<p>Objectives of the project</p> <p>The main aim of the project is to detect, reduce and control HPAI in poultry in order to improve livelihoods and promote food security of large vulnerable population, thereby reducing poverty, contributing to rural economic development and improving the gross domestic product (GDP) in India. The overall objective of the programme is to reduce and then to eliminate the threat posed by HPAI H5N1 in the country. The country will then cease to be at risk for the development of human pandemic influenza from the H5N1 influenza virus. The specific objective of the project, <i>inter alia</i>, is to support DADF in building the required capacity to improve surveillance and epidemiological analysis and reporting within the central and state veterinary services and at local levels using a community based approach by improving understanding of the epidemiology of HPAI, and so, identifying priorities to reduce the risk of poultry outbreaks and consequent human cases. The main outputs are as follows:</p> <p>Output 1: Establishment of a HPAI (Epidemiology) Unit in India</p> <p>Output 2: Improved epidemiological capacity within the DADF, MoA of India</p> <p>Output 3: Establishment of a risk based surveillance programme</p> <p>Output 4: Improved understanding of epidemiology of HPAI in India for rational and targeted control of the disease</p>

Planned activities for the reporting period (April 2013 to September 2013)

Output 1: Establishment of a Department of Animal Husbandry Dairying and Fisheries (DADF) Veterinary Epidemiology Unit in India

- establishment of a DADF Veterinary Epidemiology Unit at the Animal Quarantine and Certification Station (AQCS) at Kapashera, New Delhi;
- coordination of country programme;
- management and operations support; and
- capacity building in project/programme management.

Output 2: Improved epidemiological capacity within the DADF, Ministry of Agriculture (MoA) of India

- conduct Field Veterinary Epidemiology Training Programme (FETPV);
- conduct outbreak investigation courses for Field/District Veterinary Officers; and
- conduct trainings for grassroots level disease detection and reporting (e.g. community-based animal health workers [CAHWs]):

Output 3: Establishment of a risk-based surveillance programme

- develop a grassroots level surveillance programme;
- conduct disease outbreak investigation in the event of an HPAI outbreak in collaboration with DADF;
- undertake structured virus isolation and characterization; and
- establish a disease information system dedicated to HPAI.

Output 4: Improved understanding of epidemiology of HPAI in India for rational and targeted control of the disease

- value chain and risk assessment and mapping;
- phylogenetic and phylodynamic analysis of HPAI H5N1 isolates; and
- structured virus isolation and characterization followed by monitoring virus evolution in different species to assess spatial and temporal spread of the virus in the country and region.

Activities undertaken during the reporting period (April 2013 – September 2013)

Output 1: Establishment of a DADF Veterinary Epidemiology Unit in India

The DADF Epidemiology Unit, already established at the Animal Quarantine and Certification station at Kapashera, New Delhi, was maintained both structurally and functionally.

Current staff: The third year of the Project started with only the national staff being comprised of a Team Leader/National Project Coordinator, two national epidemiology consultants and one Operations Officer.

All the project activities were implemented with the input and support of the DADF and the Commissioners/Directors of the State Animal Husbandry Departments. The DADF was regularly consulted and updated on the progress of the project through the submission of reports and by conducting meetings.

The project promoted consistency of India's national strategy for HPAI control with regional and global frameworks. This was carried out through consultative interaction among national partners (MoA), regional partners the South Asian Association for Regional Cooperation (SAARC) and the FAO sub-regional and regional support units, and globally with the FAO headquarters in Rome and the World Organisation for Animal Health (OIE).

Two staff from FAO's Emergency Centre for Transboundary Animal Diseases (ECTAD) in India attended a training workshop on the "Practical application of designing risk based surveillance in livestock value chains" conducted at Chandigarh from 15 to 20 April 2013. The workshop was attended by participants from the SAARC Member States: India, Nepal and Bhutan as well as representatives from FAO's Regional Support Unit (RSU) in Nepal.

The DADF Epidemiology Unit and FAO ECTAD India team attended a workshop from 24 to 25 June 2013 organized by the United States Agency for International Development (USAID), in collaboration with the Government of Thailand, on 'Technical and Policy Discussions on the Prevention and Control of Avian Influenza A(H7N9) in Asia'. The workshop provided a platform for sharing experiences and lessons learned from both the H5N1 HPAI in the region as well as those learned from the interventions implemented by the Government of China related to A(H7N9). The Team Leader/National Project Coordinator also attended the USAID-FAO HPAI Programming Meeting on 26 June 2013; participated in the technical, operational and programme discussions; and delivered a presentation on Avian Influenza and Emerging Pandemic Threats, dealing with past and current HPAI situation and risk mapping of HPAI in India. He also highlighted the progress made by the project in India, especially in the terminal year.

The FAO Representation in India and the Team Leader met the new DADF Secretary on 30 August 2013 and apprised him of the progress/achievements and way forward for continuation of the project beyond 30 September 2013.

The Team Leader Attended the inception workshop for FAO Technical Cooperation Projects "Emergency Assistance For Surveillance of Influenza A(H7N9) Viruses in Poultry and Animal Population in South East and South Asia", held in Bangkok from 18 to 19 September 2013.

Output 2: Improved epidemiological capacity within DADF, MoA of India

Conduct Field Veterinary Epidemiology Training Programme (FETPV): The project continued to mentor previous FETPV students through a list server (EpiNet) and direct support. There has been strong support from the states and specialist institutes for further access to FETPV courses previously conducted in Tamil Nadu and Orissa States during 2012. Owing to funding constraints, one additional FETPV course for the northern states could not be conducted. The capacity of selected field veterinarians from high-risks states in epidemiological analysis of disease outbreaks was enhanced using the Regional FETPV curriculum based in Thailand, which was adapted to a three-week module for India. However, the FETPV training for veterinarians from India is being sustained through the SAARC RSU, at Kathmandu in November 2012 and most recently in September 2013.

Outbreak investigation courses for Field/District Veterinary Officers:

Two four-day Training of Trainer (TOT) workshops on outbreak investigations in HPAI vulnerable areas (30 veterinarians) was conducted in March 2013 on:

- HPAI surveillance;
- outbreak investigation and SOPs;
- epidemiological viewpoints of disease control and prevention;
- risk assessment, management and communication; and
- risk-based surveillance.

In order to sustain the effort to build the capacity of field veterinarians, this issue was followed up with the State Directors for further training to the field veterinarians in the states.

Advocacy Workshop: the workshop for senior policy makers was conducted on 20 September 2013 to promote sustainable improvement of disease surveillance systems that will inform policy changes with State Animal Husbandry Departments and in DADF. The need for making epidemiology a core discipline for animal and veterinary public health was also emphasised. Further group discussions were held on the policy and infrastructural changes required at state and central levels and technical capacity upgrading needed to strengthen the existing surveillance systems. The Animal Husbandry Commissioner, Government of India and Commissioners/Directors from 24 States and Union Territories of the country participated and appreciated the work done by the project to improve the epidemiological capacity of the country and proposed that the project should continue with wider scope to include other transboundary animal diseases.

Output 3: Establishment of a risk-based surveillance programme

Develop a grassroots level surveillance programme: a surveillance approach directed at the grassroots level to improve disease detection and reporting of HPAI. Training materials developed in collaboration with the Society for Management of Information, Learning and Extension (SMILE), Bhubaneswar, including a training manual, flipchart and a video, were used for imparting training to grassroots level workers. Five ToT workshops for grassroots level disease detection and reporting (community-based animal health workers [CAHWs]) were conducted for 134 District Officers as per schedule given below:

State(s) (No. of District Officers)	Date	Location
Orissa (30)	11 March 2013	Bhubaneswar
West Bengal (18), Tripura (4) and Sikkim (4)	2 April 2013	Kolkata
Manipur (13), Nagaland (7) and Mizoram (8)	4 April 2013	Imphal
Assam (20) and Meghalaya (6)	6 April 2013	Guwahati
Arunachal Pradesh (16) and Assam (8)	8 April 2013	Itanagar

More than 5 000 paravets/CAHWs were trained in these districts on disease detection and reporting from July to September 2013. The trainings provided current information on HPAI (and other significant disease issues) with an emphasis on disease detection and immediate reporting from the grassroots level by the CAHWs.

The project team prepared standard operating procedures (SOPs):

1. **Outbreak investigation and response** which covers all actions to be taken from the point of receipt of a report of suspected HPAI and includes:
 - reporting of a suspected outbreak to the village officer / para-vet / veterinarian;
 - arranging and conducting an initial visit to farm/poultry owner;
 - clinical examination of sick birds;
 - completion of the Outbreak Investigation form; and
 - appropriate biosafety measures to be taken.
2. **Strengthening passive surveillance** (detection, investigation, reporting and analysis) through the appropriate use of active and risk-based surveillance for states to develop their surveillance plans. The early detection of outbreaks of HPAI (so called 'passive surveillance') is critical to reducing the risk of ongoing virus transmission and of continuing outbreaks. This activity is complementary to the current passive surveillance conducted by States where data is compiled and analyzed at regional centers e.g. PD ADMAS.

3. **Production of a biosecurity brochure** consisting of a set of management practices, which when followed, collectively reduces the potential for the transmission/spread of disease-causing organisms – including the avian influenza virus onto and between sites, animals and humans. The principles of biosecurity (isolation, movement control, cleaning and disinfection and waste management) were emphasized.

Guidelines for planning HPAI surveillance using a risk based approach were developed and submitted to the Government. These guidelines are in the form of a checklist that will enable the planning of active and risk-based surveillance at the district level.

EpiNet, a fortnightly list-server newsletter dedicated to HPAI epidemiology and other important emerging diseases, is being circulated across the country to sustain engagement with FETPV trainees and to create awareness regarding the critical role of surveillance and epidemiology at all levels of government. Information on HPAI outbreaks across the world is being updated regularly.

Output 4: Improved understanding of epidemiology of HPAI in India for rational and targeted control of HPAI

Continuation of research on structured virus isolation, characterization, and phylogenetic studies:

Collaboration amongst the DADF Epidemiology Unit, High Security Animal Disease Laboratory (HSADL) and Duke-National University of Singapore (Duke-NUS) was coordinated to further investigate the epidemiology of HPAI in India using molecular epidemiology techniques. Virus isolation and molecular characterization with probable source(s) of virus introduction, including virus evolution continued. The joint molecular epidemiology study was also carried out between FAO-India, HSADL and Duke-NUS to include HPAI sequence data and spatial and temporal data of HPAI outbreaks from Bangladesh, Bhutan, Myanmar and Nepal, for analysis and improved understanding of HPAI virus evolution in the sub-region. Improved data sharing was evident as a result of this collaboration.

Additionally, a research study entitled *Spatio-temporal epidemiology of Highly Pathogenic Avian Influenza (subtype H5N1) in poultry in eastern India* was completed by one of the project epidemiologists and is currently undergoing final review for publication in the international journal, Preventive Veterinary Medicine. This work stands out as an important output of the project, representing a significant contribution to improving risk based surveillance based upon a greater understanding of the epidemiology of H5N1 in West Bengal, Assam and Sikkim States between 2008 and 2012.

The project conducted the Terminal Workshop on 24 September 2013 at Hotel Ashok, New Delhi. Key stakeholders attended the workshop. The main project outputs were summarized in the presentations followed by a panel discussion. The panellists included Peter Kenmore, R. S. Rana, Subhash Morzaria, Mohinder Oberoi and A. B. Negi. The issues raised in the Advocacy workshop by the policy makers of the Government of India and the State Directors/Commissioners of Animal Husbandry were discussed and the key components which need to be strengthened under the epidemiology programme were summarized under:

- strengthening capacity building in epidemiology and surveillance;
- involvement of various stakeholders, including those from industry, public health, poultry (including backyard) sector and others;
- framing of guidelines and legislation to help in its implementation; and

- the need for consistent and complementary national and regional vision for controlling HPAI and other transboundary animal diseases.

The end of project report has been prepared and submitted to the Regional Manager of FAO's Regional Office for Asia and the Pacific for approval.

Project Highlights INDONESIA

“Monitoring AI virus variants in Indonesian poultry and defining an effective and sustainable vaccination strategy”

Project code: OSRO/INS/703/USA

Donor: USA

Contribution: USD 1 630 500

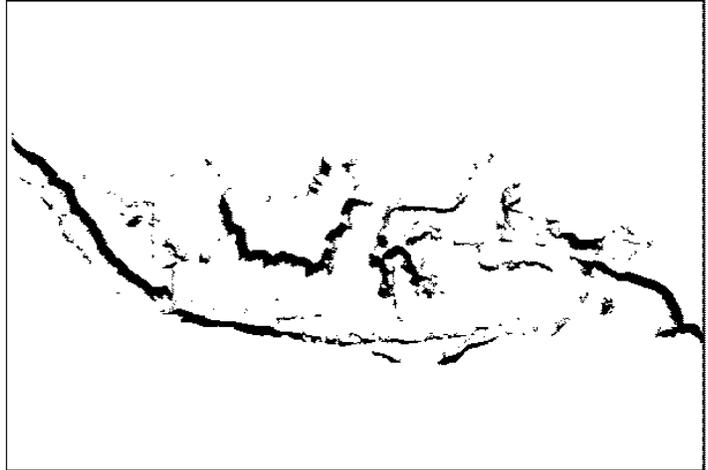

Implementation: 01/10/07 – 30/12/10

Target areas: nationwide

Contact: Daniele Donati

Title: Chief, Emergency Operations Service

Email: daniele.donati@fao.org

Objective:

To conduct virus characterization and mapping of Indonesian antigenic variants with intensified Highly Pathogenic Avian Influenza (HPAI) field isolate collection and analysis, and to provide recommendations for an appropriate vaccination strategy to prevent and control HPAI in Indonesia.

Key partners:

Ministry of Agriculture, local government livestock services and national and international research groups.

Beneficiaries reached:

National veterinary authorities and animal health and livestock services at provincial, district and municipal level; poultry producers and traders; the general public; and the international community.

Activities implemented:

- Biological and genetic characterization of 244 H5N1 isolates (266 total viruses) from 317 samples in Indonesia, representing approximately 90 districts predominantly from backyard chickens.
- Challenge testing of antigenic variants and vaccine strains selection.
- Technical recommendations for the vaccination strategy and capacity building.
- Local procurement of supplies and equipment to facilitate the collection of field isolates and support the Disease Investigation Centres in performing antigenic characterization of viruses and analysing resulting data.

Impact:

- Improved knowledge of circulating H5N1 viruses to directly inform vaccine policy.
- Development of a safe, efficacious vaccine for use in Indonesia.
- Increased capacity of Indonesian laboratories to perform antigenic characterization of viruses and analyse results.
- Technical recommendations made to provide a foundation upon which a comprehensive national vaccination strategy can be developed.

EXECUTIVE SUMMARY

Since 2004, Highly Pathogenic Avian Influenza (HPAI) outbreaks have been documented in 32 of Indonesia's 33 provinces. Based on available surveillance data, HPAI appeared to be endemic on the island of Java, Bali, and parts of Sumatra and Sulawesi, of which the most heavily affected provinces were: Lampung (Sumatra Island) and Yogyakarta, Central Java and West Java (Java Island). In mid-2004, mass Government sponsored vaccination was implemented for sector 4 and small-scale sector 3 producers. However, the vaccination efforts were unable to achieve effective coverage for poultry in Indonesia, as a result of technical issues related to the vaccines themselves, such as poor antigenic content, cold chain and application issues, lack of structured approach to post-vaccination monitoring and continued use of ineffective vaccines (heterologous H5N2 and H5N9 vaccines).

As a response, the internationally collaborative Vaccine Efficacy Project was designed to identify and characterize HPAI virus variants in Indonesian poultry and provide recommendations for an effective and sustainable vaccination strategy. Its aim was to determine major antigenic differences among some Indonesian strains leading to vaccine failure. Therefore, the Food and Agriculture Organization of the United Nations (FAO), under the umbrella of the World Organisation for Animal Health (OIE)-FAO Network of Expertise on Animal Influenza (OFFLU), implemented a project for "Monitoring avian influenza (AI) virus variants in Indonesian poultry and defining an effective and sustainable vaccination strategy" (OSRO/INS/703/USA), supported by leading scientists from a range of scientific fields including virology, epidemiology, bioinformatics, vaccinology, laboratory diagnostics and poultry production.

In collaboration with national and international partners, the OFFLU project conducted biological and genetic characterization and analysis of 244 H5N1 HPAI viruses, isolated from 317 samples, which were collected across 98 districts from 2007–2009, predominantly from village-based poultry in Indonesia. The genetic analysis indicated that all Indonesian viruses from animal sources characterized under the project were found within the virus grouping "clade 2.1". Further analysis suggested that Indonesia experienced a single introduction of H5N1 HPAI, which was followed by the subsequent in-country evolution of the virus. To further understand the evolution of the H5N1 HPAI virus in Indonesia and the subsequent impact of vaccines applied to poultry, antigenic cartography was applied as a new tool for assessment of antigenic differences between vaccine strains and circulating viruses and technology transfer. Overall, the outcome of biologic, genetic and antigenic analyses of the viruses in Indonesia contributed to safe and efficacious poultry vaccines with updated strains using reverse genetics technology. This work also improved the epidemiological understanding of viruses circulating in village-based poultry across a large geographical area and highlighted the need to include representative sampling from all poultry production sectors.

In a sustainable approach to technology transfer and laboratory capacity building, the animal health laboratory network was established for the detection, isolation and characterization of influenza viruses across the Disease Investigation Centres, representing the first coordinated effort of its kind for monitoring of influenza in animals at a national level. Capacity building technology transfer efforts were conducted within this network in support of the rapid and accurate diagnosis of H5N1 HPAI in Government veterinary laboratories and of a sustainable mechanism to monitor viruses and vaccine efficacy in the field.

Ongoing needs were identified during the final technical meeting (on 28 and 29 October 2010) and included continued support to the: (1) **sustainable laboratory system** established for influenza virus monitoring (IVM), consisting of three major pillars: i) identify potential virus variants; ii) identify potential candidates for updated challenge and vaccine strains (antigenic relevance); and iii) monitor efficacy of vaccines in use, with progressive engagement of national, industry and university laboratories; and (2) **development of a viable mechanism** for registration and licensing of vaccines (inactivated conventional or reverse genetics and novel vectored or reassortant vaccines) that demonstrate efficacy against relevant Indonesian strains that are identified through the IVM. Activities in support of these needs were included under the FAO national programme (OSRO/INS/604/USA) for January–September 2011.

1. INTRODUCTION

1.1. Project background

Highly Pathogenic Avian Influenza (HPAI) is caused by the Influenza A H5N1 virus and poses a significant threat to the world's human and avian populations. In chickens, infections cause rapid systemic disease and high mortality. At the time of this report (15 December 2011), 573 human cases have been confirmed worldwide, 59 percent of which resulted in fatalities. In Indonesia, which has been of growing concern in relation to human cases, of 182 officially reported human cases 150 have been fatal. Every human infection creates the possibility for genetic reassortment between H5N1 and a human influenza virus. This reassortment could generate a new strain of influenza virus that possesses the ability to transmit from human-to-human and cause a human influenza pandemic of unknown proportions. Thus, immediate action to control the virus and decrease the risk of human infection is imperative.

Indonesia is a global hot spot for the HPAI epizootic in poultry and for human H5N1 infections. Owing to high levels of H5N1 virus circulating in poultry, and frequent contact between poultry and humans, Indonesia remains a likely origin of a human influenza pandemic. Underlying this pandemic risk is the ongoing health risk posed by infected poultry. Since HPAI was first recognized in 2003, it has become enzootic in poultry throughout much of Indonesia. Outbreaks continue to be reported on every island where veterinary services are actively monitoring the disease, with high incidences on Java, Sumatra, Bali and Sulawesi. Indonesia's 242 million citizens live in an area one-fifth the geographic size of the United States. The annual population of 1.4 billion poultry consists of approximately 970 million broilers, 100 million layers, 300 million backyard chickens and 35 million ducks (Directorate General of Livestock Services, 2006) that are frequently raised in close proximity to humans and traded through live bird markets. Poultry raising at the household level (for food and income) is common. Moreover, Indonesians traditionally use live birds for home consumption, ceremonial requirements and entertainment, creating numerous opportunities for exposure to the virus.

Indonesia introduced a policy of vaccination against avian influenza (AI) in early 2004 as one of the measures aimed at controlling the burgeoning HPAI epidemic. All vaccines used had to be registered with the Government of Indonesia. At the time the project was initiated, 15 vaccines were registered, including H5N1, H5N2 and H5N9 from Chinese, European, Indonesian and Mexican production laboratories.

At the beginning of the project, the Government policy was to provide and deliver vaccine for village-based poultry (e.g. sector 4) and to permit commercial companies to vaccinate their flocks with a registered vaccine of their choice. A number of problems were encountered, including the inability to adequately monitor vaccine use and variable vaccine efficacy. Additional issues encountered for small-scale producers in sectors 3 and 4 included: insufficient vaccine stocks and logistical capacity to provide adequate coverage, an inadequate cold chain, poor biosecurity and biosafety, and weak programme management.

The preliminary results of a collaborative vaccine efficacy project between the Government of Indonesia, the Food and Agriculture Organization of the United Nations (FAO) and the United States Department of Agriculture (USDA) Southeast Poultry Research Laboratory (SEPRL) (Georgia, USA) indicated that at least one antigenic variant virus (A/chicken/West Java/PWT-WIJ/2006) had emerged in Indonesia against which immunity induced by current vaccine strains, using a standardized intranasal challenge test, was not protective. Analysis of the challenge study results concluded that A/chicken/West Java/PWT-WIJ/2006 was antigenically

distant to the vaccine strains that were currently in use in Indonesia, such that the vaccines did not confer effective protection against the West Javan variant strain; however, the prevalence and distribution of the strain was not fully understood.

Indonesia's control strategy for HPAI has nine components, one of which is the vaccination of domestic poultry. To gain insight into the viruses circulating in village-based poultry production systems, the World Organisation for Animal Health (OIE)/FAO Network of Expertise on Animal Influenza (OFFLU) project proposed to conduct biological and genetic characterization and analysis of H5N1 HPAI from representative poultry sectors and geographic locations in Indonesia. To further understand the evolution of the H5N1 AI virus in Indonesia and the subsequent impact of vaccines applied to poultry, the OFFLU project proposed to apply antigenic cartography to AI viruses. These activities served to help identify candidate viruses for challenge strains and updated vaccine strains. In parallel, laboratory capacity building activities were undertaken to improve the capacity in national laboratories to perform advanced virus characterization and challenge testing where adequate facilities are available. Finally, Project partners together with other stakeholders contributed to technical recommendations for a vaccination strategy including vaccine(s) selection.

1.2. Financial contribution of the Donor

The project was implemented from October 2007 to December 2010. The Government of the United States of America through the United States Agency for International Development (USAID) contributed USD 830 500 for Phase I (October 2007–September 2008) and USD 800 000 for Phase II (October 2008–December 2010) to implement the project OSRO/INS/703/USA, "Monitoring AI virus variants in Indonesia poultry and defining an effective and sustainable vaccination strategy." Under the first phase, an additional USD 200 000 was allocated from the Australian Agency for International Development-funded OSRO/INS/701/AUL project as complementary funding, in support of project activities.

1.3. Project objectives

The project aimed to conduct virus characterization and mapping of Indonesian antigenic variants with intensified HPAI field isolate collection and analyses. With information provided by biological characterization of virus isolates and challenge testing, the project collaborated with national and international research groups, including the SEPRL, the Australian Animal Health Laboratory (AAHL), Erasmus University and national Disease Investigation Centres (DICs) to develop recommendations on how to monitor for antigenic changes in circulating strains, ensure relevance of strains used for challenge testing poultry AI vaccines, and to select potentially efficacious candidate vaccine viruses, including provision of low pathogenicity reverse genetics virus strains for use as vaccines. The project was expected to respond to the immediate need for updated vaccine strains and to provide recommendations for an appropriate vaccination strategy to prevent and control HPAI in Indonesia.

Specifically, the objectives were as follows, to:

- screen for antigenic/genetic variants, especially among a targeted subset of already collected isolates;
- obtain a representative sample of circulating HPAI viruses across all sectors in Indonesia;
- determine the ability of registered vaccines to provide protection against each selected isolate, and, if necessary, select new vaccine seed strain(s);

- improve the capacity in Indonesian laboratories to perform advanced virus characterization and challenge testing where adequate facilities are available; and
- partner with other stakeholders to contribute technical recommendations to a vaccination strategy including vaccine(s) selection and prepare a revised costing of the proposed strategy.

1.4 Planned beneficiaries

The project planned to benefit the following persons and institutions:

- national veterinary DICs: from direct capacity building activities, reagent and equipment procurement, and increased information sharing and communication through implementation of network activities;
- poultry owners, producers and traders: from a reduced incidence of HPAI through improved vaccination programmes;
- national veterinary and veterinary public health services: from the training provided to local government livestock agencies in management, technical understanding and responsibilities regarding epizootic disease control;
- district, municipal and provincial local government animal health and livestock services in Indonesia: from increased capacity and expertise in HPAI surveillance and response;
- Indonesian population: from a reduced risk of AI; and
- international community: from a reduced risk of the spread of HPAI and of the human influenza pandemic.

2. PROJECT IMPLEMENTATION

2.1 Implementation arrangements

FAO implemented this project in close collaboration with the Ministry of Agriculture (MoA) and local government livestock services. The project activities were carried out by the Animal Health Service (AGAH), the Emergency Operations Service (TCES) and the Emergency Centre for Transboundary Animal Diseases (ECTAD) of FAO. There was additional collaboration with OFFLU laboratories, Livestock Policy Service of FAO (AGAL) and respective universities.

The MoA was the counterpart Government institution and provided coordination through existing channels. Technical backstopping of the project was provided through ECTAD, based within the Emergency Prevention System (EMPRES) for Transboundary Animal and Plant Pests and Diseases programme of AGAH in FAO headquarters and Bangkok. In addition, AGAL also provided backstopping on the analysis of socio-economic variables related to the implementation of a vaccination programme.

2.2 Main project activities

2.2.1 HPAI field isolate collection for biological and genetic characterization

- Characterization of 244 H5N1 isolates (266 total viruses) from 317 samples in Indonesia, representing approximately 90 districts predominantly from backyard chickens.
- Selection and production of reference antisera and antigens for Indonesia.
- Antigenic cartography data from 100 isolates, in addition to biologic and molecular data, was used to select five candidate vaccine strains and six potential challenge strains for

further investigation. Viruses were received at SEPRL for vaccine construct and challenge studies in June 2009.

- DIC Wates was nominated as focal point for antigenic cartography. A work plan was developed, and capacity building activities for antigenic cartography were initiated in July 2009.
- Six of the seven DICs conducted prescreening of 276 H5 positive virus isolates from 2008 to 2010 during April and May 2010 and submitted results to DIC Wates, where analysis was initiated for selection of variants to be forwarded for further characterization.
- Three laboratories were nominated to support genetic characterization of antigenic variants, launch the capacity building activities for sequencing and bench-side workshops.
- The Director-General of Livestock and Animal Health Services in Indonesia agreed in principle to the release of virus sequences into the public domain in June 2010.
- Presentations were made at the (i) seventh International Symposium for AI in April 2009 in Athens, Georgia, USA; and (ii) regional meeting on “Molecular epidemiology of origin and evolution of H5N1 HPAI virus in Asia,” (USDA/FAO) in Bangkok, Thailand, in September 2009; and by the (iii) national scientist in collaboration with OFFLU at the National Scientific Conference in Bogor, July 2010, on “Initial study of antigenic diversities of AI virus H5N1 in Indonesia using reference antisera produced for antigenic cartography”.

2.2.2 Challenge testing of antigenic variants and vaccine strains selection

- Signing of collaborative Material Transfer Agreement (MTA) between the Directorate General of Livestock Services (DGLS), AAHL, SEPRL and industry, and receipt of selected vaccine candidate and challenge strains at SEPRL in June 2009 to continue vaccine development and challenge testing.
- Selection of five vaccine strains and six challenge strains based upon data generated from antigenic and molecular characterization of isolates.
- Return of fully characterized isolates to Indonesia to contribute to updated vaccine production and challenge models. DGLS informed vaccine manufacturers of the availability of the candidate vaccine and challenge viruses and invited them to retrieve the viruses from the MoA Veterinary Biologicals Laboratory (Pusvetma) and the National Veterinary Drug Assay Laboratory for Indonesia (BPM SOH).
- Challenge tests conducted using available reverse genetics constructs at SEPRL using updated challenge viruses selected from the OFFLU project data. Six reverse genetics (RG) virus seed strains were generated at SEPRL. Results indicated that of the six, four RG virus seed strains generated protective titres, significantly reduced virus shedding and provided equivalent protection against challenge viruses selected from the November 2009 Technical Meeting as compared to conventional inactivated vaccines generated using two of the same seed strains.

2.2.3 Capacity building

Please refer to the Section 2.4: Training for capacity building activities conducted under the project.

2.2.4 Technical recommendations for the vaccination strategy

- FAO interim recommendations were submitted to the DGLS in April 2008. These recommendations were updated in June 2009 based upon data analysed from the OFFLU project.
- Development of a mechanism to monitor AI antigenic variants, involving all DICs and collaborating laboratories using a virus pre-screening assay and antigenic cartography.
- Consultation with a legal firm specializing in intellectual property completed.
- Development and assessment of newly engineered low pathogenicity reverse genetics vaccine strain(s) for Indonesia selected through data gathered from this project.
- OFFLU technical review meetings with open forum held in June and November 2008, and in November 2009. The meetings provided an overview of the OFFLU Indonesia project activities and included presentations from national vaccine manufacturers, universities and industry stakeholders in order to update the status of HPAI in Indonesia as well as laboratory activities and parallel projects engaged in the control HPAI.
- The final OFFLU project technical review meeting was held in Jakarta on 28 and 29 October 2010, and a set of recommendations was produced.
- A report was prepared by a socio-economist on “Vaccination and surveillance costs for operational research project in Indonesia” under this project.
- Interviews of 155 broiler chicken farmers (average flock size 2 700) and 56 layer chicken farmers (average flock size 2 200) were conducted for the the Indonesian Center for Agriculture Socio-Economic Policy Studies field survey “Assessment of farm level financial incentives and willingness to pay for HPAI vaccination in Indonesia” in 13 districts/municipalities in western Java.

2.2.5 Procurement

Supplies and equipment were procured locally to facilitate the collection of field isolates and support DICs in performing antigenic characterization of viruses and analysing resulting data.

2.3 **Actual beneficiaries**

The following have benefited from the project activities to-date:

- The national veterinary DICs, the Balai Besar Penelitian Veteriner Veterinary Research Institute (Bbalitvet), Pusvetma, and the National Veterinary Drug Assay Laboratory benefited directly from on-site assessment visits and workshops, which have strengthened the technical capacity at the laboratory level and launched a laboratory network for monitoring AI viruses including genetic and antigenic characterization, such as antigenic cartography, as a tool to monitor antigenic variants in Indonesia with increased information sharing and communication through implementation of network activities.
- District, municipal and provincial local government animal health and livestock services in Indonesia benefited from increased capacity and expertise in HPAI surveillance and response.
- Stronger ties with the university personnel have resulted in including representatives in the OFFLU technical review meetings and training workshops.
- The poultry industry benefited from increased communication with the MoA and its cooperation and inclusion in project activities.

- Poultry owners, producers and traders benefited directly from a reduced incidence of HPAI resulting from improved vaccination programmes.
- The Indonesian population benefited from a reduced risk of AI.
- The international community benefited from a reduced risk of the spread of HPAI and of a human influenza pandemic.

2.4 Training

The following training and capacity-building activities were carried out under the project:

- OFFLU workshops were conducted on introductory molecular and antigenic analysis for 82 Indonesian scientists representing all DICs, four veterinary faculties, industry and the MoA (November 2008, March and September 2009).
- Eight Indonesian scientists from the DICs and commercial poultry industry were hosted at AAHL for training on molecular and antigenic characterization of viruses (June 2008, October 2009).
- Six Indonesian scientists participated in bench-side training for sequencing at AAHL in November 2010.
- The FAO/OFFLU scientist has completed five months of capacity building activities in close coordination with AAHL. Support visits, workshops and technical assessments were conducted at DIC Wates, DIC Denpasar and DIC Bukittinggi. Capacity building activities for antigenic cartography were undertaken in close coordination with AAHL.
- A national FAO/OFFLU technical officer was recruited to assist with the coordination of OFFLU activities in close collaboration with representatives from the Directorate of Animal Health (DAH)/ National HPAI Campaign Management Unit (CMU), the seven DICs, particularly DIC Wates, and other relevant public sector structures and private sector stakeholders to support the transfer of activities to Indonesia.
- Completion of the User Acceptance Testing Workshop and subsequent activities to launch InfoLabPlus.

2.5 Difficulties encountered during implementation

- Project implementation was slower than anticipated. The project initially faced difficulties with the shipment of samples out of Indonesia. Through the efforts of the ECTAD team based in Indonesia, however, isolates were shipped to AAHL. Revision of the existing MTA was again requested during the spring of 2009 and agreement achieved by September 2009.
- Two project partners included in Phase I (the Veterinary Laboratories Agency and the Central Institute for Animal Disease Control) retired from the project owing to a lack of Indonesian biological material for scientific study. As a consequence, the transmission studies and some viral characterization originally proposed were not performed.
- While recommendations were generated through the outcomes of the technical review meetings for Indonesia (refer to 2.2.4), the impact of these recommendations remains difficult to quantify. One example is that the official governmental recommendation for use of H5N2 vaccines in Indonesia was not revoked until April of 2009, despite repeated recommendations through this project and others against their use. This has resulted in much confusion at the field level and may indeed have encouraged the marketing of mislabeled vaccines, as the vaccine industry recognized that the H5N2 vaccines were ineffective, but the Government stance was pro-H5N2.

- Collected isolates should be representative of major circulating viruses. Isolates characterized to-date are representative of 2007, and too few are from the commercial poultry industry and from western Java.
- The project encountered extreme difficulties in returning the fully characterized vaccine and challenge virus strains to Indonesia. A combination of issues from the Australian Government regulations, in addition to slow reactivity to urgent issues, hindered the process significantly.
- While the DGLS have agreed in principle to pursue collaboration with the private vaccine companies, there is still much confusion about the status of challenge testing of current influenza vaccines as well as vaccine registration.

3. PROJECT IMPACT

The OFFLU project in Indonesia significantly improved the knowledge of circulating H5N1 viruses to directly inform vaccine policy. The project also developed a novel, more efficacious vaccine, and increased the capacity of Indonesian scientists and laboratories to lead the vaccine development process.

- **Improved knowledge of circulating H5N1 viruses to directly inform vaccine policy**

The characterization and analysis of 244 virus isolates from 317 samples at AAHL (an international reference laboratory for AI) provided insight into the viruses predominately circulating in village-based poultry. This knowledge contributed to the understanding of the epidemiology of circulating viruses in Indonesia and highlighted the need to have representative sampling from all poultry production sectors. Additionally, these analyses provided further evidence that the use of H5N2 vaccines should not be recommended in Indonesia owing to the antigenic distance between the vaccine virus and the predominant subclade 2.1.3 viruses circulating in the country.

- **Development of a safe, efficacious vaccine for use in Indonesia**

The outcome from the biological, genetic and antigenic analysis of these viruses served as the basis for the selection of five updated candidate vaccine strains and six candidate vaccine challenge testing viruses for Indonesia. At the national level, these and other data were considered, and the selection was narrowed to four candidate vaccines viruses and two challenge testing viruses (to represent the two broad antigenic groups in subclade 2.1.3). As an indication of improved sharing and transparency, the selected strains were provided to SEPRL under a collaborative MTA between the Indonesian Government, a poultry production company, AAHL and SEPRL, so that the candidate vaccine strains could be challenge tested against at least four antigenically distinct challenge viruses.

When the strains are provided to vaccine manufacturers, it is expected that they will provide more efficacious vaccines for distribution and use in Indonesia. It is expected that the antigenicity of new generation vaccines will be higher than vaccines previously produced in Indonesia and that this will also contribute to more efficacious vaccines. In addition, certified low pathogenicity reverse genetics derived vaccine strains based upon the same four candidate vaccine viruses were generated, and will also be provided to Indonesia for consideration as alternatives to generating inactivated vaccines from highly pathogenic strains.

At an international level, these analyses identified a new third-order subclade circulating in Indonesia, and this information was submitted for consideration. Improved transparency was achieved through presentations given at both the 7th International Symposium on AI (April

2009) and at the Regional Meeting on Molecular Epidemiology of Origin and Evolution of H5N1 HPAI Virus in Asia (USDA/FAO, Bangkok, Thailand, September 2009). The Government agreed to place the sequence data generated from this project in the public domain (deposited to GenBank).

- **Increased capacity of Indonesian laboratories to perform antigenic characterization of viruses and analyse results**

To further understand the evolution of the H5N1 HPAI virus in Indonesia and the subsequent impact of vaccines applied to poultry, the OFFLU project pioneered the application of a method known as antigenic cartography to AI viruses. This technique was developed to characterize human influenza viruses and used to facilitate human vaccine strain selection for seasonal influenza viruses since 2002. Overall, the outcome of biologic, genetic and antigenic analyses of these viruses in Indonesia contributed to the identification of updated candidate vaccine strains for poultry.

In a sustainable approach to technology transfer and laboratory capacity building, an animal health laboratory network was established for the detection, isolation and characterization of influenza viruses across the veterinary DICs, representing the first coordinated effort of its kind for monitoring of influenza in animals at a national level. Focal point laboratories were nominated to coordinate and conduct advanced antigenic characterization and sequencing. Capacity building technology transfer efforts were conducted within this network, in close coordination with AAHL, through a series of consultations, working groups and workshops from the international reference laboratories to the network in support of the rapid and accurate diagnosis of H5N1 HPAI in government veterinary laboratories, and to establish a sustainable mechanism to monitor viruses and vaccine efficacy in the field. Other impacts at the national laboratory level were achieved through workshops and individual laboratory assessments and training. These include: improved harmonization of molecular and serological methods and virus-naming strategies, improved inclusion of epidemiological data upon sample intake, and broader acceptance and improved capacity of the updated InfoLab-Plus platform.

- **Technical recommendations made to provide a foundation upon which a comprehensive national vaccination strategy can be developed**

This project contributed technical recommendations, including monitoring of field strains for antigenic variants through the FAO recommendations on vaccination (March 2008 and May 2009), six technical review meetings, and technical expert teleconferences to address specific questions, as well as to provide a cost evaluation for vaccination of village-based poultry. While the impact of these recommendations is not yet realized, these inputs are expected to provide a foundation upon which a comprehensive national vaccination strategy could be developed.

4. RECOMMENDATIONS AND FINDINGS (additional recommendations in Annexes 1-3)

For Sustainability – A National Programme to monitor antigenic variants should include:

- Structured prospective surveillance of AI viruses representative of all poultry industry sectors and geographic locations to deliver a comprehensive understanding of the national situation and allow recommendations relevant for both commercial and village poultry sectors.
- Continued development of technical competence for monitoring and genetic and phenotypic characterization of antigenic variants across the laboratory network, with:

- Laboratories using harmonized laboratory procedures and a data information platform to underpin a virus monitoring programme;
- systems of quality assurance;
- ongoing mechanisms for communication across the laboratory network and the Directorate General of Livestock and Animal Health Services in support of the laboratory network activities; and
- strategic approach to continually utilize and maintain molecular analysis equipment through routine application to pathogens in addition to HPAI.
- Appointment of a science manager with laboratory background to oversee, coordinate and ensure that results inform decisions at the central level:
 - This post should be a position of adequate authority within DAH.
- A structured system to generate quality-assured reagents required for antigenic characterization:
 - Prepare budget to improve facilities at Pusvetma including upgrading the poultry housing for production of antisera to BSL-2 level to avoid contamination; and
 - conduct a review of the facility renovation for HPAI, as well as the current poultry antigen/vaccine production capability for multiple antigens.
- A nationally coordinated mechanism to manage public-private partnerships to achieve a unified national analysis of data on emerging influenza viruses.

For Vaccines and Vaccination

- H5N1 vaccine seed strains should be antigenically and genetically similar to the current circulating viruses (non-homologous strains should be discouraged).
- Owing to the divergent genetic evolution of AI in Indonesian commercial production systems (sectors 1-2) as compared to village-based poultry (sectors 3-4), more than one epidemiologically relevant and antigenically distinct seed strains may be necessary to cover all production sectors.
- Proper administration of high-quality, potent vaccines per manufacturers' instructions is critical in inducing protective immunity in poultry populations: choice of antigen is not the only factor for successful vaccination.
- Consider using antigenic relevance to build flexibility into governmental regulations and allow updated seeds to continue to be introduced (e.g. can recommend "X" virus or its "antigenic equivalent"):
 - Currently clade 2.1.3 predominates and within that subclade there are two major antigenic lineages: "common" and WJ variant.
 - Map currently available Indonesian poultry vaccine strains onto the antigenic cartography data map for Indonesia to include vaccines in active use, as only the A/chicken/Legok/03 and A/turkey/England/73 antigens are available on the map.
- In vivo challenge testing for efficacy evaluation of vaccines should use antigenically relevant challenge viruses. Vaccine licenses should be issued in relation to a specific challenge virus, and because a single vaccine seed cannot protect from antigenically diverse challenge viruses, single challenge virus testing may be appropriate to fit specific sectors or geographic regions. Antigenically relevant challenge viruses selected using a two-tiered approach to test vaccines is suggested to expedite crucial information needed for Indonesia, as well as for purposes of registration of newly available vaccines:
 - Pass challenge against common lineage subclade 2.1.3 (e.g. A/chicken/West Java Sbg/29/2007); and
 - Pass challenge against West Javan variant subclade 2.1.3 (e.g. A/chicken/West Java/SMI-PAT/2006).

- Additionally, consider different levels for vaccine registration to allow for faster updates to vaccine strains based upon epidemiologically relevant virus data – for example, the US system has three levels:
 - autogenous registration (inactivated vaccines only): purity and safety data needed;
 - conditional registration: safety and purity and some efficacy data needed; and
 - full registration: safety and purity and efficacy and potency in full dossier format. All live recombinant vaccines require full registration.
- Register vaccines using technologies that can demonstrate high potential for providing protection against HPAI, for example:
 - live recombinant vaccines as an adjunct to inactivated vaccines for use in broiler sectors; and
 - vaccine seed strains produced using low pathogenic reverse genetics, which can achieve higher growth titres in eggs. Their use improves employee and environmental safety because manufacturing can be managed under BSL-2 conditions.
- Inactivated vaccines produced from low pathogenic reverse genetics seed strains should not be considered as genetically modified organisms for the purposes of registration. This is common international practice.
- Consider the use of bivalent vaccines to achieve a broader immune response where the antigenic content for each seed virus is equivalent to the monovalent dose; relevant research data for poultry is not yet available to support the use of >2 antigens in a vaccine.
- A minimum vaccination protocol is a 2-dose regime to provide adequate protection throughout the production cycle.
- Antigens used in hemagglutination inhibition (HI) serological evaluation should be urgently updated to relevant virus strains to include the specific vaccine virus strain, and one or more antigens representative of H5N1 HPAI current field and/or challenge viruses.

Recommendation to endorse the use of A/chicken/Indonesia/Wates-1/2005 clade 2.1.3 at the DICs and other national laboratories as follows:

- To aid in the comprehensive analysis of the serosurveillance efforts being conducted at the DICs, use of an updated “common” circulating field isolate, A/chicken/Indonesia/Wates-1/2005 clade 2.1.3, as the antigen for conducting HI assays to assess vaccine protection.
- Use of a characterized and standardized hyperimmune H5 antiserum generated from this updated “common” circulating field isolate (Wates-1) is further recommended for typing of hemagglutination (HA)-positive agents, to be used in conjunction with the previously recommended prescreening efforts for monitoring antigenic variation introduced by the OFFLU project.

And:

- Production of the standardized H5 antigen and hyperimmune serum for Wates-1 is recommended to commence at an MoA nominated laboratory under a quality assurance system with guidance from AAHL; and reagents to subsequently be assessed at the relevant regulatory body for veterinary biologics in line with previous recommendations from the OFFLU project (refer to 4a. above).

Poultry serum samples for H5N1 serosurveillance are received on a routine basis in the DICs in Indonesia. In general, it is difficult at the DIC level to apply the HI assay to specifically assess **vaccine response** (1) owing to the use of several antigenically distinct AI vaccines in Indonesia, and the lack of information on which vaccine has been applied in most cases. Therefore, it is

often not possible to select an appropriate homologous antigen to adequately assess vaccine response.

Instead, an assessment of **vaccine protection** (2) is performed using the antigen(s) available in each laboratory. However, there are currently at least two antigenically distinct antigens being produced and used in the DICs leading to difficulties in interpretation and comparison of serosurveillance data from different DICs.

Additionally, there is a need to generate standardized H5 hyperimmune antiserum that is broadly reactive against a well characterized, updated “common” circulating field isolate from Indonesia to be used for **identification/typing** (3) of HA-positive agents.

Data from the OFFLU project for “Monitoring AI virus variants in Indonesian poultry and defining an effective and sustainable vaccination strategy” (Government of Indonesia-FAO-OFFLU-USAID) supports the use of **A/chicken/Indonesia/Wates-1/2005** clade 2.1.3 (Wates-1) for the production of hyperimmune antiserum and a homologous standardized antigen to represent an updated “common” circulating field isolate (refer to figures below). Quality reagents produced from Wates-1 should be readily available to all laboratories and can serve as a quality assurance control, as standardized references against which other reagents can be compared and validated, and to allow intra- and inter-laboratory comparisons of HI data. **The use of other antigens as needed to adequately conduct the assays as above is encouraged under quality assurance guidelines.**

For International Engagement

- The control of animal influenza requires a global approach as coordinated by OFFLU.
- The role of international reference laboratories in the Indonesian programme should be defined and the mechanism of engagement agreed, with AAHL and OFFLU engaged in a prolonged programme of support to designated national reference facilities in Indonesia to develop a high level of capability in the laboratory studies that underpin full virus characterization.
- Indonesia-international partnerships should include technical communication and timely sharing of data and biological materials, such as viral sequence data, which contribute not only to ongoing efforts in Indonesia but to the global efforts to control HPAI.
- Continued provision of reagents specifically for antigenic cartography and associated prescreening from international partners is recommended until demonstrated technical competence and resources can be fully established in-country.
- Surveillance for and characterization of HPAI in Indonesia can make other contributions to OFFLU initiatives for the management of influenza infections at the human animal interface. Continued active participation by Indonesia in OFFLU is valuable in the international context.

ANNEX 1. FAO interim recommendations on poultry vaccination against HPAI in Indonesia, March 2008

FAO interim recommendations on poultry vaccination against HPAI¹ in Indonesia – on behalf of OFFLU²-March 2008

Introduction

Vaccination can be a useful tool in the control of enzootic HPAI providing that efficacious vaccine is available, the strategies for vaccination are clearly defined, appropriate and implementable, sustainable and accompanied by other control measures, and that post-vaccination monitoring is undertaken.

Indonesia introduced a policy of vaccination against H5N1 in early 2004 as one of the measures aimed at controlling the burgeoning HPAI epidemic. The Government vaccination campaign has had insufficient apparent impact on disease incidence. The large commercial sector has used vaccine widely and although information is limited it appears to have prevented infection and reduced commercial losses. Barriers to effective application of vaccination against AI virus in Indonesia include difficulty to cover village backyard small producers and insufficiently defined vaccination strategies. In addition to that, the problem of new circulating strains and uncertain vaccine efficacy in ducks make the situation even more complex.

This paper sets out interim recommendations regarding the national strategy for AI vaccination in Indonesia. As information becomes available from the OFFLU project (OSRO/INS/703/USA-AUL), especially with identification of circulating H5N1 viruses, these recommendations will be reviewed and updated as necessary.

Continuation of the vaccination policy

The results of a collaborative Vaccine Efficacy Project between GOI, FAO Indonesia technical staff and two OFFLU laboratories (AAHL³ and USDA-ARS⁴/SEPRL⁵) were presented in June 2007 in Jakarta. The objectives of the study were to evaluate the protection conferred by currently available vaccines against three Indonesian H5N1 field viruses. The results showed that though the antibody response was good, indicating that the vaccines were of high quality, the currently available vaccines were not fully protective in the challenge studies when using these 2006 viruses. Vaccine protection was poorest for the virus strain, A/chicken/West Java/PTW-WIJ/06 (9/2006), partly protective for a second strain, A/chicken/Papua/TAS/06 (7/2006), and good for the third strain, A/chicken/WJ/SMI-HAMD/06 (5/2006). The variation in protection suggests significant variation in antigenicity of the tested field strains.

The distribution and prevalence of new virus strains in Indonesia is currently unknown. An improved knowledge of circulating H5N1 field viruses as well as the efficacy of currently used vaccines are expected through the OFFLU project⁶ (implemented by FAO on behalf on OFFLU beginning in October 2007) aimed at 'Monitoring AI virus variants in Indonesian poultry and defining an effective and sustainable vaccination strategy'. Therefore, it is not yet possible to predict whether currently available vaccines will provide adequate protective immunity in

⁶ OSRO/INS/703/USA-AusAID

chickens and in other species across the country; nor is information available to indicate whether specific virus strains are circulating in particular locations or poultry sectors – a situation that might lead to specific vaccines being used by locality or sector. Nevertheless these results show that vaccines are still effective against some circulating H5N1 viruses. Considering that the main purpose of vaccination is to decrease the level of circulating virus and therefore the risk of virus transmission, **FAO recommends that the Indonesian MoA maintains a policy of vaccination but efforts are required to increase vaccination coverage of the poultry population. The precise vaccine selection will be reviewed following characterisation of representative field H5N1 isolates.**

Targeted vaccination

Given the enormous logistical effort required to undertake any country wide mass vaccination campaign and the limitations of the current programme in Indonesia, **it is recommended that government sponsored vaccination should be extended to known heavily contaminated districts or provinces and to any targeted high risk populations.** As experience in logistics and delivery are gained, extension of the vaccination campaigns should be considered using a risk based approach that will identify high risk production and marketing practices, in particular the current live poultry marketing system. Where vaccination is implemented, a programme to improve biosecurity of production units is also critical. Moreover duck vaccination should be specifically considered as this species is recognized as a major reservoir of the virus. Known infected areas with a high incidence of HPAI in poultry and with human cases should be selectively targeted.

Additionally, the use of vaccine by commercial producers must be regulated and monitored. A programme to promote effective use of vaccine by commercial industry should be implemented and should also include other risk mitigation measures such as improving biosecurity and general husbandry practices. It is important that the logistics of a vaccination campaign are considered and the constraints clearly understood before embarking on any vaccination campaign. The logistics required must be identified by clearly defining vaccination protocols (frequency, target populations, monitoring seroconversion), identifying cold chain requirements and by introducing an audit trail for monitoring vaccine supply and use. Data should be recorded not only for monitoring the vaccination use but also to be able to assess any impact of vaccination on disease control. Finally, HPAI viruses must continue to be collected to monitor any virus circulation in all vaccinated populations, including from large poultry industries.

Monitoring of vaccine quality

Good vaccine quality is a prerequisite for good vaccination efficacy and programme effectiveness. At this stage, the vaccine quality (or potency) is independent from vaccine matching with field strains. Some assessments of vaccine quality have previously been conducted and have shown that Indonesia is producing and importing good quality vaccines⁷. However, there might be some variability between vaccine batches. The quality and quantity of antigen as well as the type of adjuvant play an important role in vaccine quality.

In vitro quality control of inactivated AI vaccines is not standardized and established in the international pharmacopocia. However vaccine immune response can be assessed *in vivo* using SPF⁸ birds in experimental conditions and measuring the level of post-vaccination-induced antibodies. These tests do not require any challenge trials. Then to assess vaccine quality the antigen used in the HI test to detect vaccine-induced antibodies should be the same as the

⁷ Ivo Claassen *et al.* (2006)

⁸ Specific Pathogen Free

antigen used to produce the vaccine. The vaccine manufacturer should be required to provide the laboratory performing the HI⁹ test with the antigen used for vaccine production. Producers should be encouraged to raise their antigen content to achieve a 1:120 average HI titer in single immunized specific pathogen free layer chickens.

FAO recommends that the quality of all vaccines currently used in Indonesia be continually monitored. These controls could be conducted by the Veterinary Drug Assay Laboratory on a regular basis and by a clearly established programme. Results should be made publicly available and poor performing vaccines should be deregistered.

Vaccine selection

Vaccine strains

Preliminary results of the OFFLU project seem to confirm the results obtained in the trials conducted by USDA-ARS/SEPRL: vaccine strains that closely match antigenically to HPAI H5N1 viruses are more protective than classical LPAI¹⁰ vaccine strains. NA subtype is not relevant to the field protection Therefore, **FAO recommends that H5N1 vaccines (Legok/03) or any H5 Reverse Genetic vaccine prepared from HPAI Eurasian H5N1 strains be used and preferred over any H5N2 vaccines until fully protective low pathogenic vaccine strains are generated –most likely by reverse genetic- for Indonesia.**

A selection of vaccines protective against currently circulating H5N1 field viruses is to be carried out as part of the OFFLU project. Vaccines will be selected on the basis of the outcomes of the antigenic mapping of Indonesian field isolates and confirmation with challenge tests. Distribution of viruses geographically, by enterprise type, by species and by flock vaccination status will also be considered when selecting vaccine seed strain(s).

FAO recommends that consideration be given to the following scenarios when selecting vaccines to be used:

- If the results indicate that the best protection is provided by vaccines currently not registered in Indonesia, then the Ministry of Agriculture should immediately start a process of emergency registration.
- If Indonesia does not have the ability to produce the required vaccines in sufficient quantities, then vaccines should be imported from other countries (at least until local quality production can meet demand).
- If final results confirm that H5 subtype vaccine strains that are antigenically and genetically closer to circulating HPAI viruses of the H5 subtype, are more protective than classical LPAI H5 strains, then only these H5 vaccine strains should be used (whatever the NA subtype).
- It might be shown necessary to use bivalent vaccines based on already available vaccine strains and/or incorporate additional vaccine strains.
- If results indicate that a new vaccine strain or strains must be developed specifically for Indonesia, then new vaccine seed strain(s) will need to be identified as a matter of urgency.
- If reverse genetic techniques are to be used, the 'construct' should be developed by the Government of Indonesia in partnership with international institutes and then provided to vaccine manufacturers who supply Indonesia. If national production

⁹ Hemagglutination Inhibition

¹⁰ Low Pathogenic Avian Influenza

capacities are deemed insufficient for Indonesia, the MoA should identify another potential manufacturer (or several) outside the country. The development of a new vaccine will take at least 6 months. Interim use of already available vaccines should be considered in the light of data obtained through the OFFLU project. If representative isolates in sufficient number can be characterized through the OFFLU project, new recommendations will be made by June 2008 on vaccine strain(s) to use in Indonesia until new vaccines are identified for Indonesia.

Review existing registered products

Twenty vaccines are currently registered in Indonesia. Vaccine seed strains include a local highly pathogenic strain A/ckicken/Legok/2003 (H5N1), A/ckichen/Mexico/94 (H5N2), A/Turkey/Wisconsin/69 (H5N9) and A/Turkey/England/73 (H5N2). This wide range of vaccine types and manufacturers makes vaccination monitoring and assessment more difficult. **FAO recommends that the range and type of vaccines available for use in Indonesia be reviewed and that only proven efficacious vaccines retain registration; poorly performing vaccines should be deregistered.**

New technology vaccines

- **Reverse genetic vaccines**

Owing to its high pathogenicity Asian H5N1 virus cannot usually be grown to high titre in eggs (the traditional method of vaccine virus production for human and AI vaccines). Furthermore, for AI vaccine production, OIE recommends that for any subtype, only well characterised influenza A virus of proven low pathogenicity, preferably obtained from an international or national repository, should be used to establish a master seed for inactivated vaccines. For these reasons, alternatives to homologous virus vaccines have been developed. The most promising approach is the use of reverse genetics to create a novel influenza virus having the current H5 HA antigen derived from contemporary viruses in a genetic background derived from a virus that has a high replication capacity in eggs, but that has also low pathogenicity in both avian and mammalian species^{11,12}. The seed strain contained in the vaccine is essentially a synthetic virus engineered in the laboratory. This combination allows the generation of a virus with low pathogenicity and high replicative efficiency ensuring high production yield of antigen and specific antigenicity. Once the vaccine seed strain is generated, these vaccines are produced as conventional inactivated vaccines and have the same properties as these vaccines. Current reverse genetic H5 vaccines are H5N1 strains (manufactured in China) or with another NA subtype (H5N3 manufactured by Fort Dodge). Vaccine strains based on another NA subtype enable anti-NA DIVA¹³ testing.

According to preliminary experimental results obtained by SEPRL¹⁴ with H5 reverse genetics vaccines and positive experiences in the field in China¹⁵ and Vietnam¹⁶, H5 reverse genetic vaccines should offer better protection than heterologous strains since they more closely match

¹⁶ Unpublished information

the antigenicity of HPAI H5N1 field strains. These results still need to be confirmed with Indonesian strains through the ongoing OFFLU project.

- **Recombinant live vector vaccines**

A number of recombinant live vector-engineered vaccines expressing the HA antigen in the backbone of viruses or bacteria have been shown to induce protection in poultry⁸. A fowlpox virus vaccine expressing the HA of the H5 subtype is commercially available and has been used in AI control programmes in several countries; as yet information on the efficacy of this vaccine under Indonesian field conditions is not sufficiently known and this requires urgent assessment. Vaccination at the hatchery of day-old-chicks is logistically simple to carry out and facilitates higher vaccination coverage of the bird population and protection of short-lived birds. FAO supports the urgent undertaking of field trials to assess the efficacy of TROVAC[®].

FAO recommends that the Ministry of Agriculture expedites as quickly as possible the assessment and registration of new technology vaccines, both reverse genetic and recombinant vaccines.

Establish a national technical group on vaccination

Given the need for ongoing monitoring and adaptation of the vaccination strategy to the disease situation, **FAO recommends that a national technical group on vaccination be established.** This group should be part of the responsibility of the CMU and should include representatives from all relevant parties including government, universities and research institutes, commercial industry and the vaccine manufacturers. Technical expertise should include virology, epidemiology, immunology, finance and logistics, and project planning. This group should clearly define the process and identify the roles of each Indonesian partner/institute for vaccine efficacy monitoring and vaccine strain selection in the future. It should also define the vaccination strategy to be applied in the country.

Close links should be maintained with international agencies including FAO and OIE as well as with other OFFLU members (laboratories) and with the wider international scientific community. It is essential that transparency prevail in this global public good effort where people's lives and livelihoods are at stake. The sharing of information, in particular on virus variants with the OFFLU laboratories will support disease control in Indonesia and other countries. It will also enable OFFLU laboratories to develop effective systems for monitoring antigenic changes worldwide. The support of the regional and international Reference Laboratories to the national capacity of Indonesia in order to monitor for antigenic changes and to conduct independent studies on available vaccines will have to be strengthened.

Increasing Indonesia scientific capacities

The national diagnostic and research facilities will be strengthened by working collaboratively with the OFFLU project and international scientists. A workplan will be developed that clearly specifies the roles of the national institutes, the facilities and equipment required and their personnel needs. This workplan will be used to guide international support to increase the capacity of Indonesia to undertake monitoring of H5N1 and required vaccines. It is expected that international scientists will be seconded to assist Indonesia in this process and that Indonesian scientists will be sponsored to attend international training courses and seminars. In particular, capacity building in sequencing, antigenic mapping, bioinformatics, challenge testing and reverse genetics engineering are critical for the future of Indonesian animal and human health.

ANNEX 2. FAO Update to recommendations on poultry vaccination against HPAI17 in Indonesia, May 2009

Update to recommendations on poultry vaccination against HPAI¹⁸ in Indonesia – FAO on behalf of OFFLU¹⁹ – May 2009

Introduction

Control of enzootic HPAI requires a coordinated approach using tools such as vaccination, farm biosecurity, movement control, sanitation along the market chain, rapid outbreak control, depopulation. When accompanied by other control measures, well-timed vaccination campaigns can be considered as a temporary means to induce flock immunity prior to periods of expected high challenge; thus to reduce virus circulation in the environment and poultry, and exposure risks to humans. While vaccination is a useful tool when used in combination with coordinated control strategies, it is crucial to consider the efficacy of available vaccines and to have clearly defined strategies for vaccination including post-vaccination monitoring. Day-old-chick vaccination is considered as an optimal option for large scale vaccination but it is not yet achievable due to the lack of safe and efficacious vaccines for AI in this age group.

Indonesia introduced a policy of vaccination against H5N1 in early 2004 as one of the measures aimed at controlling the burgeoning HPAI epidemic. As H5N1 has become entrenched in Indonesia, vaccination remains an important tool in control of HPAI. However, vaccine application is logistically challenging in many poultry sectors, especially in backyard poultry and ducks. In addition, there is currently no fully protective poultry vaccine against all HPAI viruses circulating in Indonesia. Research to develop safe and efficacious poultry vaccines is ongoing including investigation and challenge testing of newly developed commercial vaccines.

These recommendations arise from the collective data analyzed for the OFFLU project (OSRO/INS/703/USA), including the OFFLU technical meetings in June and November 2008, teleconference discussions between national and international experts for OFFLU, and data from the FAO component of Operational Research in Indonesia (OSRO/INS/604/USA).

Background

The results of a collaborative Vaccine Efficacy Project between GOI, FAO Indonesia technical staff and two OFFLU laboratories (AAHL²⁰ and USDA-ARS²¹/SEPRL²²) evaluating the protection conferred by currently available vaccines against three Indonesian H5N1 field viruses isolated in 2006 showed that although the antibody response was good, indicating that the vaccines were of high quality, the currently available vaccines were not fully protective in the challenge studies when using these 2006 viruses. Vaccine protection was poorest for the virus strain, A/chicken/West Java/PWT-WIJ/2006 (PWT/06), partly protective for a second strain, A/chicken/Papua/TA5/2006 and good for the third strain, A/chicken/WJ/SMI-HAMD/2006. The variation in protection suggests significant variation in antigenicity of the tested field strains.

²² South East Poultry Research Laboratory, Georgia, USA

Additional studies carried out in 2008 in SEPRL indicate the PWT/06 strain, when used as a vaccine gave acceptable protection against challenge by all 3 test strains.

Through the OFFLU project "Monitoring AI virus variants in Indonesian poultry and defining an effective and sustainable vaccination strategy," a total of 190 samples were submitted to the AAHL of which 162 viruses were isolated and 153 HA sequences generated. All isolates belonged to Indonesian HA clade 2.1. The majority of isolates clustered in HA subclade 2.1.3. One cluster of 6 isolates, predominantly from Bali was located in subclade 2.1.1 which contains older viruses (similar to Legok/2003). While PWT/06-like viruses have not been detected among the isolates studied thus far under the OFFLU project, anecdotal evidence from different national sources suggests that PWT/06 variants continue to circulate in the highly intensive sectors. It is important to note that the majority of viruses studied for the OFFLU project were obtained from village-based scavenging poultry (sector 4), in 2006-2008, and that the western Java region and intensive poultry sectors remain significantly underrepresented (9/162 isolates).

The majority of HPAI H5N1 isolates analyzed between 2006 and 2008, largely from village-based poultry, are antigenically similar; however, outliers demonstrating significant antigenic variation have been identified, predominantly from larger scale poultry production units. Based upon the data analyzed to date (virus characterization and challenge tests), vaccines currently being used in Indonesia are not fully protective against these variant viruses. New vaccines based upon updated virus strains will be required to adequately protect birds and combat this disease now and in the future.

Vaccines

Vaccine strain selection

While antigenic and biologic data from OFFLU partner laboratories suggests that none of the currently available vaccines provide full protection against all circulating viruses in Indonesia, the A/chicken/Legok/2003 (Legok/03) vaccine strain, found in clade 2.1.1 which is representative of earlier viruses from Indonesia (2004-05), is phylogenetically more closely related to (and therefore a better match for) the currently circulating viruses (clade 2.1.3) than other available vaccines. For example, the Chinese H5N1 reverse genetic strains (Re-1 from clade 0 and Re-4 from clade 7) are both antigenically and phylogenetically distant from Indonesian viruses and provide limited protection based upon current challenge test results. The antigenic differences between strains in Indonesia are sufficient to envisage the need for region or sector-specific vaccine strains in the future.

The use of vaccines prepared from HPAI Eurasian H5N1 strains continues to be preferred over LPAI H5N2-based vaccines. Therefore, until updated vaccines are available, the OFFLU recommendation is that the inactivated vaccines based upon the (Legok/03) virus remain the best choice for Indonesia for immediate procurement. However, it should be highlighted that the use of high-quality potent vaccines is even more important when there is a poor match between vaccine and field strains.

Research and development of more efficacious vaccines, including testing of available international vaccines, is required in the short-term. While the use of Reverse Genetics vaccine strains is still recommended over the conventional vaccine (HPAI versus LPAI strains), conventional vaccines using selected vaccine candidate strains should be considered in the short term and can be facilitated by cooperation with vaccine manufacturers to provide feedback and data on master seeds demonstrating adequate properties for commercial production.

Additionally, safe and efficacious commercial vaccines appropriate for application in day-old-chicks should be evaluated in Indonesia.

Sixty-nine AI viruses representing the phylogenetic variation in isolates were analyzed by antigenic cartography. The November 2008 Review meeting for the OFFLU project in Jakarta provided an expert forum to discuss the antigenic cartography results and selection of possible candidates for use as seed strains for future vaccines in Indonesia. Two candidate vaccine viruses in addition to PWT/06 were suggested for further studies (per FAO official letter to the Director General of Livestock Services, 12 January 2009). Recent biologic and antigenic data have shown that one other strain should also be considered (Table 1).

These selected candidate strains are considered to be broadly representative of the majority of circulating viruses analysed so far and are predicted to confer protection against existing circulating H5N1 viruses. However, confirmation of the antigenic results must be conducted through challenge testing with appropriate challenge strains.

Because AI viruses in Indonesia will continue to undergo antigenic drift, OFFLU also strongly recommends that 2009 viruses be included in the biologic and antigenic analysis to confirm candidate vaccine strain(s) selection. The commercial sector is the predominant consumer for vaccines, therefore full characterization of viruses from the commercial sector is needed to ensure that the updated vaccine antigens are effective against antigenic variants identified in this sector.

Challenge testing

Challenge tests are required for two different purposes in Indonesia, 1) to validate antigenic cartography analyses of viral strains in support of selection of candidate vaccine antigens, and 2) to meet the requirements of GOI regulations for the registration of AI vaccines. Since facilities in Indonesia and other OFFLU laboratories are limited it is important to conduct challenge tests only when necessary. In general, investigations in support of product registration (e.g. item 2) are considered a "private good" and should be conducted at the expense of the vaccine company. An exception may be where GOI wants to take responsibility for the work to facilitate the availability of a vaccine product in support of its national AI strategy and government funded programmes.

The official challenge strain(s) to be used for registration purposes should be representative of the majority of circulating strains and have suitable growth characteristics for laboratory work. The GOI regulatory authorities should select the strain(s) based upon the available field data and data from antigenic cartography. Official challenge strain(s) must be made available to vaccine manufacturers so that appropriate assessments of their products can be conducted to prepare data for registration if desired. Updates to the official challenge strain(s) should be based upon ongoing antigenic analysis of field strains to ensure vaccines being registered are appropriately matched to the field challenge. Challenge tests to validate antigenic cartography and characterize candidate vaccine strains under the OFFLU project will be conducted using six challenge strains, selected to represent the antigenic diversity of circulating H5N1 viruses in Indonesia (Table 1). Field vaccine trials in Indonesia are strongly recommended using the selected vaccines to validate results of challenge tests under field conditions and with native birds.

Vaccine registration

- It is recommended that GOI examine the EU system of registration of vaccines, under which vaccine usage is controlled to ensure that only products efficacious under current circumstances are allowed to be used. Updates to the official challenge strain implies that previously registered vaccine seed strains be re-assessed using the current challenge strain(s)
- Vaccine manufacturers should be encouraged to raise their antigen content to achieve a minimal 1:120 average HI titre in single immunized specific pathogen free layer chickens when tested against the homologous antigen
- Provisions for temporary versus permanent licensure of AI vaccines should be considered in Indonesia as updates to AI vaccines will likely be an ongoing need
- Continue to monitor the potency and efficacy of all vaccines currently registered in Indonesia following a clearly established protocol

Vaccination strategy

Based on data and experience to date, targeting year-around preventative vaccination in breeder and layer production units, as well as ensuring vaccine coverage of high-risk poultry in semi-intensive and intensive production units during periods of increased risk (e.g. rainy season, festivals) would benefit the GOI vaccination strategy. Government-subsidized mass vaccination of scavenging village poultry and other poultry kept for personal use is currently not recommended on a large-scale, both based upon previous experience and for practical reasons. Lessons learned from the recent operational research may help in determining ways to deliver vaccine to selected, high risk small-scale poultry at low cost, and targeted vaccination of scavenging poultry should be envisaged based on human/animal risk analysis. Communities should continue to be encouraged to vaccinate their poultry against HPAI and Newcastle disease. Additionally, vaccination of free-grazing ducks and ensuring that poultry entering the live bird market chain are adequately vaccinated would help interrupt virus amplification and circulation will be difficult to carry-out at the present time. Provision of resources for cold chain and training of vaccination teams must be provided as part of the vaccination strategy and support in this area may be available from the international donor community. Poultry producers themselves could be trained to effectively deliver the vaccinations, thus relieving local government of this onerous responsibility. The vaccination protocol will vary among the production systems considered. The protocol in small-scale layer farms would require multiple vaccinations during both growth and production phases. FAO will continue to work closely with the MoA on understanding the epidemiology of the disease and vaccination programme planning so that the vaccination strategy can evolve accordingly.

Conclusion

Vaccination remains a tool for reducing the overall viral load in an endemic country such as Indonesia in the short to medium term. Antigenic and biologic data from OFFLU partner laboratories suggest that currently there is no fully protective vaccine against all circulating viruses in Indonesia and that more than one vaccine strain might be needed to have efficacious vaccines across all sectors (and locations) in Indonesia. Field vaccine trials in Indonesia are strongly recommended using the selected vaccines to validate results of laboratory challenge tests under field conditions and with native poultry birds. OFFLU also strongly recommends that 2009 viruses be included in the biologic and antigenic analysis to confirm candidate vaccine strain(s) selection.

In the medium to long term, control of HPAI H5N1 in Indonesia requires a coordinated approach and will require some restructuring of the poultry industry. Improving biosecurity measures for production of short lived broilers is needed to help decrease virus entering live poultry markets. Small-scale, poorly bio-secured commercial farms are likely to be responsible for spread of disease throughout the country and for contamination of live bird markets. However, it can be difficult to adequately vaccinate these small flocks. Despite the difficulty of working in Sector 3 layer farms, vaccination remains an important component of the overall HPAI control and prevention strategy. The importance of private/public partnerships should be highlighted for better control of the disease, in particular a better sharing of outbreak and virus information. Options to improve the genetic resistance of fast growing broiler chickens to H5N1 viruses should be explored as an alternative to vaccination,

ANNEX 3. OFFLU AI vaccine guidance

Continued evaluation and updating of vaccine seed strains to protect against emergent variant field virus strains

Historically, H5 LPAI inactivated vaccine seed strains and recombinant fowl poxviruses with H5 gene inserts have shown broad cross protection in chickens against challenge by diverse H5 HPAI viruses from Eurasia and North American (4-6,8). However, AI vaccines have had limited use in the field until 1995 when the H5N2 HPAI outbreak occurred in Mexico and vaccine use was implemented as part of the control programme (9). The HPAI strains were eradicated by June 1995, but as H5N2 LPAI viruses have continued to circulate, vaccination was maintained in the region as one of the control tools for these H5N2 LPAI strains. Within a few years, multiple lineages of antigenically variant H5N2 LPAI field viruses emerged that escaped from immunity induced by the original 1994 vaccine seed strain used in the conventional inactivated vaccine (3). Similarly, emergent H5N1 HPAI field viruses have arisen in China, Indonesia and Egypt since 2005 that escaped from immunity induced by classical H5 inactivated vaccine seed strains used in commercial vaccines (1,7). It is not entirely clear whether the emergence of these antigenic variants is related solely to use of vaccines.

All AI vaccination programmes should have an epidemiologically relevant surveillance programme to check for emerging variants and representative isolates of AI viruses obtained should be assessed for genetic and antigenic variation. Screening can be done by HI testing using genetic variant field viruses and vaccine seed strains as antigen, and isolates suspected of being antigenic variants should then be analyzed by methods such as antigenic cartography (2). H5 and H7 LPAI vaccine seed strains used in inactivated vaccines and recombinant vaccine viruses with AI hemagglutinin gene inserts should be re-evaluated and seed strains that are not protective should be discontinued: a) whenever there is evidence of emergence of antigenic variants or vaccine failure (clinical disease in vaccinated flocks with a solid immune response to the vaccine antigen); or b) every 2-3 years for efficacy against circulating field viruses, and the use of seed strains that are not protective should be discontinued. The vaccine seed strain evaluation should include field viruses from all relevant geographic regions and production sectors, and sequence analyses of such viruses to identify genetic variants that can be further evaluated for antigenic change that may reduce the efficacy of the vaccine(s) in use. Strains representative of the major circulating antigenic lineage(s) plus selected antigenic variants should be used in challenge trials against current licensed vaccine seed strains, as well as potential future seed strains. Based on this scientific information, the competent veterinary authority within the country should establish, in consultation with leading veterinary vaccine scientists and international organizations, naturally isolated or reverse genetics LPAI vaccine seed strains for conventional inactivated vaccines, and H5 and H7 hemagglutinin gene insert cassettes for recombinant vaccines. In some situations, more than one seed strain may be necessary to cover all production sectors within a country. Only high quality and potent vaccines should be licensed and used in AI control programmes. Proper administration of high quality, potent vaccines is critical in inducing protective immunity in poultry populations.

Project Title: Expansion of the avian influenza participatory disease surveillance and response program in Indonesia

Extension Title: Reinforcement and expansion of the avian influenza participatory disease surveillance and response program in Indonesia

Period: October 2010 - March 2011

Country: Indonesia
Project title: Reinforcement and expansion of the avian influenza participatory disease surveillance and response program in Indonesia
Code: OSRO/INS/604/USA
Budget: USD 44.2 million ¹
Effective starting date: 9 June 2006
Planned end date: 30 September 2011
<p>Context of the project</p> <p>The purpose of the project is to enhance the capacity and ability of the Government of Indonesia and partners to control HPAI in order to help safeguard the health and livelihoods of the Indonesian population by providing broad-based support to the FAO Indonesia HPAI Control Programme implemented by ECTAD Indonesia.</p>
<p>Objectives of the project</p> <p>Output A: Sustainable surveillance, prevention and control of HPAI in village poultry</p> <p>Output B: Improved biosecurity and vaccination practices in commercial sectors</p> <p>Output C: Improved HPAI surveillance and control along the poultry marketing chain</p> <p>Output D: Engagement with duck producers for improved control of HPAI</p> <p>Output E: Sustainable virus monitoring and vaccine development</p> <p>Output F: Coordinated and enhanced management of the HPAI control programme</p>

¹ The breakdown of the total contribution is as follows: USD 4 million for first year (June 2006-May 2007), USD 11 million for second year (June 2007-May 2008), USD 2.7 million for interim extension (June -September 2008), USD 7.5 million for third year (October 2008-May 2009), USD 11 million (June 2009-September 2010) and USD 8 million (October 2010-September 2011).

National Poultry Quality Improvement Programme, including regular Biosecurity Coordination meetings

B.5 Evaluate effectiveness of biosecurity measures implemented by poultry producers

B.6 Facilitate design of local government-implemented poultry farm profiling and certification system

B.7 Assist central government to monitor commercial poultry producer compliance with avian influenza vaccination regulations

Output C: Improved HPAI surveillance and control along the poultry marketing chain

C.1 Support local government to conduct longitudinal surveillance and trace-back for H5 subtype virus and HPAI in live bird markets, collector yards and slaughterhouses

C.2 Support implementation of minimum standards of biosecurity and sanitation in selected live bird markets, collector yards and slaughterhouses

C.3 Facilitate poultry market restructuring with emphasis on food safety in DKI Jakarta and surrounding areas

C.4 Explore mechanisms to improve inter-provincial movement control out of HPAI high risk provinces

Output D: Engagement with duck producers for improved control of HPAI

D.1 Assess role of ducks in the epidemiology of HPAI in selected areas of Java

D.2 Conduct duck vaccination field trial in one identified high risk HPAI-endemic area

Output E: Sustainable virus monitoring and vaccine development

E.1 Assist public and private sectors to develop a centrally-managed system to monitor circulating viruses and sustain vaccine efficacy

E.2 Increase knowledge of best practices for avian influenza vaccination in poultry

Output F: Coordinated and enhanced management of the HPAI control programme

F.1 Facilitate implementation of integrated HPAI control plan on one island where the HPAI situation is considered readily controllable

F.2 Strengthen government capacity to conduct veterinary services training and continuing education

F.3 Improve competencies of local government decision-makers to manage sustainable and effective HPAI control programmes and to promote understanding of the economic impact of animal diseases on livelihoods and public health

F.4 Assist central and local governments to design and implement a national veterinary service strategy

F.5 Develop and integrate emerging databases into the national veterinary information system

F.6 Provide technical assistance for establishment of local cold chain capacity

F.7 Increase public visibility of the HPAI control programme

F.8 Provide operational support to enable implementation of the ECTAD Indonesia programme

Activities undertaken during the reporting period

Output A: Sustainable surveillance, prevention and control of HPAI in village poultry

A.1 Maintain, develop and adapt local government prevention, passive surveillance and outbreak control capacity for village poultry across endemic areas of Indonesia, prioritized by level of HPAI risk; manage a staged transition of costs to local government

- A meeting was held on the initial design to improve village-based decision making for the prevention and control of HPAI in sector 4 poultry.
- Local government capacity was strengthened through the training of 25 PDSR officers in West Bandung; initial training for these officers was carried out in August 2010 and this training, Continuing Education A and the training of ten PDSR officers in Continuing Education B, reinforced the skills learned in the introductory training.
- A modified PDSR training module was developed for low risk areas to focus on HPAI rapid response and control and 20 local government livestock service staff in Papua Province were trained in the Introductory I module in February 2011.
- Cost-sharing methods between FAO and local government to ensure sustainability of the PDSR programme were developed and presented at the Yogyakarta Decision Makers' Meeting (DMM) in December 2010; the concept of cost-sharing was agreed to during the meeting by the

participants present.

- A draft plan for rewarding the districts which are early-adopters of cost-sharing agreements was developed and discussed at the LDCC Coordinators' meeting held in October 2010 in Semarang. West Bandung, Papua and Samarinda districts have allocated funds to cover the costs of PDSR officers.

A.2 Strengthen the capacity of Puskesmas (animal health centres) by integrating participatory diseases surveillance and response techniques; pilot system first in ten Puskesmas

- Individual reports on structured active surveillance for HPAI in village poultry conducted in 6 selected districts on Java were completed.
- The Participatory Community Engagement (PCE) training course, which uses elements of PDSR training and will underpin training for the National Veterinary Service (NVS), was developed and the curriculum for three levels of training agreed. Ten modules have been prepared for levels 1 and 2 and tested as part of the pilot PVUK training programme.
- An evaluation of human and capital resources of all NVS Puskesmas has been carried out based on Government information.

A.3 Increase local government veterinary service competency to detect, diagnose, report and control other animal diseases of zoonotic and economic importance in villages

- The USDA/Cornell University Sample Collection and Necropsy Videos with narration in Bahasa Indonesia were produced. These videos were distributed to 40 PVUK trainees as a training aid and to assist them with their field work.
- The Directorate General of Livestock and Animal Health Services (DGLAHS) NVS Task Force agreed on a tiered training approach for all local government veterinarians, including those who have received PDSR training.
- The NVS Task Force also agreed to pilot the new approach with the rabies control programme in Bali.
- Seven draft SOPs, work flow and technical guidelines and training curricula have been developed to train PDSR staff in the detection and control of rabies as a pilot of the NVS concept. These will be tested in Bali and linked to PCE training.
- Avian Influenza Bulletin Vol. 7, in Bahasa Indonesia and English, was produced and distributed to PDSR officers, laboratories and government offices.

A.4 Develop locally-realistic methods and communication materials for prevention and control of HPAI and other animal diseases of zoonotic and economic importance to enable communities to make informed decisions together and supported by local government

- Plans developed for biosecurity communication material based on experience in South Sulawesi.
- Overview video of FAO Indonesia communication activities produced and shared with DGLAHS during Technical Briefing Meeting in December.
- With the proposed changes in PDSR and development of NVS, the existing communication material is being reviewed for relevance in the new system. Material on rabies in Bali is being developed.
- Development of communication material for farmers to complement PVUK training is ongoing.
- Interviewed farmers and workers at commercial poultry farms in Central Java to get better understanding on the communication needs and methods/materials suitable for commercial poultry farms.

Output B: Improved biosecurity and vaccination practices in commercial sectors

B.1 Provide specialized technical support to selected layer farmers to enhance production efficiency and quality of layer vaccination and biosecurity measures

- Farm profiling of six participating layer farms was completed.
- Farm flock health status was tested in collaboration with participating farmers.
- Feed and water samples were quality tested in collaboration with participating farmers.
- Farm assessments for each participating farm were completed.

- Meetings were held with each farmer to identify their top priorities and a Phase I management plan was agreed to address non-biosecurity issues for each participating farm.
- Assistance was provided to each farm to implement their Phase I management plan.
- Baseline bird and environmental sampling was carried out to determine the presence of H5-subtype virus on each farm.

B.2 Support local government veterinary and laboratory services to engage more effectively with poultry farmers on disease prevention and outbreak investigations (PVUK programme)

- PVUK teams were established in eight districts from four provinces.
- The training module outlines and methodologies were agreed. The curriculum for three levels of training was agreed and modules were prepared for the three levels.
- Ten PVUK trainees were given level 1 and 2 training in Lampung and the remaining 30 participants received level 1 training in Solo.
- The ten trainees in Lampung commenced work and are being backstopped by the training team as they begin to implement the pilot project. Data collection forms were tested and refined to produce final formats.

B.3 Facilitate trial of private sector-funded compensation programme

- Agreed with ADPHI (Indonesian Poultry Veterinary Association) to include a private-sector compensation pilot as a signature activity of the National Poultry Quality Improvement Programme (NPQIP).
- Met with GOPAN-associated broiler farmers to further discuss the opportunities and constraints to establishing a private-sector funded compensation programme.

B.4 Facilitate government and industry to establish a functional public-private partnership via a National Poultry Quality Improvement Programme, including regular Biosecurity Coordination meetings

- Responsibility for NPQIP development has now been assumed by ADPHI with USDA and FAO providing technical support.
- Agreed with ADPHI to focus on five signature activities, including a compensation scheme for producers and a continuing education programme for poultry veterinarians, on which immediate progress can be made in order to increase farmer support and enthusiasm for the NPQIP.
- Draft Terms of Reference (TOR) for Commercial Poultry Health Master Trainers were developed.
- The NPQIP concept was discussed with the DGLAHS and is now fully supported by the Director-General.

B.5 Evaluate effectiveness of biosecurity measures implemented by poultry producers

- The baseline collection of economic data on six layer farms was completed
- A farmers' feedback meeting was conducted to discuss the baseline findings and to present the findings of production cost data analysis and the overall productivity assessment
- The farmers' perception and decision-making study on the commercial layer chicken production system was drafted.

B.6 Facilitate design of local government-implemented poultry farm profiling and certification system

- Twenty-four data managers, assisted in the training and supervision of 358 enumerators to collect profiling data on commercial farms in the eight PVUK districts. Profiling information from a total of 11,130 farms was collected and entered into district-level databases.
- Draft maps showing the distribution of poultry farms were produced for each district.
- Vector layers were installed on the PVUK computers in all districts and refresher training for data managers was carried out in all districts.

B.7 Assist central government to monitor commercial poultry producer compliance with avian influenza vaccination regulations

- To complete this activity, FAO ECTAD's Commercial Poultry Health programme is reviewing

the vaccine selection and vaccination practices of layer farmers participating in the programme.

Output C: Improved HPAI surveillance and control along the poultry marketing chain

C.1 Support local government to conduct longitudinal surveillance and trace-back for H5 subtype virus and HPAI in live bird markets, collector yards and slaughterhouses

- Local government market surveillance officers (PSP) collected and tested environmental samples from 260 LBMs every month in the Jabodetabek area as part of the live bird market surveillance programme.
- A National Technical Advisor for Market Chain Surveillance was successfully recruited.
- The analysis of collector yard surveillance and targeted research data was continued (Phase II).
- A rapid field assessment of the Semanggi Collector Yard in Central Java was carried out.
- The LBM database was evaluated to improve LBM surveillance in Jabodetabek by holding meetings with the Jakarta category B Animal Health Laboratory and with Data Encoders (DE) from LDCC Jakarta, Bogor and Serang.
- The new list of LBMs to participate in the surveillance programme was finalized.
- A coordination meeting was held with PSP, LDCC and the Jakarta category B animal health laboratory to evaluate the implementation of LBM surveillance in Jabodetabek.
- Refresher training was conducted for all PSP staff and additional training of new PSP officers in Jabodetabek was carried out.

C.2 Support implementation of minimum standards of biosecurity and sanitation in selected live bird markets, collector yards and slaughterhouses

- Conducted field assessment to introduce improved cleaning and disinfection (C&D) practices in 21 collection yards, 17 LBMs and three vehicle C&D stations in Jabodetabek.
- Conducted training on C&D practices and public awareness activities for cleaning workers and owners of 21 collector yards, 17 LBMs and three vehicle C&D stations. Local Agricultural Dinas officials were also included in the trainings.
- Distributed 41 high pressure washers, 163 metal cages as well as C&D tools and materials to 21 collector yards, three C&D stations and 17 live bird markets in Jabodetabek.
- FAO supported local government monitoring and evaluation of market chain C&D activities in 31 collector yards in Jabodetabek.
- Focus group discussions were held at five LBMs in Jabodetabek to develop appropriate market rehabilitation designs.
- The design and budget estimates were finalized for the establishment of two vehicle C&D stations and the rehabilitation of five LBMs in Jabodetabek.
- Training materials were prepared and a schedule for collaboration with WHO and MOH on live bird market C&D training was agreed.
- Two vehicle C&D stations were established in Bekasi and Bogor.
- The construction of two rehabilitated LBMs in Tangerang was supervised.
- On-site refresher training was conducted for staff at 21 collector yards and 17 LBMs previously equipped with high pressure washer machines.
- Recruitment for the National Engineer and Assistant National Engineer positions was completed
- The DKI market restructuring programme supported market C&D training and a food safety inspection workshop in accordance with DKI Jakarta regulation No. 5/1992.
- Meetings were held with the West Java Agriculture Service in Bandung regarding an assessment plan for C&D activities and field assessments at collector yards/ slaughterhouses in high-risk areas in Western Java were carried out.

C.3 Facilitate poultry market restructuring with emphasis on food safety in DKI Jakarta and surrounding areas

- Assistance was provided in the adaptation of the Jakarta poultry markets restructuring strategy, moving towards an increase in the number of designated relocation / slaughtering centres.
- A targeted public awareness campaign for the promotion of "healthy chicken meat" was continued via editorials in Jakarta newspapers similar to the previous semester and the publicity

campaign in markets was continued. A comprehensive promotion campaign for "healthy chicken meat" was successfully implemented with consumers and traders in two traditional markets (Klender, November 2010 and Kramat Jati, February 2011) selling poultry meat.

- The market programme continued its close collaboration with the private sector and the local government administration in the development of adapted cold chain equipment and restructuring of distribution channels, including the cold chain. The distribution channel from one of the five collection yards/ slaughterhouses to two traditional markets (Rawa Kepiting to Klender & Kramat Jati) was trialed this semester.
- Technical support was provided to local government to strengthen food safety measures and government structures. The national food safety expert assessed the situation and formulated a number of recommendations for food safety and meat inspection improvements and tried them out during the pilot activity in the slaughterhouse and traditional market. In February 2011 a workshop was held to validate the assessment of the capacity of the Jakarta Livestock Service staff and the law enforcement structures on food safety and proposing the gradual strengthening of food safety information, inspection and law enforcement in relocation centres and traditional markets.
- Plans for collaboration on the establishment and promotion of relocation centres (collection yards with slaughtering facilities) in the sub-districts of Tangerang Kota, Tangerang Kabupaten, Tangerang Selatan and Depok were downsized because of delays in the implementation of the Jakarta poultry restructuring process and expected programme budget constraints.

C.4 Explore mechanisms to improve inter-provincial movement control out of HPAI high risk provinces

- Recommendations were developed to renovate the Semanggi collector yard in Surakarta city in order to reduce the risk of viral amplification along the native chicken market chain.
- A technical meeting was conducted with Central Java provincial Dinas and the Agricultural Dinas and Market Dinas of Surakarta city regarding the epidemiological situation of the native chicken trade originating at the Semanggi collector yard and the high priority need to renovate the collector yard in order to reduce risk.
- An initial meeting was held with Jabodetabek agricultural Dinas and DAH on improving Animal Health Certification (SKKH) for poultry entering Jabodetabek.
- Meetings were held with the West Java Agriculture Dinas in Bandung regarding an assessment plan for checkpoint operation and Animal Health Certification (SKKH).
- In collaboration with DAH, a meeting was held with the mayor of Surakarta city to advocate for support for the initiation of high-priority renovations to the Semanggi collector yard.

Output D: Engagement with duck producers for improved control of HPAI

D.1 Assess role of ducks in the epidemiology of HPAI in selected areas of Java

- The Java duck survey was re-analysed.
- The PCR test results produced by the DKI laboratory on samples from the Java duck survey were verified
- The conclusions were completed and the draft final report produced.

D.2 Conduct duck vaccination field trial in one identified high risk HPAI-endemic area

- Further progress on this task is pending finalization of the Java duck study (Activity D.1).

Output E: Sustainable virus monitoring and vaccine development

E.1 Assist public and private sectors to develop a centrally-managed system to monitor circulating viruses and sustain vaccine efficacy

- The characterization of 244 H5N1 isolates (total of 266 viruses) from 317 samples representing approximately 90 districts predominantly from backyard chickens during 2007-08 was reported upon during the final OFFLU technical review meeting Oct 2010. This contributed to the ongoing efforts to monitor field viruses.
- Backstopping and ongoing support for the transfer of technology to Indonesia was provided by the FAO-OFFLU scientist in October-November 2010. Outputs included the following:

facilitating meeting with DGLS, CMU, BPM SOH, Pusvetma, FAO, OFFLU to discuss disposition of candidate vaccine and challenge strains, the status of avian influenza vaccine registration in Indonesia and the provision of reverse genetics constructs to Indonesia; prepared and conducted workshops for the laboratory network and the Final Technical Review meeting; meetings with the DAH and other relevant government officials as needed and with partners for coordination of ongoing activities.

- Laboratory Network meetings with bench-side work were jointly conducted (FAO-OFFLU /AAHL) for sequencing (25-27 October) and pre-screen HI partners (1-3 November) in support of the effort to monitor antigenic variation of circulating viruses. Standardized reagents were provided to all collaborating laboratories.
- Viruses selected from the Round 1 national pre-screen results were sent to AAHL for parallel generation of antigenic and genetic data for capacity building purposes (Feb 2010). The DIC Wates produced full panel antigenic cartography data on these 32 isolates with support from an AAHL scientist (March 2011). The DICs continued the pre-screening process, submitting raw data for the haemagglutination inhibition (HI) assay conducted using cartography sera on H5-positive fluids isolated through their ongoing diagnostic activities. Round 2 analysis was conducted in March 2011.
- Six Indonesian scientists participated in bench-side sequencing training at AAHL during November 2010.
- The national OFFLU technical facilitator coordinated OFFLU activities with representatives from the DAH/National HPAI Campaign Management Unit (CMU) and other relevant public sector units and private sector stakeholders. Outputs included the following: receipt of letter from the DG to release virus sequences characterized by the project into the public domain; approval to receive the reverse genetic construct viruses at the Pusvetma laboratory; securing the material transfer agreement and ensuring shipment of selected viruses to AAHL; and assisting in preparations for the workshops and meetings.
- A proposal was received from the three sequencing partners on continued molecular sequencing activities in addition to support of HPAI monitoring to include a more strategic approach, communication and sharing of biologic materials between partners. This will contribute to recommendations on establishing the mechanism for sustainable virus characterization.
- A paper titled "Initial study of antigenic diversities of avian influenza virus H5N1 in Indonesia using reference antisera produced for antigenic cartography" was presented by a national scientist at the National Scientific Conference organized by the Indonesian Veterinary Medical Association in Semarang, October 2010.
- A presentation on "OFFLU: Contributions toward improved vaccine strain selection for poultry" was made by an international scientist in collaboration with OFFLU at the 1st International One Health Congress in Melbourne, Australia, February 2011.

E.2 Increase knowledge of best practices for avian influenza vaccination in poultry

- The final OFFLU project technical review meeting was conducted 28-29 October 2010 and recommendations were produced including guidance on registration and licensing for efficacious poultry vaccines.
- Clearance was received from the Director General to deliver the reverse genetics (RG) virus seed strains, generated at SEPRL, to Pusvetma.
- Following a meeting on 5 November 2010 facilitated by FAO/OFFLU, the DGLAHS informed vaccine manufacturers of the availability of the candidate vaccine and challenge viruses and invited them to retrieve the viruses from Pusvetma and BPM SOH. However, these strains have still not been released.

Output F: Coordinated and enhanced management of the HPAI control programme

F.1 Facilitate implementation of integrated HPAI control plan on one island where the HPAI situation is considered readily controllable

- The analysis of the market chain network study on Bali was completed. This was the last piece of work for phase I of the Bali project.

F.2 Strengthen government capacity to conduct veterinary services training and continuing education

- The curriculum for communication and improved training skills for Master Trainers (MT) has been developed and was approved and nine modules were prepared and tested. Linked to the Improved Training Skills, three Training of Trainers (TOT) sessions (GPS, sample submission and SMS gateway) have been developed so that the MTs can carry out these trainings at the provincial or district levels.
- Three national MTs have developed TOT skills and a further four MTs have been trained in Improved Training Skills.
- Three National MTs have returned to Jakarta and are learning how to develop training modules and have developed their abilities in module preparation and training. Two MTs in Bandung were given on-the-job support to improve their training skills. Data managers trained for the PVUK programme were supported to train enumerators in data collection.
- A need has been identified for a training module on understanding data which will build skills in data analysis and culminate in Quantum GIS training for Provincial and District staff. The curriculum for this training has been developed and module preparation commenced.

F.3 Improve competencies of local government decision-makers to manage sustainable and effective HPAI control programmes and to promote understanding of the economic impact of animal diseases on livelihoods and public health

- One Decision Makers' Meeting (DMM) for Yogyakarta was held on 21 and 22 December 2010. The meeting underlined the fact that backyard chickens are the main livestock species of the majority of people in Yogyakarta and are kept traditionally as an additional economic source or as a source of animal protein for the household. In addition, there are still many traditional markets in the province selling live chickens or birds.
- The meeting further highlighted the efforts made by the provincial and district Livestock Services (included PDSR-trained staff) in implementing effective HPAI control programmes with community participation and the need to implement more IEC activities to raise public awareness and to build off existing community cadres / volunteers at the village level. There is also a need to improve disease surveillance, control poultry movements in the market chain and build the capacity of Livestock Service officers (to be funded by local government).
- The output of this DMM meeting was a document signed by local government decision makers, stating that the provincial and district governments are ready with their 2011 and 2012 local government budgets to continue operational support of the PDSR programme.

F.4 Assist central and local governments to design and implement a national veterinary service strategy

- The NVS workplan was completed and approved by the Director of Animal Health.
- Guidelines on National Veterinary Services, establishment of Veterinary Authority and appointment of the Authorized Veterinarian were drafted and the content has been agreed in principle by DGLAHS NVS Task Force.
- Guidelines for the Control Strategy for rabies, anthrax, brucellosis and hog cholera were drafted by the DGLAHS NVS Task Force.

F.5 Develop and integrate emerging databases into the national veterinary information system

- The draft plan for the national animal disease surveillance system was completed.
- Database design for a generic animal disease surveillance system was initiated.
- Work on standardization of data collection to ensure compatibility of databases was continued.

F.6 Provide technical assistance for establishment of local cold chain capacity

- Inclusion of Bali in USAID-funded cold chain capacity strengthening activities was promoted
- Technical support was provided for the cold chain TOT implemented by JSI-Deliver.
- In collaboration with DAH/CMU and JSI-Deliver, a field assessment of the cold chain in Bali province was conducted.

F.7 Increase public visibility of the HPAI control programme

- FAO participated in the Indonesian Veterinary Medical Association conference and exhibition

in October 2010, establishing the programme's booth and disseminating public materials related to the project.

- The 2009 ECTAD Indonesia Annual Report (Indonesian version) distributed to partners and government offices.
- A Media Gathering on Market Restructuring was held in February 2011.
- Work has started on preparation of the 2010 ECTAD Indonesia Annual Report.

F.8 Provide operational support to enable implementation of the ECTAD Indonesia programme

- Service contracts were signed with vendors and partner organizations to facilitate various project activities, including the establishment of four cleaning and disinfection stations in East Jakarta, Bekasi and Tangerang, renovation of two markets in Tangerang, laboratory testing of samples for surveillance activities and a publicity campaign to promote "Ayam ASUH" (healthy chicken meat) in the Jabodetabek area.
- 355 IT equipment packages were procured and distributed to 29 provincial livestock service offices.
- The renewal of vehicle registration for 632 motorcycles and 38 cars was initiated.
- A Memorandum of Understanding (MOU) for testing of samples from layer farms participating in the biosecurity cost-effectiveness study was signed.
- In line with technical activities undertaken during the quarter, project personnel were recruited, project equipment and supplies were procured and distributed and Letters of Agreement (LOA) were signed with partner organizations.

Planned activities for the next six-month period

Output A: Sustainable surveillance, prevention and control of HPAI in village poultry

A.1 Maintain, develop and adapt local government prevention, passive surveillance and outbreak control capacity for village poultry across endemic areas of Indonesia, prioritized by level of HPAI risk; manage a staged transition of costs to local government

- Village empowerment strategies to be developed for incorporation into a modified version of PDSR that will evolve over the semester to focus on improving passive reporting and reducing amount of time spent on active reporting. New and simplified reporting methods will be developed to allow PDSR staff to work to empower the village community to take a greater role in decision-making. Strategies to develop village decision-making skills will be developed.
- Fourteen new PDSR staff will be trained in West Bandung and 39 officers in Samarinda. A review of existing PDSR coverage will be carried out to determine future needs for ongoing training. Twenty livestock service officers in Papua will be given Intro II training.
- Further DMMS will be held in Banten, West and Central Java to discuss cost-sharing.

A.2 Strengthen the capacity of Puskesmas by integrating participatory diseases surveillance and response techniques; pilot system first in ten Puskesmas

- Implementation of PCE field training will be linked to the development of the NVS. Initially this will take place in Bali to control rabies and this will serve as a model for other areas affected by rabies that are included within the NVS programme.

A.3 Increase local government veterinary service competency to detect, diagnose, report and control other animal diseases of zoonotic and economic importance in villages

- Eleven SOPs for the prevention and control of rabies will be completed and used in the NVS rabies eradication programme in Bali.
- Sixty-nine PDSR staff will be trained to carry out vaccination, rapid response and vaccination to control rabies in Bali.
- A system will be developed to increase passive reporting of suspect rabies cases and increase the communities' understanding of herd immunity amongst vaccinated dogs.
- PDSR Disease Transmission Video will be transitioned to commercial poultry and PVUK programmes following further discussion with the CPH and Local Government teams.
- SOP, workflow and technical guidelines and training will be developed for detection and control of rabies as a pilot of the NVS concept. These will be tested in Bali and linked to PCE

training.

A.4 Develop locally-realistic methods and communication materials for prevention and control of HPAI and other animal diseases of zoonotic and economic importance to enable communities to make informed decisions together and supported by local government

- An overall communication strategy will be developed to pass information from central government to commercial farmers through the LDCC system.
- Completion and distribution of IEC material as part of piloting the NVS concept in Bali.
- With the proposed changes in PDSR and development of NVS, the existing communication material will be reviewed for relevance in the new system.
- Development of communication material for farmers and farm workers to complement PVUK training and the CPH programme.

Output B: Improved biosecurity and vaccination practices in commercial sectors

B.1 Provide specialized technical support to selected layer farmers to enhance production efficiency and quality of layer vaccination and biosecurity measures

- Meet with each farmer to identify the farmer's top priorities and agree on a management plan to address biosecurity issues for each participating farm (phase-2 period).
- Continue to assist each farm to implement management plan phase-1 and phase-2.
- Sample birds and environment to determine presence of H5-subtype virus at end of phase 1 and 2 periods.
- Begin implementation study of farmers' perceptions and decision-making.

B.2 Support local government veterinary and laboratory services to engage more effectively with poultry farmers on disease prevention and outbreak investigations (PVUK programme)

- Complete final introductory level (level 3) training of pilot PVUK officers so they can formally begin to work as PVUK officers.
- Conduct Knowledge, Attitudes and Practices (KAP) study in selected districts as a baseline to later assess changes attributable to PVUK activities.
- A project evaluation will be carried out to document the impact of the PVUK pilot and make recommendations for scale-up.
- The PVUK database will be developed and managed at the district level.

B.3 Facilitate trial of private sector-funded compensation programme

- Further discuss opportunities to pilot a compensation system with GOPAN-associated broiler farmers.
- Identify early adopter farmers based on discussions above and initiate design.

B.4 Facilitate government and industry to establish a functional public-private partnership via a National Poultry Quality Improvement Programme, including regular Biosecurity Coordination meetings

- Continue development of the NPQIP document.
- Hold consultation meeting with farmers in collaboration with ADPHI, USDA and DGLAHS.
- Finalize TOR for Commercial Poultry Health Master Trainers in collaboration with ADPHI and USDA.

B.5 Evaluate effectiveness of biosecurity measures implemented by poultry producers

- Continue monitoring the implementation of the cost-effectiveness study.
- Analyze data from study and begin preparing preliminary report.
- Meet the farmers and key stakeholders to share study analyses and findings.
- Provide farmers with digital production cost data management system (database).
- Continue monitoring farmer decision-making patterns and conduct preliminary analysis.

B.6 Facilitate design of local government-implemented poultry farm profiling and certification system

- Further training for data managers on encoding the data generated by the PVUK officers will be carried out.
- Data managers will be given “understanding data” training to enable them to make best use of the profiling data.

B.7 Assist central government to monitor commercial poultry producer compliance with avian influenza vaccination regulations

- Prepare report to DGLAHS on findings of vaccination practices of farmers participating in CPH programme.

Output C: Improved HPAI surveillance and control along the poultry marketing chain

C.1 Support local government to conduct longitudinal surveillance and trace-back for H5 subtype virus and HPAI in live bird markets, collector yards and slaughterhouses

- Continue to support monthly LBM surveillance by local government in Jabodetabek.
- Conduct coordination meeting with Provincial Livestock Services of West Java, Jakarta and Banten, district/city livestock services and PSP in Jabodetabek.
- Complete analysis of collector yard surveillance data (Phase II) once PCR results are verified and then design Phase III market chain surveillance based on Phase II findings.
- Prepare training for Phase III market chain surveillance.
- Conduct Phase III market chain surveillance.

C.2 Support implementation of minimum standards of biosecurity and sanitation in selected live bird markets, collector yards and slaughterhouses

- Conduct market C&D training at ten pilot LBMs in collaboration with the MOH-WHO healthy markets programme.
- Supervise the operation of the new C&D stations in Bekasi and Bogor.
- Continue to develop C&D station design, budget estimation and contractor selection for 3 slaughterhouses in Jabodetabek.
- Develop minimum standards guidelines for sanitation along the poultry market chain.
- Support ongoing local government monitoring and evaluation of market chain C&D activities in Jabodetabek.
- Continue to oversee construction works at Anyar market in Tangerang City and Bonang market in Tangerang District.
- Develop and supervise the bidding process and contractor selection for Parung Panjang market (Bogor district), Anyar market (Bogor city) and Kranggan Market (Bekasi city).
- Conduct monitoring and evaluation of the implementation of cleaning day at LBMs in Jabodetabek.
- Provide documented lessons learned and recommendations to improve implementation of C&D activities.

C.3 Facilitate poultry market restructuring with emphasis on food safety in DKI Jakarta and surrounding areas

- Continue to provide assistance in the consolidation of the Jakarta poultry market restructuring strategy, which has agreed an increase in the number of designated relocation centres as a more accommodating approach towards the poultry operators.
- Help identify and assess potential locations proposed by collectors and slaughterers that can become official relocation centers.
- Continue to implement comprehensive promotion campaigns for “healthy chicken meat” with consumers and traders in other traditional markets selling poultry meat.
- Continue to collaborate closely with the private sector and the local administration in the restructuring of distribution channels, including the cold chain; continue the trial of a new distribution channel from one of the five collection yards to the traditional markets (Rawa Keping to four more traditional markets) and adoption of adapted cold chain equipment.
- Continue to collaborate closely with local government to strengthen food safety measures by ensuring the government relocation centres comply by food safety standards, develop training

programmes for meat inspectors and enforce specific inspection for the markets and slaughterhouses.

- Continue to assist provincial government to identify alternative income-generating activities for poultry stakeholders who may become unemployed by the market restructuring programme and design support programmes accordingly.

C.4 Explore mechanisms to improve inter-provincial movement control out of HPAI high risk provinces

- Hold focus group discussions with traders and vendors in Semanggi collector yard once the requisite support has been obtained from local government.
- Explore the possibility of establishing a poultry health monitoring system for all poultry entering Semanggi collector yard.
- Conduct follow-up meetings with central and local government on Animal Health Certification (SKKH) and field assessment to check points in Western Java.
- Follow up the agreement between FAO, DAH and local government of Surakarta city regarding Semanggi collector yard upgrading plan.
- Provide inputs to the local government of Western Java regarding checkpoint operation improvement.

Output D: Engagement with duck producers for improved control of HPAI

D.1 Assess role of ducks in the epidemiology of HPAI in selected areas of Java

- Clear and circulate the final report to partner organizations.
- Review the potential value and feasibility of AI vaccination of ducks in Indonesia.

D.2 Conduct duck vaccination field trial in one identified high risk HPAI-endemic area

- Further investigate decrease in detected HPAI cases in Yogyakarta province during the 2009-2010 influenza season.
- Reassess value of targeted duck vaccination trial once Java duck study and Yogyakarta assessment complete.

Output E: Sustainable virus monitoring and vaccine development

E.1 Assist public and private sectors to develop a centrally-managed system to monitor circulating viruses and sustain vaccine efficacy

- Facilitate ongoing Laboratory Network meetings in support of the effort to monitor antigenic variation in circulating viruses (May - Sequencing Network; Jul-Aug Pre-screening Network); and follow-up on the characterization of isolates selected based upon pre-screen data from DIC Wates as part of the parallel data generation for capacity building.
- Conduct "Communicating Science - Scientific Writing Workshop".
- The FAO-OFFLU Scientist will continue to provide support to the ongoing transfer of technology to Indonesia. The next inputs are scheduled for July-August 2011.
- Conduct workshop for improvement of laboratory data management including Excel, EMPRES-i Asia and InfoLabPlus.
- Assist AAHL to conduct workshop on quality reagent production at Pusvetma.
- Expand pre-screen effort to partner labs (e.g. industry/university) with DAH approval.
- Develop a module for InfoLabPlus to record and network all DIC results for the pre-screening and antigenic cartography (to be called Infolab Cartography) and provide training for DIC staff in the use of this new module (contingent upon DAFF support for InfoLabPlus).

E.2 Increase knowledge of best practices for avian influenza vaccination in poultry

- Confirm disposition of candidate vaccine and challenge strains returned to Indonesia for vaccine industry to develop updated vaccines.
- Support SEPRL to provide assistance to MoA designated laboratories for the preparation of vaccine master seeds from RG H5N1 avian influenza constructs provided through the project and to provide didactic and on-site challenge test training for efficacy and potency

determination to demonstrate efficacy and potency of vaccines for purposes of registration/licensing.

- Facilitate workshop on practical aspects of vaccines and vaccination. This workshop will increase the knowledge of poultry veterinarians and industry representatives on all practical aspects of vaccines and vaccination in poultry for improved control of avian influenza.
- Provide technical support for serosurveillance using homologous vaccine antigen and Wates-1 antigen and coordinate with existing vaccination efforts when possible.
- Prepare updated technical recommendations on vaccination strategy based upon recent field vaccine trials, continued epidemiological analysis of the disease situation in Indonesia and global epidemiological knowledge on HPAI.

Output F: Coordinated and enhanced management of the HPAI control programme

F.1 Facilitate implementation of integrated HPAI control plan on one island where the HPAI situation is considered readily controllable

- Write the report for phase 1 of the Bali project.
- Plan activities for phase 2 (intervention phase) of the project.
- Develop the plan with the Bali authorities.
- Start interventions depending on funds availability.

F.2 Strengthen government capacity to conduct veterinary services training and continuing education

- Provide the remaining 49 MTs with Improved Training Skills training and TOT training in GPS, SMS gateway and sample submission. They will then be able to carry out trainings of PDSR-trained staff at the local level.
- Assist DAH to recruit more National MTs to participate in the in-service training programme in Jakarta.
- Complete the “understanding data” modules, field test and begin field implementation.
- Hold DMM in the provinces of Banten, Lampung and East Java.

F.3 Improve competencies of local government decision-makers to manage sustainable and effective HPAI control programmes and to promote understanding of the economic impact of animal diseases on livelihoods and public health

- Revise DMM model to incorporate epidemiology and disease management training and NVS development, as well as the redesigning of the PDSR system. Conduct at least two newly designed DMMs in the next reporting period.
- Plan three DMMs to be attended by local government decision makers [representatives of provincial planning authorities (BAPPEDA), provincial parliaments (DPRD I and II) and the Assistant Governor for economic development] for Lampung, Banten and East Java provinces.

F.4 Assist central and local governments to design and implement a national veterinary service strategy

- Revise PDSR system to incorporate the NVS approach.
- Complete development of PCE training module.
- Implement pilot PCE training in Bali province.
- Facilitate meeting between MoA and Ministry of Internal Affairs to discuss NVS and the issuing of Joint Circular Letter.
- Finalize Joint Circular Letter of Minister of Agriculture and Minister of Internal Affairs on Guidelines on National Veterinary Services.
- Finalize guidelines for control strategy for rabies, anthrax, brucellosis and hog cholera.
- Develop reporting forms for rabies, anthrax, brucellosis and hog cholera.
- Advocate with Local Government on National Veterinary Services plan in pilot areas.

F.5 Develop and integrate emerging databases into the national veterinary information system

- Complete version 1.0 of the database for the animal disease surveillance system.
- Continue work on standardization of data collection to ensure compatibility of databases.
- Commence training on the new animal disease surveillance system in NVS pilot areas.

- Commence field trial of the new animal disease surveillance system in NVS pilot areas.

F.6 Provide technical assistance for establishment of local cold chain capacity

- In collaboration with DAH/CMU and JSI-Deliver, provide technical support for cold chain training to local government staff and capacity strengthening in Bali province.

F.7 Increase public visibility of the HPAI control programme

- Produce and distribute the Programme's Promotional Video Vol. 2.
- Produce and distribute the 2010 FAO ECTAD Indonesia Annual Report.

F.8 Provide operational support to enable implementation of the ECTAD Indonesia programme

- Facilitate service contracts and provide operational support to activities, such as the establishment of three cleaning and disinfection stations in South Jakarta, West Java and Tangerang and renovation of three markets in Bekasi and Bogor.
- Complete renewal of vehicle registrations for project vehicles and motorcycles.
- Complete distribution of 355 IT equipment packages to district livestock service offices.
- In line with planned technical activities for the next quarter, continue to recruit project personnel, procure and distribute project equipment and supplies and facilitate signing of Letters of Agreements (LOA) with partner organizations.
- Commence transfer of OSRO/INS/604/USA project assets to government.

Main challenges encountered and response provided

The most significant challenge faced this quarter was moving forward with timely implementation of multiple programmes and close collaboration with and in support of, our government counterparts. By combining timely technical expertise with experience facilitating cooperation between the Government of Indonesia and the international community, as well as intra-governmental cooperation, ECTAD Indonesia has been successful in making progress in all major areas of the HPAI Control Programme. Specific technical difficulties continue to be encountered with data management and diagnostic testing procedures in partner laboratories. As previously reported, these difficulties have caused delays in finalizing analyses for target research on collector yard surveillance, as well as the epidemiology of HPAI in ducks. Better progress in this area can be expected with more focused technical support tailored to the individual needs of each laboratory, as well as a greater focus on improving data management practices in general. Finally, the FAO programme is now facing the challenge of increasing the positive impact of activities, while faced with a significant budget reduction for FY 12 budget. ECTAD Indonesia is working closely with the DGLAHS and USAID to conduct a programme review and planning exercise for 2011-2012, which should enable the limited funds available to be focused on those activities which will have greatest impact in terms of both H5N1 risk reduction and long-term sustainability. Consultation on activities to be included in a new follow-on HPAI project will take place this semester and a project document will be drafted.

Main progress made towards the achievement of project outcomes (from the start of the current project phase)

Output A: Sustainable surveillance, prevention and control of HPAI in village poultry

- Activities have been designed to increase passive surveillance of HPAI. As active surveillance activities will be reduced, the PDSR and other local government staff will be trained to work closely with villages to encourage village-based solutions to HPAI prevention and control.
- There is now strong commitment, support and integration at the local government level (e.g. between the LDCC and provincial/district livestock services) in animal health and HPAI disease control programmes as a direct result of the FAO project.
- The PDSR programme has strengthened veterinary services capacity to detect and respond to HPAI outbreaks in village poultry throughout HPAI-endemic areas of Indonesia.
- The LDCC system has enabled more effective communication and coordination between central and local governments within the highly decentralized Indonesian governance system.
- Additional local governments have allocated funding specifically to support the establishment and operations of LDCC and PDSR activities, thereby contributing to sustainable disease control.

Output B: Improved biosecurity and vaccination practices in commercial sectors

- The commercial poultry health programme team has built rapport and trust with participating farmers, ensuring a healthy veterinarian-client relationship required for further progress in improving biosecurity and vaccination practices in commercial sectors.
- The understanding of the role of commercial poultry production in the maintenance and spread of HPAI has improved.
- The PVUK pilot programme has been developed in close collaboration with farmers, central and local governments in order to improve communication and cooperation between farmers and local government animal health services.
- Databases profiling the commercial poultry farms in each pilot district have been established by district livestock services.
- Public sector collaboration with commercial poultry producers has been accelerated. In particular, public sector disease controllers and international agencies are both more aware of the complexity of commercial poultry production in Indonesia and more engaged with private sector stakeholders involved in commercial poultry production.
- As a result of CPH programme activities, the HPAI Control Programme now understands that one of the key constraints poultry farmers are facing is a very limited capacity to track and interpret their farm's productivity and profit. Training and engagement activities are being adjusted to directly address this fundamental need.

Output C: Improved HPAI surveillance and control along the poultry marketing chain

- Test results from the DKI Jakarta category B animal health laboratory were distributed to all livestock services at district level throughout Jabodetabek to increase local government awareness and responsiveness to market chain contamination and veterinary public health issues.
- A targeted research activity to test collector yard-based surveillance methods to assess relative risk of poultry production areas and poultry type was developed and successfully implemented.
- Improved understanding of poultry market dynamics in DKI Jakarta by the public sector.
- Increased private and public sector C&D capacity and increased implementation of C&D practices along the poultry market chain in greater Jakarta.
- Critical weaknesses in the DKI Jakarta market restructuring preparations were identified and corrective measures proposed and subsequently implemented by the Government.
- A specific high-risk poultry market system has been identified as a result of project-implemented surveillance activities and is now being addressed with the relevant government stakeholders.

Output D: Engagement with duck producers for improved control of HPAI

- The database of duck flocks developed from the study area provides a sample frame for the prevalence study and other future activities to be undertaken in duck populations by animal health authorities; knowledge of locations of high density duck populations is a critical first step to identifying critical control points for targeted interventions to control HPAI.

Output E: Sustainable virus monitoring and vaccine development

- Development of a safe and efficacious vaccine for use in Indonesia.
- Characterization of AI viruses circulating in Indonesia.
- Increased capacity of Indonesian laboratories to perform antigenic and genetic characterization of viruses and analyse results.
- Improved collaboration between Indonesian private sector and public sector on field virus monitoring.

Output F: Coordinated and enhanced management of the HPAI control programme

- The human resource capacity of local government livestock services has been improved through PDSR training and preparation of Master Trainers to lead training and continuing education activities within the HPAI Control Programme.
- Improved knowledge of factors associated with outbreaks of HPAI in village poultry to be used to inform and refine surveillance and control strategies.

- Critical control points identified. Data and subsequent analysis leading to identification of further points for disease control efforts to be targeted.
- Significant improvement in technical capacity and management of local government human resources working in the field throughout all known HPAI-endemic areas.
- Guidelines for the implementation of the NVS have been prepared by DGLAHS under the direction of the NVS Task Force with technical advice provided by ECTAD Indonesia.
- The NVS approach has been made operational via the rabies eradication programme in Bali, allowing capacities developed by the project to be utilized for other major Indonesian public health priorities in addition to H5N1 HPAI.

I Quarter 2010

Project Monitoring Sheet: **OSRO/INS/703/USA**

Project Title: **Monitoring AI virus variants in Indonesian poultry and defining an effective and sustainable vaccination strategy**

Reporting Period: **January - March 2010**

<p>Country: Indonesia</p> <p>Project title: Monitoring AI virus variants in Indonesian poultry and defining an effective and sustainable vaccination strategy</p>
<p>Project Code: OSRO/INS/703/USA</p>
<p>Budget: USD 830 500 (Phase I), USD 800 000 (Phase II)</p> <p>Budget total: USD 1 630 500 ¹</p>
<p>Effective starting date: Phase I (October 2007-September 2008), Phase II (1 October 2008)</p>
<p>Planned end date: Phase II: 30 Sep 2010</p>
<p>Context of the Project:</p> <p>Since 2005, Indonesia has become one of the major global hotspots for the Highly Pathogenic Avian Influenza (HPAI) epizootic in both poultry and humans. To help control HPAI in the field, an understanding of the circulating field isolates is needed to both monitor poultry vaccine efficacy and to identify appropriate strains for new vaccine development.</p>
<p>Objectives of the Project: Phase 2 Extension</p> <ul style="list-style-type: none"> • H5N1 HPAI virus field isolate collection for biological and genetic characterization. • Challenge testing of antigenic variants against newly developed vaccine strain. • Capacity building. • Technical recommendations for vaccination strategy.
<p>Planned activities</p> <p>Output A-B. HPAI field isolate collection for biologic and genetic characterization</p> <p><i>Activity AB1.</i> To continue collection of samples.</p> <p><i>Activity AB2.</i> To Support beta testing of InfoLab-Plus by Peter Durr, Australian Animal Health Laboratory (AAHL) to allow for field entry of standardized sample information, improved data integration and communication between laboratories, and to ensure data integrity. This activity has been completed.</p> <p><i>Activity AB3.</i> To screen samples by real-time polymerase chain reaction (RT-PCR) in Disease Investigation Centre (DIC), Bbalitvet, and new partners where possible.</p> <p>Submission of specimens to laboratories continues both through participatory disease surveillance (PDSR) and normal activities.</p> <p><i>Activity AB4.</i> To provide samples positive for avian influenza to the AAHL for characterization.</p>

¹ Under the first phase, an additional USD 200 000 was allocated from OSRO/INS/701/AUL in support of project activities. The duration of the project has been extended from 12 months to 24 months.

To continue to pursue collaborative efforts to obtain needed isolates from underrepresented and high-risk species and geographical areas.

Activity AB5. To conduct genetic and antigenic characterization of HPAI isolates in Indonesia.

- National and international reference laboratories continue with the characterization of available isolates.
- To produce/distribute antisera panel confirmed for use in antigenic cartography to additional partners named by the Department of Animal Health (DAH) using the protocols agreed to by Erasmus Medical Center (MC) and AAHL.

Output C. Challenge testing of antigenic variants and vaccine strains selection

Activity C1. Perform challenge testing with priority isolates against new vaccine(s) strain.

- To continue efforts to send the reverse genetics low pathogenicity certified master seed to Indonesia. Awaiting response from the Director General of Livestock Service (DGLS); once approved, master seed can be shipped to the National Veterinary and Drug Assay Laboratory (NVDAL).
- To continue characterization of additional constructs.

Output D. Capacity building

Activity D1. Five-month support from the World Organisation for Animal Health (OIE)- Food and Agriculture Organization of the United Nations (FAO) Network of Expertise on Avian Influenza (OFFLU) Scientist in close coordination with AAHL.

- The OFFLU scientist from FAO will continue to provide in-country technical assistance to support laboratory capacity and establishment of activities for antigenic cartography. Next inputs will be scheduled for February and March 2010.
- To continue procurement of needed reagents and equipment for Disease Investigation Centre (DIC) Wates.
- To confirm activities at DIC Wates for antigenic cartography and prescreening activities at the DICs to include OFFLU Recommendation to include a standardized reference H5 hyperimmune antisera and the homologous antigen based on an updated common Indonesian lineage for use in the DICs and other national laboratories.
- A joint assessment visit to Pusvetma in March 2010 by AAHL, OFFLU, and Indonesia Dutch Partnership (IDP) to determine needs.
- To continue to encourage cooperation with industry to conduct virus monitoring activities.

Activity D2. Molecular and antigenic analysis workshops.

A follow-up of Workshop on Serology and Virus Typing for Antigenic Cartography held from 2 to 4 September and 30 November to 4 December 2009 scheduled to be held during this reporting period has been rescheduled in June 2010. This is because of the delay in the transmittal of the letter to DICs from DAH regarding roles and responsibilities for Antigenic Cartography.

Activity D3. Develop capability to conduct vaccine efficacy tests in Indonesia.

- To suggest improved involvement of industry to sustain vaccine efficacy testing.
- To determine training needs for either Bbalivet or NVDAL on challenge testing at AAHL.
- To continue to encourage DAH to partner with private companies to pursue challenge testing field trials.

Output E. Technical recommendations for the vaccination strategy

Activity E1. Continue development of reverse genetic vaccine based upon the drift variant identified in Phase I. This activity has been completed.

Activity E2. Support field trials with alternative vaccines.

To support field trials with alternative vaccines and continue to encourage DAH to partner with private companies to pursue trials using candidates demonstrated likely to be efficacious, especially against variant viruses in Indonesia.

Activity E3. Encourage the Government of Indonesia to streamline registration of efficacious recombinant and reverse genetic vaccines. This activity has been suspended, since investigations in support of product registration are considered as a “private good” and should be conducted at the expense of the vaccine company.

Activity E4. Continue the assessment of costs and cost-effectiveness of vaccination strategies in Indonesia.

Initiate data entry of the Indonesian Center for Agriculture Socio-Economic and Policy Studies (ICASEPS) field survey conducted in Western Java area for “Assessment of Farm Level Financial Incentives and Willingness to Pay for HPAI Vaccination in Indonesia”.

Activity E5. Prepare updated technical recommendations on a vaccination strategy.

- To prepare and conduct consultation to develop recommendations for a comprehensive vaccination strategy in Indonesia for July 2010.

Activity E6. Organize technical review meetings.

- To prepare for final Technical Review Meeting scheduled for September to October 2010.

Activities undertaken during the reporting period

Output A-B. HPAI field isolate collection for biologic and genetic characterization

Activity AB1. Continue collection of samples

Reviewed proposal from DIC Wates to increase sample submission. DIC Wates was advised to proceed with clearance from the head of the PDSR programme.

Activity AB2. Support beta testing of InfoLab-Plus by Peter Durr, AAHL to allow for field entry of standardized sample information, improved data integration and communication between laboratories, and to ensure data integrity. This activity has been completed.

Activity AB3. Screen samples by RT-PCR in DICs, Bbalitvet, and new partners where possible
Submission of specimens to laboratories has continued both through PDSR and normal activities.

Activity AB4. Provide samples positive for avian influenza to AAHL for characterization.

- Continued to pursue collaborative efforts to obtain needed isolates from underrepresented and high risk species and geographical areas. Communication with Medion, which has expressed interest in sharing and receiving training for antigenic cartography, was initiated.
- Advocacy for release of virus sequences in the public domain - response awaited from DGLS to letters from OFFLU in August 2008 and on 15 March 2010 to authorize release of available cDNA sequences to a publicly held database.
- Collaboration with AAHL to prepare draft for collaborative manuscripts is in process.

Activity AB5. Conduct genetic and antigenic characterization of HPAI isolates in Indonesia

- National and international reference laboratories continued with the characterization of available isolates.
- Request was made to AAHL to supply standard reference materials.

Output C. Challenge testing of antigenic variants and vaccine strains selection

Activity C1. To perform challenge testing with priority isolates against new vaccine(s) strain.

- Continued characterization of additional constructs at the Southeast Poultry Research Laboratory (SEPRL).
- Cartography reagents from AAHL received at SEPRL, pending confirmation from Erasmus.
- Continued to encourage DAH to partner with private companies to pursue challenge testing field

trials.

- Initiated processing of Materials Transfer Agreement (MTA) to ship characterized vaccine master seeds and challenge viruses to Indonesia.

Output D. Capacity building

Activity D1. Five-month support from OFFLU Scientist in close coordination with AAHL.

- The OFFLU scientist from FAO has continued to provide in-country technical assistance to support laboratory capacity.
- Positive response received from Bbalitvet to participate in OFFLU activities such as the pre-screening process to monitor avian influenza viruses for antigenic variation and participation in generating genetic data for antigenic cartography in parallel and with guidance from AAHL.
- The DAH nominated three laboratories to receive capacity building for molecular characterization of antigenic variant HPAI isolates identified through antigenic cartography (DIC Bukittinggi, Pusvetma, and Bbalitvet), and an introductory meeting was conducted on 22 March 2010 in coordination with AAHL for the three laboratories. The DAH and Campaign Management Unit (CMU) were in attendance.
- Initiated procurement of reagents to support molecular characterization efforts.
- Pusvetma can now produce small amounts of antisera for cartography e.g. ~500 mls of a single sera per each ten week period using the facilities available.
- National technical facilitator for OFFLU proposed to assist with the coordination of the OFFLU project in close collaboration with representatives from the DAH/CMU, the seven DICs, particularly DIC Wates, and other relevant public sector structures and private sector stakeholders. The incumbent will facilitate the coordination of the project's day-to-day activities and operations for identifying isolates for characterization, screening antigenic variants, and conducting efficacy studies on poultry vaccines for avian influenza.
- Site visit to DIC Wates was conducted by the OFFLU scientist in coordination with CMU to follow up on activities for antigenic cartography and analysis of data generated to date (March 2010).
- Positive response received from DAH to include Vaxindo and Medion in cartography activities.
- Continued procurement of needed reagents and equipment for DIC Wates – OFFLU scientist confirmed the arrival of needed equipment and consumables – more needs were identified during the March 2010 visit.
- Conducted joint assessment visit to Pusvetma by AAHL and OFFLU, (IDP were unavailable) to determine needs.

Activity D2. Molecular and antigenic analysis workshops.

The launching meeting for laboratories nominated for molecular characterization of antigenic variants was conducted in March 2010.

Activity D3. Develop capability to conduct vaccine efficacy tests in Indonesia.

- Visited Bbalitvet in March 2010 to revisit its participation in the pre-screening process to monitor avian influenza viruses for antigenic variation. As one of the sequencing partners recently nominated by the DAH, Bbalitvet is being encouraged to participate in the capacity building effort by OFFLU and AAHL to support the sequencing of antigenic variants detecting using antigenic cartography, and in the capacity building effort on challenge testing of new vaccines using the reverse genetics vaccine strains developed at SEPRL.
- Continued to encourage DAH to partner with private companies to pursue challenge testing field trials.

Output E. Technical recommendations for the vaccination strategy

Activity E1. Continued development of reverse genetic vaccine based upon the drift variant identified in Phase I. This activity has been completed

Activity E2. Support field trials with alternative vaccines.

Suggested support field trials with alternative vaccines and continuation to encourage DAH to partner with private companies to pursue trials using candidates demonstrated to be efficacious, especially against variant viruses in Indonesia

Activity E3. Encourage the Government of Indonesia to streamline registration of efficacious recombinant and reverse genetic vaccines. This activity has been suspended, since investigations in support of product registration are considered as a "private good" and should be conducted at the expense of the vaccine company.

Activity E4. Continue the assessment of costs and cost-effectiveness of vaccination strategies in Indonesia.

- ICASEPS field survey conducted in 13 districts/municipalities is being continued in Western Java area for "Assessment of Farm Level Financial Incentives and Willingness to Pay for HPAI Vaccination in Indonesia".
- Initiated data entry of surveys

Activity E5. Prepare updated technical recommendations on a vaccination strategy.

- Preparation for the consultation to develop recommendations for a comprehensive vaccination strategy in Indonesia for July 2010 is underway.

Activity E6. Organize technical review meetings.

- Preparation for final Technical Review Meeting September-October 2010 has been initiated.

Planned activities for the next quarter

Output A-B. HPAI field isolate collection for biologic and genetic characterization

Activity AB1. Continue collection of samples.

Activity AB2. Support beta testing of InfoLab-Plus by Peter Durr, AAHL to allow for field entry of standardized sample information, to improve data integration and communication between laboratories, and to ensure data integrity. This activity has been completed.

Activity AB3. Screen samples by RT-PCR in DICs, Bbalitvet, and new partners where possible.

- Submission of specimens to laboratories continues both through PDSR and normal activities.
- Follow up with proposal from DIC Wates (after approval through PDSR) to conduct surveillance under the OFFLU project,

Activity AB4. Provide samples positive for avian influenza to AAHL for characterization.

- To continue to pursue collaborative efforts to obtain needed isolates from underrepresented and high risk species and geographical areas.
- To select a set of 25-30 isolates from existing pre-screened data generated at DIC Wates to be sent to the three labs selected for molecular characterization (DIC Bukittinggi, Pusvetma, and Bbalitvet) as well as AAHL for parallel generation of antigenic and genetic data for capacity building purposes.

Activity AB5. To conduct genetic and antigenic characterization of HPAI isolates in Indonesia.

- National and international reference laboratories continue with the characterization of available isolates.
- To produce/distribute antisera panel confirmed for use in antigenic cartography to additional partners named by the DAH using the protocols agreed to by Erasmus MC and AAHL.

Output C. Challenge testing of antigenic variants and vaccine strains selection

Activity C1. Perform challenge testing with priority isolates against new vaccine(s) strain.

- DAH suggested that the OFFLU Technical Facilitator continue the follow up on submitted letters to DGLS for receipt of reverse genetics low pathogenicity H5N1 virus strains, antigenic cartography, and sequence deposit.
- To follow-up MTA to ship characterised vaccine master seeds and challenge viruses to Indonesia.
- To continue characterization of additional constructs at SEPRL.

Output D. Capacity building

Activity D1. Five-month support from OFFLU Scientist in close coordination with AAHL.

- The OFFLU scientist from FAO will continue to provide in-country technical assistance to support laboratory capacity and establishment of activities for antigenic cartography. Next inputs will be scheduled for June and July 2010.
- To finalize recruitment of National Technical Facilitator for OFFLU activities in Indonesia.
- To continue follow-up on Phase II procurement for DIC Wates.
- To follow-up procurement of reagents to support molecular characterization efforts.
- National Technical Facilitator for OFFLU will assist with the initiation of prescreening activities at DICs to include OFFLU Recommendation to include a standardised reference H5 hyperimmune antisera and the homologous antigen based on an updated common Indonesian lineage for use in DICs and other national laboratories.
- To determine antigenic cartography training needs for industry.

Activity D2. Molecular and antigenic analysis workshops.

- Follow-up to the Workshop on Serology and Virus Typing for Antigenic Cartography held from 2 to 4 September and 30 November to 4 December 2009 at DIC Wates will be scheduled in June 2010.
- AAHL to prepare and conduct Sequencing Workshop and possible biosafety/security at Pusvetma in April and May 2010 with support from OFFLU Technical Facilitator, FAO-Indonesia and CMU.

Activity D3. Develop capability to conduct vaccine efficacy tests in Indonesia.

- To determine training needs for either Bballivet or NVDAL on challenge testing at AAHL.
- To determine need for a memorandum of understanding (MoU) with industry partners named by DAH for cartography activities.
- To continue to encourage DAH to partner with private companies to pursue challenge testing field trials.

Output E. Technical recommendations for the vaccination strategy

Activity E1. Continue the development of reverse genetic vaccine.

SEPRL to report on data from completed challenge tests using available reverse genetic constructs.

Activity E2. Support field trials with alternative vaccines.

To support field trials with alternative vaccines and continue to encourage DAH to partner with private companies to pursue trials using candidates demonstrated likely to be efficacious, especially against variant viruses in Indonesia.

Activity E3. To encourage the Government of Indonesia to streamline registration of efficacious recombinant and reverse genetic vaccines. This activity has been suspended, since investigations in support of product registration are considered as a "private good" and should be conducted at the expense of the vaccine company.

Activity E4. To continue the assessment of costs and cost-effectiveness of vaccination strategies in Indonesia.

To continue data entry and analysis for ICASEPS field survey.

Activity E5. To prepare updated technical recommendations on a vaccination strategy.

To prepare a consultation to develop recommendations for a comprehensive vaccination strategy in Indonesia for July 2010.

Activity E6. To organize technical review meetings.

To prepare for final Technical Review Meeting scheduled from September to October 2010.

Main challenges encountered and response provided (*This section refers to external challenges only*)

Delay in the arrival of the letter from the DAH regarding roles and responsibilities of the DICs for Antigenic Cartography has resulted in confusion among the DICs about the prescreen process. Also, the Director of DIC Wates was distributing misinformation to the other DICs regarding shipment of HPAI positive samples. This confusion is in the process of being corrected but will hinge on accurate and timely information from the DAH. It is hoped that the National Technical Facilitator for OFFLU will be instrumental in this. The request to release the sequences to public databases is still pending DAH approval; another letter has been sent to the DG.

Main progress made towards the achievement of project outcomes (*from the start of the project activities*)

Output A-B: HPAI field isolate collection for biologic and genetic characterization:

- Characterization of 175 isolates from 215 samples representing ~90 districts predominantly from backyard chickens.
- Completion of the UAT Workshop and subsequent activities to launch InfoLabPlus.
- Selection and production of reference antisera and antigens for Indonesia.
- Antigenic cartography data from 100 isolates in addition to biologic and molecular data was used to select five candidate vaccine strains and six potential challenge strains for further investigation. Viruses have been received at SEPRL for vaccine construct and challenge studies in June 2009.
- Nomination of DIC Wates as focal point for antigenic cartography; work plan developed 1 July 2009; capacity building activities for antigenic cartography launched July 2009.
- Nomination of three laboratories to support genetic characterization of antigenic variants and launch of the capacity building activities for sequencing in March 2010.
- Selection of five vaccine strains and six challenge strains based upon data generated from antigenic and molecular characterization of isolates.
- Data available to date presented at November 2009 Technical review meeting.
- Presentation at the 7th International Symposium for Avian Influenza in April 2009.
- Presentation at the Regional Meeting on Molecular Epidemiology of Origin and Evolution of H5N1 Highly Pathogenic Avian Influenza Virus in Asia, USDA/FAO, Bangkok, Thailand, September 2009.

Output C: Challenge testing of antigenic variants and vaccine strains selection:

- Signing of collaborative MTA between DGLS, AAHL, SEPRL, and industry and receipt of selected vaccine candidate and challenge strains at SEPRL in June 2009 to continue vaccine development and challenge testing.
- Collaborative MTA to return fully characterized isolates to Indonesia.

- Challenged the tests conducted using available reverse genetics constructs at SEPRL using updated challenge viruses selected from the OFFLU project data.
- Continued efforts to deliver the certified LP master seed to Indonesia. Awaiting response from DGLS; once approved, master seed can be shipped to NVDAL.
- Continued to encourage DAH to partner with private companies to pursue challenge testing field trials.

Output D: Capacity building

- OFFLU workshops have been conducted on introductory molecular and antigenic analysis for 56 Indonesian scientists representing all DICs, four veterinary faculties, industry and MoA (November 2008, March and September 2009).
- The FAO/OFFLU scientist has completed the five-month capacity building activities in close coordination with AAHL; support visits and technical assessments have been conducted at DIC Wates, Denpasar, and Bukittinggi. Capacity building activities for antigenic cartography will continue in close coordination with AAHL.
- Capacity building activities conducted to allow DICs to perform antigenic characterization of viruses and analyse resulting data in order to identify isolates to be further tested with challenge studies. This will help to ensure that vaccines in use in Indonesia are efficacious.
- Positive response from the DAH to engage the industry in the virus monitoring effort will contribute to a broader understanding of viruses circulating in Indonesia.

Output E: Technical recommendations for the vaccination strategy

- Two constructs near completion and full low pathogenic certification, others in characterization process.
- Consultation with legal firm specializing in intellectual property has been completed, final report is in preparation
- Final report prepared by socio-economist on "Vaccination and surveillance costs for operational research project in Indonesia".
- FAO interim recommendations submitted to the DGLS in April 2008.
- An update to the FAO interim recommendations was submitted to the DGLS in June 2009 based upon data analysed from the OFFLU project.
- Development and assessment of newly engineered low pathogenicity reverse genetics vaccine strain(s) for Indonesia selected through data gathered from this project.
- OFFLU Technical review meetings with open forum held in June and November 2008 and November 2009.
- Presentation at the 7th International Symposium on Avian Influenza in Athens, GA, from 5 to 8 April 2009 "Characterization of H5 HPAI virus variants in Indonesian poultry – OFFLU Indonesia Project"
- Presentation of the OFFLU project at the Regional Meeting on Molecular Epidemiology of Origin and Evolution of H5N1 Highly Pathogenic Avian Influenza Virus in Asia, USDA/FAO, Bangkok, Thailand, 9 September 2009.

I Quarter 2010

Project Monitoring Sheet: OSRO/INS/604/USA

Project Title: **Expansion of the avian influenza participatory disease surveillance and response programme in Indonesia**

Extension Title: **Reinforcement and expansion of the avian influenza participatory disease surveillance and response programme in Indonesia**

Period: **January-March 2010**

Country: Indonesia
Project title: Reinforcement and expansion of the avian influenza participatory disease surveillance and response programme in Indonesia
Code: OSRO/INS/604/USA
Budget: USD 4 million (Phase I), USD 13.7 million (Phase II), USD 7.5 million (Phase III), USD 11 million (Phase IV)
Total budget: USD 36.2 million
Effective starting date: 9 June 2006
Planned end date: 31 May 2010 (no-cost extension approved until 30 September 2010)
<p>Context of the project</p> <p>The purpose of the project is to enhance the capacity and ability of the Government of the Republic of Indonesia and partners to control Highly Pathogenic Avian Influenza (HPAI) in order to help safeguard the health and livelihoods of the Indonesian population by providing broad-based support to the Food and Agriculture Organization of the United Nations (FAO) Indonesia HPAI Control Programme, implemented by the FAO Emergency Centre for Transboundary Animal Disease Operations (ECTAD) in Indonesia.</p>
<p>Objectives of the project</p> <ul style="list-style-type: none"> ● Sustainable surveillance, prevention and control of HPAI in village poultry. ● Improved biosecurity and vaccination practices in commercial sectors. ● Improved HPAI surveillance and control along the poultry marketing chain. ● Engagement with duck producers for improved control of HPAI. ● Coordinated and enhanced management of the HPAI control programme.
<p>Planned activities</p> <p>Output 1: Sustainable surveillance, prevention and control of HPAI in village poultry</p> <p><i>Activity 1.1: Maintain village surveillance, prevention and outbreak control capacity across endemic areas of Indonesia, prioritized by strategic importance.</i></p> <p><i>Activity 1.2: Assess the potential of the participatory disease surveillance and response (PDSR) system, structure and capacities to strengthen the national veterinary service.</i></p> <p><i>Activity 1.3: Facilitate the drafting of a national veterinary service strategy and work plan.</i></p> <p><i>Activity 1.4: Assist the Campaign Management Unit (CMU) in advocating to local governments for budgetary support for HPAI control, including PDSR and local disease control centres (LDCC) activities.</i></p>

Output 2: Improved biosecurity and vaccination practices in commercial sectors

Activity 2.1: Provide specialized technical support to selected layer producers within high-risk areas of West Java to enhance efficiency and quality of layer vaccination and biosecurity measures.

Activity 2.2: Provide biosecurity training of trainers for commercial producers and relevant government agencies.

Activity 2.3: Assist government and industry in establishing an advisory council modeled on the United States (US) National Poultry Improvement Plan (NPIP) to gain more coordinated and broad-based support for partnership between public and private sectors.

Activity 2.4: Evaluate the effectiveness of biosecurity measures implemented by poultry producers.

Activity 2.5: Provide expert technical assessments to Sectors 1 and 2 farms in high-risk locations.

Output 3: Improved HPAI surveillance and control along the poultry marketing chain

Activity 3.1: Conduct longitudinal surveillance for HPAI in live bird markets and collector yards.

Activity 3.2: Implement biosecurity and sanitation interventions in selected live bird markets, collector yards and slaughterhouses.

Activity 3.3: Facilitate DKI (special zone) Jakarta poultry market restructuring.

Output 4: Engagement with duck producers for improved control of HPAI

Activity 4.1: Conduct duck vaccination field trial in selected districts of Java.

Activity 4.2: Expand duck producer profiling and HPAI surveillance to selected districts in Java, Lampung and Bali.

Output 5: Coordinated and enhanced management of the HPAI control programme

Activity 5.1: Integrate and analyse data sets to identify critical control points.

Activity 5.2: Once western Java activities are consolidated, extend essential control programme elements (e.g. market surveillance, commercial profiling, targeted support for high-risk producers) to other priority regions based on outcomes of western Java intensification activities and lessons learned.

Activity 5.3: Expand the monitoring and evaluation system (M&E system) programme-wide with increased integration with government.

Activity 5.4: Improve technical capacity of government human resources.

Activity 5.5: Improve virus strain monitoring, including training, sample submission, collection of field isolates and improved surveillance.

Activity 5.6: Increase the capacity of Indonesian laboratories to conduct antigenic and genetic characterization of virus isolates.

Activity 5.7: Provide technical recommendations on vaccination strategy.

Activity 5.8: Conduct vaccination challenge testing and field challenge testing of antigenic variants.

Activities undertaken during the reporting period

Output 1: Sustainable surveillance, prevention and control of HPAI in village poultry

Activity 1.1: Maintain village surveillance, prevention and outbreak control capacity across endemic areas of Indonesia, prioritized by strategic importance.

Epidemiology

- Technical and operational support for Participatory Disease Surveillance/Response (PDSR) teams and Local Disease Control Centres (LDCCs) throughout Java, Sumatra, Bali, South Sulawesi and West Sulawesi provinces is ongoing.
- Analysis of the PDSR database is also ongoing and provides information on the HPAI status of village poultry throughout the PDSR coverage areas. The village HPAI positive detection rate for this quarter (January-March 2010) was 19.8 percent (713/3 601) as compared with the previous quarter's village detection rate of 6.2 percent (182/2 945). All but 14 of the positive cases were a result of passive surveillance (callout report). Due to the reliance of HPAI detections on passive surveillance, the method of reporting PDSR detection rates will change next quarter to more accurately reflect disease incidence rates. Analysis of the data contained in the village information reports is nearly finished and will contribute information to help improve disease control at village level.
- Structured village surveillance to assess the prevalence of HPAI-infected villages was completed in Banyuwangi, Blitar and Ciamis. About 3 percent of villages had HPAI-like sickness in village chickens, but none had HPAI based on rapid antigen detection test results.

Programme Management and Operations

- FAO continues to provide operational and technical support for 23 LDCCs in Java, Sumatra, Bali and South Sulawesi and West Sulawesi provinces of Sulawesi island.
- The World Bank (WB) project funding for Coordinators of Community Vaccinators (KVM) ended in December 2009. A CMU/FAO/LDCC decision was made in a meeting held on 23 February 2010 to include KVMs under the management of the LDCCs (there were four LDCCs under which KVMs are operating: Yogyakarta, Bandung, Purwokerto and Semarang). FAO supports the operational expenses and daily subsistence allowance payment for KVM officers through the already-established LDCC system.
- A consultation mission on project management was carried out during this reporting period. It focused on the preparation of work plans and performance evaluation for project staff and managers. A performance evaluation sheet was drafted based on inputs from the managers and staff.
- The registration process for motorcycles and vehicles is ongoing. FAO and the Ministry of Agriculture (MOA) are waiting for a confirmation letter from provincial governments stating that they would cover all costs incurred for the vehicle and motorcycle registration and taxes.

Activity 1.2: Assess the potential of the PDSR system, structure and capacities to strengthen the national veterinary service

- Following the consultancy last quarter to review the data collected in the PDSR activity reports and to identify essential information for disease control and management, revised PDSR reports have been drafted and are currently under technical review.
- An external evaluation of the PDS training and continuing education programme was conducted this quarter via an expert consultancy. The evaluation included a desk study, interviews of key stakeholders and field visits to multiple district locations on Java and

Sumatra islands. A seminar to present initial evaluation findings to the government, FAO and donor stakeholders was held at the conclusion of the evaluation consultancy. The final evaluation report is under review for technical clearance and will be distributed next quarter.

- The Strengthening Veterinary Services in West Sulawesi Workshop was held in March 2010 in Mamuju, West Sulawesi in order to address key issues for the integration of PDSR activities with West Sulawesi government services as part of the overall development of a National Veterinary Service (NVS).

Activity 1.3: Facilitate the drafting of a national veterinary service strategy and work plan

- The draft concept for the NVS was shared with the MOA NVS Task Force; the task force held its first meeting this quarter.
- A meeting between central and local government stakeholders to determine the way forward on NVS is scheduled for the next quarter. Activities in South and West Sulawesi (as highlighted in Activity 1.3 above) are also contributing to the development of an effective NVS strategy.
- A suitable candidate for the NVS Facilitator consultancy was identified this quarter and will take up his appointment early next quarter.

Activity 1.4: Assist the CMU to advocate to local governments for budgetary support for HPAI control, including PDSR and LDCC activities

- In close collaboration with the Directorate of Animal Health (DAH) and CMU, FAO continues to advocate for sustainability of the local government's HPAI control activities. With facilitation from CMU, further efforts have been made to coordinate with local governments to ensure provision of sufficient funding at provincial and district levels. During this quarter, two Decision-Makers' Meetings were held in Sumatra in order to engage the local government in the HPAI control activities and to advocate for the long-term sustainability of animal disease control services. The DMM for Kepulauan Riau Province was held on 10 and 11 February 2010 in Batam and the DMM for Aceh province was carried out on 17 and 18 February 2010 in Banda Aceh. In both regions, control of HPAI is one of the priorities of the local government and the provincial/district livestock services, with disease management carried out through surveillance, outbreak control and prevention activities.
- The local governments in both regions support the sustainability of PDSR and have already included PDSR activities in their 2010 budget plan. Some provincial governments have allocated additional funding for sustainability of PDSR and for HPAI control in general, including funds to cover the taxes for vehicles to be used by PDSR officers/LDCC in the field to support HPAI control in their respective areas.

Output 2: Improved biosecurity and vaccination practices in commercial sectors

Activity 2.1: Provide specialized technical support to selected layer producers within high-risk areas of West Java to enhance efficiency and quality of layer vaccination and biosecurity measures

- The ECTAD Indonesia programme is continuing to provide technical, logistic and operational support in collaboration with partners for targeted vaccination of small-scale layer producers in ten districts in Yogyakarta, Central Java and West Java under the InVak intensified vaccination programme.
- The International Technical Advisor (Commercial Poultry Health) began in-country activities this quarter.
- A rapid field assessment of the pilot layer farms identified in Central Java for the layer engagement programme was conducted at the end of the quarter and the inception workshop for the layer programme will be held next quarter.

Activity 2.2: Provide biosecurity training of trainers for commercial producers and relevant government agencies

- A stakeholder workshop with key central and local government staff, poultry farmers and FAO was held to initiate design of a local government commercial poultry programme.
- A concept note and implementation plan was subsequently developed in conjunction with DAH and CMU for the pilot programme for training district livestock officials to engage with commercial poultry producers.
- Field visits were conducted to farmers and local governments in Central Java, West Java and Lampung to refine the plan and identify potential pilot locations.
- References for training materials were compiled.

Activity 2.3: Assist government and industry in establishing an advisory council modeled on the US National Poultry Improvement Program to gain more coordinated and broad-based support for partnership between public and private sectors

- Support for activities related to the National Poultry Quality Improvement Program (NPQIP) by ECTAD Indonesia is continuing.
- An Indonesian expert was recruited for the NPQIP Facilitation consultancy.
- The NPQIP Facilitator conducted interviews of stakeholders for NPQIP concept development in West Java, Lampung and South Sulawesi.
- Monthly coordination meetings on NPQIP progress were held between the United States Department of Agriculture (USDA) and ECTAD Indonesia.
- A second individual to assist in NPQIP development was identified and will be recruited next quarter as a NPQIP Facilitator.

Activity 2.4: Evaluate the effectiveness of biosecurity measures implemented by poultry producers

This activity has been integrated with Activity 2.1 above, and will commence concurrently. An initial assessment of layer farms included in the biosecurity effectiveness study was conducted at the end of this quarter, and the cost-effectiveness evaluation methods will be developed next quarter in collaboration with the ECTAD Socioeconomics Unit.

Activity 2.5: Provide expert technical assessments to Sectors 1 and 2 farms in high-risk locations

Upon further consultations with Sector 1 and 2 industry representatives, this activity will be integrated within activities to be carried out under the NPQIP. With the Technical Advisor (Commercial Poultry Health) now on duty, ECTAD Indonesia is awaiting assessment requests from Sector 1 and 2 farms in addition to the Sector 2 layer farms already included in the layer engagement programme.

Output 3: Improved HPAI surveillance and control along the poultry marketing chain

Activity 3.1: Conduct longitudinal surveillance for HPAI in live bird markets and collector yards

- Environmental sampling continued at live bird markets through Jabodetabek (Jakarta province and surrounding metropolitan areas).
- The targeted research activity to identify a cost-effective collector yard surveillance method was successfully implemented in East Jakarta and Tangerang city. The data is currently being analysed and will be used to help determine high-risk geographic areas and types of birds.
- An additional training course for new Market Surveillance Officers (PSP) was conducted and numerous meetings on collector yard surveillance were held with related stakeholders to ensure smooth implementation.

- A refresher training course for all PSP was held along with a market chain surveillance coordination meeting among market surveillance stakeholders to improve M&E efforts.
- The market list for live bird market surveillance was also revised this quarter.

Activity 3.2: Implement biosecurity and sanitation interventions in selected live bird markets, collector yards and slaughterhouses

- A new Engineer Field Assistant was recruited for cleaning and disinfection station establishment.
- A manual describing cleaning and disinfection practices in collector yards was finalized.
- Ten selected private collector yards in Bodetabek (metropolitan area surrounding Jakarta) received training in biosecurity principles and were equipped with gasoline-powered high-pressure washing equipment. On-site refresher training on cleaning and disinfection for cleaning workers in collector yards was conducted.
- A locally available alternative disinfectant was procured for collector yards and live bird markets in Jabodetabek.
- The ongoing cleaning day in Kutabumi market was monitored and lessons learned were utilized to revise standard operating procedures (SOPs) for other live bird markets in Tangerang. A field assessment was conducted to select the potential live bird markets in Tangerang for introduction of a market cleaning day.
- Construction of the cleaning and disinfection station in Pulo Gadung poultry collection yard and slaughterhouse was completed and the station was operationally tested. The station will begin service early next quarter.
- Supervision was provided for tiling and drainage upgrading at the Cakung poultry collection yard and slaughterhouse.
- Meetings were held with DKI Jakarta provincial livestock services, East Jakarta and South Jakarta district livestock services and PT Dharma Jaya management regarding the possibility of establishing cleaning and disinfection stations in Rawa Kepiting, Cakung and Petukangan collector yards, in addition to the station under construction at Pulo Gadung.
- An agreement was reached among all stakeholders in Jakarta to establish dedicated cleaning and disinfection stations for poultry transport trucks in all major collector yards. The purpose of the cleaning station is to clean and disinfect all trucks leaving the collector yard.

Activity 3.3: Facilitate DKI Jakarta poultry market restructuring

- The targeted public awareness campaign for the promotion of healthy chicken meat was initiated with press conferences, talk shows and organized visits to the marketing and slaughter areas in DKI Jakarta. Close liaison with the DKI Governor's office and its administration is increasing the likelihood of success for DKI restructuring.
- ECTAD Indonesia has also provided technical support for the development of SOPs related to the organization of the five collection yards/slaughterhouses and their management, as well as operational assistance for the start-up of one of the five collection yards (Rawa Kepiting).
- Support for the promotion of the collection yards with the collectors and slaughterers, in collaboration with the local administration, was continued.
- Further technical support was provided to law enforcement units and FAO facilitation continued for the set-up of poultry transport checkpoints at the entrance to the city.
- Finally, ECTAD Indonesia continued to facilitate private sector participation in a study tour to Viet Nam as a follow-up to the completed December 2009 study tour by public sector representatives.

Output 4: Engagement with duck producers for improved control of HPAI

Activity 4.1: Conduct duck vaccination field trial in selected districts of Java

ECTAD Indonesia further pursued the opportunity to initiate this activity during the current project period; however, the current Directorate General of Livestock Services (DGLS) vaccination policy does not include ducks. ECTAD is working with DAH and DGLS to determine if the activity can be pursued strictly as a research project and thus be permissible under the current vaccination policy.

Activity 4.2: Expand duck producer profiling and HPAI surveillance to selected districts in Java, Lampung and Bali

- The profiling of duck flocks in the remaining districts of Banten and West Java provinces was completed.
- Activities to support the implementation of targeted surveillance to determine the prevalence of AI subtype H5 in duck flocks in Banten and West Java were initiated. These included training of district staff in sampling techniques, coordination with district authorities to obtain permission to conduct the study, as well as coordination with the three laboratories responsible for processing the collected samples.
- ECTAD Indonesia also made available a virus transport medium (VTM) to the implementing agency to be used for sampling.

Output 5: Coordinated and enhanced management of the HPAI control programme

Activity 5.1: Integrate and analyse data sets to identify critical control points

- A study of the prevalence of HPAI in the duck population of South Kalimantan was completed and the report drafted. Findings indicate that the duck population in the study was not acting as a reservoir for HPAI in Kalimantan, thus warranting further studies to better understand the role of ducks in the epidemiology of HPAI.
- Analysis of the InVak data on the willingness of farmers to pay for AI vaccine was completed indicating that over 80 percent of farmers had been using HPAI vaccine in the past, thereby indicating a likelihood that most farmers in the programme would continue to purchase AI vaccine on their own following completion of InVak programme.
- Work has commenced in comparing the data from PDSR activities with the random field prevalence studies in three of the planned six districts of Java. Initial results indicate similar results from both methods.

Activity 5.2: Once western Java activities are consolidated, extend essential control programme elements (e.g. market surveillance, commercial profiling, targeted support for high-risk producers) to other priority regions based on outcomes of western Java intensification activities and lessons learned

- This activity is ongoing and contingent on the successful implementation of a complete "suite" of commercial, market and village-based surveillance, prevention and control activities in the western Java area. Currently village-based activities are fully operational in all priority regions, and targeted vaccination of small-scale producers is underway in central Java. Market, village and commercial activities are underway in South Sulawesi under an AusAID-funded project.
- The commercial poultry programme was initiated this quarter in Central Java. Expansion of market activities to Central Java and Yogyakarta will commence once all planned activities in western Java have been successfully implemented. In particular, a critical market for export of poultry to Jakarta has been identified in Central Java and it is expected that market chain activities in Central Java will be initiated in the next project cycle.

Activity 5.3: Expand the M&E system programme-wide with increased integration with government

- The collector yard surveillance database commenced operation, providing monitoring information while collector yard surveillance was underway, and continues to receive laboratory test results of samples submitted. Improvements were made to the market surveillance database to allow increased accuracy of place name identification. Minor improvements were made to the PDSR database and this database is now at version 3.1.2.
- A new database for tracking collector yard cleaning and disinfection activities was designed.
- A project log database was designed and implemented to assist management in reporting FAO activity to senior DAH officials. Twenty-eight regular monitoring reports were produced for FAO and DAH management each month.
- Work plan preparation support was provided to ECTAD Indonesia management.

Activity 5.4: Improve technical capacity of government human resources

- Three continuing education training workshops (Package A & B) for PDSR officers were conducted in Bekasi, West Java and Kupang, East Nusa Tenggara (155 persons: 107 male, 48 female).
- One continuing education training workshop (Package B) for former participatory impact assessment officers was conducted in Semarang (31 persons: 22 male, 9 female).
- Training team members participated in and provided technical inputs to 18 LDCC monthly meetings and 11 district focal person meetings at various LDCCs.
- Members of the training team participated in two Decision-Makers' Meetings in Kepulauan Riau and Aceh provinces.
- The training team also provided requested information for the evaluation of the PDSR training programme conducted this quarter. The evaluator was assisted by training team staff during her visits to Semarang, Purwokerto, Bandung and Pekanbaru LDCC.
- The training team participated in a stakeholders' workshop conducted in Jakarta on the proposed local government commercial poultry programme and at a similar workshop in Jambi, Sumatra organized by the Jambi provincial government.
- An additional Training Specialist joined the programme this quarter in order to provide technical input for the development of the local government commercial poultry programme in collaboration with DAH, CMU, local government and poultry farmers.

Activity 5.5: Improve virus strain monitoring, including training, sample submission, collection of field isolates and improved surveillance

The DAH has still not cleared and distributed the Sample Submission SOP to local governments in order to officially initiate the sample submission programme. FAO continues to work closely with the DAH to facilitate issuance of the Sample Submission SOP so that the activity can commence in the field in all locations with PDSR.

Activity 5.6: Increase the capacity of Indonesian laboratories to conduct antigenic and genetic characterization of virus isolates

- The OIE-FAO Network of Expertise on Avian Influenza (OFFLU) scientist continues to provide in-country technical assistance to support laboratory capacity. A positive response was received from the Bbalitvet laboratory to participate in OFFLU activities such as the pre-screening process to monitor AI viruses for antigenic variation, and participation in generating genetic data for antigenic cartography in parallel and with guidance from the Australian Animal Health Laboratory (AAHL).

- The DAH nominated three laboratories to receive capacity building for molecular characterization of antigenic variant HPAI isolates identified through antigenic cartography (DIC Bukittinggi, Pusvetma and Bbalitvet), and an introductory meeting was conducted for the three laboratories on 22 March 2010 in coordination with AAHL. DAH and CMU also attended this meeting.
- Procurement of reagents was initiated to support molecular characterization efforts. Pusvetma can now produce small amounts of antisera for cartography (e.g. ~500 mls of a single serum per each ten-week period) using the facilities available.
- The position of national technical facilitator for OFFLU was proposed to assist with the coordination of the OFFLU project in close collaboration with the DAH, CMU, the seven Disease Investigation Centres, particularly DIC Wates and other relevant public sector structures and private sector stakeholders.
- A site visit to DIC Wates was conducted by the OFFLU scientist in coordination with the CMU to follow up on antigenic cartography activities and analysis of data generated to end in March 2010.
- A positive response was received from DAH to include poultry vaccine producers Vaksindo and Medion in antigenic cartography activities.
- Procurement of needed reagents and equipment for DIC Wates continued. The OFFLU scientist confirmed the arrival of equipment and consumables. More needs were identified during the March 2010 visit.
- The OFFLU scientist also conducted a joint assessment visit to Pusvetma in conjunction with AAHL to determine laboratory needs.

Activity 5.7: Provide technical recommendations on vaccination strategy

- OFFLU continues to encourage the DAH to support field trials of alternative vaccines and to partner with private companies to pursue vaccine trials using candidate vaccines demonstrated likely to be efficacious, especially against variant viruses in Indonesia.
- A field survey was conducted by the Indonesian Center for Agriculture Socio-Economic and Policy Studies (ICASEPS) in 13 districts/municipalities and continues in the western Java area for "Assessment of Farm Level Financial Incentives and Willingness to Pay for HPAI Vaccination in Indonesia." Data entry of survey results was initiated.

Activity 5.8: Conduct vaccination challenge testing and field challenge testing of antigenic variants

- Characterization of additional vaccine constructs at the Southeast Poultry Research Laboratory (SEPRL) in Athens, Georgia, USA continues.
- Cartography reagents from AAHL were received at SEPRL, pending confirmation from Erasmus University.
- DAH is encouraged to partner with private companies to pursue challenge testing field trials.
- A Material Transfer Agreement (MTA) is in process to ship characterized vaccine master seeds and challenge viruses back to Indonesia from AAHL.
- The OFFLU scientist visited Bbalitvet in March to re-discuss their participation in the pre-screening process to monitor AI viruses for antigenic variation and other project activities.

Cross-cutting activities

Information, Education and Communication

Activities this quarter continued to focus on developing and distributing materials for public awareness and PDSR continuing education. The following activities were completed/initiated:

- Printed and distributed the 6th Edition of the PDSR Newsletter and the 6th Edition of the Avian Influenza Bulletin in cooperation with the MOA.
- Finalized and distributed the flipchart animation video.
- Continued the development of the PDSR training video and the Dinas Briefing Package (video).
- Continued discussion with CMU on how to proceed with implementation of the National Communication Strategy on HPAI for the MOA.
- Additional progress made on concept development of the Disease Transmission Video in collaboration with the production company.
- Continued the subscription to a media monitoring company for AI-related news and coverage of selected animal diseases.
- Commenced the development of PDSR Hotline stickers and calendars.
- Commenced planning for a promotional video for DKI Jakarta's market restructuring programme.

Planned activities for the next quarter

Output 1: Sustainable surveillance, prevention and control of HPAI in village poultry

Activity 1.1: Maintain village surveillance, prevention and outbreak control capacity across endemic areas of Indonesia, prioritized by strategic importance

- Maintain technical and operational support for PDSR teams throughout Sumatra, Java, Bali and southern Sulawesi. Continue with technical support for government-implemented LDCCs in Kalimantan and remainder of Sulawesi funded by local government.
- In close consultation with DGLS/DAH/CMU and USAID, conduct meetings to plan the next phase of the PDSR programme.
- Conduct village HPAI prevalence surveys in Serang and Situbondo districts.
- Complete all individual district survey reports and a consolidated survey report for all six Java districts, including a cost-efficiency comparison between village surveys and PDSR surveillance.
- Continue follow-up on vehicle procurement and registration with relevant government authorities.

Activity 1.2: Assess the potential of the PDSR system, structure and capacities to strengthen the national veterinary service

- Clear revised PDSR forms with LDCC Coordinators and DAH.
- Collaborate with the training team to revise training modules to incorporate revised PDSR forms.
- Select trial districts for surveillance data entry at district level as part of the local government commercial poultry health programme.
- Translate and distribute the PDSR training evaluation report.

Activity 1.3: Facilitate the drafting of a national veterinary service strategy and work plan

- Facilitate a stakeholder workshop on NVS for improvement of disease control capacity of animal health services in Indonesia.
- Complete the recruitment of a NVS Facilitator.

- Conduct a site visit to West Sumatra province to assess the possibility of a NVS pilot programme in West Sumatra.

Activity 1.4: Assist the CMU to advocate to local governments for budgetary support for HPAI control, including PDSR and LDCC activities

- Continue facilitation of Decision-Makers' Meetings in selected provinces in Sumatra and Java.
- Assist the CMU and DAH to coordinate with local government on budgetary support for HPAI control.
- In close consultation with DGLS/DAH/CMU and USAID, modify the next phase of the OSRO/INS/604/USA project to encourage further government investment in HPAI control.

Output 2: Improved biosecurity and vaccination practices in commercial sectors

Activity 2.1: Provide specialized technical support to selected layer producers within high-risk areas of West Java to enhance efficiency and quality of layer vaccination and biosecurity measures

- Recruit national technical and operational staff for the commercial poultry health team.
- Develop farm assessment (including biosecurity, vaccination and management) methods.
- Conduct an inception workshop for the layer engagement programme with participating layer farmers.

Activity 2.2: Provide a biosecurity training of trainers for commercial producers and relevant government agencies

- Finalize a plan for piloting a local government commercial poultry health programme and coordinate closely with local governments to ensure local support.
- Continue to compile training references (including the translation of training videos and guides) and develop training modules.

Activity 2.3: Assist government and industry in establishing an advisory council modeled on the US National Poultry Improvement Program to gain more coordinated and broad-based support for partnership between public and private sectors

- Continue interviewing key stakeholders from all sectors of the commercial poultry industry.
- Hire an additional part-time NPQIP Facilitator.
- Prepare an updated draft of the NPQIP roadmap.
- Plan a national workshop on NPQIP in collaboration with USDA and the commercial poultry industry.

Activity 2.4: Evaluate the effectiveness of biosecurity measures implemented by poultry producers

- Develop methods to measure biosecurity effectiveness in farms participating in the layer engagement programme (see Activity 2.1 above) and control farms.
- Conduct baseline farm assessments.

Activity 2.5: Provide expert technical assessments to Sectors 1 and 2 farms in high-risk locations

- Conduct specialized assessments upon request from Sector 1 and 2 farms and companies.

Output 3: Improved HPAI surveillance and control along the poultry marketing chain

Activity 3.1: Conduct longitudinal surveillance for HPAI in live bird markets and collector yards

- Continue environmental sampling at live bird markets in Jabodetabek.
- Conduct trial of a sustainable sentinel bird system, using collector yard managers as sentinel bird monitors.

- Determine the most cost-effective means of collector yard surveillance from targeted research study and utilize to prepare a long-term market chain surveillance system.
- Conduct additional training for new and/or replacement PSP.
- Assess options for the most sustainable method of providing ongoing supply of sentinel birds.

Activity 3.2: Implement biosecurity and sanitation interventions in selected live bird markets, collector yards and slaughterhouses

- Establish a cleaning and disinfection station in Rawa Kepiting and Cakung collector yards.
- Train cleaning workers on cleaning and disinfection station operations.
- Continue on-site refresher training on cleaning and disinfection activities for cleaning workers in collector yards.
- Monitor and evaluate cleaning and disinfection activity within the market chain in Jabodetabek.
- Supervise tiling and drainage upgrading in Petukangan collector yard.
- Conduct public awareness and training for live bird market stakeholders in Tangerang to implement market cleaning and disinfection day.
- Conduct a market cleaning and disinfection day in two live bird markets in Tangerang.
- Distribute alternative locally available disinfectant to selected collector yards and live bird markets in Jabodetabek.
- Rehabilitate the floors, walls and waste drainage system in Kutabumi market Tangerang as a pilot for determining ideal rehabilitation specifications for live bird markets in general.

Activity 3.3: Facilitate DKI Jakarta poultry market restructuring

- Continue a targeted public awareness campaign for the promotion of healthy chicken meat via press conferences, talk shows and organized visits to the marketing and slaughter areas in DKI Jakarta.
- Liaise with the DKI Governor's office and its administration to reconsider the critical deadline for relocation of live poultry and the potential for postponement.
- Continue support for the development of SOPs related to the organization of the five collection yards and their management, as well as the training of the collectors and slaughterers.
- Continue providing support for the promotion of the collection yards with the collectors and slaughterers, in collaboration with the local administration.
- Collaborate closely with the private sector and local administration in the restructuring of distribution channels from the five collection yards/slaughterhouses to the traditional markets, particularly regarding cold chain.
- Continue to provide limited technical support to law enforcement units in view of the postponement of the relocation.
- Design a further assistance programme of ECTAD Indonesia in view of the postponement of the relocation of the collectors and slaughterers to the five designated collection yards/slaughterhouses.

Output 4: Engagement with duck producers for improved control of HPAI

Activity 4.1: Conduct duck vaccination field trial in selected districts of Java

Continue to engage with DGLS to determine if a duck vaccination research study can be conducted on Java in case duck vaccination is required in the future to bring HPAI under control in Indonesia.

Activity 4.2: Expand duck producer profiling and HPAI surveillance to selected districts in

Java, Lampung and Bali

- Distribute the report of the Kalimantan duck study.
- Complete sampling for targeted surveillance to determine the prevalence of AI subtype H5 virus in duck flocks in Banten and West Java provinces.

Output 5: Coordinated and enhanced management of the HPAI control programme*Activity 5.1: Integrate and analyse data sets to identify critical control points*

- Complete the analysis of collector yard surveillance and review market chain surveillance results from other organizations.
- Complete the review of poultry type as a risk factor for HPAI on Java, utilizing market chain surveillance data.
- Complete the comparison of the results from district village HPAI active structured surveillance to equivalent results collected by PDSR.

Activity 5.2: Once western Java activities are consolidated, extend essential control programme elements (e.g. market surveillance, commercial profiling, targeted support for high-risk producers) to other priority regions based on outcomes of the western Java intensification activities and lessons learned

- Expand commercial poultry activities in Central Java via initiation of the layer engagement programme.
- Facilitate the development of a local government-implemented commercial poultry HPAI control tool for potential deployment in priority regions.
- Conduct meetings with local stakeholders to develop a market chain strategy in Solo area of Central Java.

Activity 5.3: Expand the M&E system programme-wide with increased integration with government

- Continue to operate the collector yard database system to log laboratory sample results and produce required datasets and reports.
- Revise the PDSR database based on recommendations from management for streamlining the PDSR forms.
- Continue operation of the market surveillance database.
- Commence operation of the collector yard cleaning and disinfection database.
- Transfer selected regular database reporting tasks to the CMU.

Activity 5.4: Improve technical capacity of government human resources

- Prepare and finalize the local government commercial poultry programme by designing material/modules, preparing schedules and selecting districts for the initiation of pilot work.
- Plan and implement various PDSR training courses at various LDCCs.
- Develop a revised training programme to implement recommendations of the PDSR training evaluation.

Activity 5.5: Improve virus strain monitoring, including training, sample submission, collection of field isolates and improved surveillance

- Facilitate a meeting with DAH to discuss clearance and issuance of Sample Submission SOP.

Activity 5.6: Increase the capacity of Indonesian laboratories to conduct antigenic and genetic characterization of virus isolates

- The OFFLU scientist from FAO will continue to provide in-country technical assistance

to support laboratory capacity and the establishment of activities for antigenic cartography. Next inputs are scheduled for June and July 2010.

- Finalize the recruitment of a national Technical Facilitator for OFFLU activities in Indonesia.
- Continue follow-up on phase 2 procurement for DIC Wates.
- Follow up on the procurement of reagents to support molecular characterization efforts.
- National Technical Facilitator for OFFLU to assist with the initiation of pre-screening activities at the DICs to affect OFFLU Recommendation. This will include a standardized reference H5 hyperimmune antisera and the homologous antigen based on an updated common Indonesian lineage for use in the DICs and other national laboratories.
- Determine antigenic cartography training needs for industry.

Activity 5.7: Provide technical recommendations on vaccination strategy

- SEPRL to report on data from the completed challenge tests using available reverse genetic constructs.
- Support field trials with alternative vaccines and continue to encourage DAH to partner with private companies to pursue trials using candidate vaccines demonstrated likely to be efficacious, especially against variant viruses in Indonesia.
- Continue data entry and analysis for ICASEPS field survey.
- Prepare consultation to develop recommendations for a comprehensive vaccination strategy in Indonesia for July 2010.
- Prepare for the final Technical Review Meeting, September-October 2010.

Activity 5.8: Conduct vaccination challenge testing and field challenge testing of antigenic variants

- DAH suggested that the OFFLU Technical Facilitator should follow up on submitted letters to DGLS for receipt of reverse genetics low pathogenicity H5N1 virus strains, antigenic cartography and sequence deposit.
- Follow up on MTA to ship characterized vaccine master seeds and challenge viruses to Indonesia.
- Continue characterization of additional constructs at SEPRL.

Cross-cutting activities

Information, Education and Communication

- Provide contributions to the DAH Newsletter as the replacement of the PDSR Newsletter.
- Produce the 7th Edition of the Avian Influenza Bulletin in cooperation with the MOA.
- Duplicate and distribute the animation video to all districts with PDSR.
- Continue the preparation of the PDSR training video.
- Continue the preparation of the Dinas Briefing Package.
- Finalize the National Communication Strategy on HPAI with the MOA.
- Produce the Disease Transmission Video.
- Continue monitoring and documenting news coverage related to the ECTAD programme.
- Produce PDSR Hotline stickers and calendars.
- Finish preparation of the 2009 FAO Annual Report (print, electronic and video versions).
- Produce promotional video for DKI Jakarta's Market Restructuring Project.
- Produce related posters.
- Repackage Media Partnership materials for global dissemination.
- Hold a media gathering to improve relationships with the media and update them on interesting and important information from the project and MOA.

Main challenges encountered and response provided

As expected with a programme of this magnitude, a number of challenges were encountered this quarter. Specific details on the difficulties encountered and response provided can be found in the sections above. In addition to the fundamental challenge of limited government financial commitment to HPAI control described in previous quarters, the ECTAD Indonesia management continues to experience challenges in the area of technical advisor recruitment. The FAO-selected candidate for the Poultry Market Chain Technical Advisor position was not approved by government and that position remains unfilled. Also recruitment of the Technical Advisor for Commercial Poultry Health was significantly delayed due to difficulties in receiving government clearance. ECTAD Indonesia management has responded to this by engaging more directly with DGLS early in the recruitment process, including screening all candidates for international and national technical positions with CMU before formally requesting clearance. Management has also increased the number of national technical recruitments and has decreased the number of long-term international staff. Another challenge for the HPAI Control Programme, which became more apparent this quarter, is the lack of DGLS engagement with MOA Quarantine Services. Movement control is a major gap in the current HPAI Control Programme, and this would best be resolved by more direct engagement with quarantine services at both national and local levels.

Main progress made towards the achievement of project outcomes *(from the start of the current project phase)*

Output 1: Sustainable surveillance, prevention and control of HPAI in village poultry

- The PDSR programme has strengthened veterinary services' capacity to detect and respond to HPAI outbreaks in village poultry throughout HPAI-endemic areas of Indonesia.
- The LDCC system has enabled more effective communication and coordination between central and local governments within the highly decentralized Indonesian governance system.
- As a direct result of advocacy conducted through local government village poultry HPAI control activities (e.g. PDSR), central and local governments are well aware of the need for cost-sharing for the HPAI control programme and animal disease control activities in general. In addition, government stakeholders are now more committed to support and advocate for animal health and HPAI disease control as a result of the FAO project.

Output 2: Improved biosecurity and vaccination practices in commercial sectors

- Understanding of the role of commercial poultry production in the maintenance and spread of HPAI has improved.
- Public-private partnership for targeted vaccination of at-risk small-scale poultry producers has been initiated.
- Public sector collaboration with commercial poultry producers has accelerated. In particular, public sector disease controllers and international agencies are both more aware of the complexity of commercial poultry production in Indonesia and more engaged with private sector stakeholders involved in commercial poultry production.

Output 3: Improved HPAI surveillance and control along the poultry marketing chain

- Test results from the DKI Jakarta category B animal health laboratory were distributed to all livestock services at district level throughout Jabodetabek to increase local government awareness and responsiveness to market chain contamination and

veterinary public health issues.

- Programme to test collector yard-based surveillance methods to assess relative risk of poultry production areas and poultry type were developed and successfully implemented.
- Understanding of poultry market dynamics in DKI Jakarta by the public sector has improved.
- There is increased private and public sector cleaning and disinfection capacity and increased implementation of cleaning and disinfection practices along the poultry market chain in greater Jakarta.
- Critical weaknesses in the DKI Jakarta market restructuring preparations have been identified and corrective measures proposed and subsequently implemented by the government.

Output 4: Engagement with duck producers for improved control of HPAI

The database of duck flocks developed from the study area provides a sample frame for the prevalence study and other future activities to be undertaken in duck populations by animal health authorities; knowledge of locations of high-density duck populations is a critical first step towards identifying critical control points for targeted interventions to control HPAI.

Output 5: Coordinated and enhanced management of the HPAI control programme

- Improved knowledge of factors associated with outbreaks of HPAI in village poultry to be used to inform and refine surveillance and control strategies.
- Critical control points identified. Data and subsequent analysis leading to identification of further points for disease control efforts to be targeted.
- Significant improvement in technical capacity and management of local government human resources working in the field throughout all known HPAI-endemic areas.
- Development of a safe, efficacious vaccine for use in Indonesia.
- Characterization of avian influenza viruses circulating in Indonesia.
- Increased capacity of Indonesian laboratories to perform antigenic characterization of viruses and analyse results.
- Improved collaboration between Indonesian private sector and public sector on field virus monitoring.

Project Monitoring Sheet: **OSRO/INS/103/USA**Project Title: **Enhancing the capacity of the Government of Indonesia and partners to control Highly Pathogenic Avian Influenza**Reporting period: **April 2013 to September 2013**

Country: Indonesia
Project title: Enhancing the capacity of the Government of Indonesia and partners to control Highly Pathogenic Avian Influenza
Code: OSRO/INS/103/USA
Budget: Initial budget: USD 8.2 million Amendment No.1: USD 5.2 million Amendment No. 2: USD 3.9 million
Total Budget: USD 17.3 million
Effective starting date: 1 October 2012
Planned end date: 30 September 2014
Context of the project The purpose of the project is to contribute to the control of Highly Pathogenic Avian Influenza (HPAI) in poultry in Indonesia, thus safeguarding the health and livelihoods of the Indonesian population. The expected outcome of the project is that the capacity and ability of the Government of Indonesia and partners to control HPAI are enhanced.
Objectives of the project Output A: Increased empowerment of village residents in biosecurity and HPAI prevention and control through an expansion of a government-funded, streamlined Participatory Disease Surveillance and Response (PDSR) system. Output B: Reduced HPAI-infected poultry from commercial farms through improved cooperation among all stakeholders. Output C: Reduced H5N1 virus at selected critical control points in the market chain through improved biosecurity practices by related stakeholders. Output D: Improved biosecurity practices in backyard and commercial duck-raising. Output E: Reduction of HPAI in poultry farms through widespread use of locally produced vaccines as appropriate based on local antigens and new strains monitored. Output F: Strengthened veterinary services at central, provincial, and district levels with increased commitment from related stakeholders.
Planned activities for the reporting period (April to September 2013) Output A: Increased empowerment of village residents in biosecurity and HPAI prevention and control through an expansion of a government-funded, streamlined PDSR system. <i>A.1 Distribute and use communication materials to support HPAI prevention and control activities.</i> <i>A.2 Revise and streamline PDSR system to incorporate more community-based decision-making for improved HPAI prevention and control.</i> <i>A.3 Provide Local Disease Control Centre (LDCC)/PDSR operational budget by local government.</i> <i>A.4 Extend PDSR database system to district level for improved local disease control management.</i> Output B: Reduced HPAI-infected poultry from commercial farms through improved cooperation among all stakeholders. <i>B.1 Establish effective communication and coordination between government and commercial poultry industry in order to build trust among the stakeholders.</i> <i>B.2 Establish a confidential database of outbreak information from commercial farms.</i> <i>B.3 Increase competency in commercial poultry health (CPH) in both public and private sectors.</i> <i>B.4 Advocate for best practices for CPII.</i> <i>B.5 Conduct trials on private sector-funded compensation system.</i> Output C: Reduced H5N1 virus at selected critical control points in the market chain through improved biosecurity practices by related stakeholders. <i>C.1 Improve the surveillance system along the post-production market chain and make it more cost-effective.</i> <i>C.2 Improve biosecurity along post-production market chain.</i>

C.3 Increase demand for healthy poultry end-product.

Output D: Improved biosecurity practices in backyard and commercial duck-raising.

D.1 Advocate for best practices in duck health management.

D.2 Implement duck epidemiological data analysis in low incidence areas in Indonesia to improve understanding of the reservoir role of ducks.

Output E: Reduction of HPAI in poultry farms through widespread use of locally produced vaccines as appropriate based on local antigens and new strains monitored.

E.1 Promote use of effective vaccine by farmers.

E.2 Establish partnership between commercial poultry industry and government for sharing of influenza virus data and isolates.

E.3 Establish sustainable laboratory system for influenza virus monitoring.

Output F: Strengthened veterinary services at central, provincial, and district levels with increased commitment from related stakeholders.

F.1 Pilot National Veterinary Services (NVS) in three provinces for selected priority diseases.

F.2 Ensure effective programme management with respect to finance, administration, technical inputs, and partner relations (donor and Government of Indonesia).

F.3 Ensure appropriate support to programme components and management to maximize stakeholder participation and build capacity of animal health services.

F.4 Conduct epidemiological studies to better inform disease control and support government strategic planning.

F.5 Provide technical support to the Directorate of Animal Health (DAH) for HPAI policy development.

F.6 Contribute to the Komnas Zoonosis One Health communication and advocacy strategy.

Activities undertaken during the reporting period (April to September 2013)

Output A: Increased empowerment of village residents in biosecurity and HPAI prevention and control through an expansion of a government-funded, streamlined PDSR system.

A.1 Distribute and use communication materials to support HPAI prevention and control activities.

- Produced, printed, and distributed 200 copies of the bilingual English/Bahasa Indonesia Food and Agriculture Organization of the United Nations (FAO) Emergency Centre for Transboundary Animal Diseases (ECTAD) Annual Report 2012; the electronic version of the annual report was distributed electronically to over 110 recipients, including LDCC Coordinators for redistribution to over 2 000 PDSR/ Commercial Poultry Veterinarian Programme (PVUK) field staff;
- Designed booth and communication materials for the 2013 Indo Livestock Expo & Forum held in Nusa Dua, Bali and for the National Poultry Farmers' Seminar which followed; and
- Initiated design of topic-based posters and factsheets to encourage and motivate Sector 3 layer farmers to conduct more effective vaccination programmes.

A.2 Revise and streamline PDSR system to incorporate more community-based decision-making for improved HPAI prevention and control.

- A meeting on Sustainability of PDSR and Socialization of *Unit Respons Cepat Penyakit Hewan Menular Strategis* (Rapid Response Unit – Strategic Infectious Animal Diseases [URC-PHMS]) was held in Surabaya for 61 participants with 30 LDCC coordinators, 13 DAH representatives and 18 Provincial Heads of Animal Health Section. The participants agreed that:
 - Central, provincial and local government would continue the process of taking over financial responsibility for PDSR, PVUK, NVS operational costs;
 - An Incident Command System (ICS) will be used to respond to outbreaks of strategic diseases;
 - For HPAI outbreaks, short message service (SMS) reports should always be followed by paper reports; and
 - The role of LDCC will be incorporated into the provincial URC-PHMS;
- Provided training for 115 (53 male, 62 female) new PDSR officers in Bengkulu, Samarinda, Tanjung Pinang, Manado and Makassar with financial support from local government budget;
- Provided training for 181 (125 male, 56 female) PDSR officers on PDSR V3, bringing the total trained to date to 1 523 (1079 male, 444 female) PDSR field staff. In addition, 62 (41 male, 21

female) PDSR officers were mentored and supported in the implementation of PDSR V3 in 16 districts and six provinces, bringing the total mentoring coverage of the project period to 39 districts in 13 provinces; and

- Updated and revised the PDSR training curriculum into one six-day training for Introduction and one six-day training for Continuing Education. Seventeen modules have been prepared to support the network of Master Trainers to conduct their own trainings.

A.3 Provide LDCC/PDSR operational budget by local government.

- Successfully recruited the Senior National Veterinary Advisor (local government) to provide high-level representational and technical support to the Local Government Advocacy and Training teams;
- Conducted an evaluation meeting with DAH/Rapid Response Unit (*Unit Respons Cepat* [URC formerly CMU]) to review the results of advocacy meetings and develop strategies to communicate the identified issues and gaps in relation to the implementation of local government commitment made during the advocacy meetings, including the development of an integrated advocacy strategy which will incorporate the development of national budget planning guidelines, local government strategic planning, and local government advocacy;
- Provided the final budget proposal developed by FAO in collaboration with URC and the West Java Provincial Livestock Service to obtain additional funding from the local government contingency budget for improved sustainability of PDSR activities in 2013 in the province;
- Held follow-up meetings with Lampung, Central Java, East Java, Yogyakarta, *Daerah Khusus Ibukota Jakarta* (Special Capital City District [DKI]) Jakarta, North Sumatra, and Banten provinces which had received previous advocacy visits in order to identify progress and challenges on the PDSR payment and reporting system using committed local government budgets;
- Conducted a coordination meeting with DAH/ Directorate General of Livestock and Animal Health Services (DGLAHS) to report on and evaluate the results of follow-up meetings and the performance of current government-funded PDSR activities, as well as to develop follow-up actions;
- Conducted presentation for LDCC coordinators and provincial heads of animal health on the transition, change, and sustainability of PDSR, PVUK, and other FAO programmes, in addition to the evaluation of PDSR performance now funded by Government of Indonesia budget;
- Held evaluation meeting with DAI and Central URC-PHMS on the results of follow-up advocacy meetings that have been implemented in eight provinces;
- Conducted an advocacy meeting with the Secretariat of DGLAHS and DAH regarding the sustainability of the PDSR method funded by the Government of Indonesia; and
- Conducted an internal meeting between FAO, DAH and URC-PHMS to prepare the next step of advocacy strategies and to follow-up on the recommendations of the advocacy meeting.

A.4 Extend PDSR database system to district level for improved local disease control management.

- Provided specialized training to DAH staff members on database management, including data downloading and compilation, in preparation for eventual handover of PDSR data management responsibility to DAH;
- Collaborated with URC-PHMS on the development and rollout of the operational aspects of PDSR V3 district-provincial-national system and prepared formal standard operating procedures (SOPs) for use by URC;
- Prepared curriculum and software for training of trainers (TOT) activities for provincial data encoders who are to train district data encoders in PDSR V3 software;
- Conducted TOT activities for provincial data encoders who are to train district data encoders in PDSR V3 software; and
- Provided funding and technical support for six district data encoder training programmes in Jakarta, Malang, Jambi, Padang, Makassar, and Pekanbaru LDCCs.

Output B: Reduced HPAI-infected poultry from commercial farms through improved cooperation among all stakeholders.

B.1 Establish effective communication and coordination between government and commercial poultry industry in order to build trust among the stakeholders.

- Conducted coordination meeting with the National Poultry Health Committee (KKUN) to discuss and prepare activities to be conducted by KKUN to endorse more communication between academia, government and the commercial poultry industry;
- Developed a “Grand Rounds” concept as a means to bring the private and public sectors together to discuss technical issues related to poultry health under the umbrella of KKUN;
- Participated in the 2013 Indo Livestock Expo & Forum in Nusa Dua, Bali through the “Warung Nasihat” booth concept, which enabled farmers to receive practical recommendations for biosecurity implementation and the most up-to-date information on vaccination against H5N1 in a relaxed and welcoming environment;
- Conducted the second annual National Poultry Farmers’ Seminar for 120 layer farmers immediately following the Indo Livestock Expo & Forum to enable farmers to share their experiences and to provide more detailed recommendations on effective vaccination and biosecurity practices for layer farms;
- In coordination with the KKUN and Bogor Agricultural University (IPB), presented experiences in implementing three-zone biosecurity concept in layer farms in Solo at the IPB *Dies Natalis* seminar on Zone-Based Poultry Farm Biosecurity; and
- Prepared for FAO participation in the International Livestock and Dairy Expo (ILDEX Indonesia), from 3 to 5 October 2013 in Jakarta; and the Farmers Seminar on 4 October 2013. FAO will have two booths at ILDEX Indonesia that will provide information in detail on the three-zone biosecurity concept and good vaccination practices. An outdoor booth will provide visitors with hands-on experience, giving them a better understanding of three-zone biosecurity and the gentle vaccination concept.

B.2 Establish a confidential database of outbreak information from commercial farms.

- Integrated HPAI outbreak reporting within the PVUK database and reporting system; and
- Conducted mentoring activities for PVUK-trained veterinarians to further develop farmer groups as a trusted space in which farmers can report disease events.

B.3 Increase competency in CPH in both public and private sectors

- Thirteen mentoring visits were held in 22 districts to assist all PVUK staff to conduct farmer trainings, conduct stakeholder meetings, assist in farm investigations, and help develop local farmer groups;
- Held a TOT for Master Trainers for 11 participants (6 male, 5 female) to prepare the Master Trainers for training and mentoring in the Government of Indonesia-funded PVUK replication areas;
- Supported PVUK Levels 1, 2 and 3 training for 16 (6 male, 10 female) participants from eight districts in the Government of Indonesia-funded PVUK replication areas;
- Provided specialized training in humane euthanasia of poultry, including ducks, to 76 PVUK and government veterinarians;
- Conducted Continuing Education II training on vaccination skills for 44 (21 male 23 female) PVUK staff;
- Assisted PVUK to conducted six stakeholder meetings for 161 farmers (161 male, 19 female) to introduce the PVUK programme to poultry farmers;
- Developed two SOPs on cleaning feeders and drinkers, two on humane euthanasia of poultry, and three on vaccination skills; PVUK staff have been trained in their use;
- Assisted PVUK to conduct two farm outbreak investigations in Lampung and Central Java; and
- Provided technical support for PVUK to conduct two farmer trainings in Central Java for poultry associations.

B.4 Advocate for best practices for CPH.

- Conducted three Poultry Layer Farmers Seminars on Good Biosecurity Practices and Vaccination Strategy for 240 poultry layer farm owners and managers in Sukorejo and Solo, Central Java;
- Completed additional data analysis and composition of the Phase I report of the biosecurity

cost-effectiveness study and submitted them to the ECTAD-FAO Regional Office for Asia and the Pacific (RAP) Regional Economist for further input and revision;

- Conducted weekly farm visits and monthly feedback meetings with participating farmers to provide technical support and monitoring for proper implementation of the agreed biosecurity interventions;
- Assisted a CPH study with designing and implementing participating farmers' agreed biosecurity intervention plans;
- Initiated collection of the study's Phase II farm production and financial data. The production and financial data are required for the study to assess the cost-effectiveness and cost-benefit of biosecurity implementation in the participating farms;
- Designed, prepared, and conducted a poultry health information booth during the 2013 Indo Livestock Expo & Forum in Nusa Dua, Bali. More than 500 visitors were introduced to and received detailed information on simple profitable poultry farm biosecurity interventions and important vaccination guidance to protect poultry layer farms from clades 2.1.3 and 2.3.2.1 H5N1 HPAI viruses, and also promoted the ASUH (*Aman-Sehat-Utuh-Halal*: Safe-Healthy-Whole-Halal) chicken concept through the *ayam betutu* and *sate lilit* served in the booth;
- Designed, prepared, and conducted a National Poultry Farmers' Seminar following Indo Livestock Expo & Forum in Nusa Dua, Bali. One-hundred and twenty poultry layer farmers attended the seminar in which the six poultry layer farmers participating in the CPH biosecurity cost-effectiveness study shared their experiences and the benefits of the chicken layer farm best practices they have implemented;
- Designed, produced, and distributed 18-month 2013-2014 calendars filled with readily understandable information on proper vaccination and farm biosecurity that will be used by farmers and farm managers for further on-farm training;
- Conducted progress meeting of the Indo CPH biosecurity cost-effectiveness study in which CPH assisted to fine tuning the agreed biosecurity intervention implementation of each farm. Real-time technical support and facilitation of technical and economic data collection from all layer farms are still regularly provided;
- Completed the development of vaccination SOPs for all types of chicken production (broilers and layers) that will be used in PVUK Level 1-3 trainings and their various continuing education trainings, as well as in CPH trainings on proper vaccination techniques for Cold Chain Master Trainers and veterinary pharmaceutical companies vaccinators and vaccinator supervisors;
- Presented experiences in implementing the three-zones biosecurity concept in layer farms in Solo at the IPB *Dies Natalis* seminar on Zone-Based Poultry Farm Biosecurity in Bogor, in coordination with KKUN. A small working group was established to further discuss the possibility of including the concept in government regulation; and
- Provided technical assistance for the PVUK Continuing Education training in Bandung and Level-2 PVUK training in Bogor.

B.5 Conduct trials on private sector-funded compensation system.

- Continued one-on-one and group meetings with members of broiler farmer groups in the Bogor area to provide information and advocate for the introduction of a farmer-funded compensation system; and
- Worked with "nucleus" of the farmers group in the Bogor area to organize member "plasma" farmers to participate in the private sector-funded culling compensation pilot programme.

Output C: Reduced H5N1 virus at selected critical control points in the market chain through improved biosecurity practices by related stakeholders.

C.1 Improve the surveillance system along the post-production market chain and make it more cost-effective.

- Provided operational and technical support for monthly environmental surveillance of live bird markets (LBMs), as well as for additional market profiling in the greater Jakarta area. Preparations were made for additional testing and characterization of isolated H5 viruses at Bbalitvet;

- Conducted coordination meetings with market surveillance officers (PSPs) and related local livestock services in the greater Jakarta area for reviewing and updating LBM surveillance activities;
- Held a refresher training for LBM surveillance and profiling for PSPs in the greater Jakarta area and conducted training on profiling and surveillance for the initiation of LBM surveillance in Medan, North Sumatra, and Surabaya, East Java;
- Supported PSPs to conduct LBM profiling and surveillance in Surabaya and Medan and provided technical and operational support to the LBM surveillance activities. Data was collected from both the market and vendor level to allow back tracing of positive LBMs;
- Supported PSPs to conduct additional LBM sample collection in greater Jakarta, Medan and Surabaya for rapid H7N9 virus surveillance;
- Held coordination meeting on LBM environmental surveillance with the World Health Organization (WHO) and also with the Bbalitvet laboratory for collaboration activity on molecular characterization (sequencing) of isolates from LBMs in the greater Jakarta area; and
- Conducted monitoring visits in greater Jakarta, Surabaya and Medan and LBM surveillance sample testing at BKHI laboratory Jakarta, the Diagnostic Unit of FKH UNAIR Surabaya, Disease Investigation Centre (DIC) Medan, and DIC Wates respectively.

C.2 Improve biosecurity along post-production market chain

- Held cleaning and disinfection (C&D) refresher training and cleaning day events at two LBMs in the Jabodetabek area to strengthen the implementation of market C&D activities;
- Conducted quarterly monitoring and evaluation reviews of C&D implementation at 22 LBMs in Jabodetabek;
- Conducted coordination meetings with market managers and local authorities of two markets under rehabilitation in order to finalize the markets' rehabilitation designs;
- Commenced the construction and conducted site monitoring of the truck C&D station at the Semanggi native chicken collector yard in Surakarta, Central Java;
- Conducted introductory C&D training for cleaning workers and market managers, in addition to a TOT for local livestock services, in Surabaya, East Java with funding provided by the DAH;
- Provided technical support for trainers of local livestock services in the implementation of C&D refresher training for cleaning workers and market managers in Bekasi, West Java, with funding provided by Bekasi City Livestock Services;
- Finalized the market rehabilitation design and commenced the construction work at Baru Market in Bekasi City, West Java;
- Conducted site assessment and follow-up meetings at Leluwiliang Bogor Market, Koja Jakarta Market, Tugu Jakarta Market, Ramadani Tangerang Market and Family Bekasi Market, which were proposed as possible LBMs to be rehabilitated under the market rehabilitation plan;
- Conducted a quarterly monitoring and evaluation of C&D implementation at 22 pilot LBMs at Jabodetabek areas in September 2013;
- Completed the construction of a C&D station at Semanggi collector yard in Surakarta city;
- Conducted C&D introductory training for C&D station workers and staff from related local administrations at Semanggi collector yard Surakarta city; and
- Conducted socialization activities in collaboration with URC-PHMS DAH and Surakarta administration on C&D station activities in the market before starting operation for all poultry truck owners and drivers entering Semanggi collector yard.

C.3 Increase demand for healthy poultry end-product.

- No further activities planned; activities completed during Phase 1.

Output D: Improved biosecurity practices in backyard and commercial duck-raising.

D.1 Advocate for best practices in duck health management.

- No further activities planned; activities completed during Phase 1.

D.2 Implement duck epidemiological data analysis in low incidence areas in Indonesia to improve understanding of the reservoir role of ducks.

- No further activities planned; activities completed during previous reporting period.

Output E: Reduction of HPAI in poultry farms through widespread use of locally produced vaccines as appropriate based on local antigens and new strains monitored.

E.1 Promote use of effective vaccine by farmers.

- Conducted three Poultry Layer Farmers Seminars on Good Biosecurity Practices and Vaccination Strategy for 240 poultry layer farm owners and managers in Sukorejo and Solo, Central Java;
- Shared the most up-to-date vaccination recommendations for protecting against both clade 2.3.1 and 2.3.2.1 H5N1 viruses with over 600 farmers during the Indo Livestock Expo & Forum 2013 and the National Farmers' Seminar held in Nusa Dua Bali; and
- Designed and distributed 1 000 18 month 2013-2014 calendars containing specific key messages for effective poultry vaccination against H5N1 and began development of modified calendar and vaccination recommendations booklet for distribution during the 2013 ILDEX livestock exhibition and concurrent National Farmers' Seminar for Western Indonesia.

E.2 Establish partnership between commercial poultry industry and government for sharing of influenza virus data and isolates.

- Met with three local avian influenza vaccine producing companies during the 2013-14 FAO-Government of Indonesia-United States Agency for International Development (USAID) OSRO/INS/103/USA planning workshop and subsequent meetings to develop training a plan for their technical vaccination staff on vaccination biosecurity and proper vaccination techniques; and
- Facilitated DAH to enable receipt, testing and production of candidate reverse genetic vaccine strains from the United States Department of Agriculture's Southeast Poultry Research Laboratory (SEPR) under cooperative agreement between Pusvetma and IPB Shigetama.

E.3 Establish sustainable laboratory system for influenza virus monitoring.

- Drafted and secured technical clearance of the fourth FAO- Australian Animal Health Laboratory (AAHL) letter of agreement to be funded by the IDENTIFY Indonesia project;
- Developed the Influenza Virus Monitoring (IVM) *Alat Preskrin* and *Alat Skrin Lengkap* (IVM Online) software under the FAO-AAHL letter of agreement and compiled a subset of H5N1 isolates with complete antigenic and genetic data for advanced bioinformatics analysis (30 50 isolates);
- In consultation with AAHL, prepared a list of pre-screening and screening reagents to be procured for IVM participant laboratories under the IDENTIFY project;
- Delivered reference reagents for quantitative reverse transcription - polymerase chain reaction (qRT-PCR), including primers/probes, positive and negative controls for both H7 and N9 genes, for a minimum of 8 000 tests, along with the suggested diagnostic protocols developed by FAO-RAP and AAHL to Indonesia; reference reagents prepared and maintained at the DKI Jakarta category B animal health laboratory (BKHI) were made available to 10 laboratories within the network;
- Provided conventional PCR H7N9 primers, test protocols and control reagents to the Faculty of Veterinary Science laboratory, Airlangga University, DIC Wates, and the BKHI laboratory Jakarta;
- Delivered reference reagents for qRT-PCR including primers/probes, positive and negative controls for H5N1 clade 2.3.2.1 for a minimum of 4 000 tests, along with the suggested diagnostic protocols to DIC Wates, the BKHI laboratory, and DIC Subang;
- Facilitated laboratory networking at national and regional level through participation in the Four-Way Linking Workshop held in Bali, with participation from virology laboratory and epidemiology staff from both animal and human health sectors; and
- Facilitated participation in regional training events, including two participants from DIC Bukittinggi and DIC Denpasar and two participants from Banten and West Sumatra Provincial Animal Health Services for Training on Laboratory-Epidemiology linkage. Two participants from DIC Bukittinggi and Pusvetma participated in Training on Applied Veterinary Bioinformatics.

Output F: Strengthened veterinary services at central, provincial, and district levels with increased commitment from related stakeholders.

F.1 Pilot NVS in three provinces for selected priority diseases.

- Conducted technical mentoring visits for 26 NVS officers in Dumai and Agam districts to support development of NVS competencies;
- Held NVS level three training for 42 participants in the pilot NVS districts. The training reinforced earlier trainings on control of HPAI and rabies and introduced brucellosis control (Dumai and Agam), Jembrana disease control (Dumai and Klungkung), classical swine fever control (Klungkung), and control of blood borne parasites in cattle (Agam) were covered as part of the broad veterinary service strengthening approach of the NVS programme. All training included participation by senior staff from the district, province and DIC;
- Held five advocacy visits on the establishment of the Veterinary Authority; reviewed the implementation of NVS in the field in relation to Veterinary Authority issues; and discussed animal disease surveillance and response funding support for 2014 with livestock services of West Sumatra Province and Agam District, Riau Province and Dumai City, and Klungkung District in Bali Province;
- Visited the Australian Department of Agriculture, Fisheries and Forestry (DAFF) project in Sulawesi to observe the SMS gateway training for syndromic surveillance with a view of including the training in the NVS pilots;
- Involvement of West Sumatra Provincial Livestock Services in the planning of activities resulted in decisions on replication of NVS to all districts in West Sumatra during the next project phase and agreement on cost-sharing between DAH, province, districts, and FAO;
- Continued participation in the preparation process of NVS Guidelines led by DAH; and
- Facilitated regular communication with Provincial Livestock Services of West Sumatra on the harmonization of Local Government funded and FAO funded activities on the replication of NVS to other districts within West Sumatra.

F.2 Ensure effective programme management with respect to finance, administration, technical inputs, and partner relations (donor and Government of Indonesia)

- Continued active participation in all monthly USAID Chief of Party meetings, as well as coordination meetings with other partners, including Komnas Zoonosis, the DAFF Australia Indonesia Partnership for Emerging Infectious Diseases (AIP-EID), and WHO;
- Continued facilitating weekly coordination meetings with both URC and the DAH, in order to synchronize project activities and challenges and minimize risks of delays and constraints to project implementation;
- Prepared project progress reports in accordance with the project document and local agreement with USAID Indonesia;
- Continued monitoring of project activities as per workplan and budget. Activities are carried out based on a continuously updated workplan and budget in order to keep track of activity implementation and expenditures and ensure proper funds allocation for the implementation of all activities;
- Continued preparation and submission to project management of updated financial reports at activity level in order to allow for the timely re-adjustment of activities and budgets; and
- Continued operational support to the project in order to minimize delays and ensure timely delivery of project inputs for successful implementation of project activities.

F.3 Ensure appropriate support to programme components and management to maximize stakeholder participation and build capacity of animal health services.

- Continued technical support and management supervision for the various components of the ECTAD Indonesia programme. During this reporting period additional emphasis was placed on ensuring an effective project planning process with related public and private sector stakeholders for the next project phase despite many stakeholders being fully engaged in implementing activities required for successful completion of the current project phase;
- Dealt with administrative issues in a timely fashion, such as travel arrangements, staff recruitment, procurement and service contracts to allow for the smooth implementation of project activities during the reporting period;

- Dealt with financial transactions in a timely manner, such as budget authorizations and petty cash for trainings, which allowed for the effective implementation of project activities; and
- Carried out workplan and budget reviews and updates at activity and output (project component) levels to improve resource allocation and monitoring and to assure appropriate availability of resources for the implementation of activities.

F.4 Conduct epidemiological studies to better inform disease control and support government strategic planning.

- Initiated the planned evaluation of the influenza A rapid antigen test was; however, field testing has not been conducted yet because no outbreaks in ducks have occurred within the study area. The evaluation will be continued in the next project phase; and
- Initiated study design planning for testing control strategies for reducing the risk of native chicken transport from Central Java as well as to better elucidate the viral amplification process along the extended market chain. The study may also be adapted to include the assessment of the risk factors for viral contamination within the greater Jakarta area.

F.5 Provide technical support to DAH for HPAI policy development.

- Provided technical recommendations to the DAH on vaccination policy in light of the continued circulation of clade 2.3.2.1 and 2.1.3 viruses, including specifically the recommendation to update the vaccine registration regulations and to consider the approval of multivalent vaccines from Indonesian vaccine manufacturers, as well as advising against monovalent 2.3.2.1 vaccine production for use in chickens;
- Held a week-long workshop in outbreak investigation and control to increase the response capacity of Government officers at central and provincial levels; and
- Held a three-day workshop on decision making in outbreaks and contingency planning with representatives of all sub-Directorates of Animal Health as well as the National Quarantine Service to initiate a process of contingency planning for outbreaks of exotic or new animal diseases.

F.6 Contribute to the Komnas Zoonosis One Health communication and advocacy strategy.

No further activities planned, activities completed during Phase I.

Planned activities for the next six-month period (October 2013 to March 2014)

Output A: Increased empowerment of village residents in biosecurity and HPAI prevention and control through an expansion of a government-funded, streamlined PDSR system.

A.1 Distribute and use communication materials to support HPAI prevention and control activities.

- Support the PDSR programme in the development and production of success stories from officers in the field. The stories will be disseminated to PDSR officers through multiple channels, including social media.
- Revise the design of information, education and communication (IEC) brochure on HPAI control in villages and conduct field testing.
- Design funhouse-inspired activity booth for use by the CPH team at the 2013 ILDEX livestock exposition. Visitors will actively participate in the funhouse to gain practical experience in the three-zone biosecurity concept and gentle vaccination technique advocated by FAO.
- Develop 16-month and 12-month versions of the CPH calendar for distribution to farmers at ILDEX and to private sector technical staff and PVUK officers during trainings which will be conducted during the next reporting period.
- In close collaboration with the local government team, develop first set of IEC materials specifically for support of the NVS pilot programme.

A.2 Revise and streamline PDSR system to incorporate more community-based decision-making for improved HPAI prevention and control.

- Stimulate officers within the PDSR programme by the development, collection and dissemination of PDSR success stories. A competition will be held for the best stories and photographs. Success stories will be subsequently disseminated via social networking and LDCCs.
- Finalize condensed curriculums and modules for Introductory and Continuing Education and

disseminate revised training material to Master Trainers.

- Hold National LDCC Coordination Meeting in November 2013.
- Conduct TOTs for 50 Master Trainers on new skills for PDSR, after which the Master Trainers will conduct refresher trainings for PDSR officers in their areas.
- Facilitate training of at least 40 new PDSR officers with funding provided by local government budget in Indramayu District and Padang LDCC, and conduct mentoring after the new PDSR officers have worked for three months.
- Coordinate with Local Government Advocacy and Monitoring and Evaluation teams on their activities for increasing local government resource allocation, strengthening local government data management systems, and monitoring field reporting to determine if progress is being made in improving the timeliness and consistency of PDSR reporting and data entry.

A.3 Provide LDCC/PDSR operational budget by local government.

- Facilitate meetings with central Government to develop national technical guidelines for local governments in the use and proposal of central budget (APBN Dekon) for HPAI control activities.
- Conduct a meeting with DAH in order to identify existing budget structure and needs in targeted provinces.
- Conduct a national consultation meeting with central and local governments to share the lessons learned and success stories from selected provinces on their approaches to achieving targeted budget allocations.
- Disseminate information on the national technical guidelines on use and proposal of central government budget (APBN Dekon) to targeted provinces.
- Participate in and observe the fiscal year 2015 budget allocation process, including allocation of local government data encoders in regular coordination meetings (with district governments) conducted by selected provincial governments.
- Conduct field visit to eight targeted provinces to ensure the budget allocation and programme implementation in fiscal year 2014 and fiscal year 2015.

A.4 Extend PDSR database system to district level for improved local disease control management.

- Provide funding and technical support for remaining district data encoder training programmes in provinces where URC has determined sufficient levels of capability are in place.
- Conduct assessments of district-level use of data for planning and programme management.
- Provide capacity building training for district data encoders in the use of database outputs for reporting and analysis.
- Conduct refresher training for provincial data encoders in use of the PDSR V3 database.

Output B: Reduced HPAI-infected poultry from commercial farms through improved cooperation among all stakeholders.

B.1 Establish effective communication and coordination between government and commercial poultry industry in order to build trust among the stakeholders.

- Conduct and support KKUN with regular meetings and its related working group meetings, including the piloting of a Grand Rounds session to bring together both public and private sector poultry veterinarians to discuss challenging field cases.
- Collaborate with commercial poultry industry representatives to participate in the 2013 ILDEX Indonesia Expo in Jakarta and integrate the FAO-MOA National Farmers' Seminar within ILDEX in order to enable the participation of a greater number of farmers in the seminar.
- Continue to facilitate local government collaboration with the poultry industry in their areas through the activities of PVUK-trained government veterinarians to hold farmer meetings and to establish collaborations with local poultry associations.
- Establish and implement vaccination and biosecurity training programmes for technical service providers, vaccinators, and vaccinator supervisors with multiple vaccine and poultry companies servicing the commercial poultry industry.

B.2 Establish a confidential database of outbreak information from commercial farms.

- HPAI outbreak reporting has been integrated within the PVUK database and reporting system; no further activities planned.

B.3 Increase competency in CPH in both public and private sectors.

- Conduct ongoing technical mentoring for all 72 active PVUK officers on farmer training, farm evaluation, and on-farm disease investigation.
- Update PVUK approaches to farm evaluation and farmer training based on latest findings and best practices identified by the CPH programme and also facilitate establishment of closer working relationships between PVUK and CPH activities in locations where both programmes are active.
- Initiate project-funded sample submission for suspected HPAI or Newcastle disease outbreaks and post-vaccination sero-surveillance as a means of improving government capacity to detect outbreaks on commercial poultry farms by increasing farmers' willingness to report disease events.
- Conduct Continuing Education II trainings on vaccination for PVUK officers in government expansion areas.
- Develop Continuing Education III training based on needs arising from PVUK officers and farmers.
- Plan project-funded PVUK expansion in three districts of South Sulawesi and to expand the PVUK programme to eight additional districts via central government funding sources.
- Hold PVUK TOT for Master Trainers to increase the number PVUK Master Trainers and to strengthen their training and technical competencies.
- Conduct initial meetings with stakeholders for brainstorming and subsequent consensus-building on a proposed national poultry health programme.
- Develop and field test simplified reporting PVUK formats as a means of reducing reporting burden and increasing reporting frequency.

B.4 Advocate for best practices for CPH.

- Continue Phase 2 of the CPH biosecurity cost-effectiveness study in Central Java, including regular collection of technical and economical data from participating layer farms and control layer farms.
- Develop and field test training modules on vaccination to be used in trainings for private veterinary company vaccinators and vaccinator coordinators.
- Initiate training of vaccinator coordinators and training of vaccinators of private veterinary companies including Medion, Caprifarmindo, Vaksindo, Kalbe Farma, and JAPFA Comfeed.
- Perform basic quality testing of avian influenza vaccines currently produced and sold in Indonesia.
- Design, build, and present new "funhouse" inspired activity booth at the 2013 ILDEX Indonesian livestock expo focused on providing participants with practical experience in the three-zone biosecurity concept and gentle vaccination technique advocated by FAO.

B.5 Conduct trials on private sector-funded compensation system.

- Conduct workshop with participating farmers to plan financial contribution component of private sector-funded culling compensation pilot.
- Collaborate with PVUK officers in Bogor District on the technical implementation of the private sector-funded culling compensation pilot, including diagnosis and subsequent culling in the event of an HPAI outbreak.
- Continue to work with the nucleus of the farmers group to organize plasma farmers participating in the pilot programme.

Output C: Reduced H5N1 virus at selected critical control points in the market chain through improved biosecurity practices by related stakeholders.

C.1 Improve the surveillance system along the post-production market chain and make it more cost-effective.

- Continue providing technical and operational support to the LBM surveillance activity in greater Jakarta, East Java and North Sumatra.

- Analyse collected LBM surveillance and profiling data from the three urban centres and evaluate the potential for using the data to increase risk-based surveillance and backtracing.
- Conduct coordination meetings with PSPs and related local livestock services in East Java and North Sumatra for reviewing LBM surveillance activities and LBM profiling results.
- Continue monitoring for greater Jakarta, Surabaya and Medan LBM surveillance sample testing at BKHI laboratory Jakarta, the Diagnostic Unit of FKH UNAIR Surabaya, DIC Medan and DIC Wates respectively.
- Conduct monitoring visit to Bbalivet for laboratory sequencing testing of LBM isolates and hold coordination meeting with WHO to review LBM environmental surveillance activities in the greater Jakarta area.
- Provide technical and operational support for laboratory testing for real-time PCR testing for subelade 2.3.2.1 virus from greater Jakarta LBM samples tested at DIC Subang.

C.2 Improve biosecurity along post-production market chain.

- Supervise and monitor the construction work for rehabilitation of the Baru Bekasi LBM in West Java to ensure timely and quality completion of the required construction activities.
- Conduct a handover ceremony to handover the rehabilitated market to local authority and conduct C&D introductory training for vendors and cleaning workers at Baru Bekasi Market.
- Conduct minor rehabilitation improvements at Ramadani LBM in Tangerang City to improve sanitary and hygienic conditions within in the market.
- Procure and distribute metal cages to replace bamboo cages at selected traditional markets.
- Conduct refresher training as well as monitoring and evaluation of C&D activities at the C&D station in Semanggi collector yard in Surakarta city and Baru market in Bekasi City.
- Prepare a draft proposal for generating novel surveillance and risk reduction strategies to improve detection of rare viruses and reduce the health risks of poultry marketing within Jakarta.

C.3 Increase demand for healthy poultry end-product.

- No further activities planned; activities completed during Phase 1.

Output D: Improved biosecurity practices in backyard and commercial duck-raising.

D.1 Advocate for best practices in duck health management.

- No further activities planned; activities completed during Phase 1.

D.2 Implement duck epidemiological data analysis in low incidence areas in Indonesia to improve understanding of the reservoir role of ducks.

- No further activities planned; activities completed during previous reporting period.

Output E: Reduction of HPAI in poultry farms through widespread use of locally produced vaccines as appropriate based on local antigens and new strains monitored.

E.1 Promote use of effective vaccine by farmers.

- Finalize design of trainings in best vaccination practices for vaccinators and supervisors of vaccinators within the three Indonesian vaccination production companies and initiate trainings.
- Develop specialized training programme which includes training in vaccination theory, vaccination schedules, and vaccination practices for 'technical service' veterinarians within collaborating poultry industry companies.
- Finalize revision of vaccination module for use in PVUK refresher trainings, and by Government of Indonesia cold chain Master Trainers, and private sector veterinarians.
- Develop a 12-month CPH calendar to include messages of optimum vaccination scheduling, vaccine selection, and vaccination technique.
- Share advice on vaccination with poultry farmers during the 2013 ILDEX livestock expo and accompanying National Farmers' Seminar in Jakarta.
- Share farmer opinions and experiences with vaccination against avian influenza during the OIE (World Organization for Animal Health)/FAO Network of expertise on animal influenza (OFFLU) Technical Meeting on avian influenza vaccination.

E.2 Establish partnership between commercial poultry industry and government for sharing of influenza virus data and isolates.

- Continue to support collaboration between government stakeholders and FAO ECTAD Indonesia with poultry industry representatives, farmers, technical service staff, vaccinators, and vaccinators coordinators through the variety of activities implemented by the project to support avian influenza control in the commercial poultry industry.
- Facilitate technical meeting on HPAI strain information sharing between private sector laboratories and government.
- Assist to organize and facilitate meeting with DAH and stakeholders to discuss government review and revision of AI vaccine registration policy and procedures.

E.3 Establish sustainable laboratory system for influenza virus monitoring

- Conduct refresher training course for laboratory staff on performance of quality control of PCR at DIC Subang.
- Launch IVM Online website and reporting system in Jakarta and conduct next IVM coordination meeting in early 2014.
- Prepare government laboratory training programme for application of PREDICT viral detection tools to Indonesian livestock samples in collaboration with PREDICT and DIC laboratories.

Output F: Strengthened veterinary services at central, provincial, and district levels with increased commitment from related stakeholders.

F.1 Pilot NVS in 3 provinces for selected priority diseases.

- Provide training and technical support to extend the NVS programme to 83 additional local government officers in 18 more districts in West Sumatra Province via a cost-sharing funding arrangement with local government.
- Condense the NVS curriculum to two levels of training and provide technical support to NVS Master Trainers to implement the revised training curriculum.
- Hold a local government workshop in West Sumatra to introduce the NVS programme to the new districts and then provide PDSR V3 training to 20 Puskesmas staff that have not yet been trained in PDSR.
- Provide regularly scheduled technical mentoring support to both NVS pilot areas and expansion areas.
- Develop Continuing Education training based on identified needs and competency gaps to support further development of the NVS pilot.
- Test the SMS gateway developed by the DAFF EID project for syndromic surveillance and for engaging village cadres in NVS pilot districts.
- Develop IEC materials specifically for the NVS programme.
- Train and support NVS Master Trainers to manage and implement the training and mentoring programme for the expansion of NVS across West Sumatra.
- Advocate DAH to finalize NVS Guidelines in line with Law No. 18 of 2009.
- Conduct advocacy visits to Provincial and District Livestock Services of West Sumatra, Riau, and Bali pilot provinces to encourage further progress on the establishment of Veterinary Authority and Authorized Veterinarian in line with Law No. 18 2009.

F.2 Ensure effective programme management with respect to finance, administration, technical inputs, and partner relations (donor and the Government of Indonesia).

- Continue facilitation of weekly coordination meetings with both URC and the Director of DAH.
- Continue preparation of project progress reports in accordance with the project document and local agreement with USAID Indonesia.
- Continue participating at the USAID Chief of Party meeting, in coordination with Komnas Zoonosis and WHO.
- Review the overall workplan of the project in consideration of the approval of Phase III and finalise the operational budget and share with project management and technical teams.
- Continue the implementation of necessary operational actions to ensure the timely delivery of project inputs to enable successful implementation of activities.

F.3 Ensure appropriate support to programme components and management to maximize stakeholder participation and build capacity of animal health services.

- Provide support and management supervision on a regular basis to the various components of the ECTAD Indonesia programme.
- Continue dealing with all administrative issues in a timely fashion, such as travel arrangements, recruitments, procurement and service contracts to allow for the smooth implementation of project activities.
- Ensure the proper and timely dealing of financial transactions, such as budget authorizations and petty cash for trainings, to allow smooth implementation of project activities.
- Prepare provisional operational budgets for all the project components to improve resource allocation and monitoring and revise periodically in order to assure appropriate availability of resources for the implementation of the activities.

F.4 Conduct epidemiological studies to better inform disease control and support government strategic planning.

- Evaluate factors which may impact on H5N1 endemicity in Indonesia and means of reducing amplification along long-distance poultry market chains.
- Finalize study design and initiate research plan for native chicken market chain and urban risk factor study.
- Provide training in outbreak investigation and epidemiology-laboratory linking in collaboration with DIC laboratories.

F.5 Provide technical support to DAH for HPAI policy development.

- Explore more effective means of addressing the current shortcomings with DAH policies on master seeds for avian influenza vaccine and on the restriction of multivalent vaccines, including engagement on these topics with global experts at OFFLU Technical Meeting on avian influenza vaccination.

F.6 Contribute to the Komnas Zoonosis One Health communication and advocacy strategy.

- No further activities planned, activities completed during Phase 1.

Main challenges encountered and response provided

The most significant project implementation challenge encountered during this reporting period was the transition of the FAO operational management system to the Global Resource Management System (GRMS). The transition period, which also included shifting of project oversight responsibilities to the country level, resulted in intermittent delays in implementation of some planned activities. However, through a concerted effort between country, regional, and global offices, delays were self-limiting and sustainable solutions were found for each of the GRMS challenges encountered.

In relation to technical challenges, difficulties continued to be experienced in the Government of Indonesia's reluctance to update AI vaccination policy following the introduction of clade 2.3.2.1 H5N1 in mid-2012. ECTAD Indonesia responded to this issue by providing specific technical advice to the URC-PHMS and the Director of Animal Health in response to each concern raised regarding the safety and efficacy of a combined clade 2.1.3 and 2.3.2.1 vaccine. In addition, the Indonesia programme sought further advice from OFFLU Chairperson for Vaccine and Vaccine Technology, who submitted two technical letters to ECTAD Indonesia and DAH regarding the safety, use, and benefits of bivalent AI vaccines. Despite providing sufficient technical justification, the DAH has still not appropriately updated its vaccine policy, nor approved any bivalent AI vaccines. Further sustained effort in this area is required over the next reporting period.

Regarding financial constraints, reporting of disease detection and control activities by local government field officers trained in PDSR decreased during the reporting period. This was a result of the gap in operational funding for field activities and data encoding following cessation of operational funding via the OSRO/INS/103/USA project at the end of 2012. Building upon the local government advocacy initiative previously reported, ECTAD Indonesia worked closely with local and central government representatives to develop an enhanced budget advocacy approach

which integrates the active advocacy directly with local government decision-makers with the development of national animal disease control budgeting guidelines and sharing of budgeting best practices and success stories between local governments. Advocacy activities implemented during the reporting period increased local government budget for HPAI surveillance and control activities by 79% compared to funding levels before advocacy activities were initiated. Transition to PDSR V3 and district-level data management should further ease the financial and human resource burden on local governments. Efforts are also underway with DAFF to integrate HPAI outbreak reporting within a national SMS-based animal disease surveillance system currently under development, which may also further alleviate the data entry burden at local level in the future.

Main progress made towards the achievement of project outcomes (from the start of the current project phase).

Output A: Increased empowerment of village residents in biosecurity and HPAI prevention and control through an expansion of a government-funded, streamlined PDSR system.

- During the 2012-2013 project period, 1 523 PDSR officers have been trained in PDSR V3 and a total of 1 946 PDSR officers from 30 provinces are able to use PDSR V3.
- The database has been modified to utilize simplified data forms. PDSR officers are now networking with the community, community leaders and village poultry farmers to explain the need for HPAI reporting.
- Reporting levels have dropped; although field work is still being conducted, the reports are not being entered into the national database owing to financial and human resource constraints for data management at the provincial level. Only 896 passive networking reports were entered into the database as compared with 1 900 reports in the previous six month period.
- Fifty-three village HPAI outbreaks were identified and controlled by PDSR during the reporting period.
- PDSR have identified outbreaks of HPAI clade 2.3.2.1 H5N1 in duck farms and have been able to explain the new clade to the community and to colleagues in the local government, thereby helping to reduce fear and misunderstandings. SOPs for humane euthanasia, developed by FAO and following OIE guidelines, have assisted in outbreak control.
- The technical capacity of local government staff in 24 LDCCs has increased on the use of the enhanced PDSR V3 information system for data analysis and reporting. Twenty-five provincial DEs from 24 of 32 LDCCs have been trained using PDSR V3. Currently, 20 LDCCs are using PDSR V3. However, despite the trainings provided and the ongoing field activities by PDSR, data entry and management has decreased substantially as a result of limited financial support for LDCC activities at the provincial level.
- Central government and 13 provincial governments targeted in advocacy activities have supported animal disease control activities by allocating additional government budget in 2013 and 2014. However, nationwide, the level of support varies depending on their financial situation and political commitment.
- Central government, local governments, and relevant government institutions have raised their level of awareness and coordination concerning the proper allocation of budget for animal health issues.
- The central government, through the DGLAHS, committed to follow up the inputs obtained from the local government advocacy conducted by FAO and DAH by establishing a team who will develop guidance for the utilization of the central Government budget distributed to each province.

Output B: Reduced HPAI-infected poultry from commercial farms through improved cooperation among all stakeholders.

- Improved understanding of the commercial poultry sector as a result of profiling 4 000 farms in the PVUK expansion areas. Profiling information is available to the DLS for decision-making.
- Following the Master Trainer TOT, Master Trainers had the confidence and skills to pass on clear information on HPAI clade 2.3.2.1. They conducted one interactive radio programme, one TV programme, 11 coordination meetings for 276 local government staff (191 male, 85 female), and 15 farmer and community meetings for 224 participants (183 male, 41 female).
- The PVUK programme has increased trust between local government animal health services

and commercial poultry farmers. PVUK officers continue to conduct farmer trainings and farm visits. A noticeable change has been seen in the attitude of poultry farmers who now contact PVUK officers to book trainings, request assistance with farm hygiene and vaccination, and request PVUK to assist with problem solving. In total, PVUK have carried out 34 farmer trainings for 772 participants (620 male, 172 female) and eight farmer trainings have been requested and funded by farmer groups.

- There has been a noticeable change in behaviour with farmers following good vaccine cold chain management, improved farm biosecurity, including movement control, and improved farm hygiene. In the reporting period, 591 farm visits were conducted and during these visits, 190 farmers have changed their behaviour, indicating that 32 percent of farm visits appear to be contributing to farmer behaviour change. Once a monitoring visit has taken place, over 50 percent of farmers have fully complied with the PVUK recommendations.
- PVUK have successfully conducted 80 problem investigations using the SOAP (subjective, objective, assessment, and plan) diagnostic and treatment planning method.
- Best practices in poultry vaccination and farm management have been identified via the CPH biosecurity cost-effectiveness study and have been subsequently incorporated to the training modules, advocacy materials, and academic outreach activities related to CPH. The biosecurity intervention phase of the study is now underway in order to evaluate the cost-effectiveness of specific biosecurity practices.
- Layer farmers in high-risk production areas have adopted best practices as identified via the CPH programme, and as disseminated via the PVUK programme and CPH outreach activities. Farmers have improved biosecurity through building fences, locked gates, displaying no entry signs and changing footwear when entering a shed. Others have improved cold storage for vaccines and have improved their vaccination scheduling and vaccination technique to increase vaccination compliance during the egg production period.
- Since project inception, 74 farmers groups (for chicken, duck and quail farmers) have been formed for on-farm training and to develop biosecurity plans for the farms. These groups will improve biosecurity measures in the members and encourage better disease reporting.

Output C: Reduced H5N1 virus at selected critical control points in the market chain through improved biosecurity practices by related stakeholders.

- There has been a significant increase in the understanding of controlling H5N1 in Indonesia and H5N1 epidemiology in general as a result of using specially-designed market surveillance tools, such as regularly scheduled environmental surveillance of LBMs and targeted surveillance at collector yards and along the market chain.
- Viruses originating from the commercial industry have been detected and can be further isolated for antigenic and genetic characterization, with specific isolates potentially serving as vaccine master seeds in the future.
- Lessons learned from the LBM environmental surveillance system have been incorporated into the global surveillance recommendations for detection of the novel H7N9 virus.
- There has been more cleaning and disinfection activities and awareness of the importance of maintaining cleanliness in selected markets in the greater Jakarta area that have been trained by FAO in collaboration with local governments. This has provided a considerable impact both in terms of the level of cleanliness of the markets' environment and the participation of traders and market managers.
- Central and local governments have allocated funds for the sustainability of market cleaning and disinfection activities through support on C&D training for markets that had not received the training previously.
- The cleanliness of the markets that are implementing cleaning and disinfection activities has improved.

Output D: Improved biosecurity practices in backyard and commercial duck-raising.

- The understanding of the relatively limited role played by ducks in the persistence of clade 2.1.3 virus has increased as a result of the successful implementation of the Lombok duck study.

Output E: Reduction of HPAI in poultry farms through widespread use of locally produced vaccines as appropriate based on local antigens and new strains monitored.

- The commercial poultry farming community has been provided with examples of commercial layer farms that are successfully using local strain HPAI vaccines with a specific vaccination regime that yields excellent protection for the flock against H5N1.
- There has been an overall reduction in H5N1 virus detection since 2009, correlated with an increase in the use of local strain vaccines supported by laboratory-based vaccine research, evaluated on the farm by the CPH programme, and advocated to farmers via the PVUK and CPH outreach programmes. Of note is the recent increase in virus detection following introduction of clade 2.3.2.1 virus. Vaccine policy, and likewise vaccine formation, will need to adapt in order to prevent infection from both clades, and thereby contribute to further reduction in viral load going forward.

Output F: Strengthened veterinary services at central, provincial, and district levels with increased commitment from related stakeholders.

- Since the NVS started working in early 2013, 3 306 activity reports have been received, the majority of which are passive surveillance reports. From April to September 2013, reports have been received from the pilot districts of Agam and Dumai, although less activity has been observed in Klungkung district.
- Agam and Dumai Districts have carried out 565 syndromic surveillance activities (covering dogs, poultry, cattle, goats and monkeys) and 659 networking meetings.
- The importance of human health and livestock health working together has been recognized at the local government level as a result of the NVS pilot programme. For rabies control activities, 137 rapid responses to bite cases were investigated, with three samples submitted and one found positive for rabies. Emergency vaccination was conducted around the positive case in order to reduce further spread. In total, 47 coordination activities between livestock and human health, in response to bite cases, has continued to improve communication between human and animal health counterparts.
- Rabies vaccination has been conducted in all pilot districts with 1 020, 4 000 and 5 580 dogs vaccinated in Agam, Dumai and Klungkung respectively in the last six months. The NVS information system, including database designed for district-level data entry, has been successfully deployed in NVS pilot areas.
- The close involvement of the West Sumatera Provincial Livestock Services in the planning process for the next project phase, and agreements on cost-sharing between DAH, resulted in the decision to scale up the NVS to all districts in West Sumatera districts.
- There has been an overall marked improvement in HPAI control in poultry in Indonesia since inception of the ECTAD Indonesia programme.
- There has been effective detection and identification via the field rapid response and laboratory networks of the clade 2.3.2.1 H5N1 virus, newly introduced into Indonesia in mid-2012.

Quarter III 2010

Project Monitoring Sheet: OSRO/RLA/901/USA

Reporting period: July - September 2010

Regional Component: Latin America and the Caribbean
--

Project Title: Strengthening regional capacity for surveillance of Influenza A H1N1 virus and other subtypes of swine flu in pig populations in Central America and other countries in Latin America

Code: OSRO/RLA/901/USA

Budget:	USD 700 000
----------------	-------------

Effective Starting Date:	28 July 2009
---------------------------------	--------------

Planned End Date:	31 December 2010
--------------------------	------------------

Context of the Project:

Pandemic H1N1 2009 has been reported in animals (pigs and turkeys) in several countries, including Argentina, Canada, Chile and the United States on the American continent, raising the concern of the international community. Pigs can harbour influenza viruses of both avian and mammalian origin and act as "mixing vessels" in which the re-assortment of human, swine influenza (SI) and avian influenza (AI) virus may occur, producing a virus capable of human-to-human transmission leading to human pandemics.

Studies in the developed countries have shown that various subtypes (H1N1, H3N2 and H1N2) co-circulate in pig populations in those countries. However, it is still unknown whether these subtypes are also widespread in swine populations in Central America and the neighbouring countries because of the lack of appropriate monitoring and surveillance networks for SI.

Objectives of the Project:

The project aims at strengthening the surveillance capacities of the affected countries, or the countries at risk, to deal with Influenza A/H1N1, other influenza viruses and other transboundary animal diseases (TADs) in Central America and neighbouring countries.

Specifically, the project will improve the knowledge of the epidemiology and ecology of Influenza type A viruses in swine populations in the target countries.

Planned activities for the reporting period:

Output 1: The ECTAD Decentralized Coordination Unit (DCU) for Central America is established and operational.

Activity 1.4: Provision of services to the Central American and neighboring countries.

The Emergency Center for Transboundary Animal Diseases Operations (ECTAD) Decentralized Coordination Unit (DCU) in Panama has been responsible for continuing the backstopping of the veterinary services of the beneficiary countries and reinforcing the regional epidemio-surveillance network in order to improve communication and the exchange of information on TADs and other respiratory diseases in swine populations, as well as to provide special support to countries facing outbreaks, if needed. Activities are conducted in close coordination with other organizations, such as Organismo Internacional Regional de Sanidad Agropecuaria (OIRSA) and Pan American Health Organization (PAHO).

Output 2: Surveillance activities implemented and the extent and intensity of possible influenza viruses type A in circulation better understood and a proposal for contingency plans prepared.

Activity 2.1: Signing of Letter of Agreement (LoA) with a research institution for field investigation/training.

Upon finalization of the review and approval process by the counterpart, an agreement was signed with the National Veterinary Services Laboratory (NVSL) in Ames, USA. This institution provided diagnostic training in the Vesicular Disease Diagnostic Laboratory (LADIVES) located in Panama City, Panama, for three lab experts and will train a LADIVES staff on virus sequencing as well as will act as a reference laboratory for

25 samples of positive cases detected in LADIVES.

Activity 2.3: Training and conducting of field investigations and finalization of the guidelines.

Field investigations are carried out in beneficiary countries and up to 500 samples (per country) of suspected swine populations are collected and sent to LADIVES for real time – polymerase chain reaction (RT-PCR) diagnosis. Required field equipment and shipping costs is covered by the project.

Activity 2.5: Awareness raising and reporting of respiratory cases.

National workshops aimed at raising awareness and reporting of suspected cases in pigs are carried out with support of OIRSA, according to the methodology provided to the participants of the regional workshop on communication held in Panama in May 2010. FAO provides assistance and follow up to these activities.

Output 3: National animal health information systems to collect, process and analyse data from surveillance activities reinforced.

Activity 3.1: Procurement and distribution of equipment and software.

Two desktop computers are distributed to veterinary services in Guatemala, San Salvador, Honduras, Belize, the Dominican Republic and Panama to strengthen their capacity to process animal health-related information and to install TADInfo software.

Activity 3.2: Revision and updates of national animal health information systems used by countries (provided by FAO).

Customization of TADInfo maps for Belize, El Salvador, Guatemala and Honduras is finalized. A one-week regional workshop on TADInfo is carried out in August 2010 to train the key staff in the installation and use of this tailor-made software.

Output 4: Laboratory diagnostic capacities reinforced and network established between national laboratories and international reference laboratories.

Activity 4.2: Procurement and distribution of laboratory equipment and supplies.

Over 100 items are distributed to beneficiary countries, especially those that will carry out RT-PCR diagnostic (Costa Rica, Guatemala and Panama). In addition, LADIVES in Panama receives equipment (including a second block for PCR) in order to be able to process samples from other beneficiary countries and act as a project regional laboratory.

Activity 4.3: Signing of a Letter of Agreement (LoA) with a specialized laboratory.

Upon signature of the agreement with NVSL (see activity 2.1), an agreement is signed with LADIVES. Under the agreement, this Panamanian laboratory is to process up to 3 000 samples of suspected swine populations from Belize, El Salvador, Honduras, Nicaragua, Panama and the Dominican Republic.

Activity 4.4: Training of personnel working in animal health diagnostic laboratories at national level.

Under the framework of the agreement with NVSL and LADIVES, laboratory staff from Panama, Guatemala and Honduras are trained on RT-PCR diagnostic and sequencing according to the protocol developed by NVSL.

Activity 4.6: Transport of samples to international reference laboratories for analysis, sequencing and molecular epidemiological analysis.

An agreement with an international carrier is reached to enable national veterinary services to ship samples of suspected swine to LADIVES for RT-PCR diagnosis. Up to 25 of those samples diagnosed positively are forwarded to NVSL for confirmation, sequencing and quality control.

Output 5: Early detection and notification of A/H1N1/2009.

Activity 5.1: Support national services and organizations in education and communication and reporting of respiratory cases in pigs.

FAO provides assistance and follow up to the national workshops aimed at raising awareness and promoting the reporting of suspected cases in pigs to be carried out by the participants of the regional workshop on communication techniques conducted in May 2010. Moreover, communication materials developed under a consultancy on communication covered by TCP/RLA/3206 are printed and distributed.

Activity 5.2: Coordination of veterinary authorities with national public health authorities to improve disease field investigation, detection and reporting of cases in particular from rural areas.

A final workshop is organized in September 2010 in Panama with the participation of Chief Veterinary Officers (CVOs) and national coordinators in order to present the results of the project and to discuss continuity of activities and achievements beyond the end of the project.

Activities undertaken during the reporting period:

Output 1: The ECTAD Decentralized Coordination Unit (DCU) for Central America is established and operational.

Activity 1.4: Provision of services to the Central American and neighboring countries.

The ECTAD DCU in Panama, jointly with OIRSA and PAHO, carried out an assessment about the response of Panamanian authorities to the outbreak of East Equine Encephalomyelitis in East Panama in June 2010. Conclusions have been shared with officials of the Ministry of Health and Ministry of Agriculture.

A mid-term regional strategy to prevent and control TADs in Latin America and the Caribbean and several concept notes have been drafted.

Output 2: Surveillance activities implemented and extent and intensity of possible influenza viruses type A in circulation better understood and a proposal for contingency plans prepared.

Activity 2.1: Signature of an LoA with a research institution for field investigation/training.

An agreement between FAO and NVSL was signed in August 2010. Within this Agreement, two NVSL technicians travelled to Panama and provided diagnosis training to three technicians from LADIVES, one from Costa Rica and one from Guatemala in August 2010. Moreover, the last week of September 2010, a technician from LADIVES attended a on-the-job training at NVSL in Ames, USA, on influenza virus sequencing.

Activity 2.3: Training and conduction of field investigations and finalization of the guidelines.

Field equipment was delivered to national counterparts in eight countries (Belize, Costa Rica, the Dominican Republic, El Salvador, Guatemala, Honduras, Nicaragua and Panama) at the end of September 2010 and field active surveillance and sampling collection activities started immediately in most of the countries. Moreover, national project coordinators in Costa Rica, Honduras and Panama trained colleagues on collection and submission of samples of swine. A template to collect appropriate information has been prepared and distributed among field veterinarians.

Activity 2.5: Raising awareness and reporting of respiratory cases.

Costa Rica, El Salvador, Guatemala, Honduras, Nicaragua and Panama organized national events to promote notification of respiratory cases in pigs. This activity was also supported by radio spots in local and national radio stations in the last four countries. Some reports have already been investigated in Honduras and samples were collected.

Output 3: National animal health information systems to collect, process and analyse data from surveillance activities reinforced.

Activity 3.1: Procurement and distribution of equipment and software.

Two desktop computers were distributed to veterinary services in Belize, El Salvador, Guatemala, Honduras, the Dominican Republic and Panama to strengthen the capacity at epidemiology and laboratory units to process epidemiological surveillance information and install TADinfo software.

Activity 3.2: Revision and updates of national animal health information systems used by countries (provided by FAO).

A one-week practical training workshop on the use and administration of TADinfo data base was carried out in Tegucigalpa, Honduras in August 2010 with participants from Belize, El Salvador and Honduras. The tailor-

made software for Honduras was used for training purposes. The customization of software for the other countries is at the final stage.

Output 4: Laboratory diagnostic capacities reinforced and network established between national laboratories and international reference laboratories.

Activity 4.2: Procurement and distribution of laboratory equipment and supplies.

Laboratory equipment and supplies have been delivered and handed over to national counterparts in Costa Rica, Guatemala and Panama. Laboratories in these countries are now equipped and trained to carry out PCR diagnostic on SI.

Activity 4.3: Signature of an LoA with a specialized laboratory.

An agreement between FAO and LADIVES was signed in August 2010. LADIVES has been provided with equipment and supplies and its staff has been trained by NVSL. Under the Agreement, LADIVES is acting as a regional laboratory and will process samples of sick swine from Belize, El Salvador, Honduras, Nicaragua, Panama and Dominican Republic. Moreover, LADIVES will provide technical support to laboratories in Guatemala and Costa Rica.

Activity 4.4: Training of personnel working in animal health diagnostic laboratories at national level.

Under the framework of the agreement with NVSL and FAO, laboratory staff from Panama, Guatemala and Costa Rica were trained during one week on RT-PCR diagnostic and virus isolation HA/HI in August 2010. A LADIVES staff attended a one-week hands-on training on sequencing in NVSL in September 2010. Other beneficiary countries do not have currently suitable laboratory premises to carry out this kind of diagnostic (biosecurity level 3 is required but only level 2 available) and diagnostic will be carried out by LADIVES in Panama (biosecurity level 3).

Activity 4.6: Transport of samples to international reference laboratories for analysis, sequencing and molecular epidemiological analysis.

An agreement with an international carrier has been reached to enable national veterinary services to ship samples of suspected swine to LADIVES for RT-PCR diagnosis. Up to 25 of those samples diagnosed positively are expected to be forwarded to NVSL for confirmation, sequencing and quality control. LADIVES expects to receive the first samples in October 2010.

Output 5: Early detection and notification of A/H1N1/2009.

Activity 5.1: Support national services and organizations in education and communication and notification of respiratory cases in pigs.

FAO, through an ad-hoc consultant, provided assistance to national communication officials in organizing national events to promote the reporting of suspected cases in pigs. Moreover, communication materials were printed and distributed to the countries in collaboration with OIRSA. Radio spots were broadcasted in Nicaragua, Honduras, Guatemala and Panama.

Activity 5.2: Coordination of veterinary authorities with national public health to improve disease field investigation, detection and reporting of cases in particular from rural areas.

Considering the no-cost extension of the project until 31 December 2010, the final workshop to present the results of the project and to discuss continuity of activities and achievements beyond the end of the project has been postponed until November 2010.

Planned activities for the next reporting period:

Output 1: The ECTAD Decentralized Coordination Unit for Central America is established and operational.

Activity 1.4: Provision of services to the Central American and neighbouring countries.

The ECTAD DCU in Panama to continue backstopping the veterinary services of the beneficiary countries and reinforcing the regional epidemio-surveillance network in order to improve the communication and exchange of information on TADs and other respiratory diseases in swine populations. All activities will be conducted in close coordination with other organizations, such as OIRSA and PAHO. Special support will be provided to countries facing outbreaks, if needed.

Output 2: Surveillance activities implemented and extent and intensity of possible influenza viruses type A in circulation better understood and a proposal for contingency plans prepared.

Activity 2.1: Signature of an LoA with a research institution for field investigation/training.

Extend the Agreement with NVSL will be extended until 15 December 2010 to enable NVSL to finalize all planned activities, namely confirmation of positive diagnostic of up to 25 samples of positive cases detected in LADIVES.

Activity 2.3: Training and conduction of field investigations and finalization of the guidelines.

Carry out field investigations in beneficiary countries in October and November 2010. Up to 500 samples (per country) of suspected swine populations will be collected and sent to LADIVES for RT-PCR diagnosis. Guatemala and Costa Rica will diagnose their own samples.

Activity 2.4: Assistance to the National Project Coordinators for the preparation of reports on the situation of A/H1N1 in beneficiary country.

National Project Coordinators to present results of field surveillance conducted in their countries during the Final Workshop to be held in November 2010, according to a format provided by FAO.

Activity 2.5: Raising awareness and reporting of respiratory cases.

Follow up on activities focused on raising awareness and promoting notification of suspected cases at national level will continue.

Activity 2.6: Preparation and discussion of proposed contingency plan for early response in each country.

Draft and discuss a manual on contingency planning with national counterparts during the Final Workshop.

Output 3: National animal health information systems to collect, process and analyse data from surveillance activities reinforced.

Activity 3.2: Revision and updates of national animal health information systems used by countries (provided by FAO).

Finalize and distribute tailor-made TADinfo software to the beneficiary countries of Belize, Guatemala and El Salvador for installation.

Output 4: Laboratory diagnostic capacities reinforced and network established between national laboratories and international reference laboratories.

Activity 4.3: Signature of an LoA with a specialized laboratory.

Extend the Agreement between FAO and LADIVES until 30 November 2010, in order to enable the Panamanian lab to process up to 3 000 samples collected during the field activities in the beneficiary countries.

Activity 4.6: Transport of samples to international reference laboratories for analysis, sequencing and molecular epidemiological analysis.

Send by courier up to 3 000 samples of suspected swine populations from Belize, El Salvador, Honduras, Nicaragua, Panama and the Dominican Republic to LADIVES for diagnostic. Up to 25 of these samples, if tested positive, will be forwarded to NVSL in USA.

Output 5: Early detection and notification of A/H1N1/2009.

Activity 5.2: Coordination of veterinary authorities with national public health to improve disease field investigation, detection and reporting of cases in particular from rural areas.

Organize a final workshop in November 2010 in Panama with the participation of CVOs, national coordinators, lab specialists and public health veterinarians in order to present the results of the project and to discuss continuity of activities and achievements beyond the end of the project. Other international organizations such as OIRSA, PAHO, OIE and the Inter-American Institute for Cooperation on Agriculture (IICA) will also be invited to attend.

Main challenges encountered and response provided:

The large procurement action carried out under the project (purchase and distribution of over 100 items [some

of them require cold chain] for laboratory diagnostic and field surveillance in nine countries) has been a complicated and time-consuming exercise. Due to the special nature of some of the goods, special import processes were necessary in some countries. FAO Representations in the beneficiary countries played an essential role in speeding up the importation of goods and all items were handed over to national counterparts in good condition.

Due to heavy rains in Guatemala in September 2010, field collection of samples was postponed until October 2010.

Main progress made towards the achievement of project outcomes:

- The ECTAD DCU in Panama has been established in the framework of this project and provides technical support to the national veterinary services in all beneficiary countries, including situations of outbreaks of TADs such as rabies, classical swine fever and equine encephalitis. Furthermore, the ECTAD DCU in Panama acts as a regional hub for reception and exchange of real-time information of animal health issues, linked to the Global Early Warning and Response System (GLEWS) FAO team.
- Technical backstopping missions have been carried out to all beneficiary countries, especially to support the preparation of surveillance guidelines in the framework of national workshops with key staff, and as a first step in carrying out the surveillance and sample collection activities intended under the project.
- LADIVES of Panama has agreed to provide RT-PCR diagnostic services to other beneficiary countries and serve as a regional laboratory for SI in the future. The diagnostic capacity of this laboratory (and other laboratories in Costa Rica and Guatemala) has been strengthened through training by NVSL (USA) and purchasing of a large number of laboratory equipment and supplies.
- The veterinary services of Belize, El Salvador, Guatemala and Honduras decided to strengthen their capacities to analyse epidemiological information and are received support to install and properly operate TADInfo as their tailor-made animal health information system. Related equipment was also procured and delivered to final users.
- Communication specialists from all beneficiary countries were trained on how to develop national trainings to raise awareness of respiratory diseases in swine and promote notification of suspected cases. Materials such as posters, radio commercial breaks, leaflets and brochures were prepared considering countries' feedback and made available to all national veterinary services. Raising awareness campaigns on radio were carried out in Guatemala, Honduras, Nicaragua and Panama and national training events were organized in Costa Rica, Guatemala, Honduras, Nicaragua and Panama.
- Two documents on good practices for biosecurity in the pig sector and preparation of African swine fever contingency plans (<http://www.fao.org/docrep/012/i1435e/i1435e00.htm>) were translated into Spanish and adapted to the region for distribution among key staff from the beneficiary countries.
- An agreement with OIRSA was reached to include the differential diagnosis of other respiratory diseases in swine, in addition to pandemic influenza H1N1/2009, to the diagnostic activities to be carried out under the framework of the project. This is crucial not only to determine whether the pandemic influenza H1N1/2009 is circulating in the region but also to determine which other viral and bacterial diseases are more prevalent in swine populations.

I Quarter 2010

Project Monitoring Sheet: OSRO/RLA/901/USA**Reporting period: January - March 2010**

Regional Component: Latin America and the Caribbean	
Project Title: Strengthening regional capacity for surveillance of influenza A H1N1 virus and other subtypes of swine flu in pig populations in Central America and other countries in Latin America	
Code: OSRO/RLA/901/USA	
Budget: USD 700 000 (Phase I) Total budget: USD 700 000	
Effective Starting Date:	28 July 2009
Planned End Date:	30 September 2010
Context of the Project:	
<p>Pandemic H1N1 2009 has been reported in animals (pigs and turkeys) in several countries, including Argentina, Canada, Chile and the United States in the American continent, raising the concern of the international community. Pigs can harbour influenza viruses of both avian and mammalian origin and act as a “mixing vessels” in which the re-assortment of human, swine and avian influenza virus may occur producing a virus capable of human-to-human transmission leading to human pandemics.</p> <p>Studies in the developed countries have shown that various subtypes (H1N1, H3N2 and H1N2) co-circulate in pig populations in those countries. However, it is still unknown whether these subtypes are also widespread in swine populations in Central America and neighbouring countries due to lack of appropriate monitoring and surveillance networks for swine influenza.</p>	
Objectives of the Project:	
<p>The project aims at strengthening the surveillance capacities of the affected countries or countries at risk to deal with Influenza A/H1N1, other influenza viruses and other transboundary animal diseases in Central America and neighbouring countries.</p> <p>Specifically, the project will improve the knowledge on the epidemiology and ecology of Influenza type A viruses in swine populations in targeted countries.</p>	
Planned activities for the reporting period:	
<p>In the previous progress report, the following activities were planned to be carried out during the reporting period:</p> <p><i>Output 1: The ECTAD Decentralized Coordination Unit for Central America is established and operational</i></p> <p>Activity 1.4: Provision of services to the Central American and neighbouring countries</p> <p>The Emergency Centre for Transboundary Animal Diseases of FAO (ECTAD) Decentralized Coordination Unit (DCU) in Panama will continue backstopping the veterinary services of all beneficiary countries and reinforcing the regional epidemiological surveillance network in order to improve communication and the exchange of information on transboundary animal diseases and respiratory diseases in pigs.</p> <p><i>Output 2: Surveillance activities implemented and extent and intensity of possible influenza viruses type A in circulation better understood and a proposal for contingency plans prepared.</i></p> <p>Activity 2.1: Signature of Letter of Agreement (LoA) with a research institution for field investigation /training</p>	

Upon final agreement with an FAO/International Office of Epizootics (OIE) Reference Laboratory (discussions are being currently carried out with Ames, USA) a LoA to conduct training on reverse transcriptase PCR (RT-PCR) diagnosis for LADIVES laboratory staff will be signed and first activities to this effect will be carried out.

Output 3: National animal health information systems to collect, process and analyse data from surveillance activities reinforced.

Activity 3.1: Procurement and distribution of equipment and software

Technical specifications for computer equipment to install TADInfo database system will be prepared and equipment will be procured and delivered for all the countries, especially those interested in upgrading their national animal health information systems. Digital maps will be adapted.

Activity 3.3: Promotion and use of other animal health information systems including TADInfo and others

Promotion activities will continue in the countries with no database and appropriate animal diseases information systems.

Output 4: Laboratory diagnostic capacities reinforced and network established between national laboratories and international reference laboratories

Activity 4.2: Procurement and distribution of laboratory equipment and supplies

Upon the preparation of surveillance guidelines and the final estimation of the required supplies to test the samples, the list of inputs for laboratory diagnosis and epidemiological surveillance will be finalized and the procurement process will be started.

Activity 4.3: Signature of a LoA with a specialized laboratory

LADIVES laboratory in Panama has been identified as the most suitable laboratory in the Central American region to carry out the activities envisaged under this LoA (provide training at national level on RT-PCR diagnosis and diagnose samples collected in Belize, El Salvador, Honduras, Nicaragua, Panama and Dominican Republic).

Activities Undertaken during the reporting period:

Output 1: The ECTAD Decentralized Coordination Unit for Central America is established and operational

Activity 1.4: Provision of services to the Central American and neighbouring countries

The ECTAD DCU provided technical support to Guatemalan veterinary authorities to control rabies and classical swine fever outbreaks in this country in February 2010. The Unit continued playing a major role in coordinating the information exchange on transboundary animal diseases among the countries in the region and timely reported any important issues to the relevant early warning systems.

Output 2: Surveillance activities implemented and extent and intensity of possible influenza viruses type A in circulation better understood and a proposal for contingency plans prepared.

Activity 2.1: Signature of LoA with a research institution for field investigation/training

The National Veterinary Services Laboratory in Ames, USA, has been selected as the most suitable institution to provide high-level laboratory training. Upon beneficiary laboratory's request (LADIVES), an additional component (training on virus sequencing) was included in the agreement. This has delayed in some weeks the signature of the LoA, which is now under final consideration by USDA.

Output 3: National animal health information systems to collect, process and analyse data from surveillance activities reinforced.

Activity 3.1: Procurement and distribution of equipment and software

Technical specifications for Information Technology (IT) equipment suitable for animal health information systems have been prepared. Funds to provide with this equipment to all beneficiary countries have been allocated. The final purchase and distribution will depend on the finalization of the customization of TADInfo.

Activity 3.3: Promotion and use of other animal health information systems including TADInfo and others
 Belize, El Salvador, Guatemala and Honduras officially requested assistance to FAO in January 2010 to establish TADInfo as their national animal health information system. Countries submitted necessary mapping information to start data customization. A home-based experienced IT consultant has been identified to provide this service.

Output 4: Laboratory diagnostic capacities reinforced and network established between national laboratories and international reference laboratories

Activity 4.2: Procurement and distribution of laboratory equipment and supplies

All laboratories expected to provide diagnostic services at national (Guatemala, Costa Rica) and regional levels (LADIVES in Panama for samples collected in Belize, El Salvador, Honduras, Nicaragua, Panama and Dominican Republic) provided a list of all required items. An international tender was launched in March 2010. Sixty-seven companies worldwide were invited to bid. Results are expected for May 2010.

Activity 4.3: Signature of a LoA with a specialized laboratory

In addition to RT-PCR diagnosis, LADIVES laboratory and FAO agreed to conduct virus sequencing in the premises of this Panamanian laboratory under the framework of the project. This will enable a more detailed and reliable diagnostic. This additional component and the sudden death of Director of LADIVES laboratory have delayed signature of the agreement. However, final agreement is expected to be signed shortly.

Planned activities for the next quarter:

Output 1: The ECTAD Decentralized Coordination Unit (DCU) for Central America is established and operational

Activity 1.4: Provision of services to the Central American and neighbouring countries.

The ECTAD DCU in Panama will continue backstopping the veterinary services of the beneficiary countries and reinforcing the regional epidemiological surveillance network in order to improve communication and the exchange of information on transboundary animal diseases and other respiratory diseases in swine populations. Special support will be given to countries facing outbreaks, if needed.

Output 2: Surveillance activities implemented and extent and intensity of possible influenza viruses type A in circulation better understood and a proposal for contingency plans prepared.

Activity 2.1: Signature of LoA with a research institution for field investigation/training.

An agreement will be signed with the National Veterinary Services Laboratory in Ames, USA. This institution will provide diagnostic training in LADIVES premises will train a LADIVES expert on virus sequencing and will act as a reference laboratory for positive cases detected in LADIVES.

Activity 2.3: Training and conduction of field investigations and finalization of the guidelines.

A regional workshop will be held in Panama on 13-14 May 2010 with participation of all national project coordinators in order to discuss biosecurity measures in the pig sector, using as guidance the joint FAO/OIE/World Bank document on good practices for biosecurity in the pig sector (<http://www.fao.org/docrep/012/i1435e/i1435e00.htm>) and agree on common procedures for the forthcoming surveillance and sample collection activities to be carried out at national level.

Activity 2.5: Raising awareness and reporting of respiratory cases.

A regional workshop will be held in Panama on 11-12 May 2010 with participation of 19 experts from all beneficiary countries. Participants will learn communication techniques to raise awareness and promote reporting of suspected cases in pigs in their countries. Participants are expected to organize national workshops on this matter with the collaboration of the International Regional Organization for Plant and Animal Health (OIRSA).

Output 3: National animal health information systems to collect, process and analyse data from surveillance activities reinforced.

Activity 3.1: Procurement and distribution of equipment and software.

Funds have been allocated and technical specifications have been prepared to purchase necessary equipment to install TADInfo in four countries and strengthen information management capacities in the others. In order to avoid the computers to become outdated, they will be purchased as soon as customization of the software is finalized.

Activity 3.3: Promotion and use of other animal health information systems including TADInfo and others.

TADInfo software will be customized for Belize, Honduras, Guatemala and El Salvador. An international workshop to train key staff on installation, use and maintenance of this information system is envisaged for the third quarter of this year.

Output 4: Laboratory diagnostic capacities reinforced and network established between national laboratories and international reference laboratories.

Activity 4.2: Procurement and distribution of laboratory equipment and supplies

More than 100 items for laboratory diagnosis in three countries and sample collection in all beneficiary countries will be procured and distributed in order to enable field surveillance, collection of samples from suspected pigs and laboratory diagnosis.

Activity 4.3: Signature of a LoA with a specialized laboratory.

The letter of agreement with LADIVES, a Panamanian laboratory will be signed. Under this agreement, LADIVES will carry out training at national level on RT-PCR diagnosis and run samples collected in Belize, El Salvador, Honduras, Nicaragua, Panama and Dominican Republic. Guatemala and Costa Rica will diagnose their own samples and will send positive cases to LADIVES for confirmation.

Main Challenges Encountered and Response Provided:

The need for additional support to national officers in sampling design and drafting of surveillance guidelines required celebration of additional specific workshops on this matter in most of the countries.

The unexpected death of the Director of LADIVES in March 2010 has delayed the signature of the letter of agreement with this institution.

Main progress made towards the achievement of project outcomes:

- The ECTAD DCU in Panama has been established in the framework of this project and provides technical support to the national veterinary services in all beneficiary countries, including situations of outbreaks of transboundary animal diseases such as rabies and classical swine fever. Furthermore, the ECTAD DCU in Panama acts as a regional hub for reception and exchange of real-time information of animal health issues, linked to the Global Early Warning and Response System (GLEWS) FAO team.
- Technical backstopping missions have been carried out to all beneficiary countries, especially to support the preparation of surveillance guidelines in the framework of workshops with key staff, and as a first step for carrying out the surveillance and sample collection activities envisaged under the project.
- An agreement with a laboratory in Panama (biosecurity level 3) is being finalized in order to provide RT-PCR diagnosis for samples collected in beneficiary countries. A second agreement is about to be signed with a laboratory in Ames, USA to serve as a reference laboratory and provide training on viral sequencing.
- An international market research for laboratory equipment and supplies, as well as materials for field surveillance and sample collection, has been conducted. Goods will be purchased and delivered to relevant laboratories as soon as offers are available.
- Upon request of four beneficiary countries (Belize, El Salvador, Guatemala and Honduras) arrangements are being made to establish TADInfo as a tailor-made animal health information system in these countries, including customization of the system to countries' needs and training. Related equipment is also being procured and delivered to final users.
- Two documents on good practices for biosecurity in the pig sector and preparation of African Swine

Fever contingency plans (<http://www.fao.org/docrep/012/i1435e/i1435e00.htm>) have been translated into Spanish and adapted to the region for distribution among key staff from the beneficiary countries.

- An agreement with OIRSA has been reached to include the differential diagnosis of other respiratory diseases in swine, in addition to pandemic influenza H1N1/2009, to the diagnostic activities to be carried out under the framework of the project. This will enable the national veterinary services in the beneficiary countries, not only to determine whether the pandemic influenza H1N1/2009 is circulating in the region, but also to determine which other viral and bacterial diseases are more prevalent in swine populations.

Project Monitoring Sheet: OSRO/RAS/604/USA Baby 03

Project title: **Immediate Technical Assistance to Strengthen Emergency Preparedness for Highly Pathogenic Avian Influenza in Lao PDR**

Reporting period: **April 2013 to September 2013**

Country: Lao People's Democratic Republic (Lao PDR)
Project title: Immediate Technical Assistance to Strengthen Emergency Preparedness for Highly Pathogenic Avian Influenza in Lao PDR
Code: OSRO/RAS/604/USA Baby 03
Budget: USD 1 000 000 (Phase I), USD 1 285 000 (Phase II), USD 900 000 (Phase III), USD 800 000 (Phase IV), USD 550 000 (Phase V), USD 372 000 (Phase VI), USD 50 000 (Phase VII) and USD 100 000 (VIII phase) Total budget: USD 5 057 000
Effective starting date: 1 August 2006
Planned end date: 30 September 2014
Context of the project The project assists the Government in responding to the consequences of a possible poultry disease epidemic related to highly pathogenic avian influenza that could not only cause serious damage to the poultry sector, but also have serious consequences in terms of human health and household livelihoods.
Objectives of the project The specific objectives of the project are to: <ul style="list-style-type: none"> • Strengthen coordination and support of avian influenza control policy development. • Strengthen risk-based surveillance for Highly Pathogenic Avian Influenza (HPAI) in target provinces. • Improve disease response capability.
Planned activities for the reporting period (April 2013 to September 2013) Output 1: Planning, coordination and policy support strengthened for effective management and control of HPAI and other emerging zoonoses <ul style="list-style-type: none"> • Continue the monthly meetings among project staff. • Continue to participate in technical meetings organized by the National Emerging Infectious Diseases Coordination Office (NEIDCO) to support the multi-sectoral coordination and collaboration in the spirit of One Health. • Regularly communicate and meet with the United States Agency for International Development (USAID) Representative for Lao PDR to keep him/her informed of the project work plan. • Continue to support veterinary epidemiology training at regional and country levels, including the Field Epidemiology Training Programme for Veterinarians (FETPV). • Continue to participate in the development of joint activities with other partners related to the implementation of the 2011-2015 National Work Plan for Emerging Infectious Diseases and Public Health in Emergencies. • Participation of the National Project Director in USAID partners' meetings. Output 2: Risk assessment and management along the poultry supply chain strengthened <ul style="list-style-type: none"> • Recruit an international consultant on veterinary epidemiology for one month to provide recommendations to conduct the training course on field epidemiology in action.

- Conduct the longitudinal risk-based surveillance in four target provinces.
- Provide necessary equipment and supplies for surveillance and response.
- Establish a team and network consisting of field staff trained in epidemiology (including the FETPV and Field Epidemiology Training [FET] graduates/trainees) and laboratory experts from the Department of Livestock and Fisheries to develop and link epidemiological and virological information for risk assessment and management.

Output 3: Strengthen laboratory capacity

- Under the Emerging Pandemic Threats (EPT) IDENTIFY regional project:
 - Recruit an international consultant to evaluate the current laboratory operations and management system as well as implement standard operating procedures (SOPs) and provide in-country training.

Activities undertaken during the reporting period (April to September 2013)

Output 1: Planning, coordination and policy support strengthened for effective management and control of HPAI and other emerging zoonoses

- The project's monthly meetings with staff to discuss technical and operational issues have continued.
- The National Project Director participated in the quarterly meeting of USAID-funded EPT programme to update the work activities for FAO IDENTIFY on strengthening laboratory diagnosis. The meeting was organized by the National Animal Health Laboratory (NAHL).
- The National Project Director attended several preparatory meetings with NEIDCO, the World Health Organization (WHO), Ministry of Health and Ministry of Agriculture and Forestry for organizing the One Health Symposium. The Symposium, organized by the Ministry of Health and the Ministry of Agriculture and Forestry in collaboration with WHO and FAO, was held from 5 to 6 September 2013.
- The National Project Director attended the Avian Influenza and Emerging Pandemic Threats Programme Discussions organized in Bangkok, Thailand on 26 June 2013. The meeting brought the team leaders from FAO's Emergency Centre for Transboundary Animal Diseases (ECTAD) Country Programme to review and discuss on reprogramming the regional projects to address the current situation of HPAI.
- The National Project Director attended the Technical and Policy Discussion on the Prevention and Control of Avian Influenza A(H7N9) in Asia which was jointly hosted by USAID and the Royal Thai Government in Bangkok, Thailand from 24 to 25 June 2013. The objectives of the meeting were to: (i) share the lessons learned from actions undertaken by the Government of China in preventing and managing the situation of H7N9 influenza infections in poultry and humans as well as monitoring H7N9 influenza viral evolution; (ii) discuss specific unresolved issues related to viral transmission, surveillance, risk assessment and management as well as appropriate and practical interventions for H7N9 influenza infection based on capacity developed from H5N1 crisis; (iii) discuss risks and scenarios of the H7N9 situation in the region and the possible mitigation measures in the short, medium and long term; and (iv) identify the opportunities for synergies of the human health, animal health and other sectors among the countries in the region and between the countries and the relevant international organizations.
- The National Project Director participated in the inception workshop of the two regional emergency Technical Cooperation Projects for Surveillance and Response to H7N9 which was organized in Bangkok from 18 to 20 September 2013.

Output 2: Risk assessment and management along the poultry supply chain strengthened

- The ECTAD team in Lao PDR followed up on the implementation of the longitudinal risk

based surveillance in the target provinces, which was completed in August 2013.

- In collaboration with the ECTAD-RAP (FAO Regional Office for Asia and the Pacific) team, the ECTAD team in Lao PDR supported the Department of Livestock and Fisheries to conduct emergency surveillance for H7N9 in the districts of the three provinces, Luangnamtha, Phongsaly and Oudomxay, bordering and have poultry value chain connected to China. This included the organization of the planning and wrap-up workshops in addition to field sample collection.

Output 3: Strengthen laboratory capacity

- The procurement of reagents and supplies for NAHL to test the samples collected from the longitudinal surveillance was finalized.
- Under the EPT IDENTIFY regional project, the National Project Director facilitated the participation of NAHL staff to the following regional trainings/workshops:
 - Regional Workshop on Laboratory-Epidemiology Linkage, 20-31 May 2013, Bangkok, Thailand.
 - Regional Laboratory Network Workshop on Diagnosis Characterization of Influenza A(H7N9) and Pig Diseases (African swine fever, classical swine fever and porcine reproductive and respiratory syndrome), 29 July – 9 August 2013, Ho Chi Minh City, Viet Nam.
 - Regional Workshop on Applied Veterinary Bioinformatics, 26 June – 1 July 2013, Bangkok, Thailand.
 - Regional Laboratory Network Training on Diagnosis of Rabies and Newcastle Disease, 26 August – 6 September 2013, Bangkok, Thailand.
- The National Project Director provided her coordination roles for the letter of agreement issued by ECTAD-RAP to the Mahidol-Oxford Research Unit (MORU) to strengthen the capacity of the NAHL and Department of Livestock and Fisheries on laboratory management, biosafety and bio-security. The letter of agreement is effective from June – November 2013. The following events were conducted at NAHL and attended and facilitated by the National Project Director during the reporting period:
 - Orientation Workshop for the letter of agreement, 12 June 2013;
 - Gap Analysis Workshop, 26-27 June 2013; and
 - On-the-job training on laboratory quality management, 12-13 August 2013.

Planned activities for the next six-month period (October 2013 to March 2014)

Output 1: Planning, coordination and policy support strengthened for effective management and control of HPAI and other emerging zoonoses

- Request approval from the Government of Lao PDR for Phase VIII of the project.
- Recruit project staff.
- Organize an inception workshop to formally start the activities of the next phase (Phase VIII) of the project.
- Consult with the national government in planning for A(H7N9) in three high risk provinces noted previously.
- Conduct FETPV training at the provincial level in collaboration with animal health and public health partners.
- Continue regular monthly meetings among the HPAI project staff.
- Regularly communicate and meet with the USAID Representative of Lao PDR to keep him/her informed of the project work plan.
- Continue to support veterinary epidemiology training at regional and country levels including FETPV.

- Provide inputs to the technical meetings organized by the NEIDCO to develop joint activities with other partners related to the implementation of the 2011–2015 National Work Plan for Emerging Infectious Diseases and Public Health in Emergencies; and
- Ensure the participation of the National Project Director in USAID partners' meetings.

Output 2: Risk assessment and management along the poultry supply chain strengthened

- Organize the planning workshop to support the longitudinal risk-based surveillance which includes H5N1 and H7N9 in four target provinces.
- Conduct the longitudinal risk-based surveillance in Luangnamtha, Oudomxay, Vientiane province and Vientiane Capital.
- Provide necessary equipments and supplies for surveillance and response.
- Establish a team and network consisting of field staff trained in epidemiology (including the FETPV and FET graduates/trainees) and laboratory experts from the Department of Livestock and Fisheries to develop and link epidemiological and virological information for risk assessment and management.

Output 3: Strengthen laboratory capacity

- Under the EPT IDENTIFY regional project:
 - Continue to provide coordination between the Department of Livestock and Fisheries and MORU to ensure smooth implementation.

Main challenges encountered and response provided

- As H7N9 emerged in China, the ECTAD team in Lao PDR had to provide support to the Department of Livestock and Fisheries to ensure that the incursion of H7N9 can be detected and responded to in a timely manner. The ECTAD team in Lao PDR was responsible for adjusting the HPAI project to accommodate this need.
- Due to an upsurge in activities related to preparedness for A(H7N9), the plan to organize Field Epidemiology Training for Veterinarians and Animal Health Personnel is postponed to the next reporting period.

Main progress made towards the achievement of project outcomes

Output 1: Planning, coordination and policy support

- The project continued to emphasize the control of HPAI and the broadened scope of prevention, control and laboratory diagnosis of low pathogenic avian influenza (LPAI) A(H7N9) and other high-impact diseases through the National Mid-Term Priority Plan (NMTPP) for Animal Health for Lao PDR.
- The project is strengthening multi-sectoral cooperation for the prevention and control of five priority zoonoses in Lao PDR through the National Work Plan for Emerging Infectious Diseases and Public Health in Emergencies.

Output 2: Risk assessment and management along the poultry supply chain strengthened

- The provincial and district staff's capability in conducting field surveillance and the cold chain for sample submission to the central laboratory were further improved.
- The laboratory facility of the National Animal Diagnostic Centre is currently functioning.
- The implementation of longitudinal surveillance and more targeting will describe the epidemiological status as well as risks of both LPAI A(H7N9) and HPAI H5N1 at the target sites, which can be utilized for planning management of HPAI prevention and control in the future.

Output 3: Strengthen laboratory capacity

- The staff at the national laboratory was trained on operations management as well as on implementation of laboratory diagnostic tests and related measures.
- The NAHL will be enhancing quality laboratory management and services.

Project Monitoring Sheet: **OSRO/RAS/604/USA Baby 03**

Project title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)**

Reporting period: **October 2010 – March 2011**

Country: Lao People's Democratic Republic
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)
Code: OSRO/RAS/604/USA Baby 03
Budget: USD 1 000 000 (Phase I), USD 1 284 990 (Phase II), USD 900 000 (Phase III), USD 800 000 (Phase IV), 550 000 (Phase V) Total budget: USD 4 534 990
Effective starting date: 1 August 2006
Planned end date: 30 September 2011
Context of the project The project assists the Government in responding to the consequences of a possible poultry disease epidemic that could not only cause serious damage to the poultry sector, but also cause serious consequences to human health and household livelihoods.
Objectives of the project The specific objectives of the project are to: <ul style="list-style-type: none"> • strengthen coordination of and support avian influenza (AI) control policy development; • strengthen risk-based surveillance for Highly Pathogenic Avian Influenza (HPAI) in target provinces; • improve disease response capability; and • strengthen risk management measures, including biosecurity measures and cross-border movement.
Planned activities Output 1: Coordinated project implementation and policy support <ul style="list-style-type: none"> • continue the weekly meetings among the HPAI project staff • extend the contracts of the project staff until 30 September 2011 • support the bilateral meeting between Lao People's Democratic Republic (PDR) and People's Republic of China • support the development of the National Five Year Plan (2011-2015) on communicable diseases organized and coordinated by the National Emerging Infectious Disease Coordination Office (NEIDCO) • support the United States Agency for International Development (USAID) Partners' meeting from 3 to 5 November 2010 in Luang Prabang province Output 2: Strengthened surveillance and response <ul style="list-style-type: none"> • continue to conduct the fourth round of active surveillance in nine provinces from 29 November to 12 December 2010 • conduct training for laboratory staff to improve HPAI and other basic diagnostic capacity in Champasak province in November 2010 • Standard Operating Procedures (SOPs) and sublaws/decrees approved by the Government, printed and disseminated

Output 4: Strengthened risk management measures, including biosecurity improvement among the high-risk poultry populations

- construction of the stall at the live bird market (LBM) as part of the pilot implementation on biosecurity improvement in Oudomxay province to start in October 2010
- monitor pilot activities by project staff together with the Provincial Agriculture and Forestry Office (PAFO) and District Agriculture and Forestry Office (DAFO) staff to follow up on the progress of the biosecurity improvement at LBM in Oudomxay province

Output 5: Strengthening capabilities to manage cross-border trade

- international consultant on cross-border activities together with the national Project Director will undertake two visits to Boten, Luang Namtha province and to Kaysone, Savannakhet province to meet and liaise with PAFO/DAFO and the check point staff
- organize training for staff at border check points

Activities undertaken during the reporting period

Output 1: Coordinated project implementation and policy support

- The International Operations Officer concluded his backstopping mission to assist in daily operation of the project from 20 October 2010 to 16 January 2011.
- Continued conducting of the AI weekly meetings staff to discuss technical, as well as operational issues.
- All contracts of national consultant and other project staff were extended until 30 September 2011.
- The Government of Lao PDR's approval for the Phase V of the project was received on 11 November 2010.
- An inception workshop to evaluate the activities implemented during Phase IV and to plan the activities to be implemented during Phase V of the project was organized on 9 and 10 December 2010.
- The project team revised the 2011 work plan, based on the inputs during the inception workshop.
- The Team Leader attended the Ecohealth Emerging Infectious Diseases Research Proposal Development workshop in Siem Reap, Cambodia, from 18 to 22 October 2010, supported and organized by the Canada's International Development Research Centre (IDRC).
- The Team Leader and the National Project Coordinator participated at the Tripartite Review Mission meeting organized by the Food and Agriculture Organization of the United Nations (FAO) Environmental Animal Health Initiative Management for Enhanced Smallholder Production (EAHMI) project on 25 October 2010.
- The Team Leader and the National Project Coordinator were in Bangkok on 29 and 30 November 2010 to attend:
 - inception workshop for the Regional Cooperation Programme on Highly Pathogenic and Emerging Diseases (HPED) in Southeast Asia on 29 November 2010; and
 - closing workshop on Technical Cooperation Project (TCP) on Emergency assistance for Surveillance of Novel Influenza A Subtype H1N1 Viruses in Pig and Poultry Production Sectors in High Risk Southeast Asian Countries on 30 November 2010.
- The Team Leader delivered a lecture on the application of the One Health approach to control zoonoses at the Study Conference for One Health Master programme at Massey University, New Zealand, on 14 December 2010. This visit was sponsored by Massey University.
- The Team Leader (sponsored by IDRC and the International Livestock Research Institute [ILRI]) and the National Project Coordinator (sponsored by the European Union)

participated at the One Health Congress 2011 in Melbourne, Australia, from 14 to 16 February 2011.

- The Team Leader attended the 5th Annual Regional Emergency Centre for Transboundary Animal Diseases (ECTAD) meeting for Asia and the Pacific in Bangkok from 22 to 24 February 2011 and participated in the PEMS training on 25 February 2011.
- The Team Leader and the National Project Coordinator attended the Preparation Meeting Emerging Pandemic Threats (EPT) Program coordinated by NEIDCO in collaboration with USAID in Vientiane on 28 February 2011.
- The Team Leader and the National Project Coordinator participated in several discussion meetings for the development of Zoonosis Collaboration Mechanism (ZCM) concept as part of the National 5-Year Work Plan for the emerging infectious diseases (EID) and Public Health Emergency Preparedness and Response during February to March 2011.

Output 2: Strengthened surveillance and response

- A Field Veterinary Epidemiology in Action course in collaboration with the Faculty of Veterinary Medicine Khon Kaen University (KKU) Thailand was organized for ten provincial officers from 4 to 22 October 2010.
- Training for Animal Disease Diagnosis to improve the capabilities of 12 staff from provincial animal disease diagnostic laboratories of Champasak and Savannakhet was organized in Champasak from 22 to 26 November 2010.
- The fourth sampling of active surveillance in nine provinces (Vientiane Capital, Vientiane, Savannakhet, Champasak, Luang Prabang, Luang Namtha, Xiengkhouang, Oudomxay and Phongsaly) was conducted from 29 November to 12 December 2010.
- The Team Leader and the Director of NAHC attended the Regional workshop on Surveillance Network Analysis Tool (SNAT) organized by the Agricultural Research for Development Centre (CIRAD) in Hanoi, Vietnam, on 4 to 5 October 2010.
- A Zoonosis Risk Assessment workshop was organized jointly by the World Health Organization (WHO) and FAO in Vientiane province from 27 to 29 October 2010.
- The project supported five follow-up outbreak investigations carried out by PAFO as part of the passive surveillance to Xiengkhouang (19 October 2010 and 29 and 30 November 2010); Xayabouly (from 13 to 16 December 2010); Phongsaly (14 December 2010); and Luang Namtha (10 January 2011).
- The Regional Project Coordinator carried out two missions to assist in data management and analysis of the active surveillance; the first mission was on 30 and 31 August 2010 and the second mission from 20 to 24 December 2010.
- Under the TCP project on H1N1, the National Animal Health Center (HC) staff conducted training and cross-sectional studies in pig population in four provinces (Vientiane Capital, Luang Prabang, Savannakhet and Champasak) between 28 September and 19 October 2010. Also bi-weekly visits and disease investigations to monitor suspected cases of swine influenza conducted in two provinces (Bolikhamxay and Khammouane) between 20 September and 22 November 2010.
- Under the IDENTIFY regional project, two biosafety experts from Asia-Pacific Biosafety Association (APBA) conducted two missions to the NAHC laboratory to demonstrate the correct use of biosafety equipments and supplies; the first mission was on 13 and 14 December 2010 and the second mission on 26 to 28 January 2011.
- One Department of Livestock and Fisheries (DLF) staff member was supported to attend a short training course on 'Veterinary Epidemiology in Action' under the Field Epidemiology Training Programme for Veterinarians (FETPV) from 17 January to 11 February 2011.

- The Evaluation and Planning workshop for HPAI surveillance to better understand the active surveillance plan, improve data and sample collection and improve coordination at all levels was organized from 3 to 5 February 2011 and attended by 45 participants.
- A field simulation exercise for HPAI rapid response team was conducted in Xiengkhouang province from 7 to 10 March 2011 with a total of 48 participants. The risk communication activity in this simulation exercise carried out in collaboration with the Academy for Educational Development (AED).
- The first round of active surveillance in ten provinces (previous nine provinces in phase IV plus Xayabouly province) was conducted from 22 March to 2 April 2011.
- Four missions were conducted by the national consultants to monitor the implementation of data and sampling collection process by PAFOs and DAFOs during the active surveillance activities in ten provinces from 22 March to 2 April 2011.

Output 3: Strengthened risk management measures, including biosecurity improvement among the high-risk poultry population

- The construction of the stall at LBM Nongleng as part of the pilot implementation on biosecurity improvement in Oudomxay province was completed by 29 November 2010.
- Two project staff together with PAFO/DAFO staff monitored the progress of the pilot implementation of the biosecurity improvement and inspected the new stall construction at LBM Nongleng in Oudomxay province from 2 to 5 December 2010.

Output 4: Strengthening capabilities to manage cross-border trade

- The International Consultant for Cross-border Activities completed a two-month mission from 27 September to 26 November 2010 and submitted his recommendations for improvement of cross-border capacity.
- The International Consultant for Cross-border Activities carried out visit to Boten, Luang Namtha province from 9 to 15 October 2010 and to Kaysone, Savannakhet province from 17 to 20 October 2010 to meet and liaise with PAFO/DAFO and the check point staff.
- Training workshop for 28 staff at the International and National Border Check-point was organized in Vientiane province from 9 to 11 November 2010.

Planned activities for the next six-month period

Output 1: Coordinated project implementation and policy support

- continue the weekly meetings of the HPAI project staff
- conduct two backstopping missions, first for a month in April 2011 and then for three months, from July to September 2011
- support bilateral meetings with Thailand and Viet Nam
- continue to participate in the discussion meetings coordinated by NEIDCO for the development of ZCM concept
- participate at the NEIDCO final wrap-up meeting of the National 5-Year Work Plan for EID and the Public Health Emergency Preparedness and Response on 21 April 2011
- participate in the USAID EPT programme for Lao PDR on 26 April 2011
- recruit an International Consultant on Veterinary Legislation for one month in June-July 2011 to assist DLF in completion of the veterinary legislation framework based on the gap analysis carried out in Phase IV
- organize final wrap-up meeting at the end of the project
- develop and produce an HPAI booklet on the achievement of the project from Phase I to V

Output 2: Strengthened surveillance and response

- participate in the Surveillance Working Group (SWG) meeting for sharing surveillance data and updating surveillance issues with other partners on 5 April 2011
- continue to conduct the second round of active surveillance in ten provinces for Phase V, from 20 June to 1 July 2011
- recruit an International Consultant on Veterinary Epidemiology for one month in May 2011 to provide recommendations on surveillance activities and data management
- conduct two training courses for outbreak investigation for PAFO and DAFO staff in the provinces of Xayabouly and Bolikhamxay in May 2011
- continue to support the Field Veterinary Epidemiology in Action training in Khon Kaen University of Thailand in June 2011
- provide laboratory diagnostic training in Phongsaly province for laboratory staff from northern provinces in August 2011
- support two NAHC laboratory staffs to learn the laboratory management and operational strategy of BSL3 facility at the Virology Research Institute (VRI) in Pakchong, Thailand on June-July 2011
- provide necessary equipment and supplies for surveillance and rapid response

Output 3: Strengthened risk management measures, including biosecurity improvement among the high-risk poultry population

- conduct the workshop to review the pilot implementation of biosecurity improvement at LBM in Oudomxay province in April 2011
- start the activities relating to the pilot implementation of biosecurity improvement in Luang Namtha province in May 2011 by conducting:
 - training on biosecurity for PAFO and DAFO officers in May 2011;
 - training for market managers, vendors and cullers/slaughterers in May 2011;
 - construction of stall at selected LBM as a prototype for biosecurity improvement in June 2011;
 - monitor progress of pilot activities in July 2011
- organize training for LBM authorities and traders associations about biosecurity
- organize training workshop for the public and private sectors on poultry production and biosecurity measures in Vientiane Capital and Savannakhet

Output 4: Strengthening capabilities to manage cross-border trade

- organize a scoping workshop in Vientiane Capital in April 2011 to map out the domestic poultry value chain to link with the cross-border trade for HPAI risk assessment
- continue to support a study to be conducted in Vientiane Capital to link the Thai cross-border poultry trade to in-country poultry production profile and its market chain
- recruit an International Consultant for Cross-border Activities for one month in July 2011 to prepare and supervise cross-border activities
- organize training to improve capabilities of border check points staff in July 2011
- organize evaluation workshop to discuss the effectiveness of measures introduced to and currently implemented at the border check points in July 2011
- provide equipment and supplies for border check points

Main challenges encountered and response provided

- Limited early reports on HPAI outbreak and insufficient outbreak investigation still need to be overcome in order to improve the capacity to respond to HPAI outbreaks and other

TADs.

- The limited availability of national veterinary human resources is a constraint to the absorption capacity of the governmental services in the country. The activities carried out under Output 2 in Phase III, IV and V of this project have addressed some of the capacity building needed.
- Gaps in knowledge have been identified regarding the process by which the H5N1 virus enters Lao PDR and how it remains and spreads within the country, owing to insufficient outbreak investigation. More evidence is being gathered through active surveillance, but this needs to be reinforced by the specific socio-economic studies planned on cross-border movements and value chains.
- There is a very limited local capacity to manage and analyse data. The absence of an effective epidemiology unit at the central level and the heavy workload of the technical staff at the provincial level have exacerbated the problem. Phase IV and V of the project should help to address this issue.
- Legislative support to animal health control still remains a challenge, although progress is being made in this area.

Main progress made towards the achievement of project outcomes

Output 1: Coordinated project implementation and policy support

- The project team revised the work plan for 2010 and reached an agreement with the Government on the schedule of implementation of the work plan.
- The draft of sublaws/decrees under the new legislation Law on Livestock and Animal Health Matters was developed and finalized.
- The National Animal Health Roadmap (NAHR) for Lao PDR was drafted based on the inputs from the veterinary services staff.
- The HPAI Prevention and Control Programme is incorporated into Strategy 1 of the National Avian Influenza Control and Pandemic Preparedness Plan 2006-2010 and will be further developed and expanded for the next five years.

Output 2: Strengthened surveillance and response

- LoAs for two rounds of active surveillance during phase V were signed between the project and the ten provinces.
- The improved risk-based active surveillance design, which incorporated the spatial and temporal distribution of HPAI and focused on duck species and LBM, was implemented and produced significant results.
- The global positioning system (GPS) tools provided by the project were utilized for recording the geo-coordinates of the active surveillance sites.
- The central and provincial staff capabilities in animal virus influenza diagnosis were improved.
- SOPs were completed and are ready to be used for control zones, culling, disease investigation in backyard poultry and commercial poultry farms and sample collection.

Output 3: Strengthened risk management measures, including biosecurity improvement among the high-risk poultry populations

- Practical biosecurity guidelines for LBMs, slaughter point and duck farms were developed with regard to the local situation. This was used as operational guidance for pilot implementation in Oudomxay province.

- A prototype stall model for biosecurity improvement was constructed and operated in one LBM in Oudomxay province.

Output 4: Strengthening capabilities to manage cross-border trade

- Cross-border trade flows and their links to domestic poultry value chain were mapped and documented for selected borders, such as with China (Luang Namtha and Oudomxay) and with Thailand and Viet Nam (Savannakhet). In Phase V, similar activity will be carried out in Vientiane Capital.
- Legislative support and technical inputs provided to revise the current decree on inspection of animal, animal products and other related products imported to and in transit through Lao PDR.

I Quarter 2010**Project Monitoring Sheet: OSRO/RAS/604/USA Baby 03**

Project title: Immediate technical assistance to strengthen emergency preparedness for highly pathogenic avian influenza (HPAI)

Reporting period: January – March 2010

Country: Lao People's Democratic Republic
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)
Code: OSRO/RAS/604/USA Baby 03
Budget: USD 1 000 000 (Phase I), 1 284 990 (Phase II), 900 000 (Phase III), 800 000 (Phase IV) Total budget: USD 3 984 990
Effective starting date: 1 August 2006
Planned end date: 30 October 2010
Context of the project The project assists the government in responding to the consequences of a possible poultry disease epidemic that could not only cause serious damage to the poultry sector, but also cause serious consequences to human health and household livelihoods.
Objectives of the project The specific objectives of the project are to: <ul style="list-style-type: none"> ▪ strengthen coordination and support avian influenza (AI) control policy development; ▪ strengthen risk-based surveillance for Highly Pathogenic Avian Influenza (HPAI) in target provinces; ▪ improve disease response capability; ▪ strengthen risk management measures, including biosecurity measures and cross border movement.
Planned activities Output 1: Coordinated project implementation and policy support <ul style="list-style-type: none"> • Organize an inception workshop to formally start the activities of the next phase (Phase IV) of the project. • Organize information, education and communication (IEC) flipcharts training and distribution at the beginning of the year. Output 2: Strengthened surveillance <ul style="list-style-type: none"> • Procure laboratory supplies as per recommendations of the short-term Laboratory consultant. • Conduct planning workshop to support active surveillance for high risk areas and targeted population on the first week of February 2010. • Conduct Epidemiology and Global Positioning System (GPS) Training during the second and third week of February 2010. • Carry out active surveillance through letters of agreement (LoAs) between the project and

the Provincial Agriculture and Forestry Offices (PAFOs) in Luang Prabang, Champasack, Savannakhet, Vientiane, Vientiane province, Luang Namtha, Oudomxay and Phongsaly in March 2010.

- Provide support to the Department of Livestock and Forestry (DLF) Epidemiology Unit in the computerization of the epidemiological data. The project will also support the nominated person on the start-up of the new practice starting from February 2010.
- Start data and sample collection training on passive surveillance in February 2010. This training will be a continuous activity.
- With an installation of the new TADinfo desktop, data entry is expected to start analyzing the disease information reports provided by the system.

Output 3: Strengthened emergency response

Print and disseminate the standard operating procedures (SOPs).

Output 4: Strengthened risk management measures, including biosecurity improvement among the high-risk poultry populations

- Organize workshop to review the existing guidelines on biosecurity improvement at live bird markets and slaughter points on the last week of March 2010.
- Plan the start of pilot introduction on biosecurity measure improvements in a duck farm in high risk area in March 2010.

Output 5: Strengthening capabilities to manage cross-border trade

Recruitment of an International Coordinator for cross-border activities to prepare and supervise all cross-border activities planned for the coming year.

Activities undertaken during the reporting period

Output 1: Coordinated project implementation and policy support

- An inception workshop to evaluate the activities implemented during Phase III and to plan the activities to be implemented during Phase IV of the project was organized from 4 to 6 February 2010.
- The training and distribution of the IEC manuals and flipcharts are being organized in conjunction with the implementation of Village Veterinary Service (VVS) training of the World Bank project.
- The Implementation Review Support of the National Avian Influenza Control and Pandemic Control and Pandemic Preparedness Plan 2006-2010 led by the World Bank was undertaken from 6 to 22 January 2010. The Food and Agriculture Organization of the United Nations (FAO) was assigned as the leading agency for the review of Strategy 1 on Animal Health. The Team Leader and National Project Director attended the progress implementation meeting with other collaborating partners.
- The National Medium Term Priority Plan (NMTPP) for Animal Health was carried out from 22 to 31 March 2010. A national stakeholder workshop was organized to develop the next five year plan for Lao Peoples Democratic Republic (Lao PDR).
- Continued conducting of the AI weekly meetings to discuss technical as well as operational issues.
- The government of Lao PDR approval for Phase IV of the project was received on 10 February 2010.
- A new administrative assistant was recruited in mid February 2010.
- The revised draft of decrees resulted from the last year workshop has been translated into

English, while currently waiting for the approval from the Minister of Agriculture and Forestry (MAF).

- The Team Leader attended the 4th Regional Annual Emergency Centre for Transboundary Animal Diseases (ECTAD) Meeting in Bangkok from 23 to 25 February 2010 and participated in the ECTAD Asia Information System in 26 February 2010 together with the National Consultant on Information Systems.
- The project team revised the 2010 work plan based on the inputs during the inception workshop.
- The project supported the translation of National Veterinary Policy into English.

Output 2: Strengthened surveillance

- One national staff was supported to attend a short training course on 'Veterinary Epidemiology in Action' under the Field Epidemiology Training Programme for Veterinarians (FETPV) from 4 to 29 January 2010 in Bangkok, Thailand.
- The proposal for the procurement of laboratory equipment and supplies for the central laboratory and two provincial laboratories in Luang Prabang and Champasak has been drafted and is waiting for budget revision.
- The Planning Workshop on HPAI Surveillance to better understand the new active surveillance design and the protocol of follow up disease investigation for passive surveillance was organized on 4 and 5 March 2010.
- The GPS training was conducted during the practical session of the Planning Workshop on HPAI surveillance.
- In collaboration with FAO- Regional Office for Asia and the Pacific (RAP), training on animal virus influenza and molecular characterisation for six laboratory staff from Lao PDR was conducted from 8 to 10 March 2010.
- The TADinfo training programs were conducted in Vientiane for central and Vientiane Capital staff from 16 to 19 February 2010, for provincial staff in Champasack from 10 to 13 March 2010, in Savannakhet from 15 to 18 March 2010 and in Luang Prabang from 29 March to April 2010.
- The LoAs for the implementation of active surveillance between the project and PAFOs in Luang Prabang, Champasack, Savannakhet, Vientiane, Vientiane province, Luang Namtha, Oudomxay and Phongsaly were signed and the recipient organizations have carried out the first round of active surveillance from 22 March to 3 April 2010.
- The International Consultant on Veterinary Epidemiology has completed two weeks mission from 15 to 27 March to review the new strategy of active surveillance and/or advise on implementation.
- One outbreak report was received from Luang Namtha province in the first week of March 2010 and an investigation team went to the field from 20 to 24 March 2010. Some samples were positive for Newcastle disease using rapid test kit, but further laboratory test is still ongoing.

Output 3: Strengthened emergency response

The final draft of SOPs was submitted by DLF to MAF for approval.

Output 4: Strengthened risk management measures, including biosecurity improvement among the high-risk poultry population

- The preparation and discussion between the project and PAFO of Oudomxay for the implementation of the pilot introduction on biosecurity improvements in a duck farm in high risk area, selected live bird markets and slaughter points is underway.

- A visit to Phongsaly province was conducted to discuss detail preparation for the implementation of simulation exercise for HPAI response in Phongsaly scheduled from 31 March to 5 April 2010.

Output 5: Strengthening capabilities to manage cross-border trade

The recruitment of an International Consultant for cross border activities is underway.

Planned activities for the next quarter

Output 1: Coordinated project implementation and policy support

- Request for the recruitment of the International Operation Officer as planned.
- Continue the weekly meetings among the HPAI project staff.
- Support the National Project Director to participate at the 7th International Ministerial Conference on Animal and Pandemic Influenza (IMCAPI) from 19 to 21 April 2010 in Hanoi, Viet Nam.
- Participation of the Team Leader and the National Project Director in the United States Agency for International Development (USAID) Partners' Meeting and Regional Workshop on Poultry Value Chain in Bangkok in June 2010.
- The training and distribution of the IEC manuals and flipcharts will be organized in conjunction with the implementation of VVS training of the World Bank project.
- A national workshop on veterinary legislation framework will be conducted in June 2010 in collaboration with the Regional Asian Development Bank Project on HPAI.

Output 2: Strengthened surveillance

- Continue to conduct the second round of active surveillance in nine provinces from 21 June to 3 July 2010.
- The procurement of necessary equipment and supplies for surveillance and laboratory diagnosis has to be finalized for all four rounds of active surveillance.
- Support National Consultant on Laboratory Diagnosis to attend training covering quality assurances, biosafety, biosecurity and phylogenetic analysis in the Australian Animal Health Laboratory in Geelong, Australia from 19 to 30 April 2010.
- In collaboration with FAO RAP, a training workshop on animal influenza surveillance will be conducted for 14 central and provincial staff from Lao PDR in May 2010.

Output 3: Strengthened emergency response

- The SOPs will be printed and disseminated after having been approved by MAF.
- A simulation exercise in Phongsaly will be conducted in April 2010.
- The recruitment of an International Consultant on Incident Command System (ICS) will be finalized.
- Necessary equipment and supplies for outbreak response will be provided.

Output 4: Strengthened risk management measures, including biosecurity improvement among the high-risk poultry populations

- A workshop to review the existing guidelines on biosecurity improvement at live bird markets and slaughter points will be organized in May 2010.
- The pilot implementation on biosecurity improvement will start in June 2010.

Output 5: Strengthening capabilities to manage cross-border trade

- Recruitment of an International Coordinator for cross-border activities. The duty of this

consultant will be the organization and supervision of all cross-border activities planned for Phase IV of the project.

- A scoping workshop will be organized with stakeholders in Savannakhet province to discuss and identify HPAI risk in relation with domestic poultry value chain and cross-border trade.
- A study tour across border of Quang Tri-Savannakhet-Mukdahan for representatives from the national and quarantine/border services of the three countries (Thailand, VietNam and Lao PDR) will be carried out in June 2010.
- A Tri-lateral workshop to be hosted by Lao PDR will be conducted in Savannakhet in June 2010.

Main challenges encountered and response provided

- The limited availability of national veterinary human resources is a constraint to the absorption capacity of the government services in the country. The activities carried out under Output 2 of the Phase III of this project have addressed some of the capacity building needed.
- For some time, the project used village chiefs and village veterinary workers as key contacts in conveying messages to poultry keepers. It is therefore essential that their further training be carried out.
- There are gaps in knowledge on the process by which H5N1 virus enters Lao PDR, how it remains and spreads within the country. More evidence is being gathered through active surveillance, but this needs to be reinforced by the specific socio-economic studies planned on cross-border movements and value chains.
- There is a very limited local capacity to manage and analyze data. The absence of an effective epidemiology unit at the central level and the heavy workload of the technical staff at the provincial level have exacerbated the problem. Phase IV of the project should help to address this issue.
- Legislative support to animal health control still remains a challenge - although progress is being made in this area.

Main progress made towards the achievement of project outcomes

Output 1: Coordinated project implementation and policy support

- The project team completed further development of the work plan for 2010 and reached an agreement on the implementation of the work plan with the nine PAFOs during the inception workshop.
- The draft of sub-laws/decrees under the new Law on Livestock and Animal Health Matters has been developed and finalized.
- The National Animal Health Roadmap for Lao PDR has been drafted based on the inputs from the veterinary services staff.

Output 2: Strengthened surveillance

- The LoAs for four rounds of active surveillance during Phase IV were signed between the project and the nine provinces.
- The new design of risk-based active surveillance which took into account the spatial and temporal distribution of HPAI has been finalized and the first round has been conducted in nine provinces.
- GPS tools provided by the project have been utilized for recording the geo-coordinates of

the active surveillance sites.

- The refresher training on TADinfo has supported the active surveillance data management system at central and four pilot provinces.
- The central and provincial laboratories' capabilities in animal virus influenza diagnosis were improved.

Output 3: Strengthened emergency response

Completion of the SOPs ready to be used for control zones, culling method, disease investigation in backyard poultry and commercial poultry farms and sample collection.

Project Monitoring Sheet: **OSRO/MYA/702/USA**

Project title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)**

Reporting period: **April to September 2013**

Country: Myanmar
Project: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)
Code: OSRO/MYA/702/USA
Budget: USD 500 000 (Phase I), USD 750 000 (Phase II), USD 375 000 (Phase III), USD 150 000 (Phase IV), USD 279 000 (Phase V), USD 275 000 (Phase VI)
Total budget: USD 2 329 000
Effective starting date: 1 January 2008
Planned end date: 30 September 2014
<p>Context of the project</p> <p>Myanmar has experienced five waves of Highly Pathogenic Avian Influenza (HPAI) outbreaks in 2006, 2007, 2010, 2011 and 2012. The last outbreaks occurred in February and March 2012 in two townships (Chaung Oo and Taungoo) in Sagaing and Bago regions, and were successfully managed. The country remains at risk from duck populations, in which the virus is endemic as well as migrating wild birds and trade with neighboring countries. The Food and Agriculture Organization of the United Nations (FAO) is implementing an avian influenza control programme funded during the reporting period by the United States Agency for International Development (USAID). The programme is being implemented in collaboration with the Livestock Breeding and Veterinary Department (LBVD) of the Ministry of Livestock, Fisheries and Rural Development (MLFRD). This report describes activities funded by the project from April 2013 to September 2013.</p>
<p>Project impact</p> <p>The impact of the project is to reduce and stop the spread of H5N1 among flocks of poultry in the country, thus reducing the risk of contagion to other mammals and humans, and avoiding the possibility of a pandemic.</p>
<p>Project outcome</p> <p>The project outcome is to continue the improvement of the capacities and capabilities of Myanmar to prevent, prepare for and respond to the outbreaks of HPAI in the animal population effectively so as to limit its impacts and risk of infection to humans.</p>
<p>Planned activities for the reporting period (April 2013 to September 2013)</p> <p>Output 1: Planning, coordination and policy support strengthened for effective management and control of HPAI and other emerging zoonoses</p> <p>In order to achieve the above output, the following activities were planned:</p> <p>Activity 1.1: Support the Country team to provide inputs for planning and coordination required at the country level.</p> <p>Activity 1.2: Support national and international coordination related to disease control. This includes active participation of the country programme with other projects or programmes, such as the European Union (EU) Highly Pathogenic Emerging Diseases (HPED) project and the Emerging Pandemic Threats (EPT) programme, and exploring collaboration with PREVENT on risk communication.</p>

Activity 1.3: Support the Government of Myanmar to participate in a laboratory quality assurance (QA) and quality control (QC) system for HPAI and regional HPAI laboratory networks.

Activity 1.4: Support LBVD staff in veterinary epidemiology training at the regional and country levels, including the Field Epidemiology Training Programme for Veterinarians (FETPV).

Output 2: Risk assessment and management strengthened along the poultry supply chain at the selected townships of Mandalay region

In order to achieve the above output, the following activities were planned:

Activity 2.1: Establish a team and network. The network will consist of FETPV graduates/trainees from LBVD, laboratory experts from Central Veterinary and Mandalay Laboratories who have been trained previously, public health authorities and community workers, etc. Through consultation with relevant authorities, identify their roles and responsibilities for surveillance and outbreak response.

Activity 2.2: Conduct longitudinal surveillance in high-risk townships and animal populations (such as ducks, wild birds, live bird markets, environment, etc.), based on the risks identified by the previous supply chain studies.

Activity 2.3: Conduct 'active clinical surveillance' during the high-risk period through 'community networks'; and strengthen 'zero reporting' from selected communities and teams.

Activity 2.4: Design and organize simulation training exercises.

Activities undertaken during the reporting period (April 2013 to September 2013)

Output 1: Planning, coordination and policy support strengthened for effective management and control of HPAI and other emerging zoonoses

Activity 1.1: Support the Country team to provide inputs for planning coordination required at the country level.

- During this period the national project team consisted of the National Project Manager, National Operations Officer and technical consultants. The biosecurity and risk management national consultant completed her appointment on 19 April. Two laboratory experts were engaged from 1 June to 31 August, one in Yangon veterinary diagnostic laboratory and the other in the Mandalay regional laboratory.
- The input of the international Country Team Leader was shared between Myanmar and Nepal. During the six months under review the team leader input to Myanmar was 90 days.

Activity 1.2: Support national and international coordination related to disease control. Interventions in coordination with the regional FAO programme during this period have included:

- The provision of essential laboratory equipment to support HPAI diagnosis including six biosecurity cabinets and three high-speed centrifuges to key laboratories. (Funded through the EU-HPED programme).
- Organizational support for and participation in a joint FAO-World Organisation for Animal Health (OIE) consultative workshop on foot-and-mouth disease control in Myanmar (from 3 to 5 April in NayPyiTaw).
- Interaction with expert groups on zoonoses (including avian influenza) in emerging livestock systems bidding for funding from the United Kingdom for joint implementation with LBVD with FAO participation.
- Working with LBVD on preparedness for influenza A(H7N9) including the conduct of a

USAID supported (OSRO/GLO/302/USA) emergency surveillance programme.

- Coordination has been maintained with the national coordinator for the PREVENT risk communication programme supporting FAO's country team activities. The National Project Manager accompanied the PREVENT risk communication expert and the national coordinator on a pre-formulation mission to NayPyiTaw, Mandalay and Sagaing from 8 to 13 May 2013. The concept document and work plan have been submitted to the LBVD Director-General and has been submitted for cabinet approval.
- The FAO country team has facilitated the participation of LBVD personnel in the following regional training modules:
 - 20–31 May, Bangkok: improving linkages between laboratory and epidemiology units
 - 26 June – 1 July, Bangkok: Bio-informatics
 - 29 July – 9 August, Viet Nam: diagnosis of H7N9 and priority swine diseases
 - 26 August – 6 September, Bangkok: diagnosis of rabies and Newcastle disease

Activity 1.3: Support the Government of Myanmar to participate in a laboratory QA and QC system for HPAI and regional HPAI laboratory networks.

- The FAO country team has continued to work with the Yangon veterinary laboratory on supporting participation in the Association of Southeast Asian Nations (ASEAN) regional laboratory network for proficiency testing in order to ensure that diagnostic capacity for HPAI is maintained.
- The requested panel of test materials has been provided by FAO to the Yangon laboratory.
- Under the regional laboratory capacity building programme LBVD laboratory staff participated in an FAO technical backstopping mission carried out with the cooperation of the National Institute of Animal Health, Thailand, to optimize the primer – probe set-up for H7N9 RT-PCR at the Yangon Veterinary Diagnostic Laboratory.

Activity 1.4: Support LBVD staff in veterinary epidemiology training at the regional and country levels, including the FETPV.

- This programme has been delayed because of the many demands placed on the small epidemiology unit and will not take place during the period under review. The LBVD epidemiology unit has provided the FAO country team with proposals (templates) to take this programme forward in the immediate future.

Output 2: Risk assessment and management strengthened along the poultry supply chain at the selected townships of Mandalay region

Activity 2.1: Establish a team and network.

- Completed in the last semester. (October 2012–March 2013).

Activity 2.2: Conduct longitudinal surveillance in high-risk townships and animal populations based on the risks identified by the previous supply chain studies.

- The field work for this activity was concluded during the last semester (October 2012–March 2013). The data were analysed and the final report prepared during the current period.
- Twenty-two duck farms from three townships in Bago, Yangon and Mandalay regions with a total start-up population of 18 472 ducklings were included in the study.
- The flock-masters were committed to advising the township veterinary officer of any health problems arising and to cooperate in sending carcasses or other material to the diagnostic laboratory. The quantity of material submitted fell well below expectations.
- At the end of the observation period at pullet stage a total of 640 sera were collected and

tested for the presence of H5 antibody using the HI test. No sample showed antibodies at a level meeting the criteria for a positive result.

- Significant losses were recorded for non-infectious causes; mainly a result of heavy floods in the region.

Activity 2.3: Conduct 'active clinical surveillance' during the high-risk period through 'community network'; and strengthen 'zero reporting' from selected communities and teams.

- The community animal health worker (CAHW) programme builds on the networking approach by taking advantage of the daily engagement of CAHWs with poultry farmers and backyard producers and has the objective to increase the two way flow of information between LBVD's township veterinary office and the poultry keepers.
- The programme was conducted in five townships over a four-month period between February and May 2013 and engaged a total of 59 CAHWs responsible for 659 commercial farms and 600 backyard producers. Within the commercial farms broiler farms were more numerous but the total number of birds on layer farms was greater. Quail and duck farms were in lesser number in these townships.
- This pilot exercise showed potential with enthusiastic involvement of most of the CAHWs but to realize the potential more effort and dedication to this programme, with support from PREVENT, is merited.

Activity 2.4: Design and organize simulation-training exercises.

- Two table top exercises on HPAI outbreak response were conducted during the period. There were 19 participants (12 male, 7 female) from LBVD at the Yangon exercise held on 18 July and 29 participants (21 male, 8 female) in the second exercise held on 24 July in Mandalay, where participants represented LBVD, Myanmar Livestock Federation and Mandalay City Development Committee.

Planned activities for the next reporting period (October 2013 to March 2014)

Output 1: Planning, coordination and policy support strengthened for effective management and control of HPAI and other emerging zoonoses

Activity 1.1: Support the country team to provide inputs for planning coordination required at the country level.

- The project team will continue to provide technical support during the reporting period through periodic meetings with the Director-General of LBVD and interaction with relevant key staff at headquarters, appropriate regional offices and technical units.

Activity 1.2: Support national and international coordination related to disease control.

- At national level, the FAO country team will maintain links and information sharing with other FAO programmes which touch upon livestock health and production as well as with other academic and development partner organizations implementing poultry sector projects and studies. The FAO Animal Health and Production team will also act as a hub for FAO regional programmes, particularly those concerning preparedness for avian influenza A (H7N9).

Activity 1.3: Support the Government of Myanmar to participate in a laboratory QA and QC system for HPAI and regional HPAI laboratory networks.

- This will be implemented through the Southeast Asia regional laboratory network supported by USAID-EPT-IDENTIFY and the EU-IIPED programme and designed to strengthen laboratory capacity, assure the quality of laboratory services, improve biosafety and facilitate networking. The laboratory proficiency-testing scheme has commenced and will continue through the next reporting period for the full range of panel items identified.

Activity 1.4: Support LBVD staff in veterinary epidemiology training at the regional and country levels including the FETPV.

- The FAO Animal Health and Production team is supporting the LBVD epidemiology unit in the planning and implementation of ten-day FETPV courses for township veterinary officers which will commence during the first quarter of the next project year.

Activity 1.5: Support the extension of proven methodologies for surveillance, disease awareness and biosecurity to selected key poultry production areas.

- The FAO Animal Health and Production team will work in close collaboration with LBVD colleagues to extend the reach of key messages on HPAI. Four orientation workshops will be conducted in areas where poultry production is making an increasingly important contribution to livelihoods but which have fallen outside the main thrust of the programme to date.

Output 2: Risk assessment and management strengthened along the poultry supply chain

Activity 2.1: Support the quality and quantity of disease information gathering and dissemination of animal health information.

- The FAO team with support from the PREVENT project will collaborate with LBVD epidemiology section and the township veterinary officers in the five targeted townships, and, through additional training and monitoring, seek to enhance the performance experienced in the earlier pilot exercise.

Activity 2.2: Conduct surveillance for both H5N1 and H7N9 at identified critical points along live bird market chains.

- The FAO Animal Health and Production team will capitalize on its unique position to bring together a national concern on H5N1 HPAI and the additional threat from the novel Chinese H7N9 virus, surveillance for which is being tackled through a regional FAO Technical Cooperation project. A dual-purpose surveillance methodology will be developed and implemented, given the fact that Myanmar is considered to be at high risk for A(H7N9) due to its shared border with China and history of informal and informal trade of poultry and poultry products.

Activity 2.3: Conduct awareness and advisory campaigns in selected areas taking advantage of market chain information.

- Recognizing that poultry disease transmission is closely linked to the live bird market trade the FAO Animal Health and Production team, in cooperation with PREVENT, will use updated market chain information to guide targeting of five one day training workshops to enhance owner awareness of the zoonotic and livelihood risks from avian influenza and the measures to manage those risks.

Activity 2.4: Strengthen biosecurity and management practices in poultry production zones.

- The density of poultry within a poultry production zone (PPZ) is such that should the biossecurity barrier be breached the potential for disaster is high calling for the highest standards in management practices within the PPZ. The national consultant for disease control will undertake two missions to key PPZs during this period to ensure best practice compliance and comprehensive understanding of the threats posed.

Main challenges encountered and response provided

In the general context, recent political changes are likely to bring additional resources and missions into Myanmar, and this is challenging given the absorptive and coordination capacity of the LBVD.

The physical separation of the project base in Yangon from the decision makers at the Ministry and LBVD headquarters in NayPyiTaw is inconvenient. Project management contrives face-to-face meetings as and when possible.

Main progress made towards the achievement of project outcomes *(from the start of the project activities)*

1. Strengthened planning and cross-sectoral coordination

Good relations with the Government are established. The coordination between the animal-human sectors has further improved with additional meetings, but further work needs to be done.

2. Strengthened laboratory capacity

The laboratory system is operating well, with recent outbreaks rapidly diagnosed and samples from field surveys being processed effectively. The laboratory information system has been developed and regularly updated to store data of samples, diagnostic results as well as laboratory inventory. Past and future participation in regional and international proficiency testing programmes is maintaining the quality of the laboratory service.

3. Strengthened disease control management capacity

There is now a much better understanding of the concepts of risk, supply chains, and of epidemiology of HPAI based on the national duck survey and national surveillance programmes, both of which were major achievements. The national commercial farm database proved to be an invaluable tool in responding to the outbreaks and identifying high-risk areas.

Project Monitoring Sheet: **OSRO/RAS/605/USA Baby 03**Project Title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)**Reporting period: **October 2010 – March 2011**

Country: Nepal
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)
Code: OSRO/RAS/605/USA Baby 03
Budget: USD 965 000 (Phases I-IV) and USD 250 000 (Phase V)
Total budget: USD 1 215 000
Effective Starting Date: 1 October 2006
Planned End Date: 30 September 2011
<p>Context of the Project</p> <p>The project is addressing the short- and medium-term actions of the Government of the Federal Democratic Republic of Nepal required to strengthen its capacity in preventing the introduction of Highly Pathogenic Avian Influenza (HPAI) and minimize its spread in the event of its occurrence. During the first quarter of 2009, the first outbreaks in Nepal were recorded. After a disease-free period of ten months, multiple outbreaks occurred during the period of January to March 2010. In contrast to the previous year, the 2010 outbreaks were attributed to clade 2.3.2 of the H5N1 virus, previously unrecorded in South Asia, suggesting an introduction through infected migrating wildfowl, rather than a cross-border one. In October 2010, the clade 2.3.2 virus reappeared in a previously infected district, indicating its persistence in reservoir species. The Government's resources, including those provided by international donors, have been severely stretched. The project has provided essential capacity building for preparedness and response. However, the scenario of declining international support for HPAI control is alarming, coupled with an increasing danger of the disease becoming endemic in Nepal, with negative consequences for the livelihoods of smallholder farmers and the control efforts of neighbouring countries.</p>
<p>Objectives of the Project</p> <p>The project has assisted the Ministry of Agriculture and Cooperatives (MOAC) in the implementation of the National Contingency Plan for HPAI. The main objective of the project is to contribute to rural development in the country by preventing and controlling the detrimental consequences of HPAI and raising awareness of other emerging infectious diseases in poultry. The expected outcome of the project is to create an effective mechanism for planning and coordination across sectors and key stakeholders involved in HPAI control activities, particularly with the United States Agency for International Development (USAID)-supported projects in Nepal and the South and Southeast Asia region.</p>
<p>Planned activities for October 2010 – March 2011</p> <p>Output 1: Monitor the avian influenza (AI) situation in the country and update the national strategy and plans.</p> <p><i>Activity 1.1. Provide working groups on Animal Health with appropriate guidance and technical assistance.</i></p> <p><i>Activity 1.2. Conduct workshops and training exercises in each region to explain surveillance modalities and facilitate planning of field work.</i></p>

Activity 1.3. Conduct outbreak response simulation exercises – at least one in each of the regions.

Activity 1.4. Support Emergency Disease Investigation Teams (EDIT) through material and logistical support.

Activity 1.5. Conduct a review of live bird markets (LBMs) and poultry value chain and establish model facilities.

Activity 1.6. Design and construct a new post-mortem facility at the central veterinary laboratory (CVL).

Activity 1.7. Develop an enhanced surveillance programme for high-risk districts.

Output 2: Improve communication between key stakeholders that share data, information and knowledge, including reports and publications on HPAI.

Activity 2.1. Strengthen functional linkages between projects funded by USAID and other key stakeholders.

Activity 2.2. Assist the Government in the improvement of the dissemination of information (i.e. bulletins, reports and updates).

Activities undertaken during the reporting period (October 2010 – March 2011)

Output 1: Monitor the AI situation in the country and update the national strategy and plans.

Activity 1.1. Provide working groups on Animal Health with appropriate guidance and technical assistance.

- The technical working group met regularly at the Directorate of Animal Health (DAH) to discuss and guide the project's implementation, focusing on the issue of reappearance of clade 2.3.2 virus in Tanahu district.
- The laboratory working group held two meetings dedicated to the topic of CVL's diagnostic capability.

Activity 1.2. Conduct workshops and training exercises in each region to explain new surveillance modalities and facilitate planning of field work.

- Rapid response team (RRT) training modules (culling, disposal, decontamination, sampling and surveillance) were conducted in Nepalgunj, Biratnagar and Bhairahawa for field technicians from Doti, Pyuthan, Salyan, Dailekh, Banke, Surkhet, Taplejung, Sankhuwasba, Bhojpur, Teratjhum, Gulmi, Sindhuli and Arghakhachi districts. Among the total of 173 trainees were ten female technicians.

Activity 1.3. Conduct simulation exercises – at least one in each of the regions.

- Jointly with the Department of Livestock Services (DLS), the first of the two planned AI outbreak simulation exercises was carried out in Dhankuta district in the Eastern Region over a five day period in March and involved some 85 participants from technical offices and stakeholder groups from the Eastern Region districts.

Activity 1.4. Support EDIT through material and logistical support.

- The central EDIT investigated suspect outbreaks in Chitwan (confirmed) and Kaski/Tanahu. Material collected by the EDIT from the two adjoining properties in Chitwan was forwarded to an international reference centre (VLA-UK), and both H5N1 and H9 AI viruses were isolated. Furthermore, material submitted from a commercial unit in Tanahu with 80 percent mortality was negative for Newcastle Disease but positive for H5 virus on rapid test and conventional polymerase chain reaction (PCR). However,

the reference lab only isolated the H9 virus.

Activity 1.5. Conduct a review of LBMs and establish model facilities.

- The project organized a workshop to examine the outcomes of the poultry value chain study completed by the SEEPOR consultancy and its implications for the risk management of the disease spread.
- Progress with the Kathmandu Municipality on construction of a market stall facility for the safe marketing of live and freshly slaughtered birds was slow. An alternative site had to be selected, and a contract was awarded for the necessary civil works. Several meetings with the concerned officers of the Municipality were necessary, and a final decision will be made by 31 March 2011.

Activity 1.6. Design and construct a new post-mortem facility at the CVL.

- The construction of a new post-mortem facility and incinerator room at the CVL to allow safe and efficient handling of potentially infected poultry carcasses is in its final stage, and the handover to the Department is being planned by 31 March 2011.

Activity 1.7. Develop an enhanced surveillance programme for high-risk districts.

- The enhanced surveillance programme covering 12 high-risk districts has been active since November 2010 and will run during the period of a perceived high risk from HPAI until the end of April 2011.
- In each participating high-risk district, eight surveillance sites were set up, each consisting of four to six contact points. Because of the number of sites, an additional monitoring layer was interposed, and district office-based focal officers and technicians provided immediate supervision.
- National consultants provided orientation and overall supervision to 150 field staff involved in the programme.

Output 2: Improve communication between key stakeholders that share data, information and knowledge, including reports and publications on HPAI.

Activity 2.1. Strengthen functional linkages between projects funded by USAID and other key stakeholders.

- In addition to the routine interactions maintained within the MOAC/DLS/DAH, the project benefited from the following opportunities to gather and share information:
 - 13-14 October 2010: CTA attended the Global Rinderpest Eradication Programme (GREP) meeting held in Rome.
 - 22 November 2010: An inception workshop was organized to update partners and implementing stakeholders on key issues relating to the project implementation.
 - Information sharing with the USAID-funded cross-border project (OSRO/RAS/701/USA) and the EU-funded SAARC regional support unit is maintained.
 - 17 December 2010: CTA participated in a workshop on the progressive control of foot-and-mouth disease (FMD), organized by the Regional Support Unit under the Highly Pathogenic Emerging and Re-Emerging Animal Diseases (HPED) programme.
 - 11 February 2011: A media sensitization workshop offered an opportunity to share information on the project's activities with media representatives.
 - 2-4 March 2011: A regional consultation on laboratory networks facilitated the regional exchange of information with colleagues working on AI control.
 - 10 January 2011: CTA attended a regional workshop on biosecurity and public private partnerships (OSRO 802 and OSRO 805), sharing information on the status of these areas in Nepal with a view to further collaboration.
 - 24-28 January: Interaction with the World Bank implementation support mission to the Avian Influenza Control Project (AICP) and AICP coordination were routinely

maintained.

- 2 February 2011: CTA and national consultant met with a group of commercial poultry producers in Chitwan district to discuss issues of biosecurity in commercial units and possible FAO interventions in this area.
- 22-24 February 2011: CTA attended the fifth annual ECTAD meeting held in Bangkok and shared information and views on AI surveillance programmes.

Activity 2.2. Assist the Government in the improvement of the dissemination of information (i.e. bulletins, reports and updates).

- The training film on simulation exercises was aired on national television on a number of occasions.
- Translation of SOPs into Nepali and of other key documents that are currently in English is forthcoming, and a further edition of the valued AI compendium to include a wider audience is in progress. A workshop was held on 3 February 2011 to collate and share the information gathered under three overseas observation tours of border controls and quarantine service operations.

Planned activities for the next six-month period

Output 1: Support DLS in planning, coordinating and managing strategies to prevent, control and eliminate outbreaks of HPAI.

Activity 1.1. Conduct regular meetings with DLS and MOAC.

- Continue close collaboration with DLS and its relevant directorates. Changing epidemiological status of HPAI in Nepal may have an impact on the currently adopted measures for early detection and rapid response, such that SOPs and the existing legal framework may need to be updated.

Activity 1.2. Maintain and further develop linkages with all AI-related projects operating in Nepal.

- The major funding source for the government interventions in the field of AI control, the World Bank-funded AICP concludes in July of this year. No other AI-specific projects are extant at this time, or envisaged in the mid-term. As the disease is now well entrenched in Nepal, there is a concern over future support to this sector. Some support may become available through programmes dedicated to emerging pandemic threats (EPT), such as the USAID EPT programme, and the HPED project funded by the European Union (EU).

Activity 1.3. Advise and support the DLS in planning and implementing AI-related activities through conferences, meetings and seminars.

- Conduct three workshops in the period June-August to examine the progress made on the prevention of HPAI and other emerging diseases, the gaps remaining and the way ahead as part of the process of project conclusion and handover.

Activity 1.4. Update and distribute relevant AI documentation, bulletins and reports including updated compendium of AI documents.

- Complete the updating and translation of the final edition of the compendium of key AI documents to produce and distribute to the target audience.

Output 2: Strengthen HPAI emergency preparedness and response capacity in Nepal.

Activity 2.1. Review the AI strategy and SOPs to keep up-to-date with the changing disease situation in the country and in the region and lessons learned from previous outbreaks.

- Encourage further debate on this issue through working group meetings and relevant workshops. The re-occurrence of HPAI owing to H5N1 clade 2.3.2 after a gap of seven months suggests that the virus is established in at least some parts of Nepal, most

probably with ducks acting as a reservoir species. Efforts should be made to confirm this situation, and initial results of a duck antibody survey are already lending support to this hypothesis. This has major implications for targeted surveillance and disease risk management.

Activity 2.2. RRT to field staff in high/medium risk districts.

- Organize two further training sessions in order to maintain the outbreak response capacity and assist in the disease detection efforts.

Activity 2.3. Plan, train, conduct and evaluate a further simulation exercise.

- Complete the final AI outbreak simulation exercise during the next semester.

Activity 2.4. Encourage and guide the development of the emergency disease investigation concept.

- Develop a more structured approach with DAH. The Department has been slow in adopting this concept, but now greater emphasis is given to this area.

Output 3: Strengthen disease surveillance.

Activity 3.1. Enhance surveillance in high-risk zones.

- Continue as planned for the remaining month of the high-risk period and evaluate the outcome and performance of the programme. Address the ways in which known weaknesses in the implementation of the programme may be overcome, while at the same time seeking to increase its efficiency by making it more sustainable without losing effectiveness.

Activity 3.2. Surveillance in buffer zones around migratory bird stop-over points, markets and resident duck populations.

- Resources remain insufficient to carry out this element of the surveillance programme in a comprehensive manner. Consideration will be given to targeting key markets and ensuring that the active surveillance programme is working effectively in those districts where the disease has surfaced in the past, prioritizing them where possible.

Output 4: Safe LBM development.

Activity 4.1 Expand model market concept.

- Complete this first initiative together with the training of market stall operators and inspectors. The slow progress of this programme in association with the Kathmandu municipality was not an encouraging approach in the Kathmandu valley.
- Continue to build on preliminary proposals to address the issue of inspection and certification and onward transportation of live birds, particularly backyard raised birds, from the high-risk district of Jhapa in Eastern Nepal. This will be coordinated with the no-cost extension phase of the OSRO INT 805 project.

Main challenges encountered and response provided

- Cross-border trading practices continue to present a major risk for Nepal, as HPAI is entrenched in Bangladesh and parts of neighbouring India. However, the introduction of the 2.3.2 clade of the virus last year and its apparent persistence in at least some parts of Nepal complicates the simplistic approach of having a high-risk belt of districts along the Indian border. The approach to risk management including targeted surveillance has to be revisited in the light of current information. The ability to manage outbreak situations has been strengthened through a programme of outbreak simulation exercises and training of field technicians in rapid response activities.

- The likely role of wild birds in the transmission of the 2010 HPAI epidemic posed an added challenge for the animal health authorities. While it may be impossible to prevent such transmission of HPAI to Nepal in the future, there is a need for the system to improve its capacity for detecting cases at the earliest instance and to take measures which prevent or limit further spread of HPAI.
- A complete understanding of the poultry market chain is essential in refining control measures. At the same time, the control measures adopted must be as efficient and cost effective as possible in order to be sustainable by the Government, and the role and participation of the private sector in developing and funding these controls addressed.
- During the 2010 epidemic, the major failings were the inability to prevent internal spread of the disease coupled with inadequate and tardy material and financial support to the affected districts (excepting Pokhara). These issues have been voiced in a lessons-learned workshop, and it is now critical that measures be taken to ensure that these issues are more effectively addressed in the future.
- Efforts to expand the knowledge base in veterinary epidemiology have so far only scratched the surface and need to be given further impetus.

Main progress made towards the achievement of project outcomes

Output 1: Monitor the AI situation in the country and update the national strategy and plans.

- Select project activities, involving capacity building of district staff in relation to disease identification, sampling, use of rapid tests, reporting, biosecurity and surveillance methodology, as well as the support given to the diagnostic services contributed significantly to the early detection of and effective response to the recent outbreaks. Table-top and field simulation exercises in particular strongly contributed to this progress.

Output 2: Improve communication between key stakeholders that share data, information and knowledge, including reports and publications on HPAI.

- Over the period of project's implementation, the number of other projects directly involved with HPAI issues steadily decreased, as for example, the AICP project, which will terminate in less than six months. The focus now is towards wider programmes, such as the HPED and EPT projects and the regional South Asian Association for Regional Cooperation (SAARC) programme, addressing transboundary animal diseases (TADs) as a whole. In light of this, the project management has avoided an insular approach and sought to place HPAI within the wider TADs environment in line with the One Health initiative.

I Quarter 2010**Project Monitoring Sheet: OSRO/RAS/605/USA Baby 03**

Project Title: Immediate Technical Assistance to Strengthen Emergency Preparedness for Highly Pathogenic Avian Influenza (HPAI) – Phase IV

Reporting period: January - March 2010

Country: Nepal
Project Title: Immediate Technical Assistance to Strengthen Emergency Preparedness for Highly Pathogenic Avian Influenza (HPAI) – Phase IV Code: OSRO/RAS/605/USA
Budget : USD 815 000 (Phase I) and USD 150 000 (Phase II) Total budget: USD 965 000
Effective Starting Date: October 2006
Planned End Date: September 2010
<p>Context of the Project</p> <p>The project is addressing the short- and medium-term actions that are to be undertaken by the Government of Nepal to strengthen its capacity in preventing the introduction of Highly Pathogenic Avian Influenza (HPAI) into the country and minimize its spread in the case of its occurrence. HPAI is presently a serious problem of regional dimensions with continuing outbreaks in Bangladesh and West Bengal, India. After a period of ten months free of clinical disease, new outbreaks were recorded and multiple ones occurred during the first quarter. The government's resources, including those provided by international donors, have been severely stretched. Under these circumstances, the project has provided an invaluable lifeline for preparedness and response. However, the scenario of declining international support for HPAI control coupled with the increasing challenge (eight districts affected in this quarter compared with a single district in the same quarter of 2009) is alarming and threatens to let Nepal slip into an endemic situation with negative consequences for the livelihoods of small farmers as well as undermining the control efforts of neighboring countries.</p>
<p>Objectives of the Project</p> <p>The execution of this project ensures assistance to the Ministry of Agriculture and Cooperatives (MOAC) to implement the National Contingency Plan for HPAI. This contributes to rural development in the country by preventing and controlling the detrimental consequences of HPAI and other emerging infectious diseases in poultry.</p> <p>The outcome will be an effective mechanism for planning and coordination across sectors and key stakeholders involved in HPAI control activities, particularly with the United States Agency for International Development (USAID) supported projects in Nepal.</p>
<p>Planned Activities</p> <p>Output 1: The AI situation in the country is monitored and the national strategy and plans are updated</p> <p><i>Activity 1.1. Working groups on Animal Health provided with appropriate guidance and</i></p>

technical assistance.

Activity 1.2. Workshops and training exercises conducted in each region to explain new surveillance modalities and facilitate planning of field work.

Activity 1.3. Simulation exercises conducted – one in each of the regions.

Activity 1.4. Emergency Disease Investigation Teams (EDIT) supported through material and logistical support.

Activity 1.5. Review of live bird markets conducted and model facilities established.

Output 2: Improved communication between key stakeholders that share data, information and knowledge, including reports and publications on HPAI

Activity 2.1. Functional linkages strengthened between projects funded by USAID and other key stakeholders

Activity 2.2. Assist the Government in the improvement of the dissemination of information (i.e. bulletins, reports, updates)

Activities Undertaken during the Reporting Period

Output 1: The AI situation in the country is monitored and the national strategy and plans are updated

Activity 1.1. Working groups on Animal Health provided with appropriate guidance and technical assistance

The Animal Health Directorate's Bird Flu Monitoring Cell receives regular reports from the programmed village monitoring programme. The value of this exercise is doubtful as it has so far failed to identify any suspect outbreaks. On the other hand, the enhanced surveillance programme has played a major role in detecting outbreaks. The programme expanded in November 2009 to 12 districts funded through this project with the remaining 14 high risk districts funded through the Government's Avian Influenza Control Project (AICP), has played a major role in detecting outbreaks. Although not every district is functioning optimally as yet, the information and material submitted to the regional laboratories from the enhanced field technician-poultry keeper contact is encouraging. This programme was teased out of the existing National Surveillance Plan, which was failing due to inadequate monitoring and guidance and a consequent lack of understanding by the district and livestock service sub-centre staff. It is critical that monitoring by the district/regional and central Directorate of Animal Health (DAH) officers is adequate and that the operators at the sub-centre level are adequately and promptly compensated for their visit costs. Inevitably, there are questions of sustainability. Targeted surveillance in the field may be an effective tool but it is costly and unlikely to be prioritized by the government once donors support lapses.

Activity 1.2. Workshops and training exercises conducted in each region to explain new surveillance modalities and facilitate planning of field work

The project supported a Department of Livestock Support Services (DLS) cross-border workshop held in Jhapa on 10 January 2010 at which the Chief Technical Adviser (CTA) presented a summary of the Food and Agriculture Organization of the United Nations (FAO)

support to HPAI prevention and control in Nepal. A consultative meeting was organized in Janakpur on 13 January 2010 followed by a workshop in Jaleswor, Mahottari district in preparation for an outbreak response simulation exercise planned from 15 to 19 April 2010. The project team briefed the USAID country director and his staff on the current HPAI situation at the American Embassy on 3 March 2010.

Training on the operation of the Real Time PCR equipment supplied by FAO was given by consultants fielded by the suppliers on 6 and 7 January 2010 to nine trainees and further hands on training using field samples to six trainees from 23 to 25 March 2010. Training was given on ELISA testing to three participants in Pokhara Regional Vet Lab from 11 to 14 March 2010 and on PCR testing at the National Avian Diseases Lab at Chitwan to three participants from 16 to 18 March 2010.

Rapid Response Team training modules (culling, disposal, decontamination, sampling, surveillance) were conducted in Dhangadhi (for Baitadi, Dadeldhura, Darchula) and Nepalgunj (for Surkhet and Rukum districts).

Activity 1.3. Simulation exercises conducted – one in each of the regions

No simulation exercises were conducted during the quarter owing to the demands of the HPAI epidemic affecting the country but preparatory visits were made in advance of the planned exercise at Mahottari district.

Activity 1.4. Emergency Disease Investigation Teams (EDIT) supported through material and logistical support

The Emergency Disease Investigation Teams (EDIT) have been active in responding to HPAI outbreaks in Pokhara, Tanahu, Banke, Dang, Chitwan, Rupandehi, Newalparasi and Kailali.

Activity 1.5. Review of live bird markets conducted and model facilities established

The poultry market chain study is underway and the project team met with the contracted consultancy group to review progress and emphasize priorities in the light of current outbreaks.

An international consultant on poultry markets made his first mission to Nepal and, accompanied by the national consultant, examined and assessed the risk situation at live bird markets and other marketing channels in the Kathmandu and Pokhara areas.

Discussions were held with representatives of Kathmandu municipality and with officers of the Marketing and Promotion Directorate of DLS. This work will continue during the next quarter.

Output 2: Improved communication between key stakeholders that share data, information and knowledge, including reports and publications on HPAI

Activity 2.1. Functional linkages strengthened between projects funded by USAID and other key stakeholders

- Coordination meetings with the AICP and DAH take place routinely.
- Coordination meetings with AICP project management and with the STOP AI team leader have also been held frequently.
- Field missions to Kaski, Janakpur, Mahottari, Chitwan, Rupandehi and Banke districts have allowed close interaction with District Livestock Service Office staff and the CTA.
- Meetings were also held with the Chief District Officers of Rupandehi and Mahottari.
- Meetings have been held with donors (actual and potential) including the head of the USAID mission in Nepal and the attaché at the European Union Office in Kathmandu.

- Meetings have been maintained with the MOAC Secretary and Joint Secretary-Planning.
- Within the United Nations (UN) organization contacts have been maintained with relevant staff from the United Nations Children's Fund (UNICEF) and World Health Organization (WHO) and frequent information sharing takes place with team members of OSRO/RAS701/USA project and the FAO Representative.
- The CTA attended a meeting of the Technical Sub Committee for Avian Influenza (TSCAD) under the chairmanship of the Secretary, Ministry of Health and Population, on the declaration of the Pokhara outbreak.

Activity 2.2. Assist the Government in the improvement of the dissemination of information (i.e. bulletins, reports, updates)

The production of training films on simulation exercises using material gathered during the Kaski simulation with some additional footage is in progress.

Planned Activities for the Next Quarter

Output 1: The AI situation in the country is monitored and the national strategy and plans are updated

Activity 1.1. The epidemic of HPAI is continuing but it is anticipated that the incidence of new cases will drop off to a low level during the coming quarter. However the situation requires strict monitoring and continuing efforts to identify and remove obstacles to early detection and swift response. Further refinements to the current legislative framework and SOPs will be necessary and the project will assist in guiding this process forward.

Activity 1.2. Rapid response team training will continue with three training sessions covering ten districts as planned.

Activity 1.3. The field AI simulations which were postponed through the demands of the HPAI epidemic will be conducted with a joint exercise (with AICP) in Mahottari and a further simulation originally planned for Rupandehi, but now subject to re-location, to be carried out during this period.

Activity 1.4. The mobile lab will be delivered during the next quarter and will be a valuable addition to the capability of the central EDIT.

Activity 1.5. The project management will monitor the progress of the poultry market study group with regular interchanges and feedback. The short term expert on poultry market bio-security and safety will complete his mission during the upcoming quarter. The focus of this input is to agree on a way forward to develop a structured and organized market for live poultry and particularly native birds from backyard producers that operates under improved hygiene and safe practices. This will involve working closely with the Department's marketing division and the Kathmandu Municipality.

Activity 1.6. The civil engineer contracted by the World Bank funded project will complete the design and cost estimate for the post mortem room at the Central Veterinary Laboratory and the tender will be launched by mid April. Subject to an acceptable bid, the contract should be signed in May and the construction completed in the final quarter.

Activity 1.7. The monitoring and analysis of the expanded enhanced surveillance programme in the twelve districts now under the project's responsibility will continue through to end April and may be extended if the epidemic has not been brought under control by that time.

Output 2: Improved communication between key stakeholders that share data, information and knowledge, including reports and publications on HPAI

Activity 2.1. The meetings held under the chairmanship of the Director General, DLS in coordination with STOP AI will continue as before and act as a forum for USAID funded projects in Nepal. The project management is also invited to attend the joint Ministry of Agriculture and Ministry of Health TSCAI.

Activity 2.2. The production of a training video utilizing the material captured during the Kaski district simulation exercise has been contracted under the terms of Letter of Agreement (LOA). Some additional materials may be required and will be captured during the planning and implementation of the Janakpur exercise.

Activity 2.3. The project will organize a number of meetings and workshops over the coming period. This will include a workshop to examine the events relating to the 2010 epidemic and the conclusions of the Crisis Management Centre (CMC) mission in order to adjust the preparedness activities in advance of the next winter season. A workshop will examine the outcome of the poultry market chain study and a further meeting will examine the progress of the project and propose interventions for the following year (Phase V).

Activity 2.4. The Compendium of Avian Influenza documents produced earlier was in high demand that it is proposed to update this product and distribute to relevant offices.

Activity 2.5. The updated and revised Standard Operating Procedures (SOPs) for HPAI stamping out has been approved by MOAC. Unfortunately, this is a continuing process and further revision may be judged necessary. Once finalized, the project will assist in producing the translation into Nepali.

Main Challenges Encountered and Response Provided

- The national strategy remains focused on early detection and effective response based on culling of poultry in affected properties. The culling zone is restricted to the immediate area and drawn up using natural barriers where possible. Compensation is paid and the level of compensation has recently been raised although still well below market value. Secondary outbreaks detected through surveillance around outbreaks are similarly culled although the cull is further restricted, often to the affected household/farm. The SOPs are under constant scrutiny. Presently, the Department is shackled by the need to declare outbreaks in newly affected districts through cabinet decision in order to activate the emergency procedures for resource provision to affected districts. Secondary outbreaks in the same district do not present this obstacle and are referred to as "hotspots". The major problem is lack of adequate financial resources to properly implement the SOPs and this leads to a reluctance to declare outbreaks because of the financial implications, leaving district offices to struggle with control actions with limited district resources.

- High risk behaviours by the communities living close to the border who continue to purchase cheaper poultry products from close-by Indian markets and by traders who make their living in part or in whole from cross border activities maintain the threat level for Nepal. The challenge, therefore, is to maintain awareness of the disadvantages of allowing the disease to enter and become established in Nepal and encourage a change in behaviour patterns that reduces that risk. Coupled with this, it is vital that the country's surveillance mechanisms are efficient in the early detection of suspect outbreaks. Current arrangements for district surveillance are deficient and do not give the level of confidence demanded. The project has developed a pilot programme for the frontline districts and is gradually extending this to other high risk districts. The ability to deal with outbreaks is being fine tuned through a programme of outbreak simulation exercises and training of field technicians in rapid response activities.
- The likely role of wild birds in the transmission of the current HPAI epidemic poses an added dimension for the animal health authorities. It may be impossible to prevent such transmission of HPAI to Nepal in the future but the system must be better able to detect cases at the earliest opportunity and to take measures which prevent or limit further spread.
- The outcome of the poultry market study may be important in refining control measures. At the same time the control measures adopted must be as efficient and cost effective as possible in order to be sustainable by government and the role and participation of the private sector in developing and funding these controls addressed.

Main progress made towards the achievement of project outcomes *(from the start of the project activities)*

Output 1: The AI situation in the country is monitored and the national strategy and plans are updated

The project programme, involving capacity building of district staff in relation to disease identification, sampling, use of rapid tests, reporting, biosecurity and surveillance methodology as well as the support given to the diagnostic services, has significantly contributed to the early detection and effective response to the recent outbreaks. Table top and particularly field simulation exercises have strongly contributed to this progress.

Output 2: Improved communication between key stakeholders that share data, information and knowledge, including reports and publications on HPAI

The project has established effective links with all the bodies concerned with delivering HPAI prevention and control programmes and is assisting the government in the management and dissemination of information relating to avian influenza.

Project Monitoring Sheet: **OSRO/RAS/605/USA Baby 03**

Project Title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza**

Reporting period: **April to September 2013**

Country: Nepal
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza
Code: OSRO/RAS/605/USA Baby 03
Budget: USD 1 594 000 (Phases I-VII) for period ending September 2013. The budget is being increased USD 150 000 for the period from October 2013 to September 2014. Total budget: USD 1 744 000
Effective starting date: 1 August 2006
Planned end date: 30 September 2014
Context of the project The project supports the Government of the Federal Democratic Republic of Nepal in strengthening its capacity to detect and contain Highly Pathogenic Avian Influenza (HPAI). The first detected outbreaks of HPAI in Nepal occurred in the eastern region in early 2009 and sporadic outbreaks have occurred in every subsequent year during the cooler months. In 2009, the virus of clade 2.2 was clearly a cross border introduction, whereas the 2010 outbreaks were most probably introduced through infected migrating birds as this was the first detection of clade 2.3.2. in South Asia. Clade 2.3.2 has evolved in subsequent years and the virus now in circulation in Nepal has been classified as 2.3.2.1a. Outbreaks have occurred in all major poultry production centres in the country which are linked by poultry market chains. During the current year the pattern of HPAI in Nepal has changed with a massive increase in the incidence of cases which commenced in the usual winter period but which have intensified through the year irrespective of climate. It has been noted that commercial units have borne the brunt of infections in 2013, unlike previous years when the focus was on backyard producers. The concerned government authorities have shown a high degree of competence in dealing with sporadic outbreaks but have been completely overwhelmed by events during the current year. FAO, with support from USAID and others, through this project, now in its seventh year, continues to provide high quality technical assistance to the government of Nepal in confronting the serious challenges posed by HPAI.
Objectives of the project The overall objective of the project is for HPAI and other emerging infectious diseases to be effectively prevented and controlled on a national scale, thereby minimizing risks to human health, food security and livelihoods. The anticipated outcome is that the Department of Livestock Services (DLS) is enabled for early detection, prompt and accurate diagnosis, and effective response to HPAI at the national level.
Activities planned for the reporting period (April to September 2013) Output 1: Planning and cross-sectoral coordination at national level strengthened Activity 1.1: Support the Government in planning and coordinating inputs at national level. In order to achieve the above output, the following activities were planned: The project team will work closely with the DLS and particularly with the Directorate of Animal Health (DAH), Central Veterinary Laboratory (CVL) and Veterinary Epidemiology Centre (VEC) to address concerns relating to the HPAI diagnostic capability at the CVL and related Regional

Veterinary Laboratories (RVLs). Together with FAO colleagues from the Kathmandu-based Regional Support Unit (RSU) of the FAO-EU-SAARC regional programme, the project team will facilitate the collection of data to assist in decision making on the question of vaccination against the H9N2 sub-type virus prevalent in Nepal and consider the findings in relation to the effects on poultry production and possible interference with H5N1 detection.

Activity 1.2: Support regional and international coordination related to disease control.

The project team will continue the coordination with FAO Emergency Centre for Transboundary Diseases (ECTAD) – Regional Office for Asia and the Pacific (RAP) to provide an emergency expert mission to examine and investigate variations in the laboratory findings between the CVL and reference laboratories to identify possible causes and to make recommendations for improvement. International support for the completion of the post-mortem room facilities and the adoption of satisfactory Standard Operating Procedures (SOPs) to reduce possible cross contamination in that unit will be sought. The country team leader will continue interaction with relevant FAO-ECTAD-RAP experts to provide necessary tools to analyse the need for action, including possible vaccination, to control H9N2 infection. The project team will coordinate with the USAID country office to ensure the latter is kept informed of developments and FAO's analysis of the situation and needed responses.

Output 2: Surveillance methodologies assimilated and integrated into DLS' regular programmes

In order to achieve the above output, the following activities were planned:

Activity 2.1: Conduct assessment and planning stakeholder workshops at development region level with inclusion of animal health, human health and civil authorities.

During the period, the project will organize three workshops, one each in the central, eastern and western development regions in advance of the next risk period. The focus will be on those districts currently deemed to be most at risk of appearance or re-appearance of HPAI and will benefit from the inclusion of local stakeholders and development partners to ensure that available resources are effectively applied to implement national strategies and SOPs.

Activity 2.2: Provide technical guidance to the VEC in designing, setting up, implementing and monitoring disease surveillance activities.

The project team will extend the gains already achieved in the handover of avian influenza surveillance activities to the VEC through technical collaboration with the Programme Director – Animal Health (PD-AH) and joint fieldwork with the VEC.

Activity 2.3: Provide technical orientation to the concerned field staff at district and regional level on the effective implementation of targeted active surveillance for HPAI.

The process of incorporation of surveillance activities into the district and regional programmes is advancing but the methodology is less well understood in some districts that have not benefited from direct FAO surveillance management in the past. The VEC will be supported in monitoring the implementation in those districts deemed deficient and training of surveillance site community contact persons will be conducted in two eastern region locations during this period.

Activity 2.4: In coordination with DAII, conduct six-monthly reviews and adjust programmes as necessary.

The reappearance of H5N1 HPAI during the risk period of October to March appears to be well established. While the disease favours poultry-dense districts, it has shown the ability to appear over a wide area of the country from the far east to the far west. The department is tasked with maintaining stakeholder alertness and ensuring that the Government services are efficient in confirming infection and responding accordingly. The project will coordinate with the DAII in conducting six-monthly lessons learned review workshops.

Output 3: VEC achieves a comprehensive and evidence-based knowledge on the endemicity of HPAI in Nepal

In order to achieve the above output, the following activities were planned:

Activity 3.1: Support and facilitate epidemiology working groups to analyse available data (national and international) and make recommendations.

Earlier work has indicated that Nepal faces three significant risks for introduction of HPAI. Cross border introduction through informal trading patterns and introduction by infected migratory birds add to the possible resurgence from virus maintained in domestic duck populations. Value chain studies have given an understanding of the movement patterns that facilitate spread. The project team will assist the department in building on this basic knowledge with the additional information obtained through analysing the outbreak pattern from each new wave of outbreak and to interpret this data to identify required adjustments to the controls in place.

Activity 3.2: Provide technical guidance to field studies with particular emphasis on market chains and live bird markets in southeastern districts with reference to cross-border chains and Gangetic plain association.

The project team has acquired a considerable database of information and extensive field based knowledge of the factors concerned in the maintenance of H5N1 infection in Nepal and is ready to share and discuss this information with colleagues within the department in order to contribute to efforts that throw light on issues that demand further study.

Activities undertaken during the reporting period (April to September 2013)

Output 1: Planning and cross-sectoral coordination at national level strengthened

Activity 1.1: Support the Government in planning and coordinating inputs at national level.

The project team, in coordination with FAO-ECTAD-RAP, was able to facilitate a backstopping mission in May from an FAO virologist. The mission reviewed the operation of avian influenza diagnosis at the CVL facilitating the reinstatement of the real time RT-PCR test for H5N1. The project team has worked closely with the Programme Director-Animal Health and his technical officers to assist in confronting the dramatic upsurge in H5N1 outbreaks occurring in Nepal during this reporting period. This has included provision of rapid antigen detection kits and Virkon S disinfectant. In addition significant quantities of primers, probes, DNA extraction kits and other diagnostic materials required for PCR testing has been procured through the project and supplied to DAH.

Activity 1.2: Support regional and international coordination related to disease control.

The team leader has interacted regularly with the WHO office in Kathmandu with regard to the zoonotic aspects of H5N1 outbreaks occurring in the country and also with the Department of Health in considering the need for awareness and preparation for any extension of the H7N9 outbreaks affecting eastern China. ECTAD-Nepal has worked closely with department colleagues in designing and implementing emergency surveillance to ascertain the status of H7N9 in Nepal. ECTAD-Nepal has also maintained continuous interaction with the United States of America Embassy and USAID-Nepal officers to interpret the current situation and consider measures to support the response of the Government of Nepal.

Output 2: Surveillance methodologies assimilated and integrated into DLS' regular programmes

Activity 2.1: Conduct assessment and planning stakeholder workshops at development region level with inclusion of animal health, human health and civil authorities.

The project organized three workshops, one each in the western, eastern and central development

regions as a follow up to the emergency surveillance for avian influenza A(H7N9) carried out in these areas which were judged at high risk for both H7N9 virus and the currently circulating H5N1 subtype. These workshops provided training for 71 stakeholders representing government and the private sector and enhanced awareness of the risks posed by the novel virus and the critical differences from H5N1 which demand additions to the existing SOPs.

Activity 2.2: Provide technical guidance to the VEC in designing, setting up, implementing and monitoring disease surveillance activities.

A surveillance orientation workshop conducted in April benefited 36 technical staff from three high-risk Kathmandu valley districts and two adjoining districts judged medium risk for HPAI. Surveillance programme monitoring missions were made in collaboration with the VEC to five district offices and six high risk service centres

Activity 2.3: Provide technical orientation to the concerned field staff at district and regional level on the effective implementation of targeted active surveillance for HPAI.

Training for community based surveillance contact persons from Bhaktapur and Makwanpur districts benefited a total of 106 contact persons.

Activity 2.4: In coordination with DAH conduct six-monthly reviews and adjust programmes as necessary.

This element of the planned programme could not be completed as the demands placed on key department officials by the unprecedented number of HPAI outbreaks precluded attention to this important facet of understanding the disease processes in the country. However, project management participated frequently in technical group discussions at the DAH on the developing situation and a coordinated response.

Output 3: VEC achieves a comprehensive and evidence-based knowledge on the endemicity of HPAI in Nepal

Activity 3.1: Support and facilitate epidemiology working groups to analyse available data (national and international) and make recommendations.

Unfortunately Nepal is still very much in the dark in respect of an understanding of the detailed mechanisms of HPAI transmission as the number of outbreaks, sometimes ten per day, have not allowed anything other than the most superficial outbreak investigation to take place. Consequently, there is a lack of understanding as to why the pattern of outbreaks in 2013 should be so different from the largely sporadic outbreaks of previous years. The multiple and rapid spread of the H5N1 virus is all the more difficult to understand when the majority of outbreaks are said to occur in commercial units with some degree of biosecurity in place which should reduce outward spread as well an inward incursion. Few outbreaks are said to have occurred in backyard units although this may be a result of detection and reporting deficiencies.

The ECTAD team, while appreciating the constraints limiting the possibility of a detailed epidemiological investigation in parallel with immediate response efforts, has convinced the programme director-animal health and his technical team that such investigation must be prioritised as soon as the resource situation permits. It is agreed that this investigation will be supported through the country programme in the coming phase, utilising FAO-RAP expertise and building on data acquired through earlier work carried out by the Regional Support Unit for HPEDs in SAARC countries.

Activity 3.2: Provide technical guidance to field studies with particular emphasis on market chains and live bird markets in southeastern districts with reference to cross-border chains and Gangetic plain association.

The project team was able to use the outputs of the market chain studies conducted under this project in earlier years to identify live bird markets and collecting yards for risk based targeted surveillance directed at H7N9 but of benefit also in surveillance for H5N1 and H9N2 viruses.

Planned activities for the next six-month period (October 2013 to March 2014)

Output 1: Cross-sectoral coordination at country and international levels strengthened

Activity 1.1: Support the ECTAD country team to provide inputs for planning and coordination at the national level.

The FAO avian influenza project national project director will continue to spearhead FAO's support to the DLS' efforts to limit the damage inflicted by HPAI on the country's poultry production sector and, taking advantage of extensive local knowledge combined with engagement with this programme from inception, will engage with key department officers to capture an in depth perception of the department's priorities and vision with regard to the events on the ground, including the private sector and political contexts. This activity will also support necessary updating and adjustment of SOPs and/or legislation through working groups.

Activity 1.2: Support national, regional and international coordination related to disease control through regular meetings.

The national project director, supported by the ECTAD sub-regional manager, will build upon the close working relationship with the DLS and heads of the DAI technical units established over preceding project phases to ensure that the resources available through FAO, including those resulting from FAO's links with relevant international agencies and organizations, are given due consideration. This may encompass technical, advisory and financial support to the government of Nepal's efforts to prevent, contain and eliminate avian influenza incursion and spread. Within this context, FAO will also address issues relating to outbreak risk communication, including the role of mass media.

Output 2: The existing mechanisms available to DLS to monitor avian influenza viruses in circulation strengthened and their relative economic and zoonotic importance assessed

Activity 2.1: Enhance surveillance at live bird markets and collecting yards.

The project will advise and support surveillance at live bird markets through three regional orientation workshops and monitoring activities conducted in coordination with VEC and DAI as these locations have been identified in other countries of the region as having a higher risk of harbouring avian influenza viruses. This will be undertaken in coordination with a TCP-funded programme to monitor for the presence of the influenza A(H7N9) virus.

Activity 2.2: Support the technical capacity of regional veterinary laboratories for avian influenza virus diagnosis

In cooperation with the central veterinary laboratory, and under the guidance of an FAO laboratory expert, the project will support the upgrading of technical capacity in selected regional laboratories, including the national avian laboratory at Chitwan and the regional laboratory at Pokhara. This would enable the national avian laboratory to conduct rapid and sensitive screening of suspect samples using M-gene PCR and, when competency is assured, H5 PCR for positives, which would take a lot of pressure off the CVL.

Activity 2.3: Support the central veterinary laboratory in maintaining comprehensive diagnostic capacity for all avian influenza sub-types that pose a threat to human and poultry health in Nepal.

FAO has been able to reinstate the real time RT-PCR for H5N1 and H7N9. To maintain and further strengthen this aspect of HPAI detection and control short-term periodic missions from FAO

laboratory experts are indicated. The project management will coordinate with DAH and VEC to identify the precise requirements and timing for this activity.

Activity 2.4: Encourage links with avian influenza reference laboratories for proficiency testing.

It is necessary to support quality assurance through sustainable engagement with proficiency testing programmes managed by international laboratory networks. The project will continue to advocate for this approach and facilitate the set-up of such a programme for avian influenza and other transboundary animal diseases of zoonotic and livelihoods importance as well as assist in upgrading technologies and capabilities where shortcomings are indicated. This will be addressed through regional laboratory network collaboration.

Output 3: Appropriate response to mitigate avian influenza virus spread during epizootics and future internal dissemination developed

Activity 3.1: Support the VEC and DAH in gathering and analysing data from the 2013 outbreaks.

To date, 2013 has seen a massive increase in the number of H5N1 outbreaks detected which have been concentrated in a small number of poultry producing zones. A major concern has been the inability to contain the outbreaks and prevent spread. This has been combined with a lack of in depth investigation into possible sources and outward flow of potentially infected birds. With guidance from expert missions from FAO-RAP, the project management will support DAH and VEC in strengthening the skill base of field veterinarians, particularly those that have been exposed to field epidemiology training through FAO, for case investigation and the VEC analysis of data gathered with a view to providing an evidence base for interventions to limit the disastrous spread of avian influenza virus presently being experienced. FAO will also provide technical assistance to combine these studies with an impact assessment on the livelihoods of those affected by the recent surge of outbreaks.

Activity 3.2: Support advocacy to influence producers and traders to adopt stronger biosecurity measures.

The adoption and maintenance of strict biosecurity measures has been shown to be at least as effective as vaccination and more economic to implement. Although this project and others have conducted training on biosecurity for farmers and their veterinary advisers and assisted in producing biosecurity guidelines appropriate for Nepal producers, it is clear from the number of outbreaks detected this year that implementation of such measures is inadequate. Further engagement with producers in key areas including live bird markets utilizing data and conclusions from activity 3.1 will be conducted with support and guidance on message elaboration and targeted delivery provided during this period through FAO.

Main challenges encountered and response provided

- Private sector cooperation with government policies and strategies for HPAI control and elimination is paramount. Such cooperation is only possible if: (i) the measures imposed on the producers can be seen by them as reasonable in relation to the degree of threat; (ii) the compensation offered is adequate; and (iii) the assistance given in re-establishing production in commercial units is sympathetic to the economics of production.
- Critical to the Government's strategy of early detection and rapid response is the capability to provide a rapid and accurate mechanism for confirming the presence of the H5N1 avian influenza virus. The project has responded by arranging for short-term training missions by FAO experts but in the long term there is a need for CVL participation in regional or international proficiency testing programmes to maintain confidence.

Main progress made towards the achievement of project outcomes**1: Planning and cross-sectoral coordination at national level strengthened**

The project management's close working relationship has ensured fruitful collaboration with DLS and the technical units of DAH, while FAO's standing in the forefront of global HPAI control strategy development and its leading position in adopting a One Health approach has contributed to maintaining an overarching and effective communication with development partners and national stakeholders.

2: Aspects of disease surveillance related to outbreak investigation strengthened

In close collaboration with the VEC, the project developed a comprehensive HPAI surveillance programme, including country-wide passive surveillance supported by active surveillance targeting districts categorized as high risk. Combined with support to the veterinary diagnostic laboratories, this has provided a basis for monitoring the avian influenza situation. The results from this programme have guided continued evaluation of national strategy and the mechanisms for its implementation.

Project Monitoring Sheet: **OSRO/BGD/101/USA**

Project title: **Strengthening Emergency Preparedness and Response for Highly Pathogenic Avian Influenza (HPAI) in Bangladesh**

Reporting period: **October 2012 to March 2013**

Country: Bangladesh
Project title: Strengthening Emergency Preparedness and Response for Highly Pathogenic Avian Influenza (HPAI) in Bangladesh
Code: OSRO/BGD/101/USA
Budget: USD 2.5 million
Effective starting date: 1 October 2011
Planned end date: 30 September 2013
<p>Context of the project</p> <p>Bangladesh is one of the five high risk countries where Highly Pathogenic Avian Influenza (HPAI) H5N1 is still considered endemic. Since March 2007, Bangladesh has reported a total of 555 outbreaks (498 commercial and 57 backyard farms). Some 52 out of 64 districts and 179 out of 492 Upazilas (sub-districts) have been affected so far. This resulted in the culling of over 2.7 million birds and the destruction of over 3.5 million eggs. Following the peak of HPAI H5N1 incidence in 2008, there were around 30 outbreaks in 2009 and 2010. Outbreaks again peaked in 2011, with 171 farms affected. However, in 2012, 23 outbreaks were reported and as of 31 March 2013, three outbreaks were confirmed for the year. While new clades 2.3, 2.1 and 2.3.4 were reported in addition to clade 2.2, only clade 2.3.2.1 remained in 2012. No fatal human cases of H5N1 virus have been reported in Bangladesh. In total, six people have been infected since 2008, of whom three were found to be clustered around a live bird market (LBM) in Dhaka in 2011. In December 2012, the Government started implementing an experimental vaccination programme in two districts (Gazipur and Kishorgonj) targeting the commercial poultry sector, which might complicate the surveillance system for HPAI. The project was extended to the end of September 2013 to enable full utilization of funds. The active surveillance system, already transferred to the Department of Livestock Services (DLS) under the World Bank (WB)-funded Avian Influenza Preparedness and Response Project (AIPRP), which was terminated on 31 December 2012, faced the risk of complete collapse. The Food and Agriculture Organization of the United Nations (FAO) provided interim support for two months (January to February 2013) until the Government secures funding.</p>
<p>Objectives of the project</p> <p>The primary objective of the project is to strengthen the emergency preparedness to prevent and control HPAI in Bangladesh. The immediate objective is to improve the HPAI surveillance capacity of the Government of Bangladesh to respond more effectively to HPAI outbreaks and thereby reduce economic losses and the global human pandemic threat. Specifically, the project aimed to achieve the following:</p> <ul style="list-style-type: none"> ▪ increased capacity of the DLS to manage the surveillance programme; ▪ early reporting of poultry diseases and early HPAI detection; ▪ increased public awareness; ▪ improved biosecurity and hygiene in poultry farms and live bird markets; and ▪ identification and elimination of the sources of HPAI infection.
<p>Planned activities</p> <p>Output A: Strengthened coordination, planning and policy support for effective management and control of HPAI and other emerging and re-emerging zoonoses</p> <p>Activities:</p> <ul style="list-style-type: none"> • refine standard operating procedures (SOPs) for outbreak investigations and implement SOPs to capture essential data; • revisit/visit all commercial farms and nearby backyard poultry holdings affected during the last four years to assess or monitor the state of biosecurity in relation to the backyards in the vicinity; • actively engage with animal health authorities as appropriate; • conduct regular meetings with DLS, the Ministry of Fisheries and Livestock (MOFL), the

Institute of Epidemiology, Disease Control and Research (IEDCR), the Ministry of Health and the World Health Organization (WHO);

- organize regular coordination meetings with key stakeholders (the Bangladesh Poultry Industries Association [BPIA], the Bangladesh Livestock Research Institute [BLRI] and the Central Disease Investigation Laboratory [CDIL]);
- attend regional meetings and workshops to integrate national project activities;
- undertake an analysis of the key strengths and weaknesses of the current control approach;
- provide technical support to facilitate contact between the Government and donors;
- take concerted action with the Government to ensure full transfer of the active surveillance responsibility to the AIPRP of the WB;
- facilitate participation of officials of national veterinary services and policy makers in regional and international conferences and seminars related to HPAI and other emerging infectious diseases;
- disseminate web-based Livestock Disease Information System (LDIS) to all Upazilas to facilitate early electronic reporting on various diseases through training of all DLS staff; and
- ensure active participation and facilitate coordination of the country programme with the regional European Union (EU)-funded Highly Pathogenic and Emerging and Re-emerging diseases (HPED) project

Output B: Enhanced outbreak response and preemptive measures to prevent the outbreaks of H5N1 in commercial farms

Activities:

- analyse data collected from post outbreak investigations of commercial and neighbouring backyard farms to identify and determine disease transmission dynamics, disseminate the findings and adjust control programme as appropriate;
- visit and seek information on signs of a small-scale mortality among poultry in backyards in areas indicated as high-risk by spatial temporal analysis of outbreaks;
- conduct epidemiological as well as virological investigations whenever crow die-offs occur in order to identify links to poultry in commercial farms as well as backyard poultry;
- study free-ranging ducks longitudinally and in depth in 50 backyards in the vicinity of affected farms for sequence analysis;
- conduct biosecurity checks and ensure good biosecurity is in place before restocking of farms where previous infections have occurred and the disease has been stamped out by culling;
- conduct field studies to identify the causes of the pronounced seasonal pattern of HPAI in Bangladesh;
- continue to collect and test samples from free-ranging duck populations in the vicinity of farms previously affected by H5N1 in order to detect hidden reservoirs;
- ensure biological samples from outbreaks and surveillance to be processed for isolation of Low Pathogenic Avian Influenza (LPAI) and HPAI at BLRI and ship to FAO/OIE Reference Lab for molecular characterization;
- strengthen capacity in DLS for molecular analysis of sequence data derived from H5N1 virus by establishing a sequence database and sequence analysis facility within FAO Avian Influenza (AI) Technical Unit;
- continue to support and strengthen the activities of the Outbreak Response Management Centre through the provision of appropriate human resources and equipment;
- further refine the geospatial mapping programme by including smaller commercial farms; and
- incorporate information on backyard poultry into the existing database.

Output C: Improved biosecurity and hygiene in backyard, commercial poultry sectors and LBMs

Activities:

- regularly assess the biosecurity of small commercial poultry farms adopting assessment tools developed by previous USAID-funded project on public-private partnership (PPP);
- encourage commercial poultry farms to be registered and compliant with regulations as well as biosecurity standards by raising public awareness in collaboration with the United Nations

Children's Fund (UNICEF) and non-governmental organizations (NGOs);

- review registration procedures for poultry farms with DLS;
- provide technical advice to the Government and stakeholders on the renovation and rehabilitation of LBMs in collaboration with AIPRP; and
- train market personnel, including veterinary officers in cleaning and disinfection exercises using power sprayers and pressure washers in collaboration with AIPRP.

Output D: PPP for the Prevention and Control of HPAI and other emerging infectious animal diseases developed and maintained

Activities

- advocate with different city corporations/municipalities and market committees for renovation of LBMs in line with established guidelines; and
- strengthen the dialogue between the public veterinary services and various stakeholders such as BPIA by holding workshops on shared interests such as biosecurity.

Output E: "One Health" initiatives through active collaboration with wildlife and public health sectors promoted

Activities

- actively engage in multi-sectoral collaborations in all areas of animal/zoonotic diseases;
- seek to increase visibility of FAO and USAID to the public in all areas of animal health issues, including important zoonotic diseases (anthrax, rabies, Nipah, H1N1 and other emerging and re-emerging infectious diseases) by actively taking the lead to demonstrate commitment;

Additional activities:

- narrowing down flocks of HPAI-infected ducks without symptoms;
- extending weekly rest day for cleaning and disinfection to the rest of the country;
- further expanding multi-sectoral collaboration with public health, wildlife/environment and universities; and
- ensuring smooth transition of activities to the new USAID project "OSRO/BGD/202/USA".

Activities undertaken during the reporting period (October 2012 to March 2013)

Output A: Strengthened coordination, planning and policy support for effective management and control of HPAI and other emerging and re-emerging zoonoses

- SOPs were reviewed, refined further and complied. They are still pending Government of Bangladesh approval.
- Daily contact was maintained with the Chief Veterinary Officer (CVO) and key DLS staff.
- Meetings (20) held with DLS on HPAI and other diseases, including three monthly meetings. Meetings (17) were also held with key stakeholders such as MOFL, IEDCR, Ministry of Health and Family Welfare (MOHFW), UNICEF and WHO, including five meetings of the National Experts Committee on Vaccination.
- Coordination meetings (5) were held with the International Centre for Diarrhoeal Diseases Research, Bangladesh (icddr,b) and other Emerging Pandemic Threats (EPT) partners (Family Health International [FHI] 360, EPT PREVENT, Eco-Health Alliance, IEDCR), BPIA (2), BLRI (11) and CDIL (12). Four general and ten project-specific BLN (lab network) coordination meetings were facilitated.
- Six regional meetings and five workshops/conferences were organized and/or attended, in order to integrate project activities (Annual Regional ECTAD [Emergency Centre for Transboundary Animal Diseases] Meeting [AREM], tripartite and sub-regional).
- Ongoing analysis of the key strengths and weaknesses of the current control approach was performed. A checklist was developed and used during field visits/outbreak investigations.
- Contact between the Government and donors was facilitated, including four meetings with USAID, four with the United States Department of Agriculture (USDA), two with WB, two with the Embassy of Japan, one with the Japan International Cooperation Agency (JICA) and participated in facilitating two senior missions of the Government of the Netherlands.
- The short message service (SMS) Gateway active HPAI surveillance system was fully transferred to DLS in 2012. The project supported SMS Gateway staff salaries for two months (January-

February 2013) following the completion of the WB-funded AIPRP on 31 December 2012.

- Support was provided to 18 officials and policy makers of the Government who participated in seven regional and international conferences/meetings related to HPAI, other emerging infectious diseases and One Health.
- Training to support a web-based information system (LDIS) to support DLS animal disease surveillance was conducted. As of the end of this reporting period, people in 394 out of 492 Upazilas and 584 DLS staff have been trained.
- HPED national expert attended a regional meeting and training in Sri Lanka, regional training in peste des petits ruminants (PPR) diagnosis conducted in Dhaka, attended by 20 Lab staff from SAARC countries. In addition, the HPED project provided reagents and equipment to PPR lab in BLRI. Of 405 serological samples tested, 193 (47.7 percent) indicated presence of antibodies. The 250 nasal swab and tissue samples tested for virus indicated 182 (72.8 percent) positive.

Output B: Enhanced outbreak response and preemptive measures to prevent the outbreaks of H5N1 in commercial farms

- Based on the report of a study in which 115 farms previously infected with H5N1 virus during the last four years were revisited. Results indicated that no improvement in biosecurity was observed and almost 50 percent of the surveyed farms had either closed or shifted to other livelihood enterprises.
- Biosecurity checks were conducted during investigations using a standard checklist, in joint post-outbreak investigations (3) with DLS and during field visits conducted by project staff. Risks were identified and reports were issued.
- Data collected from post outbreak investigations is being analysed for identifying disease transmission dynamics.
- A letter of agreement (LoA) signed with Chittagong Veterinary and Animal Sciences University (CVASU) and 1 113 samples were collected from resident and migratory birds, including 400 environmental samples from wild and domestic birds, and 84 pooled samples obtained from LBMs in Chittagong. So far, 15 samples were demonstrated to have antibodies against H5. Other tests for presence of H5N1 virus will be performed.
- Samples from free-ranging ducks were collected in 2012 (14 000); testing was performed in BLRI on 12 500 samples (1 250 pools of tens) out of which 10 pools were influenza positive (0.01 percent) and out of those 10, two were HPAI positive.
- Biological samples collected from outbreak and suspected farms continued to be sent to CDIL and BLRI. Positive samples (20) were sent to the OIE/FAO Reference Laboratory for molecular characterization, and 19 were sequenced and confirmed three sub-clades of clade 2.3.2.1.
- To strengthen the capacity in DLS for molecular analysis of sequence data, bioinformatics software was identified and the procurement process was initiated.
- Geospatial mapping database of commercial poultry farms and LBMs is being updated and validated using lists (more than 60 000) of registered farms obtained from DLS of which 15 919 records have been entered. An LoA for developing a comprehensive GIS database was prepared and the process has been initiated.
- A backyard expert was recruited and a plan to conduct a duck survey and sample collection was prepared.

Output C: Improved biosecurity and hygiene in backyard, commercial poultry sectors and LBMs

- Biosecurity of small commercial farms was assessed during outbreak investigations and field visits using biosecurity guidelines and tools developed by FAO. Fifteen draft manuals/SOPs for farm biosecurity were prepared in English and Bangla. Two workshops were organized.
- As a result of project advocacy, MoFL has issued an order for poultry farm registration. Two meetings were held with DLS to initiate farm registration. A study was conducted to assess the knowledge of DLS staff (62) and poultry farmers (329). Findings were presented in a workshop in December 2012.
- A workshop on "Advocacy for poultry farms accreditation and registration" was organized in March 2013, attended by DLS and poultry farmers associations.
- A backyard expert was recruited. Procurement of backyard poultry inputs (sheds, feed and ducks)

was initiated and 185 farmers were identified in three Upazilas in Netrakona in collaboration with DLS.

Output D: PPP for the Prevention and Control of HPAI and other emerging infectious animal diseases developed and maintained

- In collaboration with AIPRP, technical advice was provided to DLS and partners on the renovation of LBMs. A second consultant mission was completed and a report was prepared setting plans for renovating 18 LBMs in 2013 (12 under this project and 6 under OSRO/BDG/202/USA).
- Advocacy by FAO continued to enforce a weekly rest day in 69 LBMs in Dhaka, starting April 2012 for thorough cleaning and disinfection. Three more municipalities (Gazipur, Khulna and Manikanj) started enforcing the same rest days. FAO continues to provide technical support for these operations.
- Seventeen meetings were held with stakeholders to advocate for LBM renovation, decontamination, surveillance and weekly closures. Plans for developing 12 LBMs were prepared.
- Refresher training for 100 people on biosecurity and disinfection were conducted in LBMs renovated under the USAID-funded FAO/DLS project.
- Ten thousand Behaviour Change Communication (BCC) posters on regular decontamination and 5 000 posters on weekly closure were prepared and distributed through DLS to city corporations/municipalities and market committees around the country.

Output E: "One Health" initiatives through active collaboration with wildlife and public health sectors promoted

- in collaboration with key partners, actively participated and took the lead in a workshop that validated strategic framework and action plan;
- organized training of 30 multi-sectoral participants in One Health with a focus on wildlife and ecology;
- presented and participated in the international One Health Prince Mahidol conference in Thailand;
- attended more than 20 coordination meetings involving partners;
- prepared concept note for EU funding;
- signed LoA with NGO (Obhoyaronno - Bangladesh Animal Welfare Society ("O-BAWS")) which implemented rabies control and dog population management programme in Dhaka;
- collaborated with DOH, DLS and other partners for developing national strategic plan for rabies control;
- coordinated project activities with other USAID-funded projects (EPT-IDENTIFY, EPT+ and icddr,b/CDC) to ensure no duplication of efforts; and
- participated in 20 technical meetings and workshops on various diseases (anthrax, HPAI, rabies, foot-and-mouth disease and PPR).

Additional activities:

- Narrowing down flocks of HPAI-infected ducks without symptoms will be achieved with the completion of the nomadic duck surveillance in Netrokona and EPT+ studies.
- Extending weekly the rest day for cleaning and disinfection to the rest of the country has already started with three areas (Gazipur, Khulna and Manikanj).
- Further expanding multi-sectoral collaboration with public health, wildlife/environment and universities has already started with One Health training "Wildlife Investigation in Livestock Diseases and Public Health ("WILD") and LoAs with universities.
- Smooth transition of activities to project OSRO/BGD/202/USA was ensured through coordinating workplans and two no-cost extensions of the project.

Planned activities for the next three-month period

According to the no-cost extension of the project to 30 September 2013, two main components will be funded: (i) LBM development, advocacy and capacity building; and (ii) serological and virological monitoring of the experimental HPAI vaccination programme implemented by the Government. The

following activities are planned:

- upgrade biosecurity and biosafety in a maximum of 12 additional LBMs – 10 from among the already developed 24 LBMs and two new priority markets;
- intensify advocacy with city corporations/municipalities and market committees to improve biosafety and biosecurity at 12 LBMs;
- conduct regular surveillance of the additional 12 LBMs;
- train LBM personnel, traders, transporters, local government staff and veterinary officers in adopting biosafety and biosecurity measures;
- hold meetings at least once a month with all stakeholders for promoting PPP in sustaining LBM bio-security;
- raise public awareness for ensuring that bio-security is maintained and sustained in LBMs; and
- monitor and characterize presence or absence of viruses in the two districts where the Government conducted experimental vaccination (Gazipur and Kishorgonj).

Main challenges encountered and responses provided

- The Government of Bangladesh started implementing an experimental vaccination of poultry against HPAI in two districts in December 2012. This may compromise the active surveillance by masking the manifestation of symptoms in infected birds. FAO/ECTAD organized a consultative workshop to guide planning and preparation requirements and to allow participants to evaluate their preparedness, and attended technical meetings organized by DLS. Serological and virological monitoring of vaccinated poultry is planned.
- The active surveillance system on HPAI requires continued advocacy and public awareness-raising to remain operational and sustainable within the Government system, especially after the phasing out of WB funding. Advocacy on active surveillance continues.
- Sustaining and extending the LBM rest days and decontamination practices will require continued advocacy with stakeholders and monitoring. City corporations have become engaged in sustaining cleaning and disinfection activities.

Main progress made towards the achievement of project outcomes

- National capacity was built to report and effectively respond to HPAI outbreaks, including surveillance (active and passive) and diagnostic capabilities.
- The “One Health” approach has been accepted by key stakeholders, which allowed multi-sectoral collaboration between livestock, public health and environmental sectors.
- ECTAD Bangladesh has played a pivotal role in developing a national strategy for “One Health” and a five-year action plan.
- The active surveillance system, using SMS Gateway, has been successfully transferred to the Government. Alternative funding options to sustain it are being considered by the Government.
- A novel disease reporting system, LDIS has been developed and is being disseminated. Seventy percent of DLS field staff have been trained in operating the system, which will allow quick reporting of the animal health situation directly from the field to Dhaka.
- Significant technical and logistics support was provided to DLS, BLRI, CDIL, two national universities and national veterinary services in augmenting the capacity in disease surveillance, diagnosis and control/prevention.
- Biosecurity and HPAI awareness have been strengthened through active surveillance, training and dissemination of information.
- A strong partnership was established between DLS and FAO, allowing for a smooth transmission of information and collective action.
- For the improvement of LBMs, a solid partnership was established with key stakeholders, including AIPRP, DLS, local governments, icddr,b and market committees.

Project Monitoring Sheet: **OSRO/BGD/101/USA**

Project title: **Strengthening Emergency Preparedness and Response for Highly Pathogenic Avian Influenza (HPAI) in Bangladesh**

Reporting period: **April to September 2012**

Country: Bangladesh
Project title: Strengthening Emergency Preparedness and Response for Highly Pathogenic Avian Influenza (HPAI) in Bangladesh
Code: OSRO/BGD/101/USA
Budget: USD 2.5 million
Effective starting date: 1 October 2011
Planned end date: 31 December 2012
<p>Context of the project</p> <p>Bangladesh is one of the five high-risk countries that are still considered endemic for Highly Pathogenic Avian Influenza (HPAI) H5N1. Since March 2007, Bangladesh has reported a total of 550 outbreaks (493 commercial and 57 backyard farms). Some 52 out of 64 districts and 179 out of 492 Upazilas (subdistricts) have been affected so far. This resulted in the culling of over 2.5 million birds and destruction of over 3.1 million eggs. Following the peak of HPAI H5N1 incidence in 2008, the number of annual outbreaks remains at around 30 in 2009 and 2010. However, in 2011, the number of outbreaks increased to 171. The situation is compounded by the occurrence of new clades of H5N1 HPAI viruses, clade 2.3.2.1 and 2.3.4. While no fatal cases have been reported in Bangladesh, three new non-fatal human infection with H5N1 virus was reported between February and March 2012. The last three human infections were found to be a cluster in a live bird market (LBM) in Dhaka.</p>
<p>Objectives of the project</p> <p>The primary objective of the project is to strengthen the emergency preparedness to prevent and control HPAI in Bangladesh. The immediate objective is to improve the HPAI surveillance capacity of the Government of Bangladesh to respond more effectively to HPAI outbreaks and thereby reduce economic losses and the global human pandemic threat. Specifically, the project aimed to achieve the following:</p> <ul style="list-style-type: none"> • increased capacity of the Department of Livestock Services (DLS) to manage the surveillance programme; • early reporting of poultry diseases and early HPAI detection; • increased public awareness; • improved biosecurity and hygiene in poultry farms and live bird markets; and • identification and elimination of the sources of HPAI infection.
<p>Planned activities</p> <p>Output A: Strengthened coordination, planning and policy support for effective management and control of HPAI and other emerging and re-emerging zoonoses</p> <p>Activities:</p> <ul style="list-style-type: none"> • Refine Standard Operating Procedures (SOPs) for outbreak investigations and implement SOPs to capture essential data. • Revisit/visit all commercial farms and nearby backyard poultry holdings affected during the last four years to assess or monitor the state of biosecurity in relation to the backyards in the vicinity. • Actively engage with animal health authorities as appropriate. • Conduct regular meetings with DLS, the Ministry of Fisheries and Livestock (MOFL), the Institute of Epidemiology, Disease Control and Research (IEDCR), the Ministry of Health and Family Welfare (MOHFW) and the World Health Organization (WHO).

- Organize regular coordination meeting with key stakeholders (the Bangladesh Poultry Industries Association [BPIA], the Bangladesh Livestock Research Institute [BLRI], the Central Disease Investigation Laboratory [CDIL]).
- Attend regional meetings and workshops to integrate national project activities.
- Undertake an analysis of the key strengths and weaknesses of the current control approach.
- Provide technical support to facilitate contact between the Government and donors.
- Take concerted action with the Government to ensure full transfer of the active surveillance responsibility to the Avian Influenza Preparedness and Response Project (AIPRP) of the World Bank in DLS.
- Facilitate participation of officials of national veterinary services and policy makers in regional and international conferences and seminars related to HPAI and other emerging infectious diseases.
- Disseminate web-based Livestock Disease Information System (LDIS) to all Upazilas to facilitate early electronic reporting on various diseases through training of all Upazila Livestock Officers/Veterinary Surgeons.
- Ensure active participation and facilitate coordination of the country programme with the regional European Union (EU)-funded Highly Pathogenic and Emerging and Re-emerging diseases (HPED) project.

Output B: Enhanced outbreak response and preemptive measures to prevent the outbreaks of H5N1 in commercial farms

Activities:

- Analyse data collected from post outbreak investigations of commercial as well as the neighbouring backyard farms to identify and determine disease transmission dynamics, disseminate the findings and adjust control programme as appropriate.
- Visit and seek for information on signs of a small number of mortality among poultry in backyards in areas indicated as high-risk areas by spacial temporal analysis of outbreaks.
- Carry out monthly investigations of 100 villages by veterinary surgeons in Upazila Livestock Offices in frequently affected Upazilas throughout the year.
- Conduct epidemiological as well as virological investigations whenever crow die-offs occur in order to identify links to poultry in commercial farms as well as backyard poultry.
- Study free-ranging ducks longitudinally and in depth in 50 backyards in the vicinity of affected farms for sequence analysis.
- Conduct biosecurity checks and ensure good biosecurity is in place before restocking of commercial farms where previous infections have occurred and the disease has been stamped out by culling.
- Conduct field studies to identify the causes of the pronounced seasonal pattern of HPAI in Bangladesh.
- Continue to collect and test samples from free-ranging duck populations in the vicinity of farms previously affected by H5N1 in order to detect hidden reservoirs.
- Ensure biological samples from outbreak investigation and active surveillance to be processed for isolation of Low Pathogenic Avian Influenza and HPAI at BLRI and ship to FAO/ the World Organization for Animal Health (OIE) Reference Laboratory for molecular characterization.
- Strengthen capacity in DLS for molecular analysis of sequence data derived from H5N1 virus isolated in Bangladesh by establishing a sequence database and sequence analysis facility within the Food and Agriculture Organization of the United Nations

(FAO)Avian Influenza Technical Unit/Emergency Centre for Transboundary Animal Diseases (ECTAD) in collaboration with OIE/FAO Network of Expertise on Animal Influenza (OFFLU) and OIE/FAO Reference Laboratory for Avian Influenza and Newcastle Disease, Padova, Italy.

- Continue to support and strengthen the activities of the Outbreak Response Management Centre through the provision of appropriate human resources and equipment.
- Further refine the geospatial mapping programme by including smaller commercial farms.
- Incorporate information on backyard poultry into the existing database.

Output C: Improved biosecurity and hygiene in backyard, commercial poultry sectors and LBMs

Activities:

- Assess regularly the biosecurity of small commercial poultry farms adopting assessment tools developed under the previous United States Agency for International Development (USAID)-funded project on public-private partnership (PPP).
- Encourage commercial poultry farms to be registered to be compliant with regulations as well as biosecurity standards by raising public awareness in collaboration with other organizations (e.g. the United Nations Children's Fund [UNICEF], and national and international non-governmental organizations [NGOs]).
- Review registration procedures for poultry farms with DLS.
- Provide technical advice to the Government and stakeholders on the renovation and rehabilitation of LBMs in collaboration with AIPRP.
- Train market personnel, including veterinary officers in cleaning and disinfection exercises using power sprayers and pressure washers in collaboration with AIPRP.

Output D: PPP for the Prevention and Control of HPAI and other emerging infectious animal diseases developed and maintained

Activities

- Advocate with different city corporations/municipalities and market committees for renovation of LBMs in line with established guidelines.
- Strengthen the dialogue between the public veterinary services and various stakeholders such as BPIA by holding workshops on shared interests such as biosecurity.

Output E: "One Health" initiatives through active collaboration with wildlife and public health sectors promoted

Activities

- Actively engage in multi-sectoral collaborations in all areas of animal/zoonotic diseases.
- Seek to increase visibility of FAO and USAID to the public in all areas of animal health issues, including important zoonotic diseases, such as anthrax, rabies, Nipah, pandemic influenza H1N1 and other emerging and re-emerging infectious diseases by actively taking the lead to demonstrate commitment.

Activities undertaken during the reporting period (April 2012 to September 2012)

Output A: Strengthened coordination, planning and policy support for effective management and control of HPAI and other emerging and re-emerging zoonoses

- SOPs were reviewed, refined further and compiled. They are currently pending Government of Bangladesh approval.
- Daily contact was maintained with the Chief Veterinary Officer (CVO) and key DLS staff.

- More than 20 meetings with DLS on HPAI and other diseases. Meetings were also held regularly with key stakeholders such as MOFL, IEDCR, MOHFW, UNICEF and WHO, including the National Vaccination Advisory Committee meeting at the MOFL on 3 June.
- Coordination meetings were held with BPIA (one), BLRI (10) and CDIL (10). Two BLN coordination meetings were facilitated.
- Four regional meetings and workshops were organized and/or attended to integrate national project activities.
- Ongoing analysis of the key strengths and weaknesses of the current control approach was performed.
- Contact between the Government and donors was facilitated during the visits of USAID, USDA, and JICA.
- Support was provided to 18 officials and policy makers of the Government who participated in six regional and international conferences/meetings related to HPAI and other emerging infectious diseases.
- A recently developed web-based information system (LDIS) was disseminated to 394 out of 492 Upazilas in the country and 584 Upazila Livestock Officers and Veterinary Surgeons were trained.
- Support was provided to the regional EU-funded HPED project through recruitment and facilitation of technical aspects of the project.

Output B: Enhanced outbreak response and preemptive measures to prevent the outbreaks of H5N1 in commercial farms

- A total of 115 farms previously infected with H5N1 virus during the last four years were revisited to assess biosecurity status. Results indicated that no change in biosecurity was observed and almost 50% of the surveyed farms were either closed or shifted to other livelihood enterprises.
- Biosecurity checks were conducted during investigations, in post-outbreak investigations and during field visits conducted by project staff.
- Data collected from post outbreak investigations is being analyzed for identifying disease transmission dynamics.
- Samples from free-ranging ducks collected during 2011 are currently being tested. Preliminary results using pooled samples confirmed the presence of H5N1 in apparently healthy flocks.
- Biological samples collected from outbreak and suspected farms continued to be sent to CDIL and BLRI. Positive samples were sent to the OIE Reference Laboratory for molecular characterization.
- Preparations were initiated to strengthen capacity in DLS for molecular analysis of sequence data through provision of required bioinformatics software.
- Support continued to be provided to the Outbreak Response Management Centre (Control Room in DLS).
- Geospatial mapping database is being updated with poultry farm lists obtained from district and sub-district levels.

Output C: Improved biosecurity and hygiene in backyard, commercial poultry sectors and LBMs

- After continued lobbying by FAO, a weekly rest day in LBMs in Dhaka commenced in April 2012 for thorough cleaning and disinfection. FAO continues to provide technical support for these operations. To monitor the effectiveness of the process, 24 veterinarians were recruited and actively participated in technical supervision.

- The biosecurity of small commercial farms was assessed during outbreak investigations and field visits using biosecurity guidelines developed by FAO under the USAID-funded project.
- Commercial poultry farmers were encouraged to register with DLS to be compliant with national regulations as well as biosecurity standards by raising public awareness and collaborating with other organizations.
- A survey is being conducted investigating farm registration process and awareness. 48 DLS officials and 231 poultry farmers have been interviewed so far.
- In collaboration with AIPRP, technical advice was provided to DLS and partners on the renovation of LBMs.
- Refresher training for 100 people on biosecurity and disinfection were conducted in five LBMs renovated through the USAID-funded FAO/DLS project.
- An assessment was conducted to assess the renovation of 24 LBMs and to build on the success in further intervening in other LBMs. Recommendations were used to formulate the next phase of optimizing biosecurity in selected LBMs.
- Technical expert was recruited in May 2012 and provided additional technical support to the LBM operations.

Output D: PPP for the Prevention and Control of HPAI and other emerging infectious animal diseases developed and maintained

- Advocacy continued with key stakeholders, including corporations/municipalities and market committees, for renovation of LBMs in line with established guidelines. The LBM Assessment was also used as an advocacy opportunity for promoting cost sharing.
- Meetings were held between FAO/ECTAD and the market committee (New Market, Dhaka) advocating for cost sharing related to the improvement of biosecurity in LBMs.
- Dialogue between the DLS and various stakeholders such as BPIA was strengthened during field visits conducted by project staff.
- Poultry farm managers (230) were trained on “Farm biosecurity and decontamination for poultry farm managers in HPAI affected areas.

Output E: “One Health” initiatives through active collaboration with wildlife and public health sectors promoted

- In collaboration with key partners a workshop was held to validate the One Health Strategic Framework and develop an Action Plan for the next five years.
- Took the lead supporting DLS, DoH and other partners in developing national strategic plans for rabies control.
- Coordinated project activities with other USAID funded projects to ensure no duplication of effort (EPT – IDENTIFY, EPT+ and icddr,b/CDC).
- Wildlife Investigation, Livestock and Public Health - Introductory Training course in One Health was held in September.

Planned activities for the next three-month period

In addition to maintaining the activities mentioned above in Output A-E, the following activities are planned:

- narrowing down flocks of HPAI-infected ducks without symptoms;
- extending weekly rest day for cleaning and disinfection to the rest of the country;
- further expanding multi-sectoral collaboration with public health, wildlife/environment and universities; and
- ensuring smooth transition of activities to the new USAID project “OSRO/BGD/202/USA”.

Main challenges encountered and responses provided

- The government of Bangladesh made a decision to initiate an experimental vaccination of poultry against HPAI in two districts. FAO ECTAD organized a consultative workshop to guide planning and preparation requirements and to allow participants to evaluate their preparedness.
- The active surveillance system on HPAI requires continued advocacy and public awareness-raising to remain sustainable within the government system. Advocacy continues.
- Vaccination of poultry against HPAI might compromise the active surveillance by masking manifestation of symptoms in infected birds. Sero-surveillance of vaccinated poultry is planned.
- Collaboration with wildlife/environmental as well as public health sectors was needed to strengthen surveillance. Multisectoral collaboration was strengthened under One Health initiative.
- Decontamination practices at LBMs by trained market cleaners are irregular: cleaners should be stably employed by the market committee. The City Corporation has actively become engaged in sustaining cleaning and disinfection activities.
- Weekly rest day of LBMs needs to be continued and extended to the whole country to minimize a risk of HPAI virus circulation in LBMs. Advocacy and raising public awareness are continuing.

Main progress made towards the achievement of project outcomes

- A successful active surveillance system on HPAI H5N1 using SMS Gateway has been developed.
- The active surveillance system using SMS Gateway has been successfully incorporated in the Government system except for the central server and the database.
- The established active surveillance system on HPAI using SMS Gateway was acclaimed as the “best practice” among the countries in the regions (Southeast Asia and South Asia) at the 6th Regional ECTAD Meeting, held from 20 to 22 February 2012 in Bangkok.
- A novel disease reporting system, LDIS has been developed and is being disseminated throughout the country to allow quick reporting of animal health situation directly from the field to the headquarters.
- The “One Health” concept has been accepted by the general public to the level of allowing multi-sectoral collaboration possible between livestock, public health and environment sectors in Bangladesh.
- ECTAD Bangladesh has played a pivotal role in developing a national strategy for the “One Health” approach.
- A 5-year action plan on One Health has been developed.
- The ECTAD Unit provided significant technical and logistic support to DLS, BLRI, CDIL and national veterinary services in augmenting the capacity in disease surveillance, diagnosis and control/prevention.
- Biosecurity and HPAI awareness are strengthened through active surveillance, training and dissemination of information.
- FAO contributed to the development of the second national AIPRP in Bangladesh (2011–2016).
- Strong partnership was established between DLS and FAO, allowing for smooth transmission of information and collective action.
- For the improvement of LBMs, a solid collaboration was established with AIPRP and DLS.

Project Monitoring Sheet: **OSRO/BGD/202/USA**

Project title: **Strengthening national capacity to respond to Highly Pathogenic Avian Influenza (HPAI) and emerging and re-emerging diseases in Bangladesh.**

Reporting period: **October 2012 to March 2013**

Country: Bangladesh
Project title: Strengthening national capacity to respond to Highly Pathogenic Avian Influenza (HPAI) and emerging and re-emerging diseases in Bangladesh
Code: OSRO/BGD/202/USA
Budget: USD 2 million
Effective starting date: 1 October 2012
Planned end date: 30 September 2013
<p>Context of the project</p> <p>The Food and Agriculture Organization of the United Nations (FAO) and its Emergency Centre for Transboundary Animal Diseases (ECTAD) continues to support the Government of Bangladesh in controlling Highly Pathogenic Avian Influenza (HPAI) H5N1 outbreaks and in building national veterinary service capacity to report and respond to outbreaks. These efforts were initiated in 2007 after which successive projects were designed and implemented to assist the Government. However, Bangladesh remains one of five countries in which HPAI is still considered endemic. Since March 2007, there have been a reported total of 555 outbreaks (498 commercial and 57 backyard farms) in Bangladesh. Some 52 out of 64 districts and 179 out of 492 Upazilas (sub-districts) have been affected so far. This resulted in the culling of over 2.7 million birds and the destruction of over 3.5 million eggs. Following the peak of HPAI H5N1 incidence in 2008, the number of annual outbreaks remains at approximately 30 in 2009 and 2010. Another peak was reported 2011, when the number of outbreaks reached 171. However, in 2012, a total of 23 outbreaks were reported. In 2013, and as of March 31, three outbreaks were confirmed. While new clades 2.3, 2.1 and 2.3.4 were reported in addition to clade 2.2, only clade 2.3.2.1 remained in 2012. No fatal human cases of H5N1 virus have been reported in Bangladesh. In total, six people were infected since 2008, out of whom three were found to be clustered near a live bird market (LBM) in Dhaka in 2011. In December 2012, the Government started implementing an experimental vaccination programme in two districts (Gazipur and Kishorgonj) targeting the commercial poultry sector, which might complicate the surveillance system for HPAI. The project was extended until the end of September 2013 to enable full utilization of funds. The active surveillance system, already transferred to the Department of Livestock Services (DLS) under the World Bank (WB) funded Avian Influenza Preparedness and Response Project (AIPRP), which was terminated on 31 December 2012, faced the risk of complete collapse. FAO provided interim support for two months (January to February 2013) until the Government was able to secure its funding. Moreover, Bangladesh also faces the risks of other emerging disease threats, which broadened the scope of the ECTAD mandate to address these issues through the <i>One Health</i> approach.</p>
<p>Project Impact</p> <p>The project will contribute to the improvement of livelihoods of vulnerable populations in Bangladesh by safeguarding human and animal health, and improving food security and safety.</p>
<p>Outcome of the project</p> <p>The outcome of the project is a decreased spread of H5N1 HPAI and other emerging and re-emerging diseases of significant public health and economic impact in the country. This will be achieved through enhanced coordination, multi-sectoral approach, outbreak management, disease surveillance systems and biosafety and bio-security at farm and LBM levels.</p>
<p>Planned activities</p> <p>Output 1: Coordination, planning and policy support for effective management and control of HPAI and other emerging and re-emerging diseases strengthened.</p> <p><i>Activities:</i></p> <p>1.1 Support the Country Team Leader and the Team to provide inputs for planning coordination required at the country level.</p> <p>1.2 Actively engage with animal health authorities as appropriate.</p>

- 1.3 Conduct regular meetings with DLS, the Ministry of Fisheries and Livestock (MOFL), Institute of Epidemiology, Disease Control and Research (IECDR), Ministry of Health and Family Welfare (MOHFW), International Centre for Diarrheal Diseases Research, Bangladesh (Icddr,b) and the World Health Organization (WHO) to promote *One Health* coordination using avian influenza (AI) as a model.
- 1.4 Organize regular coordination meetings with DLS and MOFL, and liaise with relevant stakeholders in the public and private sectors.
- 1.5 Attend regional meetings and workshops to integrate national project activities and to facilitate coordination of the country programme with national, regional and global projects (AIPRP, the European Union (EU) Highly Pathogenic Emerging Diseases (HPED) programme, the United States Agency for International Development (USAID) Emerging Pandemic Threats (EPT), EPT Plus, etc.).
- 1.6 Undertake an analysis of the key strengths and weaknesses of the current control approach including the HPAI vaccination policy and provide the policy advice and necessary support to the Government, including post-vaccination serological and virological monitoring.
- 1.7 Provide technical support to facilitate contact between the Government, FAO and donors.
- 1.8 Facilitate the participation of officials of national veterinary services and policy makers in regional and international conferences and seminars related to HPAI and other emerging infectious diseases.
- 1.9 Ensure the active participation, as appropriate, and facilitate the coordination of the country programme with other projects or programmes (including EU-HPED, AIPRP, EPT and EPT Plus) and explore collaboration with PREVENT on risk communication and prevention at the LBMs.
- 1.10 Advocate with poultry farmers and associations to adopt biosecurity measures at the farm level.
- 1.11 Advocate with DLS and poultry associations to encourage commercial poultry farmers to register their farms in compliance with regulations, including biosecurity guidelines.

Output 2: Veterinary services capacity in HPAI surveillance and control enhanced.

Activities:

- 2.1 Review and refine standard operating procedures (SOPs) already developed by the ECTAD-Bangladesh Team for controlling HPAI and other zoonotic diseases, to ensure good practice, based on international requirements.
- 2.2 Ensure full operation and dissemination of web-based Livestock Disease Information System (LDIS) by following up on its implementation for the timely electronic reporting on HPAI and other zoonotic diseases by all Upazila Livestock Offices and Disease Investigation Laboratories, and assist the Epidemiology Unit and Outbreak Response Management Centre of DLS to conduct outbreak investigations and process epidemiological data to identify disease transmission dynamics and adjust control programmes as appropriate.
- 2.3 Create and operationalize the Bangladesh Laboratory Response Network in collaboration with FAO/USAID's EPT-IDENTIFY project and the DLS, Directorate General of Health and other partners involved in providing laboratory services; ensure coordination with EPT-IDENTIFY.
- 2.4 Visit and seek information for signs of small-scale mortality among poultry in backyards in areas indicated as high risk by spatial temporal analysis of outbreaks.
- 2.5 Conduct epidemiological studies, in collaboration with DLS and other relevant stakeholders, to identify the trends and patterns of HPAI in Bangladesh, as well as virological investigations whenever crow and other bird die-offs occur, in order to identify links to poultry in commercial farms and backyards.
- 2.6 Continue conducting an in-depth longitudinal study that has already been initiated on free-ranging ducks in the vicinity of affected farms for sequence analysis in five selected districts and ensure synergy with the EPT Plus activities.
- 2.7 Ensure biological samples from outbreak investigations and active surveillance to be processed for isolation of low pathogenic avian influenza (LPAI) and HPAI in Central Disease Investigation Laboratory (CDIL) and Bangladesh Livestock Research Institute (BLRI) and shipped to the FAO/World Organisation for Animal Health (OIE) Reference Laboratory for molecular characterization.
- 2.8 Strengthen the capacity of DLS and BLRI for molecular analysis of sequence data derived from the H5N1 virus isolated in Bangladesh.
- 2.9 In collaboration with the environmental/forestry sector, monitor wild birds and cases of unusual death to effectively roll out preventive measures such as carcass disposal before being scavenged by crows or other animals to contain the virus and to have samples collected.
- 2.10 Further refine the geospatial mapping programme by including smaller commercial farms.

- 2.11 In collaboration with DLS, regularly assess the biosecurity of commercial poultry farms adopting assessment tools developed under a previous USAID-funded project on public private partnership (PPP).
- 2.12 Support the participation of national epidemiologists from DLS to the Regional Field Epidemiology Training Programme for Veterinarians (RFETPV).

Output 3: Bio-security of Live Bird Markets improved through targeted renovation.

Activities

- 3.1 Select and upgrade biosecurity in up to six LBMs out of the already developed 24 LBMs.
- 3.2 Intensify advocacy with city corporations/municipalities and market committees to improve biosafety at LBMs.
- 3.3 Conduct regular surveillance of the 24 LBMs.
- 3.4 Train LBM personnel, traders, and veterinary officers in adopting biosafety and biosecurity measures and conduct refresher training of LBM cleaners and traders in cleaning and disinfection exercises following SOPs in collaboration with DLS and city corporations/municipalities/development authorities and AIPRP.
- 3.5 Hold meetings at least once a month with market committees for promoting PPP in sustaining the bio-security in LBMs, and continue to provide technical advice to the Government and stakeholders on the renovation and rehabilitation of LBMs in collaboration with the AIPRP of the WB.
- 3.6 Raise public awareness for ensuring that bio-security is maintained in LBMs and poultry farms and distribute communication materials on biosafety and biosecurity in collaboration with stakeholders, including DLS, AIPRP, city corporations/municipalities, school teachers, religious leaders and the United Nations Children's Fund (UNICEF).

Output 4: A model for HPAI safety developed through health certification.

Activities:

- 4.1 Hold meetings with the DLS Services to adopt a short message service (SMS) gateway system and geospatial maps of commercial farms for monitoring the movement of poultry from production to live bird markets.
- 4.2 Initiate a pilot study for monitoring poultry movement and its biosecurity practices using the SMS system by selecting one major live bird market in Dhaka.

Sub-activities include:

- 4.2.1 Support DLS in establishing checking posts for monitoring the movement on the routes of poultry transportation into Dhaka.
- 4.2.2 Assess the feasibility of the monitoring used the system.
- 4.2.3 Expand the system to the remaining LBMs in Dhaka.

Activities undertaken during the reporting period (October 2012 to March 2013)

Output 1: Coordination, planning and policy support for effective management and control of HPAI and other emerging and re-emerging diseases strengthened.

- Several funding proposals, concept notes and two progress reports were prepared.
- Daily contact was maintained with the Chief Veterinary Officer (CVO) and key DLS staff.
- More than 20 meetings with DLS on HPAI and other diseases, including three monthly meetings. Seventeen meetings were also held with key stakeholders such as MOFL, IEDCR, MOIIFW, UNICEF and WHO, including five meetings of the National Experts Committee on Vaccination.
- Coordination meetings (5) were held with icddr,b and other EPT partners (Family Health International [FHI] 360, EPT PREVENT, Eco-Health Alliance, IEDCR), BPIA (two), BLRI (11) and CDIL (12) to promote a *One Health* approach. There were more than coordination meetings in total.
- Six regional meetings and five workshops/conferences were organized and/or attended to integrate project activities (Annual Regional ECTAD Meeting [AREM], tripartite and sub-regional).
- Ongoing analysis of the key strengths and weaknesses of the current control approach was performed. A checklist developed and used during field visits/outbreak investigations.
- Contact between the Government and donors was facilitated, including four meetings with

USAID, four with the United States Department of Agriculture (USDA), two with WB, two with Japan Embassy, one with the Japan International Cooperation Agency (JICA) and participated in facilitating two senior missions by the Government of the Netherlands.

- Support was provided to 18 officials and policy makers of the Government who participated in seven regional and international conferences/meetings related to HPAI, other emerging infectious diseases and *One Health*. ECTAD presented and participated actively in the international One Health Prince Mahidol conference held in Thailand in January 2013, Kunming, China in August 2012 and Bali, Indonesia in September 2012.
- A concept note was prepared for EU funding for a regional *One Health* project.
- A letter of agreement (LoA) was implemented with a non-governmental organization (NGO) (Obhoyarouno - Bangladesh Animal Welfare Society ("O-BAWS")) which implemented rabies control and dog population management programmes.
- Took the lead in supporting DLS, Department of Health (DoH) and other partners in developing national strategic plans for rabies control.
- ECTAD took the lead in coordinating EPT partners in Bangladesh – four coordination meetings held. Three meetings with FHI 360 PREVENT were held to explore collaboration in Khulna slaughterhouse.
- ECTAD and icddr,b collaborated in LBM duck and pig surveillance and sharing of information. icddr,b animal health laboratory will conduct sample testing for EPT+ samples.
- Project activities were coordinated with other USAID funded projects to ensure no duplication of efforts (EPT-IDENTIFY, EPT+ and icddr,b/Center for Disease Control and Prevention [CDC] Atlanta).
- An LoA with Chittagong Veterinary And Animal Sciences University (CVASU) was signed, data was collected, analysis is ongoing to detect incursion of new influenza viruses in migratory birds in five districts. A total of 657 samples were collected and tested.
- Project staff participated in twenty technical meetings and workshops on various diseases (anthrax, HPAI, rabies, foot-and-mouth disease and *peste des petits ruminants* [PPR]).
- An HPED national expert attended a regional meeting and training in Sri Lanka. The regional training in PPR diagnosis, conducted in Dhaka, was attended by 20 laboratory staff from the South Asian Association for Regional Cooperation (SAARC) countries. Reagents and equipment were provided to the PPR in BLRI. Of the 405 serological samples tested, 193 (47.7 percent) indicated presence of antibodies, and the 250 nasal swab and tissue samples tested for virus indicated 182 (72.8 percent) positive.
- The biosecurity of small commercial farms was assessed during outbreak investigations and field visits using biosecurity guidelines and tools developed by FAO. Fifteen draft manuals/SOPs for farm biosecurity were prepared in English and Bangla. Two workshops were organized.
- As a result of project advocacy, MoFL has issued an order for poultry farm registration. Two meetings were held with DLS to initiate poultry farm registration. A study was conducted to assess the knowledge of DLS staff and poultry farmers. Sixty-two DLS staff and 329 farmers were interviewed and the findings were presented in a workshop attended by DLS senior staff in December 2012. A workshop on "Advocacy for poultry farms accreditation and registration" was organized in March 2013, and was attended by DLS and poultry farmers associations. Thirty percent of poultry farms are registered as a result of project advocacy.

Output 2: Veterinary services capacity in HPAI surveillance and control enhanced.

- SOPs were reviewed, refined further and complied. They are still pending Government of Bangladesh approval.
- LDIS – a web-based information system to support DLS animal disease surveillance – was disseminated to 394 out of 492 Upazilas in the country: 584 DLS staffs were trained.
- Biosecurity checks were conducted during investigations using a standard checklist, in three joint post-outbreak investigations with DLS and during field visits conducted by project staff. Risks were identified and reports were issued.
- The Bangladesh Laboratory Response Network (BLRN), which was established in 2011 with key players (DLS, BLRI, icddr,b, Bang Agric and Chittagong Universities) was represented. Four

general and 10 project-specific meetings were held; activities were coordinated and resources were shared.

- Data collected from post outbreak investigations is being analyzed for identifying disease transmission dynamics.
- A backyard expert was recruited and plans to conduct a duck survey and sample collection has been prepared.
- An LoA has been signed with CVASU. Sample were collected (600 serum and 657 cloacal swabs) from 657 resident and migratory birds, from April to December 2012. The total number of samples collected as of the end of February 2013 is 1 113. An additional 400 environmental samples were collected from wild and domestic birds, and 84 pooled samples were obtained from LBMs in Chittagong. Laboratory testing is ongoing. So far, 15 samples were demonstrated to have antibodies against H5. Other tests for the presence of H5N1 virus will be performed.
- Samples from free-ranging ducks were collected in 2012 (14 000). Testing was performed in BLRI on 12 500 samples (1 250 pools of tens) out of which 12 pools were HPAI positive (0.96 percent).
- An additional 3 500 duck samples were collected through the EPT+ programme and are still continuing.
- Biological samples that were collected from outbreak and suspected farms continued to be sent to CDIL and BLRI. Twenty positive samples were sent to the OIE/FAO Reference Laboratory for molecular characterization, out of which 19 were sequenced and confirmed for various sub-types of clade 2.3.2.1.
- To strengthen capacity in DLS for molecular analysis of sequence data, bioinformatics software was identified and the procurement process initiated.
- A One Health training “Wildlife Investigation in Livestock Diseases and Public Health (“WILD”) was conducted, focusing on forests and ecology and was attended by 30 participants with focus on environmental and forest issues.
- Geospatial mapping database, which includes commercial poultry farms and LBMs, is being updated and validated using lists (more than 60 000) of registered farms obtained from DLS district and sub-district levels, out of which 15 919 records have been entered. An LoA for developing a comprehensive GIS-based database was prepared and the process was initiated.
- Four DLS participants could not attend the SAARC FETPV training in Nepal in November 2012 owing to delayed release process. They are expected to attend in September 2013.

Output 3: Bio-security of Live Bird Markets improved through targeted renovation.

- A second consultant mission was completed and the report was prepared, setting plans for renovating 18 LBMs in 2013 (six under this project and 12 under OSRO/BDG/101/USA). An architect has been recruited and has already prepared drawings and bill of quantity (BOQ).
- Lobbying by FAO continued to enforce a weekly rest day in LBMs in 69 markets in Dhaka, which commenced in April 2012 for thorough cleaning and disinfection. Other parts of the country (Gazipur, Khulna and Manikanj) started enforcing similar policies. FAO continues to provide technical support for these operations through the presence of veterinarians at the LBM level.
- Seventeen meetings were held with stakeholders to advocate for LBM renovation, decontamination, surveillance and weekly closures. Plans for developing six LBMs have been prepared.
- Refresher training for 100 people on biosecurity and disinfection were conducted in LBMs renovated through the USAID-funded FAO/DLS project.
- Ten thousand Behaviour Change Communication (BCC) posters on regular decontamination and 5 000 posters on weekly closure were prepared and distributed through DLS to city corporations/municipalities and market committees around the country.
- A protocol has been developed for LBM surveillance; 19 LBMs have been covered by surveillance; 2 590 samples have been collected; and 50 (2 percent) positive cases were detected.

Output 4: A model for HPAI safety developed through health certification.

- Twelve posts were established by DLS around Dhaka to monitor poultry movement and to look for signs of HPAI
- The model will be developed in the next quarter.

Additional activities performed:

- The project supported SMS gateway staff salaries for two months (January to February 2013) following the completion of the WB-funded AIPRP on 31 December 2012. The Government is currently looking for an alternative funding mechanism.

Planned activities for the next three-month period

In addition to maintaining the activities mentioned above in Outputs 1-4, the following activities are planned:

- use findings of duck surveillance to narrow down flocks of HPAI-infected ducks without symptoms;
- extend weekly rest day for cleaning and disinfection to the rest of the country;
- post-vaccination serological and virological monitoring;
- develop a model for HPAI safety through health certification;
- hold meetings with the DLS to adopt SMS gateway system and geospatial maps of commercial farms for monitoring the movement of poultry from the production to live bird markets;
- initiate a pilot study for monitoring poultry movement and its biosecurity practices using the SMS system by selecting one major LBM in Dhaka;
- assess the feasibility of the monitoring by using the SMS system; expand the SMS system to the remaining LBMs in Dhaka.

Main challenges encountered and responses provided

- The Government of Bangladesh started implementing an experimental vaccination of poultry against HPAI in two districts in December 2012, which might compromise the active surveillance by masking manifestation of symptoms in infected birds. FAO ECTAD organized a consultative workshop to guide planning and preparation requirements and to allow participants to evaluate their preparedness, and attended technical meetings organized by DLS. Serological and virological monitoring of vaccinated poultry is planned.
- The active surveillance system on HPAI requires continued advocacy and public awareness-raising to remain operational and sustainable within the government system, especially after the phasing out of WB funding on 31 December 2012. FAO/ECTAD, through the project, supported the salaries of field surveillance staff for two months (January-February 2013) and the Government is currently looking for alternative funding options.
- Sustaining and extending the LBM rest days and decontamination practices will require continuous advocacy with stakeholders and monitoring. City Corporations have become engaged in sustaining cleaning and disinfection activities.
- The institutionalization of *One Health* remains a priority. Funding and coordination efforts must continue.

Main progress made towards the achievement of project outcomes

- National capacity was strengthened to report and effectively respond to HPAI outbreaks, including surveillance (active and passive) and diagnostic capabilities.
- Significant technical and logistic support was provided to DLS, BLRI, CDIL, two national universities and national veterinary services in augmenting the capacity in disease surveillance, diagnosis and control/prevention.
- The project sustained and guaranteed smooth continuity of activities initiated by preceding USAID-funded projects, and facilitated coordination with other projects and partners (EPT, EPT Plus, Food Safety and F111 360 EPT PREVENT, Eco-Health Alliance and icddr,b/CDC).
- The focus of the *One Health* approach has shifted from conceptual acceptance by key stakeholders to the adoption of strategies through which it can be practically implemented (in

terms of funding and institutions), especially in integrating the food safety sector, which will allow Bangladesh to achieve significant progress in the near future. ECTAD Bangladesh will continue to play a pivotal role in this evolutionary process.

- A novel disease reporting system, LDIS, has been developed and is being disseminated. Seventy percent of DLS field staff have been trained in operating the system, which will allow quick reporting of animal health situation directly from the field to the Dhaka.
- Biosecurity and HPAI awareness have been strengthened through active surveillance, training and dissemination of information.
- A strong partnership has been established between DLS and FAO, allowing for the smooth transmission of information and collective action.
- For the improvement of LBMs, a solid partnership was established with key stakeholders, including AIRRP, DLS, local governments, icddr, b and market committees.

Quarter II 2010

Project Monitoring Sheet: **OSRO/BGD/902/USA**

Project Title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) in Bangladesh, including active surveillance

Reporting period: **April to June 2010**

Country: Bangladesh
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) in Bangladesh, including active surveillance
Code: OSRO/BGD/902/USA + OSRO/RAS/605/USA Baby01
Effective starting date: October 2009
Planned end date: September 2010
Budget OSRO/BGD/902/USA: USD 3 082 800 (Phase I) Total budget: USD 3 082 800
Budget OSRO/RAS/605/USA Baby 01: USD 515 000 (Phase I), USD 1 365 000 (Phase II), USD 1 225 000 (Phase III) Total budget: USD 3 105 000
Effective starting date: July 2006
Planned end date: September 2010
Context of the project Bangladesh is a high-risk country with respect to Highly Pathogenic Avian Influenza (HPAI) H5N1, experiencing its first outbreak in March 2007. As of 30 June 2010, a total of 358 (304 commercial and 54 backyard) outbreaks have been recorded in 49 out of 64 districts and in 156 out of 492 Upazilas/Thanas (sub-districts), resulting in the culling of over 1.8 million birds.
Objectives of the project The primary objective of the project is to improve control of infectious diseases by enhancing outbreak responses for preventing poultry diseases and developing awareness of HPAI in Bangladesh. Specific immediate objective is to improve the HPAI surveillance capacity of the Government of Bangladesh to respond more effectively to HPAI outbreaks and thereby reduce economic losses and a global human pandemic threat. Specifically, the project aimed to achieve the following: <ul style="list-style-type: none"> • increasing the capacity of the Department of Livestock Services (DLS) to manage the Surveillance programme without technical or operational help from the Food and Agriculture Organization of the United Nations (FAO); • early reporting of poultry diseases by door-to-door surveillance; • early HPAI detection by diagnostic specimen collection and testing to ensure a rapid

- and effective disease response to control HPAI;
- increasing awareness among the surveyed farmers and villagers to strengthen passive surveillance; and
- monitoring minimum biosecurity standards in commercial farms.

Planned activities :

Output 1: Improved coordination and management for disease detection, diagnosis, control and prevention

- strengthen the national capacity for disease detection, diagnosis, control and prevention through coordinated efforts of all stakeholders;
- have international and national experts provide continuous assistance to the Government of Bangladesh to facilitate contacts between the Government and donors and coordinate projects and regional activities; and
- have the FAO country team take lead role in the coordination and technical backstopping to cover activities funded by the World Bank (WB) and the Swiss Government.

Output 2: Enhanced outbreak response by effective Outbreak Response Management Centre

- strengthen capacity of the Outbreak Response Management Centre within DLS through the provision of appropriate human resources and equipment;
- improve DLS' capacity for communicating with field operators, facilitating logistics, collection and analysis of data;
- have national and international experts in disease surveillance provide control and epidemiology technical inputs to assist the Government of Bangladesh in animal disease management.

Output 3: Improved biosecurity status in poultry sectors through biosecurity campaigns in the target areas

- implement biosecurity campaign across the country as much as possible in targeted large-, medium- and small-scale poultry farmers in poultry-dense areas in every district;
- develop educational materials to train trainers by technical experts in epidemiology, response management and advocacy; and
- organize the campaign on biosecurity to reach at least 20 percent of the entire poultry farmer population in the planned areas.

Output 4: Provision of assistance to the Government of Bangladesh to implement the National Avian Influenza & Human Pandemic Influenza Preparedness plan

- assist the Government of Bangladesh in the implementation of the national Avian Influenza & Human Pandemic Influenza Preparedness Plan for 2009-2011, which was elaborated in collaboration with FAO; and
- have FAO assist in surveillance, disease response and diagnostics and provide further technical inputs.

Output 5: Active Surveillance on HPAI

- conduct door-to-door active surveillance to collect information on sickness and unusual deaths in poultry of 260 Upazilas, of which 150 have been already under surveillance since 1 October 2008;

- send reports through coded message to web-based SMS gateway system;
- have sites of potential outbreak investigated by Upazila livestock officers (ULO)s and/or additional veterinary surgeons (AVS)s supported by the project; and
- have specimens collected for diagnosis in suspected cases by ULOs or AVSs and shipped to laboratories.

Activities undertaken during the reporting period

Output 1: Improved Coordination and Management for disease detection, diagnosis, control and prevention.

- International and national experts continued to provide expertise to the Government of Bangladesh, facilitated contacts between the Government and donors and coordinated projects and regional activities.
- FAO country team continued its coordination role to cover those activities funded from WB, Government of Switzerland and United States Agency for International Development (USAID).
- FAO continued to facilitate the Laboratory Working Group meetings attended by Bangladesh Livestock Research Institute (BLRI), Central Disease Investigation Laboratory (CDIL) and Field Disease Investigation Laboratory (FDIL), World Health Organization (WHO), USAID and Japan International Cooperation Agency (JICA) to provide advice on laboratory design and procurement.
- Team leader and a national consultant participated in the assessment of national capability arranged jointly by National Influenza Centre (IEDCR) and Centers for Disease Control and Prevention (CDC) Atlanta.
- On request from the Asian Development Bank (ADB), one national consultant facilitated a session in the inception meeting for launching a project on food security including control of transboundary diseases.
- Members from FAO avian influenza (AI) team participated in the meeting on AI coordination.
- Members had a discussion with Mr Vinod Ahuja, Policy officer of FAO–Regional Office for Asia and the Pacific (RAP). The team leader, an international consultant for epidemiology and a national expert joined him in a meeting with the Secretary.
- The FAO AI Unit member actively contributed in the formulation of a draft of the National Midterm Priority Plan by a Mission from FAO headquarters.
- Expert from the team participated in the further revision and editing of the Bangladesh animal slaughter and meat quality control law waiting to be vetted by Ministry of Law and Parliamentary Affairs.
- FAO actively participated in the One Health conference and workshop with participants from CDC Atlanta, Wildlife Trust, International Centre for Diarrhoeal Disease Research, Bangladesh (ICDDR,B) and WHO.
- The FAO AI Unit actively contributed in the review of knowledge, attitude and practices (KAP) study on AI, sponsored by the United Nations Children’s Fund (UNICEF).
- FAO communication consultant critically reviewed the Communication Strategy of National Agricultural technology project.
- Samples collected from free-ranging ducks around farms affected with HPAI have been collected and submitted to the National Reference Laboratory for Avian Influenza of BLRI in Savar for virus propagation and identification.

Output 2: Enhanced Outbreak Response by effective Outbreak Response Management Centre

- FAO has been providing training on post-outbreak management to DLS field officials.
- Chief Technical Advisor (CTA) and other members of the team have been monitoring the outbreak management system by visiting the vicinity of affected farms after occurrence of outbreaks.
- International consultant on epidemiology and national experts have been carrying out epidemiological investigation regularly after outbreak. During investigation, local staff members have been nominated for improving post-outbreak response.
- As part of the post-outbreak investigation, samples have been collected from free-ranging ducks in backyards for monitoring.
- Samples have been brought to BLRI to be inoculated into embryonated eggs for isolation of viruses.

Output 3: Improved biosecurity status in poultry sectors through biosecurity campaigns in the targeted areas

- The biosecurity campaign continued across the country's targeted large-, medium- and small-scale poultry farmers through AVSs/Community Animal Health Workers (CAHWs).
- AVSs/CAHWs have been provided with written instructions on biosecurity by visiting individual commercial farms.
- The project supported and contributed to the Public-Private-Partnership (PPP) project, also supported by USAID, in delivering biosecurity training for poultry industry suppliers.
- The project manager of Geospatial Farm Mapping and data loggers for collecting data and other basic information have been recruited. Information on 45 percent of the estimated farms has already been collected.
- National consultants are monitoring and quality checking the data through a field visit.

Output 4: Provision of assistance to the Government of Bangladesh to implement the National Avian Influenza and Human Pandemic Influenza Preparedness plan

- FAO has signed an agreement with Government of Bangladesh to provide technical assistance to Avian Influenza Preparedness and Response Plan in implementing the national plan.
- In addition to AI plan, FAO has submitted a draft strategy on foot-and-mouth disease (FMD) control drafted by the animal health officer with support from technical unit.
- One of the national consultant is participating in the development of strategy on rabies control

Output 5: Active Surveillance on Highly Pathogenic Avian Influenza

- The Active Surveillance programme is continuing in 260 Upazilas with 780 CAHWs and 88 AVSs.
- The newly recruited CAHWs and the ULOs of newly added Upazilas were trained on active surveillance.
- The veterinary officers (VOs) working under "Strengthening of Support Service for Combating Avian Influenza (SSCAIB) in Bangladesh" were trained to be involved in active surveillance.
- A four-member team from Nepal was trained on SMS gateway system.
- The national consultant and programme coordinator/representative from the Government monitored activities of AVSs and CAHWs.

Planned activities for the next quarter

Output 1: Improved Coordination and Management for disease detection, diagnosis, control and prevention.

- International and national experts will continue to provide expertise to the Government of Bangladesh, facilitate contacts between the Government and donors and coordinate projects and regional activities.
- FAO country team will increase its coordination role to cover activities funded by WB, ADB and USAID.
- FAO country team will support geospatial farm mapping project.

Output 2: Enhanced Outbreak Response by effective Outbreak Response Management Centre

- National and international Consultant will support the Government in conducting outbreak investigation on AI.
- Post-outbreak investigation will be intensified by collecting samples from free-ranging ducks in backyards in the vicinity of affected farms. Samples are to be inoculated to isolate viruses, if any.
- The FAO AI Unit, consisting of one international, six national consultants, one web page manager, one operation officer, one logistics and procurement assistant and one secretary. financially supported by the project, will be ready to support the Government on any disease response and control efforts.

Output 3: Improved bio-security status in poultry sectors through bio-security campaigns in the target areas

- Biosecurity campaign will be conducted across the country targeting the large-, medium- and small-scale poultry farmers through AVSSs/CAHWs, expanding from 150 to up to 300 Upazilas.
- Continuous assistance will be provided to PPP and cleaning and disinfection (C&D) of live bird market (LBM) projects.

Output 4: Provision of assistance to the Government of Bangladesh in implementing the National Avian Influenza and Human Pandemic Influenza Preparedness plan

- The team will continuously support the Government in the execution of National Avian Influenza and Human Pandemic Influenza Preparedness Plan.

Output 5: Active Surveillance on Highly Pathogenic Avian Influenza

- The active surveillance programme will be extended to 300 Upazilas.

Main challenges encountered and response provided

The post outbreak decontamination and improvement of biosecurity are two main challenges to achieving the objectives of the project.

Main progress made towards the achievement of project outcomes

- FAO Technical Unit has been established at DLS comprising a team of international and national experts and support staff.
- The office for the Technical Unit at DLS has been refurbished including the provision of standby power supply. The Unit is fully computerized with high-speed reliable internet services.
- AI Technical Unit is technically and logistically supporting the DLS. The AI Unit's technical support enhances DLS staff capacity.
- Biosecurity and awareness of HPAI are reinforced and strengthened by: active surveillance programme, teachers' training and dissemination of 50 000 leaflets, posters and stickers to schools and at various national and regional meetings.
- Door-to-door/farm-to-farm surveillance has been initiated using a network of 780 CAHWs. The CAHWs and respective 260 supervising ULOs, 32 veterinary officers of SSCAIB project have received the necessary training. As a result, disease surveillance has enhanced disease reporting. Better surveillance combined with increased awareness and constant reinforcing of biosecurity messages have helped to reduce the number of HPAI outbreaks.
- All 780 recruited CAHWs were given training and then refresher training by FAO consultants on basic communication skills, specifically on those related to HPAI and SMS gateway.
- Various laboratory supplies including polymerase chain reaction (PCR) kits, RNA extraction kits, primers and other consumables have been provided to BLRI laboratory to support the increase in diagnostic workload.
- Standard operating procedures (SOPs) for laboratory tests for AI diagnosis have been drafted and submitted to the Government.
- SOPs for outbreak response, disease investigation, culling, C&D have been drafted and are being reviewed.
- FAO team facilitated the Laboratory Working Group meetings attended by BLRI, CDIL and FDIL to provide advice on laboratory design and procurement.
- Technical officers of eight leading farms and selected government veterinarians have received training on biosecurity and routine disinfection for poultry raising establishments.
- Two hundred government veterinarians received training on post-outbreak decontamination.
- FAO contributed to the development of the Second Communication Strategy for Avian and Pandemic Influenza.
- Web-based SMS gateway has improved the early reporting system.

Quarter II 2010Project monitoring sheet: **OSRO/EGY/701/USA**Project title: **Strengthening Avian Influenza Detection and Response (SAIDR) in Egypt**Reporting period: **April – June 2010**

<p>Country: Egypt Title: Strengthening Avian Influenza Detection and Response (SAIDR) in Egypt Code: OSRO/EGY/701/USA</p>
<p>Budget: USD 3 000 000 (Phase I), USD 3 000 000 (Phase II), USD 3 000 000 (Phase III) Total budget: USD 9 000 000</p>
<p>Effective starting date: October 2007</p>
<p>Planned end date: September 2010</p>
<p>Context of the Project</p> <p>Outbreaks of Highly Pathogenic Avian Influenza (HPAI) spread in Egypt since February 2006, and the disease has become endemic. The Food and Agriculture Organization of the United Nations (FAO) has been providing technical assistance to the Ministry of Agriculture and Land Reclamation (MoALR) through the implementation of the animal health component of the “Strengthening Avian Influenza Detection and Response (SAIDR) in Egypt” project funded by the United States Agency for International Development (USAID).</p>
<p>Objectives of the project</p> <p>The overall objective of the project is to minimize the human health risks and reduce the livelihood impacts posed by HPAI through its effective prevention and control. The specific objectives of the project are to ensure and facilitate:</p> <ol style="list-style-type: none"> 1. Regular updating of the national HPAI control/response plan; 2. Improvement of biosecurity measures to reduce virus circulation in poultry populations and bird-to-human transmission; 3. Improvement of surveillance activities of H5N1 in poultry and wild bird populations; 4. Improvement of HPAI outbreak investigation and response measures in poultry populations.
<p>Planned outputs and activities</p> <ul style="list-style-type: none"> • Prepare a draft active and passive HPAI surveillance plan based on identified critical control points, covering all poultry production sectors and in accordance with the integrated national plan. • Organize a technical workshop, involving relevant stakeholders and partners, for gathering of inputs and the enrichment of the draft HPAI surveillance plan. • Follow up on the proper implementation of the various Letters of Agreement (LoAs) by national and international partners. • Re-assess the implementation of the current LoA with the International Livestock Research Institute (ILRI) and enter into a second agreement with the same for the implementation of the remaining project activities. • Conduct an introductory community-based animal health and outreach (CAHO) course (ten

days) for 20 new practitioners.

- Conduct a refresher workshop (five-days) for the 20 new CAHO practitioners who will receive the introductory course mentioned above.
- Conduct a training of trainers (ToT) course (six-days) for 12 CAHO practitioners.
- Organize and conduct two consultative workshops on principles and management of CAHO program in Egypt involving veterinary directors and other decision-makers at governorate level.
- Finalize the procurement process for the remaining items to be delivered to the General Organizations for Veterinary Services (GOVS) and National Laboratory for Veterinary Quality Control on Poultry Production (NLQP) on time.
- Operationalize the HPAI hotline system established within GOVS premises.

Activities undertaken during the reporting period (April – June 2010)

Objective 1: Ensure the regular updating of the national HPAI control/response plan

- The English and Arabic version of the revised “HPAI Animal Health and Livelihood Sustainability Strategy” has been officially approved on 31 May 2010 by H.E. Amine Abaza, Minister of Agriculture and Land Reclamation (MoALR). The Minister also advised the GOVS to move into the implementation of the revised strategy with immediate effect and to work in close partnership with all relevant counterparts.
- GOVS, NLQP and FAO Emergency Centre for Transboundary Animal Diseases (ECTAD) have continued to publish the “Monthly HPAI News Review” and distribute hard and electronic copies to the stakeholders both in Egypt and abroad. This monthly publication provides relevant information on HPAI and related project activities in Egypt.
- The process for the refurbishment of 120 decentralized epidemiology units is initiated through the assessment of the local needs and identification of appropriate contactors. In terms of the procurements required for these decentralised Epidemiology Units (Epi-Units), the status is as follows:
 - Some 50 desktop computers received and delivered to GOVS for distribution to various Epi-units across the country;
 - Some 120 Air conditioners received and distributed to 21 veterinary governorates;
 - Extra procurements were conducted to facilitate data transfer from district to governorate level (500 flash memory drives (4 GB), 250 electrical connectors, 400 DVDs and one hard disk) and to assist GOVS in establishment of a network in district Epi-Unit.
 - The procurement of 50 UPSs, 50 printers, 120 computer tables and 240 chairs is still in process.

Objective 2: Improvement of biosecurity measures to reduce virus circulation in poultry population and bird-to-human transmission

- Nine out of the 14 governorate Veterinary Services (namely Behaira, Dakahlia, Fayoum, Gharbia, Helwan, Kafr El-Sheikh, Minya, Qena and Six October governorates) have properly and timely implemented field activities as per agreed terms of LoAs signed with FAO. They have also delivered completed questionnaires with checklists and progress reports for the period from February to May 2010. Three governorate Veterinary Services (namely Souhag, Sharqia and Menofia) were lagging behind as a result of some internal limitations and were required to make extra preparations. These veterinary directorates started implementation of LoA activities only in May 2010. As a result, an intensive follow up was organized in order to ensure the proper implementation and timely reporting as per the terms of the LoAs. The remaining two governorates (namely Assuit and Banisuef) had some internal constraints that

hindered them in implementing the agreed LOA activities.

- In order to enhance existing technical capacity in application of biosecurity measures, from 12 May to 29 June 2010, ECTAD-FAO conducted eight training sessions on practical biosecurity in 11 veterinary governorates for a total of 157 trainees drawn from 119 districts. The purpose of the training was to assist GOVS in forming district-level biosecurity teams in the high risks governorates.
- Preparation of biosecurity guidelines for the different poultry production sectors and farming types is underway and handled by other FAO-implemented projects.

Objective 3: Improvement of surveillance activities of H5N1 in poultry and wild birds

- ILRI submitted the final technical report of the second year activities. The report described all participatory epidemiology (PE) activities conducted in the past year to strengthen animal disease surveillance and control of HPAI H5N1.
- From 19 April to 22 April 2010, two workshops on “Principles and Management of CAHO Program in Egypt” were conducted with the aim of setting up standard management plan for CAHO program at both central and local levels, explaining technical issues related to CAHO field activities, discussing problems and challenges faced and suggesting solutions. A total of 67 CAHO practitioners and decision-makers took part in these workshops.
- From 1 May to 5 May 2010, ILRI, in collaboration with ECTAD, conducted a six-day ToT session on CAHO, involving 12 skilled CAHO practitioners drawn from six governorates. In addition, a ten-day training course was organized involving 22 new CAHO practitioners from five governorates (namely Qena, Assuit, Sohage, Dameitta and Sixth October).
- From 27 June to 1 July 2010, ILRI and FAO jointly conducted a five-day refresher training for previously recruited CAHO team (22 participants from five governorates). Apart from refreshing their PE skills, the training allowed for the reviewing of CAHO field experiences and identified key constraints and lessons learned.
- In March 2010, a LoA was signed with ILRI in order to support the expansion of the CAHO approach through tailored short-term group training program in both previously selected and new governorates.
- The 32 CAHO teams continue to operate in 15 governorates and have visited 176 villages during the reporting period. As a result, the CAHO teams detected 15 suspected HPAI outbreaks, of which 11 were confirmed positive by the reverse transcriptase polymerase chain reaction (RT-PCR) test. During the reporting period, 58 percent of HPAI confirmed outbreaks from the household poultry sector were reported through CAHO program.
- Procurement of the following items is in process:
 - Consumables/plastic ware for real-time reverse transcriptase polymerase chain reaction (RRT-PCR) for NLQP to meet its requirements for routine HPAI diagnosis in poultry
 - Sampling kits and transport media as required by GOVS

Objective 4: Improvement of HPAI outbreak investigation and response measures in poultry populations

- Of the 22 Veterinary Directorates that signed LoA for HPAI outbreak response with FAO, 21 (namely Alexandria, Assuit, Aswan, Banisuef, Beheira, Dakahlia, Damietta, Fayoum, Gharbia, Giza, Helwan, Ismailia, Kafr El-Sheikh, Matrouh, Minya, Monufia, Qena, Sharqia, Six October, Souhag and Suez) are properly and timely implementing field activities per the agreed LoA terms. They have also submitted all required reports (technical, comprehensive individual case and monthly progress reports) for the period from February to May 2010. Five of 21 governorates (Assuit, Banisueif, Ismailia, Matrouh and Souhag governorates) did not report any confirmed HPAI outbreaks during the reporting period. The Veterinary Directorate

in Luxor governorate had a delay in the identification and assignment of district rapid response team (RRT) members. To date, no report has been received from this governorate. They have recently indicated that they have started implementing LoA activities as of May 2010. A national consultant handling field outbreak investigation and reporting is closely following the matter with the Director of Veterinary Services in Luxor in an attempt to enhance the delivery on the agreed LoA terms.

- From 8 April to 29 April 2010, ECTAD conducted four training sessions involving 70 veterinarians from 16 governorates and 86 districts. The main purpose of the training was to assist GOVS in forming district-level RRTs and enhance their performance in responding to HPAI outbreaks.
- The following items required outbreak investigation, and responses were procured and delivered to GOVS:
 - 100 000 pieces of disposable aprons
 - 100 000 pieces of disposable plastic shoe covers
 - 50 000 sterile rayon swabs, and
 - 5 000 boxes of sterilized latex powder

The procurement of disinfectant (Omnacid 2.5 ton) is still in process.

Project management issues:

- After a long delay, the renovation of office space for the establishment of HPAI hotline system within GOVS premises is completed. GOVS has nominated 37 staff members for the hotline system, who are currently receiving practical training. Upon successful completion of the training and the attainment of the skills on the HPAI hotline system, the most outstanding candidates will be selected to make the system operational. FAO contracted SANCO PLC Company to provide the above specified specialized training.

Planned Activities for the Next Quarter:

- Follow up on the proper implementation of the various LoAs by national and international partners.
- Organize and implement two introductory CAHO training courses for core national trainees from ten governorates. Each training session will last ten days and will be carried out jointly by FAO and ILRI.
- Carry out two field monitoring missions, each lasting ten days, to assess the performances of the newly trained CAHO practitioners.
- Provide, in collaboration with ILRI, two refresher workshops (five days each) on CAHO approach for recently trained CAHO practitioners.
- Continue supporting GOVS in forming district-level biosecurity teams in the identified high risk governorates (14) through the provision of five biosecurity training courses.
- Finalize procurements in process and deliver the items to GOVS and NLQP.
- Operationalize the HPAI hotline system.
- Provide administrative and technical assistance to SAIDR- Project Management Unit (PMU) in GOVS and support them in completing planned project activities.

Main challenges encountered and solutions:

- Delay in the approval of the revised HPAI strategy forced Mr Abdessalam OuldAhmed, the FAO-Representative in Egypt and Deputy Regional Representative (DRR) of the Regional Office for the Near East and North Africa (RNE), to write an official letter to H.E. Amine Abaza, MoALR. The ECTAD Team Leader held series of meetings with the Chief Veterinary

Officer (CVO) and the Coordinator of the Animal Health Institute (AHI) Supreme Council and explained the need for a formal approval of the revised strategy in order to solicit support from development partners and make subsequent preparations for its implementation. Thanks to the support from all parties approached, the revised strategy was officially approved on 31 May 2010 by H.E. Amine Abaza, MoALR.

- It is apparent that some governorate veterinary services lack the capacity to implement activities and to timely report according to the terms specified in the various LoAs signed with FAO. ECTAD-EGY extended all rounded support and regularly followed up on the implementation and reporting status of these governorates. As a result, a considerable improvement has been achieved in both activity implementation and timely submission of reports. However, there is no encouraging improvement from three of the governorates (namely Assuit, Luxor and Benisuif) due mainly to internal constraints beyond the scope of this project. A decision was made by the Project Coordinator and ECTAD Team Leader not to disburse the remaining LoA instalments until a convincing delivery is made.

Main progress made towards the achievement of project outcomes

- FAO has implemented, analysed and compiled numerous field-level studies on livelihoods, poultry value chains and disease control constraints for use by GOVS. Project outputs have strengthened institutional capacities (manpower, infrastructure, etc.) of veterinary services at both central and governorate levels.
- The assessment study conducted in the framework of the SAIDR project on AI vaccination of poultry in Egypt indicated that vaccination coverage and flock immunity level was low. The organization of vaccination campaigns is poorly managed. The study suggested that vaccination should be seen as the only one of the many efforts required to make significant improvements to HPAI control and prevention in the country. FAO has developed and handed over to GOVS a risk-based, targeted vaccination scheme for the different production sectors as well as an operational plan and exit strategy.
- The strategic HPAI review meeting held in June 2009, jointly organized by USAID, GOVS, MoALR and FAO, urged stakeholders to refocus their efforts in the future. As a result, the SAIDR project is focusing its efforts on the following key areas: (i) sustainable and cost-effective biosecurity in all production sectors; (ii) risk-based targeted surveillance; and (iii) improved outbreak investigation and disease management capacities.
- In close consultation with the primary stakeholders, FAO continually evaluated its project implementation. Government counterparts operating at various levels and private sector players appreciated FAO's approach and demonstrated high levels of confidence. In close consultation with relevant partners, FAO has completed the process of reviewing the animal health component of the integrated national plan that needs to reflect the endemicity of the disease and is needed for longer term risk reduction measures. The revised "HPAI Animal Health and Livelihood Sustainability Strategy," has been officially approved on 31 May 2010 by H.E. Amine Abaza, MoALR. This will thus form the basis for HPAI control efforts in the next five years.

Quarter III 2010

Project monitoring sheet: **OSRO/EGY/701/USA**Project title: **Strengthening Avian Influenza Detection and Response in Egypt**Reporting period: **July – September 2010**

Country: Egypt
Title: Strengthening Avian Influenza Detection and Response in Egypt
Code: OSRO/EGY/701/USA
Budget: USD 3 000 000
Effective starting date: 1 October 2009
Planned end date: 30 September 2011
<p>Context of the project</p> <p>Outbreaks of Highly Pathogenic Avian Influenza (HPAI) spread in Egypt since February 2006 and the disease has become endemic. The Food and Agriculture Organization of the United Nations (FAO) has been providing technical assistance to the Ministry of Agriculture (MALR) through the implementation of the animal health component of the Strengthening Avian Influenza Detection and Response (SAIDR) project funded by the United States Agency for International Development (USAID).</p>
<p>Objectives of the project</p> <p>The overall objective of the project is to minimize the human health risks and reduce the livelihood impacts posed by HPAI through its effective prevention and control. The specific objectives of the project are to facilitate:</p> <ol style="list-style-type: none"> 1. Ensure the regular updating of the national HPAI control/response plan. 2. Improvement of biosecurity measures to reduce virus circulation in poultry population and bird-to-human transmission. 3. Improvement of surveillance activities of H5N1 in poultry and wild birds. 4. Improvement of HPAI outbreak investigation and response measures in poultry populations.
<p>Planned outputs and activities</p> <ul style="list-style-type: none"> • Follow up on the implementation of the various letters of agreement (LOA) by national and international partners. • Organize two introductory community-based animal health outreach (CAHO) training courses for core national trainees from ten governorates. Each ten-day training session will be carried out jointly by FAO and the International Livestock Research Institute (ILRI). • Carry out two field monitoring ten-day missions to assess the performances of the newly trained CAHO practitioners. • Provide, in collaborating with ILRI, two refresher five-day workshops on CAHO approach, to recently trained CAHO practitioners. • Continue supporting the General Organization for Veterinary Services (GOVS) in forming district-level biosecurity teams in the identified high-risk governorates (14) through the provision of five biosecurity training courses. • Finalize procurements under process and deliver the items to the GOVS and the National Laboratory for Quality Control and Poultry Production (NLQP). • Operationalize the HPAI hotlines system.

- Provide administrative and technical assistance to the SAIDR project management units in GOVS and provide ongoing support for the completion of planned project activities.

Activities undertaken during the reporting period (July – September 2010)

Objective 1: Ensure the regular updating of the national HPAI control/response plan

- Based on the revised and approved HPAI control strategy, the following activities were undertaken:
 - GOVS, with the assistance of FAO, has developed a three-year action plan for the control of HPAI in Egypt. The action plan focuses on biosecurity, market chain management and enhanced disease reporting through appropriate outbreak response and better determination of epidemiological parameters of the disease. FAO has organized a stakeholders meeting on 23 September 2010 (including GOVS, NLQP, USAID, the United Nations Children's Fund and the World Health Organization) to discuss the approved action plan as well as the new USAID-funded FAO project.
 - A new national Animal Health Technical Committee (AHTC) for HPAI has been established by a Ministerial decree and under the direct leadership of GOVS. The committee is composed of representatives of several national and international organizations with FAO serving as a secretariat. The main role of the AHTC is to provide science-based technical advice to the Ministry of Agriculture and Land Reclamation (MoALR) and the National Avian and Human Influenza Supreme Council.
- The process for the refurbishment of 120 decentralized epidemiology units is still ongoing. The local needs were assessed, specifications prepared and contractors identified. The office equipment for the decentralized epidemiology units have delivered to GOVS for distribution to the units across the country.

Objective 2: Improvement of biosecurity measures to reduce virus circulation in poultry population and bird-to-human transmission

- Thirteen out of the 14 Governorate Veterinary Services (namely Assuit, Behaira, Dakahlia, Fayoum, Gharbia, Helwan, Kafr El-Sheikh, Minya, Menofia, Qena Souhag, Sharqia and Six October governorates) that signed LOA with FAO, have properly and timely implemented field activities as per agreed terms. They have also completed questionnaires with checklists and delivered progress reports. FAO is following up to ensure the proper implementation and timely reporting. It was, however, noted that the Banisuef Governorate Veterinary Services has some internal constraints that hindered the implementation of the activities agreed in the LOA.
- FAO, in collaboration with GOVS, conducted five training sessions on biosecurity practices for a total of 90 trainees drawn from 73 districts in 12 governorates. The purpose of the training was to assist GOVS in forming district-level biosecurity teams in HPAI high-risk governorates.
- Preparation of a simplified minimum biosecurity guideline for the different commercial poultry production sectors and farming types was completed.

Objective 3: Improvement of surveillance activities of A/H5N1 in poultry and wild birds

- An amendment was made to the LOA signed between FAO and ILRI in order to facilitate the production of a CAHO manual for practitioners and its translation into Arabic.
- ILRI, in collaboration with FAO, conducted a ten-day introductory CAHO training course Followed by a five-day refresher course. These capacity building activities aim to support the plan of the government to expand CAHO activities to additional districts. Three governorates (Gharbia, Menoufia and Dakahlia) were trained in July and September 2010, seven other governorates (Kafr Elshiekh, Menoufia, Minya, Bani Swif, Dakahlia, Kalubia and Fayoum) were trained in August and September 2010.

- Two ten-day field monitoring missions were conducted by FAO, ILRI and GOVS to assess the performances of the newly trained CAHO practitioners in eight governorates (July – August 2010).
- The 108 CAHO qualified practitioners continue to operate in 15 governorates (Gharbia, Sharkia, Beheira Dakahleya, Dameitta, Six October, Baniswief, Fayoum, Qena, Minya, Assuit, kafr Elshiekh, Kalubia and Sohage governorates). The practitioners visited 460 villages during the reporting period and detected 29 suspected cases matched with HPAI clinical case definition, of which nine were RT-PCR confirmed HPAI positive outbreaks. During the reporting period, 24 percent of the confirmed HPAI outbreaks from the household poultry sector were reported through the CAHO programme.
- A web-based CAHO database has been prepared to enable the decentralized data entry by CAHO teams as well as facilitate rapid consolidation and analysis of data by the GOVS epidemiology unit.

Objective 4: Improvement of HPAI outbreak investigation and response measures in poultry populations

- Of the 22 Directorates of Veterinary Services that signed an LOA with FAO for HPAI outbreak response, 20 are properly and timely implementing field activities per the agreed terms (namely in Alexandria, Assuit, Aswan, Beheira, Dakahlia, Damietta, Fayoum, Gharbia, Giza, Helwan, Ismailia, Kafr El-Sheikh, Matrouh, Minya, Monufia, Qena, Sharqia, Six October, Souhag, and Suez). They have successfully fulfilled their reporting obligations.. Four governorates (Assuit, Ismailia, Matrouh and Souhag) did not experience HPAI outbreak and did not use the LOA money. Two LOA related to Baniswif and Luxor governorates were cancelled due to internal administrative.
- FAO, in collaboration with GOVS, conducted a training session for district-level rapid response teams for enhanced HPAI outbreak response. Twenty-two veterinarians drawn from 16 districts in nine governorates have benefited from this training.
- Two and half tonnes of disinfectant (Omnacid) was purchased and delivered to GOVS for further distribution in high-risk governorates.

Planned activities for the next six-month period

- Continue the process of refurbishment of 120 decentralized epidemiology units and distribution of purchased items.
- Finalize the various LOA signed with national and international partners.
- Follow up on procurements under process and deliver the items to the concerned beneficiary organization.
- Finalize SAIDR Year IV project activities and follow up on the clearance process from FAO and USAID.

Main challenges encountered and solutions

- The support to the CAHO programme ended on 30 September 2010 (end of SAIDR III project). The main challenge now is how to ensure the sustainability of this vital surveillance system. A series of meetings were held with the national veterinary authority including the Chief Veterinary Officer. Agreement was reached to integrate the CAHO programme into the existing government structure. FAO provided critical technical support to GOVS which facilitated the transfer of the CAHO programme to GOVS.
- It seems to appear that some governorate veterinary services lack the capacity to implement the activities and to timely report on them, as per the terms of the LOA. FAO extended its support and regularly followed up on the implementation and reporting status. As a result, a considerable improvement has been achieved in both activity implementation and timely reporting.

Main progress made towards the achievement of project outcomes

- FAO has implemented, analysed and compiled numerous field-level studies on livelihoods, poultry value chains and disease control constraints for use by GOVS. Project outputs have strengthened institutional capacities (manpower, infrastructure, etc.) of veterinary services at both central and governorate levels.
- The assessment study conducted in the framework of the SAIDR project on avian influenza vaccination of poultry in Egypt indicated that vaccination coverage and flock immunity level is low. The organization of vaccination campaigns is poorly managed. The study suggested that vaccination should be seen as only one of the many efforts required to make significant improvements to HPAI control and prevention in the country. FAO has developed and handed over to GOVS a risk-based, targeted vaccination scheme for the different production sectors, as well as an operational plan and exit strategy.
- The strategic HPAI review meeting held in June 2009, jointly organized by USAID, GOVS, Ministry of Health and FAO, urged stakeholders to refocus efforts for the future. As a result, the SAIDR project is focusing its efforts on the following key areas: (i) sustainable and cost-effective biosecurity in all production sectors; (ii) risk-based targeted surveillance; and (iii) improved outbreak investigation and disease management capacities.
- In close consultation with the primary stakeholders, FAO continually evaluated its project implementation. Government counterparts operating at various levels and private sector player appreciated FAO's approach and demonstrated high-level confidence. FAO has also completed the process of reviewing the animal health component of the integrated national plan that needs to reflect the endemicity of the disease and the needed for longer-term risk reduction measures. The revised 'HPAI Animal Health and Livelihood Sustainability Strategy', has been officially approved on 31 May 2010 by H.E. Amine Abaza, Minister, MoALR. This will thus form the basis for HPAI control efforts for the next five years.
- A three-year elaborated action plan was prepared and finalized with direct support from FAO.
- As a recommendation of the revised strategy and United Nations joint mission report, an Avian Influenza Unit has been established in GOVS. The unit is fully engaged in all HPAI control measures and in the implementation of coordinated activities with GOVS and other key partners. FAO provided technical advice and played a facilitative role in the establishment of this unit.

Quarter II 2010Project monitoring sheet: **OSRO/EGY/801/USA**Project title: **Avian Influenza Vaccine Efficacy Project (AIVEP) in Egypt**Reporting period: **April – June 2010**

Country: Egypt
Title: Avian Influenza Vaccine Efficacy Project (AIVEP) in Egypt
Code: OSRO/EGY/801/USA
Budget: USD 2 416 500
Effective Starting Date: July 2008
Planned End Date: September 2010
Context of the Project
<p>Outbreaks of Highly Pathogenic Avian Influenza (HPAI) spread in 18 governorates in Egypt within less than three months after the disease was originally diagnosed in three governorates on 17 February 2006. The Government attempted to control the outbreak through a stamping out procedure, which included culling of all poultry within a 1 km radius of the confirmed diagnosis. By the end of 2006, nearly 30 million birds had been culled. Outbreaks continue to be reported in 23 of the 29 governorates in the country, and the disease has become endemic.</p> <p>In response to the continued threat of HPAI to Egypt, the Food and Agriculture Organization of the United Nations (FAO) and the World Organisation for Animal Health (OIE) have been providing technical assistance through the joint OIE/FAO Influenza Network (OFFLU) and other initiatives. Specifically, FAO has been providing the Ministry of Agriculture and Land Reclamation (MALR) with major technical assistance through the implementation of the Avian Influenza Vaccine Efficacy Project (AIVEP) and the Strengthening Avian Influenza Detection and Response (SAIDR) project, both funded by the United States Agency for International Development (USAID).</p> <p>In collaboration with the Government of the Arab Republic of Egypt (GoE), FAO, OFFLU and USAID are working together to conduct virus characterization and mapping of Egyptian antigenic variants with intensified HPAI field isolate collection and analyses. Through antigenic mapping, challenge testing and transmission studies, this project has identified strategic recommendations for Egypt, including the development of clear criteria for the selection of vaccinal strains.</p> <p>FAO is providing key technical support through the AIVEP, as vaccination is considered part of the overall efforts to reduce the HPAI infections and the spread of the virus in Egypt with the potential to benefit other countries in the region and worldwide.</p>

Objectives of the Project

The overall project objective is to assist the GoE in its efforts to control HPAI in the domestic poultry population and to avoid the risks of human infection.

The specific project objectives are to conduct:

1. screening and evaluation of genetic and antigenic variants among existing H5N1 HPAI field strains previously collected from 2006 until early 2008;
2. intensified collection of H5N1 HPAI field isolates from newly confirmed outbreaks (since mid-2008);
3. challenge testing of antigenic variants in specific pathogen free (SPF) birds and currently used avian influenza (AI) vaccines in Egypt; and
4. controlled transmission trials in the laboratory on birds raised and vaccinated in commercial poultry farms.

Planned Activities

Output 1.1: Screening and evaluation of genetic and antigenic variants among existing field strains previously collected from 2006 until early 2008.

- Activity 1.a: Screening and evaluation of genetic and antigenic variants among existing field strains (2006 – early 2008 collections).
- Activity 1.b: Carry out sequencing and phylogenetic analysis.
- Activity 1.c: Conduct antigenic profiling.
- Activity 1.d: Perform antigenic cartography.
- Activity 1.e: Selection of variants for challenge studies as specified under Output 1.3 below.
- Activity 1.f: Assessment of biosecurity and biosafety of the National Laboratory for Veterinary Quality Control on Poultry Production (NLQP) and laboratory operations.
- Activity 1.g: Capacity building (i.e. training of Egyptian scientists).

Output 1.2: Intensified collection of H5N1 HPAI field isolates from newly confirmed outbreaks (since mid-2008).

- Activity 2.a: Intensified HPAI field isolate collection.
- Activity 2.b: Conduct reverse transcription - polymerase chain reaction (RT-PCR) analysis (support for laboratory consumables provided through SAIDR project).
- Activity 2.c: Identify all H5N1 HPAI isolates collected since mid 2008 to 2009.
- Activity 2.d: Conduct sequencing and analysis of 100 isolates at NLQP under the supervision of and assessment by the Southeast Poultry Research Laboratory (SEPRL).
- Activity 2.e: Perform antigenic profiling and cartography.

Output 1.3: Challenge testing of antigenic variants in SPF birds and currently used AI vaccines in Egypt.

- Activity 3.a: Safety, purity and potency testing of currently used AI vaccines in Egypt conducted at the Central Laboratory for Evaluation of Veterinary Biologics (CLEVB).
- Activity 3.b: Selection and testing of vaccinal seed strains for challenge testing (planned to test six vaccinal seed strains against four challenge viruses [requiring a total of 24 isolation units] carried out at SEPRL [USA]).
- Activity 3.c: Second-year challenge testing carried out at NLQP (Egypt).
- Activity 3.d: Capacity building (refurbishing one of the existing NLQP units to biosafety level 2 [BSL2] animal facility).

Output 1.4: Controlled transmission trials in the laboratory on birds raised and vaccinated

<p>in commercial poultry farms.</p> <p>Activity 4.a: Organize and provide support through training and workshop (during the last quarter of the project) to enhance skills of NLQP staff in transmission trials.</p>
<p>Activities Undertaken during the reporting period</p> <p>Output 1.2: Intensified collection of H5N1 HPAI field isolates from newly confirmed HPAI outbreaks (since mid-2008).</p> <p>Activity 2.a: Intensified HPAI field isolate collection.</p> <ul style="list-style-type: none"> • From April to June 2010, NLQP, in close collaboration with the SAIDR project staff, has collected 178 370 samples from 3 396 cases. Of these, 84 cases tested positive for HPAI by real-time reverse transcription - polymerase chain reaction (RRT-PCR). <p>Activity 2.b: Conduct reverse transcription - polymerase chain reaction (RT-PCR) analysis (support for laboratory consumables provided through SAIDR project).</p> <p>Results of RRT-PCR tests undertaken from April to June 2010 include:</p> <ul style="list-style-type: none"> • All collected samples from 3 396 cases were tested for a common gene by RT-PCR, and 84 of the cases were found positive for AI. • All the above-indicated positive cases for a common gene of AI also tested positive for H5 gene and negative for H7 gene. • The database of the new avian-influenza-positive samples has been regularly updated. <p>Activity 2.c: Identify all H5N1 HPAI isolates collected since mid 2008 to 2009.</p> <ul style="list-style-type: none"> • Compilation of the list of positive samples and isolates from 2008 and 2009 is completed, and the process for the collection of positive samples from 2010 is underway. • Isolation of the 68 positive tested cases with RRT-PCR was started during the reporting period and is still underway. • Virus propagation and reactivation of 48 positive samples was carried out at NLQP. • Isolated samples were titrated using haemagglutination (HA) test and kept at -80 degrees centigrade, and the database was regularly updated. • NLQP finalized the sequencing of H5 gene for five isolates and N1 gene for nine isolates from 2010 collections. <p>Activity 2.e: Perform antigenic profiling and cartography.</p> <ul style="list-style-type: none"> • NLQP prepared and standardized all reagents and equipment needed. • NLQP arranged the work plan according to the isolates' list database and in close collaboration with SEPRL. A sequence phylogenetic tree has been completed for the new isolates. In addition, ten new isolates were selected to be added into the isolates' list used for cartography. • The haemagglutination inhibition (HI) test required for cartography is under construction for 20 samples from 2009 and 2010. Results of HI test will be ready during the first week of July 2010. • Data will be shared with other partners (SEPRL, Erasmus University and OFFLU experts). <p>Output 1.3: Challenge testing of antigenic variants in SPF birds and currently used AI vaccines in Egypt.</p> <p>Activity 3.a: Safety, purity and potency testing of currently used AI vaccines in Egypt</p>

conducted at the Central Laboratory for Evaluation of Veterinary Biologics (CLEVB).

- Scientists from SEPRL (Drs David Swayne, David L. Suarez and Cary Rue) were on a mission to Egypt from 4 to 15 April 2010 (the mission was previously delayed twice) to assess the implementation of training in “Vaccine Efficacy and Potency Regulatory Testing” at CLEVB. Dr Swayne visited CLEVB to follow up on the implementation of training skills received at SEPRL and to assess the currently used/licensed vaccines against international standards.

Second year testing

NLQP, SEPRL and Erasmus University examine antigenic, genetic, potency, efficacy and make recommendations to GOE

- Results of the HI test needed for cartography data analysis will be shared with other partners during the first week of July. Based on the output of the analysis, which will be conducted at Erasmus University, the challenge virus(s) will be selected in collaboration with SEPRL and will be used for the second challenge test to be carried out at NLQP.

Non-intermediate results (IRs) Activities

- Two workshops were held in Alexandria and Port Said involving staff from NLQP and Satellite laboratories with the aim of strengthening the coordination between them and of discussing technical and administrative challenges and ways to address them.
- At request of SEPRL, and in close consultation with all concerned parties, a six-month no-cost extension with budget revision was approved. The project will, thus, be completed in February 2011.

Planned activities for the next quarter

Output 1.4: Controlled transmission trials in the laboratory on birds raised and vaccinated in commercial poultry farms.

to be dealt with separately - training

Other:

- Developing the BSL3 capacity at NLQP through the technical assistance of the United States Naval Medical Research Unit 3 (NAMRU3).
- Following up on the process of the upgrading of the animal facility to BSL3 to enable the conducting of the planned challenge test.

Main challenges encountered and solutions

- Because of the need to re-do some of the challenge test groups conducted at SEPRL, the activities were rescheduled for August 2010. As this delay has affected the time plan of the project, a no-cost extension was requested by SEPRL and FAO and granted by USAID.
- Difficulties were faced in finding a local company specialized in design, construction and follow-up on the delivery of BSL3 labs and air ventilation systems. This has led to the delay in finalizing reconstruction of the animal facility area to reach BSL3 quality, an aspect essential for conducting challenge tests in order to determine the efficacies of the vaccines. An international bid has been prepared and four companies were invited to deliver offers (one local and three foreign companies). However, all the three foreign companies declined to tender. This has raised a concern, as a minimum of three companies is required to continue with the bidding process. There is an urgent need to search for new companies that are willing to participate in the bidding and that are able to complete the reconstruction of the animal facility on time.

Objectives of the project

The overall project objective is to assist the Government of the Arab Republic of Egypt in its efforts to control HPAI in the domestic poultry population and avoid the risks of human infection.

The specific project objectives are to conduct:

1. Screening and evaluation of genetic and antigenic variants among existing H5N1 HPAI field strains previously collected from 2006 until early 2008;
2. Intensified collection of H5N1 HPAI field isolates from newly confirmed outbreaks (since mid-2008);
3. Challenge testing of antigenic variants in specific pathogen-free birds and currently used avian influenza vaccines in Egypt; and
4. Controlled transmission trials in the laboratory on birds raised and vaccinated in commercial poultry farms.

Planned activities

Output 1.1: Screening and evaluation of genetic and antigenic variants among existing field strains previously collected from 2006 until early 2008

Activity 1.a: Screening and evaluation of genetic and antigenic variants among existing field strains (2006 – early 2008 collections)

Activity 1.b: Carry out sequencing and phylogenetic analysis

Activity 1.c: Conduct antigenic profiling

Activity 1.d: Perform antigenic cartography

Activity 1.e: Selection of variants for challenge studies as specified under Output 1.3 below

Activity 1.f: Assessment of biosecurity and biosafety of the National Laboratory for Veterinary Quality Control on Poultry Production (NLQP) and laboratory operations

Activity 1.g: Capacity building (i.e. training of Egyptian scientists)

Output 1.2: Intensified collection of H5N1 HPAI field isolates from newly confirmed outbreaks (since mid-2008)

Activity 2.a: Intensified HPAI field isolate collection

Activity 2.b: Conduct real-time polymerase chain reaction (RT-PCR) analysis (support for laboratory consumables provided through SAIDR project)

Activity 2.c: Identify all H5N1 HPAI isolates collected since mid 2008 to 2009

Activity 2.d: NLQP conduct sequencing and analysis of 100 isolates under the supervision of and assessment by the Southeast Poultry Research Laboratory (SEPRL)

Activity 2.e: Perform antigenic profiling and cartography

Output 1.3: Challenge testing of antigenic variants in specific pathogen-free birds and currently used avian influenza vaccines in Egypt

Activity 3.a: Safety, purity and potency testing of currently used avian influenza vaccines in Egypt conducted at the Central Laboratory for Evaluation of Veterinary Biologics (CLEVB)

Activity 3.b: Selection and testing of vaccinal seed strains for challenge testing (planned to test six vaccinal seed strains against four challenge viruses (requiring a total of 24 isolation units) carried out at SEPRL (United States of America)

Activity 3.c: Second year challenge testing carried out at NLQP (Egypt)

Activity 3d: Capacity building (refurbishing one of existing NLQP units to BSL2 + animal facility)

Output 1.4: Controlled transmission trials in the laboratory on birds raised and vaccinated in commercial poultry farms

Activities: FAO to organize and provide support through training and workshop (during the last quarter of the project) to enhance skills of NLQP staff in transmission trials.

Activities undertaken during the reporting period

Antigenic profiling and cartography

- NLQP prepared and standardized all reagents and equipment needed.
- NLQP revised the work plan according to the isolates list database and in close collaboration with SEPRL sequence phylogenetic tree has been finished for the new isolates and sent to SEPRL and 25 new isolates (including three reference isolates, one isolate from 2006, two isolates from 2007, five isolates from 2008, eight isolates from 2009 and six isolates from 2010) have been selected to be added to the list to be used for the cartography work.
- Human influenza test, which is required for cartography, was conducted on the 25 isolates. In July 2010, the results of the human influenza test have been shared with SEPRL, Erasmus and OFFLU for data analysis.
- In consultation with the technical officers in SEPRL and FAO, further human influenza test for cartography has been rescheduled for end January 2011, when new antisera and reference strain required to complete the human influenza test will be prepared and shipped by SEPRL to NLQP. NLQP has contacted Centers for Disease Control and Prevention (CDC) in Atlanta to obtain the two missing reference isolates for the human influenza test.

Challenge testing of antigenic variants and existing vaccines

- The first year challenge test was carried out at SEPRL using three selected isolates from year 2006, 2007 and 2008 isolates against four vaccines. Repeated testing in some experimental groups was necessary. This repeated testing was originally scheduled to take place in September 2010 concurring with an NLQP expert visit to SEPRL. The challenge test did not take place due to the renovation of the Biosafety Laboratory Level 3 (BSL3) at SEPRL. The NLQP expert used the opportunity to hold discussions with SEPRL scientists on the preparation of antigen and anti-sera for the challenge test.

Testing of isolates from the second year (September 2009-10)

- In July 2010, the result of human influenza test required for cartography data analysis were shared with other partners and submitted by SEPRL to Erasmus. The selection of the challenge virus(es) has been rescheduled to take place in February 2011.

Non-intermediate results activities:

- Two workshops were organized and took place in Fayoum and Luxor Governorates. The purpose was to strengthen the coordination between the central (NLQP) and satellite (provincial) laboratories. In addition, the technical and administrative problems faced by the satellite laboratories were discussed and the way to overcome them recommended. A total of 87 laboratory personnel drawn from five satellite laboratories participated in these workshops.
- USAID approved the reallocation of the budget to upgrade the animal testing facility to procure five chicken isolators instead. The procurement process has been initiated.
- The upgrade of animal testing facility normally includes both construction and installation of a ventilation system, due to the limitations in local contractor to undertake the upgrading work as one package; this activity is no longer valid under the current project. Instead, NLQP wanted that this activity to be supported by the Egyptian Government.

Planned activities for the next six-month period:

- Challenge testing: follow-up with SEPRL.
- Conduction of transmission trial: will be discussed with all partners if needed.
- The project will continue developing the BSL3 capacity at NLQP through the technical assistance of NAMRU3.

Main Challenges Encountered and Response Provided

- The fact that the challenge test to be undertaken by SEPRL has been delayed up to November 2010 (initially planned for August-September 2010) will have serious implications on related activities.
- The need for additional reference strains and antisera resulted in delaying the human influenza testing for cartography analysis. Direct contact between NLQP and SEPRL was established which should provide the missing reference isolate by January 2011. Another contact between NLQP and CDC was established to obtain two more reference strains. As a result some project activities will be delayed until February 2011 namely the selection of the new challenge strain (from years 2009 and 2010 isolates) and challenge testing (for vaccine evaluation in the second year of the project).
