- Difficulties in identifying an experienced and specialized company for the design, construction and delivery of BSL3 laboratories and air ventilation systems hindered the achievement of this activity. NLQP agreed to cover all related costs.

I Quarter 2010

Project Monitoring Sheet: **OSRO/GLO/802/USA**Project Title: **Improved biosecurity and hygiene at production, collection points and live bird markets (LBM), including decontamination**Reporting period: **January 2010 – March 2010**

Countries: Bangladesh, Egypt and Indonesia
Project Title: Improved biosecurity and hygiene at production, collection points and live bird markets (LBM), including decontamination
Code: OSRO/GLO/802/USA
Total budget: USD 2 500 000 ²
Effective Starting Date: 15 January 2009
Planned End Date: 31 July 2010
Context of the project In many infected countries, live bird markets (LBM) and points of concentration for eventual commercial distribution are considered an important element in the maintenance and spread of the Highly Pathogenic Avian Influenza (HPAI) virus. Reducing the spread of HPAI from collection points within LBMs (bio-exclusion containment) and improved inspection and prevention through improved cleaning and disinfection (C&D) measures will contribute to the reduction in the overall secondary spread. Biosecurity measures are designed to reduce the amount of agent (HPAI virus, in this case) that is moved from place to place. Cleaning and disinfection of LBMs and transport vehicles can contribute to the goal of decreasing the amount of infective agent available to spread the disease from markets to farms and to humans.
Objectives of the project The objective of this project is to develop and implement an integrated C&D programme in selected LBMs and other collection points in Bangladesh, Egypt and Indonesia. This would minimize the risk for human health and reduce transmission and spread of HPAI virus. Liaison with national project managers has been carried out on a continuous, "as needed" basis and through planned missions to the projects. Field visits have been made by the international co-ordinator and technical advisor to Indonesia and Bangladesh to assist with briefing of project staff, offering technical advice for the project activities and undertaking visits to collector yards, wholesale markets, LBMs and selected checkpoints on the perimeter of the capital cities.

² (The amount of USD 2 500 000 is the total contribution that includes the allocation per country. The project budget has been divided into four main project components which are: Global Cross-country Coordination. (budget allocation amounts to USD 775 000), the Arab Republic of Egypt, (budget allocation amounts to USD 575 000), the People's Republic of Bangladesh (budget allocation amounts to USD 575 000) and the Republic of Indonesia (budget allocation amounts to USD 575 000).

Planned activities**BANGLADESH****Output 1. Target LBMs and points of concentration or production identified and prioritized in Bangladesh**

Activity 1.1 Mapping and characterizing of LBMs and points of concentration in the targeted areas and selection of those where the number of avian species in and out (either as a live bird or as meat) is greatest.

Activity 1.2 Scheduling of visits to market managers, butchers, and stands sellers to establish a participatory process for C&D mechanisms for improved hygiene of LBMs.

Output 2. LBMs cleaning and disinfection guidelines and protocols developed and agreed and approved by the Government of Bangladesh, with input from veterinary officials, local authorities and LBM managers

Activity 2.1 Reviewing of existing legislation for LBMs, transport or collection point operations and requirements.

Activity 2.2 Collating risk behaviours and participatory methods for their reduction.

Activity 2.3 Developing C&D protocols for LBMs and fomites (cages, egg flats, etc.).

Activity 2.4 Establishing procedures for implementing disinfection of trucks and vehicles in LBMs.

Output 3. Sufficient staff and workers adequately trained in cleaning and disinfection of LBMs, live bird stands and materials and means of transport

Activity 3.1 Training of relevant staff and animal health workers in LBM C&D operations.

Activity 3.2 Communication and awareness workshops for all involved.

Output 4. Cleaning and disinfection operations implemented and monitored at target LBMs or collection points

Activity 4.1 Provision of inputs: decontamination kits including cleaning/disinfection supplies, Personal Protective Equipment (PPE), disinfectants and disinfection equipment (high pressure sprayers), printed material, storage facilities, water equipment/basin, holding cages, transport crates.

Activity 4.2 Equipping selected LBMs with reusable tools and subsidised products with the anticipation that improved hygiene locally (stand) would be more acceptable to consumers.

Activity 4.3 Refurbishing selected LBMs (installation of basic infrastructure for hygiene measures).

Activity 4.4 Implementing C&D operations as per agreed protocols.

Activity 4.5 Monitoring the process of hygiene measures adopted.

EGYPT**Output 1. Target commercial poultry farms identified and prioritized**

Activity 1.1 Collect Baseline data on commercial poultry farms and concentration facilities.

Activity 1.2 Complete mapping and characterizing of commercial poultry farms and points of concentration for the targeted project areas.

Activity 1.3 Prepare lists and detailed accounts of priority key sites, C&D strategy and work plan.

Activity 1.4 Prepare list and procure required input supplies.

Activity 1.5 Prepare schedules for regular visits/meetings to stakeholders.

Output 2. Cleaning and/or disinfection guidelines and protocols developed and agreed up on

Activity 2.1 Prepare implementation guidelines and concise protocols for cleaning and/or disinfection.

Activity 2.2 Conduct a consultative workshop to discuss and enrich the guidelines and protocols as well as to create awareness amongst key implementing partners.

Activity 2.3 Consultant review and identify key regulatory/policy gaps in existing legislation of poultry farms management, bird transport and requirements for concentration points.

Activity 2.4 Organize consultative meetings with key decision-makers to discuss and agree on key regulatory policy changes and their enforcement.

Activity 2.5 Collect and collating data on risk behaviours and participatory methods for their reduction; develop guidelines and protocols and agree with local authorities.

Activity 2.6 Review and update cleaning and/or disinfection protocols for the various project sites.

Output 3. Sufficient staff/workers adequately trained and implement cleaning and/or disinfection operations

Activity 3.1 Sign contractual agreements with veterinary directorates in the selected Governorates.

Activity 3.2 Conduct Training for Trainers (ToT) courses for governorate-level veterinary personnel.

Activity 3.3 Carry out tailor-made training for those involved in cleaning and/or disinfection operations.

Activity 3.4 Prepare and implement clear communication messages addressing the different categories of stakeholders and implement effective awareness functions.

Output 4. Cleaning and disinfection operations implemented and monitored at commercial poultry farms or collection points

Activity 4.1 Deliver inputs (expendable and non-expendable) required for project operation.

Activity 4.2 Implement cleaning and decontamination operations as per agreed protocols.

Activity 4.3 Review the practical field level constraints and updated procedures.

Activity 4.4 Prepare checklists for qualitative assessment of hygienic improvements in targeted areas.

Activity 4.5 Develop and implement a comprehensive monitoring and evaluation mechanism for the project.

INDONESIA

Output 1. Engage with high-risk collector yards in the greater Jakarta area (JABODETABEK) and develop and implement procedures to immediately improve biosecurity at these locations (Phase I)

Activity 1.1 Selecting 12 collector yards in JABODETABEK with high volume sales or trading in poultry species/breeds at high-risk for spreading HPAI (i.e. spent layers, backyard poultry, mixed species).

Activity 1.2 Developing Phase I standard operating procedures (SOPs) for C&D of items in the collector yard contaminated with poultry waste (i.e. vehicles and transport crates).

Activity 1.3 Training collector yard owners/workers and relevant local government officials on SOPs and use of equipment for C&D of vehicles and crates.

Activity 1.4 Equipping selected collector yards for implementation of C&D of vehicles and crates and upgrade infrastructure to meet the needs of the programme.

Activity 1.5 Designing a monitoring programme and training local government officials to monitor implementation.

Activity 1.6 Implementing and monitoring of C&D of vehicles and crates in 12 collector yards in JABODETABEK.

Output 2. Collector yards and transport links to farms selected for improvement in biosecurity as a means of reducing spread of HPAI within the live poultry market chain and between farms

Activity 2.1 Mapping and characterizing collector yards and improve understanding of transport links between collector yards and farms. Select those dealing with the high volume and high-risk species/breeds.

Activity 2.2 Visiting and discussing with collector yard owners and key informants involved in transport of live poultry, using a participatory process, to determine feasible C&D mechanisms for improved biosecurity in the live bird market chain.

Output 3. Poultry market chain cleaning and disinfection guidelines and protocols developed and agreed upon with local veterinary officials and collector yard owners, with inputs from key players involved in transport of live birds

Activity 3.1 Reviewing existing legislation and regulations for transport of live poultry and poultry collector yards.

Activity 3.2 Collating risk behaviours and participatory methods for their reduction.

Activity 3.3 Comparing technology options for cleaning which are both effective and sustainable.

Activity 3.4 Developing Phase II C&D protocols for collector yard holding areas and fomites (cages, egg flats) involved in transport of live poultry and poultry products.

Activity 3.5 Improving procedures for C&D of vehicles and crates based on Phase I monitoring and comparison of cleaning technology.

Output 4. Sufficient staff and workers adequately trained in cleaning and disinfection of poultry market chain; cleaning and disinfection guidelines and protocols developed

Activity 4.1 Phase II training of collector yard owners/workers and local government officials in C&D guidelines and protocols.

Activity 4.2 Communication and awareness workshops for all those involved.

Output 5. Cleaning and disinfection operations implemented and monitored in target collector yards and transport links

Activity 5.1 Provision of inputs: decontamination kits including cleaning/disinfection supplies, PPE, detergents, disinfectants and equipment (high pressure sprayers), sampling materials, printed material, water equipment/basin, holding cages / transport crates, etc.

Activity 5.2 Equipping selected collector yards and key players involved in live bird transport with reusable C&D tools and products.

Activity 5.3 Refurbishing selected collector yards and C&D sites (installation of basic infrastructure for hygiene measures).

Activity 5.4 Implementing C&D operations as per agreed protocols.

Activity 5.5 Develop a monitoring program for measurement of impact and implementation of C&D protocols.

Activity 5.6 Monitoring the implementation and impact.

Activities undertaken during the reporting period :

BANGLADESH

Output 1. Target LBMs and points of concentration or production identified and prioritized in Bangladesh

- Plans for the Cleaning and Disinfection Project and implementation have been updated from June 2009 to July 2010.
- Live Bird Markets were surveyed and characterized for C&D operations.
- On the basis of the above survey results, 18 LBMs were selected of which eight LBMs (including STOP AI handed over two LBMs to FAO in September 2009) were in Dhaka city region and ten LBMs in other five divisions in the country. FAO will concentrate its resources on these LBMs.

- The names of eight LBMs in Dhaka city region are as follows:
 - 1) South Jatrabari Whole Sale Market
 - 2) South Jatrabari Wet Market
 - 3) Gulshan -I DCC Market
 - 4) Kawran Bazar
 - 5) New Market
 - 6) Kaptan Bazar
 - 7) Mohammadpur Town Hall Market and
 - 8) Mohammadpur New Market

- Other ten LBMs outside Dhaka

In Chittagong division :

 - 1) CDA Karnaphuly Market, Chittagong
 - 2) Karnaphuly Complex Market, Chittagong

In Sylhet division :

 - 1) Ambarkhana Bazar, Sylhet
 - 2) Khan Bazar Madina Market, Sylhet

In Rajshahi division :

 - 1) Shaheb Bazar, Rajshahi
 - 2) Fateh Ali Market (Bogra)

In Khulna division :

 - 1) Sandha Bazar, Khulna
 - 2) Galfamari Majghat

In Barisal division :

 - 1) Bangla Bazar Alekanda, Barisal
 - 2) Chowmatha Bazar

- Out of 18 LBMs five markets have been upgraded in the Dhaka city region, the rest of the markets are expected to be upgraded by June 2010.

Output 2. LBMs cleaning and disinfection guidelines and protocols developed and agreed and approved by the GOB, with input from veterinary officials, local authorities and LBM Managers

- C&D Guidelines and Protocols were developed for LBMs during second quarter reporting period.
- Memorandum of Understanding (MOUs) between FAO and 18 market committees have been signed.
- The MOUs relate to C&D, upgrading of LBMs (floor, drainage facility, slaughter house, poultry transport cleaning area, electric and water supply etc.), training of existing cleaners of 18 selected LBMs in the country.
- Checklist developed for use by Veterinary officers to check the C&D activities in the renovated LBM's.

Output 3. Sufficient staff and workers adequately trained in cleaning and disinfection of LBMs, live bird stands and materials and means of transport

- Training materials and training programme have been developed.

- Training courses for cleaning staff are planned to be offered within one week of the upgrade completion of the respective market upgrade.
- A day long training session was conducted for Karcher job aid and other sprayers for 12 veterinarians in Dhaka city region and ten veterinarians in other five divisions of district H.Q.
- Two-day long training session for three LBMs comprising 14 cleaners were conducted.

Output 4. Cleaning and disinfection operations implemented at LBMs or collection points

- Some LBMs at COX's Bazaar will be surveyed and two LBMs will be selected finally for C&D operation.
- Work order for two LBMs in Dhaka city is under process.
- Upgrading mainly electric and water supply points, drainage facility, poultry stall, slaughter house and poultry transport cleaning area will be carried out.
- Decontamination kits including C&D supplies, PPE, detergents, disinfectants, high pressure sprayers and poultry holding cages will be supplied to LBMs after completion of upgrading work.

EGYPT

Output 1. Target commercial poultry farms identified and prioritized

Activity 1.4 Prepare list and procure required input supplies.

The procurement of 4 tons citric acid, 2 000 pairs of gloves, 2 000 pairs of boots, 4 000 long-handle brushes, 4 000 banister brushes and 4 000 overalls is in process.

Output 2. Cleaning and/or disinfection guidelines and protocols developed and agreed upon

Activity 2.1 Prepare implementation guidelines and concise protocols for C&D.

- The final draft of a self-assessment guide reflecting essential operational biosecurity practices in commercial poultry farms (for use by farm owners and/or supervisors) were distributed for final review and comments.
- A poster guide reflecting some of risky biosecurity practices and behaviours in sectors 2 and 3 poultry farms in the country is drafted and distributed for review and comments.

Activity 2.5 Collect and collate data on risk behaviours and participatory methods for their reduction; develop guidelines and protocols and confirm with local authorities.

- Comprehensive data covering the prevailing risk behaviours associated with the use of 'external injectors' (vaccinators) and bird catchers by 405 farms (262 long- 143 short-cycle farms) located in Dakahlia (152), Qalyubia (147) and Sharqia (106) governorates, covering a total of 191 villages in 17 districts was collected and collated. Information was gathered through number of focus group discussions and interviews of poultry farm workers/owners. Measures to be taken in addressing the identified risk behaviours are identified and used in the experience sharing and training activities.

Output 3. Sufficient staff/workers adequately trained and implement cleaning and/or disinfection operations.

Activity 3.1 Sign contractual agreements with veterinary directorates in the selected Governorates.

- An addendum for the extension of contractual agreements to amend the Letter of Agreement (LoA) end dates to read as 31 May 2010 was signed. The amendment was done at the request of the Recipient Organization. The request for no-cost extension of the project was also approved.

Activity 3.3 Carry out tailor-made training for those involved in cleaning and/or disinfection operations.

- A one day consultative workshop for experience and good practice sharing between producers from moderately improved and weak biosecurity poultry farms was conducted. A total of 54 poultry farm owners and external injector have participated in the pilot session as opposed to a maximum of 35 expected. A post-training workshop held in ECTAD country office underscored that the lessons learned from the pilot session be considered in the subsequent similar sessions and the number of participants per session limited to a maximum of 35.

Output 4. Cleaning and disinfection operations implemented and monitored at commercial poultry farms or collection points

Activity 4.2 Implementation of cleaning and decontamination operations as per agreed protocols.

- District veterinarians (48), who were previously trained under the current project, have visited 809 different poultry farms. Each farm was visited on three occasions. During the farm visits, the veterinarians provided hands-on training on proper cleaning, dilution, application and safe use of disinfectants. They also monitored the implementation of C&D activities in farms where such training were previously provided. Monitoring data were collected through interviews using pretested questionnaire developed for this purpose. Analysis of the collected data from randomly sampled farms revealed that about 60 percent of the farms showed moderate biosecurity improvement while the remaining 40 percent remained with poor/weak biosecurity practices.

INDONESIA

Output 1. Engaging with high-risk collector yards in the greater Jakarta area (JABODETABEK) and developing and implementing procedures to immediately improve biosecurity at these locations (Phase I)

Activity 1.1 Selecting 12 collector yards in JABODETABEK engaged in high volume sales or trading in poultry species/breeds which are at high-risk of spreading HPAI (i.e. spent layers, backyard poultry, mixed species).

Completed.

Activity 1.2 Developing Phase I SOPs for C&D of items in the collector yard contaminated with poultry waste (i.e., vehicles and transport crates).

SOP development. Completed.

Activity 1.3 Training collector yard owners/workers and relevant local government officials on SOPs and use of equipment for C&D of vehicles and crates.

Completed for the nominated 12 collector yards in JABODETABEK in 2009 and ten collector yards in BODETABEK in 2010.

Activity 1.4 Equipping selected collector yards for implementation of C&D of vehicles and crates and upgrading infrastructure to meet the needs of the programme.

Completed equipment allocation as previously reported.

Activity 1.5 Designing a monitoring programme and training local government officials to monitor implementation.

Completed designing of monitoring form and training for Dinas staff.

Activity 1.6: Implementing and monitoring C&D of vehicles and crates in 12 collector yards in JABODETABEK.

- Local government monitoring of C&D at collector yards is ongoing since last quarter.

Output 2. Collector yards and transport links to farms selected for improvement in biosecurity as a means of reducing spread of HPAI within the live poultry market chain and between farms

Activity 2.1 Mapping and characterizing collector yards and improve understanding of transport links between collector yards and farms. Select those dealing with high volume and high-risk species/breeds.

- A comprehensive poultry movement study has been completed by ECTAD Indonesia as previously reported. In addition, surveys have been conducted of poultry transport and traffic pathways in order to get a better understanding of poultry transport patterns. For Phase II implementation by end of 2009, 10 single-holder collector yards have been selected, trained and equipped with a gasoline-powered high pressure washer: two from Bogor district, two from Tangerang city, two from Tangerang District, two from Bekasi city and two from Depok city. Market surveillance programme is ongoing in Jabodetabek areas and the collector yard surveillance programme has been conducted from 20 January to 21 February 2010 in two districts, East Jakarta and Tangerang City.

Activity 2.2 Visiting and discussing with collector yard owners and key informants involved in transport of live poultry, using a participatory process, to determine feasible C&D mechanisms for improved biosecurity in the live bird market chain.

- Completed all visits and discussions with collector yard owners, poultry transport operators, government checkpoint officers and poultry brokers. These discussions have contributed to implementation of C&D for poultry transport vehicles and crates.

Output 3. Poultry market chain cleaning and disinfection guidelines and protocols developed and agreed upon with local veterinary officials and collector yard owners, with inputs from key players involved in transport of live birds

Activity 3.1 Reviewing existing legislation and regulations for transport of live poultry and poultry collector yards.

Completed as part of ECTAD Indonesia's support of DKI Jakarta market restructuring.

Activity 3.2 Collating risk behaviours and utilizing participatory methods to determine how risky behaviours can be reduced.

Completed as reported last quarter.

Activity 3.3 Comparing technology options for cleaning which are both effective and sustainable.

- Completed the comparison of alternative electric-powered and gasoline-powered pressure washers. Locally-available alternative disinfectant and detergent have been procured.

Activity 3.4: Developing Phase II C&D protocols for collector yard holding areas and fomites (cages, egg flats) involved in transport of live poultry and poultry products.

- SOPs have been prepared as reported last quarter.

Activity 3.5 Improving procedures for C&D of vehicles and crates based on Phase I monitoring and comparison of cleaning technology.

Completed updating of C&D SOPs this quarter.

Output 4. Sufficient staff and workers adequately trained in cleaning and disinfection of poultry market chain cleaning and disinfection guidelines and protocols

Activity 4.1 Phase II training of collector yard owners/workers and local government officials in C&D guidelines and protocols.

- Training for Phase II C&D station workers in Pulo Gadung and local government officers in Jakarta Timur has been carried out. This is an ongoing activity.

Activity 4.2 Communication and awareness workshops for all involved.

- All training workshops have included a communications and awareness component. Awareness raising will be included in all future trainings as well.

Output 5: Cleaning and disinfection operations implemented and monitored in target collector yards and transport links

Activity 5.1 Provision of inputs: decontamination kits including cleaning/disinfection supplies, PPE, detergents, disinfectants and equipment (high pressure sprayers), sampling materials, printed material, water equipment/basin, holding cages/transport crates, etc.

- Provision of decontamination equipment such as Karcher electric pressure washer machine and gasoline-powered pressure washer, disinfectant, detergent, crates, dipping tubs, and PPE has been completed for Phase I. Procurement of cleaning equipment, disinfectant, detergent, dipping tubs, PPE and additional alternative pressure washers has been completed for Phase II.

Activity 5.2 Equipping selected collector yards and key players involved in live bird transport with reusable C&D tools and products.

- This activity is now completed. The C&D tools and materials have been allocated to 12 selected Collector Yards for Phase I and ten selected collector yards for Phase II.

Activity 5.3 Refurbishing selected collector yards and C&D sites (installation of basic infrastructure for hygiene measures).

- Electrical upgrades have been completed at 11 collector yard sites as well as the C&D station in Pulo Gadung. Refurbishments required for Phase II have been planned and will be initiated next quarter at Rawa Kepiting, Cakung and Petukangan collector yard/slaughterhouses.

Activity 5.4 Implementing C&D operations as per agreed protocols.

- This has been carried out by trained collector yard workers since project initiation and is ongoing.

Activity 5.5 Developing a monitoring programme for measurement of impact and implementation of C&D protocols.

- The updated monitoring form has been developed. Monitoring is being conducted by *dinas* officers and reports are being submitted to FAO for collation and comment and this continues to be implemented.

Activity 5.6 Monitoring the implementation and impact.

- Monitoring of project implementation has been ongoing. Impact on HPAI contamination and transmission may be assessed indirectly via the market and collector yard surveillance programme, although direct assessment of impact on HPAI viral spread is not possible at this time.

Planned activities for the next quarter:**BANGLADESH****Output 1. Target LBMs and points of concentration or production identified and prioritized in Bangladesh**

- Some LBMs at COX's Bazaar will be surveyed and two LBMs will be selected finally for C&D operation.
- Work order for two LBMs in Dhaka city is under process.
- Upgrading mainly electric and water supply points, drainage facility, poultry stall, slaughter house and poultry transport cleaning area will be carried out.
- Decontamination kits including C&D supplies, PPE, detergents, disinfectants, high pressure sprayers and poultry holding cages will be supplied to LBMs after completion of upgrading work.

Out put 2. LBMs cleaning and disinfection guidelines and protocols developed and agreed and approved by the Government of Bangladesh, with input from veterinary officials, local authorities and LBM managers

- C&D guidelines have been developed before.

Output 3. Sufficient staff and workers adequately trained in cleaning and disinfection of LBMs, live bird stands and materials and means of transport

- Two-day long training courses for LBMs cleaning staff are planned to be offered after completion of the respective LBM upgrade.
- Communication and awareness workshops for stake holders will be organized.

Out put 4. Cleaning and disinfection operations implemented and monitored at target LBMs or collection points

- C&D operations will be implemented.
- Supervision and monitoring of C&D activities of LBMs will be adopted.

EGYPT**Output 2. Cleaning and/or disinfection guidelines and protocols developed and agreed upon**

Activity 2. Consultant review and identify key regulatory/policy gaps in existing legislation of poultry farms management, bird transport and requirements for concentration points.

Activity 2.4 Organize consultative meetings with key decision-makers to discuss and agree on key regulatory policy changes and their enforcement.

Output 3. Sufficient staff/workers adequately trained and implement cleaning and/or disinfection operations

Activity 3.3 Carry out tailor-made training for farms on C&D operations and biosecurity practices.

- Conduct training workshops on biosecurity application including composting, decontamination and sprayers calibration by an international expert for commercial farm owners in the selected 7 governorates.

Output 4. Cleaning and disinfection operations implemented and monitored at commercial poultry farms or collection points

Activity 4.1 Deliver inputs (expendable and non-expendable) required for project operation.

Activity 4.2 Implementation of cleaning and decontamination operations as per agreed protocols.

- Conduct workshops on sharing of experience and best practices between poultry producers from category A farms (those who responded well to the practical training of C&D) and others from (Category B farms) and Category C farms, those responded with minor or no changes) in the selected governorates.

INDONESIA

Output 1. Engaging with high-risk collector yards in the greater Jakarta area (JABODETABEK) and developing and implementing procedures to immediately improve biosecurity at these locations (Phase I)

Activity 1.1 Selecting 12 collector yards in JABODETABEK with high volume sales or trading in poultry species/breeds which are at high-risk for spreading HPAI (i.e. spent layers, backyard poultry, mixed species).

Completed.

Activity 1.2 Developing Phase I standard operating procedures for C&D of items in the collector yard contaminated with poultry wastes (i.e. vehicles and transport crates).

Completed.

Activity 1.3 Training collector yard owners/workers and relevant local government officials on standard operating procedures and use of equipment for C&D of vehicles and crates.

Completed.

Activity 1.4 Equipping selected collector yards for implementation of C&D of vehicles and crates and upgrading of infrastructure to meet the needs of the programme.

Completed.

Activity 1.5 Designing a monitoring programme and training local government officials to monitor implementation.

Completed.

Activity 1.6 Implementing and monitoring C&D of vehicles and crates in 12 collector yards in JABODETABEK.

Completed.

Output 2. Collector yards and transport links to farms selected for improvement in biosecurity as a means of reducing spread of HPAI within the live poultry market chain and between farms

Activity 2.1 Mapping and characterizing collector yards with improved understanding of transport links between collector yards and farms. Select those dealing with the high volume and high-risk species/breeds.

- In addition to the poultry movement profiling which addressed this activity, ECTAD Indonesia will continue to engage with poultry transport drivers and owners to learn about the transport system of poultry and the requirements for cleaning of trucks.

Activity 2.2 Visiting and discussing with collector yard owners and key informants involved in transport of live poultry to determine feasible C&D mechanisms for improved biosecurity in the live bird market chain using a participatory process.

- Ongoing discussions are being held with poultry brokers and transport operators at Petukangan, Cakung and Rawa Kepiting to discuss C&D station establishment and completion of small-scale slaughterhouses. Lessons learned are being used to improve C&D station design at other collector yards.

Output 3. Poultry market chain cleaning and disinfection guidelines and protocols developed and agreed upon with local veterinary officials and collector yard owners, with inputs from key players involved in transport of live birds

Activity 3.1 Reviewing existing legislation and regulations of transport of live poultry and poultry collector yards.

Completed.

Activity 3.2 Collating risk behaviours and participatory methods for risk reduction.

- Further discussions with stakeholders to identify novel approaches to risk reduction are ongoing.

Activity 3.3 Comparing technology options for cleaning which is both effective and sustainable

Completed.

Activity 3.4 Developing Phase II C&D protocols for collector yard holding areas and fomites (cages, egg flats) involved in transport of live poultry and poultry products.

Completed.

Activity 3.5 Improving procedures for C&D of vehicles and crates based on Phase I monitoring and comparison of cleaning technology.

Completed.

Output 4. Sufficient staff and workers adequately trained in cleaning and disinfection of poultry market chain cleaning and disinfection guidelines and protocols

Activity 4.1 Phase II training of collector yard owners/workers and local government officials in C&D guidelines and protocols.

- Training on Phase II C&D SOPs has been conducted for all stakeholders.
- ToT courses for selected C&D workers is planned for next quarter.

Activity 4.2 Communication and awareness workshops for all involved.

- This activity is addressed within all training and planning workshops with stakeholders.

Output 5: Cleaning and disinfection operations implemented and monitored in target collector yards and transport links

Activity 5.1 Provision of inputs: decontamination kits including cleaning/disinfection supplies, PPE, detergents, disinfectants and equipments (high pressure sprayers), sampling materials, printed material, water equipment/basin, refrigeration equipment, holding/transport cages, etc.

Completed.

Activity 5.2 Equipping selected collector yards and key players involved in live bird transport with reusable C&D tools and products.

Completed.

Activity 5.3 Refurbishing selected collector yards and C&D sites (installation of basic infrastructure for hygiene measures).

- This activity is continuing in Rawa Kepiting, Cakung and Petukangan collector yards/slaughterhouses.

Activity 5.4 Implementing C&D operations as per agreed protocols.

- Implementation of Phase II decontamination activities is underway.

Activity 5.5 Develop a monitoring programme for measurement of impact and implementation of C&D protocols.

Completed.

Activity 5.6 Monitoring the implementation and impact.

- Impact on HPAI contamination and transmission is being assessed indirectly via the market and collector yard surveillance programme. Direct assessments of project activity impact on cleanliness of poultry transport are being considered as part of Phase II.

Main challenges encountered and response provided

Each country has had issues related to the C&D of LBMs and collector yards and therefore have approached the project with different target areas to clean. Each country has developed an effective strategy to answer those difficulties:

1. Bangladesh is focusing on major LBM's to upgrade power, water, flooring, drainage and the supply of relevant C&D equipment and supplies.
2. Indonesia has completed C&D activities on major collector yards and is focusing on cleaning the large poultry transport vehicles after they have been unloaded and before they return to poultry farms by establishing specific cleaning stations at the five slaughter house sites that have been allocated in Jakarta. These sites will be supported by FAO through the construction of cleaning stations to disinfect all vehicles leaving the premises.
3. Egypt has officially banned the selling of live birds at markets. The C&D emphasis is now placed on private and public sector people's training who are directly related to the poultry industry and in particular connected with farm gate biosecurity.

BANGLADESH

- Preparation of drawing, specification, quotation, tender and work order procedure and upgrading work took longer than expected.
- Five LBMs have been upgraded until now and twelve LBMs will be expected to be completed between May and June 2010.

To respond to these challenges, the project manager was instructed to bring forward visits to each of the regional markets with a consultant architect to develop plans for each of the proposed markets.

EGYPT

Project management issues

The second LoA instalments to support the running costs for field level project operations in all seven governorates are effected.

ECTAD Team Leader (TL) discussed with the project team the need to adhere to the objective of workshops/training/experience sharing sessions and to deal with manageable number of participants. In addition, the TL emphasized the need to inform the team members about all unexpected events happening at field level. Team members were also notified of the decision to include the M&E Expert in most of the training and focus group discussion sessions in the future.

Because of the persistent project coordination problems particularly affecting field level operations, the ECTAD Team Leader assigned Dr AbdelHakin Ali to become the National Project coordinator.

INDONESIA

The challenges faced this quarter were primarily administrative; construction activities require a high-level of coordination among FAO, government, the private sector, and FAO subcontractors.

Main progress made towards the achievement of project outcomes (from the start of the project activities).

BANGLADESH

Output 1. Target LBMs and points of concentration or production identified and prioritized in Bangladesh

- National Project Manager and National Poultry Market Supervision Consultants were appointed.
- DLS, DCC, USAID and other partners were informed of objectives and purposes.
- Permission from city corporation/city authorities for upgrading of LBMs was approved and received.
- LBMs C&D project plan had been updated.
- LBMs C&D activities of STOP AI had been handed over to FAO on 30 September 2009.
- About 30 live bird markets have been surveyed and finally 18 LBMs have been selected.
- Upgrading of five LBMs have been completed in Dhaka city region.
- Work order for ten LBMs upgrading has been issued and other work order for two LBMs will be issued within middle of April 2010.
- Work order for 350 poultry cages has been issued and already 100 poultry cages have been supplied to New Market and Kawran Bazar LBMs in Dhaka.

Output 2. LBMs cleaning and disinfection guidelines and protocols developed and agreed and approved by the Government of Bangladesh, with input from veterinary officials, local authorities and LBM managers

- C&D guidelines and protocols were developed.
- Signing of MOUs between FAO and 18 market committees has been completed.
- Checklist developed for use by veterinary officers to check the C&D activities in the renovated LBMs.

Output 3. Sufficient staff and workers adequately trained in cleaning and disinfection of LBMs, live bird stands and materials and means of transport

- Two-day long training sessions for five LBMs for 28 cleaners and one-day long training session for 12+10=22 DLS veterinarians have been conducted.
- Training materials and training programme have been developed and printed.
- Training courses for cleaning staff are planned to be offered within one week of the completion of the respective LBM upgrade.

Output 4. Cleaning and disinfection operations implemented and monitored at target LBMs or collection points

- C&D commodities have been purchased and delivered to respective LBMs and concerned DLOs.
- 10+15 =25 drums@ 185 litres. Detergent, 150 kg Virkon-s disinfectant, ten Karcher sprayers for Dhaka city region and ten Karcher sprayers for other five divisions had been allocated and distributed by DLS.
- C&D operations have been running at upgraded five LBMs in Dhaka city region.
- C&D operations have been running at six LBMs in Dhaka city region.
- C&D operations have been monitored.

EGYPT**Output 1. Target production points identified and prioritized**

- Baseline data on commercial (1 392) layers/breeders and (1 340) broiler poultry farms are developed.
- Mapping and characterizing of long and short cycle farms are completed.
- List of required input supplies are prepared and procured.

Output 2. Cleaning and/or disinfection guidelines and protocols developed and agreed upon

- Implementation guidelines for C&D on farm gate customized to Egyptian context were developed, reviewed updated and finalized.
- Data base on risk behaviours and prevailing practices in (1 392) layers/breeders and (1 340) broiler poultry is developed.
- A database on risk behaviours associated with use of external injector and bird catchers in 405 poultry farms (long and short cycles) in three high risk governorates is developed.
- A guide for self-assessment for the essential biosecurity practices for use by farm owners and /or supervisors is developed.
- A poster guide for risky biosecurity practices and behaviours by some poultry farms is developed.

Output 3. Sufficient staff/workers adequately trained and implement cleaning and/or disinfection operations

- Sign contractual agreements with veterinary directorates in the selected governorates.
- Seven contractual agreements with veterinary directorates in the selected governorates on extension of LoAs to be terminated at 31 May 2010.
- ToT C&D courses for governorate-level veterinary personnel conducted.
- Sufficient farm workers (3 007) involved in C&D operations trained.
- Core communication messages addressing the different categories of stakeholders and implement effective awareness functions developed.
- Comprehensive data base covering district, village, farm code, trainees and trainers contact information, number of farms served, date of training and receiving biosecurity equipment were developed.

Output 4. Cleaning and disinfection operations implemented and monitored at commercial poultry farms

- Inputs (expendable and non-expendable) required for project operation delivered.
- C&D operations implemented as per agreed protocols in 2 732 commercial poultry farms.
- A preparation checklist for qualitative assessment of hygienic improvements in targeted areas is developed.
- Comprehensive assessment of operational biosecurity improvements for 809 farms (long and short cycles) after three visit for each farm is performed.
- A workshop on sharing experience and transfer of best practices between poultry producers with good and bad biosecurity practices and other service providers ('External injectors').

INDONESIA**Output 1. Engaging with high-risk collector yards in the greater Jakarta area (JABODETABEK) and developing and implementing procedures to immediately improve biosecurity at these locations (Phase I)**

- Output and lessons learned from Phase I achieved.
- Implementation of Phase II has started in selected collector yards in Jakarta.

- The local *dinas* are monitoring the collector yards for compliance with use of the equipment and cleaning of the crates and vehicles. Monthly reports are prepared and sent to FAO for collation.

Output 2. Collector yards and transport links to farms selected for improvement in biosecurity as a means of reducing spread of HPAI within the live poultry market chain and between farms

Progress has been made in engaging with farmers, brokers, and other key stakeholders involved in the transport of live poultry into JABODETABEK. Pulo Gadung, Rawa Kepiting, Cakung and Petukangan collector yards have been selected as locations for permanent C&D stations for poultry transport vehicles.

Output 3. Poultry market chain cleaning and disinfection guidelines and protocols developed and agreed upon with local veterinary officials and collector yard owners, with inputs from key players involved in transport of live birds

SOPs for C&D are being updated and alternative technologies are being explored. A cleaning station design for designated collector yards in DKI Jakarta has been developed and approved by government. All key stakeholders from both public and private sectors have been involved in the selection of sites for cleaning stations.

Output 4. Sufficient staff and workers adequately trained in cleaning and disinfection of poultry market chain; cleaning and disinfection guidelines and protocols developed

Staff and workers successfully trained and equipped in 12 collector yards with electric-powered high pressure washers and ten collector yards with gasoline-powered high pressure washers for Phase I of the C&D programme. Phase 2 trainings conducted thus far in Pulo Gadung have been successful.

Output 5. Cleaning and disinfection operations implemented and monitored in target collector yards and transport links

Phase I C&D activities being carried out by trained staff and workers using equipment provided by ECTAD Indonesia.

Phase II C&D activities being carried out by the establishment of C&D stations in selected large collector yards in DKI Jakarta.

Project Monitoring Sheet: **OSRO/IND/802/USA**

Project Title: “Immediate Technical Assistance to Strengthen Emergency Preparedness for Highly Pathogenic Avian Influenza (HPAI) to India”

Reporting period: October 2012 - March 2013

Country: India
Project title: Immediate Technical Assistance to Strengthen Emergency Preparedness for Highly Pathogenic Avian Influenza (HPAI) to India
Code: OSRO/IND/802/USA
Total budget: USD 2 220 000 of which USD 51 866 for Year 3
Effective starting date: 28 June 2010
Planned end date: 30 September 2013
<p>Context of the project</p> <p>This project focuses on capacity building of animal health personnel especially in the field of surveillance, epidemiology and in-depth outbreak investigations. Porous, long land borders between neighbouring countries with minimal control points and quarantine facilities and diffused low biosecurity poultry production and marketing chains continue to pose a risk for the spread of Highly Pathogenic Avian Influenza (HPAI) in India. It is necessary to develop an understanding of the dynamic structure of poultry production systems, supply chains and marketing of poultry and poultry products within India and internationally. There is also a lack of capacity in terms of skilled human resources and facilities to develop sensitive surveillance systems and to conduct effective epidemiological studies for the better management of HPAI. Although there is an existing Preparedness, Control & Containment Plan for Avian Influenza, it is expected that, with the support of this project, the Government of India will be able to draft a long-term national strategy in consultation with various stakeholders to deal with the longer-term issues to control and prevent HPAI.</p>
<p>Objectives of the project</p> <p>The main aim of the project is to (i) detect, reduce and control HPAI in poultry; (ii) improve livelihoods and promote food security of large vulnerable population, thereby reducing poverty, in addition to contributing to rural economic development and to improve the gross domestic product of India. The objective of the project, inter-alia, is to build capacity to improve surveillance and epidemiological analysis and reporting within the central and state veterinary services and at local levels using a community-based approach by improving the understanding of the epidemiology of HPAI, and so identifying priorities to reduce the risk of poultry outbreaks and consequent human cases. The overall objective of the programme is to reduce and then to eliminate the threat posed by HPAI H5N1 in the country. The country will then cease to be at risk for the development of human pandemic influenza from the H5N1 influenza virus.</p>
<p>Planned activities</p> <p>Output 1: Establishment of a Department of Animal Husbandry Dairying and Fisheries (DADF) Veterinary Epidemiology Unit in India.</p> <p>Output 2: Improved epidemiological capacity within the veterinary workforce in India.</p> <p>Output 3: Establishment of a risk-based surveillance programme.</p>

Output 4: Improved understanding of epidemiology of HPAI in India for rational and targeted control of HPAI.

Output 1: Establishment of a DADF Veterinary Epidemiology Unit in India

In order to achieve the above output, the following activities will be implemented:

- establishment of a DADF Veterinary Epidemiology Unit at the Animal Quarantine and Certification Station (AQCS) at Kapashera, New Delhi;
- coordination of country programme;
- management and operations support; and
- capacity building in project/programme management.

Output 2: Improved epidemiological capacity within the DADF, Ministry of Agriculture (MoA) of India

In order to achieve the above output, the following activities will be implemented:

- conduct Field Veterinary Epidemiology Training Programme (FETPV);
- conduct outbreak investigation courses for Field/District Veterinary Officers; and
- conduct trainings for grassroots level disease detection and reporting (e.g. community-based animal health workers [CAHWs]):

Output 3: Establishment of a risk-based surveillance programme

In order to achieve the above output, the following activities will be implemented:

- develop a grassroots level surveillance programme;
- conduct disease outbreak investigation in the event of an HPAI outbreak in collaboration with DADF;
- undertake structured virus isolation and characterization; and
- establish a disease information system dedicated to HPAI.

Output 4: Improved understanding of epidemiology of HPAI in India for rational and targeted control of the disease

In order to achieve the above output, the following activities will be implemented:

- value chain and risk assessment and mapping;
- phylogenetic and phylodynamic analysis of HPAI H5N1 isolates; and
- structured virus isolation and characterization followed by monitoring virus evolution in different species to assess spatial and temporal spread of the virus in the country and region.

Activities undertaken during the reporting period (October 2012 – March 2013)

Output 1: Establishment of a DADF Veterinary Epidemiology Unit in India

The DADF Epidemiology Unit, already established at the Animal Quarantine and Certification station at Kapashera, New Delhi was maintained, and landscaping of the premises for lawns and garden developed.

Current staff: The third year of the project started with the national staff being comprised of a Team Leader cum National Project Coordinator, one National Consultant–Epidemiology and one Operations Officer. As the International Consultants/Experts had to leave the project owing to

financial resource constraints, one more National Consultant–Epidemiology was appointed in November 2012 to bridge the gap.

FAO staff from Regional Sub Unit (RSU) in Kathmandu, Nepal supported the Epidemiology Unit of the FAO Emergency Centre for Transboundary Animal Diseases (ECTAD) India in various training programmes.

All the project activities were implemented with the active support of the DADF and the Directors of the State Animal Husbandry Departments. The DADF was regularly updated on the progress of the project through the submission of reports and conducting meetings.

In order to oversee the project activities, a Steering Committee was constituted in DADF. A meeting under the chairmanship of the Secretary, DADF was held on 11 February 2013 and the progress of the project was reviewed.

The project advocated for consistency between the national strategy for HPAI control with regional and global frameworks. This was carried out by interacting with national partners (MoA), regional partners – the South Asian Association for Regional Cooperation (SAARC) and the FAO sub-regional and regional support units, and globally with FAO headquarters and the World Organisation for Animal Health (OIE).

The FAO-ECTAD India continued to support the engagement of the Government of India in international meetings and training sessions and facilitated the Quarantine Officer from the northern region to attend the “Regional Workshop on Risk Analysis and Risk Management for Animals and Animal Products” held in Kathmandu, Nepal from 7 to 11 January 2013 and two officers from the Government of India to attend the Joint Prince Mahidol Award Conference 2013, the first Global Conference on Regional Disease Surveillance Networks, the second International One Health Congress, and the Centennial Commemoration of the Rockefeller Foundation held from 28 January to 2 February 2013 in Bangkok.

One National Consultant-Epidemiology was trained in spatial modelling of HPAI disease data for predictive risk mapping at *Université Libre de Bruxelles* (LUBIES), Brussels, Belgium. Two FAO-ECTAD staff members participated in “Regional Workshop on Risk Analysis and Risk Management for Animals and Animal Products” in Kathmandu, Nepal from 7 to 11 January 2013. The Team Leader attended the Joint Prince Mahidol Award Conference 2013, the first Global Conference on Regional Disease Surveillance Networks, the second International One Health Congress, and the Centennial Commemoration of the Rockefeller Foundation held from 28 January to 2 February 2013 in Bangkok, Thailand. All project staff attended the training on “Good Emergency Management Practices (GEMP)” in Bangkok, Thailand on 26 February 2013.

The DADF Epi-Unit of FAO- ECTAD India made a presentation on the HPAI situation and risk mapping of HPAI in India at the Annual Regional ECTAD Meeting at Bangkok held from 27 February to 1 March 2013.

Discussions were held with DADF staff on managing the national disease surveillance and control programme, as well as the logistics and management requirements.

Output 2: Improved epidemiological capacity within DADF, MoA of India

Conduct Field Veterinary Epidemiology Training Programme (FETPV): The capacity of selected field veterinarians from high risks states in epidemiological analysis of disease outbreaks was enhanced. Five delegates from India participated in a three-week FETPV conducted by the SAARC RSU in Nepal. One National Consultant-Epidemiology participated in the Regional FETPV for the SAARC countries held in Kathmandu, Nepal from 25 November to 15 December 2012 as a

resource person.

Outbreak investigation courses for Field/District Veterinary Officers: In order to build capacity of field veterinarians, two training for trainers (ToT) workshops for Outbreak Investigation, comprised of 15 participants from HPAI-vulnerable states and critical areas (12-15 Feb 2013 in Guwahati and 12-15 March 2013 at Bhubaneswar) were conducted and evaluated.

EpiNet network established: A list server for EpiNet was developed to sustain interest and commitment for trainees and other interested parties. It provided current information on HPAI (and other significant disease issues) and further mentoring on disease surveillance activities with updates on control programmes.

Output 3: Establishment of a risk-based surveillance programme

Develop a grassroots level surveillance programme: A surveillance programme developed at the grassroots level to increase advocacy. Training materials were developed in collaboration with the Society for Management of Information, Learning and Extension (SMILE), Bhubaneswar which includes a training manual, flipchart, a video and other materials on an external storage device for aiding the trainers in imparting training to grassroot-level workers. One ToT workshop (30 participants) for grassroots level CAHWs on disease detection and reporting was also conducted on 11 March 2013 in Bhubaneswar.

Undertake structured virus isolation and characterization: Collaborative projects were developed among the DADF Epidemiology Unit, High Security Animal Disease Laboratory (HSADL) and Duke-NUS Graduate Medical School, to investigate the epidemiology of HPAI in India using molecular epidemiology techniques and with *Université Libre de Bruxelles* (LUBIES), Belgium on Risk Mapping of HPAI epidemiology in India.

A joint molecular epidemiology study was carried out between FAO-India, HSADL and Duke-NUS Graduate Medical School. HPAI sequence data and spatial and temporal data from HPAI outbreaks from 2006 to 2012 was characterized using the latest phylogenetic and phylogeographic analysis. Sequence data from neighbouring countries was also included in the analysis for improved understanding of HPAI virus evolution in the sub-region.

An Outbreak Investigation on Highly Pathogenic Avian Influenza (H5N1) was conducted in the Central Poultry Development Organisation and Training Institute (CPDO-TI) in Bangalore in November 2012. The investigation characterized the HPAI H5N1 virus and probable source of the virus' introduction in collaboration with HSADL Bhopal and FAO Vietnam and prepared the Epidemiology Report. The report was submitted to the DADF.

The National Animal Disease Recording System (NADRS) is being implemented. The project team had access to NADRS. Standard operating procedures (SOPs) for outbreak investigation were developed and submitted to DADF for review and implementation across the country for standardizing outbreak investigation procedures for HPAI.

A fortnightly EpiNet list server newsletter, dedicated to HPAI epidemiology and other important emerging diseases, is being circulated across the country to create awareness regarding surveillance and epidemiology. Information on HPAI outbreaks across the world is being updated regularly.

Output 4: Improved understanding of epidemiology of HPAI in India for rational and targeted control of HPAI

Mapping of outbreak data from 2006 onwards was done. Identification of risk factors associated with HPAI outbreaks in the HPAI-vulnerable states of West Bengal, Assam and Tripura was completed. Using this data predictive risk maps of HPAI for the three states have been prepared at the sub-district level. These maps will now be used to target HPAI surveillance in high-risk areas.

A joint study between HSADL, Duke-NUS Graduate Medical School and FAO India was completed and has yielded useful insights into virus evolution over time and space. In order to understand the infection and transmission dynamics and critical points for focused interventions/response, farming poultry sectors and the socio-economic background of poultry raisers were mapped. Phylogenetic and phylodynamic analysis of HPAI H5N1 isolates from various outbreaks in the country was done and virus clades in various geo-locations were mapped. In order to assess the spatial and temporal spread of the virus in the country and region, a sustained collaboration was established between HSADL Bhopal and Duke-NUS Graduate Medical School, for monitoring the virus' evolution in different species (crow and other wild birds).

Risk factors for control of HPAI were identified and recommendations for targeted and risk-based surveillance were provided for the states of West Bengal, Assam and Tripura.

Planned activities for the next six-month period (1 April 2013 to 30 September 2013)**Output 1: Establishment of a DADF Veterinary Epidemiology Unit in India**

The Epidemiology Unit at Kapashera, New Delhi, along with its facilities, will be maintained. The project will continue to be backstopped by RSU Nepal and FAO international staff.

Output 2: Improved epidemiological capacity within the DADF, MoA of India

FETPV: The project will continue to mentor previous FETPV students through direct support and an EpiNet list server. There is strong support from the states and specialist institutes for further access to FETPV courses. Therefore, additional funding sources will be explored for conducting at least one more FETPV course for the northern states.

Two training workshops for Farm Managers of the State/Government of India/Indian Council of Agricultural Research (ICAR) poultry farms on biosecurity, surveillance and epidemiology of poultry diseases, with special reference to HPAI will be conducted in collaboration with HSADL, Bhopal.

One advocacy workshop for senior policy makers will be conducted to address the need for improved disease surveillance systems and to advocate for policy change in DADF and state governments so that epidemiology is recognized as a core discipline for animal and veterinary public health which is a vital component of all disease control programmes.

Output 3: Establishment of a risk-based surveillance programme

Four ToT workshops on disease detection and reporting at the grassroots level have been scheduled.

Further training to grassroots level workers (para-veterinarians and CAHWs) by master trainers will be coordinated with the states so that district-level trainings can be organized. Staff of the project

will be present at these trainings as observers.

Sixteen veterinarians/scientists from DADF, states, Regional Disease Diagnostic Labs (RDDLs), Project Directorate on Animal Disease Management and Surveillance (PD-ADMAS), Bangalore, HSADL, Bhopal and FAO-ECTAD India will be trained on improved risk assessment to enable the development of a risk-based surveillance programme in India under the aegis of the FAO RSU in Nepal.

Collaboration will be strengthened between DADF Epidemiology Unit, HSADL and Duke-NUS Graduate Medical School to further investigate the epidemiology of HPAI in India using molecular epidemiology techniques. Virus isolation and molecular characterization with probable source(s) of virus introduction, including virus evolution, will continue.

Guidelines for the preparation of risk-based state HPAI surveillance plans will be developed. These will include both active and passive surveillance. SOPs on biosecurity in backyard poultry, live bird markets and commercial poultry will be developed and submitted to the DADF.

The final project report will be prepared and submitted upon completion of the project.

Project Monitoring Sheet: **OSRO/IND/802/USA**

Project Title: **Immediate technical assistance to strengthen preparedness to combat highly pathogenic emerging diseases and transboundary animal diseases in India**

Reporting period: **April to September 2012**

Country: India
Project title: Immediate technical assistance to strengthen preparedness to combat highly pathogenic emerging diseases and transboundary animal diseases in India
Code: OSRO/IND/802/USA
Budget: USD 1 220 000, USD 948 134 and USD 831 866 (Phases I and II)
Total budget: USD 2 120 000
Effective starting date: 28 June 2010
Planned end date: 30 September 2013
Context of the project This project will focus on capacity building of animal health personnel especially in the field of surveillance, epidemiology and in-depth disease field investigations. Porous, long land borders between neighbouring countries with minimal control points and quarantine facilities and diffuse low biosecurity, poultry production and marketing chains continue to pose a risk for the spread of Highly Pathogenic Avian Influenza (HPAI) and other transboundary animal diseases (TADs) in India. It is necessary to develop an understanding of the dynamic structure of the animal (poultry) production systems, value/supply chains and marketing in animals (especially poultry and poultry products) within India and internationally. There is also a lack of capacity of skilled human resources and facilities to develop sensitive surveillance systems and to conduct effective epidemiological studies for the better management of HPAI. Although there is an existing Avian Influenza Control Plan (AICP), it is expected that, as a result of this project, India will be able to draft a long-term national strategy in consultation with various stakeholders to deal with the longer term issues to control and prevent HPAI.
Objectives of the project The project aims to detect, reduce and control disease in animals, particularly poultry, to improve livelihoods, promote the food security and livelihoods of the large vulnerable population, thereby reducing poverty and contributing to rural economic development and to improve the Gross Domestic Product (GDP) of India. The project will strengthen the capacity of the Department of Animal Husbandry, Dairying and Fisheries (DADF) by improving understanding of the epidemiology of HPAI, and so identifying priorities to reduce the risk of poultry outbreaks and consequent human cases. The project aims to build capacity to improve surveillance and epidemiological analysis and reporting within the central and state veterinary services and at local levels using a community-based approach. The overall objective of the programme is to contribute to the elimination of the threat posed by HPAI by controlling the disease in poultry, such that India no longer poses a risk for the development of human pandemic influenza from the H5N1 virus.
Planned activities for the reporting period (April to September 2012)
Output 1: Establishment of a DADF Veterinary Epidemiology Unit in India
Output 2: Improved epidemiological capacity within the DADF and Indian Council of Agricultural Research (ICAR) of the Ministry of Agriculture (MoA) of India
Output 3: Establishment of a risk-based surveillance programme
Output 4: Improved understanding of epidemiology of HPAI in India for rational and targeted control of these diseases

Output 1: Establishment of a DADF Veterinary Epidemiology Unit in India

In order to achieve the above output, the following activities will be implemented:

- establishment of a DADF Veterinary Epidemiology Unit at the Animal Quarantine and Certification station at Kapashera, New Delhi;
- coordination of country programme;
- management and operations support; and
- capacity building in project/programme management.

Output 2: Improved epidemiological capacity within the DADF, MoA of India

In order to achieve the above output, the following activities will be implemented:

- conduct Field Veterinary Epidemiology Training Programme for Veterinarians (FETPV), including field outbreak investigation courses for district/state veterinary officers;
- country visits for technical staff of DADF to study best practices for disease surveillance and control (in Thailand for X-ray surveillance, in Indonesia for the participatory disease surveillance and response [PDSR], and in Viet Nam for HPAI vaccination programmes); and
- provide overseas training in advanced epidemiology and surveillance to the technical staff of DADF.

Output 3: Establishment of a risk-based surveillance programme

In order to achieve the above output, the following activities will be implemented:

- develop a grassroots level surveillance programme;
- undertake structured virus isolation and characterization; and
- establish a disease information system dedicated to HPAI.

Output 4: Improved understanding of epidemiology of TADs (including HPAI) and zoonotic diseases in India for rational and targeted control of these diseases

In order to achieve the above output, the following activities will be implemented:

- study the livestock and poultry value chains including wet markets and slaughter facilities;
- map the farming sectors and socio-economic background along the market and value chains;
- conduct data analysis for mapping disease outbreaks and distribution of virus strains and clades as appropriate;
- define infection and transmission dynamics in the context of the various farming systems and socio-economic background; and
- identify critical points for intervention to control TADs and zoonotic diseases.

Activities undertaken during the reporting period (April to September 2012)**Output 1: Establishment of a DADF Veterinary Epidemiology Unit in India**

Establishment of an Epidemiology Unit: The DADF Centre had already been established at the Animal Quarantine and Certification station at Kapashera, New Delhi. Final refurbishments were completed, and some additional equipment was provided.

Current staff: International - Chief Technical Adviser/Team Leader, Geographic Information System (GIS) Specialist, Operations Officer, National - Project Coordinator, Consultant - Epidemiology, Operations Officer. The position of National Consultant - Surveillance was dropped from the project.

Coordination of country programme: The Joint Secretary of DADF was regularly updated on the progress of the project with monthly meetings and regular submission of project reports and papers. Meetings were held with the Donor. The project advocated for consistency between the national strategy for HPAI control with regional and global frameworks. This was carried out by interacting with local partners (MoA), regional partners – the South Asian Association for Regional Cooperation (SAARC) and the FAO subregional and regional support units, and globally with the FAO in Rome and the World Organisation for Animal Health (OIE) under the Global Framework for

Transboundary Animal Diseases (GF-TADs). There has been ongoing collaboration and information sharing with partners - the Centre for Disease Control (CDC), the World Health Organization (WHO) and the International Livestock Research Institute (ILRI).

Management and operations support: The operations team continued to support the engagement of India in international meetings and training sessions with variable success. Two staff from DADF attended the global foot-and-mouth disease (FMD) conference in Bangkok. No staff from India participated in SAARC consultation working groups on communications nor in FAO training on disease notification.

Capacity building in project/programme management: Ongoing discussions with DADF staff on managing a national disease surveillance and control programme, the logistics and management requirements. Meetings were scheduled with the National Informatics Centre on information systems development and management.

Output 2: Improved epidemiological capacity within DADF, MoA of India

FETPV: A further three-week FETPV course including field outbreak investigations was held in Odisha in July 2012 in collaboration with the local department in Bhubaneswar and with support from the regional offices of FAO and Colorado State University. A total of 22 district/state veterinary officers attended the course.

Output 3: Establishment of a risk-based surveillance programme

Develop a grassroots-level surveillance programme: In the reporting period, five short outbreak investigation/surveillance courses (250 participants) were undertaken for all the remaining states of India for district/state veterinarians (total now trained: 450). The surveillance course focused on outbreak investigation, sample collection and diagnosis, data capture/analysis and reporting, and designing and implementing effective disease surveillance.

Undertake structured virus isolation and characterization: Formal recommendations on improving surveillance with increased isolation of viruses were delivered. A joint molecular epidemiology study proposal was developed between FAO-India, High Security Animal Disease Laboratory (HSADL) and Duke University, Singapore. The proposal was endorsed by ICAR and is awaiting approval by DADF. A protocol for the investigation of crow die-offs with virus isolation and characterization was presented.

Establish a disease information system dedicated to HPAI: General information on current systems of surveillance and data handling was collected. The National Animal Disease Recording System (NADRS) is being implemented. The project team had access to NADRS. This system should be the basis for collecting HPAI data in addition to that from other diseases.

Output 4: Improved understanding of epidemiology of TADs (including HPAI) and zoonotic diseases in India for rational and targeted control of these diseases

Study the livestock and poultry value chains including wet markets and slaughter facilities: A value chain study was completed in Jalpaiguri (West Bengal) and Dhubri (Assam) districts; these districts are a focus of poultry movement between 'mainland' India and the northeastern states, and also across international borders with Bangladesh, Nepal and Bhutan. The study has demonstrated the complexity of the poultry production marketing and distribution system in this area, and has identified key targets to mitigate disease risk.

Map the farming sectors and socio-economic background along the market and value chains: Poultry chain studies have developed maps of production centres and distribution hubs against other activities in the study districts.

Conduct data analysis for mapping disease outbreaks and distribution of virus strains and clades as appropriate: Initial analysis of international and state-level risk factors was completed. Field investigations have identified local risk factors. Crow die-off investigations were undertaken and a protocol delivered on strengthening these investigations. A joint proposal was prepared (see above) that will look at virus evolution over time and space.

Define infection and transmission dynamics in the context of the various farming systems and socio-economic background: Poultry value chain studies have undertaken a risk assessment; this baseline data on risk and demographics will be used with virus characterisation to map likely reservoirs and transmission routes.

Identify critical points for intervention to control HPAI: Poultry value chain studies have mapped the production and marketing system in two districts identifying key hubs of activities and critical control points for risk reduction.

Planned activities for the next six-month period (October 2012 to March 2013)

Output 1: Establishment of a DADF Veterinary Epidemiology Unit in India

Establishment of an Epidemiology Centre: Maintain the facility at Kapashera.

Recruitment of staff: The project team will be reduced, as funding is limited. The project will be backstopped by FAO international staff.

Output 2: Improved epidemiological capacity within the DADF, MoA of India

FETPV: There are insufficient funds to run further FETPV courses. Five Indian nationals will be trained in a SAARC regional course (Nov/Dec 2012). The project will mentor previous FETPV students through a list server and direct support. Additional funding sources will be explored so that additional FETPV courses can be held. There is very strong support from the states and specialist institutes for further access to FETPV courses.

Output 3: Establishment of a risk-based surveillance programme

Develop a grassroots-level surveillance programme: Develop and implement a Training-of-Trainers course for district veterinarians to train community level staff/private veterinarians. This course will need to be developed using an agency with specialist skills in adult learning.

Undertake structured virus isolation and characterization: Review the system for information management of virus data. Promote surveillance activities to increase virus isolation rate.

Establish a disease information system dedicated to HPAI: NADRS is being implemented for all animal health events; it needs critical review to ensure it meets the demands of an effective disease information system, providing for robust epidemiological analysis – the project will review of NADRS in the next project phase.

Output 4: Improved understanding of epidemiology HPAI in India for rational and targeted control of this disease

Study the livestock and poultry value chains including wet markets and slaughter facilities: No further activity was planned in this period owing to limited funding.

Map the farming sectors and socio-economic background along the market and value chains: Limited mapping will be undertaken by the National Consultant – Epidemiology using the poultry value chain data and data layers recently sourced.

Conduct data analysis for mapping disease outbreaks and distribution of virus strains and clades as appropriate: Simple mapping of outbreaks will be provided; cluster analysis of previous outbreaks will be undertaken.

Identify critical points for intervention to control TADs and zoonotic diseases: Formal documentation of risk factors identified in the poultry value chain studies will be developed into a formal paper recommending priorities for risk mitigation.

Main challenges encountered and response provided

Initially, there was a misunderstanding with DADF of project expectations and major concerns over project staff recruitment. The continuity of the good relationship with the counterpart was strengthened by ensuring the regular delivery of hard copies of data analyses, reports, discussion and position papers to a wide group of staff in DADF.

Though there has been a lack of access in obtaining quality data on outbreaks, information on virus characterization and spatial layers. The project managed to analyse and report on the data provided. Additional spatial data has recently been provided from other sources, and further analysis is now being undertaken.

The poor quality of surveillance data and the limiting ability to assess the epidemiology of HPAI in India was a great challenge. A report was delivered on the epidemiology of HPAI in the northeastern states; the gaps in the surveillance programme were identified and recommendations made. A supposed agreement for a project revision extending the project to include TADs was rejected by the Government – this was non-negotiable, and the project proceeded to focus on HPAI issues, recognizing that epidemiology skills developed are generally applicable to other diseases.

Main progress made towards the achievement of project outcomes (*from the start of the project activities*)

Output 1: Establishment of a DADF Veterinary Epidemiology Unit in India – established.

Output 2: Improved epidemiological capacity within the DADF, MoA of India – some 500 veterinary staff trained to various levels; further training scheduled.

Output 3: Establishment of a risk-based surveillance programme – field investigations undertaken; surveillance systems analysis conducted, and recommendations made on necessary improvements.

Output 4: Improved understanding of epidemiology of HPAI in India – reduced culling zone/ limitations of sero-surveillance of poultry. A number of papers delivered including outbreak and crow mortality investigations, state-level spatial risk factors, considerations for vaccination and poultry value chain risk assessments.

Quarter II 2010

Project Monitoring Sheet: **OSRO/IND/802/USA**

Project Title: **Immediate technical Assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) to India**

Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) to India
Code: OSRO/IND/802/USA
Budget: USD 1 220 000 (Phase I) Total budget: USD 3 000 000 ¹
Effective starting date: July 2009
Planned end date: June 2012
<p>Context of the project</p> <p>This project will focus on the eastern Indian states of Assam and West Bengal in the short term with a longer term capacity building of animal health personnel, especially in the field of surveillance, epidemiological analysis and in-depth disease investigation. The project focuses on understanding the dynamic patterns of the poultry production systems, value/supply chains and trade in poultry and poultry products within India.</p> <p>The project is expected to provide information on infection and transmission dynamics of the virus in the local environment where the virus persists and to consolidate the capacity to establish and conduct risk-based surveillance programmes. The aim of building capacity to strengthen surveillance and epidemiological analysis will lead to an improved tracking of the virus movement, greater virus isolations and better molecular information on the virus evolution. Such information is critical for rational and targeted control of the disease. With the strategic inputs in the project, the country would be better placed to take a leadership role in supporting regional efforts to control HPAI.</p>
<p>Objectives of the project</p> <p>The project aims to build capacity to improve surveillance and epidemiological analysis in both domestic and wild birds. The overall objective of the programme is to contribute to the elimination of the threat posed by HPAI by controlling the disease in poultry such that India no longer presents a risk for the development of human pandemic influenza from the H5N1 virus.</p>
<p>Planned activities</p> <p>Output 1: Establishment of a HPAI (Epidemiology) Unit in India Activity 1.1 Establishment of an HPAI (Epidemiology) Unit.</p>

¹ This project has a three-year duration. Total budget is USD 3 000 000 subdivided as follows: USD 1 220 000 for year I, USD 948 134 for year II and USD 831 866 for year III. Funds have been committed for year I only; activities planned for years II and III will be implemented based on project performance and fund availability.

Activity 1.2 Coordination of the country programme.

Activity 1.3 Management and operations support.

Activity 1.4 Capacity building in project/programme management.

Output 2: Improved epidemiological capacity within the Department of Animal Husbandry, Dairying and Fisheries (DADF), Ministry of Agriculture (MoA) of India

Activity 2.1 Conduct Field Epidemiology Training Programme for Veterinarians (FETPV).

Activity 2.2 Conduct outbreak investigation courses for Field/District Veterinary Officers.

Activity 2.3 Country visits to study best practices for surveillance (in Thailand for X-ray surveillance, in Indonesia for participatory disease surveillance and response (PDSR), and Viet Nam for grass-roots level surveillance).

Activity 2.4 Conduct trainings for grass roots level disease detection and reporting (e.g. community based animal health workers).

Activity 2.5 Provide overseas training in advanced epidemiology and surveillance to the technical staff of DADF.

Output 3: Establishment of a risk-based surveillance programme

Activity 3.1 Develop a grassroots level surveillance programme.

Activity 3.2 Undertake structured virus isolation and characterization.

Activity 3.3 Establish a disease information system dedicated to HPAI.

Output 4: Improved understanding of epidemiology of HPAI in India for rational and targeted control of the disease

Activity 4.1 Study the poultry value chains to include wet markets.

Activity 4.2 Map the farming sectors and socio-economic background along the market and value chains.

Activity 4.3 Conduct data analysis for mapping disease outbreaks and distribution of virus clades.

Activity 4.4 Define infection and transmission dynamics in the context of the various poultry farming systems and socio-economic background.

Activity 4.5 Identify critical points for intervention to control HPAI.

Activities undertaken during the reporting period

As a result of internal official formalities/clearances, there was a considerable delay in the process of obtaining official agreement from the Government of India (GoI) to implement the project. However, several pre-inception workshop activities were undertaken.

Output 1: Establishment of an HPAI (Epidemiology) Unit in India

Activity 1.1: Establishment of an HPAI (Epidemiology) Unit.

- *Pre-inception workshop activities*

The schedule for the official launching of the project was discussed and coordinated with the Department of Animal Husbandry, Dairying and Fisheries (DADF). It was initially agreed with DADF to hold the inception workshop on 7 April and 8 April 2010. However, owing to the busy schedule of the Secretary, the workshop was finally scheduled on 10 and 11 May 2010.

The agenda/programme, invitees and venue for the workshop was finalized through a consultation process with DADF and the United States Agency for International Development (USAID) - India officials. The list of participants included the Secretaries of Bangladesh, Bhutan and Nepal, as the project had relevance in the regional context. The neighbouring countries needed to be aware of the ongoing activities in India. In consultation with various stakeholders during the period of this project, GoI will be able to draft a longer term national strategy to address the issues relevant to the avian influenza (AI) control programme. India should also take on a leadership role in facilitating better coordination among the countries in the region and achieving the primary objective of the project.

- *Organization of the inception workshop and preparation of inception workshop report.*

An inception workshop was organized to address the shortcomings in the control and containment of HPAI through the project OSRO/IND/802/USA –“Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) to India” held at New Delhi, India on 10 and 11 May 2010. The key role of this project was to improve the capacity building efforts of the country to rapidly control and avoid possible future incursions of the disease over the next several years through an increased emphasis on epidemiological analysis and disease tracking.

The workshop was inaugurated by the Secretary, DADF, Animal Husbandry Commissioner. It was attended by (i) the Joint Secretary (Livestock Health) and several officials of DADF; (ii) the Director General, Indian Council of Agricultural Research (ICAR), the Deputy Director General (Animal Sciences) and scientists of ICAR; (iii) the Director, Indian Veterinary Research Institute (IVRI), the Directors of veterinary services of various state governments, scientists from Regional Disease Diagnosis Laboratories (RDDLs) and High Security Animal Disease Laboratory (HSADL-OIE Reference Laboratory); (iv) USAID officials, representatives from the World Health Organization (WHO) and other international organizations; and (v) the FAO officials from headquarters, Emergency Centre for Transboundary Animal Diseases - Regional office for Asia and the Pacific (ECTAD-RAP) and ECTAD – Subregional Office based in Kathmandu, Nepal. In addition, the workshop was attended by the Secretaries of Ministries of Agriculture/Fisheries and Livestock from Bangladesh, Bhutan and Nepal.

An inception workshop report was prepared and has been circulated for technical clearance.

- *Implementation of the project*
 - Recruitment of national and international staff
 - Suitable candidates have been identified to fill the position of Chief Technical Advisor (CTA) Team Leader/international Epidemiology Expert and international Geographic Information System (GIS) Expert. The MoA will soon nominate a candidate for the position of a national Project Coordinator who will work closely with the CTA.
 - Three national staff positions (HPAI Epidemiology, HPAI Surveillance and national Operations Officer) were advertised in leading websites and widely circulated to various state governments and universities in the country. Based on the prescribed selection criteria, two national veterinarians were identified for recruitment for the positions of national consultant (HPAI epidemiology) and national consultant (HPAI surveillance). The Selection Committee recommended cancellation of the vacancy announcement (VA) for the operations position. In place of the national Operations Officer's position, a decision was made to create and appoint two new positions for a finance/administration assistant and an operations assistant with revised TORs. This is expected to give more flexibility in field operations of the project. Discussions are in progress with the two selected candidates for the technical positions with respect to remuneration, date of entry, etc.
 - Renovation of the project site
 - The architect to prepare the layout plans for the renovation and refurbishment of the selected project site in the animal Quarantine station in Delhi was identified through a competitive process.
 - The layout plans prepared by the selected architect were circulated to senior officials of FAO for suggestions and modifications. These layout plans were finalized based on FAO's internal consultation.
 - Based on the architect's report, layout plans and bill of quantity, the contractor to undertake the renovation work is being identified by a competitive process.
 - Budget revision, i.e. shifting of funds from general operating expenses to contracts budget line, has been requested from USAID India. Renovation work will commence as soon as an approval to the request is received from USAID India.
 - Meetings with Government of India Officials
 - The Sub-regional Manager, ECTAD-SAARC, FAO Nepal had a meeting on 1 April 2010 with the Joint Commissioner (Livestock Health), DADF to pursue and discuss various issues pertaining to launching and implementation of the project. The outcomes of the discussions were the following:
 - (i) Signing of project document (OSRO/IND/802/USA) – The Joint Commissioner (LH) informed that the DADF is waiting for the response from the Joint Secretary (IC), MOA.
 - (ii) Letter regarding refurbishing/repairs at Quarantine Station – The Joint Commissioner (LH) promised to send a mail to FAO concurring with the proposal.
 - The national project consultant had a meeting with Joint Secretary (LH) on 23 April 2010 regarding the invitations to be extended to the participants of the inception workshop and finalization of the workshop agenda. The list of invitees, letters of

invitation, agenda for the workshop, banners and other logistics for the workshop were finalized in consultation with the Joint Secretary (LH).

- The FAO delegation had a side meeting with GoI (Joint Secretary LH, DADF, MoA) during inception workshop to discuss urgent matters regarding implementation of the project. As a result of this side meeting, the Joint Secretary (LH) provided the agreement of GoI to initiate project activities, proceed with recruitment of national and international personnel for the project and initiate renovation works at the building that has been allocated to the USAID Epidemiological Unit project in the premises of the Quarantine Office. The Joint Secretary (LH) has acknowledged the need to ensure minimum operating security standards (MOSS) compliance of the premises and the setting up of necessary functionalities without significantly deviating from Quarantine Office's standards.

- *Meetings with USAID - India Officials*

A side meeting with USAID India officials was held during the inception workshop to discuss the status of the Government's approval of the project along with some operational matters related to the implementation of the project. USAID was also updated on the status of the rehabilitation of the premises assigned to the project in the quarantine station and the need for a budget revision to accommodate the costs of rehabilitation and refurbishing. USAID has agreed to the rehabilitation work and allocation of necessary funds within the project budget, to which FAO has agreed to send a written request for confirmation. The meeting also discussed ways of ensuring closer coordination between FAO and USAID on project implementation, regular updating on project achievements, and fiscal year (FY) 2010 financial allocations for the India and cross-border projects (OSRO/IND/802/USA and OSRO/RAS/701/USA, respectively). USAID confirmed a possible reduction of the overall USAID contribution to the ECTAD HPAI programme and the fact that projects with a significant budget balance will not receive additional funding for FY 2010. This approach will apply to this project, which is in the process of starting project activities.

Planned activities for the next quarter

Output 1: Establishment of a HPAI (Epidemiology) Unit in India

Activity 1.1: Establishment of an HPAI (Epidemiology) Unit

- Implementation of the project including recruitment of national and international staff, renovation of the project site as per the approved work plan during the inception workshop.

Activity 1.2: Coordination of country programme

Activity 1.3: Management and operations support

Activity 1.4: Capacity building in project/programme management

Output 2: Improved epidemiological capacity within the DADF, MoA of India

Activity 2.3: Country visits to study best practices for surveillance (in Thailand for X-ray surveillance, in Indonesia for PDSR and Viet Nam for grassroots level surveillance).

Main challenges encountered and response provided

Obtaining the formal acceptance and signing of the project document by the Indian Ministry of Agriculture was the main challenge encountered, which was resolved through continuous follow-up with the concerned officials of the DADF.

Main progress made towards the achievement of project outcomes *(from the start of the project activities)*

Output 1: Establishment of an HPAI (Epidemiology) Unit in India

Although an officially signed project document has not been received, an agreement with GoI was obtained to initiate project activities, proceed with recruitment of national and international project personnel and to commence renovation work at the building that has been assigned to the USAID Epidemiological Unit project in the premises of the Quarantine Office.

**Project Title: Enhancing the capacity of the
Government of Indonesia and partners to control highly pathogenic
avian influenza (HPAI)**

Period: October 2012 - March 2013

Country: Indonesia
Project title: Enhancing the capacity of the Government of Indonesia and partners to control Highly Pathogenic Avian Influenza (HPAI)
Code: OSRO/INS/103/USA
Budget: USD 5.2 million
Effective starting date: 1 October 2012
Planned end date: 30 September 2013
Context of the project The purpose of the project is to contribute to the control of Highly Pathogenic Avian Influenza (HPAI) in poultry in Indonesia, thus safeguarding the health and livelihoods of the Indonesian population. The expected outcome of the project is that the capacity and ability of the Government of Indonesia and partners to control HPAI is enhanced.
Objectives of the project Output A: Increased empowerment of village residents in biosecurity and HPAI prevention and control through an expansion of a government-funded, streamlined Participatory Disease Surveillance and Response (PDSR) system. Output B: Reduced HPAI-infected poultry from commercial farms through improved cooperation among all stakeholders. Output C: Reduced H5N1 virus at selected critical control points in the market chain through improved biosecurity practices by related stakeholders. Output D: Improved biosecurity practices in backyard and commercial duck-raising. Output E: Reduction of HPAI in poultry farms through widespread use of locally produced vaccines, as appropriate, based on local antigens and new strains monitored. Output F: Strengthened veterinary services at central, provincial, and district levels with increased commitment from related stakeholders.
Planned Activities Output A: Increased empowerment of village residents in biosecurity and HPAI prevention and control through an expansion of a government-funded, streamlined PDSR system <i>A.1 Distribute and use communication materials to support HPAI prevention and control activities.</i> <i>A.2 Revise and streamline PDSR system to incorporate more community-based decision-making for improved HPAI prevention and control.</i> <i>A.3 Ensure operational budget allocations for Local Disease Control Center (LDCC)/PDSR by local governments.</i> <i>A.4 Extend PDSR database system to district level for improved local disease control management.</i> Output B: Reduced HPAI-infected poultry from commercial farms through improved cooperation among all stakeholders <i>B.1 Establish effective communication and coordination between Government and commercial</i>

poultry industry in order to build trust among the stakeholders.

B.2 Establish a confidential database of outbreak information from commercial farms.

B.3 Increase competency in commercial poultry health in both public and private sectors.

B.4 Advocate for best practices for commercial poultry health.

B.5 Conduct trials on private sector-funded compensation system.

Output C: Reduced H5N1 virus at selected critical control points in the market chain through improved biosecurity practices by related stakeholders

C.1 Improve the surveillance system along the post-production market chain and make it more cost-effective.

C.2 Improve biosecurity along post-production market chain.

C.3 Increase demand for healthy poultry end-product.

Output D: Improved biosecurity practices in backyard and commercial duck-raising

D.1 Advocate for best practices in duck health.

D.2 Implement duck epidemiological data analysis in low incidence areas in Indonesia to improve understanding of the reservoir role of ducks.

Output E: Reduction of HPAI in poultry farms through widespread use of locally produced vaccines, as appropriate, based on local antigens and new strains monitored

E.1 Promote use of effective vaccine by farmers.

E.2 Establish partnership between commercial poultry industry and the Government for sharing of influenza virus data and isolates.

E.3 Establish sustainable laboratory system for influenza virus monitoring - funded under the IDENTIFY project.

Output F: Strengthened veterinary services at central, provincial, and district levels with increased commitment from related stakeholders

F.1 Pilot National Veterinary Services (NVS) in three provinces for selected priority diseases.

F.2 Ensure effective programme management with respect to finance, administration, technical inputs, and partner relations (donor and Government of Indonesia).

F.3 Ensure appropriate support to programme components and management to maximize stakeholder participation and build capacity of animal health services.

F.4 Conduct epidemiological studies to better inform disease control and support the Government's strategic planning.

F.5 Provide technical support to the Department of Animal Health (DAH) for HPAI policy development.

F.6 Contribute to the Komnas Zoonosis One Health communication and advocacy strategy.

Activities undertaken during the reporting period

Output A: Increased empowerment of village residents in biosecurity and HPAI prevention and control through an expansion of a government-funded, streamlined PDSR system

A.1 Distribute and use communication materials to support HPAI prevention and control activities

- gathered photo and video documentation from NVS Level 2 training in Padang, West Sumatra and PDSR Level 3 mentoring in Pekanbaru, Riau Province;
- provided training for 50 PDSR and Commercial Poultry Veterinarian Programme (PVUK) Master Trainers (MTs) to improve skills in public speaking and

presentation techniques;

- produced video footage of the biosecurity practices employed during the management of sentinel bird farm in Surakarta, Central Java for the collector yard surveillance study;
- gathered video documentation of feeder and drinking cleaning practices on Commercial Poultry Health (CPH) layer farms; and
- captured and produced a video and audio speech in both English and Indonesian for a training package used by the translation team to improve translation skills.

A.2 Revise and streamline PDSR system to incorporate more community-based decision-making for improved HPAI prevention and control

- By the time of report preparation, 1 445 PDSR (37 percent female and 63 percent male) had been trained in PDSR V3 and 8 LDCCs are now using the PDSR V3 information system.
- Eight mentoring visits covering 21 districts and 92 PDSR officers were conducted to backstop the PDSR V3 training.
- Using local government funds, 36 new PDSR officers (20 female and 16 male) were trained and 15 PDSR (8 female and 7 male) were provided with continuing education training.
- Held a Training of Master Trainers (TOMT) on presentation skills and the newly-introduced clade 2.3.2.1 H5N1 virus for 48 MTs (including the 12 PVUK MTs). MTs were provided with updated information required to train PDSR, local government staff, and the community on the control and prevention of clade 2.3.2.1 outbreaks. Follow-up plans on further dissemination of clade 2.3.2.1 were agreed upon for this training.
- As clade 2.3.2.1 affects ducks, it was necessary to develop humane methods for culling ducks when controlling an outbreak. Standard operating procedures (SOPs) for two methods of humane duck culling using dry ice and neck dislocation were developed and tested.

A.3 Ensure operational budget allocations for LDCC/PDSR by local governments

- held meetings with the Rapid Response Unit (*Unit Respons Cepat* [URC, formerly CMU]) and the Planning Division of DAII to determine strategies for local government advocacy activities to ensure the continuation of PDSR, PVUK, *Petugas Surveilans Pasar* (Market Surveillance Official), and LDCC activities in 2013;
- conducted individual provincial-level advocacy meetings with provincial government leaders of Lampung, Central Java, East Java, Banten, West Java, Yogyakarta, DKI Jakarta and North Sumatra;
- conducted a meeting with URC and DAII Planning Division to evaluate the results of advocacy meetings that have already been implemented in eight provinces;
- conducted monitoring and follow-up meetings with provincial governments to follow-up on the agreement/commitment made during the advocacy meetings; and
- participated in Local Government Budgeting and Planning Training conducted by the Australian Department of Agriculture, Fisheries and Forestry (DAFF) Emerging Infectious Diseases (EID) programme in Makassar, South Sulawesi.

A.4 Extend PDSR database system to district level for improved local disease control management

- held PDSR V3 Data Encoder (DE) Training at the province level for 25 provincial

DEs in 24 provinces;

- assisted nine LDCCs in transitioning to the PDSR V3 information system;
- completed the survey of provincial DEs on the status and use of the 355 district computers;
- provided specialized training to DAH staff members on database management, design, and programming in preparation of PDSR V3 transition and to enable further handover of PDSR management responsibility to DAH; and
- completed revision of the PDSR officer Travel Report module for the PDSR V3 information system.

Output B: Reduced HPAI-infected poultry from commercial farms through improved cooperation among all stakeholders

B.1 Establish effective communication and coordination between the Government and commercial poultry industry in order to build trust among the stakeholders

- Six stakeholder meetings were held in the PVUK expansion areas of West Java, Central Java, East Java, and Lampung, to increase awareness of the benefits of the PVUK programme for improving local poultry production.
- Held meetings with URC to identify opportunities and strategies for engaging the National Poultry Health Committee (KKUN) in order to enable FAO to facilitate the continuation of KKUN activities.
- A coordination meeting was held between URC/DAH, KKUN and FAO in which collaborative initiatives with KKUN were discussed.
- FAO staff followed-up on the recommendations produced in the URC/DAH, KKUN and FAO meeting to identify activities on which FAO and KKUN will collaborate together.

B.2 Establish a confidential database of outbreak information from commercial farms

- As reported previously, this activity has been incorporated into the private sector-funded compensation pilot and PVUK programmes (Activities B.3 and B.5).

B.3 Increase competency in commercial poultry health in both public and private sectors

- The PVUK pilot phase was completed. The 50 trained PVUK officers from the pilot areas developed their skills and confidence in working with commercial poultry farmers in their areas.
- The PVUK expansion for this project phase was completed with the Level 3 training of 23 PVUK veterinarians from the four expansion districts, bringing the total trained PVUK to 62. To date, 58 PVUK (27 male and 31 female) are active in the field.
- Five technical documents have been posted and discussed by PVUK on the e-forum, which was designed to provide technical support to PVUK veterinarians in the field.
- In conjunction with the PDSR MTs, the 12 PVUK MTs (6 male and 6 female) joined the TOMT on presentation skills and control of clade 2.3.2.1 H5N1 virus.
- A Continuing Education I training for 52 PVUK participants was held, covering clade 2.3.2.1, the CPHI recommendations for cleaning feeders and drinkers, and group formation for biosecurity planning.
- In the expansion areas, poultry farm profiling training was held for PVUK and a number of PDSR officers to assist PVUK. Data from 4 000 commercial farms have been recorded.
- Thirteen mentoring visits were conducted to support the PVUK in farmer training

and assist with stakeholder meetings. All districts have been mentored at least once.

B.4 Advocate for best practices for commercial poultry health

- trained 59 PVUK officers in feeder and drinker cleaning procedures and are able to pass on the skills to commercial poultry farmers in their area;
- completed Phase 1 of the layer farm biosecurity cost-effectiveness study in Central Java, which improved and harmonized farm production management practices including proper vaccination strategy, feeder and drinker cleaning procedures;
- conducted farmers' feedback meeting in Solo with all participating farmers to evaluate the implementation of Phase 1 and its benefits for the farmers as well as to prepare the biosecurity-based management plan to be implemented during Phase 2;
- initiated Phase 2 of the biosecurity cost-effectiveness study based on the evaluation of results and agreement with farmers on the specific biosecurity interventions to be implemented on each farm;
- conducted weekly farm visits and monthly feedback meetings with participating farmers to provide technical support and monitor for proper implementation of the agreed biosecurity interventions; and
- continued weekly data collection and analysis of economic and production data from all layer farms participating in the biosecurity study – FAO Regional Economist conducted mission to Indonesia to assist with analysis of Phase 1 and preparation of findings within a Phase 1 report.

B.5 Conduct trials on private sector-funded compensation system

- Following further evaluation, the location of the trial was moved from Yogyakarta to Bogor, West Java in order to increase the feasibility of implementation. Two farmer groups, the Association of the National Chicken Farmer Organizations (GOPAN) and the Indonesian Poultry Market Information Centre (PINSAR)/Kurnia, have been identified as potential partners for implementing a private sector-funded compensation system.
- Individual meetings were conducted with the decision makers/influencers of each farmers group to present the private sector-funded compensation plan. Each meeting produced plans to identify participating broiler farms.
- To support the humane and efficient culling operations, which must be conducted before compensation can be provided following an outbreak, a short seminar was hosted on humane culling of poultry for disease control by Dr Rastislav Kolesar from the World Organisation for Animal Health (OIE) as the expert speaker.

Output C: Reduced H5N1 virus at selected critical control points in the market chain through improved biosecurity practices by related stakeholders

C.1 Improve the surveillance system along the post-production market chain and make it more cost-effective

- provided operational and technical support for quarterly environmental surveillance of live bird market (LBMs) in the greater Jakarta area;
- conducted preliminary meetings with East Java and North Sumatra Province Livestock Services to plan establishment of LBM surveillance in these areas;
- conducted training in profiling and LBM surveillance techniques for local government officers in Surabaya and Medan;
- held market surveillance officer coordination meeting to facilitate the reinstatement of monthly LBM sampling by the local government in greater Jakarta;

- provided feedback to Surakarta Livestock Services based on the results of the Semanggi collector yard surveillance study; and
- coordinated with and delivered samples to Disease Investigation Centre (DIC) Subang for virus isolation from positive samples from LBM surveillance in greater Jakarta in 2011.

C.2 Improve biosecurity along post-production market chain

- conducted joint assessments and follow-up meetings with local livestock services in the greater Jakarta area at 15 potential markets for the next round of planned market rehabilitation and conducted follow-up meetings with poultry traders and market managers of selected markets to be rehabilitated in collaboration with local livestock services;
- completed finalization of cleaning and disinfection (C&D) training materials for submission to the K4Health website via the SAFE project;
- held a closing meeting and handover of the SOPs on slaughtering processes, healthy chicken meat production and handling, biosecurity and management at slaughterhouses in addition to the activity reports for the Market Restructuring Programme to the DKI Jakarta government;
- conducted field assessments and provided technical support for 22 LBMs in the greater Jakarta area in order to strengthen the implementation of C&D activities in collaboration with local authorities;
- completed the bidding process for the construction of a C&D station at a high-risk native chicken collector yard in Surakarta, Central Java;
- conducted C&D refresher trainings and cleaning day events at five LBMs in Tangerang, five LBMs in Bekasi, five LBMs in Bogor, two LBMs in Depok, and two LBMs in Jakarta in order to strengthen the implementation of the market C&D activities; and
- Conducted introductory C&D training for cleaning workers and market managers, in addition to training of trainers (ToT) sessions for local livestock services, in Semarang city, Central Java Province funded by central budget from the DAH.

C.3 Increase demand for healthy poultry end-product

- No further activities are planned. Activities were completed during Phase 1.

Output D: Improved biosecurity practices in backyard and commercial duck-raising

D.1 Advocate for best practices in duck health management

- No further activities are planned. Activities were completed during Phase 1.

D.2 Implement duck epidemiological data analysis in low incidence areas in Indonesia to improve understanding of the reservoir role of ducks

- Samples from the Lombok (in Nusa Tenggara Barat NTB province) duck study were tested at DIC Denpasar.
- Data from the Lombok study were analysed and the draft report was prepared.
- Results from the Lombok duck study were presented in March to the NTB local government in Mataram, Lombok. Results support the conclusion reached elsewhere in Indonesia that ducks do not play an important role in the endemicity of H5N1 (clade 2.1.3) in the area.

Output E: Reduction of HPAI in poultry farms through widespread use of locally produced vaccines as appropriate based on local antigens and new strains monitored

E.1 Promote use of effective vaccine by farmers

- initiated the development of new training modules for training of farmers in recommended avian influenza vaccination methods, including vaccine selection, scheduling, and vaccination technique;
- provided continuing technical advice and support to ensure the continuing use of local strain H5N1 vaccines in the flocks of layer farms participating in the CPH biosecurity cost-effectiveness study;
- participated and presented “The Result of IndoCPH Vaccination Study in Central Java Poultry Layer Farms” at the Vaccination Intensification National Coordination Meeting in Semarang, Central Java; and
- prepared training and implementation plan for DAH cold chain MTs to train farmers on effective vaccination practices.

E.2 Establish partnership between commercial poultry industry and Government for sharing of influenza virus data and isolates

- initiated partnership with PINSAR Solo layer farmers to enable sampling and testing of members’ farms in the event of a significant disease event;
- facilitated communication between the Directorate General of Livestock and Animal Health Services (DGLAHS) and poultry vaccine production laboratories on the development and use of a vaccine to prevent clade 2.3.2.1 virus outbreaks;
- participated in the USDA workshop on “Strengthening Poultry Diagnostic Laboratories in Java” at the DIC Subang in November 2012; and
- continued facilitation to enable receipt, testing and production of candidate reverse genetics vaccine strains from the United States Department of Agriculture (USDA) Southeast Poultry Research Laboratory (SEPR) under cooperative agreement between Pusvetma and Bogor Agricultural Institute (IPB) Shigeta.

E.3 Establish sustainable laboratory system for influenza virus monitoring - funded under the OSRO/INT/902/USA IDENTIFY project.

- A two-day national influenza virus monitoring (IVM) network meeting was conducted in November 2012 in Yogyakarta. The meeting was attended by 23 participants consisting of one virologist and one serologist from each DIC, one molecular biologist from each of the sequencing partners (Pusvetma, DIC Bukittinggi and Bbalitvet), two virologists from BBPMSOH, two virologists from the Ministry of Health (MOH) and four international experts (three from the Australian Animal Health Laboratory [AAHL] and one from FAO’s Animal Production and Health division [AGAH]). This was the first IVM network meeting involving participants from MOH (National Institute of Health Research and Development [NIHRD] and the Vector Research Centre, Salatiga) in order to strengthen technical collaboration between the Ministry of Agriculture (MOA) and MOH.
- A collaboration framework was prepared with AAHL to develop user friendly tools for characterization, visualization and analysis of H5N1 antigenic data; to be included in the 4th FAO-AAHL letter of agreement (LoA) 2013. The proposal was presented to the DAH in mid-February and received approval.
- A biosafety risk assessments was conducted to improve quality assurance (QA) practices in 10 DGLAHS laboratories (eight DICs, Pusvetma, and the National Veterinary Drug Assay Laboratory [NVDAL]) between October and December 2012. The assessment was performed by two international biosafety professionals contracted through the FAO Regional Biosafety Programme.

Assessment reports, including recommendations and follow-up action, have been provided to the Director of Animal Health.

- Each partner laboratory using FAO's Lab Mapping tools was assured for QA.
- The laboratories' timely reporting of IDENTIFY targeted diseases to national authorities was enabled by supporting and facilitating the genetic characterization of duck isolates done by Pusvetma and DIC Bukittinggi. Initial recommendations to the Director of Animal Health on the containment of the new H5 avian influenza strain identified in Central Java, Yogyakarta and East Java provinces have been delivered.
- A list of pre-screening and screening reagents to be procured for IVM participant laboratories under the IDENTIFY project was prepared in consultation with AAHL.
- Technical clearance of the 4th FAO-AAHL LoA to be funded by the IDENTIFY Indonesia project was drafted and secured.

Output F: Strengthened veterinary services at central, provincial, and district levels with increased commitment from related stakeholders

F.1 Pilot NVS in three provinces for selected priority diseases

- A simplified format for disease control SOPs (also called: "keep it simple standard operating procedure" [KISSOP]) was developed agreed upon. The SOPs are used as the basis for technical training modules.
- An NVS level 1 training was held in Klungkung, Bali for 12 participants (11 male and 1 female), with the training expenses cost-shared by DAH and FAO. This training focused on developing participatory skills and improved ways to communicate with the community.
- An NVS level 2 training for all 47 NVS trainees and supervisors was held in all three pilot districts of Klungkung, Dumai and Agam, with the training expenses cost-shared by DAH and FAO. A Level 2 training covered HPAI and rabies control and introduced the NVS staff to syndromic surveillance of other diseases. Joint training for Integrated Bite Case Management (IBCM) with representatives from local government human health (e.g. hospitals and Puskesmas) and animal health services (e.g. Puskesmas) was also included, with a total of 73 participants from both animal health and human health services.
- A TOMT NVS Level-2 (13 MTs) and an NVS Data Encoder training (with 13 participants from provincial and district level) were conducted in Jakarta in November 2012.
- Advocacy on the establishment of a Veterinary Authority, a review of the implementation of NVS in the field, and a discussion on animal disease surveillance and response funding support for 2013 and 2014 with livestock services of West Sumatra Province and Agam District were conducted in December 2012.
- Mentoring of NVS officers in order to support and advise on the implementation of NVS in the field was conducted in Dumai and Agam in January. Mentoring was conducted by staff from DAH, province livestock services, local MTs, and FAO. These visits also enabled discussions on the veterinary authority and its implications in the pilot districts.

F.2 Ensure effective programme management with respect to finance, administration, technical inputs, and partner relations (Donor and Government of Indonesia)

- Project staff actively participated in all monthly USAID Chief of Party (COP) meetings, as well as coordination meetings with other partners, including SAFE, DAFF, and the World Health Organization (WHO).

- During the reporting period, FAO's Emergency Centre for Transboundary Animal Diseases (ECTAD) Indonesia facilitated weekly coordination meetings with both URC and the Director of Animal Health. These meetings enabled both FAO and project counterparts to remain synchronized regarding project priorities and challenges, despite various delays in project implementation.
- Project progress reports were prepared in accordance with the project document and local agreement with USAID Indonesia.
- An effective workplan and budget monitoring system has been in place since October 2012. Periodic reviews have been conducted in order to adjust programme requirements with budget availability.
- All operational activities were conducted in a timely manner in order to ensure the timely delivery of project inputs for successful implementation of project activities.
- During the period October-December 2012, LoAs were signed with the LDCCs to support their operations. The support to LDCCs finished as of January 2013 and their continuing operational support will be provided by Government's funding sources.

F.3 Ensure appropriate support to programme components and management to maximize stakeholder participation and build capacity of animal health services

- Ongoing technical support and management supervision was provided on a regular basis to the various components of the ECTAD Indonesia programme, with emphasis placed on timeliness and efficiency due to the increased workload imposed by the significant reduction in project human resources.
- All administrative issues were dealt with in a timely fashion, such as travel arrangements, recruitment, procurement and service contracts to allow for the smooth implementation of project activities.
- Financial transactions, such as budget authorizations and petty cash for trainings, were dealt with in a timely manner, which allowed the smooth implementation of project activities.
- Provisional budgets were prepared for all the project components to improve resource allocation and monitoring and revised periodically in order to assure appropriate availability of resources for the implementation of activities.
- Facilitation of the vehicle registration and tax exemption processes continued.

F.4 Conduct epidemiological studies to better inform disease control and support Government strategic planning

- In light of the introduction of the new clade 2.3.2.1 H5N1 in Indonesia, targeted research activities were reassigned to quickly design and implement a field study to evaluate the use of the influenza A rapid test for the field diagnosis of clade 2.3.2.1 virus infection in ducks. A concept note was prepared and discussions were held with DIC Wates, which will be the laboratory providing support for the implementation of the field study and testing of samples.

F.5 Provide technical support to DAH for HPAI policy development

- Technical support was provided to URC and DAH to review and address gaps found in DAH and local government FY2013 budgets in relation to the HPAI control priorities identified during the strategy review process.
- Discussions were initiated with DAH on the progress made in HPAI control during 2012, the reasons for the improvement observed, and how to continue improving control in light of decreased donor support.

F.6 Contribute to the Komnas Zoonosis One Health communication and advocacy strategy

- No further activities are planned. Activities were completed during Phase 1.

Planned activities for the next six-month period

Output A: Increased empowerment of village residents in biosecurity and HPAI prevention and control through an expansion of a government-funded, streamlined PDSR system

A.1 Distribute and use communication materials to support HPAI prevention and control activities

- produce and print 200 printed copies of the FAO ECTAD Annual Report 2012 in both English and Bahasa Indonesia for distribution in electronic format to the Government and other partners;
- design booth and materials for the Indolivestock Exhibition 2013 and the follow-on Poultry Farmers' National Seminar;
- design and distribute topic-based posters and factsheets to motivate sector 3 layer farmers to conduct more effective vaccination programmes; and
- capture and produce a video and audio speech and training session package both in English and Bahasa Indonesia for practice purposes of the translator team.

A.2 Revise and streamline PDSR system to incorporate more community-based decision-making for improved HPAI prevention and control

- The remaining PDSR officers (approximately 200) will be trained in PDSR V3. All LDCCs will start using the PDSR V3 information system.
- Mentoring visits will be conducted to back-stop all LDCCs on PDSR V3 and to introduce the SOPs on humane culling methods for ducks.
- New PDSR officers will be trained in provinces/districts that have allocated local government funds for the training and operational support of additional PDSR officers.
- The MTs and PDSR officers will continue to inform their constituent communities about clade 2.3.2.1 H5N1 virus as part of their continuing efforts to control and prevent HPAI in village poultry.

A.3 Ensure operational budget allocations for LDCC/PDSR by local governments

- continue provincial-level advocacy meetings with provincial government leaders of West Sumatra, Riau, South Sulawesi and Bali provinces in order to verify allocation of sufficient operational funding for PDSR activities in FY2013 and FY2014 local government budgets;
- engage with Komnas Zoonosis to advocate for greater local government funding of animal health surveillance and response activities;
- continue monitoring and follow-up meetings with local government leaders already committed to sustain HPAI control programmes previously funded by FAO in order to ensure the fulfilment of their funding commitments made during advocacy meetings;
- hold final evaluation meeting with URC and the planning division of DAII on the results of advocacy meetings held with local governments; and
- hold a national workshop on finalization of central and local government funding commitments for FY2014 to sustain animal local government-based disease control activities previously funded by FAO.

A.4 Extend PDSR database system to district level for improved local disease control management

- continue PDSR V3 data encoder training for remaining eight provincial level LDCCs data encoders;
- continue assisting remaining 23 LDCCs to transition from PDSR V2 to the PDSR V3 information system;
- further develop PDSR V3 standard reports;
- conduct ToT activities for 34 provincial data encoders on the PDSR V3 information system in order to enable subsequent training of district-level data encoders;
- provide technical support for training conducted by provincial data encoders on the PDSR V3 database system for up to 355 district data encoders;
- support the installation of the PDSR V3 database at district level by trained district data encoders; and
- provide ongoing technical and operational support and monitoring of the PDSR V3 information system throughout Indonesia.

Output B: Reduced HPAI-infected poultry from commercial farms through improved cooperation among all stakeholders

B.1 Establish effective communication and coordination between the Government and commercial poultry industry in order to build trust among the stakeholders

- support PVUK officers to continue working with farmer groups for biosecurity planning, evaluation visits, and reporting of HPAI outbreaks;
- conduct agreed upon public private partnership (PPP) activities in collaboration with KKUN once agreement is reached among URC, KKUN, and FAO; and
- collaborate with commercial poultry industry partners and KKUN on conducting the National Poultry Farmers' Seminar for sharing best practices on profitable biosecurity for independent layer farmers.

B.2 Establish a confidential database of outbreak information from commercial farms

- As reported previously, this activity has been incorporated into the private sector-funded compensation pilot and PVUK programmes (Activities B.3 and B.5).

B.3 Increase competency in commercial poultry health in both public and private sectors

- PVUK Continuing Education II will be held for 58 PVUK officers with a focus on improving reporting of HPAI, supporting biosecurity planning for farmer groups, and ToT activities on improved vaccination skills.
- Farmers will be supported to report HPAI outbreaks through the provision of supplies and payment of transport and testing costs via the PVUK programme.
- Mentoring visits will continue to back-stop the training and support PVUK officers in their work with the poultry farmers in their areas.
- A meeting will be held to evaluate the implementation of the PVUK programme and lessons learnt documented for further expansion if required.

B.4 Advocate for best practices for commercial poultry health

- PVUK will continue to include cleaning (of feeders and drinkers) best practices in

their on-farm trainings.

- CPH training for commercial layer chicken farmers in egg production centres of Central Java will be conducted.
- The provide technical support will continue for implementation of Phase 2 of the biosecurity cost-effectiveness study with participating layer farmers in Central Java.
- The 2013 National Poultry Farmers' Seminar in Nusa Dua, Bali will be hosted to present findings to independent layer farmers on the most profitable biosecurity interventions identified during the biosecurity cost-effectiveness study as well as provide the latest information on preventing clade 2.3.2.1 virus outbreaks.
- Weekly farm visits and monthly farmers' meetings will continue, so as to ensure the successful implementation of Phase 2 management plans, including any construction activities required to improve biosecurity infrastructure.
- The Phase 1 report from the biosecurity cost-effectiveness study will be finalized.

B.5 Conduct trials on private sector-funded compensation system

- assess and identify 20 broiler farms from each farmers' group in cooperation with GOPAN and PINSAR/Kurnia farmers' group managers to participate in the compensation pilot;
- conduct a design and inception workshop for finalizing the private sector-funded compensation system and take the required first steps in implementation, including determining levy collection and compensation distribution mechanisms by each participating farmers' group; and
- monitor the implementation of the levy collection process to ensure the establishment of the compensation fund.

Output C: Reduced H5N1 virus at selected critical control points in the market chain through improved biosecurity practices by related stakeholders

C.1 Improve the surveillance system along the post-production market chain and make it more cost-effective

- provide operational and technical support for transition from quarterly to monthly environmental surveillance of LBMs in the greater Jakarta area, with funding support to additional testing and characterization to be provided via WIHO;
- provide operational support for the completion of LBM profiling in Surabaya and Medan, and conduct analysis of profiling data collected; and
- provide technical support for initiation of quarterly environmental LBM surveillance by local government staff in Surabaya and Medan, with diagnostic testing by Airlangga University and characterization by DIC Wates for Surabaya samples, and by DIC Medan for North Sumatra.

C.2 Improve biosecurity along post-production market chain

- conduct C&D refresher trainings and cleaning day events at two LBMs in the Jakarta area in order to strengthen the implementation of the market C&D activities;
- conduct quarterly monitoring and evaluation of the implementation of C&D at 22 LBMs in the greater Jakarta area;
- complete the construction of a C&D station at the high-risk native chicken collector yard in Surakarta, Central Java;
- complete the rehabilitation of two selected LBMs in the greater Jakarta area;
- hold an evaluation meeting with all rehabilitated markets in the greater Jakarta area to identify lessons learnt and encourage the continuation of C&D activities in those

markets;

- conduct introductory C&D training for cleaning workers, market managers, and local livestock services at newly rehabilitated markets and at the newly constructed C&D station in Central Java; and
- conduct introductory C&D training for cleaning workers and market managers, in addition to ToT activities for local livestock services in Surabaya with funding provided by central government budget under Directorate of Animal Health, Ministry of Agriculture.

C.3 Increase demand for healthy poultry end

- No further activities are planned. Activities were completed during Phase 1.

Output D: Improved biosecurity practices in backyard and commercial duck-raising

D.1 Advocate for best practices in duck health management

- No further activities are planned. Activities were completed during Phase 1.

D.2 Implement duck epidemiological data analysis in low incidence areas in Indonesia to improve understanding of the reservoir role of ducks

- Lombok duck study has been completed. The final report is to be presented to central and local government partners. No further activities are planned during next reporting period.

Output E: Reduction of HPAI in poultry farms through widespread use of locally produced vaccines, as appropriate, based on local antigens and new strains monitored

E.1 Promote use of effective vaccine by farmers

- conduct ToT activities for 59 PVUK officers to assist commercial farmers to improve vaccination methods who will then train poultry farmers in their areas;
- complete duck vaccination training module and introduce within PVUK and CPH programmes;
- develop modules for training on best practices in vaccination for commercial layer chicken farms for use in PVUK and CPH programmes;
- conduct ToT activities for DAH cold chain MTs on effective poultry vaccination and provide support for subsequent trainings in which the cold chain MTs will train poultry farmers in East Java and West Java on the same topic;
- conduct training for commercial layer farmers in Sukorejo and Solo on effective poultry vaccination and biosecurity practices;
- share information and field experience on effective vaccination practices at the 2013 Indolivestock Expo and via the National Poultry Farmers Seminar which will be held immediately following the Expo; and
- conduct a seminar on avian influenza vaccination strategies for technical services and vaccinators of local poultry vaccine manufacturer.

E.2 Establish partnership between commercial poultry industry and Government for sharing of influenza virus data and isolates

- maintain readiness of CPH team to investigate potential disease events within the PINSAR Solo layer farmers group;

- facilitate meetings between DGLAHS and poultry vaccine producers to share data and reach agreement on the best vaccination approach to prevent HPAI outbreaks due to clade 2.3.2.1 H5N1 virus;
- facilitate sharing of advice and experience from influenza vaccination experts with DGLAHS in order to ensure vaccination policies remain in-line with international standards;
- facilitate communication pathways to strengthen linkages between industry, local government, and DIC monitoring efforts through coordination meetings between DGLAHS and the commercial poultry industry;
- facilitate development of formal cooperative agreement between DGLAHS and the commercial poultry industry for sharing of virus isolates and influenza data; and
- facilitate testing and production of candidate RG vaccine strains from USDA SEPRL, under cooperative agreement between PUSVETMA and IPB Shigeta.

E.3 Establish sustainable laboratory system for influenza virus monitoring - funded under the IDENTIFY project.

- compile subset of H5N1 isolates with complete antigenic and genetic data for advanced bioinformatic analysis (30-50 isolates) and validation of antigenic characterisation tool;
- complete data analysis of antigenic and genetic data to refine analysis tools requirements;
- contribute to training in the use of the Alat Preskrin and Alat Skrin Lengkap (IVM Online) software tools (User Acceptance Testing workshop) combined with the next IVM Meeting;
- conduct launching workshop for antigenic characterization/visualization tool and genetic data analysis in September 2013;
- participate in the review and updating of the FAO Lab mapping tool to be conducted by FAO headquarters;
- procure IVM pre-screening and screening reagents;
- implement 4th FAO-AAHL LoA 2013; and
- participate in the Regional and Indonesia EPT planning workshops.

Output F: Strengthened veterinary services at central, provincial, and district levels with increased commitment from related stakeholders

F.1 Pilot NVS in three provinces for selected priority diseases

- hold discussions with the DAFF programme in Sulawesi to review NVS-related training materials;
- develop NVS Level 3 training modules for use in each NVS pilot district;
- conduct NVS Level 3 training to 42 NVS participants in each NVS pilot district;
- continue mentoring and advocacy visits to support NVS staff in the field and to further develop the role of the Veterinary Authority and Puskesmas; and
- hold an evaluation workshop to review the successes and challenges of the pilot and document lessons learnt for future expansion.

F.2 Ensure effective programme management with respect to finance, administration, technical inputs, and partner relations (Donor and Government of Indonesia)

- continue facilitation of weekly coordination meetings with both URC and the Director of Animal Health;
- continue preparation of project progress reports in accordance with the project

document and local agreement with USAID Indonesia;

- continue the active participation at the USAID COP meetings, as well as in coordination meetings with Komnas Zoonosis, WHO, DAFF, and other partner agencies as needed;
- continue updating and monitoring the workplan and budget monitoring system with updated expenditures and work plan revisions submitted by each technical team; and
- continue the implementation of necessary operational actions to ensure the timely delivery of project inputs for successful implementation of agreed activities.

F.3 Ensure appropriate support to programme components and management to maximize stakeholder participation and build capacity of animal health services

- provide support and management supervision on a regular basis to the various components of the ECTAD Indonesia programme;
- continue addressing all administrative issues in a timely fashion, including travel arrangements, personnel recruitment, procurement, and service contracts in order to allow for the timely implementation of project activities;
- ensure the proper and timely dealing of financial transactions, such as budget authorizations and petty cash for trainings, to allow smooth implementation of project activities; and
- prepare provisional budgets for all the project components to improve resource allocation and monitoring and revise periodically in order to assure appropriate availability of resources for the implementation of activities.

F.4 Conduct epidemiological studies to better inform disease control and support government strategic planning

- Influenza A rapid antigen test evaluation study will be implemented in ducks in Central Java and Yogyakarta provinces in collaboration with DIC Wates. PDSR teams will test ducks from suspected HPAI outbreaks using the Anigen[™] influenza A test and collect samples for PCR testing at DIC Wates.
- Once data are available from the study, project staff will analyse and advise DAIH on the results and validate the rapid test.

F.5 Provide technical support to DAH for HPAI policy development

- provide technical support and advice to URC and the Director of Animal Health on the risk of H7N9 introduction to Indonesia and the most effective ways to mitigate the risk;
- develop a surveillance plan for H7N9 and support the DAH to obtain PCR reagents and implement a surveillance programme;
- review available data on vaccine efficacy against the two circulating clades in Indonesia and advise URC and DAH on strain selection and vaccination policy for control of both clades;
- complete consultation process between DGLAHS and FAO ECTAD Indonesia for development of the work plan for the next phase of the project; and
- submit abstracts and prepare presentations for sharing with the global scientific community on the lessons learnt from the Government's efforts to control HPAI in poultry.

F.6 Contribute to the Komnas Zoonosis One Health communication and advocacy strategy

- No further activities are planned. Activities were completed during Phase 1.

Main progress made towards the achievement of project outcomes (from the start of the current project phase)

Output A: Increased empowerment of village residents in biosecurity and HPAI prevention and control through an expansion of a government-funded, streamlined PDSR system

- Thus far 1 445 PDSR officers have been trained in PDSR V3, and 9 LDCCs are now implementing the PDSR V3 system. The database has been modified to utilize the new data forms. PDSR officers are now networking with the community, community leaders and village poultry farmers to explain the need for HPAI reporting.
- PDSR has identified outbreaks of HPAI clade 2.3.2.1 H5N1 in duck farms and have been able to explain the new clade to the community and to colleagues in the local government, thereby helping to reduce fear and misunderstandings.
- There is increased capacity of local government staff in 24 LDCCs on the use of the enhanced PDSR V3 information system for data analysis and reporting. Twenty-five provincial DEs from 24 out of 32 LDCCs have been trained using PDSR V3. Currently, nine LDCCs have already moved to PDSR V3 and actively send their database update.
- Central Government and all provincial governments that were targeted in advocacy activities strongly support the sustainability of animal disease control activities by allocating government funds in 2013 and 2014. The level of support varies depending on their financial situation and political commitment.
- Central Government, local governments, and relevant government institutions have raised their level of awareness and coordination concerning proper allocation of budget for animal health issues.

Output B: Reduced HPAI-infected poultry from commercial farms through improved cooperation among all stakeholders

- Improved understanding of the commercial poultry sector as a result of profiling 4 000 farms in the PVUK expansion areas. Profiling information is available to the district livestock services for decision-making.
- Following the TOMT, MTs had the confidence and skills to communicate clear information on HPAI clade 2.3.2.1. They conducted one interactive radio programme, one TV programme, 11 coordination meetings for 276 local government staff (191 male and 85 female), and 15 farmer and community meetings for 224 participants (183 male and 41 female).
- The PVUK programme has increased trust between local government animal health services and commercial poultry farmers. PVUK officers continue to conduct farmer trainings and farm visits. A noticeable change has been seen in the attitude of poultry farmers who now contact PVUK officers to book trainings, request assistance with farm hygiene and vaccination, and request PVUK to assist with problem solving. Behaviour change has been seen with farmers following good vaccine cold chain management, improved farm biosecurity, including movement control, and improved farm hygiene. PVUK has conducted 612 farm visits, 42 farmer trainings and 272 evaluation visits thus far. During farm visits, 30 percent of farmers agreed to implement the proposed changes, and once a monitoring visit has taken place, over 50 percent of farmers fully comply with the recommendations. PVUK officers have now conducted 68 disease investigations in the field.
- Best practices in poultry vaccination and farm management have been identified via the CPH biosecurity cost-effectiveness study. The biosecurity intervention phase of the study is now underway in order to evaluate the cost-effectiveness of specific biosecurity

practices.

- Layer farmers in high-risk production areas have adopted best practices as identified via the CPH programme, and as disseminated via the PVUK programme and CPH outreach activities.

Output C: Reduced H5N1 virus at selected critical control points in the market chain through improved biosecurity practices by related stakeholders

- There has been a significant increase in the understanding of both progress on controlling H5N1 in Indonesia and H5N1 epidemiology in general as a result of using specially-designed market surveillance tools, such as regularly scheduled environmental surveillance of LBMs and targeted surveillance at collector yards.
- There has been increased cleaning and disinfection activities as well as awareness of the importance of maintaining cleanliness in selected markets in the greater Jakarta area as a result of FAO training in collaboration with local governments. This has provided a considerable impact both in terms of the level of cleanliness of the markets' environment and the participation of traders and market managers.
- There has been allocation of central and local government funds for sustaining market cleaning and disinfection activities through support on C&D training for markets that had not received the training previously.

Output D: Improved biosecurity practices in backyard and commercial duck-raising

- There is increased understanding of the relatively limited role played by ducks in the persistence of clade 2.1.3 virus as a result of the successful implementation of the Lombok duck study.

Output E: Reduction of HPAI in poultry farms through widespread use of locally produced vaccines as appropriate based on local antigens and new strains monitored

- The commercial poultry farming community was provided with examples of commercial layer farms that are successfully using local strain HPAI vaccines with a specific vaccination regime that yields excellent protection for the flock against H5N1.
- There has been a marked reduction in H5N1 virus detection since 2009, correlated with an increase in use of local strain vaccines as supported by laboratory-based vaccine research, evaluated on the farm by the CPH programme, and advocated to farmers via the PVUK and CPH outreach programmes.

Output F: Strengthened veterinary services at central, provincial, and district levels with increased commitment from related stakeholders

- The importance of human health and livestock health sectors working together has been recognized at local government level as a result of the NVS pilot programme. Following the establishment of NVS in two districts of Sumatra, NVS-trained government officers have conducted 1 279 passive surveillance activities, 192 rapid responses to bite cases, and 172 disease investigations, resulting in the detection of 10 cases of canine rabies from 14 suspected samples submitted. Emergency vaccination was conducted around the positive cases in order to reduce further spread. Response to bite cases and the subsequent detection of canine rabies in dogs was directly attributable to improved communication between human health and animal health counterparts.
- The NVS information system, including database designed for district-level data entry, was successfully deployed in NVS pilot areas.
- There has been a marked and continuing improvement in HPAI control in poultry in Indonesia.

- There is more effective detection and identification via the field rapid response and laboratory networks of the clade 2.3.2.1 H5N1 virus, newly introduced into Indonesia in mid-2012.

Project Monitoring Sheet: **OSRO/INS/103/USA**

**Project Title: Enhancing the capacity of the
Government of Indonesia and partners to control Highly Pathogenic
Avian Influenza (HPAI)**

Reporting Period: **April 2012 to September 2012**

Country: Indonesia
Project title: Enhancing the capacity of the Government of Indonesia and partners to control Highly Pathogenic Avian Influenza (HPAI)
Code: OSRO/INS/103/USA
Budget: USD 8.2 million
Effective starting date: 1 October 2011
Planned end date: 31 December 2012 (note: This report contains planned activities for the first six months of the extension phase of this project until 31 March 2013)
Context of the project The purpose of the project is to contribute to the control of Highly Pathogenic Avian Influenza (HPAI) in poultry in Indonesia, thus safeguarding health and livelihoods of the Indonesian population. The expected outcome of the project is that the capacity and ability of the Government of Indonesia and partners to control HPAI is enhanced.
Objectives of the project for the reporting period (April to September 2012) Output A: <i>Increased empowerment of village residents in biosecurity and HPAI prevention and control through an expansion of a government-funded, streamlined Participatory Disease Surveillance and Response (PDSR) system</i> Output B: <i>Reduced HPAI-infected poultry from commercial farms through improved cooperation among all stakeholders</i> Output C: <i>Reduced H5N1 virus at selected critical control points in the market chain through improved biosecurity practices by related stakeholders</i> Output D: <i>Improved biosecurity practices in backyard and commercial duck-raising</i> Output E: <i>Reduction of HPAI in poultry farms through widespread use of locally produced vaccines as appropriate based on local antigens and new strains monitored</i> Output F: <i>Strengthened veterinary services at central, provincial and district levels with increased commitment from related stakeholders</i>
Planned activities for the reporting period (April to September 2012) Output A: Increased empowerment of village residents in biosecurity and HPAI prevention and control through an expansion of a government-funded, streamlined PDSR system <i>A.1 Distribute and use communication materials to support HPAI prevention and control activities</i> <i>A.2 Revise and streamline PDSR system to incorporate more community-based decision-making for improved HPAI prevention and control</i> <i>A.3 Provide Local Disease Control Centre (LDCC) PDSR operational budget by local government</i> <i>A.4 Extend PDSR database system to district level for improved local disease control management</i> Output B: Reduced HPAI-infected poultry from commercial farms through improved cooperation among all stakeholders <i>B.1 Establish effective communication and coordination between the Government and commercial poultry industry to build trust among the stakeholders</i> <i>B.2 Establish a confidential database of outbreak information from commercial farms</i> <i>B.3 Increase competency in commercial poultry health (CPH) in both public and private sectors</i>

B.4 Advocate for best practices for CPH

B.5 Conduct trials on private sector-funded compensation system

Output C: Reduced H5N1 virus at selected critical control points in the market chain through improved biosecurity practices by related stakeholders

C.1 Improve the surveillance system along the post-production market chain and make it more cost-effective

C.2 Improve biosecurity along post-production market chain

C.3 Increase demand for healthy poultry end product

Output D: Improved biosecurity practices in backyard and commercial duck raising

D.1 Advocate for best practices in duck health management

D.2 Implement duck epidemiological data analysis in low incidence areas in Indonesia to improve understanding of the reservoir role of ducks

Output E: Reduction of HPAI in poultry farms through widespread use of locally produced vaccines as appropriate based on local antigens and new strains monitored

E.1 Promote use of effective vaccine by farmers

E.2 Establish partnership between commercial poultry industry and the Government for sharing of influenza virus data and isolates

E.3 Establish sustainable laboratory system for influenza virus monitoring

Output F: Strengthened veterinary services at central, provincial and district levels with increased commitment from related stakeholders

F.1 Pilot National Veterinary Service (NVS) in three provinces for selected priority diseases

F.2 Ensure effective programme management with respect to finance, administration, technical inputs and partner relations (donor and the Government of Indonesia)

F.3 Ensure appropriate support to programme components and management to maximize stakeholder participation and build capacity of animal health services

F.4 Conduct epidemiological studies to better inform disease control and support government strategic planning

F.5 Provide technical support to the Directorate of Animal Health (DAH) for HPAI policy development

F.6 Contribute to the National Zoonosis Commission (Komnas Zoonosis) One Health communication and advocacy strategy

Activities undertaken during the reporting period (April to September 2012)

Output A: Increased empowerment of village residents in biosecurity and HPAI prevention and control through an expansion of a government-funded, streamlined PDSR system

A.1 Distribute and use communication materials to support HPAI prevention and control activities

- Held ten focus group discussions with PDSR officers and communities in high-risk provinces
- Duplicated and distributed 400 animation videos “Let’s Prevent HPAI” in DVD format to Indo-Livestock Expo & Farmers’ Seminar attendees
- Duplicated and distributed 500 “Q&A on HPAI” brochures to Indo-Livestock Expo & Farmers’ Seminar attendees
- Produced the 2011 Emergency Centre for Transboundary Animal Diseases (ECTAD) Indonesia Annual Report
- Produced and distributed 1 200 stickers on “HPAI vaccination” to Indo-Livestock Expo & Farmers’ Seminar attendees
- Produced a video documentation of sentinel farm management for use in demonstrating

how a high level of biosecurity can be practically implemented with limited resources

- Produced a video and photo documentation of cleaning procedures for drinkers and waterers on layer farms in the biosecurity cost-effectiveness study
- Produced a video and photo documentation of laboratory testing of surveillance samples from Semanggi collector yard
- Prepared a PDSR success story for use by the United Nations Information Centre in Jakarta

A.2 Revise and streamline PDSR system to incorporate more community-based decision-making for improved HPAI prevention and control

- The curriculum, modules and materials for PDSR Version 3 (PDSR V3) refresher training were developed and introduced to 27 Master Trainers (MTs) during a training-of-trainers (TOT) workshop held in April 2012. PDSR V3 training was conducted for 423 participants (307 male and 116 female) in West and South Sulawesi, West Kalimantan, Padang and Riau Provinces in Sumatra. All trainings were assisted by the eight national MTs.
- Mentoring and backstopping was conducted for 38 new trainees in six districts of Sulawesi.
- Training for 27 (21 male and 6 female) new PDSR officers in West Kalimantan was conducted in June 2012 with funding from local government budget.
- Continuing Education (CE) training was conducted in Samarinda for 17 PDSR and in Bandung Barat for 20 PDSR using local government funds.
- The eight national MTs were given training and mentoring experience in different aspects of the training programme activities including: training module development and testing, training and field mentoring support for PDSR, NVS, the Commercial Poultry Veterinary Programme (PVUK) and rabies control.

A.3 Provide LDCC PDSR operational budget by local government

- Twenty provinces in Indonesia have committed their local budgets under "Anggaran Pendapatan dan Belanja Daerah" (APBD 1, which literally translates as "Revenue Budget and Local Expenditures" and is commonly translated as Provincial Government Budget) at the provincial level, or APBD II at the district level) to either fully or partly support PDSR and animal health activities in the provinces for 2013–2014.
- A series of work plan meetings were held with CMU and DAH to determine priority activities in HPAI control (2013–2014) and to conduct budget mapping to identify and address gaps in the funding of priority activities.
- A budget proposal for HPAI control activities managed by the Campaign Management Unit (CMU) was sent to the Directorate General of Livestock and Animal Health Services (DGLAHS) and the Secretary General of the Ministry of Agriculture (MoA) to cover gaps in the budgets provided by FAO for implementation of priority activities in control of HPAI in Indonesia.
- Three Local Government Workshops on NVS were conducted in May and June of 2012. The main objectives of these workshops was to advocate to local governments for their support of operational costs of NVS officers, including that of LDCCs in the three NVS pilot project areas: West Sumatra (Agam District), Riau (Dumai District) and Bali (Klungkung District). Participants from the local government included representatives of the Regional Planning Board (BAPPEDA), provincial and district Regional Assistants (local Government function), Livestock Agency and Veterinary Laboratory at the provincial and district levels and the LDCC coordinators. The output of these workshops was a set of recommendations, one of which was on financial support for the NVS pilot project implementation. However, ongoing government support for LDCC activities still remains unclear.

A.4 Extend PDSR database system to district level for improved local disease control management

- Continued monitoring, through LDCC data encoders, of 355 PDSR Version 2 district level installations that were set up in August 2011.
- PDSR V3 forms were field tested in three NVS pilot districts.
- PDSR V3 database and data entry front end were designed, programmed and tested.
- Six LDCC data encoders were trained to operate the PDSR V3 database.

Output B: Reduced HPAI-infected poultry from commercial farms through improved cooperation among all stakeholders

B.1 Establish effective communication and coordination between the Government and commercial poultry industry to build trust among the stakeholders

- Provided support for 21 farmers' meetings for 661 participants and 32 farmers' trainings for 553 participants during the reporting period.
- Facilitated a workshop with identified local poultry industry and local government stakeholders to brainstorm on establishing mechanisms to increase discussion of issues concerning the poultry industry.
- Prepared a draft plan for trust-building between government and industry based on above workshop.
- Planned a national farmers' meeting for sharing of best practices in collaboration with DAH and the National Poultry Health Committee (KKUN).

B.2 Establish a confidential database of outbreak information from commercial farms

- As reported previously, this activity was incorporated into the private sector-funded compensation pilot and PVUK programmes (Activities B.3 and B.5).

B.3 Increase competency in CPH in both public and private sectors

- A Local Government Workshop for PVUK expansion was held in Yogyakarta in April 2012 to discuss the programme with the four new districts. Key recommendations were that all PVUK districts should start planning for local Government funding of the PVUK programme.
- All modules used in PVUK training levels 1, 2 and 3 were modified to meet the needs of the updated curriculum.
- PVUK Training Level 1 for the four new districts was held in Padang in May 2012. Twenty-four participants (13 male, 11 female) from four new districts of Agam in West Sumatra, Kulon Progo in Yogyakarta, and Tulungagung and Blitar in East Java attended the training. The training provided knowledge on communication, basics of biosecurity and vaccination, important poultry diseases and necropsy techniques. Level 2 training, which introduces participatory approaches and more in-depth training on vaccination and biosecurity, was conducted in Yogyakarta in June 2012 for 23 participants (12 male, 11 female). The concept of biosecurity planning was introduced for the farmers to learn about several levels of disease control.
- To develop sustainability of the PVUK programme, eight (three male and five female) PVUK MTs were selected to assist in the training of the new PVUK districts. Their training skills and understanding of technical issues improved through a TOT for MTs in June 2012 in Tangerang.
- CMU representatives and the Food and Agriculture Organization of the United Nations (FAO) National Technical Advisors conducted six field mentoring visits to the PVUK area to support the teams to work with local farmers. Mentoring visits to Taskimalaya, Boyolali, Kulon Progo, Karanganyar and Klaten assisted the PVUK officers to conduct farmer trainings on biosecurity and cold chain as well as biosecurity audits, problem investigations and farm profiling.

- FAO National Technical Advisors supported the Australian Centre for International Agricultural Research (ACIAR) biosecurity training for farmers in Bogor.
- PVUK veterinarians attended a PINSAR (broiler farmers association) meeting in Solo, followed by on-farm cleaning and disinfection (C&D) training on a layer farm in Central Java with PINSAR.
- A new version of the PVUK web-based forum was developed and FAO National Technical Advisors and PVUK members are joining. Training materials, handouts, technical material of interest, including booklets of the Strategies Against Flu Emergence (SAFE) project, were placed on the forum. A PVUK Facebook page was developed and will be used as a team building platform within PVUK. The page currently has 44 members.
- Profiling of the commercial farms commenced in all four of the expansion area districts, and 376 farms were profiled by the end of August 2012.
- Forms to record PVUK activities were developed and tested in the field, and six PVUK Data Managers were trained in their use. The PVUK database is operational with the data from five PVUK forms being entered at the district level. Output report formats, to show PVUK activity, were designed and sent to the LDCC coordinators for review.
- FAO assisted CMU to develop technical guidelines for PVUK.
- In preparation for the OSRO/INS/103/USA extension phase starting in October 2012, the preparation of curricula for CE I and CE II trainings was completed. The trainings will be conducted in December 2012 and March 2013.

B.4 Advocate for best practices for CPH

- Facilitated avian influenza serology testing to validate the effectiveness of vaccination schedule changes on participating farms as part of the biosecurity cost-effectiveness study. The results provided evidence that vaccination early in the rearing period and vaccination in mid-lay induced increased antibody titres against H5. The analysis of production data before and after vaccinating layers in production provided evidence that vaccination with recommended Indonesian vaccine strains at the recommended dose rate did not result in drops in egg production.
- Assisted the local Government training team with the Level 1 PVUK training in Padang.
- Continued implementing agreed upon management activities for participating farms in the biosecurity cost-effectiveness study.
- The drinker and feeder cleaning Standard Operating Procedures (SOPs) were adopted and implemented on all study farms.
- The positive correlation between drinker and feeder cleanliness and food conversion rate (FCR) is expected to emerge as an additional improvement of production indices at the end of phase 1B of the study.
- Provided technical assistance to the local Government training team for the Level 2 PVUK training in Yogyakarta.
- Conducted and provided technical assistance to the FAO seminar ad hoc technical committee in preparation for the "Putting farmers first: low cost - high impact practices to increase layer farm profit" national seminar held in July 2012.
- Produced outreach materials for use during the Indo-Livestock Expo.
- Completed phase 1B data analysis and finalized the status report on the completion of Phase I of the study.

B.5 Conduct trials on private sector-funded compensation system

- Terms of reference, a concept note and a work plan for the private sector-funded culling compensation pilot were completed.
- Pilot area was selected as Gunung Kidul District of Yogyakarta Province.
- Counterparts were identified, including the Yogyakarta Poultry Farmers Association

(APAYO) as well as the possibility of several poultry contract farming companies (JAPFA, CP and Januputro) and the Gunung Kidul District Livestock Services.

- Meetings with counterparts were conducted, although no direct government-private sector communication was established yet.
- Use of CO/CO₂ gas was selected as the most effective and cost-efficient culling method.
- Possible financial entities that could become an escrow body for the programme are being researched. Bank Rakyat Indonesia and Bank Pembangunan Daerah Daerah Istimewa Yogyakarta are potential candidates.

Output C: Reduced H5N1 virus at selected critical control points in the market chain through improved biosecurity practices by related stakeholders

C.1 Improve the surveillance system along the post-production market chain and make it more cost-effective

- Provided technical and operational support to the live bird market (LBM) surveillance activity in the greater Jakarta area.
- Conducted coordination meetings with market surveillance officers and related local livestock services in greater Jakarta to review LBM surveillance design.
- Completed the new LBM surveillance design for greater Jakarta area and the preliminary implementation of surveillance at 86 LBM in August 2012.
- Conducted back-tracing of poultry transportation from Semanggi collector yard Surakarta city to the sources in East Java.
- Conducted evaluation meetings with the Disease Investigation Centre (DIC) Subang on the isolate shipment preparation to the Australian Animal Health Laboratory (AAHL) and virus isolation testing of LBM surveillance samples collected in 2011.
- Developed the Semanggi collector yard surveillance study design, SOPs and training materials.
- Conducted training for selected officers of Surakarta city agricultural and market services for Semanggi collector yard surveillance activity.
- Completed the implementation of the collector yard surveillance at Semanggi collector yard in Surakarta City.

C.2 Improve biosecurity along post-production market chain

- Held an evaluation and planning meeting with related stakeholders from private and government sectors in the greater Jakarta area on the achievement of C&D activities at rehabilitated LBMs.
- Developed the updated C&D Monitoring and Evaluation (M&E) form and database system in collaboration with the M&E team.
- Conducted training for local government officials in greater Jakarta on M&E of the C&D activities implementation and the completion of M&E forms.
- Conducted M&E for C&D activities at several LBMs, slaughterhouses and collection yards in the greater Jakarta area in collaboration with local authorities.
- Developed lessons learned and recommendations on the implementation of C&D activities along the poultry market chain that was conducted since 2009.
- Provided technical assistance to the LBM C&D training funded by the 2012 local Government budget of Bekasi City agricultural service.
- Conducted C&D training for sentinel bird truck drivers and farm workers in the preparation of Semanggi collector yard surveillance.
- Provided technical assistance on the poultry slaughterhouse design for several markets in DKI Jakarta in accordance with veterinary public health standards.
- Developed the truck C&D station design for Semanggi collector yard in Surakarta city.

C.3 Increase demand for healthy poultry end product

- Provided technical support to poultry vendors at several markets in DKI Jakarta to expand market activities of healthy chicken meat (*daging ayam ASUH*) promotion through socialization in collaboration with existing successful healthy chicken meat traders.
- Conducted education and socialization for local women's association (Ibu PKK) in DKI Jakarta in collaboration with local authorities to increase the public awareness on healthy chicken meat (*daging ayam ASUH*) consumption.
- Conducted healthy chicken meat (*daging ayam ASUH*) promotion at the Food and Agro Expo, Food Education Event and the MoA Food Exhibition.
- Improved the training modules on healthy chicken meat (*daging ayam ASUH*) promotion conducted by local authorities.
- Completed review and revision of DKI Jakarta poultry slaughterhouse SOPs and guidelines by international food safety expert.
- Conducted follow-up meetings on the results of DKI Jakarta restructuring evaluation workshop with key stakeholders at the central and local levels.
- Provided technical support to slaughterers who had recently moved to the Type A collecting and slaughtering facility in Rawa Kepiting slaughterhouse and slaughterers at the newly established Pintu Air slaughterhouse in East Jakarta.
- Provided technical support on the start-up of a small-scale slaughterhouse in Petukangan Utara, South Jakarta.
- Provided technical support on food inspection activity at several markets in DKI Jakarta arranged by local government authorities.
- Provided technical support on the establishment of a new slaughterhouse at Ciracas market as one of the additional relocation centres in DKI Jakarta

Output D: Improved biosecurity practices in backyard and commercial duck raising

D.1 Advocate for best practices in duck health management

- Duck health management best practices were incorporated within the revision of training modules for PDSR V3.

D.2 Implement duck epidemiological data analysis in low incidence areas in Indonesia to improve understanding of the reservoir role of ducks

- Duck, commercial poultry farm and market profiling training was conducted for local government officers in Lombok, West Nusa Tenggara Province. Profiling was implemented by the local Government following the training.
- Profiling data was analysed, and survey design planned with staff of the DIC Denpasar.
- Surveillance training was conducted for Lombok local Government officers.
- Duck and commercial poultry farm survey was conducted and samples were delivered to DIC Denpasar. Samples were tested in DIC Denpasar by polymerase chain reaction (PCR) and serology.
- Data was analysed, and a preliminary report on the findings produced.

Output E: Reduction of HPAI in poultry farms through widespread use of locally produced vaccines as appropriate based on local antigens and new strains monitored

E.1 Promote use of effective vaccine by farmers

- Advanced characterization and analysis of potential variant isolates collected from the Influenza Virus Monitoring for Animal Health (IVM-AH) activity in 2011–2012 was conducted. Sequencing results showed that H5 from 2011–2012 isolates were similar to the current circulating strains of H5N1 in Indonesia; serological results indicate no significant antigenic variation between the current isolates when tested against the joint World Organisation for Animal Health (OIE)/FAO scientific network for the control of avian influenza (OFFLU) Indonesia H5N1 reference panel.

- Updated the standardized antigen and hyper-immune antiscrum from A/chicken/Indonesia/Wates-1/2005 clade 2.1.3 to A/chicken/West Java Sbg/29/2007 clade 2.1.3 which represents the current standard challenge strain.
- Facilitated DAH approval of the update on harmonized antigen and hyper-immune sera, followed by preparation and forwarding of the standard protocol for producing prime and hyper-immune sera to Pusvetma and BBPMSOH (National Veterinary Drugs Assay Laboratory).
- Participants were selected for the Regional Laboratory Network Training on Quality Assurance and Standardization of Diagnostic Reagents from 23 September to 5 October 2012 in Geelong, Australia.
- DGLAHS' current policy on avian influenza vaccines and updated recommendations for vaccination best practices were shared with farmers from throughout Indonesia at the "Putting farmers first: low cost - high impact practices to increase layer farm profit" national seminar held in Jakarta on 7 July 2012. Based on the positive feedback from the participants, ECTAD Indonesia and DGLAHS plan to continue the farmers' seminar as an annual event.
- Updated communication materials were distributed, and presentations were given at the annual Indo-Livestock Expo. The aforementioned farmers' seminar was held immediately following the week-long Indo-Livestock Expo event.

E.2 Establish partnership between commercial poultry industry and government for sharing of influenza virus data and isolates

- Technical assistance was provided for data analysis and interpretation from environmental samples processed via PCR and virus isolation in cooperation with other studies (LBM surveillance and truck cleaning study).
- Prepared and disseminated technical materials on vaccination and participated in discussions with farmers at national farmers' seminar.

E.3 Establish sustainable laboratory system for influenza virus monitoring

- Presented on the IVM-AH network and participated in the 8th International Symposium on Avian Influenza in London from 1 to 4 April 2012, and attended the annual OFFLU meeting in London, United Kingdom, on 4 and 5 April 2012.
- Delivered eleven HPAI H5N1 virus isolates from DIC Wates selected based upon the IVM-AH activities, and 25 isolates/original samples from LBMs and truck studies from DIC Subang to AAHL, Geelong in mid-May 2012.
- Corrected issues with the genetic analysis software (DNASar). Bioinformatics software is now functioning in all sequencing partner laboratories (DIC Bukittinggi, Pusvetma and BBALITVET).
- Molecular reagents procured by FAO successfully delivered to sequencing partner laboratories.
- Conducted review of the "Alat Preskripi" software to support the IVM-AH efforts and defined next steps with AAHL.
- Planned activities for next phase of the OSRO/INS/103/USA project and integration with the IDENTIFY project work plan.

Output F: Strengthened veterinary services at central, provincial and district levels with increased commitment from related stakeholders

F.1 Pilot NVS in three provinces for selected priority diseases

- Follow-up meetings to the April NVS development meeting took place in Jakarta and Makassar to define training and workshop needs, data management and workflows.
- Preparation completed for NVS curriculum and modules for Level 1 (Participatory Community Engagement) training of animal health centre (Puskesmas) veterinarians

and non-veterinary staff.

- Thirty-six (22 male and 14 female) NVS staff from Padang (Agam District) and Riau (Dumai District) were given Level 1 training, which focused on communication with the community.
- In collaboration with DGLAHS, NVS-local Government workshops were conducted in Pekanbaru on 29 May 2012, in Padang on 1 June 2012 and in Denpasar on 7 June 2012.
- Facilitated drafting of the technical guidelines for the establishment of the Veterinary Authority and appointment of an authorized veterinarian in provinces and districts (including provincial Chief Veterinary Officers).
- Facilitated regular meetings with DGLAHS NVS Task Force to discuss the NVS work plan.
- Advocacy meetings were held with Province and District local Government livestock services (Dinas) in Riau and West Sumatera to discuss the Veterinary Authority and appointment of an authorized veterinarian, control strategy for rabies and NVS training.
- Draft SOPs for control of anthrax, brucellosis and classical swine fever (hog cholera) were developed.
- Nineteen (15 male and four female) non-veterinary NVS officers from the three pilot districts (Klungkung, Agam and Dumai) were given animal health training at the MoA Cinagara Training Centre (Bogor) from 4 to 9 June 2012.
- Training in PSDR was conducted for 20 (17 male and three female) non-PDSR NVS staff from the three pilot districts in Padang, 28 June to 3 July 2012.
- In preparation for OSRO/INS/103/USA extension activities, the curriculum and flow charts for Level 2 training were developed, and the training modules were prepared for rabies control and syndromic surveillance.
- Advocacy visits were conducted to Padang and Pekanbaru in September 2012 to discuss the NVS approach in the pilot areas and to better understand the rabies situation.

F.2 Ensure effective programme management with respect to finance, administration, technical inputs and partner relations (Donor and the Government of Indonesia)

- ECTAD Indonesia facilitated weekly coordination meetings with both CMU and the Director of DAH. These meetings enabled both FAO and project counterparts to remain synchronized regarding project priorities and challenges, despite various delays in project implementation.
- Six-monthly project progress reports continued to be prepared in accordance with the project document and local agreement with USAID Indonesia. An additional quarterly (April-June 2012) progress report was prepared at the request of the MoA International Cooperation Centre to facilitate discussion on extension of the OSRO/INS/103/USA project.
- The final report of the OSRO/INS/101/AUL project was prepared in August 2012 for submission to the Donor.
- Advisors from the ECTAD Indonesia management team participated in each United States Agency for International Development (USAID) Chief of Party (COP) meeting during the reporting period, as well as in coordination meetings with Komnas Zoonosis, the Strategies Against Flu Emergence (SAFE) project and the World Health Organization (WHO).
- Participated in the technical and policy discussion on Improving the Prevention and Control of H5N1 HPAI in Highly-Affected and Neighbouring Countries in Viet Nam in April 2012.
- Assistance was provided to DGLAHS in the organization of a Technical Briefing Meeting with government and partner agencies on animal health donor coordination in May 2012.
- A lengthy consultation and project planning process was initiated in May 2012 with the Government of Indonesia and USAID for the design of the next project phase. The Amendment document was approved by USAID Washington on 18 September 2012.

and officially submitted to the Government for approval and counter-signature on 26 September 2012.

F.3 Ensure appropriate support to programme components and management to maximize stakeholder participation and build capacity of animal health services

- Ongoing technical support and management supervision was provided on a regular basis to the various components of the ECTAD Indonesia programme; however gaps in technical support were unavoidable owing to the delay in Government of Indonesia project approval in 2011 and subsequent clearance for international advisors to return to Indonesia. Specific emphasis was placed on identifying cost-effective practices and improving sustainability of best practices via capacity building and budget planning assistance.
- All administrative issues were dealt with in a timely fashion, such as travel arrangements, recruitments, procurement and service contracts to allow for the smooth implementation of project activities.
- The financial monitoring system was revised to improve monitoring of project expenses against the main ECTAD programme components and planned activities.
- A budget revision was carried out with the Donor in May 2012 and approved.
- Financial transactions were dealt with in a timely manner, such as budget authorizations and petty cash for trainings, which allowed the smooth implementation of project activities.
- Provisional budgets were prepared for all the project components to improve resource allocation and monitoring.
- Continued vehicle registration and tax exemption processes are being pursued.

F.4 Conduct epidemiological studies to better inform disease control and support government strategic planning

- Please refer to Activities C.1 and D.2 for updates on the studies conducted in Surakarta and Lombok during this reporting period.
- Owing to funding constraints, further work on the HPAI endemicity study was postponed until the next project phase.

F.5 Provide technical support to DAH for HPAI policy development

- Conducted a strategy review with DAH and ECTAD Indonesia to review currently available data on HPAI control and identify high impact control activities and policy gaps.
- Completed a comprehensive consultation process between DGLAHS and ECTAD Indonesia to develop the next phase of the OSRO/INS/103/USA project work plan and ensure integration with DAH fiscal year (FY) 2013 activities and budget for HPAI control.

F.6 Contribute to the Komnas Zoonosis One Health communication and advocacy strategy

- Participated in the establishment of Komnas Zoonosis Communication Working Group.
- A short training on germ theory for communities was developed for use within a One Health setting, and is now being taught in all trainings conducted by the local Government training team.
- Participated in the national Komnas Zoonosis strategy meeting in Bali on 25 and 26 September 2012.

Planned activities for the next six-month period (October 2012 to March 2013)

(Note: The following activities are planned for the first six months of the extension phase of this project)

Output A: Increased empowerment of village residents in biosecurity and HPAI prevention and control through an expansion of a government-funded, streamlined PDSR system

A.1 Distribute and use communication materials to support HPAI prevention and control activities

- Design, compile and electronically distribute copies of the Bahasa Indonesia and English version of the ECTAD Annual Report 2012; and print and distribute a limited number of reports in Bahasa Indonesia and English.
- Train 30 PDSR MTs to improve skills and learn updated methods in adult learning and behaviour change communication, with emphasis on germ theory.
- Design, produce and distribute 12 500 posters on HPAI outbreak reporting and prevention in five high-risk provinces.
- Design, produce and distribute 100 000 brochures on HPAI prevention with emphasis on germ theory (hand washing practice) to all LDCCs and PDSR officers.

A.2 Revise and streamline PDSR system to incorporate more community-based decision-making for improved HPAI prevention and control.

- Complete nationwide PDSR Version 3 refresher training.
- Refresher train 1 300 local government officers in PDSR V3 by FAO NTAs and MTs. All trainings will be followed by mentoring visits to the field sites to observe the new trainees at work. The training will focus on Bali, Sumatra and Kalimantan in the first three months so that there will be regional implementation of PDSR V3.
- Conduct the training of MTs for an additional seven MTs in October 2012 to ensure that there are sufficient MTs to implement the above training and mentoring of PDSR V3.
- Hold one national LDCC coordination meeting.

A.3 Provide LDCC PDSR operational budget by local government

- Conduct advocacy visits to discuss local funding for PDSR, NVS and PVUK activities.
- Finalize the budget proposal for HPAI control activities (under CMU) to DGLAHS and the Secretary General of MoA for implementation of priority activities in control of HPAI in Indonesia.
- Assist LDCC coordinators in budget calculations and determining the budgets and procurement required to implement priority activities to control HPAI in the field.
- Conduct advocacy visits to the NVS pilot project areas to emphasize the urgency for provincial governments to financially and administratively support the LDCC's role in controlling HPAI and other priority animal diseases.
- Establish a new FAO advocacy team specifically focused on engaging with local governments directly to provide sufficient operational funding for animal disease control and management activities previously funded by FAO projects.

A.4 Extend PDSR database system to district level for improved local disease control management

- Utilizing LDCC data encoders, survey the status of the existing stand-alone PDSR V2 district installations in 355 districts.
- Integrate the planned installation of PDSR V3 at district-level with planning for NVS pilot areas.
- Continue training of provincial government data encoders in use of the PDSR V3 database following the local Government training team's PDSR V3 rollout schedule.

Output B: Reduced HPAI-infected poultry from commercial farms through improved cooperation among all stakeholders

B.1 Establish effective communication and coordination between the Government and commercial poultry industry to build trust among the stakeholders

- Expand on advocacy activities to promote communication and collaborative initiatives between the commercial poultry industry and government during the next project phase. Facilitate regular meetings new partnership initiatives between Komite Kesehatan Unggas Nasional (KKUN), DGLAHS and local governments.
- Initiate planning for monthly meetings and extended collaboration with KKUN during next project phase.
- Continue support for farmers meetings organized by PVUK and farm evaluations in PVUK districts.

B.2 Establish a confidential database of outbreak information from commercial farms

- As reported previously, this activity has been incorporated into the private sector-funded compensation pilot and PVUK programmes (Activities B.3 and B.5).

B.3 Increase competency in CPH in both public and private sectors

- Complete expansion of PVUK with Level 3 training for 24 PVUK officers in October 2012.
- Train 24 PDSR officers to assist the PVUK programme with the profiling of commercial poultry farms.
- Conduct a TOT for the 12 PVUK MTs so that they can assist in the training and mentoring of PVUK staff.
- In December 2012, conduct CE I training for 61 PVUK focused on CPH SOPs and group biosecurity planning.
- In March 2013, conduct CE II for 61 PVUK focused on problem investigation, training skills and public speaking.
- Develop and test farmer training modules for outbreak control, disease risk assessment and vaccination skills.
- In October 2012, train 18 Data Managers from 12 districts in data entry for the PVUK C&D forms.
- Develop key messages for early disease reporting and develop training modules for PVUK.
- Conduct regular field monitoring visits.
- Conduct stakeholder meetings to form groups to encourage outbreak reporting.
- Prepare draft PVUK technical support manual.

B.4 Advocate for best practices for CPH

- Report back to farmers on the phase IB findings of the biosecurity cost-effectiveness study.
- Conduct individual planning meetings with each participating farmer to develop their Phase II (biosecurity phase) management plan.
- Initiate Phase II of biosecurity cost-effectiveness study.
- Develop layer farm best practices SOPs based on findings from non-biosecurity Phase I.
- Disseminate layer farm best practices SOPs in collaboration with DGLAHS and incorporate into PVUK training and farmer advocacy activities.

B.5 Conduct trials on private sector-funded compensation system

- Develop SOPs for the programme that will be in accordance with the Yogyakarta Province and Gunung Kidul District Outbreak Mitigation Plan. Involve all local Government and private sector stakeholders in the development of the SOPs.

- Develop and begin a training programme for all personnel involved in the programme.
- Develop a financial contribution agreement with the poultry farmers and poultry farming companies involved in the programme.

Output C: Reduced H5N1 virus at selected critical control points in the market chain through improved biosecurity practices by related stakeholders

C.1 Improve the surveillance system along the post-production market chain and make it more cost-effective

- Finalize the list of markets to be sampled in the greater Jakarta area to be included in the quarterly sampling scheme in collaboration with livestock services from participating districts.
- Continue quarterly sampling of LBMs in greater Jakarta.
- Expand the LBM surveillance to two new major urban areas of Indonesia (Medan and Surabaya).
- Conduct scoping visits to Medan and Surabaya to collect field information and determine logistical needs for establishing LBM surveillance programmes in each location.
- Profile markets in the study areas, analyse the data and prepare the surveillance design.
- Socialize the LBM surveillance with the regional DIC, provincial livestock services, and district livestock and market services. Once the programme is designed and agreed upon with all stakeholders, train government officers in sample collection and laboratory testing protocols.
- Sample selected LBMs in the new areas and analyse the data.

C.2 Improve biosecurity along post-production market chain

- Continue providing technical assistance for establishment of slaughtering facilities in the designated markets and locations agreed by DKI Jakarta Government.
- Establish C&D station at Semanggi collector yard in Surakarta Central Java Province.
- Conduct site assessment of potential LBMs in greater Jakarta for market rehabilitation.
- Conduct meeting with LBM managers, local agriculture offices and local market offices in greater Jakarta as well as selection of two LBMs for market rehabilitation plans.
- In collaboration with market stakeholders, design market rehabilitation plan for the two selected LBMs in greater Jakarta area and initiate rehabilitation plan.
- Conduct C&D refresher training for cleaning workers and market staff at 22 LBMs in greater Jakarta area to strengthen the implementation of market cleaning day activities.
- Conduct C&D introductory training for C&D station workers at Semanggi collector yards and cleaning workers at two additional rehabilitated LBMs in greater Jakarta.
- Conduct meetings with the local agriculture offices in greater Jakarta area to endorse the implementation of sustainable intervention activities along the poultry market chain.
- Continue monitoring and evaluation of C&D activities of collector yards and LBMs in the greater Jakarta area in collaboration with local authorities.
- Produce video documentation of C&D activity along market chain in collaboration with the communication team to facilitate future capacity building activities.

C.3 Increase demand for healthy poultry end product

- No further activities planned during next project phase; activities completed during Phase I.

Output D: Improved biosecurity practices in backyard and commercial duck raising

D.1 Advocate for best practices in duck health management

- No further activities planned during next project phase; activities completed during Phase I.

D.2 Implement duck epidemiological data analysis in low incidence areas in Indonesia to improve understanding of the reservoir role of ducks

- No further activities planned during next project phase; activities completed during Phase I.

Output E: Reduction of HPAI in poultry farms through widespread use of locally produced vaccines as appropriate based on local antigens and new strains monitored

(Note: Support to the laboratory component of the ECTAD Indonesia programme will be co-funded under the USAID IDENTIFY project as part of the Emerging Pandemic Threats (EPT) programme. Under a programmatic approach, FAO in collaboration with other international organizations supports the Regional Laboratory Network for Southeast Asia. Indonesia is included as one of the eight countries participating in the Regional Southeast Asia FAO IDENTIFY programme).

E.1 Promote use of effective vaccine by farmers

- Facilitate continuous collection of field samples (all sectors) and submit to laboratory for HPAI and LPAI virus isolation, biologic and genetic characterization.
- Advocate for challenge testing and registration of updated vaccines to ensure availability of effective vaccines.
- Coordinate the necessary documentation and schedule delivery of reverse genetic (RG) strains for vaccine candidates from the United States Department of Agriculture (USDA) Southeast Poultry Research Laboratory (SEPRL) to Pusvetma.
- Continue to provide technical recommendations to serve as a foundation upon which a comprehensive national vaccination strategy can be developed.
- Facilitate importation of selected candidate vaccine RG strains.
- Advocate DGLAHS regulations on approved avian influenza vaccines and recommended vaccination practices to private and public sector stakeholders through PVUK, CPH and advocacy programmes.

E.2 Establish partnership between commercial poultry industry and government for sharing of influenza virus data and isolates

- Facilitate communication pathways to strengthen linkages between industry, local Government and DIC monitoring efforts through coordination meetings between DGLAHS and commercial poultry industry.
- Facilitate development of a formal cooperative agreement between DGLAHS and commercial poultry industry for sharing of virus isolates and influenza data.
- Facilitate testing and production of candidate RG vaccine strains from USDA SEPRL under a cooperative agreement between Pusvetma and IPB Shigeta.
- Contribute to USDA Workshop "Strengthening poultry diagnostic laboratories in Java" from 26 to 30 November 2012.

E.3 Establish sustainable laboratory system for influenza virus monitoring

(Note: The activities under this heading are funded under the USAID IDENTIFY project.)

- Provide coordination and support for national IVM-AH network to conduct virus monitoring activities including antigenic pre-screening and biologic and molecular virus characterization of selected viruses.
- Conduct IVM-AH Animal Health meeting on 19 and 20 November 2012.
- Develop user-friendly tools for analysis of antigenic data.
- Support the improvement of animal health laboratory biosafety via a regionally-based activity to conduct biosafety risk assessments and testing/certification of biosafety cabinets from 1 October to 13 December 2012 (activities for Indonesia implemented by DAFF/AAHL [biosafety training; equipment and maintenance training, etc.] and the regional HPED

programme [e.g. biosafety cabinet testing/certification, biorisk assessment]).

- Distribute regional proficiency panels in October 2012 (DIC Wates and DIC Subang for avian influenza; DIC Medan for PRRS, CSF, ASF; DIC Bukittinggi for Rabies; DIC Lampung for ND).
- Launch efforts to ensure access to sample collection and transport supplies in the field with DELIVER through development of a logistics management system in October 2012.
- Support Regional Laboratory Directors Forum in Nha Trang, Viet Nam, on 10 and 11 October 2012.
- In collaboration with WHO, perform assessment mission for the FAO-OIE-WHO four-way linking project to improve the linkage between epidemiology, virology, animal health and human health in December 2012.

Output F: Strengthened veterinary services at central, provincial and district levels with increased commitment from related stakeholders

F.1 Pilot NVS in three provinces for selected priority diseases

- Conduct NVS level 2 training in Padang and Pekanbaru in October 2012.
- Conduct data encoder training in Padang and Pekanbaru.
- Continue advocacy to the local Government in Pekanbaru and Padang on the establishment of the Veterinary Authority and appointment of an authorized veterinarian.
- Continue advocacy to provincial and district livestock services in Riau and West Sumatra on rabies response and control activities for Agam and Dumai districts.
- Monitor the implementation of NVS in the field.
- Complete the NVS disease control SOPs.
- Develop, design and test the training modules for NVS level 2.
- Develop rabies response and control activities for Agam and Dumai districts.
- Finalize and clear the NVS participatory community engagement (PCE) modules.
- Conduct workshop to evaluate the implementation of the NVS pilots.
- Hold a local Government workshop on replication of NVS pilots.

F.2 Ensure effective programme management with respect to finance, administration, technical inputs and partner relations (Donor and the Government of Indonesia)

- Facilitate weekly coordination meetings with both CMU and DAH to ensure continued strong collaboration with DAH and timely discussion of priority issues.
- Prepare project progress reports and monthly COP updates in accordance with the project document and local agreement with USAID Indonesia.
- Participate in each USAID COP meeting, as well as coordination meetings with Komnas Zoonosis, SAFE and WHO.

F.3 Ensure appropriate support to programme components and management to maximize stakeholder participation and build capacity of animal health services

- Provide continual technical support and management supervision to each component of the ECTAD Indonesia programme, with specific emphasis placed on identifying cost-effective practices and improving sustainability of best practices via capacity building and budget planning assistance.
- Continue the operational support to the project to allow the smooth implementation of planned activities. The support will include all administrative, financial and operational aspects, such as budget authorization, travel arrangements, procurement and recruitments.
- The financial monitoring system will be rolled out to monitor closely the expenditures against main programme components and planned activities.
- Vehicle registration and tax exemption will continue throughout the next reporting period.

F.4 Conduct epidemiological studies to better inform disease control and support government strategic planning

- Design a study on endemicity of HPAI in Indonesia and a study to assess factors which caused reduction in HPAI cases in the commercial sector. Identify study areas.
- Socialize the studies with the Government in the study areas.
- Conduct training for government officers who will conduct questionnaires and surveys in the study areas.
- Conduct field studies in the selected areas in collaboration with local governments.

F.5 Provide technical support to DAH for HPAI policy development

- Complete consultation process between DGLAHS and ECTAD Indonesia for development of the work plan for the next phase of the OSRO/INS/103/USA project.
- Provide technical support to CMU and DAH to complete review and address gaps found in DAH and local government FY 2013 budgets in relation to the HPAI control priorities identified during the strategy review process.
- Review progress made in HPAI control during 2012 and consult with CMU expert panel and other relevant stakeholders to better understand reasons for improvement, how to continue improving control, and how to increase surveillance sensitivity in the wake of decreasing donor support.

F.6 Contribute to the Komnas Zoonosis One Health communication and advocacy strategy

- No further activities were planned during next project phase; activities were completed during Phase I.

Main challenges encountered and response provided

A number of budgetary challenges were encountered during this reporting period. In previous years, the ECTAD programme was composed of a number of projects, funded by different donors, all contributing to the achievement of the programme objectives. With the completion of many of those projects, the total programme budget fell dramatically. It has been a challenge to keep up the level of activities and increasing project impact in the face of diminishing donor support for the OSRO/INS/103/USA project Phase II extension. As a result, project management reviewed its expenditure pattern, developed a revised expense tracking system linked to the project work plan, and implemented a number of cost-cutting measures to increase cost efficiency of project activities, including the following:

- Over 50 percent reduction in staffing costs, both national and international, for Phase II.
- Decrease in operational support for PDSR activities to the minimal level.
- Cancellation or postponement until the next project phase of planned project field activities for which contractual or financial commitments were not yet made.
- Reduction in project office space and office-related expenditures.
- Reduction in information technology (IT) costs as a result of revised IT contracts and usage policies.
- Reduction in vehicles rented for day-to-day project activities.
- Reduction of daily subsistence allowance (DSA) for national staff when travelling to locations outside Jakarta

It is fortunate that H5N1 remained under control during this difficult period for the programme. With the changes in place and impending decentralization of budget holder responsibility to the country-level, ECTAD Indonesia is confident that project funds will be used as agreed upon between the Donor, FAO and the Government of Indonesia in the next phase of the project.

Main progress made towards the achievement of project outcomes *(from the start of the current project phase)*

Output A: Increased empowerment of village residents in biosecurity and HPAI prevention and control through an expansion of a government-funded, streamlined PDSR system

- Updated PDSR programme for improved control of HPAI in village poultry (PDSR V3) successfully developed and field transition initiated. Thus far, 423 government staff are able to implement PDSR V3 in the field and four provinces (West Sumatra, Riau, West Sulawesi and East Kalimantan) are now reporting using the new PDSR V3 forms.
- Continued technical and operational support is being provided to PDSR officers to prevent and control HPAI in village poultry.
- Local budgets for FY 2013 were allocated to support operational costs of PDSR officers in 20 provinces thus far.
- Eight new MTs obtained training to improve their training skills and understanding of programme changes.
- A network of MTs was developed across Indonesia to enable different trainings to be carried out. In total, 28 MTs are able to train in PDSR V3; 26 MTs can train in Community Participatory Engagement; and 14 MTs can train in rabies control.

Output B: Reduced HPAI-infected poultry from commercial farms through improved cooperation among all stakeholders

- Trust was built between the commercial farming sector, private enterprise and the PVUK staff from district governments. Farmers now ask for PVUK veterinarians to assist in vaccination, problem solving and biosecurity training. Farmers are asking the PVUK about different drugs, as they are starting to more critically evaluate the recommendations being provided by the private sector and turning to PVUK as a source of unbiased technical information.
- Sixty-one PVUK staff are now active and working in the commercial poultry sector to control outbreaks of poultry disease, including HPAI. Since the beginning of April 2012, PVUK staff held seven stakeholder meetings and conducted a total of 618 farm visits (246 on-farm meetings, 262 farm evaluation meetings and 110 monitoring visits). PVUK officers report that many farmers change their behaviour following the training. Cold chain management and biosecurity improved through the use of specific slippers for each poultry house.
- Non-biosecurity phases of the cost-effectiveness biosecurity study were successfully completed.
- Evidence-based best practices in HPAI vaccination and layer farm management were identified, including an optimal vaccination schedule, best vaccination practices and drinker/feeder cleaning/management.
- A feedback meeting with the CPH programme study farmers was held in which their farm economics, management and disease status information was discussed.
- There was a marked increase in engagement between poultry farmers and local government livestock services in all locations with PVUK or CPH activities.

Output C: Reduced H5N1 virus at selected critical control points in the market chain through improved biosecurity practices by related stakeholders

- The results of LBM surveillance conducted in 2012 showed a greater than 50 percent decrease in prevalence of H5-positive markets compared to previous years in the greater Jakarta area.
- LBM surveillance system was successfully redesigned to improve cost efficiency.
- Several local governments in the greater Jakarta area allocated their local budget for

implementation of biosecurity activities and market restructuring for FY 2012 and FY 2013.

- The local government adopted some of the FAO methods for market intervention in other areas.
- Poultry business actors showed willingness to perform recommended hygiene and sanitation activities in their respective work places.
- Consumer awareness on the need for healthy chicken meat is increasing, demonstrated by an increasing demand for healthy chicken meat.
- Several actors in the poultry business in Jakarta were willing to do business in relocation centres provided by the DKI Jakarta Government.
- Several poultry businesses in Jakarta are willing to build additional slaughterhouses using their own funds to keep abreast of the Government's SOPs.

Output D: Improved biosecurity practices in backyard and commercial duck-raising

- Duck health management best practices were incorporated within the revision of training modules for PDSR V3.
- HPAI surveillance study in domestic ducks was successfully conducted in collaboration with the local Government in Lombok.

Output E: Reduction of HPAI in poultry farms through widespread use of locally produced vaccines as appropriate based on local antigens and new strains monitored

- Acceptance of the recommendation to update the strain A/chicken/Indonesia/Wates-1/2005 (put forth in November 2009) to A/chicken/West Java Sbg/29/2007, which represents the current standard challenge strain as the standardized antigen for the national sero-surveillance programme.
- Updated national vaccine policy 3345/kpts/LB450/7/2011 was distributed with recent revisions, including challenge testing, registration options for mono- and multivalent vaccines, and other local H5N1 strains found to be effective.
- A sustainable model of "regulation responsiveness" was introduced following expert recommendations, which contributes to cost and resources sharing between the public and private sectors for mutual benefit and reduced time to registration and licensing. Through PPP, manufacturers seeking registration of H5N1 poultry vaccines for avian influenza can request the challenge testing to be performed at the company's own Biosecurity Level 3 (BSL3) facility with oversight from the National Veterinary Drug Assay Laboratory (NVDAL) staff. The actual challenge testing is conducted by NVDAL staff using the challenge virus prepared and titrated by NVDAL. In addition, manufacturers may select between the two government-challenged viruses for use in the challenge trial.
- Isolates selected as candidate vaccine and challenge viruses were distributed to DAH-designated laboratories for onward distribution to national vaccine manufacturers.
- National resources increased for generation of standardized reagents for sero-surveillance in Indonesia.
- In line with OFFLU recommendations, a public-private partnership was established between Pusvetma and IPB Shigeta with plans to test and produce RG vaccines based upon constructs developed at USDA SEPRL.
- The IVM-AH activities are becoming integrated into the routine work of the DICs, and data sharing mechanisms are under development.
- DGLAHS successfully implemented revision to their avian influenza vaccine registration policy. As a result, the majority of avian influenza vaccines sold in Indonesia in 2011 contained local virus strains.

Output F: Strengthened veterinary services at central, provincial and district levels with increased commitment from related stakeholders

- Control skills in relation to the five major livestock diseases of national importance were expanded beyond HPAI to include rabies.
- With more diseases to understand, PDSR officers and their supervisors are improving their skills as veterinarians.
- The concept of NVS is being developed with CMU and DAH. The pilot districts made initial undertakings to incorporate the Veterinary Authority and make provision for local funding of NVS activities. The 20 NVS officers with no previous experience in PDSR will work side by side with the existing PDSR officers to gain experience in HPAI control.
- The One Health approach to zoonosis control was piloted in Bali and found to improve the sensitivity of the surveillance system.
- H5N1 now under control in heavily-endemic areas of Indonesia with cooperation from all levels of Indonesian Government, the commercial poultry industry and poultry-rearing communities.
- Technical and operational capability of the Government veterinary services to improve control of multiple priority animal diseases was simultaneously demonstrated by concurrent success of both the HPAI and rabies disease control programmes in Bali.

Quarter II 2010

Project Monitoring Sheet: **OSRO/INS/604/USA**Project Title: **Expansion of the avian influenza participatory disease surveillance and response program in Indonesia**Extension Title: **Reinforcement and expansion of the avian influenza participatory disease surveillance and response program in Indonesia**Reporting Period: **April - June 2010**

Country: Indonesia
Project title: Reinforcement and expansion of the avian influenza participatory disease surveillance and response program in Indonesia
Code: OSRO/INS/604/USA
Budget: USD 4 million (Phase I), USD 13.7 million (Phase II), USD 7.5 million (Phase III), USD 11 million (Phase IV)
Total budget: USD 36.2 million
Effective starting date: 9 June 2006
Planned end date: 30 September 2010
<p>Context of the project</p> <p>The purpose of the project is to enhance the capacity and ability of the Government of Indonesia and partners to control Highly Pathogenic Avian Influenza (HPAI) in order to help safeguard the health and livelihoods of the Indonesian population by providing broad-based support to the Food and Agriculture Organization of the United Nations (FAO) Indonesia HPAI Control Programme, implemented by the FAO Emergency Centre for Transboundary Animal Disease Operations (ECTAD) in Indonesia.</p>
<p>Objectives of the project</p> <ul style="list-style-type: none"> • sustainable surveillance, prevention, and control of HPAI in village poultry • improved biosecurity and vaccination practices in commercial sectors • improved HPAI surveillance and control along the poultry marketing chain • engagement with duck producers for improved control of HPAI • coordinated and enhanced management of the HPAI control programme
<p>Planned activities</p> <p>Output 1: Sustainable surveillance, prevention and control of HPAI in village poultry</p> <p><i>Activity 1.1 Maintain village surveillance, prevention and outbreak control capacity across endemic areas of Indonesia, prioritized by strategic importance.</i></p> <p><i>Activity 1.2 Assess the potential of the participatory disease surveillance and response system (PDSR) system, structure, and capacities to strengthen the national veterinary service.</i></p> <p><i>Activity 1.3 Facilitate drafting of national veterinary service strategy and work plan.</i></p> <p><i>Activity 1.4 Assist the Campaign Management Unit (CMU) in advocating to local governments for budgetary support for HPAI control, including PDSR and local disease control centres (LDCC) activities.</i></p> <p>Output 2: Improved biosecurity and vaccination practices in commercial sectors</p> <p><i>Activity 2.1 Provide specialized technical support to selected layer producers within high-risk areas</i></p>

of West Java to enhance efficiency and quality of layer vaccination and biosecurity measures.

Activity 2.2 Provide biosecurity training of trainers for commercial producers and relevant government agencies.

Activity 2.3 Assist government and industry in establishing an advisory council modeled on the United States (US) National Poultry Improvement Program to gain more coordinated and broad-based support for partnership between public and private sectors.

Activity 2.4 Evaluate the effectiveness of biosecurity measures implemented by poultry producers.

Activity 2.5 Provide expert technical assessments to Sectors 1 and 2 farms in high-risk locations.

Output 3: Improved HPAI surveillance and control along the poultry marketing chain

Activity 3.1 Conduct longitudinal surveillance for HPAI in live bird markets and collector yards.

Activity 3.2 Implement biosecurity and sanitation interventions in selected live bird markets, collector yards and slaughterhouses.

Activity 3.3 Facilitate DKI (special zone) Jakarta poultry market restructuring.

Output 4: Engagement with duck producers for improved control of HPAI

Activity 4.1 Conduct duck vaccination field trial in selected districts of Java.

Activity 4.2 Expand duck producer profiling and HPAI surveillance to selected districts in Java, Lampung and Bali.

Output 5: Coordinated and enhanced management of the HPAI control programme

Activity 5.1 Integrate and analyse data sets to identify critical control points.

Activity 5.2 Once western Java activities consolidated, extend essential control program elements (e.g. market surveillance, commercial profiling, targeted support for high-risk producers) to other priority regions based on outcomes of western Java intensification activities and lessons learned.

Activity 5.3 Expand the monitoring and evaluation (M&E) system programme-wide with increased integration with government.

Activity 5.4 Improve technical capacity of government human resources.

Activity 5.5 Improve virus strain monitoring, including training, sample submission, collection of field isolates and improved surveillance.

Activity 5.6 Increase capacity of Indonesian laboratories to conduct antigenic and genetic characterization of virus isolates.

Activity 5.7 Provide technical recommendations on vaccination strategy.

Activity 5.8 Conduct vaccination challenge testing and field challenge testing of antigenic variants.

Activities undertaken during the reporting period

Output 1: Sustainable surveillance, prevention and control of HPAI in village poultry

Activity 1.1: Maintain village surveillance, prevention and outbreak control capacity across endemic areas of Indonesia, prioritized by strategic importance.

Epidemiology

- Technical and operational support for PDSR teams and LDCCs throughout Java, Sumatra, Bali and South Sulawesi and West Sulawesi provinces is ongoing.

- Analysis of the PDSR database is also ongoing and provides information on the HPAI status of village poultry throughout the PDSR coverage areas. The village HPAI positive detection rate for this quarter (April to June 2010) was 7.0 percent (171/2448) as compared with the previous quarter's village detection rate of 19.8 percent (713/3601). All but four of the positive cases were a result of passive surveillance (callout report). Owing to the reliance of HPAI detections on passive surveillance, the method of reporting PDSR detection rates in the Monthly Report on Participatory Surveillance and Control was changed this quarter in order to reflect disease incidence more accurately.

Programme Management and Operations

- The second FAO-Department of Health (DAH) - United States Agency for International Development (USAID) project planning workshop was held in Bogor on 13 April 2010. The workshop aimed to gain inputs from the stakeholders on future planning of the OSRO/INS/604/USA project. The workshop's output served as the basis for drafting of the project's outputs and objectives for June 2010 to September 2011.
- An ECTAD Indonesia Work Plan Workshop was held from 18 to 20 May 2010 in Puncak. The workshop was attended by FAO technical and operational staff, in addition to DAH/CMU staff and USAID representatives. The output of this workshop was a work plan, and indicators for ECTAD Indonesia from June 2010 to September 2011 and relevant deliverables and indicators will be included in the next amendment of the OSRO/INS/604/USA project.
- The registration and procurement process for motorcycles and vehicles is still ongoing. A number of provincial governments have sent letters stating they would cover all the costs incurred for the vehicle and motorcycle registration and taxes. Drafts of Memorandum of Understanding (MOU) to be signed by the Team Leader of FAO HPAI Control Programme in Indonesia, Head of the Provincial Livestock Service, Provincial Government, and Director General of Livestock Service (DGLS) have been sent to a number of provinces for inputs after FAO received their letters of confirmation. Procurement for additional motorcycles and vehicles will be carried out once FAO receives signed MOUs from regional government.
- FAO continues to provide operational and technical support for 23 LDCCs on Java, Sumatra, Bali and South Sulawesi and West Sulawesi provinces on Sulawesi Island. In addition, FAO has also been requested by the Government of Indonesia (GOI) to provide support in emergency cases of outbreaks in other areas.

Activity 1.2: Assess potential of PDSR system, structure and capacities to strengthen the national veterinary service.

- Three districts in South and West Sulawesi have been selected for the field trial of a surveillance reporting system that includes HPAI in addition to other animal diseases of national importance. A database is being developed to accommodate data entry in the field.
- Active surveillance has been completed in four districts of Java to compare data from PDSR and field surveys. A total of 6 districts are planned to be surveyed in this manner. Analysis is currently underway to compare the results of structured surveillance to the passive surveillance-based data derived from PDSR activities. This analysis will help determine the cost-effectiveness of PDSR surveillance activities.

Activity 1.3: Facilitate drafting of national veterinary service strategy and work plan.

- ECTAD Indonesia facilitated a GOI National Veterinary Service (NVS) task force workshop to develop a NVS and PDSR transition concept. The NVS task force and representatives of DAH, provincial and district government livestock services participated.
- A PDSR transition to NVS concept note is now being drafted based on the outputs of this workshop.
- A NVS Facilitator began service this quarter and contributed to the workshop.

Activity 1.4: Assist CMU to advocate to local governments for budgetary support for HPAI control, including PDSR and LDCC activities.

- FAO continues to advocate with local government for financial support for HPAI control activities with CMU/DAH's facilitation.
- During this reporting period, one Decision Makers' Meeting (DMM) was held in South Sumatra province to engage the local government in the control activities of HPAI and to advocate for the long-term sustainability of animal disease control services. HPAI is considered the most important animal disease in the province, thus the local government has provided financial support for the sustainability of PDSR and has already included PDSR activities in their 2010 budget plan. In addition, the provincial government has also allocated additional funding for sustainability of PDSR and for HPAI control in general, including funds to cover the costs incurred for handover, registration and taxes on motorcycles and vehicles to support control of HPAI in the field.

Output 2: Improved biosecurity and vaccination practices in commercial sectors

Activity 2.1: Provide specialized technical support to selected layer producers within high-risk areas of West Java to enhance efficiency and quality of layer vaccination and biosecurity measures.

- Planning continued for the initiation of the layer engagement programme in the Solo region of Central Java.
- Visits to layer farms in Cianjur were conducted for comparison to the Central Java farms, a layer farm production assessment tool was developed and an inception meeting held with farmers participating in the pilot phase of the programme.
- Two national technical advisors and one operational programme assistant have been recruited to join the international Technical Advisor (Commercial Poultry Health) on the commercial poultry team.
- The ECTAD Indonesia programme continues to provide technical, logistics, and operational support in collaboration with partners for targeted vaccination of small-scale layer producers in 10 districts in Yogyakarta, Central Java and West Java under the InVak (intensified vaccination) programme.

Activity 2.2: Provide biosecurity training of trainers for commercial producers and relevant government agencies.

- Following up on the progress reported last quarter, a local government inception workshop was held in Jakarta with local government representatives from the pilot districts. Local governments welcomed the programme and provided specific input on programme content and approach. The workshop participants also identified PVUK – Petugas Veteriner Unggas Komersial (Commercial Poultry Veterinary Officers) – as the official title for the local government commercial poultry programme.
- Draft training materials for the PVUK programme were also completed this quarter and training is expected to start next quarter.

Activity 2.3: Assist government and industry to establish an advisory council modeled on the US National Poultry Improvement Program to gain more coordinated and broad-based support for partnership between public and private sectors.

- Support of the activities related to the National Poultry Quality Improvement Program (NPQIP) by ECTAD Indonesia continued this quarter.
- The NPQIP Facilitator completed a series of stakeholder interviews for NPQIP concept development.
- Monthly coordination meetings on NPQIP progress were held between the United States Department of Agriculture (USDA) and ECTAD Indonesia.
- In close collaboration with USDA, a NPQIP working group was established and met twice in

June to develop the next draft of the NPQIP concept in preparation for a national NPQIP workshop in early July.

- An international Poultry Production Industry Advisor was also recruited for a short-term consultancy to review the NPQIP proposal and provide recommendations for its improvement.

Activity 2.4: Evaluate effectiveness of biosecurity measures implemented by poultry producers.

- This activity has been integrated with Activity 2.1 above and will commence concurrently. A draft evaluation method was developed this quarter and will be reviewed and finalized during the mission of the regional socio-economist next quarter.

Activity 2.5: Provide expert technical assessments to Sectors 1 and 2 farms in high-risk locations.

- As reported last quarter, upon further consultation with Sector 1 and 2 industry representatives, this activity will be integrated within activities to be carried out under the NPQIP. With the Technical Advisor (Commercial Poultry Health) now on duty, ECTAD Indonesia is awaiting assessment requests from Sector 1 and 2 farms, in addition to the Sector 2 layer farms already included in the layer engagement programme.

Output 3: Improved HPAI surveillance and control along the poultry marketing chain

Activity 3.1: Conduct longitudinal surveillance for HPAI in live bird markets and collector yards.

- Environmental sampling continued at 231 live bird markets (LBMs) in the Jabodetabek area (Jakarta province and surrounding metropolitan areas).
- Meetings to clarify and improve on sample testing, reporting forms and information flow procedures were held with BKHI DKI Jakarta (special zone agency) animal health laboratory.
- A trial of a sustainable sentinel bird monitoring system by market surveillance officers (PSP) and collector yard managers was successfully implemented at 10 collector yards in Tangerang city. Options were explored for a more sustainable method of providing an ongoing supply of sentinel birds.
- An additional training course for new PSP officers was also conducted.
- Data from the collector yard surveillance study is currently being analysed, and the results will be used to design a long-term market chain surveillance system.

Activity 3.2: Implement biosecurity and sanitation interventions in selected live bird markets, collector yards and slaughterhouses.

- A refresher training course on cleaning and disinfection (C&D) activity was conducted for cleaning workers at ten collector yards in the Bodetabek area (metropolitan area surrounding Jakarta).
- Ten sets of gasoline-powered high pressure washing equipment were distributed to ten collector yards in Bodetabek.
- A locally available alternative disinfectant was procured and distributed to selected collector yards and LBMs in Jabodetabek.
- The C&D station in Pulo Gadung (East Jakarta) was established and equipped with high pressure washer equipment. The cleaning workers have been trained and supported during the initiation of C&D station operations.
- Refurbishment of slaughterhouses in Cakung (East Jakarta) and Petukangan (South Jakarta) was completed this quarter.
- Field assessments were conducted in Tangerang to identify potential LBMs for implementation of market cleaning days.
- Training, equipping and public awareness on market hygiene and sanitation, as well as on usage of high pressure washer machines for LBM stakeholders, was held at Anyar and Bonang markets in Tangerang in order to support market cleaning day implementation.
- The ongoing cleaning days in Kutabumi, Anyar and Bonang markets were monitored and

lessons learned used to revise standard operating procedures (SOPs) for other LBMs and to determine ideal specifications for LBM rehabilitation in Tangerang.

- Numerous meetings were also held with local government livestock services and private sector partner (PD Dharma Jaya) to discuss design of C&D stations in Rawa Keping and Cakung collector yards.

Activity 3.3: Facilitate DKI Jakarta poultry market restructuring.

- The deadline for the relocation of all poultry collectors and slaughterers was postponed from April 2010 to the end of the year.
- The targeted public awareness campaign for promotion of healthy chicken meat was continued with additional press conferences and organized visits to the marketing and slaughter areas in DKI Jakarta. Close liaison with the DKI Governor's office and its administration reinforced the likelihood of success for DKI restructuring.
- ECTAD Indonesia continued to provide technical support for the development of SOPs related to the organization of the five collection yards / slaughterhouses and their management, as well as operational assistance for the start-up of one of the five collection yards (Rawa Keping).
- Support for the promotion of the collection yards with the collectors and slaughterers, in collaboration with the local administration, was also continued.

Output 4: Engagement with duck producers for improved control of HPAI

Activity 4.1: Conduct duck vaccination field trial in selected districts of Java.

- As explained in previous quarterly reports, ECTAD Indonesia further pursued the opportunity to initiate this activity during the current project period; however, the current DGLS vaccination policy does not include ducks. ECTAD is working with DAH and DGLS to determine if the activity can be pursued strictly as a research project and thus be permissible under the current vaccination policy.

Activity 4.2: Expand duck producer profiling and HPAI surveillance to selected districts in Java, Lampung and Bali.

- Implementation of targeted surveillance to determine the prevalence of AI subtype H5 in duck flocks in Banten and West Java has been completed. The study involved sampling ducks within flocks in 6 districts in the study area.

Output 5: Coordinated and enhanced management of the HPAI control programme

Activity 5.1: Integrate and analyze data sets to identify critical control points.

- Work has started on an analysis and review of data on previous market chain surveillance activities by FAO and other organizations. This analysis includes an assessment of poultry type as a risk factor for HPAI entering the poultry market chain, as well as an assessment of the relative risk of districts of origin supplying poultry to the collector yards included in the study. Preliminary analysis and field observations have already identified a collector yard in Surakarta (Central Java) as a critical control point to reduce HPAI risk from village-raised poultry destined for consumption in greater Jakarta.
- Further analysis of the structured village study data, including a comparison to PDSR-derived surveillance data, is also ongoing this quarter.

Activity 5.2: Once western Java activities consolidated, extend essential control program elements (e.g. market surveillance, commercial profiling, targeted support for high-risk producers) to other priority regions based on outcomes of western Java intensification activities and lessons learned.

- This quarter, ECTAD Indonesia initiated the layer engagement pilot programme in Central

Java. This programme will serve as the core of the commercial poultry programme and will be focused on providing evidence-based poultry health and production advice to farmers.

- As described in Activity 2.2 above, the inception workshop for the local government commercial poultry programme (PVUK) was also held this quarter and training in pilot districts in Java and Lampung will begin next quarter.
- During work plan discussions held this quarter, DAH/CMU and FAO have agreed in principle to target activities in high risk locations (such as Surakarta as described in Activity 5.1) during the next phase of the OSRO/INS/604/USA project.

Activity 5.3: Expand M&E system programme-wide with increased integration with government.

- Monitoring and evaluation was expanded to include newly commenced C&D activity in selected collector yards.
- Activity reporting forms were field tested, approved for use and put into use by field personnel. Data from the forms were entered into LDCC databases which are then collated at DCC level. A monthly standard report is produced from the database and distributed to managers of the C&D activity.

Activity 5.4: Improve technical capacity of government human resources.

- Two PDSR introductory training workshops were held in Samarinda.
- One continuing education workshop was held in Banjarbaru, and three continuing education training workshops were also held in Bekasi, Kupang and Bajarbaru. Training members participated and provided technical inputs at seven LDCC monthly meetings in Bandung (combined meeting for Bandung and Bogor LDCCs), Jakarta, Medan, Serang, Bogor, Pekanbaru and Purwokerto.
- Selected master trainers also participated in the Decision Makers' meeting in Palembang. Master Trainers assisted with InVak cold chain monitoring in Purbalinga, Temanggung, Klaten, Gunung Kidul, Bantul, Kulon Progo and Sleman. Master Trainers also provided assistance at two household poultry surveillance training courses in Bali.
- The training team also completed preparation of draft training materials for the PVUK programme as described in Activity 2.2 above.

Activity 5.5: Improve virus strain monitoring, including training, sample submission, collection of field isolates, and improved surveillance.

- Progress on this activity continues to be delayed due to the SOPs for this activity not yet being cleared by DAH. Since sample submission is an integral part of an effective influenza surveillance programme and in-country laboratory capacity to analyse antigenic and genetic characteristics of field isolates is increasing, ECTAD Indonesia hopes that the sample submission programme will be formally approved by DAH in the near future.

Activity 5.6: Increase capacity of Indonesian laboratories to conduct antigenic and genetic characterization of virus isolates.

- On 30 April 2010, a letter was sent from the DAH to all Disease Investigation Centres (DICs) indicating their roles and responsibilities for antigenic cartography and announcing the nomination of genetic sequencing partners – this follows up to the 31 March 2010 letter from FAO –OIE Network of Expertise on Avian Influenza (OFFLU) to the Director General regarding activities for antigenic cartography.
- Six of the seven DICs conducted pre-screening of 276 H5 positive virus isolates from 2008 to 2010 during April and May 2010, and submitted results to DIC Wates who have begun analysis for selection of variants to be forwarded for further characterization. A subset of the isolates from updated pre-screened data is to be sent to the three labs selected for molecular characterization (DIC Bukittinggi, Pusvetma, and Bbalitvet) to conduct parallel generation of genetic data for capacity building purposes. The three sequencing partners are to submit a

proposal on mechanisms necessary to continue these activities.

- Requests for more reagents from the Australian Animal Health Laboratory (AAHL) have been submitted for standard reference materials needed by the DICs and project partners. The FAO OFFLU scientist provided in-country support from 7 June to 11 July 2010 (such as attending the AAHL DIC Laboratory Directors meeting, conducting site visits to DIC Wates to support the antigenic cartography activities, conducting a sequencing workshop for newly nominated sequencing partners and collaborating with workshops on diagnostics and surveillance/epidemiology of animal influenzas in DIC Lampung and Subang to support the transfer of technologies to Indonesia).
- The national OFFLU Technical Facilitator (OTF) began work on 19 April 2010 to assist with the coordination of the OFFLU project in close collaboration with representatives from the DAH/CMU, the seven DICs (particularly DIC Wates) and other relevant public sector structures and private sector stakeholders. She has assisted with the ongoing laboratory reagents procurement, attended technical management meetings, drafted and followed up letters pertaining to OFFLU activities, coordinated and supported data analysis at DIC Wates and identified the needs for the sequencing workshop held in June 2010
- Following the launch meeting for laboratories nominated for molecular characterization of antigenic variants, a workshop on “Validating the antigenic map with genetic data: sequencing of the HA gene” was conducted from 16 to 18 June 2010 at Pusvetma by AAHL and OFFLU scientists. Sequencing partners were provided with PCR samples to produce sequencing data at their own labs as part of the capacity building exercise
- Informative presentations on antigenic cartography and the processes being established in the DICs were made in a collaborative effort during workshops on diagnostics and epidemiology of animal influenzas at DICs Lampung and Subang to support the transfer of technologies to Indonesia.
- Procurement of reagents to support molecular characterization efforts was finalized for Pusvetma and is continuing for DIC Bukittinggi and Bbalitvet.
- Site visits to DIC Wates were conducted by the OFFLU scientist and the OTF in coordination with CMU to follow up on antigenic cartography activities and analysis of data generated to date (June 2010).
- Procurement of needed reagents and equipment for antigenic cartography continues for DIC Wates; needs were updated during the June 2010 site visits.

Activity 5.7: Provide technical recommendations on vaccination strategy.

- OFFLU encouraged DGLS to collaborate with vaccine companies, and an approach to including the companies in the antigenic cartography efforts was proposed.
- OFFLU continues to encourage the DAH to support field trials of alternative vaccines and to partner with private companies to pursue vaccine trials using candidate vaccines demonstrated likely to be efficacious, especially against variant viruses in Indonesia.
- Interviews of 155 broiler chicken farmers (average flock size 2 700), and 56 layer chicken farmers (average flock size 2 200) were conducted for the Indonesian Center for Agriculture Socio-Economic and Policy Studies (ICASEPS) field survey “Assessment of farm level financial incentives and willingness to pay for HPAI vaccination in Indonesia” in 13 districts/municipalities in western Java. Data entry and analysis were completed, and the final report is under review.
- Preparation for the consultation to develop recommendations for a comprehensive vaccination strategy in Indonesia, scheduled for July 2010, has been postponed – a new date to be announced in due course.

Activity 5.8: Conduct vaccination challenge testing and field challenge testing of antigenic variants.

- This activity has been suspended for commercial vaccines, since investigations in support of product registration are considered as a “private good” and should be conducted at the expense

of the vaccine company. However, the Material Transfer Agreement (MTA) was signed by AAHL and DGLS and final arrangements are being made to ship characterized candidate vaccine and challenge viruses to Indonesia. According to the MTA, the four candidate vaccine viruses will be shipped to Pusvetma and the two challenge viruses to BPMSOH (the national veterinary drugs assay laboratory). OFFLU has encouraged DGLS to collaborate with vaccine companies and an approach to including the companies in the challenge testing efforts was proposed. On 14 June 2010, the Director of Animal Health verbally indicated that these updated strains would immediately be made available to vaccine production companies.

- Characterization of additional vaccine constructs at the Southeast Poultry Research Laboratory (SEPRL) in Athens, Georgia, USA has been completed.
- Cartography reagents from AAHL were received at Erasmus University.

Cross-cutting Activities

Information, Education and Communication (IEC)

Activities this quarter still focused on developing and distributing materials for public awareness, advocacy and PDSR continuing education. Specific activities included the following:

- production and distribution of the animation video communication tool
- continued development of PDSR training video
- finalized production of the DINAS Briefing Package (video)
- gained approval on the English version of the National Communication Strategy on HPAI for the Ministry of Agriculture (MOA)
- held further discussion with MOA on the disease transmission video.
- continued subscription of media monitoring company for related news and coverage
- printed and produced PDSR hotline stickers and calendars
- finalized the promotional video for DKI Jakarta's Market Restructuring project
- produced the 2009 FAO Avian Influenza Programme Annual Report (print, electronic)
- started development of the seventh edition of AI bulletin in cooperation with MOA

Planned activities for the next quarter

Output 1: Sustainable surveillance, prevention and control of HPAI in village poultry

Activity 1.1: Maintain village surveillance, prevention and outbreak control capacity across endemic areas of Indonesia, prioritized by strategic importance.

- analyse and draft reports for Bali port survey, unofficial importation risk assessment, random village surveillance and collector yard description surveys
- plan focused Banyuwangi surveillance for HPAI and risk from unofficial importation of live birds
- conduct national LDCC Coordinator meeting to: (i) evaluate performance of LDCCs and PDSR teams in control of HPAI; (ii) discuss operation, administration and management of FAO-MOA HPAI control programme in Indonesia; and (3) disseminate information on PDSR transition to a sustainable NVS
- design pilot project for implementation of sustainable NVS in eight selected districts from six provinces (West Sumatera, Yogyakarta, Central Java, Lampung, West Java and Bali)
- hold three focus group discussions with field officers (PDSR, Puskesmas) to determine suitable messages and communication methods for them on prevention and control of HPAI and other animal diseases of zoonotic and economic importance

Activity 1.2: Assess potential of PDSR system, structure, and capacities to strengthen the national veterinary service.

- discuss the proposed (reduced) disease surveillance reporting system, which includes HPAI in

- addition to other animal diseases of national importance, with the LDCC Coordinators
- complete design of the basic data entry database module of the disease surveillance reporting system
- initiate the piloting of the new surveillance reporting system in three districts
- complete random village surveillance in Serang (western Java) and Situbondo (East Java) and prepare draft final report

Activity 1.3: Facilitate drafting of national veterinary service strategy and work plan.

- provide support to NVS task force to complete drafting of updated NVS concept note
- in conjunction with plans to improve sustainability of PDSR and to improve control of HPAI, design a pilot project for implementation of sustainable NVS in eight districts

Activity 1.4: Assist CMU to advocate to local governments for budgetary support for HPAI control, including PDSR and LDCC activities.

- conduct two Decision-Makers' meetings in Banten and Yogyakarta provinces during the next quarter
- FAO and DAH/CMU will begin revising the format of the Decision-Makers' meeting to include information on NVS, epidemiology and disease management during the next quarter

Output 2: Improved biosecurity and vaccination practices in commercial sectors

Activity 2.1: Provide specialized technical support to selected layer producers within high-risk areas of West Java to enhance efficiency and quality of layer vaccination and biosecurity measures.

- initiate poultry production and health assessments of pilot phase layer farms
- develop customized production improvement plans for each pilot farm
- provide technical support to each farm to implement their customized production improvement plan

Activity 2.2: Provide biosecurity training of trainers course for commercial producers and relevant government agencies.

- conduct training of trainers for commercial farm profiling in PVUK pilot districts
- commence training of local government veterinary officers for piloting of PVUK next quarter that is planned to be implemented in a total of eight districts in West Java, Central Java, East Java and Lampung provinces
- hold three focus group discussions with the commercial poultry sector to determine suitable communication materials and activities for them to increase disease prevention and promote good farming practices

Activity 2.3: Assist government and industry to establish an advisory council modeled on the US National Poultry Improvement Program to gain more coordinated and broad-based support for partnership between public and private sectors.

- support USDA to hold a national NPQIP workshop to review and discuss the NPQIP concept with relevant stakeholders
- utilize input from the NPQIP workshop to finalize the NPQIP document

Activity 2.4: Evaluate effectiveness of biosecurity measures implemented by poultry producers.

- this activity is being carried out in conjunction with Activity 2.1 above
- review and finalize method for determining cost-effectiveness of biosecurity measures with technical support from the ECTAD regional socio-economist

Activity 2.5: Provide expert technical assessments to Sectors 1 and 2 farms in high-risk locations.

- participate in and hold a poultry health improvement session at the Indonesia Livestock

Exposition

- provide technical advice as requested by Sector 1 and 2 farmers

Output 3: Improved HPAI surveillance and control along the poultry marketing chain

Activity 3.1: Conduct longitudinal surveillance for HPAI in live bird markets and collector yards.

- continue environmental sampling of LBMs in Jabodetabek.
- continue coordination with the BKHI DKI Jakarta animal health laboratory for sample testing, reporting and information flow
- design a long-term (Phase III) market chain surveillance system
- conduct monitoring and evaluation meetings on market chain surveillance implementation with PSP, LDCC and local government livestock and animal health services
- develop a surveillance method specifically for native chicken movement from collector yards in Surakarta to Jabodetabek

Activity 3.2: Implement biosecurity and sanitation interventions in selected live bird markets, collector yards and slaughterhouses.

- construct C&D stations in Rawa Kepiting and Cakung collector yards and conduct training of cleaning workers
- continue to monitor and evaluate market chain C&D activity in the Jabodetabek area
- conduct field assessment of potential LBMs for rehabilitation and expansion of market cleaning days in the Jabodetabek area
- conduct field assessment of potential collector yards and slaughterhouses for expansion of the market chain C&D project in the Jabodetabek area
- conduct field assessment of potential checkpoints in western Java and southern Sumatra in order to strengthen poultry movement control
- conduct a workshop to promote safe poultry waste disposal processes in DKI Jakarta
- initiate rehabilitation of the poultry slaughter site in Bonang market Tangerang district in order to improve market sanitation

Activity 3.3: Facilitate DKI Jakarta poultry market restructuring.

- continue targeted public awareness campaign for promotion of “healthy chicken meat” via press conferences, talk shows and organized visits to the marketing and slaughter areas in DKI Jakarta
- start active promotion campaign for “healthy chicken meat” with consumers and traders in the traditional markets selling poultry meat
- liaise with the DKI Governor’s office and its administration to monitor the relocation of live poultry slaughtering and marketing
- continue support for the development of SOPs related to the organization of the five collection yards and their management and training of collectors and slaughterers in SOP usage
- continue support for the promotion of the collection yards with the collectors and slaughterers in collaboration with the local administration
- collaborate closely with the private sector and the local administration in the restructuring of distribution channels, including cold chain, from the five collection yards/slaughterhouses to the traditional markets
- collaborate closely with the local administration for the strengthening of food safety measures and government structures
- identify alternative income generating activities for poultry stakeholders forced out of the (labor) market and design support programmes accordingly

Output 4: Engagement with duck producers for improved control of HPAI

Activity 4.1: Conduct duck vaccination field trial in selected districts of Java.

- continue to engage with DGLS to determine if a duck vaccination research study can be conducted in Java if a duck vaccination is required in the future to bring HPAI under control in Indonesia

Activity 4.2: Expand duck producer profiling and HPAI surveillance to selected districts in Java, Lampung and Bali.

- complete sampling and laboratory testing
- review final report and conduct further analyses if necessary
- circulate findings to stakeholders

Output 5: Coordinated and enhanced management of the HPAI control programme

Activity 5.1: Integrate and analyze data sets to identify critical control points.

- complete a review of data on previous market chain surveillance activities by FAO and other organizations, and add the current market chain surveillance study
- complete analysis of poultry type and geographic origin as risk factors for HPAI entering collector yards included in the market chain surveillance study
- compare the data from district HPAI active surveillance to equivalent data collected by PDSR
- initiate import risk analysis for poultry and poultry products from Java

Activity 5.2: Once western Java activities consolidated, extend essential control program elements (e.g. market surveillance, commercial profiling, targeted support for high-risk producers) to other priority regions based on outcomes of western Java intensification activities and lessons learned.

- initiate planning of risk reduction activities in Surakarta native chicken collector yards
- conduct field assessment of potential checkpoints in western Java and southern Sumatra in order to strengthen poultry movement control
- commence training of local government veterinary officers for piloting of PVUK next quarter that is planned to be held in a total of eight districts in the West Java, Central Java, East Java and Lampung provinces

Activity 5.3: Expand M&E system programme-wide with increased integration with government.

- continue database development work on the proposed disease surveillance reporting system and revise the database as the results of field testing leads to further revision of the form
- maintain data flows from LDCCs and field operations to DCC
- maintain the production of regular reports derived from the various HPAI activity databases

Activity 5.4: Improve technical capacity of government human resources.

- finalization of local government commercial poultry program design, material, modules, schedule and initiation of activities in eight selected pilot districts
- planning and implementation of different PDSR continuing education training courses at various LDCCs
- initiate review and revision of PDSR training materials

Activity 5.5: Improve virus strain monitoring, including training, sample submission, collection of field isolates and improved surveillance.

- continue to engage and support DAH to clear and issue the Sample Submission SOP

Activity 5.6: Increase capacity of Indonesian laboratories to conduct antigenic and genetic characterization of virus isolates.

- DICs to continue with the pre-screening process, submitting raw data for the hemagglutination inhibition (HI) assay conducted using cartography sera on H5-positive fluids isolated from

ongoing routine diagnostic activities of the DICs

- meet with vaccine companies as proposed by DGLS to invite their participation in the antigenic cartography effort and to develop a mechanism for collaboration
- facilitate production and distribution of antisera panel confirmed for use in antigenic cartography to additional partners named by the DAH using the protocols agreed to by Erasmus Medical Center (MC) and AAHL
- continue to provide support from the OFFLU scientist to the ongoing transfer of technology to Indonesia; the next in-country inputs will be scheduled in September and October 2010
- have the OFFLU Technical Facilitator begin to support laboratories and assist in the transfer of technology; her other tasks will include supporting pre-screening activities at DICs and implementing an OFFLU recommendation to include a standardized reference H5 hyper-immune antiserum and the homologous antigen, based on an updated common Indonesian lineage, for use in DICs and other national laboratories
- follow up on the procurement of reagents to support molecular characterization efforts
- determine antigenic cartography training needs for industry following the meeting proposed by DGLS
- hold a bioinformatics workshop as a follow-up to the “Validating the antigenic map with genetic data: sequencing of the HA gene” workshop held from 16 to 18 June at Pusvetma
- follow up on the shipment of cDNA from isolates, selected using antigenic cartography data produced at DIC Wates, to sequencing partner laboratories as per the outcomes of the “Validating the antigenic map with genetic data: sequencing of the HA gene” workshop held from 16 to 18 June at Pusvetma; parallel generation of genetic data will be conducted with AAHL for capacity building and proficiency testing purposes
- compare data from sequencing partners for PCR samples provided to be conducted in August 2010 as part of the capacity building exercise
- conduct a follow-up workshop on “Serology and virus typing for antigenic cartography”

Activity 5.7: Provide technical recommendations on vaccination strategy.

- facilitate reporting from SEPRL on data from the completed challenge tests using available reverse genetic constructs
- reschedule the consultation to develop recommendations for a comprehensive vaccination strategy in Indonesia
- finalize the report for the ICASEPS field survey “Assessment of farm level financial incentives and willingness to pay for HPAI vaccination in Indonesia” conducted in 13 districts/municipalities in western Java
- prepare for the final OFFLU project technical review meeting scheduled for October 2010

Activity 5.8: Conduct vaccination challenge testing and field challenge testing of antigenic variants.

- Specific field challenge testing of commercial vaccines is no longer being sought by FAO, since investigations in support of product registration are considered as a “private good” and should be conducted at the expense of the vaccine company.
- OFFLU is awaiting a reply to the 7 April 2010 letter from DGLS to DG Agency for Agricultural Research and Development outlining proposed activities at Bbalitvet and following up on the OFFLU visit to Bbalitvet in March 2010.
- OFFLU is awaiting final instruction and clearance to ship reverse genetics (RG) vaccine strains from SEPRL to Bbalitvet. The OTF in coordination with CMU will continue to follow up on letter to DGLS.
- OFFLU to schedule training on the RG strains offered by SEPRL once these strains are delivered to Bbalitvet.
- Meet with vaccine companies, as proposed by DGLS, to invite their participation in the antigenic cartography effort and to inform them that the candidate vaccine and challenge viruses will be made available to them as soon as they are delivered to the receiving

laboratories indicated in the MTA.

Cross-cutting Activities

Information, Education and Communication (IEC)

- finalize, produce and distribute PDSR training video
- produce and distribute Dinas Briefing Package (video)
- continue endorsement to formalize the National Communication Strategy on HPAI for the MOA (Bahasa Indonesia version) and incorporate it into the National Strategic Workplan for HPAI prevention and control
- produce a disease transmission video
- continue monitoring and documenting news coverage related to HPAI and other zoonotic diseases
- distribute PDSR hotline stickers and calendars
- produce and distribute promotional video on DKI Jakarta's Market Restructuring Project
- distribute the 2009 FAO Avian Influenza Programme Annual Report (English and Bahasa Indonesia versions) in both print and electronic format
- hold a media gathering to improve relationships with the media and update them with interesting and important information from the HPAI Control Programme
- repackage media partnership materials for global dissemination
- produce educational comic strips on prevention of HPAI and other diseases through PDSR officers
- initiate support for the re-establishment of the CMU's website by contributing necessary data and relevant information on HPAI prevention and control

Main challenges encountered and response provided

Two main challenges were faced this quarter. The first was the ongoing challenge of recruiting international technical advisors in a timely manner. As reported previously, the GOI review and approval process for international experts can be very long, often resulting in significant delays in the recruitment and initiation of the consultancy missions, and thus contributing to the lengthening of the lead-in period from the time that expertise gaps are identified to the time that they are filled. In response, ECTAD Indonesia has increased efforts to discuss and exchange information with MOA regarding candidates for open consultancies as well as to discuss the need for each specific consultancy. This quarter, the programme was able to successfully recruit two new consultants, one long-term and one short-term. Therefore, it is hoped that the enhanced engagement procedures put in place have improved the programme's ability to fill expertise gaps in a timely manner.

The other major challenge encountered was the programme's need to prepare a detailed work plan until September 2011 for USAID while still in the midst of accelerating implementation of a number of new activities as described in this report. ECTAD Indonesia responded by dividing the planning process into stages over a four-month period. Although this extended the time needed to complete the planning, it allowed programme staff and government counterparts to contribute to the planning of future activities without losing focus on current activities. The planning process culminated with the production of a detailed 16-month work plan, including deliverables and indicators, for the ECTAD Indonesia programme.

Main progress made towards the achievement of project outcomes (from the start of the current project phase)

Output 1: Sustainable surveillance, prevention, and control of HPAI in village poultry

- The PDSR programme has strengthened veterinary services capacity to detect and respond to HPAI outbreaks in village poultry throughout HPAI-endemic areas of Indonesia.

- The LDCC system has enabled more effective communication and coordination between central and local governments within the highly decentralized Indonesian governance system.
- As a direct result of advocacy conducted through local government village poultry HPAI control activities (e.g. PDSR), central and local governments are well aware of the need for cost-sharing for the HPAI control program and animal disease control activities in general. In addition, government stakeholders are now more committed to support and advocate for animal health and HPAI disease control as a result of the FAO project.

Output 2: Improved biosecurity and vaccination practices in commercial sectors

- Understanding of the role of commercial poultry production in the maintenance and spread of HPAI has improved.
- Public-private partnership for targeted vaccination of at-risk small-scale poultry producers was initiated.
- Public sector collaboration with commercial poultry producers has been accelerated. In particular, public sector disease controllers and international agencies are both more aware of the complexity of commercial poultry production in Indonesia and more engaged with private sector stakeholders involved in commercial poultry production.

Output 3: Improved HPAI surveillance and control along the poultry marketing chain

- Test results from the DKI Jakarta category B animal health laboratory distributed to all livestock services at district level throughout Jabodetabek to increase local government awareness and responsiveness to market chain contamination and veterinary public health issues.
- Program to test collector yard-based surveillance methods to assess relative risk of poultry production areas and poultry type developed and successfully implemented.
- Improved understanding of poultry market dynamics in DKI Jakarta by the public sector.
- Increased private and public sector C&D capacity and increased implementation of C&D practices along the poultry market chain in greater Jakarta.
- Critical weaknesses in the DKI Jakarta market restructuring preparations identified and corrective measures proposed and subsequently implemented by government.

Output 4: Engagement with duck producers for improved control of HPAI

- The database of duck flocks developed from the study area provides a sample frame for the prevalence study and other future activities to be undertaken in duck populations by animal health authorities; knowledge of locations of high density duck populations is a critical first step to identifying critical control points for targeted interventions to control HPAI.

Output 5: Coordinated and enhanced management of the HPAI control programme

- Improved knowledge of factors associated with outbreaks of HPAI in village poultry to be used to inform and refine surveillance and control strategies.
- Critical control points identified. Data and subsequent analysis leading to identification of further points for disease control efforts to be targeted.
- Significant improvement in technical capacity and management of local government human resources working in the field throughout all known HPAI-endemic areas.
- Development of a safe, efficacious vaccine for use in Indonesia.
- Characterization of AI viruses circulating in Indonesia.
- Increased capacity of Indonesian laboratories to perform antigenic characterization of viruses

and analyse results.

- Improved collaboration between Indonesian private sector and public sector on field virus monitoring.

Quarter II 2010

Project Monitoring Sheet: OSRO/INS/703/USA

Project Title: **Monitoring AI virus variants in Indonesian poultry and defining an effective and sustainable vaccination strategy**

Reporting Period: **April - June 2010**

<p>Country: Indonesia</p> <p>Project title: Monitoring AI virus variants in Indonesian poultry and defining an effective and sustainable vaccination strategy</p>
<p>Project Code: OSRO/INS/703/USA</p>
<p>Budget: USD 830 500 (Phase I), USD 800 000 (Phase II)</p> <p>Budget total: USD 1 630 500¹</p>
<p>Effective starting date: October 2007</p>
<p>Planned end date: 30 September 2010</p>
<p>Context of the Project:</p> <p>Since 2005, Indonesia has become one of the major global hotspots for the Highly Pathogenic Avian Influenza (HPAI) epizootic in both poultry and humans. To help control HPAI in the field, an understanding of the circulating field isolates is needed to both monitor poultry vaccine efficacy and to identify appropriate strains for new vaccine development.</p>
<p>Objectives of the Project: Phase 2 Extension</p> <ul style="list-style-type: none"> • H5N1 HPAI virus field isolate collection for biological and genetic characterization • challenge testing of antigenic variants against newly developed vaccine strain • capacity building • technical recommendations for vaccination strategy
<p>Planned activities</p> <p>Output A-B. HPAI field isolate collection for biologic and genetic characterization</p> <p><i>Activity AB1. To continue collection of samples.</i></p> <p><i>Activity AB2. To Support beta testing of InfoLab-Plus by Peter Durr, Australian Animal Health Laboratory (AAHL) to allow for field entry of standardized sample information, improved data integration and communication between laboratories and to ensure data integrity.</i></p> <p><i>Activity AB3. To screen samples by real-time polymerase chain reaction (RT-PCR) in Disease Investigation Centre (DIC), Bbalitvet and new partners where possible.</i></p> <p><i>Activity AB4. To provide samples positive for avian influenza (AI) to AAHL for characterization.</i></p> <p><i>Activity AB5. To conduct genetic and antigenic characterization of HPAI isolates in Indonesia.</i></p>

¹ Under the first phase, an additional USD 200 000 was allocated from OSRO/INS/701/AUL in support of project activities. The duration of the project has been extended from 12 months to 24 months.

Output C. Challenge testing of antigenic variants and vaccine strains selection

Activity C1. Perform challenge testing with priority isolates against new vaccine(s) strain.

Output D. Capacity building

Activity D1. Five-month support from the World Organisation for Animal Health (OIE)- Food and Agriculture Organization of the United Nations (FAO) Network of Expertise on Avian Influenza (OFFLU) scientist in close coordination with AAHL.

Activity D2. Molecular and antigenic analysis workshops.

Activity D3. Develop capability to conduct vaccine efficacy tests in Indonesia.

Output E. Technical recommendations for the vaccination strategy

Activity E1. Continue development of reverse genetic vaccine based upon the drift variant identified in Phase 1.

Activity E2. Support field trials with alternative vaccines.

- This activity has been suspended, since investigations in support of product registration are considered as a "private good" and should be conducted at the expense of the vaccine company.

Activity E3. Encourage the Government of Indonesia to streamline registration of efficacious recombinant and reverse genetic vaccines.

Activity E4. Continue the assessment of costs and cost-effectiveness of vaccination strategies in Indonesia.

Activity E5. Prepare updated technical recommendations on a vaccination strategy.

Activity E6. Organize technical review meetings.

Activities undertaken during the reporting period

Output A-B. HPAI field isolate collection for biologic and genetic characterization

Activity AB1. Continue collection of samples.

- Sample collection and submission are ongoing through the routine surveillance and diagnostic activities of the DICs and through participatory disease surveillance and response (PDSR).

Activity AB2. Support beta testing of InfoLab-Plus by Peter Durr, AAHL to allow for field entry of standardized sample information, improved data integration and communication between laboratories, and to ensure data integrity.

- This activity has been completed; refer to IV Quarter 2009.

Activity AB3. Screen samples by RT-PCR in DICs, Bhalitvet, and new partners where possible.

- Sample collection and submission are ongoing through the normative diagnostic activities of the DICs and through PDSR.

Activity AB4. Provide samples positive for avian influenza to AAHL for characterization.

- Reports from AAHL were submitted to Directorate General of Livestock Services (DGLS) on the characterization of 102 samples (43 from DIC Maros and 59 from DIC Medan); 78 H5N1 viruses were isolated and 76 additional haemagglutinin (HA) gene sequences obtained.

- A second request was made to DGLS for export permit to ship antigenically distinct viruses from industry project partner to AAHL.
- Advocacy for release of virus sequences in the public domain – positive response was received on 24 June 2010 from DGLS to letters from OFFLU in August 2008 and on 15 March 2010 to authorize release of available sequences to a publicly held database.
- Collaboration with AAHL to prepare draft for collaborative manuscripts is in process.

Activity AB5. Conduct genetic and antigenic characterization of HPAI isolates in Indonesia.

- On 30 April 2010, a letter from the Department of Animal Health (DAH) was sent to DICs indicating their roles and responsibilities for antigenic cartography and announcing the nomination of sequencing partners – this follows up the 31 March 2010 letter from OFFLU to DG regarding activities for antigenic cartography.
- Six of the seven DICs conducted pre-screening of 276 H5 positive virus isolates from 2008-2010 during April and May 2010 and submitted results to DIC Wates which have begun analysis for selection of variants to be forwarded for further characterization.
- Requests for more reagents from AAHL have been submitted for standard reference materials needed by the DICs and project partners.

Output C. Challenge testing of antigenic variants and vaccine strains selection

Activity C1. To perform challenge testing with priority isolates against new vaccine(s) strain.

- All challenge tests conducted at SEPRL have been completed; pending final report.

Output D. Capacity building

Activity D1. Five-month support from OFFLU Scientist in close coordination with AAHL.

- The OFFLU scientist from FAO has completed the five-month input for in-country technical assistance to support laboratory capacity building. Her recent inputs (from 7 June to 11 July 2010) include (i) attending the AAHL DIC Laboratory Directors meeting; (ii) making site visits to DIC Wates to support the antigenic cartography activities; (iii) conducting sequencing workshop for newly nominated sequencing partners; and (iv) collaborating with workshops on diagnostics and epidemiology of animal influenzas in DIC Lampung and DIC Subang to support the transfer of technologies to Indonesia.
- The national OFFLU technical facilitator (OTF) began work on 19 April 2010 to assist with the coordination of the OFFLU project in close collaboration with representatives from the DAH/National Campaign Management Unit (CMU), the seven DICs, particularly DIC Wates, and other relevant public sector structures and private sector stakeholders. She has assisted with the ongoing laboratory procurements, attended technical management meetings, drafted and followed up letters pertaining to OFFLU activities, coordinated and supported data analysis at DIC Wates and organized the needs for the sequencing workshop held in June 2010.
- Procurement of reagents to support molecular characterization efforts was finalized for Pusvetma and is continuing for DIC Bukittinggi and Bbalitvet.
- In June 2010, site visits to DIC Wates were conducted by the OFFLU scientist and the OTF in coordination with CMU to follow up on the activities for antigenic cartography and analysis of the data generated to date.
- Procurement of needed reagents and equipment continues for DIC Wates; needs were updated during the June 2010 site visits.

Activity D2. Molecular and antigenic analysis workshops.

- Following the launch meeting for laboratories nominated for molecular characterization of

antigenic variants, a workshop on “Validating the antigenic map with genetic data: sequencing of the HA gene” was conducted from 16 to 18 June 2010 at Pusvetma by AAHL and OFFLU.

- Sequencing partners were provided with PCR samples to produce sequencing data at their own labs as part of the capacity building exercise.
- Informative presentations on antigenic cartography and the processes being established in the DICs were given in a collaborative effort during workshops on diagnostics and epidemiology of animal influenzas at DICs Lampung and Subang to support the transfer of technologies to Indonesia.

Activity D3. Develop capability to conduct vaccine efficacy tests in Indonesia.

- OFFLU awaiting response to letter of October 2009 on recommended tests for vaccine registration.
- The Materials Transfer Agreement (MTA) was signed by AAHL and DGLS and final arrangements are being made to ship characterized candidate vaccine and challenge viruses to Indonesia. According to the MTA, the four candidate vaccine viruses will be shipped to Pusvetma and the two challenge viruses to BPMSOH (the national veterinary drugs assay laboratory).
- On 14 June 2010, DAH verbally indicated that these updated strains would immediately be made available to vaccine production companies.
- On 17 June 2010, the OFFLU scientist conducted the follow up visit to Pusvetma to tour the AI building and ensure facilities were ready to receive viruses.
- Cartography reagents from AAHL have been received at Erasmus.
- On 7 April 2010 a letter was sent from DGLS to DG Research outlining proposed activities at Bbalitvet and following up on the OFFLU visit in March 2010.
- Continued to encourage DAH to partner with private companies to sustain vaccine efficacy testing.

Output E. Technical recommendations for the vaccination strategy

Activity E1. Continued development of reverse genetic vaccine based upon the drift variant identified in Phase 1.

- This activity has been completed; pending final report from USDA Southeast Poultry Research Laboratory (SEPRL).

Activity E2. Support field trials with alternative vaccines.

- This activity has been suspended because investigations in support of product registration are considered as a “private good” and should be conducted at the expense of the vaccine company.

Activity E3. Encourage the Government of Indonesia to streamline registration of efficacious recombinant and reverse genetic vaccines.

- DAH informed OFFLU that the reverse genetics (RG) vaccine strains need to be delivered to Bbalitvet once clearance is received to ship. OFFLU is awaiting final instruction and clearance.
- OFFLU informed DAH that training on the RG strains is offered by SEPRL once these strains are delivered to Bbalitvet.

Activity E4. Continue the assessment of costs and cost-effectiveness of vaccination strategies in Indonesia.

- Interview of 155 broiler chicken farmers (average flock size 2700) and 56 layer chicken farmers (average flock size 2 200) was conducted for the ICASEPS field survey “Assessment of farm

level financial incentives and willingness to pay for HPAI vaccination in Indonesia” in 13 districts/municipalities in western Java.

- Data entry and analysis of production margin and vaccine expenditure data has been completed.
- A final report has been drafted and is under review by FAO.

Activity E5. Prepare updated technical recommendations on a vaccination strategy.

- Preparation for the consultation to develop recommendations for a comprehensive vaccination strategy in Indonesia for July 2010 has been postponed – date to be announced later.

Activity E6. Organize technical review meetings.

- Date for final Technical Review Meeting has been proposed (on 14 and 15 October 2010) and preparations continue.

Planned activities for the next quarter

Output A-B. HPAI field isolate collection for biologic and genetic characterization

Activity AB1. Continue collection of samples.

- sample collection and submission are ongoing through the routine surveillance and diagnostic activities of the DICs and through PDSR
- finalize proposal to supplement the sample collection from DIC Wates to include under-represented geographic areas and poultry production sectors – sampling to be conducted by DIC Wates
- revisit proposal to supplement the sample collection from DIC Wates to include under-represented geographic areas and poultry production sectors – sampling to be conducted by DIC Wates

Activity AB2. Support beta testing of InfoLab-Plus by Peter Durr, AAHL to allow for field entry of standardized sample information, to improve data integration and communication between laboratories, and to ensure data integrity.

- this activity has been completed; refer to IV Quarter 2009

Activity AB3. Screen samples by RT-PCR in DICs, Bbalitvet, and new partners where possible.

- sample collection and submission are ongoing through the routine surveillance and diagnostic activities of the DICs and through PDSR
- continue to pursue collaborative efforts to obtain needed isolates from underrepresented and high risk species and geographical areas

Activity AB4. Provide samples positive for avian influenza to AAHL for characterization.

- have AAHL conduct antigenic cartography on the 78 H5N1 viruses isolated from 102 samples (43 from DIC Maros and 59 from DIC Medan)
- have OTF follow up on export permit needs for the set of 25 to 30 isolates selected from updated pre-screened data to send to AAHL for parallel generation of antigenic and genetic data for capacity building purposes
- have OTF, in coordination with CMU, follow up on DGLS export permit for antigenically distinct viruses from industry project partner to be sent to AAHL
- reply to response to authorize release of available sequences to a publicly held database received on 24 June 2010 from DGLS

Activity AB5. To conduct genetic and antigenic characterization of HPAI isolates in Indonesia.

- have DICs continue with the prescreening process, submitting raw data for the hemagglutination inhibition (HI) assay conducted using cartography sera on H5-positive fluids isolated from ongoing diagnostic activities of the DICs
- have DIC Wates produce full panel antigenic cartography data in parallel with AAHL by end of August 2010
- organize a meeting with vaccine companies proposed by DGLS on 7 July 2010 to invite their participation in the antigenic cartography effort and to develop the mechanism for collaboration
- produce/distribute antisera panel confirmed for use in antigenic cartography to additional partners named by the DAH using the protocols agreed to by Erasmus Medical Center (MC) and AAHL.
- send a subset of the isolates from updated pre-screened data to the three laboratories selected for molecular characterization (DIC Bukittinggi, Pusvetma and Bbalitvet) to conduct parallel generation of genetic data for capacity building purposes
- have the three sequencing partners submit a proposal on the mechanism to be continued

Output C. Challenge testing of antigenic variants and vaccine strains selection

Activity C1. Perform challenge testing with priority isolates against new vaccine(s) strain.

- all challenge tests conducted at SEPRL have been completed; pending final report

Output D. Capacity building

Activity D1. Five-month support from OFFLU scientist in close coordination with AAHL.

- the five-month input is complete; however, the OFFLU Scientist will continue to provide support to the ongoing transfer of technology to Indonesia. The next inputs will be scheduled for September-October 2010.
- support provided by the OTF to the laboratories and OTF's assistance in transfer of technologies and the prescreening activities at DICs to include OFFLU recommendations for a standardized reference H5 hyperimmune antiserum and the homologous antigen based on an updated common Indonesian lineage for use in DICs and other national laboratories
- follow up on the procurement of reagents to support molecular characterization efforts
- determine antigenic cartography training needs for industry following meeting proposed by DGLS

Activity D2. Molecular and antigenic analysis workshops.

- schedule a bioinformatics workshop in September 2010 as a follow up to the "Validating the antigenic map with genetic data: sequencing of the HA gene" workshop held from 16 to 18 June 2010 at Pusvetma
- OTF to follow up shipment of cDNA from isolates, selected using antigenic cartography data produced at DIC Wates, to sequencing partner laboratories as per the outcomes of the "Validating the antigenic map with genetic data: sequencing of the HA gene" workshop held from 16 to 18 June at Pusvetma; parallel generation of genetic data will be conducted with AAHL for capacity building purposes.
- conduct comparison of data from sequencing partners for PCR samples provided in August 2010 as part of the capacity building exercise
- reschedule a follow-up workshop on "Serology and virus typing for antigenic cartography" in September 2010

Activity D3. Develop capability to conduct vaccine efficacy tests in Indonesia.

- awaiting reply to the 7 April 2010 letter from DGLS to DG Research outlining proposed activities at Bbalitvet and following up on the OFFLU visit in March 2010
- meeting with vaccine companies proposed by DGLS on 7 July 2010 to invite their participation in the antigenic cartography effort and to inform them that the candidate vaccine and challenge viruses will be made available to them as soon as they are delivered to the receiving laboratories indicated in the MTA
- continue to encourage DAH to partner with private companies to pursue challenge testing field trials
- awaiting response to the letter of October 2009 on recommended tests for vaccine registration

Output E. Technical recommendations for the vaccination strategy

Activity E1. Continue the development of reverse genetic vaccine.

- this activity has been completed; pending final report from SEPRL

Activity E2. Support field trials with alternative vaccines.

- this activity has been suspended because investigations in support of product registration are considered as a "private good" and should be conducted at the expense of the vaccine company

Activity E3. To encourage the Government of Indonesia to streamline registration of efficacious recombinant and reverse genetic vaccines.

- awaiting final instruction and clearance to ship RG vaccine strains from SEPRL to Bbalitvet and the OTF, in coordination with CMU, is to continue the follow up on the letter to DGLS
- schedule the training on the reverse genetics (RG) strains offered by SEPRL once these strains are delivered to Bbalitvet

Activity E4. To continue the assessment of costs and cost-effectiveness of vaccination strategies in Indonesia.

- finalize the report for the Indonesian Center for Agriculture Socio-Economic Policy Studies (ICASEPS) field survey "Assessment of farm level financial incentives and willingness to pay for HPAI vaccination in Indonesia" conducted in 13 districts/municipalities in western Java

Activity E5. To prepare updated technical recommendations on a vaccination strategy.

- reschedule the consultation to develop recommendations for a comprehensive vaccination strategy in Indonesia

Activity E6. To organize technical review meetings.

- prepare for the final technical review meeting scheduled on 14 and 15 October 2010

Main challenges encountered and response provided

The DGLS have agreed in principle to pursue collaboration with the private vaccine companies; however, there is still much confusion about the status of challenge testing of current influenza vaccines as well as vaccine registration. During the technical review meeting in November 2009, the DGLS indicated 3 items of concern: (1) that challenge testing of existing vaccines was to be conducted at Bbalitvet (no funding sources nor agreement from Bbalitvet received to date); (2) that temporary registrations for all imported and national AI vaccines would expire by May 2010, and it is presently not known which vaccines remain registered; and (3) that in the future, only companies producing vaccines using strains named by the government, would be allowed to submit for registration. While the mechanisms to monitor antigenic variants in the field, being developed at the DICs, should keep pace

with circulating viruses based upon experience to date alone, they are not likely sufficient to provide updated vaccines into the field without significant contribution from the vaccine companies. The meeting proposed by the DGLS with vaccine companies in July 2010 should provide a good opportunity to address these issues.

Main progress made towards the achievement of project outcomes

Output A-B: HPAI field isolate collection for biologic and genetic characterization

- characterization of 244 H5N1 isolates (266 total viruses) from 317 samples representing approximately 90 districts predominantly from backyard chickens
- completion of the UAT Workshop and subsequent activities to launch InfoLabPlus
- selection and production of reference antisera and antigens for Indonesia
- antigenic cartography data from 100 isolates, in addition to biologic and molecular data, was used to select five candidate vaccine strains and six potential challenge strains for further investigation. Viruses have been received at SEPRL for vaccine construct and challenge studies in June 2009
- nomination of DIC Wates as focal point for antigenic cartography; work plan developed 1 July 2009; and capacity building activities for antigenic cartography launched July 2009
- confirmation letter from DAH to DICs indicating their roles and responsibilities for antigenic cartography in Indonesia as an ongoing effort and essential for the transfer of technology
- six of the seven DICs conducted prescreening of 276 H5 positive virus isolates from 2008 to 2010 during April and May 2010 and submitted results to DIC Wates, which have begun analysis for selection of variants to be forwarded for further characterization
- nomination of three laboratories to support genetic characterization of antigenic variants, launch the capacity building activities for sequencing in March 2010 and benchside workshop in June 2010
- data available to date presented at November 2009 technical review meeting
- DG agrees in principle to the release of virus sequences into the public domain in June 2010
- presentation at the seventh International Symposium for Avian Influenza in April 2009
- presentation at the regional meeting on "Molecular epidemiology of origin and evolution of H5N1 Highly Pathogenic Avian Influenza Virus in Asia," (USDA/FAO) in Bangkok, Thailand on September 2009

Output C: Challenge testing of antigenic variants and vaccine strains selection

- signing of collaborative MTA between DGLS, AAHL, SEPRL and industry and receipt of selected vaccine candidate and challenge strains at SEPRL in June 2009 to continue vaccine development and challenge testing
- selection of five vaccine strains and six challenge strains based upon data generated from antigenic and molecular characterization of isolates
- collaborative MTA to return fully characterized isolates to Indonesia
- challenged the tests conducted using available reverse genetics constructs at SEPRL using updated challenge viruses selected from the OFFLU project data

Output D: Capacity building

- OFFLU workshops have been conducted on introductory molecular and antigenic analysis for 56 Indonesian scientists representing all DICs, four veterinary faculties, industry and the Ministry of Agriculture (November 2008, March and September 2009)

- the FAO/OFFLU scientist has completed the five-month capacity building activities in close coordination with AAHL; support visits and technical assessments have been conducted at DIC Wates, Denpasar, and Bukittinggi; and capacity building activities for antigenic cartography will continue in close coordination with AAHL
- a national OTF has been hired to assist with the coordination of OFFLU activities in close collaboration with representatives from the DAH/CMU, the seven DICs, particularly DIC Wates, and other relevant public sector structures and private sector stakeholders to support the transfer of activities to Indonesia
- capacity building activities conducted to allow DICs to perform antigenic characterization of viruses and analyse resulting data in order to identify isolates to be further tested with challenge studies to ensure that vaccines in use in Indonesia are efficacious
- positive response from the DAH to engage the industry in the virus monitoring effort will contribute to a broader understanding of viruses circulating in Indonesia

Output E: Technical recommendations for the vaccination strategy

- FAO interim recommendations submitted to the DGLS in April 2008
- an update to the FAO interim recommendations was submitted to the DGLS in June 2009 based upon data analysed from the OFFLU project
- development of a mechanism to monitor AI antigenic variants which involves all DICs and collaborating laboratories using a virus prescreening assay and antigenic cartography
- consultation with a legal firm specializing in intellectual property has been completed
- development and assessment of newly engineered low pathogenicity reverse genetics vaccine strain(s) for Indonesia selected through data gathered from this project
- OFFLU Technical review meetings with open forum held in June and November 2008 and November 2009
- final report prepared by socio-economist on “Vaccination and surveillance costs for operational research project in Indonesia”
- interview of 155 broiler chicken farmers (average flock size 2 700) and 56 layer chicken farmers (average flock size 2 200) was conducted for the ICASEPS field survey “Assessment of farm level financial incentives and Willingness to Pay for HPAI Vaccination in Indonesia” in 13 districts/municipalities in western Java
- presentation at the seventh International Symposium on Avian Influenza in Athens, Georgia, USA from 5 to 8 April 2009 “Characterization of H5 HPAI virus variants in Indonesian poultry – OFFLU Indonesia Project”
- presentation of the OFFLU project at the regional meeting on Molecular Epidemiology of Origin and Evolution of H5N1 Highly Pathogenic Avian Influenza Virus in Asia (USDA/FAO) Bangkok, Thailand on 9 September 2009.

Project Monitoring Sheet: **OSRO/INT/001/USA**

Project title: **EPT+ Characterizing influenza viruses posing risks as the next global pandemic**

Reporting period: **April to September 2012**

Country: Bangladesh, China, Viet Nam and Thailand
Project title: EPT+ Characterizing influenza viruses posing risks as the next global pandemic
Code: OSRO/INT/001/USA
Budget: USD 2.75 million
Effective starting date: 1 November 2011
Planned end date: 30 September 2013
<p>Context of the project</p> <p>To improve our understanding of the role livestock play in serving as reservoirs for potential pandemic influenza viruses in Southeast, East and Southern Asia, the United States Agency for International Development (USAID) has provided funding to the Food and Agriculture Organization of the United Nations (FAO) to expand influenza surveillance activities through the EPT+ programme, part of the broader Emerging Pandemic Threat (EPT) programme. Approval of the initial EPT+ project proposal from USAID was received in November of 2011, and project activities were initiated by FAO in December 2011. The project contains four components: (1) improving our understanding of fundamental drivers of influenza emergence through risk assessments and risk modelling; (2) conducting influenza surveillance in farmed animals (swine, ducks) to improve knowledge about circulating viruses of pandemic potential in livestock; (3) developing and implementing questionnaires to improve our understanding of the risk for influenza transmission among sectors; and (4) sharing information and contributing to major global influenza initiatives. The geographic scope of EPT+ initially included Viet Nam, China, and Bangladesh, with Thailand being a country that might be phased in at a later point in time. The largest portion of the EPT+ project focuses on livestock surveillance activities and aims to detect and characterize animal influenza viruses circulating in targeted livestock systems.</p>
<p>Objective of the project</p> <p>EPT+ project will contribute to the improvement of food security through prevention, detection, control and response to animal and public health risks attributable to zoonoses and animal diseases. The main objective of the project is to improve characterization and surveillance of influenza-related pandemic threats at national and regional levels in livestock populations.</p>
<p>Planned activities for the reporting period (April to September 2012)</p> <p>OUTPUT 1: Fundamental drivers of influenza emergence refined, mapped and included in the risk analyses to improve geolocalization of potential pandemic emergence sites</p> <ul style="list-style-type: none"> • Revise the agro-ecological and environmental spatial risk-factor layers • Collate and prepare influenza viral sequence data for risk analysis and modeling • Conduct a knowledge-based risk analysis for pandemic influenza • Integrate epidemiological and molecular data with agroecological factors and conduct niche modeling to determine areas with similar risk profiles • Conduct predictive modeling of pandemic influenza risk based on viral evolutionary rates and reassortment events • Conduct a risk assessment and modeling workshop to review modeling approaches

OUTPUT 2: Robust influenza surveillance strategy implemented at national/regional level to improve knowledge about circulating viruses of pandemic potential in livestock

- Conduct national stakeholder workshops for development of sampling strategies
- Conduct a regional stakeholders launching workshop
- Create an EPT+ influenza surveillance guidance strategy
- Create an off and online accessible, password-protected surveillance module, linked to the Relational Database (Activity 3.2) to enable sample information and diagnostic test results to be managed
- Conduct national laboratory capacity assessments and compile a list of necessary equipment and supplies necessary for diagnostics to support EPT+ sample analyses
- Procure necessary laboratory supplies and equipment
- Conduct a laboratory sampling refresher course
- Conduct a field sampling refresher course
- Conduct influenza surveillance sampling
- Analyse influenza virus surveillance samples including screening, isolating virus and conducting full genomic sequencing for positive samples
- Conduct closing project workshop

OUTPUT 3: Understanding of risk for influenza transmission improved among sectors

- Develop a questionnaire to be administered at surveillance sampling sites (farm, household, slaughterhouse, etc.)
- Create an off and online accessible, password protected relational database that is linked to the Surveillance Module (Activity 2.4), and enables results from the questionnaire (Activity 3.1) to be managed
- Procure tablets, write script and programme tablets to enable questionnaires to be administered using this technology

OUTPUT 4: Information exchange and coordination improved among major global influenza initiatives

- Participate in and exchange surveillance data with international influenza networks, such as FAO's Network of Expertise on Animal Influenza (OFFLU) and the OFFLU Swine Influenza Group
- Bridge the gap between various genetic databases and epidemiological data

Activities undertaken during the reporting period (April to September 2012)

National Programme Progress – in support of Output 2

- **Bangladesh**
 - EPT+ national surveillance strategy developed and agreed upon;
 - Laboratory assessment conducted to ensure sample analyses capacity and quality; and
 - Draft letters of agreement between FAO and national authorities being circulated.
- **Viet Nam**
 - FAO officially requested EPT+ to be approved by national authorities;
 - Agreement between FAO and national authorities to hire national EPT+ focal points for both surveillance and laboratory activities;
 - National surveillance strategy submitted to national authorities and under consideration; and
 - Laboratory assessment conducted to ensure the capacity and quality of sample analyses.

- **China**
 - Agreement between FAO and national authorities to hire national EPT+ focal point and broad agreement to implement EPT+ in China;
 - Draft national surveillance strategy developed;
 - Meetings with China Center for Disease Prevention and Control (CDC) and Chinese National Influenza Center to discuss potential collaborative livestock and human surveillance; and
 - Preliminary laboratory assessments conducted to ensure the capacity and quality of sample analyses.
- **Thailand**
 - Several factors have led to the decision to not currently implement EPT+ activities in Thailand including consultations with the Department of Livestock Development (DLD) in Thailand, swine surveillance currently underway by DLD, and recent swine and duck influenza surveillance results. While activities in Thailand were not completely ruled out, they are not envisioned to be implemented in the near future, and it is unlikely that they will take place during this funding cycle.

GLOBAL ACTIVITIES – In support of Outputs 1 and 4

- Some agro-ecological and environmental spatial risk-factor layers, including domestic duck and swine populations, and intensive versus extensive duck production were revised and updated
- Influenza viral sequence data was compiled
- Niche models were revised and updated
- Conference calls were conducted to discuss how to combine agro-ecological data and virus cartography data, and further details about how to integrate viral evolutionary rates and reassortment events also considered
- The Pandemic Influenza Risk Assessment and Modeling workshop was planned from 7 to 9 November 2012 including a draft agenda, list of participants and draft invitation letter
- The EPT+ influenza surveillance guidance strategy was developed, and is pending finalization
- Coordination among other influenza risk assessment and modeling programmes was undertaken including coordination with Flurisk, CDC and National Institute of Health (NIH)-funded partners
- Dialogue between EPT+ and the OFFLU scientists and the swine influenza group was established

Planned activities for the next six-month period (October 2012 to March 2013)

- See above

Main challenges encountered and responses provided

- Fully engaging national authorities in EPT+

Solution: In China, further consultations and final agreement to move forward with hiring an EPT+ national focal point

Solution: In Viet Nam, an official letter was sent from the FAO Regional Office for Asia and the Pacific (RAP) to the national authorities in Viet Nam, and FAO is currently hiring a permanent (as opposed to temporary) Emergency Centre for Transboundary Animal Diseases national team leader to support EPT+ and other projects in country

- Agreeing on sample sizes to optimize surveillance strategies
- Solution:** Requested expert opinion from a virologist involved in the OFFLU network and renegotiating with national authorities in Viet Nam and Bangladesh

Main progress made towards the achievement of project outcomes

- National agreement to move forward with EPT+ in China and Viet Nam
- Terms of reference for national consultants in China and Viet Nam and agreement to hire them between FAO and national authorities
- Surveillance guidance document developed and available
- Laboratory capacity assessed in several countries
- Risk modeling activities underway
- Engagement of other partners on influenza activities at international level.

Project Monitoring Sheet: **OSRO/INT/001/USA**

Project title: **EPT+ Characterizing influenza viruses posing risks as the next global pandemic**

Reporting period: **from October 2011 to March 2012**

Country: Bangladesh, China, Viet Nam and Thailand
Project title: EPT+ Characterizing influenza viruses posing risks as the next global pandemic
Code: OSRO/INT/001/USA
Budget: USD 2.75 million
Effective starting date: 1 November 2011
Planned end date: 1 November 2012
Context of the project EPT+ is focused on improving our understanding of the role that livestock plays as potential reservoirs for pandemic disease threats initially focusing on influenza.
Objectives of the project <ul style="list-style-type: none"> • Influenza risk modeling • Influenza surveillance in farmed animals (swine, aquatic waterfowl and others) • Conduct concurrent market trade and commodity networks assessments in the sectors sampled • Contribute to broader global influenza initiatives, such as the Food and Agriculture Organization of the United Nations (FAO) Global Animal Disease Information System (EMPRES-i) genetic module, the Joint World Organization for Animal Health (OIE)/FAO Network of Expertise for Animal Influenza (OFFLU) and others
Planned activities <ul style="list-style-type: none"> • Influenza risk modeling <ul style="list-style-type: none"> ○ collection and mapping of data on pig and poultry production ○ preparation of data layers to conduct multi-criteria decision analysis and niche modeling ○ obtaining virus/genetic sequence information to build into modeling • Influenza surveillance in farmed animals (swine, aquatic waterfowl and others) <ul style="list-style-type: none"> ○ Bangladesh, Viet Nam – start surveillance sampling and sample analyses ○ China, Thailand conduct official consultation and develop Emerging Pandemic Threats (EPT)+ national surveillance strategies ○ In China, recruit a national EPT+ focal point • Conduct concurrent market trade and commodity network assessments in the sectors sampled <ul style="list-style-type: none"> ○ Bangladesh, Viet Nam – conduct market trade and commodity network assessments in conjunction with surveillance sampling ○ China, Thailand – discuss conducting market trade and commodity network assessments in conjunction with surveillance sampling • Contribute to broader global influenza initiatives, such as the EMPRES-i genetic module, OFFLU and others <ul style="list-style-type: none"> ○ Participate in the United States Agency for International Development (USAID) H5N1 high burden country meeting in Ho Chi Minh ○ Participate in the USAID convened Bangladesh coordination workshop ○ Coordinate with other Influenza Risk Modeling Programmes (the National Institute of Health [NIH], the Centers for Disease Control and Prevention [CDC], FluRisk) to consider a joint risk modeling workshop in the fall 2012

Activities undertaken during the reporting period

- Official consultations and unofficial sensitization
 - **Viet Nam and Bangladesh** – EPT+ national surveillance strategy developed as an outcome of the official consultations
 - **Thailand and China**- one unofficial sensitization visit was carried out
- Risk modeling conference calls and workshop (January/February 2012 at FAO headquarters)
- EPT+ inception workshop – 23-24 February 2012, Bangkok, Thailand
 - produced a media notification and webpage on the EPT+ inception workshop and project launch
 - developed a draft questionnaire to accompany surveillance
 - discussed a coordinated methodology for sampling and sample testing
 - identified a mechanism for risk assessment, coordination, sharing of results, information, expertise, and samples, and developed a draft Letter of Agreement for implementation
 - Developed draft work plans for all four countries
- Communication and coordination with USAID IDENTIFY project, CDC, the World Health Organization and several other partners
- Provided inputs to the OFFLU /Swine Influenza Working Group meeting (March 2012)
- Provided inputs to the European FluRisk workshop (March 2012)
- Conducted linking of genetic sequences and epidemiological data in the EMPRES-i genetic module

Planned activities for the next six-month period

- See above

Main challenges encountered and responses provided

- Fully engaging national authorities in EPT+
Solution: In China, hiring an EPT+ national focal point
- Agreeing on sample sizes to optimize surveillance strategies
Solution: Requested expert opinion from a virologist involved in the OFFLU network and renegotiating with national authorities in Viet Nam and Bangladesh

Main progress made towards the achievement of project outcomes

- Official national consultations were carried out in two of the four target countries, and draft surveillance strategies were developed.
- Inception workshop launched the EPT+ programme.
- Risk modeling activities are underway.
- Engagement of other partners on influenza activities at international level.

Project Monitoring Sheet: **OSRO/INT/604/USA Baby 01**Project title: **Support for FAO/OIE/WHO collaboration on HPAI rapid response and containment**Reporting period: **April to September 2012**

Regional: Global
Project title: Support for FAO/OIE/WHO collaboration on HPAI rapid response and containment
Code: OSRO/INT/604/USA Baby 01
Budget: USD 5 000 000 ¹
Effective starting date: 1 January 2007
Planned end date: 30 April 2014
Context of the project: The Crisis Management Centre – Animal Health (CMC-AH) of the Food and Agriculture Organization of the United Nations (FAO) and the World Organisation for Animal Health (OIE) is mandated to respond to new outbreaks and critical epidemiologic situations involving Highly Pathogenic Avian Influenza (HPAI) and other transboundary animal diseases (TADs) upon official government request. Within the framework of the Emergency Centre for Transboundary Animal Diseases (ECTAD), the CMC-AH provides assistance where local governmental capacity may be insufficient to respond effectively and where the spread of the virus may pose a broader regional or global risk. In support of this mandate and within the context of the mandates of the World Organisation for Animal Health (OIE) to improve animal health worldwide and the World Health Organization (WHO) to lead global human health initiatives, the United States Agency for International Development (USAID) has provided to-date a total of USD 5 million to FAO in support of the CMC-AH for sustained emergency preparedness, rapid assessment and response in the field and at headquarters to suspected or confirmed outbreaks of HPAI and other zoonoses in collaboration with OIE and WHO. Under this project, the CMC-AH continues to carry out its mandate while working to combine efforts, avoid overlaps and build synergies between FAO, OIE and WHO, as the organizations work to facilitate the containment of HPAI and other zoonotic diseases at its source in animals, prevent its spread across international borders and mitigate the risk of a human pandemic.
Objectives²: The purpose of the grant is to provide funding to FAO to support activities to prevent and control HPAI worldwide and reduce the risk of a human pandemic. In this general context and in the specific context of Amendments 1 and 2, the objective of the project is to support CMC-AH operations and missions for: (i) enhanced core team capacity; (ii) improved FAO/OIE/WHO linkages at regional and country level; (iii) increased immediate capacity building; and (iv) strengthened risk communication support (provided to affected/at-risk countries) and overall communication activities (targeting donor, partner and other audiences).

¹ The budget allocation amounts to USD 2 000 000 (Phase I), USD 2 000 000 (Phase II) and USD 2 000 000 (Phase III). The total budget takes into account the reallocation of USD 1 million of CMC-AH funds to the surveillance and response component of the USAID grant as agreed with the Donor.

² These objectives represent a synthesis of the main Grant Objectives contained in the Grant Agreement and Amendments 1 and 2 (i.e. the project document). They have been presented in summarized form in compliance with the Progress Monitoring Sheet format. Detailed reporting on objectives and activities will be included in the final narrative report upon project completion.

Planned activities of the project:

- planning, deploying and following up on CMC-AH rapid response missions;
- developing tools in support of CMC-AH operations and response capacity;
- defining cooperation mechanisms between WHO and the CMC-AH;
- exchanging information and regularizing communications;
- developing standard operating procedures (SOPs) for FAO, WHO and OIE; and
- coordinating missions at headquarters and field levels.

Activities implemented during the reporting period (April to September 2012)

- **No requests were issued for assistance to respond to emergency situations linked to HPAI.**
- **Missions for other disease crises**

Democratic Republic of the Congo (DRC), 22 April-1 May 2012

This mission was deployed as a response to a virulent epidemic of *peste des petits ruminants* (PPR) causing the massive mortality of goats in the Bandundu Province. The objectives of the mission were to support the Government's response to these outbreaks and recommend appropriate control measures. The mission offered a number of recommendations to stall the outbreak including the establishment of rigorous animal movement control and epidemiological surveillance, and of a vaccination campaign in at-risk zones; a large scale awareness campaign about safe biosecurity measures; an international collaboration to strengthen the capacity of the central veterinary laboratory and other veterinarian services; and the establishment of a regional strategy with neighbouring countries.

Post-mission, CMC-AH secured FAO funding under the Technical Cooperation Programme to implement some of its recommendations, prioritizing the vaccination of 500 000 animals. Over half the targeted animals had been vaccinated by mid-September 2012.

Middle East and North Africa foot-and-mouth disease (FMD) serotype SAT2 response coordination

In 2012, outbreaks of FMD serotype SAT2 were reported in the Middle East and North Africa region, in Egypt, Libya, the Gaza Strip and Bahrain. The SAT2 strain, which originates in sub-Saharan Africa, constitutes a serious threat for the immunologically naive livestock population in this region and neighbouring regions. The CMC-AH coordinated FAO's response to contain the outbreaks in collaboration with the Organization's Regional Office for the Near East (RNE) and the European Commission for the Control of Foot-and-Mouth Disease (EuFMD). As part of this effort, the CMC-AH fielded missions to Libya and the West Bank and Gaza Strip (see below).

Libya, 1-6 May 2012

This mission was deployed as a response to an official notification of FMD SAT2 strain in the area of Benghazi, followed by notifications of other FMD strains in the area of Tripoli. The objectives of the mission were to carry out an assessment of the situation; advise on vaccination implementation and targeted control measures; and help with the elaboration of an action plan to manage short and medium-term response measures to the outbreaks. In concurrence with the veterinary authorities, the team formulated recommendations including strengthening surveillance and sampling to obtain a more accurate picture of the types of FMD circulating; implementing an awareness campaign on FMD prevention and

control; carrying out a mass vaccination strategy; enhancing collaboration with all stakeholders (farmers, traders, private veterinarians, animal production department and veterinary faculties) in FMD control strategy and activities; and developing a long-term FMD control programme.

The West Bank and Gaza Strip, 14-23 May 2012

This mission was deployed as a response to an official notification of foot-and-mouth disease (FMD) SAT2 in the Gaza Strip. The objectives of the mission were to investigate the reported outbreaks and assess the FMD SAT2 situation; evaluate risks of further outbreaks and spread of the disease; advise on targeted vaccination implementation and monitoring; assist with the elaboration of an action plan to manage prevention and response measures including surveillance strategies; and advise on a regional approach to control current outbreaks and prevent future incursions, including of new strains. The team concluded that there was no evidence of spread of the disease. However, they recommended further testing to determine the exact strains circulating, as well as booster vaccination of cattle against SAT2 in the Gaza Strip as a preventive measure. Having observed limited monitoring and diagnostic capacities and implementation of biosecurity measures at the farm level, the team also recommended investments in veterinary diagnostic capacity, the design of an active surveillance strategy, and the implementation of an awareness campaign.

Pakistan, 8-17 July 2012

This mission was deployed as a response to outbreaks of Newcastle disease (ND) in poultry already vaccinated against the virus. Upon the Government's request, the CMC-AH fielded a mission to help the country investigate the extent of spread of the virus; identify containment measures; and assist with the elaboration of an action plan and the identification of resources. Following investigations, the team concluded that outbreaks were ongoing and widespread in all regions and suggested that future work focus on biosecurity and vaccinations practices, as well as surveillance and response coordination. The mission recommended a two-phase response composed of an initial short-term action plan of six months including a new vaccination strategy; immediate improvements to biosecurity systems including the disinfection of vehicles transporting poultry; a surveillance programme and national disease emergency committee with appropriate legislation; and a compensation plan to encourage farmers to report the disease. Recommendations for a longer term three-year plan focused on ensuring the sustainability of the surveillance network and reporting system; further research into the disease and its epidemiological characteristics; and the establishment of farming practices that follow biosecurity guidelines.

- **Workshop of FAO's Good Emergency Management Practice (GEMP)**

Tunis, 12-14 September 2012

The French translation of the revised "GEMP: The Essentials" Manual (September 2011) was completed, and a preliminary version was published in September 2012. As part of its efforts to implement this second phase, CMC-AH organized a regional workshop in Tunis, Tunisia, from 12 to 14 September 2012 (a pilot workshop was carried out in Entebbe, Uganda, from 28 to 30 November 2011). CMC-AH trained a total of 17 animal health professionals and the Mediterranean Animal Health Network/Reseau Méditerranéen de Santé Animale (REMESA) focal points from four countries (i.e. Algeria, Mauritania, Morocco and Tunisia). OIE also participated, along with the United States Department of Agriculture - Animal and Plant Health Inspection Service. CMC-AH is now working on the translation of the manual in other United

Nations official languages and on the evaluation of adaptability of GEMP concepts for promotion in the Middle East, East Asia, and South and Central America.

Revision of internal SOPs for CMC-AH operations

To further streamline CMC-AH activities and work flow, the Centre developed a working group on SOPs to review their current status and suggest improvements.

○ **OIE and WHO coordination**

The Agreement between FAO and OIE dated 24 May 2004 was superseded by a reframed Memorandum of Understanding (MoU) on 31 January 2011. The ratified MoU enables FAO and OIE to better clarify respective roles and responsibilities in communication and organization of CMC-AH facilitated missions. To ensure greater effectiveness of the Agreement (e.g. streamlining the procedures for the use of the OIE expertise in accordance with FAO regulations), both parties convened in January 2012 as a first step in the process of defining standard operating guidelines (SOGs) and its continued discussion on improvement of SOGs is underway.

○ **FAO Representatives (FAORs)**

Outreach to FAORs remained a core activity, with CMC-AH continuing to brief newly appointed country and regional FAORs as standard practice.

○ **Budget adjustment requested and approved**

On 30 August 2012, the request for a budget revision was proposed to USAID by CMC-AH in order to allocate sufficient resources under appropriate budget line to ensure the functioning of the CMC-AH platform and allow the implementation of deployment activities until the end of the project (30 April 2014). The request was approved by USAID on 31 August 2012.

Planned activities for the next six-month period (October 2012 to March 2013)

- continued monitoring of high-risk countries and situations;
- mission planning and deployment upon request for or acceptance of assistance;
- continued CMC-AH awareness building activities including the Sixth Steering Committee to take place 4 October 2012;
- continued discussions with OIE and WHO on working methodologies;
- continued promotion of GEMP publications (including Spanish and Arabic translations) and concepts; and
- finalization of common FAO/OIE SOGs.

Main challenges encountered and response provided: None

Main progress made towards project objective, listed by activity³ (from project start)

- **Mission planning, deployment and follow-up**
HPAI missions: 25 Total missions: 59 Total countries: 39
- **Development of tools supporting CMC-AH response capacity**
 - Reagent contingency stock implemented for HPAI
 - HPAI reagent stock successfully utilized to support government response efforts
 - Technical SOPs revised as part of overall GEMP efforts
- **Refining cooperation mechanisms between WHO and CMC-AH**
 - Standard lines of interagency communication defined
 - Information focal points established
 - Coordinated missions (human and animal health) deployed and followed up

³ Owing to the nature of the CMC-AH concept and the project's main aim to support FAO's capacity for rapid response, the majority of activities are to be considered as ongoing initiatives.

- **Exchanging information and regularizing communications**
 - WHO's Emergency Management System analysed for applicability to CMC-AH
 - Event Tracking and Management System (ETMS) development and data entry complete; final system online and in use
 - Regular information exchange through regular meetings and staff visits
 - FAO/OIE/WHO coordination methodologies confirmed through standardized information sharing methods and focal points
- **SOP development for FAO, WHO and OIE**
 - Initial, internal SOPs defined: 21
 - Consolidated, internal SOPs: 4
 - Further streamlined SOPs: 3
- **Strengthening mission coordination and field-level cooperation**
 - After-action review processes implemented to capture lessons learned
 - Headquarter- and field-level contacts established and disseminated
 - Coordination mechanisms strengthened through mission experience
 - Field-level SOPs completed and printed for enhanced national response to HPAI

Quarter III 2010

Project Monitoring Sheet

Project title: Support for FAO/OIE/WHO collaboration on HPAI rapid response and containment

Reporting period: July – September 2010

Regional:	Global
Project title:	Support for FAO/OIE/WHO collaboration on HPAI rapid response and containment
Code:	OSRO/INT/604/USA (Baby 1)
Budget:	USD 5 000 000 ¹
Planned end date:	30 April 2014
Effective starting date:	January 2007
Context of the project:	<p>The Crisis Management Centre – Animal Health (CMC-AH) of the Food and Agriculture Organization of the United Nations (FAO) and the World Organisation for Animal Health (OIE) is mandated to respond to new outbreaks and critical epidemiologic situations involving highly pathogenic avian influenza (HPAI) and other transboundary animal diseases (TADs) upon official government request. Within the framework of the Emergency Centre for Transboundary Animal Disease Operations (ECTAD), the CMC-AH provides assistance where local governmental capacity may be insufficient to respond effectively and where the spread of the virus may pose a broader regional risk.</p> <p>In support of this mandate and within the context of the mandates of OIE to improve animal health worldwide and the World Health Organization (WHO) to lead global human health initiatives, the United States Agency for International Development (USAID) has provided to date a total of USD 5 million to FAO in support of the CMC-AH for sustained emergency preparedness, rapid assessment and effective response in the field and at headquarters to suspected or confirmed outbreaks of HPAI in collaboration with OIE and WHO.</p> <p>Under this project the CMC-AH continues to carry out its mandate while working to combine efforts, avoid overlaps and build synergies between FAO, OIE and WHO, as the organizations work to facilitate the containment of HPAI at its source in animals, prevent its spread across international borders and mitigate the risk of a human pandemic.</p>
Objectives²:	<p>The purpose of the Grant is to provide funding to FAO to support activities to prevent and control HPAI worldwide and reduce the risk of a human pandemic. In this general context and in the specific context of Amendments 1 and 2, the objective of the project is to support CMC-AH operations and missions for: (i) enhanced core team capacity; (ii) improved FAO/OIE/WHO linkages at regional and country level; (iii) increased immediate capacity building; and (iv) strengthened risk communication support (provided to affected/at-risk countries) and overall communication activities (targeting donor, partner and other audiences).</p>

¹ The budget allocation amounts to USD 2 000 000 (Phase I), USD 2 000 000 (II) USD 2 000 000 (III). The total budget takes into account the reallocation of USD 1 million of CMC-AH funds to the surveillance and response component of the USAID grant as agreed with the donor.

² These objectives represent a synthesis of the main Grant Objectives contained in the Grant Agreement and Amendments 1 and 2 (i.e. the project document). They have been presented in summarized form in compliance with the Quarterly Update format. More detailed reporting on objectives and activities will be included in the Final Narrative Report upon project completion.

Planned activities of the project:

- Planning, deploying and following up CMC-AH rapid response missions;
- developing tools in support of CMC-AH operations and response capacity;
- defining cooperation mechanisms between WHO and the CMC-AH;
- exchanging information and regularizing communications;
- developing standard operating procedures (SOPs) for FAO, WHO and OIE; and
- coordinating missions at headquarters and field levels.

Activities implemented during the reporting period (July – September 2010):

- **Missions for HPAI³**
No missions were deployed for HPAI during the reporting period.
- **Missions for zoonoses or unknown disease crises**
No missions were deployed for zoonoses or unknown emergencies under USAID funding during the reporting period.

With alternate funding from the Centers for Disease Control and Prevention (CDC), the CMC-AH deployed an animal health expert to Togo to help: (i) assess the rabies situation; (ii) sensitize authorities and partners to the rabies threat; and (iii) raise awareness of World Rabies Day (see below).
- **FAO-OIE Memorandum of Understanding (MoU)**
An agreed upon and renewed MoU will be signed following respective legal clearances.
- **Strengthening coordination and building awareness of CMC-AH and its services**
 - The CMC-AH briefed five FAORs to strengthen collaboration with response missions.
 - The Centre invited a delegation from *France Vétérinaire Internationale* and *Agronomes et Vétérinaires Sans Frontières* to FAO headquarters in July to exchange past and future experiences relevant to CMC-AH missions in the field with FAO colleagues in both the CMC-AH and the broader animal health programme.
 - The CMC-AH Rapid Missions Update and the biennial Activity Report are under production and planned for publication this fall.
- **Revision and update of FAO's Good Emergency Management Practices (GEMP)**
This project has progressed during the quarter. Preparations for seeking external comments on GEMP in the next reporting period are under discussion.
- **Event Tracking and Management System (ETMS)**
Testing is in its final phases. The system is scheduled to go live by the end of the year.
- **Staffing**
The CMC-AH identified and recruited a francophone Operations Officer during the reporting period.
- **Steering Committee preparations**
The date of 22 November 2010 has been confirmed. Preparations are underway.
- **Support to veterinary laboratory networks in Africa**
The CMC-AH provided support to the FAO study on sustainability of the West and Central Africa Veterinary Laboratory Network for Avian Influenza and other Transboundary Diseases (RESOLAB) to help improve TAD diagnostic capacities. Assistance included technical advice on:
 - sample preparation, shipment and needs assessment; and

³ During the reporting period and with alternate funds, the CMC-AH deployed a mission to the United Republic of Tanzania to help the Government assess and respond to an emergency situation involving *peste des petits ruminants*.

- liaison work between national authorities and international institutions/experts.

- **Support to zoonoses mitigation and awareness**

In the context of the strong working relationship between the CMC-AH and Togo the CMC-AH was requested to support response capacity building efforts for TADs including rabies through alternative funding. Specifically, through the above-mentioned CDC-funded mission, the CMC-AH also assisted with rabies work in Togo and raised local awareness of and support for the World Rabies Day.

Planned activities for October 2010 to March 2011:

- Continued monitoring of high-risk countries and situations;
- mission planning and deployment upon request for or acceptance of assistance;
- further review and editing of technical response and control SOPs;
- final testing of ETMS prototype;
- continued CMC-AH awareness building activities;
- continued finalization of the draft of GEMP;
- continued contact with OIE regarding the completion of FAO-OIE MOU;
- finalization and publication of CMC-AH awareness raising documents; and
- planning and preparations for and hosting of the fourth CMC-AH Steering Committee.

Main challenges encountered and response provided: None

Main progress made towards project objective, listed by activity⁴ (since project start):

- **Mission planning, deployment and follow-up**
HPAI missions: 24 Total missions: 46 Total countries: 32
- **Development of tools supporting CMC-AH response capacity**
 - Reagent contingency stock implemented for HPAI
 - Possibility obtained to store HPAI stocks under cold chain at the United Nations Humanitarian Response Depot (UNHRD) in Brindisi, Italy
 - Technical SOPs revised as part of overall GEMP efforts
- **Refining cooperation mechanisms between WHO and CMC-AH**
 - Standard lines of interagency communication defined
 - Information focal points established
 - Coordinated missions (human and animal health) deployed and followed up
- **Exchanging information and regularizing communications**
 - WHO's Emergency Management System (EMS) analyzed for applicability to CMC-AH
 - Development of ETMS prototype complete; testing underway
 - Regular information exchange through regular meetings and staff visits
 - FAO/OIE/WHO coordination methodologies confirmed through standardized information sharing methods and focal points
- **SOP development for FAO, WHO and OIE**
 - Initial SOPs defined: 21
 - Consolidated SOPs: 4
- **Strengthening mission coordination and field-level cooperation**
 - After action review processes implemented to capture lessons learned
 - Headquarter- and field-level contacts established and disseminated
 - Coordination mechanisms strengthened through mission experience
 - Field-level SOPs under development for enhanced national response

⁴ Due to the nature of the CMC-AH concept and the project's main aim to support FAO's capacity for rapid response, the majority of activities are to be considered as ongoing initiatives.

Quarter III 2010

Project Monitoring Sheet

Project title: Support of HPAI field activities related to Regional Animal Health Centres (RAHCs) in Africa

Reporting period: July – September 2010

Regional:	Africa
Project title:	Support of HPAI field activities related to Regional Animal Health Centres (RAHCs) in Africa
Code:	OSRO/INT/604/USA Baby 2
Budget:	USD 1 000 000
Effective starting date:	16 July 2010
Planned end date:	31 December 2010
Context of the project:	
<p>Within the framework of the Emergency Centre for Transboundary Animal Diseases (ECTAD), the Crisis Management Centre – Animal Health (CMC-AH) provides assistance where local governmental capacity may be insufficient to respond effectively and where the spread of the virus may pose a broader regional risk. Given this mandate and within the context of the mandates of the World Organisation for Animal Health (OIE) to improve animal health worldwide and the World Health Organization (WHO) to lead global human health initiatives, a special fund of USD 1 million was originally secured to support rapid deployments to Africa for Highly Pathogenic Avian Influenza (HPAI) emergencies. Africa was initially chosen for additional funding support owing to the high risk of new HPAI outbreaks faced by the continent.</p>	
Revised scope:	
<p>Noting the limited incidence of HPAI activity on the continent (except in Egypt), a request was made to the Donor to broaden the usage of the remaining funds totaling approximately USD 300 000. The use of these funds is focused on delivering the remainder of the CMC Africa component, while still maintaining sufficient funds under the main CMC-AH/the United States Agency for International Development (USAID) funding component to respond to outbreaks if they occur in the future. Moreover, as a result of the agreement with the Donor in July 2010, the budget was revised in order to support the implementation of HPAI laboratory, epidemiological and socio-economic and farming systems activities in sub-Saharan Africa through the three ECTAD Units in Bamako, Gaborone and Nairobi.</p>	
Objectives of the revised scope	
<p>The purpose of the grant is to provide funding to FAO to support activities to prevent and control HPAI worldwide and reduce the risk of human exposure to infected animals. In this context, the objective of the project is to provide immediate assistance to countries in Africa through the deployment of rapid response missions, both for non-infected nations at high</p>	

risk of HPAI infection and for infected countries during HPAI outbreaks. In addition to that, the project's revised objective is to co-fund the following activities implemented by the three ECTAD RAHCs based in Bamako, Gaborone and Nairobi.

The revised project has two expected results:

1. Support to laboratory and epidemiology networks.
2. Support to socio-economics and farming systems networks.

Planned activities for the revised scope

Result 1: Support to laboratory and epidemiology networks.

RAHC-Bamako activities (i.e. ECTAD-West and Central Africa [WACA])

1. Information collection and dissemination (Web site maintenance, information bulletins, DVD training, education material, etc.)
2. Organize two workshops on diagnostic laboratory quality assurance (third one for the French-speaking countries of Central Africa will be under the IDENTIFY component of the USAID Emerging Pandemic Threats [EPT] programme):
 - a. French-speaking countries: Benin, Burkina Faso, Cap-Verde, Côte d'Ivoire, Guinea, Guinea Bissau, Mali, Niger, Senegal and Togo
 - b. English-speaking countries: Ghana, Liberia, Nigeria and Sierra Leone
3. Organize two thematic meetings for the West and Central Africa Veterinary Laboratory Network for Avian Influenza and other Transboundary Disease (RESOLAB) laboratories
4. Poultry diseases diagnosis (epidemiology and laboratory teams)
5. HPAI and Newcastle disease (ND) laboratory diagnosis (intermediate level)
6. Resume with harmonization of techniques among less advanced RESOLAB members and provide appropriate reagents:
 - a. Support to Burkina Faso laboratory upgrading
 - b. Procurement of reagents to regional and selected laboratories
7. Proficiency test panels and reagents for Group 2 and 3 laboratories
8. Improve epidemiology and laboratory networks visibility and sustainability
9. Compile information on lessons learned for publishing
10. Contribute to replenishment of regional buffer stock of critical reagents and specimen shipping material
11. Procurement of reagents to Bamako buffer stock
12. Strengthen links between epidemiosurveillance and laboratory networks: common field epidemiologist and laboratory technician workshop on sampling and samples submission
13. SIG risk analysis activity
14. The Regional Network of National Epidemiosurveillance Systems for HPAI and other Priority Animal Diseases in West Africa (RESEPI) annual coordination meeting:
 - a. TADinfo regional meeting
 - b. Disease prioritization
 - c. Action programme 2010-2014

RAHC-Gaborone activities (i.e. ECTAD-Southern Africa [SA])

1. Meeting to harmonize polymerase chain reaction (PCR) avian influenza (AI) standard operating procedures (SOPs)

2. Meeting to revise haemagglutinin/haemagglutinin inhibition (HA/HI) AI SOPs
3. Memorandum of Understanding (MoU) for socio-economic study with the Keeyma Foundation
4. Reagents for ND serology
5. Awareness material
6. FLU group meeting in November
7. Backstopping country activities
8. Digital Pen Technology (DPT) licenses and server hosting for 2010

RAHC-Nairobi Activities (i.e. ECTAD-Eastern Africa [EA])

1. Mission to the Democratic Republic of the Congo (DRC) for programme formulation
2. Laboratory network coordination meeting
3. Laboratory training
4. Chief Veterinary Officers (CVOs) meeting
5. Epidemiology network coordination meeting
6. Disease information systems workshop

Result 2: Support to socio-economics and farming systems networks.

RAHC-Bamako activities (i.e. ECTAD-WACA)

1. Develop and disseminate modular self-training tool kits for biosecurity
2. Live bird market biosecurity pilot operation on three countries (Benin, Burkina Faso and Cote d'Ivoire)
3. Support private public partnership for the establishment of national poultry data/knowledge bases (Benin, Burkina-Faso and Côte d'Ivoire)
4. Field test and validation of the Economic Community of West African States (ECOWAS) zoosanitary certificate template
5. Value chain publication
6. Support development of biosecurity self-auditing tools (Ghana-pilot)
7. Review of work in compensation in EA
8. Public/private institutional arrangements around disease surveillance

RAHC-Nairobi Activities (i.e. ECTAD-EA)

1. Support the study on the development of poultry sector in EA risk assessment
2. Develop EA approach for impact of HPAI (by conducting detailed livelihood analysis in Kenya)
3. Develop appropriate HPAI compensation implementation, funding and documentation procedures
4. Support legal review process and adoption of the draft compensation plan in the South Sudan and Tanzania

Activities implemented during the reporting period (July-September 2010)

As agreed in discussions with USAID during the third quarter of 2010, the remaining funds were allocated towards the implementation of HPAI laboratory, epidemiological and socio-

economic and farming systems activities in sub-Saharan Africa through the three ECTAD Units in Bamako, Gaborone and Nairobi.

Result 1: Support to laboratory and epidemiology networks

RAHC-Gaborone activities (i.e. ECTAD-SA)

1. Harmonization of SOPs

FAO supported the implementation of proficiency tests (PTs) to test surveillance and laboratory diagnostic capacities as part of overall HPAI preparedness and prevention. With funding from this and other projects, two rounds of PTs were implemented, the first in 2009 under the guidance of the Onderstepoort Veterinary Institute (OVI) in South Africa and the second round under the coordination of the Botswana National Veterinary Institute (BNVI), with the participation of all SADC countries. ECTAD-SA facilitated the harmonization of protocols of two of the tests (i.e. HA/HI and PCR). The harmonized PCR SOP was completed during the reporting period.

2. Support to surveillance of HPAI

Increased surveillance of HPAI is the key to prevention and early detection of the disease, should it spread to SA. It is not standard to carry out surveillance of poultry diseases in sector 3 and 4 production settings, placing small to medium and backyard poultry farms at higher risk for the disease. The USAID contribution allowed ECTAD-SA to assist the countries by facilitating surveillance in the context of ND vaccination campaigns, as carried out routinely by many countries.

In addition, ECTAD-SA introduced a real-time surveillance data recording device, DPT, which has now been successfully introduced in Angola, Botswana, Malawi, Mozambique, South Africa and Zambia and which is also used for the surveillance of poultry diseases. This device was also presented to the Veterinary Authorities in South Africa during this reporting period.

RAHC-Nairobi Activities (i.e. ECTAD-EA)

1. Technical support to the DRC

8-18 August 2010: FAO deployed a follow-up mission funded under this project to help improve capacities to fight HPAI and other transboundary animal diseases (TADs) in the country by formulating a programme based on the roadmap developed by the February mission. The programme focuses on public/private partnership, especially the issuance of veterinary care with the below-mentioned objectives:

- improved rapid response for emergencies involving HPAI and other animal diseases;
- enhanced control of HPAI and other animal disease types (e.g. transboundary diseases, emerging and neglected diseases, parasite-caused diseases); and
- modernized and aligned national animal health programme.

Through its technical inputs and capacity building work, the mission supported larger Government efforts to: (i) develop policies for medium- and longer-term prevention and control of HPAI and other TADs as part of a broader animal health programme; and (ii) restore cooperation with technical and financial partners as the security situation improves.

Result 2: Support to socio-economics and farming systems networks

RAHC-Bamako activities (i.e. ECTAD-WACA)**1. Poultry trade certification support**

An international zoosanitary certificate for trade of poultry and poultry products within ECOWAS was developed by ECTAD-WACA as requested by member countries in the framework of cross-border meetings. The project supported the field testing of this certificate involving 16 border posts in Benin, Burkina Faso, Côte d'Ivoire, Ghana, Mali and Togo and six types of poultry products. Reports from these tests are being prepared.

2. Poultry value chain studies

A consultant was recruited from 13 August to 25 September 2010 to compile and make accessible to stakeholders information gathered and analyses carried out in the framework of poultry value chain studies in Burkina Faso, Cote d'Ivoire, Ghana and Togo. A full draft of the document entitled "Poultry and poultry product market chain in support of disease risk analysis" was produced and will be finalized by the end of October.

Planned activities for October to December 2010 (NTE of the project)**RAHC-Bamako activities (i.e. ECTAD-WACA)**

- ECOWAS interstates zoosanitary certificate field tests and follow-up

RAHC-Gaborone activities (i.e. ECTAD-SA)

- **SADC Veterinary Public Health Subcommittee (5-7 October, Maseru, Lesotho)**
Lessons learned from FAO's HPAI activities illustrate the need to address public health in a holistic way (i.e. veterinary and medical). FAO plans to support SA's efforts to apply HPAI knowledge within the "One Health" framework through the above-mentioned meeting.
- Proficiency testing of harmonized PCR SOP in 2011
- Results of poultry trade study to be reported

RAHC-Nairobi Activities (i.e. ECTAD-EA)

- **Interim Secretariat meeting (6-7 October, Nairobi)** organized by ECTAD to be attended by two participants, one from EAC and one from Ethiopia, as well as the representatives of AU-IBAR, OIE and the Kenya Department of Veterinary Services. This meeting is to be facilitated by ECTAD/AU-IBAR at the CVOs meeting in Zanzibar, from 24 to 26 August 2010. The objective of the Secretariat is to run the EAREN/Eastern Africa Region Laboratory Network (EARLN). The Secretariat is to be comprised of ECTAD, AU-IBAR, EAC, IGAD, one representative for Wildlife from Tanzania and one representative for veterinary services (domestic livestock) from Ethiopia.

Main challenges encountered and response provided:

None

Main progress made towards project objectives:**Result 1: Support to laboratory and epidemiology networks**

RAHC-Gaborone activities (i.e. ECTAD-SA)

The capacity of SADC laboratories to test for HPAI was increased through tailor-made training of technicians within and outside the SADC region and through the use of standardized test protocols, such as HA/VI and PCR (real-time PCR and conventional PCR) and the implementation of two rounds of proficiency testing, followed by in-country trainings carried out by the coordinating laboratory to the least performing laboratories in each PT. The BNVL received technical support and equipment in order to fulfil its role as the second service laboratory to the SADC region.

Result 2: Support to socio-economics and farming systems networks**RAHC-Bamako activities (i.e. ECTAD- WACA)**

In WACA the project supported two major activities implemented under the umbrella of the socio-economics and farming system network, the Socio-Economics and Production Network for Animal Health (RESECOP) and thus contributed to its progress.

The development and testing of the international zoosanitary certificate template for poultry and poultry products in response to a request of ECOWAS countries involved participation and collaboration between the veterinary services and the private sector. This work contributed to the establishment of more systematic private/public partnership promoted by RESECOP. Considering the role of trade in the dissemination of HPAI and other poultry diseases, the adoption of the certificate by ECOWAS member countries would represent a major step toward reduction of risk of HPAI dissemination.

It is expected that the report compiling value chain studies carried out as a pilot project in Burkina Faso, Cote d'Ivoire, Ghana and Togo will encourage and serve as a basis for other countries to undertake similar work, which will also require close cooperation between private sector and veterinary services. Better knowledge of poultry trade routes, trade actors and practices and enhanced private public partnership will support the formulation and implementation of more effective prevention and control strategies and will support decision making and better targeting of interventions for given epidemiological situation.

RAHC-Gaborone activities (i.e. ECTAD-SA)

In parallel to the surveillance activities at common border posts of the four countries, a sociological study/survey was conducted using questionnaires and interviews in villages with poultry owners and at border posts, markets and farms (poultry sector 3). The target groups were veterinary staff, backyard poultry producers and semi-commercial producers. The objective was to gain information on production systems, biosecurity, movement of poultry and poultry products, transport and trading at four out of five border districts/posts. A very detailed report is available.

Quarter II 2010

Project Monitoring Sheet

Project title: Support for FAO/OIE/WHO collaboration on HPAI rapid response and containment

Reporting period: April – June 2010

Regional Component:	Global
Project title:	Support for FAO/OIE/WHO collaboration on HPAI rapid response and containment
Code:	OSRO/INT/604/USA (Baby 1)
Budget:	USD 5 000 000 ¹
Planned end date:	30 April 2014
Effective starting date:	January 2007
Context of the project:	<p>The Crisis Management Centre – Animal Health (CMC-AH) of the Food and Agriculture Organization of the United Nations (FAO) and the World Organisation for Animal Health (OIE) is mandated to respond to new outbreaks and critical epidemiologic situations involving highly pathogenic avian influenza (HPAI) and other transboundary animal diseases (TADs) upon official government request. Within the framework of the Emergency Centre for Transboundary Animal Disease Operations (ECTAD), the CMC-AH provides assistance where local governmental capacity may be insufficient to respond effectively and where the spread of the virus may pose a broader regional risk.</p> <p>In support of this mandate and within the context of the mandates of OIE to improve animal health worldwide and the World Health Organization (WHO) to lead global human health initiatives, the United States Agency for International Development (USAID) has provided to date a total of USD 5 million to FAO in support of the CMC-AH for sustained emergency preparedness, rapid assessment and effective response in the field and at headquarters to suspected or confirmed outbreaks of HPAI in collaboration with OIE and WHO.</p> <p>Under this project the CMC-AH continues to carry out its mandate while working to combine efforts, avoid overlaps and build synergies between FAO, OIE and WHO as the organizations work to facilitate the containment of HPAI at its source in animals, combat its spread across international borders and mitigate the risk of a human pandemic.</p>
Objectives²:	<p>The purpose of the Grant is to provide funding to FAO to support activities to prevent and control HPAI worldwide and reduce the risk of a human pandemic. In this general context and in the specific context of Amendments 1 and 2, the objective of the project is to support CMC-AH operations and missions for: i) enhanced core team capacity; ii) improved FAO/OIE/WHO linkages at regional and country level; iii) increased immediate capacity building; and iv) strengthened risk communication support (provided to affected/at-risk countries) and overall communication activities (addressing donor, partner and other audiences).</p>

¹ The budget allocation amounts to USD 2 000 000 (Phase I), USD 2 000 000 (Phase II) and USD 2 000 000 (Phase III). The total budget takes into account the reallocation of USD 1 million of CMC-AH funds to the surveillance and response component of the USAID grant as agreed with the donor.

² These objectives represent a synthesis of the main Grant Objectives contained in the Grant Agreement and Amendments 1 and 2 (i.e. the project document). They have been presented in summarized form in compliance with the Quarterly Update format. More detailed reporting on objectives and activities will be included in the Final Narrative Report upon project completion.

Planned activities of the project:

In light of the project objective, planned activities concentrate on:

- planning, deploying and following up CMC-AH rapid response missions;
- developing tools in support of CMC-AH operations and response capacity;
- defining cooperation mechanisms between WHO and the CMC-AH;
- exchanging information and regularizing communications;
- developing standard operating procedures (SOPs) for FAO, WHO and OIE; and
- coordinating missions at headquarters and field levels.

Activities implemented during the reporting period (April – June 2010):

- **Rapid missions deployed for HPAI³**

Bhutan; 17–21 May 2010

Following up on the first mission to Bhutan reported during the previous period, the CMC-AH deployed a second mission to help increase laboratory capacities for polymerase chain reaction (PCR) diagnostics. An FAO laboratory capacity building expert provided theoretical and practical training to five national counterparts from the National Centre for Animal Health (NCAH). CMC-AH also provided the below-mentioned equipment and materials.

Table: Items provided to the Government of the Kingdom of Bhutan

Sl No	Items	Quantity	Date received
I. Personnel Protective Equipment			
1	Coverall (Dupont)	500 sets	14/5/2010
2	Gloves (Latex)	40 boxes	14/5/2010
3	Gloves (Rubber)	43 doz	14/5/2010
4	Safety goggles (3M)	500 pcs	14/5/2010
5	Boots (rubber)	25 doz	14/5/2010
6	Mask (N-95)	2500 Pcs	14/5/2010
7	Mask (3M)	4000 Pcs	14/5/2010
8	Waste bags (Black)	1000 Pcs	14/5/2010
9	Biohazard bags (red)	1000 Pcs	14/5/2010
II. Consumables/Diagnostics			
1	Disinfectant (Virkon 2.5kg packs)	30 packs	14/5/2010
2	Shipping boxes (IATA containers)	3 packs	16/5/2010
3	FluDetect kits	18 kits	16/5/2010
4	PCR reagents / kits	3 boxes	4/6/2010
III. Equipments			
1	Motorized sprayers	10 Pcs	4/6/2010

- **FAO-OIE Memorandum of Understanding (MOU)**

The MOU has been reviewed by FAO for OIE final consideration prior to formal clearance procedures.

- **Strengthening coordination and building awareness of CMC-AH and its services**

Briefings and outreach activities

- The CMC-AH briefed three FAO Representatives (FAORs) to strengthen collaboration with response missions.
- CMC-AH management embarked on a mission to North America to strengthen donor and partner relationships to enhance CMC-AH services. Management met with the:
 - i) Canadian International Development Agency (CIDA); ii) Canadian Food Inspection Agency (CFIA); iii) Centres for Disease Control and Prevention (CDCP); iv) FAO

³ During the reporting period and with alternate funds, the CMC-AH deployed missions to the Democratic Republic of Congo to help the government assess the situation involving multiple TADs and outline a roadmap for an overall animal disease prevention and control strategy.

liaison office in Washington; v) United States Department of Agriculture (USDA); and vi) USAID.

- o The Administration Coordinator participated in the annual consultation with the Swedish International Development Agency (Sida), which provided an opportunity to present the below-mentioned advocacy document on Sida-supported activities.
- o The CMC-AH has invited *France Vétérinaire Internationale* and *Agronomes et Vétérinaires Sans Frontières* to FAO headquarters in July to exchange past and future experiences relevant to CMC-AH missions in the field with FAO colleagues in both the CMC-AH and the broader animal health programme.

Communication tools and materials

The CMC-AH prepared a new advocacy publication on the activities and achievements supported by Sida. The document, entitled "Sida and the CMC-AH, 2007–2010", is planned for dissemination prior to the fourth CMC-AH Steering Committee meeting later this year. In addition, the CMC-AH has been updating its standard publications (the CMC-AH Rapid Missions Update and biennial Activity Report) for publication this fall.

- **Revision and update of FAO's Good Emergency Management Practices (GEMP)**
Revision and improvement of GEMP continues with the consultant recruited during the previous quarter and headquarters personnel. Ten of twelve technical response guidelines were reviewed and edited during the quarter.
- **Reagent contingency stock**
Having identified the need, the CMC-AH had the opportunity to rapidly deploy rapid antigen test kits to Bhutan as a follow-up to the mission (see above-mentioned table). The Government expressed its great appreciation for this assistance supported by USAID through an acknowledgement letter of 7 June 2010.
- **Roster of experts for rapid deployment**
New data is being updated as it is acquired.
- **Event Tracking and Management System (ETMS)**
The CMC-AH team has continued testing the pre-beta version of the system. Development is on schedule, with weekly meetings continuing to improve functionality.
- **Field HPAI simulation exercise, Togo from 4 May to 8 May 2010**
In order to share its experience in assisting countries with rapid response, a CMC-AH Response Veterinarian participated in Togo's first HPAI simulation exercise held in Kara. The CMC-AH officer took the opportunity to present the upcoming revised version of GEMP as a tool that will support improved rapid response capacity and activities. The exercise raised the need for Togo and other participating countries (e.g. Benin and Gabon) to pursue training sessions for rapid response at central and regional levels.
- **Staffing**
The CMC-AH is going through a period of change with regards to staffing with several members moving on during the period. New resources are being identified.

Planned activities for July to September 2010:

- continued monitoring of high-risk countries and situations;
- mission planning and deployment upon request for acceptance of assistance;
- maintenance, updating and continued integration of roster data within the global animal disease information system of FAO's Emergency Prevention Programme for Transboundary Animal Diseases (EMPRES-i);
- further review and editing of technical response and control SOPs;
- assistance in the shipment of pig samples from Cameroon to reference laboratory for

further analysis with regard to Cameroon's first African swine pest (ASF) outbreak occurring in the north;

- support to the ongoing FAO study on sustainability of veterinary laboratories in Western and Central Africa (i.e. RESOLAB [West and Central Africa Veterinary Laboratory]);
- assistance to larger FAO efforts in preparing for world Rabies day;
- participation in HPAI cross-border workshop with Cameroon, the Central African Republic, Chad and Nigeria;
- continued testing of ETMS prototype;
- continued CMC-AH awareness building activities;
- continued finalization of the draft of GEMP;
- continued contact with OIE regarding the completion of FAO-OIE MOU;
- finalization and publication of Rapid Missions Update, Sida brochure and Activity Report;
- planning and preparations for the fourth CMC-AH Steering Committee; and
- continued FAO/WHO coordination initiatives where feasible (see challenges).

Main challenges encountered and response provided:

The CMC-AH has experienced notable difficulty in further strengthening collaboration with WHO following the agency's reorganization. Experience has raised questions regarding the capacity of WHO counterparts to continue close engagement with the CMC-AH.

Main progress made towards project objective, listed by activity⁴ (since project start):

- **Mission planning, deployment and follow-up**
 - HPAI response missions: 24
 - total missions deployed: 45
 - total countries assisted: 32
- **Development of tools supporting CMC-AH response capacity**
 - reagent contingency stock implemented for HPAI
 - possibility obtained to store HPAI stocks under cold chain at United Nations Humanitarian Response Depot (UNHRD) in Brindisi, Italy
 - successful deployment to Bhutan of one shipment of five reagent kits (see table)
 - ten of twelve technical SOPs revised as part of overall GEMP efforts
- **Refining cooperation mechanisms between WHO and CMC-AH**
 - standard lines of interagency communication defined
 - information focal points established
 - coordinated missions (human and animal health) deployed and followed up
- **Exchanging information and regularizing communications**
 - WHO's Emergency Medical Services (EMS) analysed for applicability to CMC-AH
 - development of ETMS prototype complete; testing underway
 - regular information exchange through regular meetings and staff visits
 - FAO/OIE/WHO coordination methodologies confirmed through standardized information sharing methods and focal points
- **SOP development for FAO, WHO and OIE**
 - initial SOPs defined: 21
 - consolidated SOPs: 4
- **Strengthening mission coordination and field-level cooperation**
 - after action review processes implemented to capture lessons learned
 - headquarter- and field-level contacts established and disseminated
 - coordination mechanisms strengthened through mission experience
 - field-level SOPs under development for enhanced national response

⁴ Due to the nature of the CMC-AH concept and the project's main aim to support FAO's capacity for rapid response, the majority of activities are to be considered as ongoing initiatives.

I Quarter 2010

Project Monitoring Sheet

Project title: Support for FAO/OIE/WHO collaboration on HPAI rapid response and containment

Reporting period: January – March 2010

Regional Component:	Global
Project title:	Support for FAO/OIE/WHO collaboration on HPAI rapid response and containment
Code:	OSRO/INT/604/USA (Baby 1)
Budget:	USD 3 000 000 (Phase I), USD 2 000 000 (Phase II)
Total budget:	USD 5 000 000 ²
Planned end date:	30 April 2014
Effective starting date:	January 2007
Context of the project:	<p>The Crisis Management Centre – Animal Health (CMC-AH) of the Food and Agriculture Organization of the United Nations (FAO) and the World Organisation for Animal Health (OIE) is mandated to respond to new outbreaks and critical epidemiologic situations involving highly pathogenic avian influenza (HPAI) and other transboundary animal diseases (TADs) upon official government request. Within the framework of the Emergency Centre for Transboundary Animal Disease Operations (ECTAD), the CMC-AH provides assistance where local governmental capacity may be insufficient to respond effectively and where the spread of the virus may pose a broader regional risk.</p> <p>In support of this mandate and within the context of the mandates of OIE to improve animal health worldwide and the World Health Organization (WHO) to lead global human health initiatives, the United States Agency for International Development (USAID) has provided to date a total of USD 5 million to FAO in support of the CMC-AH for sustained emergency preparedness, rapid assessment and effective response in the field and at headquarters to suspected or confirmed outbreaks of HPAI in collaboration with OIE and WHO.</p> <p>Under this project the CMC-AH continues to carry out its mandate while working to combine efforts, avoid overlaps and build synergies between FAO, OIE and WHO as the organizations work to facilitate the containment of HPAI at its source in animals, combat its spread across international borders and mitigate the risk of a human pandemic.</p>

Objectives³:

The purpose of the Grant is to provide funding to FAO to support activities to prevent and control HPAI worldwide and reduce the risk of a human pandemic. In this general context and

² The total budget takes into account the reallocation of USD 1 million of CMC-AH funds to the surveillance and response component of the USAID grant as agreed with the donor.

³ These objectives represent a synthesis of the main Grant Objectives contained in the Grant Agreement and Amendments 1 and 2 (i.e. the project document). They have been presented in summarized form in compliance with the Quarterly Update format. More detailed reporting on objectives and activities will be included in the Final Narrative Report upon project completion.

in the specific context of Amendments 1 and 2, the objective of the project is to support CMC-AH operations and missions for: i) enhanced core team capacity; ii) improved FAO/OIE/WHO linkages at regional and country level; iii) increased immediate capacity building; and iv) strengthened risk communication support (provided to affected/at-risk countries) and overall communication activities (targeting donor, partner and other audiences).

Planned activities of the project:

In light of the project objective, planned activities concentrate on:

- planning, deploying and following up CMC-AH rapid response missions;
- developing tools in support of CMC-AH operations and response capacity;
- defining cooperation mechanisms between WHO and the CMC-AH;
- exchanging information and regularizing communications;
- developing standard operating procedures (SOPs) for FAO, WHO and OIE; and
- coordinating missions at headquarters and field levels.

Activities implemented during the reporting period (January – March 2010):

• **Rapid missions deployed for HPAI⁴**

Nepal; 9–20 March 2010

Long threatened by HPAI via cross-border threats and in-country reoccurrences, Nepal has worked with the CMC-AH since its first outbreaks in January 2009 to respond to HPAI and control the spread of the virus. Initial response efforts yielded positive results, which were backed up by CMC-AH rapid missions and their strategic recommendations. Despite continued work guarding against outbreaks, HPAI resurfaced in Nepal in early 2010.

The Government acted quickly to control the new threat in-country, having worked progressively to increase its prevention and control capacity through FAO and other international support. The CMC-AH mission provided additional support in assessing the: i) HPAI situation in the poultry sector; ii) potential involvement of wild birds; iii) relevance of biosecurity issues; and iv) gaps in funding or opportunities for the redirection of resources. The CMC-AH team, which included a wildlife specialist from FAO's Regional Office for Asia and the Pacific, conducted extensive field visits and engaged with a wide range of government and public stakeholders. Recommendations focused on: i) improving disease surveillance and reporting; ii) enhancing regional response team capacities; iii) building private-public partnerships to implement biosecurity measures and raise awareness; and iv) conducting assessments of the role of wild birds in Nepal's outbreaks.

Bhutan; 21–27 March 2010

When the Government of the Kingdom of Bhutan experienced its first outbreak of HPAI in February 2010, authorities took swift and immediate action to respond to the threat. To further support its own efforts, the Government requested FAO assistance to: i) review control measures implemented and advise on improvements; ii) assess risks of future introductions; and iii) examine requirements for equipment and operational costs. The CMC-AH deployed an expert epidemiologist on a five-day mission to address these issues.

In addition to the mission, the CMC-AH continued to support Bhutan through the provision of personal protective equipment, sprayers and rapid test kits. The Centre also facilitated the shipment of samples to the OIE regional reference laboratory and promoted cross-border linkages. A second mission, with a focus on increasing laboratory capacities for polymerase chain reaction diagnostics, was confirmed for late May 2010.

⁴ During the reporting period and with alternate funds, the CMC-AH deployed missions to the Democratic Republic of Congo to help the government assess the situation involving multiple TADs and outline a roadmap for an overall animal disease prevention and control strategy.

- **FAO-OIE Memorandum of Understanding (MOU)**
In order to build on lessons learned and capitalize on synergies, FAO and OIE have been working to revise and improve the MOU guiding their collaboration in the CMC-AH. The MOU is currently undergoing legal review.
- **Strengthening coordination and building awareness of CMC-AH and its services**
The CMC-AH briefed seven FAO audiences, including FAORs and field-based experts at headquarters and in the field (e.g. FAO's Regional Office for Asia and the Pacific) to ensure collaboration with CMC-AH response missions. Meetings were also held with one donor delegation, which included veterinary civil servants and ministers of agriculture, and five audiences containing potential rapid response roster candidates.

In February 2010, the CMC-AH participated in two FAO-OIE-WHO meetings: one in Rome on tripartite coordination and the other in Paris⁵ attended by the Canadian International Development Agency (CIDA) and emphasizing CIDA project outputs. Both meetings offered the opportunity to strengthen tripartite coordination for overall CMC-AH response initiatives. In March 2010, the CMC-AH met with a high-level delegation from the Center for Disease Control and Prevention (CDC) to explore ways to strengthen CDC participation in CMC-AH initiatives.
- **Revision and update of FAO's Good Emergency Management Practices (GEMP)**
Following the review of the CMC-AH technical response guidelines reported in the previous quarter, the CMC-AH recruited a technical expert in February 2010 to develop a revised version of GEMP. The new version will include the technical response guidelines and outbreak communication toolkit generated previously by the CMC-AH.
- **Reagent contingency stock**
Thanks to preparatory efforts during the reporting period, the CMC-AH now stands ready to deploy polymerase chain reaction diagnostic kits (including reagents) to support rapid response.
- **Roster of experts for rapid deployment**
The CMC-AH completed uploading existing profiles into the roster database nested within EMPRES-i. New human resource data is being added as it is acquired. Efforts have been focused on making the roster as user-friendly and accessible as possible.
- **Event Tracking and Management System (ETMS)**
An ETMS prototype was developed in late 2009. Efforts this quarter have focused on testing and revising the system through extensive analysis and review with FAO ICT experts. The system is scheduled to go live in mid to late 2010 after further team testing.
- **Planning for Chief Veterinary Officer (CVO) management training**
Planning has continued, with the CMC-AH developing strategies for the delivery of training packages for senior level veterinary officers (including CVOs) in conjunction with the release of the above-mentioned, revised GEMP.
- **CMC-AH staffing changes**
A loaned officer from USDA joined the CMC-AH in March 2010 and has taken up the role of Planning Coordinator and Deputy Manager.

⁵ The CMC-AH participated via video link.

Planned activities for April to June 2010:

- continued monitoring of high-risk countries and situations;
- mission planning and deployment upon request for or acceptance of assistance;
- finalization expert roster data updating, maintenance and continued Emergency Prevention Programme for Transboundary Animal Diseases (EMPRES) information system EMPRES-i integration;
- further finalization of technical response and control SOPs;
- continued finalization and deployment of contingency stocks (i.e. reagents);
- continued testing of ETMS prototype with a testing of complete system to start mid 2010;
- continued CMC-AH awareness building activities;
- finalization of the draft of GEMP, including draft plans for senior-level veterinary training;
- completion of FAO-OIE MOU; and
- continued FAO/WHO coordination initiatives.

Main challenges encountered and response provided:

None

Main progress made towards project objective, listed by activity⁶ (since project start):

- **Mission planning, deployment and follow-up**
 - HPAI response missions: 22
 - Total missions deployed: 42
 - Total countries assisted: 29
- **Development of tools supporting CMC-AH response capacity**
 - Reagent contingency stock developed; restocking and streamlining ongoing
 - Discussions ongoing with United Nations Humanitarian Response Depot (UNHRD) for cold chain storage and delivery
- **Defining cooperation mechanisms between WHO and CMC-AH**
 - Standard lines of interagency communication defined
 - Information focal points established
 - Coordinated missions (human and animal health) deployed and followed up
- **Exchanging information and regularizing communications**
 - WHO's EMS analyzed for applicability to CMC-AH
 - Development of ETMS prototype complete; testing underway
 - Regular information exchange through regular meetings and staff visits
 - FAO/OIE/WHO coordination methodologies confirmed through standardized information sharing methods and focal points
- **SOP development for FAO, WHO and OIE**
 - Initial SOPs defined: 21
 - Consolidated SOPs: 4
- **Strengthening mission coordination and field-level cooperation**
 - After action review processes implemented to capture lessons learned
 - Headquarter- and field-level contacts established and disseminated
 - Coordination mechanisms strengthened through mission experience
 - Field-level SOPs under development for enhanced national response

⁶ Due to the nature of the CMC-AH concept and the project's main aim to support FAO's capacity for rapid response, the majority of activities are to be considered as ongoing initiatives.

I Quarter 2010

Project Monitoring Sheet: **OSRO/INT/704/USA**

Title: Enhancing preparedness and response capacity to highly pathogenic avian influenza (and other emerging/re-emerging zoonotic diseases) in Eastern Europe and Central Asia countries

Reporting period: **January – March 2010**

Regional component: Europe and Central Asia

Title: Enhancing preparedness and response capacity to highly pathogenic avian influenza (and other emerging/re-emerging zoonotic diseases) in Eastern Europe and Central Asia countries

Code: OSRO/INT/704/USA

Budget: USD 370 000 (Phase I)

Total budget: USD 370 000

Effective starting date: 1 July 2008

Planned end date: 30 June 2010

Context of the project

Although most of the countries within Eastern Europe and Central Asia region have developed a preparedness and contingency plan for the Highly Pathogenic Avian Influenza (HPAI), the need for generic operation procedures to minimize the spread of HPAI virus in case of its occurrence, as well as to reduce the risk of human infection still remains.

Therefore, this project will include the development of generic standard operating procedures (SOP's) applicable in countries (or districts within countries) of different socio-economical, cultural and geographical structures and capacities in the Eastern Europe and Central Asia regions. Under the project a better understanding of the SOP's would be enhanced through dissemination of basic knowledge of Epidemiology.

In addition, the project specifically aims at enhancing the coordination and collaboration between Veterinary Services, Ministries of Forestry, Ministries of Environment and/or Departments of Ornithology which often have jurisdictional authority over wildlife management.

The risk of disease introduction and spreading within domestic poultry by migrating wild water birds remains high in these regions. In the rural poultry sector with predominant backyard poultry breeding, the risk point of introduction could be through hunters bringing back hunted wild birds that might have been previously infected with the virus. These call for the need for harmonised multi-sectoral coordination and management of risks and outbreaks as well as strengthening the epidemiological intelligence in the regions.

International sharing of wild bird epidemiology and surveillance information, as well as developing and applying SOP's on risk reduction in backyard poultry breeding in areas as the Black Sea and Caspian Sea regions would have a direct impact on reducing the risk of virus spreading.

Objectives of the project

The main goal of the project is to reduce the H5N1 viral spread from wild birds to domestic poultry and among domestic poultry by enhanced wild bird disease management and providing generic operational guidance and procedures to the veterinary services within the Eastern Europe and Central Asia regions. The ultimate goal of this project is to promote long-term veterinary service capacity building that will promote both public health improvement and better economic impact of poultry and livestock production in the future.

The main outputs expected from the project are:

1. Development of generic SOPs for HPAI and improvement of epidemiology understanding within the veterinary services;
2. Improvement of multi-sectoral coordination and management of risks and outbreaks involving wild birds and free range domestic duck, goose and chicken populations in the Black Sea and Caspian Sea regions.

Planned activities for the reporting period

1. Development of generic standard operating procedures for HPAI and improvement of epidemiology understanding within the veterinary services

1.5. Disseminate generic operating procedures to Ministries, Task Forces, Veterinary Services and eventually donors. Make SOP's available for global access through FAO website.

Activities undertaken during the reporting period

- The developed SOPs are being revised by FAO for clearance among in-house experts.

Planned activities for the next quarter

1. Development of generic standard operating procedures for HPAI and improvement of epidemiology understanding within the veterinary services

1.5. Disseminate generic operating procedures to Ministries, Task Forces, Veterinary Services and eventually donors. Make SOP's available for global access through FAO website.

Main challenges encountered and response provided

As FAO has also developed SOPs for other regions, the main challenge has been to streamline the different SOPs into a common format.

Main progress made towards the achievement of project outcomes

The project is expected to achieve its set out objectives and will make a substantial contribution to HPAI prevention and control, especially through the development of generic SOPs and enhanced cooperation between sectors.

Quarter II 2010

Project Monitoring Sheet: OSRO/INT/803/USA

Project Title: Development of integrated desktop simulation exercise on Avian Influenza in animal and human population in Europe and Eurasia

Reporting period: April – June 2010

<p>Regional component: Eastern Europe and Central Asia</p> <p>Project Title: Development of integrated desktop simulation exercise on Avian Influenza in animal and human population in Europe and Eurasia.</p> <p>Code: OSRO/INT/803/USA</p>
<p>Budget: USD 130 000</p>
<p>Effective starting date: 1 November 2008</p>
<p>Planned end date: 31 December 2010</p>
<p>Context of the project</p> <p>Emergency preparedness planning is crucial for the successful management of outbreaks of Highly Pathogenic Avian Influenza (HPAI) and for minimizing the outbreak's impact. Preparedness encompasses the development of contingency plans, operational procedures and engagement of national and local authorities in capacity building.</p> <p>The basis for an adequate implementation of measures and operations considering HPAI is a developed integrated action (contingency) plan that will clarify technical procedures, operational activities, lines of command and communication channels. To test its efficiency, however, the implementing capacity of the contingency plan should be monitored from time to time by conducting, for example, integrated desktop simulation exercises. These exercises provide an opportunity for the authorities to identify areas where cooperation and coordination needs to be improved as well as to test internal and external roles and responsibilities. Measurable outcomes need to reflect the technical and operational improvements, training and capacity building, transparency of communication and levels of coordination between different government sectors and agencies involved. The Food and Agriculture Organization of the United Nations (FAO) and World Health Organization - Regional Office for Europe (WHO-EURO) are the focal points for the technical cooperation for animal and human cases of HPAI. Both organizations are involved in assisting UN Member States in enhancing their emergency preparedness and response capacity. The United States Government through the United States Agency for International Development (USAID) is one of the leading donors in strengthening the national capacity to respond to the risk of avian and pandemic influenza.</p> <p>The starting point of WHO's pandemic preparedness plan is to strengthen the capacity of countries to respond to seasonal influenza epidemic. FAO's activities in the field of avian influenza (AI) have focused on prevention, early detection and control of HPAI in animal populations. So far, FAO, the World Organization for Animal Health (OIE) and WHO, are encouraging countries to develop or enhance existing national preparedness plans to fully consider an integrated approach by addressing animal and human health aspects as well as other sectors needed for the control of HPAI.</p>

This integrated approach allows:

- to improve the cooperation and communication of different sectors involved in HPAI emergency preparedness and response;
- to develop and implement integrated epidemiological surveillance and early warning systems for HPAI; and
- to ensure the most efficient implementation of measures and operations during an HPAI outbreak.

From December 2006, FAO and WHO EURO have been developing and implementing integrated desktop simulation exercises within the ongoing OSRO/INT/603/USA B02 project. However, emergency preparedness is a continuous process, which needs to be adapted to prevailing conditions in a country and to new scientific insights.

The geographical scope of this project is limited to countries within the Eastern Europe and Central Asia regions of the FAO Headquarters (FAO/HQ) and WHO EURO, excluding the countries that have joined the European Union.

In the Central Asia region, during the beginning of 2006, two outbreaks of HPAI in humans have been observed in Turkey and Azerbaijan. The WHO and FAO missions to the region have indicated that the animal and human health sectors needed urgent strengthening. As in most countries, the relationship between the human and animal health sectors is fragmented, as is the cooperation in response to outbreaks. This leads to delays, thus increasing the impact of the disease in the poultry industry as well as the risk for human infection.

Since the first HPAI outbreaks, the Eastern Europe and Central Asia countries, with the guidance of FAO and WHO, have established AI task forces or inter-ministerial AI working groups with the aim to prepare the country to face HPAI outbreaks. Furthermore, the development of contingency plans for HPAI and pandemic influenza preparedness plans has been promoted. However, only a limited number of countries have developed integrated multi-sectoral HPAI contingency plans or have tested their plans, while some of the existing plans still need to be revised or approved by their government.

Objectives of the project

The aim of this project is to enhance the preparedness of the Eastern Europe and Central Asia countries to respond to the outbreaks of HPAI through testing the coordination and communication mechanisms among all involved in HPAI control at national and regional level. The project activities are conceived to reduce the risk of viral introduction or spread by improving the coordination of actions to be taken. The ultimate goal of this proposal is to further develop and adapt an optimal model for HPAI desktop simulation exercises that could in the long-term strengthen the capacities of the veterinary and public health services and serve as a template for testing the preparedness for other emerging and re-emerging zoonotic diseases.

The expected outcomes of the project:

- inter-sectoral coordination and communication of stakeholders involved in the control of HPAI outbreaks improved;
- strengths and weaknesses of existing plans and response mechanisms for AI in animals and humans identified;
- understanding and practice of command and coordination to respond to AI identified;
- existing national contingency plans for HPAI enhanced;

- veterinary and public health preparedness capacities for HPAI and other emerging and re-emerging animal and human diseases strengthened.

Planned activities

Output 1: Development and implementation of two national integrated table-top simulation exercises for HPAI

Activities for the national integrated table-top simulation exercise for HPAI:

- liaising with FAO and WHO local offices to recruit national focal points for logistical and administrative support (venue, dates, translations and letters);
- identifying prospective participants including scenario writers and facilitators;
- developing the exercise scenario and handbook materials for players and observers and printing and photocopying the respective materials (at least in two languages); and
- preparing the exercise.

Activities undertaken during the reporting period

- The hybrid simulation exercise in Kiev, Ukraine was carried out from 13 April to 15 April 2010. The exercise, carried out in collaboration with Stamping Out Pandemic and Avian Influenza (STOP AI) project, consisted of both tabletop and field components. This was the first time that FAO combined the tabletop with a field exercise, and it was regarded as a very useful combination as reflected in the participant feedback/evaluation received after the exercise.

Planned activities for the next quarter

- finalization of the simulation exercise report;
- translation and dissemination of the simulation exercise report;
- participation in a final lessons learned meeting to be organized by USAID, tentatively in December 2010, to build on the experiences of the USAID projects implemented by FAO and other implementing agencies with the participation of a wider donor community.

Main challenges encountered and response provided

- A hybrid table-top and field exercise had been planned for November 2009, but the exercise had to be postponed in view of the occurrence of severe outbreaks of H1N1 in Ukraine.
- Thanks to a good relationship with an FAO national consultant, a producer in the Kiev area, agreed to provide his farm as a location for the field exercise. The task of finding a suitable location, however, has proven to be challenging because of the biosecurity considerations and the effect that the teams dressed in personal protective equipment (PPE) might have.

Main progress made towards the achievement of project outputs

- The conducting of the hybrid simulation exercise further contributed to the preparedness of the country to face HPAI outbreaks. The lessons learned during the exercise are communicated to the authorities, and it is expected that the contingency plan will be enhanced.

1 Quarter 2010

Project Monitoring Sheet: OSRO/INT/805/USA

Project title: Developing and maintaining public-private partnerships (PPP) for the prevention, detection and control of Highly Pathogenic Avian Influenza H5N1 and other emerging infectious animal diseases

Reporting period: January – March 2010

Global component: Global cross-country
Countries: Bangladesh, Egypt and Indonesia
Project title: Developing and maintaining public-private partnerships (PPP) for the prevention, detection and control of Highly Pathogenic Avian Influenza H5N1 and other emerging infectious animal diseases
Code: OSRO/INT/805/USA
Total budget: USD 1 600 000 ¹
Effective starting date: October 2008
Planned end date: July 2010
<p>Context of the project</p> <p>The ongoing Highly Pathogenic Avian Influenza (HPAI) crisis has highlighted that the current approach for operating public animal health services is not optimal given the major changes and trends occurring in the livestock sectors. This is particularly true in the dynamic and rapidly changing poultry and swine sub-sectors.</p> <p>At the same time, the private poultry sector has received insufficient attention from governments and donors. The private sector shares many of the safety and health concerns promoted by public animal health services. However, longstanding mutual mistrust and the lack of coordinating mechanisms have hampered cooperation in controlling HPAI.</p> <p>In a technical meeting held in Rome in June 2007, in preparation for the New Delhi Inter-Ministerial Conference on HPAI, the Food and Agriculture Organization of the United Nations (FAO) outlined the need to move beyond the public veterinary services and incorporate the private sector in order to strengthen national animal health systems.</p>
<p>Objectives of the project</p> <p>To create, strengthen and maintain public-private partnerships (PPP) to support poultry health and production systems in countries worse affected by HPAI within a functional animal health system led by official veterinary services.</p>

¹ This amount of USD 1 600 000 is the total contribution that includes the allocation per country. The project budget has been divided into four main project components which are: Global cross-country coordination, (budget allocation amounts to USD 650 000), the People's Republic of Bangladesh (budget allocation amounts to USD 301 000) the Arab Republic of Egypt, (budget allocation amounts to USD 312 000) and the Republic of Indonesia (budget allocation amounts to USD 337 000).

Planned activities

BANGLADESH

Output 1: Roles of the stakeholders of public and private sectors involved in the poultry production and marketing chains in the control of HPAI and other animal diseases assessed, clearly defined, distributed and agreed

Activity 1.1: Review of current level of partnership between the public services and private sector (needs, actors, resources available) at national level:

- Identification of public and private stakeholders at country level.
- Assessment of the private sector's current capacity in animal health disease prevention and control (producers, farmers, private veterinarians and other service providers, traders, drug suppliers/manufacturers and others).
- Assessment of the public veterinary services' capacity in animal health disease prevention and control including its capacity to collaborate with private sector, in line with the evaluation tool of the World Organisation for Animal Health (OIE) for the Performance of Veterinary Services (PVS).
- Assessment of the current level of collaboration between the public and the private sectors (baseline survey).

Activity 1.2: Review of related legislation and regulatory framework:

Review of in-country pre-existent animal health legislative and regulatory framework on the respective roles of the public and private sectors.

Activity 1.3: Revisiting of roles and responsibilities:

- Review of the roles and responsibilities of public veterinary services, private veterinary services, producers and sellers in poultry diseases prevention and control within the framework of standards set by OIE (workshop).
- Formulation of guidelines on roles and responsibilities of public veterinary services, private veterinary services, producers and sellers in poultry diseases prevention and control (workshop).

Output 2: The capacity of the public veterinary services strengthened to lead the development and management of the animal health systems to prevent, detect and control HPAI and other animal diseases

Activity 2.1: Facilitation for leadership and vision in public veterinary services for improved national animal health systems:

- Facilitation of the process of strengthening the public veterinary services through joint activities with the private sector (training, seminars, meetings, workshops and working committees).
- Establishment of Biosecurity Guidelines by a biosecurity committee that will focus on the development of a minimum biosecurity standard for poultry farming.
- Establishment of vaccination committee that will focus on the development of vaccination policy and programme for the poultry industry.
- Implementation of biosecurity and good farming auditors training activity for the public sector.

- Implementation of biosecurity training for input providers.

Output 3: The lessons learned from cases of PPP in key areas of disease control (vaccination, compensation, biosecurity) available for replication

Activity 3.1: Implementing a socio-economic study in a live-bird market (LBM) as a case study of PPP.

Output 4: Forums and networks of public-private stakeholders in place for enhanced communication, education, information dissemination and awareness for the prevention, detection and control of HPAI and other animal diseases

Activity 4.1: Setting up regular meetings and exchange of information of the biosecurity guidelines committee.

Activity 4.2: Setting up regular meetings and exchange of information of the vaccination committee.

Production of a newsletter or website for PPP on biosecurity and vaccination, building on the existing poultry and Ministry of Agriculture (MoA) Newsletter and websites with stronger contribution from the private sector.

EGYPT

Output 1: Roles of the stakeholders of public and private sectors involved in the poultry production and marketing chains assessed and clearly defined, distributed and agreed to control HPAI and other animal diseases.

Activity 1.1: Review of current level of partnership between the public services and private sector (needs, actors, resources available) at national level.

- Identification of public and private stakeholders at country level.
- Assessment of the private sector's current capacity in animal health prevention and control (producers, farmers, private veterinarians and other service providers, traders, drug suppliers/manufacturers and others).
- Assessment of the public veterinary services' capacity in animal health prevention and control including its capacity to collaborate with private sector, in line with OIE PVS evaluation.
- Assessment of the current level of collaboration between the public and the private sectors (baseline survey).
- Finalization of the Report on current legislation and regulations initiated under the World Bank funded project.

Activity 1.2: Revisiting of roles and responsibilities.

- Review of the roles and responsibilities of public veterinary services/private veterinary services/producers and sellers in poultry diseases prevention and control within the frame of standards set by OIE (workshop);
- Formulation of guidelines on roles and responsibilities of public veterinary services/private veterinary services/producers and sellers in poultry diseases prevention and control (workshop).

Output 2: Capacity of the public veterinary services strengthened to lead the development and management of the Animal Health System to prevent, detect and control HPAI and other animal diseases.

Activity 2.1: Facilitation for leadership and vision in public veterinary services for improved national animal health systems.

- Facilitation of the process of strengthening collaboration between the central and governorate Veterinary services in a crisis situation (through seminars, meetings, workshops).
- Implementation of workshop on Roles and responsibilities of public veterinary services/private veterinary services/producers and sellers in poultry diseases prevention, detection and response.
- Implementation of training activities for the public sector to develop and lead public-private alliances in disease control programs.

Output 3: Lessons learnt from cases of PPP in key areas of disease control (vaccination, compensation, biosecurity) available for replication.

Activity 3.1: Initiation/strengthening of partnerships between the public services and the private sector.

- Identification of mechanism for the registration of all poultry commercial farms.
- Discussion of a mechanism and elaboration of a model of contract for official delegation of public mission to private vets.
- Discuss and design a poultry multi-disease vaccination protocol.

Activity 3.2: Development, drafting and presentation of guidelines on cost sharing compensation mechanism for culled animals.

- Facilitation of further dialogue for the development of a legal framework and cost-sharing mechanism for compensation.
- Joint drafting of the compensation guidelines and facilitation of their adoption.

Output 4: Forums and networks of public-private stakeholders in place for enhanced communication, education, information dissemination and awareness for HPAI and other.

Activity 4.1: Advocacy to secure buy-in from all stakeholders

Activity 4.2: Setting up of exchange and communication platforms to facilitate interaction between public services and the private sector (discussions on animal health strategies, market mitigation measures, value chain bio-security and social responsibilities).

- Strengthening the existing platforms (such as Supreme and Technical Committees for HPAI) based on the Recommendations of the FAO– World Health Organization (WHO) – United Nations Children’s Fund (UNICEF) evaluation, through technical assistance and workshops/seminars.
- Production of a newsletter building on the existing Egypt HPAI Newsletter with stronger contribution from the private sector.

Activity 4.3: Awareness and communication.

- Development of an information brochure on the policies/legislations.

INDONESIA

Output 1: Roles of the stakeholders of public and private sectors involved in the poultry production and marketing chains in the control of HPAI and other animal diseases, is assessed and clearly defined, distributed and agreed

Activity 1.1: Review of current level of partnership between the public services and private sector (needs, actors, resources available) at national level.

- Identification of public and private stakeholders at country level.
- Assessment of the private sector's current capacity in animal disease prevention and control (producers, farmers, private veterinarians and other service providers, traders, pharmaceutical suppliers/manufacturers).
- Assessment of the public veterinary services' capacity in animal health disease prevention and control including its capacity to collaborate with private sector, in line with the World Organisation for Animal Health – Public Veterinary Services (OIE PVS) evaluation.
- Assessment of the current level of collaboration between the public and the private sectors (baseline survey).
- Mapping of all similar activities implemented by other stakeholders to allow collaboration and avoid redundancies.

Activity 1.2: Review of related legislation and regulatory framework

Review of in-country pre-existent animal health legislative and regulatory framework on the respective roles of the P/P sectors.

Activity 1.3: Revisiting of roles and responsibilities.

- Review of the roles and responsibilities of public veterinary services/private veterinary services/producers and sellers in poultry diseases prevention and control within the framework of standards set by OIE (workshop).
- Formulation of guidelines on roles and responsibilities of public veterinary services/private veterinary services/producers and sellers in poultry diseases prevention and control (workshop).

Output 2: The capacity of the public veterinary services strengthened to lead the development and management of the animal health systems to prevent, detect and control HPAI and other animal diseases.

Activity 2.1: Facilitation of the process of strengthening the public veterinary services through joint activities with the private sector such as: trainings, seminars, meetings, workshops and working committees.

Facilitate the establishment of PPP between the government and commercial poultry industry modelled on the US National Poultry Improvement Program to gain more coordinated and broad-based approach to poultry health (workshop).

Activity 2.2: Facilitate collaborative planning between DKI Jakarta (special zone) government and the private sector on implementation of the DKI market restructuring programme, and

assist the government to minimise the negative impact of poultry market restructuring on poultry producers, traders and consumers

- Assess poultry market chain in DKI Jakarta and make recommendations on the facilities required to meet supply and demand under the restructured market system.
- Assess the potential impact that restructuring will have on the livelihoods of slaughterers, brokers, traders and vendors of live poultry through focus group discussion.
- Facilitate the establishment of a working group, which includes representatives from key interest groups as well as national and local government, charged with the task of designing and implementing the government's transition plan.
- Assist the DKI Jakarta government in the process of establishing the proposed new six slaughter houses, possibly through links with the poultry industry.

Output 3: The lessons learnt from cases of PPP in key areas of disease control (vaccination, compensation, biosecurity) available for replication.

Activity 3.1 Writing case studies of PPP initiatives.

Output 4: Forums and networks of public-private stakeholders are in place for enhanced communication, education, information dissemination and awareness for HPAI and other animal diseases prevention, detection and control

Activity 4.1: Establishment of committees and working groups.

- Establish committees and working groups.
- Facilitate the establishment of and support the National Poultry Quality Improvement Programme.
- Facilitate the establishment of and support a DKI market restructuring working group.

Activity 4.2: Production of communication materials.

Develop a communication strategy for stakeholders affected by DKI market restructuring.

Activities undertaken during the reporting period

BANGLADESH

Output 1: Roles of the stakeholders of public and private sectors involved in the poultry production and marketing chains in the control of HPAI and other animal diseases assessed, clearly defined, distributed and agreed

Activity 1.1: Review of current level of partnership between the public services and private sector (needs, actors, resources available) at national level.

- Meetings were held with various stakeholders such as Animal Health Companies Association of Bangladesh (AHCAB), Bangladesh Poultry Industries Association (BPIA), Polygon Co-operative Feed Mill and Renata Pharmaceuticals, Ltd. to discuss on the way forward with PPP. The identified fields are as follows:
 - PPP compensation plan. (since insurance is not a feasible option);
 - PPP committee at the Department of Livestock Services (DLS) for policy development and adaptation (currently DLS develops policy without any consultation with stakeholders and private sector is forced to comply);
 - PPP committee for program continuity and sustainability at BPIA;

- PPP laboratory facilities accessible to farmers;
- PPP co-operative feed mills & hatchery;
- PPP controlled supply chain network for equal contribution;
- PPP training sessions for specific sectors;
- PPP committee for price fixation of poultry product;
- PPP collection committee of contributions to compensation/development;
- PPP decentralized committee for health services to farmers;
- PPP policy adaptation committee;
- PPP quality assurance committee.

Activity 1.2 Review of related legislation and regulatory framework.

In-country pre-existing animal health legislative and regulatory framework are regularly reviewed on the respective roles of the public-private sectors.

Activity 1.3 Revisiting of roles and responsibilities.

- The roles and tasks of public veterinary services/private veterinary services/producers and sellers were clearly defined.
- Personnel from the public, private or other sectors were identified as the most suitable for the performance of the roles in poultry diseases prevention and control.
- Eleven training workshops on biosecurity, each with 50 participants, were conducted for poultry suppliers throughout the country.
- Participants were selected by BPIA among poultry suppliers based on the following criteria: active poultry suppliers; supply at least 15 farms; willing to actively share biosecurity knowledge with farmers; and, with minimum secondary school certificates.
- The guidelines on biosecurity were endorsed by the Director General of the Department of Livestock Services (DG-DLS) in December 2009. Final endorsement by the Ministry of Fishery and Livestock is under process.

Output 2: The capacity of the public veterinary services strengthened to lead the development and management of the Animal Health Systems to prevent, detect and control HPAI and other animal diseases

Activity 2.1: Facilitation for leadership and vision in public veterinary services for improved national animal health systems

- Auditing exercises for the DLS are being formulated to improve biosecurity. A meeting was held with SGS Bangladesh (a biosecurity auditing company) and DLS training division regarding biosecurity auditing practices. It was suggested that PPP team elaborate a plan for biosecurity auditing and organize training for senior level DLS veterinarians so that these senior officials will be able to act as instructors for field level DLS veterinarians.
- A biosecurity training for the Poultry Industry Suppliers throughout the country is in progress. Eleven out of 17 planned training has been so far implemented during the reporting period. Extra sessions approved in response to the request of BPIA. The first training for poultry suppliers has been successfully completed in five divisions (Chittagong, Sylhet, Barishal, Khulna, and Rajshahi) and partly Rangpur. In these

training, 498 poultry industry suppliers were trained to enable them to communicate to about 4 000 commercial poultry farmers. During the training sessions, active discussions on issues relating to their associations were held in the presence of a local public official. This meeting has resulted in greater interaction and strengthening of relationships among the poultry associations and their members. Furthermore, this activity has provided strong advocacy for the PPP project in Bangladesh as evidenced by media coverage.

Output 3: The lessons learnt from cases of PPP in key areas of disease control (vaccination, compensation, biosecurity) available for replication

Activity 3.1: Implementing a socio-economic study in a LBM as a case study of PPP

The process of contracting out the socio-economic study at the live bird market in Mohammedpour to an NGO is in the final stage.

Output 4: Forums and networks of public-private stakeholders are in place for enhanced communication, education, information dissemination and awareness for HPAI and other animal disease prevention, detection and control

Activity 4.2: Setting up regular meetings and exchange of information

- The project manager from FAO attended the 16th Annual Conference of Bangladesh Society for Veterinary Education and Research (BSVER) held on 6 and 7 February 2010 at Bangladesh Agricultural University. During the conference, a symposium titled “**Public Private Partnership”: Development of Livestock Entrepreneurship in Bangladesh**” was held.
- The PPP project manager from FAO headquarters delivered a key note speech at the Conference titled “PPP: Development of Livestock Entrepreneurship”.
- The PPP activities were updated to provide information about the PPP project and the relevant activities, like poultry training materials, poultry technical information, upcoming events, etc at the website www.aitubd.org

EGYPT

Output 1: Roles of the public and private sector stakeholders involved in poultry production and marketing chains assessed and clearly defined, distributed and agreed upon to control HPAI and other animal diseases.

Activities 1.1 & 1.2: Review of current level of partnership between the public services and private sector (needs, actors, resources available) at national level, and Revisiting of roles and responsibilities.

These two activities have been completed during the previous quarters

Output 2: Capacity of the public veterinary services strengthened to lead the development and management of the Animal Health System to prevent, detect and control HPAI and other animal diseases.

Activity 2.1: Facilitation for leadership and vision in public veterinary services for improved national animal health systems.

The activities under this section have been revised and the focus has been shifted toward the private sector, such as poultry producers, service providers and feed-millers. Collaboration with these segments of the poultry industry aims at the formation of effective producers' networks and associations to enable better cooperation between producers and to better represent small farmers' interest within the poultry union. Other activities focus on capacity building and implementation of disease prevention and control measures against HPAI and other poultry diseases through series of training on biosecurity, cleaning, disinfection, and composting.

New training materials specifically for small scale commercial poultry producers of low level literacy have been developed and translated into Arabic. By the end of this quarter four out of the twenty-five planned training sessions for the Fayoum governorate have been successfully completed. The Fayoum directorate veterinarians' participated in these training sessions too.

Output 3: Lessons learned from cases of PPP in key areas of disease control (vaccination, compensation, biosecurity) available for replication.

Activity 3.2: Development, drafting and presentation of guidelines on cost-sharing compensation mechanism for culled animals:

The compensation plan developed by the public and private sectors with the facilitation of international consultant was submitted to the Minister of Agriculture for consideration. This proposed compensation strategy was widely discussed during the three days revision meeting in February 2010 of the national HPAI strategy plan.

Up to date the proposed compensation strategy has not been endorsed by the Minister of Agriculture, therefore the implementation of the compensation plan has not yet started. Recently the new CVO has been briefed about the proposed compensation strategy and intensive lobbying activity has been taken by the FAOR, assisted by the Emergency Centre for Transboundary Animal Diseases Operations (ECTAD) team leader.

Output 4: Forums and networks of public-private stakeholders in place for enhanced communication, education, information dissemination and awareness for the prevention, detection and control of HPAI and other animal diseases.

Activity 4.2: Setting up of exchange and communication platforms to facilitate interaction between public services and the private sector (discussions on animal health strategies, market mitigation measures, value chain biosecurity and social responsibilities).

The bi-weekly newsletter of the ECTAD published an article about the outcomes of the compensation workshops, technical materials and upcoming events.

Biosecurity communication materials are under development. Service providers and feed-mills in the Fayoum governorate have agreed to disseminate these communication materials to their customers. A monthly message will be attached to feed bags and distribute to all farms at the Fayoum governorate. These messages will serve as reinforcement to the information provided during the biosecurity training program in this governorate.

The formation of small poultry producers association has been strongly promoted and supported by FAO in the Fayoum governorate. The formation of this association will improve the collaboration between producers and be used as a platform for the dissemination of

information regarding the prevention and control of HPAI and other diseases. The formation and registration of such association is in process.

INDONESIA

Output 1: Roles of the stakeholders of public and private sectors involved in the poultry production and marketing chains in the control of HPAI and other animal diseases is assessed and clearly defined, distributed and agreed

Activity 1.1: Identification of public & private stakeholders at country level

The detailed organizational structure of the public sector and their relationship with the Ministry of Agriculture and the Directorate General of Livestock Services, their functional components and implementation framework from headquarters to the provinces, districts, and to the targeted farmers have been identified and mapped. A similar mapping exercise for the private sector is in process. So far, six fully integrated private poultry companies have been identified and the rest of the stakeholders in the private sector are now in the process of being identified.

Output 2: The capacity of the public veterinary services strengthened to lead the development and management of the animal health systems to prevent, detect and control of HPAI and other animal diseases

Activity 2.1: Facilitation of the process of strengthening the public veterinary services through joint activities with the private sector

Support for these activities on the National Poultry Quality Improvement Programme (NPQIP) by ECTAD Indonesia is ongoing. An Indonesian expert was successfully identified and recruited for the NPQIP Facilitation consultancy. The NPQIP Facilitator conducted interviews of stakeholders for NPQIP concept development in West Java, Lampung, and South Sulawesi provinces. Monthly coordination meetings on NPQIP progress were held between the United States Department of Agriculture and ECTAD Indonesia. A second individual to assist in NPQIP development was identified and will be recruited next quarter as a NPQIP Facilitator.

Activity 2.2: Facilitate collaborative planning between DKI Jakarta government and private sector on implementation of the DKI market restructuring programme, and assist the government to minimise the negative impact of poultry market restructuring on poultry producers, traders and consumers

Support for this program by ECTAD Indonesia is ongoing. The following activities were carried out during this quarter:

- Awareness raising
After the assessment of the perceptions of consumers and small traders regarding the risks of avian influenza and the benefits of healthy chicken meat, a proposal for an awareness-raising campaign has been prepared, submitted for financing and is expected to be approved soon. Two roundtable meetings with 22 media agencies have already been successfully conducted.
- Facilitation of relocation of collectors and slaughterers

- The social economic study has been finalized. Based on its recommendations specific standard operating procedures (SOP) for the relocation of the collectors and slaughterers were developed.
- ECTAD Indonesia continued promotion of DKI market restructuring with selected key stakeholders in DKI Jakarta:
 - SOPs for the management of the relocation centres and SOPs in Skills Development for the relocation centre users (collectors and slaughterers) were developed.
 - Training modules for the management teams were developed, tested and applied.
 - Training in competency development of collectors and slaughterers was also further developed.
- ECTAD Indonesia supported the finishing of small scale manual slaughterhouses in two of the five relocation centres.
- Regular consultations were held with the DKI Governor's office on strategic approaches to improve the likelihood of restructuring success.
- Sanctions and regulation
 - ECTAD Indonesia supported the DKI Jakarta livestock service (dinas) in developing an SOP for coordination among law-enforcement bodies for the implementation of the Jakarta Poultry Market Restructuring Decree (PERDA 4).
 - In collaboration with DKI Jakarta 'dinas', a first draft of a geographic roadmap showing drivers how to reach designated checkpoints and the five selected collection yards has been tested and partially approved.

Planned activities for the next quarter

BANGLADESH

Output 1: Roles of the stakeholders of public and private sectors involved in the poultry production and marketing chains in the control of HPAI and other animal diseases assessed clearly defined, distributed and agreed

Activity 1.1: Review of current level of partnership between the public services and private sector (needs, actors, resources available) at national level

Meeting with private stakeholders.

Output 2: The capacity of the public veterinary services strengthened to lead the development and management of the animal health systems to prevent, detect and control HPAI and other animal diseases

Activity 2.1: Facilitation for leadership and vision in public veterinary services for improved national animal health systems

- Workshop on further steps for the development of Biosecurity Guidelines for commercial poultry in Bangladesh.
- Training for biosecurity auditors for public veterinarians in June 2010.
- Continuation of the biosecurity training for the remaining four divisions of the Poultry Industry Suppliers in Bangladesh. An additional seven training workshops on

biosecurity shall be carried out.

- A total of 800 poultry industry suppliers including suppliers of poultry such as chicks, feed, medicine, farm equipment, etc will be directly trained who will then transmit the biosecurity knowledge through training for sharing of knowledge to about 10 000 commercial poultry farmers.

Output 3: The lessons learnt from cases of PPP in key areas of disease control (vaccination, compensation, biosecurity) available for replication

Activity 3.1: Implementing a socio-economic study in a LBM as a case study of PPP

Finalization and contracting out a socio-economic study to a NGO on a LBM which can be reproduced as a PPP case study. The study will be carried out under FAO team supervision.

Output 4: Forums and networks of public-private stakeholders are in place for enhanced communication, education, information dissemination and awareness of HPAI and other animal diseases prevention, detection and control

Activity 4.2: Setting up of regular meetings and exchange of information

Update technical information and upcoming events on the website.

EGYPT

Output 2: Capacity of the public veterinary services strengthened to lead the development and management of the Animal Health System to prevent, detect and control HPAI and other animal diseases.

Activity 2.1: Facilitation for leadership and vision in public veterinary services for improved national animal health systems.

- Completion of the biosecurity, decontamination and composting training program (additional twenty-four sessions) for poultry producers and government veterinarians at the Fayoum governorate. This training program will reach the majority of producers in this governorate.
- Assessment of the trainings' impact will be conducted in sampled farms.
- The FAO, PPP project will continue to support the formation of poultry association in the Fayoum governorate. The formation of this association will improve the collaboration between producers and be used as a platform for the dissemination and sharing of information regarding the prevention and control of HPAI, other diseases and any other matters of concern to the producers.
- Seven sessions of training on biosecurity, decontamination, vaccination, record keeping and production improvement will be conducted for large egg producing farms in seven governorates.
- An information sharing workshop on live bird market restructuring will be conducted for general Organization for Veterinary Services (GOVES) veterinarians and markets' operators. This workshop will provide participants with alternatives for market restructuring, based on the experienced gained in Bangladesh and Indonesia.

Output 4: Forums and networks of public-private stakeholders in place for enhanced communication, education, information dissemination and awareness for the prevention, detection and control of HPAI and other animal diseases.

Activity 4.2: Setting up of exchange and communication platforms to facilitate interaction between public services and the private sector (discussions on animal health strategies, market mitigation measures, value chain biosecurity and social responsibilities):

- Continue the collaboration with feed mills and services providers in the Fayoum governorate for the dissemination of biosecurity monthly messages and materials that will serve to reinforce the messages provided during training.

INDONESIA

Output 1: Roles of the stakeholders of public and private sectors involved in the poultry production and marketing chains in the control of HPAI and other animal diseases, is assessed and clearly defined, distributed and agreed

Activity 1.1: Review of current level of partnership between the public service and private sector (needs, actors, resources available) at national level

- Assessment of the private sector's current capacity in animal disease prevention and control (producers, farmers, private veterinarians and other service providers, traders, pharmaceutical suppliers/manufacturers).
- The final draft of public-private sector mapping will be completed next quarter.

Activity 1.3: Revisiting of roles and responsibilities

- A workshop to review the roles and responsibilities of public veterinary services/private veterinary services/producers and sellers in poultry diseases prevention and control will be organized.
- The potential for a workshop to prepare guidelines on roles and responsibilities of public veterinary services/private veterinary services/producers and sellers in poultry diseases prevention and control will be discussed with key stakeholders.

Output 2: The capacity of the public veterinary services strengthened to lead the development and management of animal health systems to prevent, detect and control HPAI and other animal diseases

Activity 2.1: Facilitate the process of strengthening the public veterinary services through joint activities with the private sector such as: trainings, seminars, meetings, workshops and working committees

Activity 2.2: Facilitate collaborative planning between DKI Jakarta government and private sector on implementation of the DKI market restructuring programme, and assist the government to minimize the negative impact of poultry market restructuring on poultry producers, traders and consumers

- Continue to encourage the public awareness campaign for promotion of healthy chicken meat via press conferences, talk shows, and organized visits to the marketing and slaughter areas in DKI Jakarta.
- Liaise with the DKI Governor's office and its administration to reconsider the critical deadline for relocation of live poultry slaughtering and the potential for postponement.
- Continue to support the development of SOPs related to the organization of the five collection yards and their management, as well as the training of the collectors and slaughterers.
- Continue to support the promotion of the collection yards with the collectors and

slaughterers in collaboration with the local administration.

- Collaborate closely with the private sector and the local administration in the restructuring of poultry distribution channels from the five collection yards to traditional markets, particularly regarding provision of cold chain.
- Continue to provide limited technical support to law enforcement units in view of the postponement of the relocation.

Output 3: The lessons learnt from the cases of PPP in key areas of disease control (vaccination, compensation, biosecurity) available for replication

Activity 3.1: Writing case studies of PPP initiatives

Initiation of the case study on the market restructuring project shall be undertaken after its implementation which is expected to start in April 2010.

Output 4: Forums and networks of public-private stakeholders are in place for enhanced communication, education, information dissemination and awareness for HPAI and other animal diseases prevention, detection and control

Activity 4.1: Establishment of committees and working groups

- Continue to support the establishment of NPQIP between public and private sectors.
- Continue to facilitate effective engagement among DKI Market restructuring stakeholders in both public and private sectors.

Activity 4.2: Production of communication materials

Initiate awareness-raising campaign for DKI restructuring using materials developed during this quarter.

Main challenges encountered and response provided

BANGLADESH

- Endorsement process by the Government is lengthy. The PPP team actively met with DLS to address the difficulties.
- Due to the short duration of the project, the follow-up of trainings cannot be done properly.

EGYPT

- Limited collaboration between the poultry companies and small involvement in the development or commenting about the biosecurity guideline for the commercial sector. Future activities will focus on the needs of this sector to ensure better engagement.
- Meantime the biosecurity guideline will be presented to the new CVO for endorsement and implementation.
- Difficulties in identifying experienced national communication experts.
- The compensation plan developed by the public and private sectors in Egypt with the FAO facilitation, has not been endorsed and implemented by the Minister of agriculture and land reclamation. An intense lobbying activity by the FAOR and the ECTAD team leader has initiated to promote the adoption of this compensation plan.

INDONESIA

- The lack of any meaningful business or subsector association for stakeholders in the post-production poultry market chain has significantly hampered the development of agreement and coordination amongst these stakeholders. At the same time, critical private- and state-companies continue to show limited understanding/collaboration on a more “comprehensive” implementation of the necessary changes to Jakarta’s poultry marketing systems. In response to these challenges, ECTAD Indonesia continues to engage closely with both private (small-scale and large-scale) and public sector stakeholders to develop a ‘win-win’ implementation strategy. ECTAD Indonesia is initiating an awareness-raising campaign to help raise public support for market restructuring in the next quarter.
- ECTAD Indonesia has been dealing with the major setback of no longer having an NGO available to contract for implementation of the Tangerang market interventions programme. The ECTAD team is continuing to recruit additional staff and provide additional operational support in order to manage the increased workload that the Tangerang programme entails.

Both the transition to a national veterinary service and the national poultry quality improvement programme are activities which require full engagement and leadership from Indonesian stakeholders. As such, activity implementation in these areas may be delayed (e.g. workshops on the role of the public and private sector in delivery of veterinary services), until FAO’s Indonesian counterparts assume process ownership.

Main progress made towards the achievement of project outcomes *(from the start of the project activities)*

BANGLADESH

- Development of biosecurity guideline for commercial poultry in Bangladesh. The workshop from 20 to 22 October 2009 resulted in the preparation of a national biosecurity document by FAO and DLS. The biosecurity guidelines from this document are expected to be implemented soon.
- Biosecurity training provided to the poultry industry suppliers of commercial poultry. The trained participants have already started participating in the information sharing network.
- DLS agreed to train their senior veterinarians on good biosecurity auditing practices.

EGYPT

- The roles of the public and private sector stakeholders involved in poultry production and marketing chains in Egypt and the level of collaboration between the sectors were assessed and clearly defined and mapped.
- The compensation programme developed and submitted to the Ministry of Agriculture for consideration and implementation. This program will be considered as well during review of the national strategy that will be developed following the UN Joint mission that assessed past work/strategy in Egypt.
- A draft national biosecurity guideline for the commercial poultry sector has been prepared and has been circulated for further comments and refinement.
- A biosecurity training program for the small poultry producers of the Fayoum governorate has been developed and four out of twenty-five sessions have been delivered

- The formation of poultry association in the Fayoum governorate has been promoted and supported.
- Collaboration between service providers and feed mills has been established for the formation of producers' networks and delivery of communication materials.

INDONESIA

- The recruitment of the national consultant has resulted in greater engagement and collaboration with the public and private sector on their respective roles in poultry production, market chains and disease control. The stakeholders in the public sector have been fully identified and the identification of private sector stakeholders has started.
- The initial meeting of representatives from the poultry industry and the government was completed with the development of the roadmap document for the formation of NPQIP. The NPQIP concept and design continues to evolve along with strong interest from private sector stakeholders.
- DKI Jakarta's market chain and the potential impact of market restructuring on private sector stakeholders' livelihoods have been assessed and specific strategic recommendations have been made by ECTAD Indonesia to DKI Jakarta provincial government. These recommendations have been incorporated into DKI Jakarta's planning and strategy development for market restructuring implementation.
- Selected strategy recommendations to improve the DKI market restructuring process are being implemented by both public and private sector stakeholders.
- A study tour to better understand poultry marketing in Viet Nam and Hong Kong has been undertaken. It is hoped that this exchange will develop into more regular exchange of experiences between Indonesia, Viet Nam and Hong Kong on sustainable measures for control and prevention of H5N1.
- A more comprehensive and participatory planning and implementation process for the DKI Jakarta poultry market restructuring is now in place, taking into account the needs and expectations of the existing small-scale collectors and slaughterers.
- An awareness-raising campaign has been developed and has been launched by the DKI Jakarta leadership and will be followed by a series of media events and field activities.
- Trial activities on law enforcement and police preparation are being undertaken through regular checkpoint control operations.

IDENTIFY | FAO

BIANNUAL REPORT

(SIX-MONTHLY PROGRESS REPORT)

REPORTING PERIOD 1 OCTOBER 2011 – 31 MARCH 2012

PLANNED ACTIVITIES 1 APRIL 2012 – 30 SEPTEMBER 2012

TO BE SUBMITTED TO:

UNITED STATES AGENCY FOR INTERNATIONAL DEVELOPMENT

UNDER COOPERATIVE AGREEMENT

SUBMITTED BY

IDENTIFY PROJECT PARTNER: FAO

Regional component: Global/Inter-regional
Three hot spot areas (with countries) : <ul style="list-style-type: none"> • Congo Basin: Uganda, Democratic Republic of the Congo, Cameroon, Republic of Congo, Tanzania, Gabon, Equatorial Guinea, Rwanda, Central African Republic, South Sudan • Southeast Asia: Cambodia, China, Indonesia*, Lao People's Democratic Republic, Malaysia, Myanmar,* Philippines, Thailand, Viet Nam • South Asia: Bangladesh, India, Nepal (future activities pending)
Project title: Support for strengthening animal health laboratory capacities in hot spot regions to combat zoonotic diseases that pose a significant public health threat - IDENTIFY
Code: OSRO/INT/902/USA
Total budget: USD 15 419 371 (of which USD 11 919 371 were allocated for implementation of activities by FAO, and USD 3 500 000 were allocated for implementation of activities by OIE through funds transferred by FAO to OIE as per the Letter of Agreement). The activities of OIE will be reported on separately.
Effective starting date: 1 October 2009
Planned end date: 30 September 2012 (31 December 2012 for the FAO project)
Context of the project This project is part of a complex programme – Emerging Pandemic Threats (EPT) – designed by the United States Agency for International Development (USAID) and aimed to identify and implement mechanisms to detect disease emergencies, especially from wildlife. The One Health concept is an important component of the whole programme. The IDENTIFY project is implemented jointly by the Food and Agriculture Organization of the United Nations (FAO), the World Organisation for Animal Health (OIE) and the World Health Organization (WHO).
Objectives of the project <ul style="list-style-type: none"> • Enhance laboratories' ability to detect – to the appropriate level of characterization for the laboratories' capability – IDENTIFY targeted diseases¹ • Enhance/support laboratories' timely reporting of IDENTIFY targeted diseases to national authorities, in support of their official notification to the appropriate regional and international organizations • Laboratories have adopted or improved Quality Assurance practices, inclusive of biosafety and biosecurity measures, and a comprehensive Quality Management System • Laboratories are participating in relevant regional and international laboratory networks according to their respective abilities, disease priorities and responsibilities
Short summary of main activities planned (1 October 2011 – 30 September 2012) Main activity headings are as follows – for further details, please refer to the FAO IDENTIFY Year Three Work Plan: Output 1. Capacity of national animal health laboratories to detect and diagnose diseases under a quality management system enhanced 1.A Follow-up of laboratory mapping exercise activities 1.B Support to and participation in conferences, trainings or workshops related to laboratory capacity building, and national laboratory policies, guidelines and standards 1.C Develop and conduct trainings or workshops to build laboratory capacity and to promote

*Indonesia and Myanmar are included in regional activities under separate funding.

¹ "IDENTIFY targeted disease" indicates those diseases selected at the regional level for support under IDENTIFY. Some IDENTIFY laboratories have no mandate/interest to detect all IDENTIFY targeted diseases and data will not be reported for diseases in those cases.

national laboratory policies and guidelines

1.D Promote and support laboratory quality management

1.E Provide laboratory equipment and supplies in a coordinated manner

Output 2. Linkages and communication pathways across national, regional and global laboratory and epidemiologic networks for the management of emerging zoonotic pathogens strengthened

2.A Communication tool development and resource building

2.B Development of joint meetings and conferences to support networking and promote national laboratory policies

2.C Review and update of the tripartite Laboratory Networking Strategy (LNS) and future planning

2.D Engage with stakeholders to support the development of cross-sectoral approach(es) concerning laboratories

2.E Support and promote laboratory networks

2.F Support and promote laboratory partnerships

TABLE OF CONTENTS

1	Activities undertaken during the reporting period (1 October 2011 – 31 March 2012) and Planned activities for the next reporting period (1 April 2012 – 30 September 2012)	6
1.1	ACTIVITIES Global component (FAO headquarters and FAO/IAEA)	6
2	Activities undertaken during the reporting period (1 October 2011 – 31 March 2012) and Planned activities for the next six-month period (1 April 2012 – 30 September 2012)	14
2.1	ACTIVITIES South/Southeast Asia component	14
3	Activities undertaken during the reporting period (1 October 2011 – 31 March 2012) and Planned activities for the next six-month period (1 April 2012 – 30 September 2012)	20
3.1	ACTIVITIES Congo Basin component	20
4	Main challenges encountered and response provided	26
5	Main progress made towards the achievement of project outcomes (from the start of the project activities)	27

1 ACTIVITIES UNDERTAKEN DURING THE REPORTING PERIOD (1 OCTOBER 2011 – 31 MARCH 2012) AND PLANNED ACTIVITIES FOR THE NEXT REPORTING PERIOD (1 APRIL 2012 – 30 SEPTEMBER 2012)

1.1 ACTIVITIES GLOBAL COMPONENT (FAO HEADQUARTERS AND FAO/IAEA)

Output 1. Capacity of national animal health laboratories to detect and diagnose diseases under a quality management system enhanced

1.A.G Follow-up of laboratory mapping exercise activities

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- The Food and Agriculture Organization of the United Nations (FAO) laboratory mapping tool (LMT) was harmonized across Asia and Africa regions. A final version of the tool was produced, and comprises five modules. The tool can be used as a whole, or in part, by focusing on just one or more modules. Before finalization of the tool, an expert-based opinion survey was conducted for ranking of the elements; no need for the weighting of elements was identified. *1.A.6.G*
- All data obtained with the LMT was compiled and analysed at headquarters for production of an overall report on the status of IDENTIFY laboratories, and for the monitoring and evaluation (M&E) and the United States Agency for International Development (USAID) data call.

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- Produce an overall report on the status of IDENTIFY laboratories supported by FAO. *1.A.4.G*
- Develop specific modules for LMT to ease independent application of specific modules, for example, disease-targeted modules and a module to measure the project's impact on laboratory functionality. *1.A.6.G*
- Compare historic disease reporting data (FAO Global Animal Disease Information System [EMPRES-i]) with current data for sentinel diseases, to be determined by region. *1.A.1.G*
- Improve data collection from FAO Reference Centres. *1.A.3.G*
- Identify regional service laboratories by disease focus, based on the outcomes of laboratory mapping. *1.A.5.G*

1.B.G Support to and participation in conferences, trainings or workshops related to laboratory capacity building, and national laboratory policies, guidelines and standards

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- None

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- Support to three to four participants from South/Southeast Asia and the Congo Basin to attend the 13th Conference of the International Society for Veterinary Epidemiology and Economics (ISVEE XII), from 20 to 24 August 2012 in Maastricht, the Netherlands. The conference will focus on Building Bridges - Crossing Borders.

1.C.G Develop and conduct trainings or workshops to build laboratory capacity and to promote national laboratory policies and guidelines

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- Contract (Letter of Agreement [LoA]) with *France Vétérinaire Internationale* was prepared to provide trainings in Africa in various expert fields (mostly trainings in French) and submitted for internal clearance.
- Contract (LoA) with *Istituto Zooprofilattico Sperimentale delle Venezie (IZSVe)*, Padova was prepared and submitted for internal clearance. Its requirements are to provide on-site technical assistance for rabies diagnosis (DRC, Cameroon and Uganda) and testing services, and to contribute to the work on provision of access of sub-Saharan African laboratories to sequencing services.
- A workshop on Classical and Molecular Veterinary Virology was held in Vienna from 28 November to 9 December 2011. Ten participants from the Congo Basin (Kenya, Senegal, Tanzania and Uganda) and Southeast Asia (Indonesia, LAO PDR, Malaysia, Philippines, Thailand and Viet Nam) attended the workshop. It was jointly organized by the International Atomic Energy Agency (IAEA), FAO, the University of Veterinary Medicine, Vienna, and the European Society for Veterinary Virology (ESVV) (co-funded by the European Commission projects EPIZONE, ConFluTech and AniBioThrea). The workshop covered the topics of molecular techniques and classical virology. The participants were able to better understand the benefits of classical and molecular technologies, and their laboratory proficiencies were enhanced. *1.C.3.G.*
- Organizational support was provided for the South/Southeast Asia regional workshop, Laboratory Information Management Systems: Identifying Needs, Resources and Ways Forward in Thailand on 8 and 9 December 2011. *1.C.1.G* and *linked to global activity 2.A.4.G.*
- Preparation of training workshops and a consultation:
 - Regional training course on Major Transboundary and Zoonotic Animal Diseases: Early Detection, Surveillance and Epidemiology (*1.C.4.G*), *Laboratoire National Vétérinaire (LANAVET)*, GAROUA (Cameroon), from 11 to 22 June 2012. The following activities were carried out: drafting of the prospectus, discussions (i.e. teleconferences and email exchanges) on the course content with selected trainers, contacts established (i.e. at the training location, the Emergency Centre for Transboundary Animal Diseases (ECTAD) Bamako and Nairobi and the FAO headquarters). Location and dates were confirmed, and the host country officially contacted by IAEA. The invited countries are: Cameroon, Central African Republic, Democratic Republic of the Congo, Equatorial Guinea, Ethiopia, Gabon, Rwanda, South Sudan, Tanzania and Uganda .
Regional training course on Major Transboundary and Zoonotic Animal Diseases in the Region: early Detection, Surveillance and Epidemiology for Asia region (*1.C.5.SSEA*) decision to replace it with a training course on Sequencing and Sequence Analysis in Vienna in October 2012.
Consultation on Good Laboratory Practices for Conducting Multiple Disease Diagnosis (*1.C.5.G*): Terms of reference (ToR) were drafted, and location and date confirmed (Vienna, September 2012).
- Validation and transfer of new techniques for multiple disease diagnosis (polymerase chain reaction [PCR] using the fluorescence resonance energy transfer [FRET] system) *1.C.6.G*
- A method developed at the Animal Production and Health Laboratory (APHL) of the joint FAO/IAEA Division for capripoxvirus detection and differentiation was taught to the participants of the workshop on Classical and Molecular Veterinary Virology, from 28 November to 9 December 2011 in Vienna.

- Terms of collaboration were defined between APHL of the joint FAO/IAEA Division and Pathofinder (Dutch company) for the development of a multiple pathogen detection assay for major pathogens causing respiratory diseases and symptoms in ruminants. This project is only partially supported by IDENTIFY.

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- Conduct activities under the LoA with *France Vétérinaire International*. See also 1.C.2.C, 1.C.5.C, 1.C.4.C and 1.C.7.C
- Conduct activities under the LoA with *IZSVe, Padova*.
- Coordinate the three sessions of the regional training-of-trainers (TOT) pathology workshop Basics of Field and Laboratory Diagnosis in both regions. 1.C.2.G and linked to global activity 2.A.2.G
- Conduct regional training course on Major Transboundary and Zoonotic Animal Diseases: early Detection, Surveillance and Epidemiology, focusing on African Swine Fever, capripox and rabies (LANAVET, GAROUA (Cameroon), from 11 to 22 June 2012). 1.C.4.G
 - Teach the variant FRET method developed at APHL of the joint FAO/IAEA Division for which a prototype kit has been made. Distribute this prototype to participants for testing and validation of the assay. 1.C.6.G
- Hold consultation on good laboratory practices for conducting multiple disease diagnosis (September 2012, Vienna). 1.C.5.G
- Carry out validation and transfer of new techniques for multiple disease diagnosis (PCR using the FRET system). The following laboratories are targeted: the National Animal Health Diagnostic Investigation Centre and the Pan-African Veterinary Vaccine Centre in Ethiopia and LANAVET in Cameroon. 1.C.6.G
 - Undertake the final discussion with Pathofinder and first steps of the development of the multiple pathogens detection assay for the major pathogens causing respiratory diseases and symptoms in ruminants.

1.D.G Promote and support laboratory quality management

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- Preparation of proficiency testing. 1.D.3.G:
 - For Rift Valley fever (RVF): serology kits were delivered to the FAO/IAEA joint Division; proficiency panels were prepared and ready for shipment.
 - For peste des petits ruminants (PPR): proficiency panels were prepared.
- Access to standardized veterinary diagnostic reagents and international standards, training on recombinant RVF antigens and sera anti-RVF production (South Africa), discussion and agreement with the National Institute for Communicable Diseases (NICD), South Africa on the period and duration of the training on production of recombinant RVF antigens and anti-RVF antisera. The beneficiary countries were Senegal and Kenya. 1.D.5.G

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- Provide support to the activities under the LoA with France Vétérinaire International: on-site audit/backstopping missions for: (i) assessing quality assurance system implementation in the Democratic Republic of the Congo, the Central African Republic, the Republic of the Congo, Rwanda, Tanzania and Uganda; and (ii) assessing biosecurity and biosafety in Cameroon and the Democratic Republic of the Congo. linked to regional activity 1.D.2.C

- Provide support to the activities under the LoA with IZSVe, Padova: avian influenza (AI)/Newcastle Disease (ND) proficiency test organized. 1.D.3.G
- Provide standardized veterinary diagnostic reagents and international standards in a coordinated manner. 1.D.5.G
- External Quality Assurance for targeted diseases.1.D.3.G:
 - Deliver RVF kits and RFV and PPR proficiency panels to selected laboratories (Cameroon, the Central African Republic, the Republic of the Congo, the Democratic Republic of the Congo, Ethiopia, Gabon, Kenya, Rwanda, Tanzania and Uganda) for testing.
- Organize training on Recombinant RVF antigens and biologicals production (South Africa, one month between July and October 2012) for each of two scientists to be selected from Kenya and Senegal). 1.D.5.G
- Sign an IAEA Technical contract with a laboratory (to be selected in the Congo basin region) for serum production to create the PPR reference sera bank at the FAO/IAEA Division. 1.D.5.G

1.E.G Provide laboratory equipment and supplies in a coordinated manner

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- Checklist of a minimum supply established per list of IDENTIFY priority diseases and provided to the Congo basin region. *linked to regional activity 1.E.1.C*

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- Launch a tender for all Congo Basin countries for procurement of equipment and consumables. *linked to regional activity 1.E.1.C*

Output 2. Linkages and communication pathways across national, regional and global laboratory and epidemiologic networks for the management of emerging zoonotic pathogens strengthened

2.A.G Communication tool development and resource building

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- A glossary was developed consisting of the available diagnostic assays and cross-cutting technologies for selected animal diseases, including zoonoses: most chapters of the glossary written and validated by experts in the field. New name for the document: LabCards. AI LabCard was validated by the Joint OIE/FAO Network of Expertise for Animal Influenza (OFFLU) for posting on the OFFLU Web site. 2.A.3.G
- Basics of Field Pathology training manual was provided to the Congo Basin and South/Southeast Asia regions: the manuals will be distributed during the regional (African and Asian) TOT pathology workshops Basics of Field and Laboratory Diagnosis. 2.A.2.G linked to regional 2.A.2.C and 2.A.1.SSEA
- A road map and a self-assessment tool for laboratories to identify the elements needed for a laboratory information management system (LIMS) were developed at FAO headquarters together with the Australian Animal Health Laboratory (AAHL) to critically review the individual laboratory needs, infrastructure and resources needed for successful implementation and sustainability of LIMS platform, and to establish guidelines for selection of a "fit-for-purpose" LIMS platform. These tools were piloted and delivered to laboratory managers during the South/Southeast Asia workshop in December 2011 (refer to 1.C SSEA) 2.A.4.G

- EMPRES-i genetic module: second phase of collaboration with the Swiss Institute of Bioinformatics started (LoA, November 2011-June 2012). Production phase of the work was initiated. Linkages were validated between the virus and epidemiological information for H5N1 (tentatively). Applications and tools of the module are under discussion. A supportive tool was offered to the FLURISK project (EFSA pandemic influenza Risk Assessment project). 2.A.5.G
- Access to sequencing services to Africa laboratories 2.A.7.G:
 - Concept note on harmonization of molecular tests and provision of access to sequencing services to Africa laboratories were developed.
 - Meeting at FAO headquarters on Improving Sequencing Access for sub-Saharan African Laboratories, Rome (10 February 2012) with 14 participants including six scientists from three FAO Reference Centres, the IDENTIFY coordinator from the joint FAO/IAEA division, IDENTIFY|FAO regional coordinators from Bamako and Nairobi, and HQ IDENTIFY|FAO management team.
 - Major OUTCOMES: Beneficiary laboratories for the improved access to sequencing services were selected; work plan and coordination between the different partners were established; training objectives and logistics, as well as the modalities for the submission of samples for sequencing, procurement and tender needs were discussed.
 - Available protocols for PCR diagnosis and sequencing for the priority pathogens targeted in the Congo Basin was compared across the three FAO Reference Centres with the aim to harmonize protocols for multiple diseases testing. Beneficiary laboratories were informed, and baseline information on PCR testing and sequencing was requested.
- Development of e-learning modules on bioinformatics (phylogeny and sequence analysis) was initiated with the partner (Swiss Institute of Bioinformatics). 2.A.6.G
 - A first draft containing the Chapter 1 of 3 was discussed between the Joint FAO/IAEA division, FAO headquarters and the Swiss Institute of Bioinformatics.

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- Finalize translation in French of the Basics of Field Pathology training manual, and distribute to French-speaking Congo basin TOT pathology workshop attendees of the Basics of Field and Laboratory Diagnosis. 2.A.2.G, linked to regional 1.C.4.C and 2.A.2.C
- Finalize all chapters of the LabCards and disseminate them to laboratories. 2.A.3.G
- Present EMPRES-i genetic module at the AI Symposium and OFFLU technical meeting for comments and future use by the scientific community. Support a master student from Viet Nam on the use of the EMPRES-i genetic module with a focus on Vietnamese H5N1 data. Validate the developed algorithm. Launch the genetic module to the public. Publish the work. 2.A.5.G
- Access to sequencing services to Africa laboratories 2.A.7.G: develop and test harmonized protocols for PCR diagnosis and sequencing. Procure reagents for PCR and preparation of products for sequencing. Develop decision trees and sequencing strategy. Carry out workshop for laboratory and epidemiology staff on PCR protocols, sequencing and bioinformatics. Tender and select sequencing provider for provision of sequencing services. Develop a moderator system for sequencing services. Promote sharing of results.
- Finalize the two e-learning modules on bioinformatics (phylogeny and sequence analysis). 2.A.6.G

2.B.G Development of joint meetings and conferences to support networking and promote national laboratory policies

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- Supported the preparation and co-funding of the Western and Central Africa Veterinary Laboratory Network for Avian Influenza and other Transboundary Animal Diseases (RESOLAB) Annual coordination meeting (from 6 to 9 December 2011, Bamako, Mali). FAO/IAEA coordinator participated in the meeting. linked to regional 2.B.C

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- Support to the preparation of the East Africa Regional Laboratory Network (EARLN) meeting (Mombasa, July 2012). linked to regional 2.B.C

2.C.G Review and update of the Laboratory Networking Strategy and future planning

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- Routine project management at headquarters and regional levels continued through conference calls/videoconferences as needed, daily email communication and tripartite face-to-face meetings between FAO, OIE and the World Health Organization (WHO) as well as the use of the IDENTIFY SharePoint.
- Participation in monthly teleconferences with IDENTIFY project management team and USAID Agreement Officer's Technical Representative on 9 March 2012 and 10 April 2012, and face-to-face meeting on 17 January 2012.
- Continued rotating system of responsibility sharing on a monthly basis between the three partners to more effectively and rapidly handle communication with programme partners, day-to-day operations and logistic arrangements. This system also applies to document creation, revision and meeting hosting.
- IDENTIFY|FAO planning meeting with the FAO project management team, the FAO/IAEA coordinator and the FAO regional coordinators from Bamako, Nairobi and Gaborone (via teleconference) in Rome on 8 and 9 February 2012; The IDENTIFY|FAO activities were planned for the coming eight months.
- IDENTIFY project planning was discussed during the following meetings:
 - Tripartite headquarters meeting on the monitoring and evaluation process and Year 12-13 planning on 17 January 2012, Washington, DC; Tripartite headquarters' meeting on the monitoring and evaluations process and IDENTIFY indicators, Paris, France, 16 February 2012.
 - Emerging Pandemic Threats (EPT) Quarterly Partners meeting, Washington, DC, from 18 to 20 January 2012.

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- Routine project management at headquarters and regional levels continued.
- Participation of the IDENTIFY |FAO management team to the Congo basin IDENTIFY|FAO planning meetings, tentatively planned on 12 and 13 July 2012.
- Participation (tentative) of the IDENTIFY |FAO management team to the Congo basin and S/SE Asia Regional EPT planning meetings, July 2012.
- Moreover, project planning will be discussed during the following meetings:
 - USAID and Tripartite Meeting to discuss IDENTIFY, Rome, on 20 and 21 June 2012.

2.D.G Engage with stakeholders to support the development of cross-sectoral approach(es) concerning laboratories

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- Four-way linking for assessing health risks at the human-animal interface. *2.D.2.G:*
 - Planning mission carried out in Viet Nam (on 17 and 18 October 2011) to prepare the concept, agenda and logistics for the four-way linking workshop in Viet Nam, in collaboration with local FAO and WHO offices.
 - Viet Nam FAO/OIE/WHO workshop was conducted in Nha Trang, from 14 to 16 February 2012 for 26 Vietnamese participants from the animal health sector. OUTCOMES: communication, information sharing and joint risk assessment were the main gaps identified. Next steps for national, regional and provincial level on communication, data sharing and joint risk assessment for Highly Pathogenic Avian Influenza (HPAI) were developed.
 - Presentation of a four-way linking concept given at the Meeting on Laboratory Strengthening for Emerging Infectious Diseases Diagnosis in Asia Pacific (October 2011 in Kuala Lumpur, Malaysia).
- FAO headquarters and FAO/IAEA provided assistance to the regional preparation of the Congo Basin National Veterinary Laboratories' Directors and Central Veterinary Officers (CVOs)/FAO planning meeting in Libreville, Gabon, from 3 to 5 April 2012, and Entebbe, Uganda, from 11 to 13 April 2012.

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- Four-way linking in Bangladesh: review mission in July 2012 and workshop in October 2012. *2.D.2.G*
- Attend the Congo Basin National Veterinary Laboratories' Directors and CVOs/FAO planning meeting in Gabon, from 3 to 5 April 2012, and Entebbe, Uganda, from 11 to 13 April 2012.

2.E.G Support and promote laboratory networks

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- Inventory of training material in animal influenza was validated and made available on the OFFLU Web site.
- Contributed to the WHO VCM Meeting consultation (December 2011) aimed to improve the influenza vaccine virus selection process through: exploring ways to improve the extent, timeliness and quality of virological and epidemiological surveillance data; the development and application of new assays and new modelling approaches; the understanding of the relationship between virus characteristics and vaccine efficacy, and the general understanding of regulatory considerations. OFFLU activities were presented to the participants of the public health sector to show animal health involvement in pandemic preparedness.
- Contributed to the WHO Vaccine Composition meeting from 20 to 22 February 2012, WHO headquarters, Geneva by collecting and compiling epidemiological analysis, genetic and antigenic data. In September 2011, OFFLU shared new and previously unreported sequences from Bangladesh, Egypt, India, Indonesia, Israel, Lao PDR, Myanmar and Viet Nam (clades 1, 2.1.3, 2.2, 2.2.1, 2.3.2, 2.3.4) with the VCM. The report included 245 H5 sequences (120 non-public and 12 public domain sequences from 2011; 113 non-public 2009–2011). For H9, the OFFLU network contributed 20 pre-2011 sequences (majority from 2009), and one 2011 sequence from Bangladesh. Among these viruses, one was selected by WHO for candidate vaccine virus preparation (clade 2.3.4.2 A/chicken/Bangladesh/11rs1984-30/2011). FAO

requested the transfer of the strain from Italy to the United States Centers for Disease Control (US CDC). The agreement was provided by Bangladesh, and the strain transferred from IZSve to US CDC.

- Support and participation in the 2nd OFFLU Swine Influenza Virus (SIV) technical meeting, Paris, on 27 and 28 March 2012: FAO's contribution to global surveillance activities for SIV was presented, and next year activities for the SIV groups were planned.

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- Support the annual technical meeting of OFFLU on 4 and 5 April 2012, back-to-back with the 8th International Symposium on Avian Influenza, from 1 to 4 April 2012 (co-funding), London, UK.
- Finalize the development of the OFFLU training Web site, with various training materials.
- Contribute to the next WHO Vaccine Composition meeting (end of September 2012, China).

2.F.G Support and promote laboratory partnerships

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- Progress was made towards the designation of FAO Reference Centres in China, India, Kenya, South Africa and Thailand (government endorsement pending for most dossiers). 2.F.1.G
- Concept note was developed on the roles and responsibilities of regional service laboratories in sub-Saharan Africa and submitted to OIE and the African Union-Interafrican Bureau for Animal Resources (AU-IBAR) for discussion. 2.F.2.G

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- Support the organization of the regional meeting in Addis Ababa from 11 to 13 July 2012 to define the roles and responsibilities of regional service laboratories in sub-Saharan Africa with institutional, technical and funding partners. 2.F.2.G

2 ACTIVITIES UNDERTAKEN DURING THE REPORTING PERIOD (1 OCTOBER 2011 – 31 MARCH 2012) AND PLANNED ACTIVITIES FOR THE NEXT SIX-MONTH PERIOD (1 APRIL 2012 – 30 SEPTEMBER 2012)

2.1 ACTIVITIES SOUTH/SOUTHEAST ASIA COMPONENT

Output 1. Capacity of national animal health laboratories to detect and diagnose diseases under a quality management system enhanced

1.A.SSEA. Follow-up of laboratory mapping exercise activities

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- Refer to backstopping visits described in 1.D.SSEA in Lao PDR (National Animal Health Centre [NAHC]) on 6 and 7 October 2011, Cambodia (National Veterinary Research Institute [NaVRI]) from 10 to 12 October 2011, Malaysia (Veterinary Research Institute [VRI]) from 11 to 13 October, Thailand (National Institute of Animal Health [NIAH]) from 14 to 18 October, Viet Nam (Regional Animal Health Office Number 6 [RAHO 6]) on 20 and 21 October, and China (China Animal Health and Epidemiology Centre [CAHEC]) from 20 to 27 November 2011.

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- Compile/update relevant laboratory capacity data for the network and associated laboratories through the laboratory mapping exercise; implementing partner: AAHL.

1.B.SSEA. Support to and participation in conferences, trainings or workshops related to laboratory capacity building, and national laboratory policies, guidelines and standards

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- The 2nd OFFLU SIV Technical Meeting, on 27 and 28 March 2012 Paris, France: IDENTIFY provided the support for a specialist from NIAH, Thailand, and a specialist from the National Centre for Veterinary Diagnostics (NCVD)/Department of Animal Health (DAH), Viet Nam to attend the meeting. The meeting was to discuss the progress made and to work towards developing a better understanding of the global implications of influenza infection in swine at the human-animal influenza interface. The two participants were also given the opportunity to visit the Animal Health and Veterinary Laboratories Agency (AHVLA) Weybridge and the Institute for Animal Health (IAH) Pirbright laboratories in the United Kingdom on 29 and 30 March 2012.

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- The 8th Avian Influenza International Symposium, from 1 to 4 April 2012, London. The project provided support for three participants, including one participant from NIAH, Thailand, and two participants from DAH, Viet Nam to attend the conference. This conference was held for scientists, biologists, veterinarians, medics and government regulators interested in the exchange and discussion of current scientific information on AI. It intended to provide a broader understanding of the global nature of AI and a framework to develop international solutions.
- The OFFLU Annual Technical Meeting, on 4 and 5 April 2012, London, UK: Following the AI Symposium, three participants also attended the meeting that brings together the leading influenza experts from all over the world to present and discuss OFFLU's progress.

- The Asia-Pacific Biosafety Association's 7th Annual Biosafety Conference, Bali, Indonesia, from 24 to 27 April 2012: Under the support from the project, a Biosafety Officer and a Biosafety Engineer from VRI, Malaysia attended the two-day preconference workshop on 24 and 25 April and a two-day conference on 26 and 27 April 2012. This regional conference aimed at generating a formal exchange on various developments in biosafety, ranging from the strategic coalition and road map for the Asia-Pacific region to biosafety capability and capacity building in the region.

1.C.5SEA. Develop and conduct FAO/OIE/WHO trainings or workshops to build laboratory capacity and to promote national laboratory policies and guidelines

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- REGIONAL training: Advanced Biorisk Training, Geelong, Australia, from 14 to 18 November 2011. 1.C.1.SSEA:
 - With the priority given to participants who attended the Biosafety Management Training in 2011, out of ten participants, seven participants were from China, Malaysia, Thailand and Viet Nam, while three participants from India joined the training with the funding support from another project.
 - Implementing partner: AAHL.
 - OUTCOME: The trained-participants would become regional biosafety resource persons to provide technical support to other countries in the region.
- REGIONAL training: Laboratory Engineering and Equipment Maintenance Training, Geelong, Australia, from 21 to 25 November 2011:
 - With priority given to those who participated in the Biosafety Management Training in 2010, there were 13 participants from China, India, Lao PDR, Malaysia, Thailand and Viet Nam
 - Implementing partner: AAHL.
 - OUTCOME: The trained biosafety engineers would become regional resource persons to provide support to other countries in the region.
- REGIONAL workshop: Laboratory Information Management Systems: Identifying Needs, Resources, and Ways Forward in Phuket, Thailand, on 8 and 9 December 2011. 1.C.3.SSEA
 - The workshop was attended by 19 participants from national animal health laboratories in 11 countries of South and Southeast Asia;
 - Implementing partners: AAHL and CSU.
 - OUTCOME: A self-assessment tool to aid in determining individual laboratory needs for LIMS was piloted and delivered to laboratory managers for their use in decision making and creating an action plan on selection and implementation of a LIMS.

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- REGIONAL training, Laboratory and Field Epidemiology Linkage TOT Workshops: Basics of Field and Laboratory Diagnosis in Chiang Mai, Thailand, scheduled for 21-25 May 2012; implementing partner: the University of Georgia. 1.C.4.SSEA
- REGIONAL workshop, Laboratory and Field Epidemiology Linkage TOT: Strengthen Laboratory and Field Epidemiology Linkages. Schedule is to be confirmed; implementing partner: AAHL.
- REGIONAL workshops related to regional laboratory networking of selected regional priority diseases for Asia. Schedules are to be confirmed; implementing partner: AAHL.
- Provide consultancy on risk assessment, standard operating procedures development and training on biosafety management to network laboratories; implementing partners: international/national consultants and PREDICT.

1.D.SSEA. Promote and support laboratory quality management

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- Conducted backstopping missions to seven laboratories to ensure implementation of appropriate diagnostic protocols under a quality assurance system. During the visits to laboratories, AAHL laboratory experts provided the following inputs: (i) follow-up on proficiency testing results for PRRS, CSF and HPAI; (ii) trouble shooting technical problems revealed by proficiency testing results; (iii) in-house training on equipment usage and maintenance; (iv) follow-up on laboratory quality systems; (v) inputs on biosafety and biosecurity; and (vi) advocacy for laboratory support for surveillance. These missions were carried out at IDENTIFY-supported laboratories: NAHC in Lao PDR on 6 and 7 October 2011, NaVRI in Cambodia from 10 to 12 October, VRI in Malaysia from 11 to 13 October, NIAH in Thailand from 14 to 18 October, RAHO 6 in Viet Nam on 20 and 21 October, and CAHEC and the Chongqing Animal Disease Control Centre (CADCC) in China from 20 to 27 November 2011. *1.D.2.SSEA*
- Provided consultancy and technical assistance to activities related to the laboratory relocation and implementation of the Biosafety Level 3 (BSL3) facility at NAHC, Lao PDR (March-May 2012).
- Provided laboratory visits and technical consultation to assist development and implementation of laboratory quality management to the network laboratories: NAHC in Lao PDR from 22 to 24 November 2011, DAH in Viet Nam, from 18 to 20 December 2011, the Central Disease Investigation Laboratory [CDIL] in Bangladesh, on 25 January 2012, NAHC in Lao PDR on 22 March and on 29 and 30 March 2012, NaVRI in Viet Nam from 26 to 29 March 2012.

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- Continue to provide advice and technical assistance to activities related to the laboratory relocation and implementation of the BSL3 facility at NAHC, Lao PDR (March-May 2012).
- Provide biosafety cabinet testing and calibration to the network laboratories (Indonesia, Lao PDR, Myanmar, the Philippines and Viet Nam). *1.D.1.SSEA*.
- Provide consultation and facilitate the procurement/access of LIMS to the network laboratories (NIAH, Thailand, and NAHC, Lao PDR). *1.D.4.SSEA*
- Continue to facilitate proficiency testing programme for diagnosis of selected regional priority diseases and provide backstopping missions to the participating laboratories to ensure implementation of appropriate diagnostic protocols under a quality assurance system; implementing partner: AAHL. *1.D.6.SSEA*.
- Provide laboratory visits and technical consultation to assist development and implementation of laboratory quality management to the network laboratories. *1.D.2.SSEA*.

1.E.SSEA. Provide laboratory equipment and supplies in a coordinated manner

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- Two PCR cabinets were procured: one for CDIL, Bangladesh, and one for the Central Veterinary Laboratory, Nepal.
- Eight biosafety cabinets procured in August 2011 were delivered and installed at the laboratories in: Bangladesh (one), Cambodia (one) and Malaysia (two) in January 2012, and at the laboratory in Nepal (two) in February 2012. Two biosafety cabinets were delivered to the laboratory in Lao PDR in November 2011, and will be installed in the new laboratory.

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- Provide necessary supplies and equipment, based on the findings and recommendations of the biosafety assessment and cabinet testing activities, to ensure the proper biosafety containment and practices in the network laboratories.
- Provide standardized veterinary diagnostic reagents including proficiency testing panel complement, supplies and equipment as requested by the network laboratories, or recommended in support of the proficiency testing programme.

<p>Output 2 Linkages and communication pathways across national, regional and global laboratory and epidemiologic networks for the management of emerging zoonotic pathogens strengthened</p>
--

2.A.SSEA. Communication tool development and resource building

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- Supported production of IDENTIFY leaflets for distribution to participants attending FAO-organized meetings and workshops. 2.A.1.SSEA.
- Provided technical inputs and supported the implementation of EMPRES-i Asia platform to share expertise and information in a real-time manner across the network.
- Provided administration and information update to the AI Network Asia email list.

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- Continue to support the implementation of EMPRES-i and AI Network Asia.
- Provide the guidelines and documents related to diagnosis, management and control of transboundary animal diseases (TADs) as per requested Distribution of Basics of Field Pathology Training manual for trainers.
- Develop training materials for the laboratory – Field Epidemiology Linkage Training.

2.B.SSEA. Development of joint meetings and conferences to support networking and promote national laboratory policies

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- REGIONAL Laboratory Directors' Forum meeting and Regional Laboratory Network meeting. 2.B.1.SSEA: The Third Laboratory Directors' Forum was jointly organized by the Department of Veterinary Services Malaysia, FAO and OIE on 18 October 2011 in Kuala Lumpur, Malaysia. The meeting was attended by 35 participants from Cambodia, Lao PDR, Malaysia, Myanmar, Thailand and Viet Nam, NIAH Japan, AAHL, OIE and FAO. The Forum welcomed new members from China, Indonesia and the Philippines. The main objective of the meeting was to update the directors of key national laboratories on the ongoing activities related to laboratory capacity building and laboratory networking in Southeast Asia.
- Meeting on Laboratory Strengthening for Emerging Infectious Diseases Diagnosis in Asia and the Pacific was held from 19 to 21 October 2011 in Kuala Lumpur, Malaysia. The meeting was organized jointly by FAO/OIE/WHO. It was the first time that representatives from cross-sectoral groups, particularly the animal and public health, met to discuss laboratory issues in the region. The international organizations, FAO, OIE and WHO presented their frameworks for implementing the laboratory strengthening programme in the region: FAO Regional Strategy on Emerging Diseases, OIE Performance of Veterinary Services Pathway and WHO Western Pacific Region Asian Pacific Strategy for Emerging Diseases. Animal and public health sectors met to

discuss the issues related to strengthening capacities before convening on the third day for an information sharing session on One Health and cross-sectoral group work.

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- Regional Laboratory Technical Advisory Group meeting (June 2012, Bangkok, Thailand).
- The 4th Laboratory Directors' Forum meeting (July 2012, Viet Nam).
- Regional Laboratory Network meeting (September 2012, Viet Nam).

2.C.SSEA. Review and update of the tripartite Laboratory Networking Strategy and future planning

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- The IDENTIFY|FAO Southeast Asia coordinator together with the OIE IDENTIFY Southeast Asia coordinator participated in the tripartite 2012 EPT Lao PDR work plan review meeting on 23 November 2011 in Vientiane, Lao PDR.
- The IDENTIFY|FAO Southeast Asia coordinator participated in the 2012 EPT Thailand work plan review meeting on 6 February 2012 in Bangkok, Thailand.

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- The IDENTIFY|FAO Southeast Asia coordinator will participate in the 2nd Quarterly EPT Lao PDR Work Plan Review meeting to be held on 5 April 2012 in Vientiane, Lao PDR.
- Participation in the Regional EPT planning meeting, July 2012, and in the EPT country level work planning meetings (tentatively).

2.D.SSEA. Engage with stakeholders to support the development of cross-sectoral approach(es) concerning laboratories

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- Provided assistance and inputs on development of the Regional Framework for Animal Health Laboratory Capacity Building and Networking in Asia which was presented and adopted during the 3rd Laboratory Directors' Forum meeting (from 19 to 21 October 2012).
- Facilitated the development of ToR for roles and responsibilities of the regional leading laboratory for classical swine fever (CSF) (DAH, Viet Nam), foot-and-mouth disease (FMD) (Regional Reference Laboratory, Thailand) and HPAI (VRI, Malaysia), which was presented and agreed at the 3rd Laboratory Directors' Forum meeting (from 19 to 21 October 2012).

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- Provide technical assistance in preparation of the Regional Framework for Animal Health Laboratory Capacity Building and Networking in Asia to the Association of Southeast Asian Nations Sectoral Working Group on Livestock (ASWGL) in the upcoming ASWGL meeting in May 2012 in Myanmar.

2.E.SSEA. Support and promote laboratory networks

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- The IDENTIFY|FAO SE Asia Coordinator participated in and provided technical inputs to DAH Viet Nam 10th Epidemiology Laboratory Network Meeting from 19 to 21 December 2011 in Hanoi, Viet Nam. A total of 50 participants attended the meeting including staff from DAH Epidemiology Division, NCVI and RAHOs. Representatives from the Viet Nam National Institute of Health and Epidemiology (NIHE), the Hanoi Agriculture University (HAU), USAID, US CDC and the Wildlife Conservation Society (WCS), and laboratory experts from FAO also participated in the meeting. The goals of the meeting were to share updates on diseases surveillance and diagnosis and to discuss plans for future surveillance, diagnosis and networking activities.
- The IDENTIFY|FAO Southeast Asia Coordinator provided technical inputs during the First Laboratory Directors' Forum meeting and workshop on Laboratory Networking and Proficiency Testing for Priority Highly Pathogenic Emerging and Re-emerging Diseases in Asia (HPEDs) in South Asian Association for Regional Cooperation (SAARC) countries on 23 and 24 January 2012 in Dhaka, Bangladesh. The meeting and workshop were attended by 27 participants from the SAARC countries including Bangladesh, Bhutan, India, Maldives, Nepal, Pakistan and Sri Lanka, with technical support from AAHL, OIE and FAO Regional Office for Asia and the Pacific. The ultimate goal of this Forum was to provide a platform to discuss problems and issues related to the national veterinary diagnostic laboratories and networks of member states in the SAARC region; and to act as a coordinating platform for the national veterinary diagnostic laboratories of the region to promote harmonization and to enhance laboratory capacity and standards for the diagnosis of TADs and emerging/re-emerging infectious diseases.

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- Continue to provide inputs and support communication and interaction among the regional network laboratories, and support national laboratory networking activities.

2.F.SSEA. Support and promote laboratory partnerships

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- Support and promote the establishment/development of regional leading laboratories
2.F.1.SSEA:
 - Supported the development and implementation of Regional Guiding Principles for Diagnosis of HPAI, FMD, CSF and porcine reproductive and respiratory syndrome (PRRS) by regional leading laboratories.

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- Provide support to the regional leading laboratory for swine diseases in Viet Nam to host the 4th Laboratory Directors Forum meeting and the Regional Laboratory Network meeting.

3 ACTIVITIES UNDERTAKEN DURING THE REPORTING PERIOD (1 OCTOBER 2011 – 31 MARCH 2012) AND PLANNED ACTIVITIES FOR THE NEXT SIX-MONTH PERIOD (1 APRIL 2012 – 30 SEPTEMBER 2012)

3.1 ACTIVITIES CONGO BASIN COMPONENT

Output 1. Capacity of national animal health laboratories to detect and diagnose diseases under a quality management system enhanced

1.A.Congo. Follow-up of laboratory mapping exercise activities

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- The first report on the Congo Basin National Veterinary Diagnostic Laboratories Mapping, based on laboratory self-evaluation system data was finalized in December 2011. Translation of the report into French was carried out. *1.A.1.C*
- Harmonization of the FAO laboratory mapping tool across Asia and Africa regions (activity linked to *1.A.6.G*):
 - Review and translation of the new and consolidated laboratory mapping tool in French. *1.A.5.C*
 - Migration of data from the 2010 questionnaires and presentation into the new laboratory mapping tool. *1.A.2.C*

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- Outcomes of the mapping results to be presented to laboratory directors and CVOs (Libreville, Entebbe meetings, April 2012) *1.A.1.C*
- Additional targeted data collection, with laboratory visits and/or follow-up assessments if necessary, to fill in gaps in knowledge on laboratory capacities; IDENTIFY supported laboratories, including regional laboratories, will be assessed with the new laboratory mapping tool by third parties. *1.A.3.C*
- Integrate the outcomes of the laboratory mapping into the Laboratory Networking Strategy. *1.A.4.C*

1.B.Congo. Support to and participation in conferences, trainings or workshops related to laboratory capacity building, and national laboratory policies, guidelines and standards

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- None

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- Support to quality/biosafety managers from Botswana, Cameroon and Uganda to attend the 3rd Annual African Biological Safety Association (AfBSA) conference, from 24 to 27 June 2012, Sandton Convention Centre, Johannesburg, South Africa.
- Support the participation of the Congo Basin and South/Southeast Asia countries in the global FMD conference in Bangkok in June 2012.
- Support the participation in East Africa Regional Biosurveillance workshop in Kampala in June 2012.

1.C.Congo. Develop and conduct trainings or workshops to build laboratory capacity and to promote national laboratory policies and guidelines

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- Preparation of a series of trainings planned in year 3 was carried out: finalization of ToR undertaken, trainers and partners contacted, preparation of contracts with training providers carried out, location and dates confirmed, countries informed about the training, logistics partially prepared, etc. The preparation covered the following activities:
 - Regional workshop on Process Control - Quality Control (sample management, quality control for quantitative tests, quality control for qualitative tests), tentatively Libreville, July-September 2012. *1.C.2.C*
 - Regional workshop on Laboratory Equipment Calibration and Maintenance, Gambia, tentatively in July 2012, co-funded with the United States Department of Agriculture (USDA)/Animal and Plant Health Inspection Service (APHIS). *1.C.5.C*
 - Regional training course on Major Transboundary and Zoonotic Animal Diseases in the Region: Early Detection, Surveillance and Epidemiology, Garoua, Cameroon, from 18 to 29 June 2012, organized together with FAO/IAEA. *1.C.3.C* (see also *1.C.4.G*)
 - Regional TOT pathology workshops (location, time, main trainers): Basics of Field and Laboratory Diagnosis. *1.C.4.C*:
 - Session 1 (anglophone countries): Eastern Congo Basin, Nairobi, from 23 to 27 April 2012
 - Session 2 (francophone countries): Western Congo Basin. Venue and dates TBD. French version of the manual is under finalization. *linked to global activity 2.A.2.G*
 - Regional training on biosecurity/biosafety for Cameroon, the Central African Republic, the Democratic Republic of the Congo, the Republic of the Congo, Gabon and Equatorial Guinea, to be held tentatively in Kinshasa, September 2012. *1.C.7.C*
 - Rabies national training (location, time, main trainers) for rabies diagnosis, followed by national seminars on rabies in Cameroon, the Democratic Republic of the Congo and Tanzania.

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- Provision to each laboratory of ISO 17025 manual, OIE terrestrial manual and OIE guidelines on biosafety in veterinary laboratory. *1.C.1.C*
- Carry out national trainings with field epidemiologists on sample collection, storage and shipping. *1.C.6.C*

1.D.Congo. Promote and support laboratory quality management

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- Two trainings in laboratory equipment calibration and maintenance (*1.C.5.C*) were prepared in support of laboratory quality management, and as part of the regional road map for quality assurance management. Laboratory support trainings to assist in equipment maintenance and calibration:
 - Session 1: at the *Laboratoire Vétérinaire* of Kinshasa for three to four trainees from each participant national veterinary laboratory (the Democratic Republic of the Congo, the Republic of the Congo and Gabon).
 - Session 2: at LANAVET of Garoua (Cameroon) for four to five trainees from each participant national veterinary laboratory (Cameroon, the Central African Republic, Chad and the Niger).

- Preparation of activities aimed at developing specific technical testing competence to face emerging disease situations: Cameroon, the Central African Republic, the Democratic Republic of the Congo (bush meat microbiology, advanced CBPP, ASF), Gabon (rabies, CBPP), the Republic of the Congo, Rwanda (ASF), Tanzania and Uganda (Contagious bovine pleuropneumonia [CBPP]). Experts were identified. Country time frames proposed. *1.D.9.C*
- Contacts were established with AfBSA for a possible collaboration with FAO and with regional laboratory networks. As a first step, it was agreed that IDENTIFY will support the participants from beneficiary countries in the AfBSA activities (see *1.B.C*). FAO requested that participants be able to submit abstracts and present veterinary perspectives in the meeting. *1.D.6.C*

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- Conduct two training sessions on laboratory equipment calibration and maintenance.
- Issue the call for a regional consultancy for on-site audit/backstopping missions for assessing quality assurance system implementation and development of quality documentation in the Central African Republic, the Democratic Republic of the Congo, the Republic of the Congo, Rwanda, Tanzania and Uganda. These missions will provide information for the IDENTIFY indicators linked to objective 3. *1.D.2.C*
- Proficiency testing for AI/ND in September 2012 for all IDENTIFY beneficiary countries (except Equatorial Guinea) and regional laboratories in Africa; RVF and PPR proficiency testing for selected countries (Cameroon, the Central African Republic, the Democratic Republic of the Congo, Ethiopia, Kenya, Senegal, Tanzania and Uganda). *linked to global activity 1.D.3.G*
- Carry out all expert missions aimed at developing specific technical testing competencies to face emerging disease situations. *1.D.9.C*
- Organize scientific visits for laboratory directors within and outside their region (all countries). *1.D.4.C*
- Conduct assessment missions (Cameroon and the Democratic Republic of the Congo) for biosafety and biosecurity infrastructures, equipment and practices. *1.D.5.C*
- Provision to the nine beneficiary countries with validated standardized veterinary diagnostic reagents (antigens and antisera) targeting priority TAD laboratory diagnosis. *1.D.8.C*

1.E.Congo. Provide laboratory equipment and supplies in a coordinated manner

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- A checklist of minimal equipment and consumables to be made available in each beneficiary laboratory was determined, which will be used as priority procurement items. The approach was developed on combining the checklist with the results of the mapping and with the list of needs for equipment and consumables already collected from beneficiary laboratories. *1.E.1.C*

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- Approach on procurement of equipment and consumables to be agreed during laboratory directors and CVOs meetings (Libreville, Gabon, from 3 to 5 April, 2012, and Entebbe, Uganda, from 11 to 13 April 2012). An indication of the budget range will be communicated to the laboratories. *1.E.1.C*

Output 2 Linkages and communication pathways across national, regional and global laboratory and epidemiologic networks for the management of emerging zoonotic pathogens strengthened

2.A.Congo. Communication tool development and resource building

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- Conception and production of a leaflet on IDENTIFY activities, in addition to the posters was produced and distributed to beneficiary laboratories. 2.A.1.C
- The following progress was made in the second phase of the study on the development of collaborations and/or partnerships between public veterinary laboratories and the animal industry: consultant to carry out the second phase of the study was preselected, pilot countries were selected (Cameroon, the Democratic Republic of the Congo and Rwanda), and his ToR were finalized. 2.A.3.C

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- Production, printing and dissemination of various public awareness and advocacy materials. 2.A.1.C
- Provide the guidelines and documents related to diagnosis, management and control of TADs as per requested distribution of the Basics of Field Pathology training manual for trainers during the TOT pathology workshops on the Basics of Field and Laboratory Diagnosis. 2.A.2.C
- Production, printing and dissemination of case definition and recommended test repertoire for IDENTIFY listed priority diseases. The Veterinary school in Dakar, Senegal (EISMV) was selected to lead this activity through an LoA with FAO. During the implementation period of the LoA, EISMV will make available one expert and two students to develop two guides for field and laboratory diagnosis for priority diseases in the Congo Basin. 2.A.5.C
- Initiate the second phase of the study on the development of collaborations and/or partnerships between public veterinary laboratories and the animal industry. This study will take place in three pilot countries (Cameroon, the Democratic Republic of the Congo and Rwanda) as a follow-up to the first study conducted by FAO in year 2. It aims at identifying alternative activities that will generate additional and sustainable financial resources for concerned laboratories. 2.A.3.C
- Propose sample referral guidelines for two priority TADs. 2.A.4.C

2.B.Congo. Development of joint meetings and conferences to support networking and promote national laboratory policies

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- RESOLAB annual coordination meeting conducted in December 2011, Bamako. All beneficiary countries, except Gabon, were able to participate. Meeting was co-funded by USDA/APHIS. Minutes can be found at:
http://www.fao-ectad-bamako.org/fr/IMG/pdf/Report_5th_RESOLAB_Dec2011_Engl_F16Jan_GD.pdf

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- EARLN annual coordination meeting, Mombasa, Kenya, on 27 and 28 July 2012.

2.C.Congo. Review and update of the tripartite Laboratory Networking Strategy and future planning

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- The IDENTIFY|FAO regional coordinators from Bamako, Nairobi and Gaborone (via teleconference) participated in the IDENTIFY|FAO planning meeting with the project management team in Rome (on 8 and 9 February 2012). The IDENTIFY|FAO activities were planned for the coming eight months.

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- Tripartite regional coordination meetings, date and venue TBD.
- Participation of the IDENTIFY |FAO regional coordinators in the Regional EPT planning meeting, July 2012.

2.D.Congo. Engage with stakeholders to support the development of cross-sectoral approach(es) concerning laboratories

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- None

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- Year 3 work plan implementation meeting of IDENTIFY|FAO project with the Western Congo Basin National Veterinary Laboratories' Directors and CVOs, from 3 to 5 April 2012, Libreville, Gabon. OIE, WHO and AU-IBAR will participate. Intersectoral discussions at national levels will be supported through national LoA.
- Year 3 work plan implementation meeting of IDENTIFY|FAO project with the Eastern Congo Basin National Veterinary Laboratories' Directors and CVOs, from 11 to 13 April 2012, Entebbe, Uganda. OIE, WHO, USAID and AU-IBAR are invited. Intersectoral discussions at national levels will be supported through national LoA.
- Facilitate national rabies seminars in Cameroon, the Democratic Republic of the Congo and Tanzania, with all stakeholders (public health, universities, WHO, laboratories, veterinary services and private veterinarians).

2.E.Congo. Support and promote laboratory networks

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- Annual regional networking meetings: participation in RESOLAB annual coordination meeting, Bamako, Mali, from 12 to 16 December 2012 for nine participants from five Congo Basin countries (Cameroon, the Central African Republic, the Republic of the Congo, the Democratic Republic of the Congo and Equatorial Guinea), two participants from RESOLAB Regional laboratories (LNERV of Senegal and NVRI of Nigeria), three participants from FAO/OIE Reference laboratory (IZSve of Padova, Italy) and three participants from the EARLN network. Implementing partners: *France Vétérinaire International*, USDA/APHIS, AIEA, USAID, CIRAD, OIE and AU-IBAR. 2.E.1.C

- An OFFLU representative was present at the RESOLAB meeting and ensured good linkage between OFFLU activities and RESOLAB (e.g. information on OFFLU activities, invitation to contribute to OFFLU technical work). *2.E.1.C*
- Representatives of Eastern and Southern African Development Community (SADC) Africa regional laboratory networks were present at the RESOLAB meeting and maintained linkages between sub-Saharan Africa regional laboratory networks. *2.E.1.C*
- Participation of EARLN interim coordinator and the National Animal Disease Diagnostics and Epidemiology Centre of Uganda Executive Manager and one senior staff in the RESOLAB 5th Annual coordination meeting. *2.E.1.C*
- Coordination of the activities of the subnetworks on PPR, FMD and rabies for Western and Central Africa region. *2.E.1.C*
- Information collection and dissemination via emailing list and Web site. Support for sharing of information and biological materials: technical information was shared through RESOLAB Web site (www.fao-ectad-bamako.org) and mailing list. In addition, contacts are underway with the International Livestock Research Institute (ILRI) to implement joint activities that aim at sequencing the gene of ASF virus isolated in Cameroon; *2.E.3.C*
- Support participants to attend an EARLN-FMD subnetwork coordination meeting and regional FMD progressive control pathway meeting in Nairobi (from 5 to 7 March 2012). *2.E.1.C*

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- Provide support to RESOLAB and EARLN network and subnetwork meetings. *2.E.1.C*
- Facilitate common workshops, at country level, between laboratory technicians and epidemiologists. *2.E.2.C*
- Resume with information collection and dissemination via emailing list and Web site. *2.E.3.C*
- Invite RESOLAB/SADC Laboratory Network members, FMD subnetwork coordinator and OFFLU representative(s) to the EARLN annual coordination meeting in July 2012 in Kenya. *2.E.1.C*
- Develop linkages with the joint AU-IBAR/OIE/FAO project entitled, Reinforcing Veterinary Governance in Africa, that will be launched in May 2012, and which includes, under FAO component, activities to support the regional networks (laboratory, epidemio-surveillance, etc.).

2.F.Congo. Support and promote laboratory partnerships

Activities undertaken during the current reporting period (1 October 2011 - 31 March 2012)

- Contribution to concept notes developed at FAO headquarters on:
 - definition of the roles and responsibilities of regional laboratories in sub-Saharan Africa and establishment/development of regional service laboratories; OIE was contacted for review and comments on the proposed approach, and a concept note was transmitted to WHO. *linked to global activity 2.F.G*
 - provision of access to sequencing services for sub-Saharan veterinary laboratories.
- Contact was established with AfBSA to explore a possible membership for RESOLAB/EARLN networks. *linked to activity 1.D.C*

Planned activities for the next reporting period (1 April 2012 - 30 September 2012)

- Meeting on regional laboratory services from 9 to 11 July 2012 in Addis Ababa. *linked to global activity 2.F.2.G*

4 MAIN CHALLENGES ENCOUNTERED AND RESPONSE PROVIDED

- The implementation of the project activities under the Year 3 work plan, corresponding to this reporting period (1 October 2011 - 31 March 2012), was delayed owing to the completion of the validation process of the Year 3 work plan in November 2011, which resulted in the adoption of a new timetable of project activities.
- In the Congo Basin, there is still a need to improve the involvement of the beneficiary laboratories in IDENTIFY|FAO activities. FAO meetings with veterinary laboratory directors and CVOs are planned in the next reporting period to present and discuss the project's implementation, common constraints, current and future work plans, and to improve the project ownership by beneficiary laboratories. For a better implementation of the IDENTIFY project at the national level, with a more active role played by the beneficiary laboratories, FAO will discuss the designation (and Terms of Reference) of national coordinators responsible for follow-up and linkages with other national and EPT partners. LoA will be signed with each laboratory, with activities carried out by beneficiary laboratories.
- IDENTIFY|FAO is seeking to fill the gaps defined from the first mapping exercise result in the Congo Basin. The major constraints reported by the laboratories with respect to the adequate performing of laboratory diagnosis were: financial and material resources (reported by 29 percent of the laboratories), inadequate number of qualified human resources (26 percent), difficulties in procurement of reagents and consumables (23 percent) and difficulties in metrology and equipment maintenance (6 percent). Furthermore, the quality system development and/or implementation have faced difficulties ranging from an insufficiency of financial and material resources (26 percent), lack of trained personnel (23 percent), suboptimal metrology and equipment maintenance operations (13 percent) to an irregular provision of water and electricity (7 percent). FAO will address the issue of advocacy to national authorities and regional institutions as well as development of national laboratory policy.
- The low priority given to animal health in country policies and development strategies often leads to difficulties in mobilizing technical, financial and human resources at national level, thus compromising the sustainability of activities implemented under the project. Therefore, there is a need to intensify advocacy at country level and increase sustainable financial resources.

5 MAIN PROGRESS MADE TOWARDS THE ACHIEVEMENT OF PROJECT OUTCOMES (FROM THE START OF THE PROJECT ACTIVITIES)

- The support provided by IDENTIFY to-date has contributed to a greater understanding of the regional animal health priorities, assessment of laboratory capacities, and identification of regional and national gaps and resources.
- The direct support afforded to laboratories is substantial, and has allowed for an expansion of the activities to include: quality assurance, biosafety, and maintenance and calibration of equipment, thus contributing to laboratories' capacity to conduct work in accordance with internationally accredited standards (e.g. ISO 17025). Many national laboratories never had the opportunity to consider these major issues. The support provided is neither isolated nor sequential; the project builds upon previous and current investments in laboratory networking and allows for a programmatic approach, proper approval of planned activities by countries and a regional approach to TADs.
- As many priority diseases are TADs, a regional approach (where agreed) allows for rapid disease detection/identification. Response measures can be coordinated regionally for more effective control. The networks in the West/Central, Eastern Africa and Southeast Asia regions have set a good example, with both the formal and informal exchange of information, collective effort and responsibility to build laboratories in the regions. Other partners, such as USDA/APHIS, EU-FMD Commission and CIRAD have demonstrated an increasing interest in and support for these laboratory networks. The growing confidence lends credence to the regional approach, and FAO has a comparative advantage in the coordination of such support and inputs. This project has provided support to regional laboratory networks, allowing networking and progress in the strategy of these networks, especially related to the status and mandate of regional service laboratories.
- While laboratory capacities and national needs are heterogeneous within each region, the laboratory mapping tool developed by FAO is contributing to a regional perspective on laboratory capacities and gaps. This tool can serve for laboratories themselves, as well as decision-makers and technical partners, to identify the regional and individual support required. It is also an invaluable tool for FAO to tailor its capacity building support in line with the project's objectives, measuring the progress made and the impact of the project. This tool is also applicable in other contexts, or under other FAO projects in the future. It will continue to evolve, through the development of specific modules and according to the feedback received.
- This project has enabled or will shortly enable the launching of innovative initiatives, such as the genetic module in the EMPRES-i database, the four-way linking framework, the laboratory mapping tool, the development of private-public partnerships between laboratories and the animal production sector and the provision of access of laboratories to sequencing services. The genetic module represents an ideal example of a multidisciplinary success, linking virology, epidemiology and bioinformatics, and is receiving increasing interest from the scientific community and from policy makers.
- Building on the investments made with support under AI, this project sustains previously established mechanisms: collaborations and communication pathways between organizations, global OFFLU and regional networks, and benefits from the momentum gained through public good concepts, such as the recognition of the importance of early detection and intervention and impacts of pathogens with pandemic potential. These investments are crucial to the continued development of technical laboratory capacities, especially molecular techniques, to respond to other transboundary and priority diseases.

Project Monitoring Sheet: **OSRO/MYA/702/USA**

Project title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)**

Reporting period: **October 2012 to March 2013**

Country: Myanmar
Project: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)
Code: OSRO/MYA/702/USA
Budget: USD 500 000 (Phase I), USD 750 000 (Phase II), USD 375 000 (Phase III), USD 150 000 (Phase IV), USD 279 000 (Phase V), USD 275 000 (Phase VI)
Total budget: USD 2 329 000
Effective starting date: 1 January 2008
Planned end date: 30 September 2013
<p>Context of the project</p> <p>Myanmar has experienced five waves of Highly Pathogenic Avian Influenza (HPAI) outbreaks in 2006, 2007, 2010, 2011 and 2012. The last outbreaks occurred in February and March 2012 in two townships (Chaung Oo and Taungoo) in Sagaing and Bago regions, and were successfully managed. The country remains at risk from duck populations, in which the virus is endemic, migrating wild birds and trade with neighboring countries. The Food and Agriculture Organization of the United Nations (FAO) is implementing an avian influenza (AI) control programme funded during the reporting period by the United States Agency for International Development (USAID). The programme is being implemented in collaboration with the Livestock Breeding and Veterinary Department (LBVD) of the Ministry of Livestock and Fisheries. This report describes activities funded by the project from October 2012 to March 2013.</p>
<p>Project impact</p> <p>The impact of the project is to reduce and stop the spread of H5N1 among flocks of poultry in the country, thus reducing the risk of contagion to other mammals and humans, and avoiding the possibility of a pandemic.</p>
<p>Project outcome</p> <p>The project outcome is to continue the improvement of the capacities and capabilities of Myanmar to prevent, prepare for and respond to the outbreaks of HPAI in the animal population effectively so as to limit its impacts and risk of infection to humans.</p>
<p>Planned activities for the reporting period (October 2012 to March 2013)</p> <p>Output 1: Planning, coordination and policy support strengthened for effective management and control of HPAI and other emerging zoonoses</p> <p>Activity 1.1: Support the Country team to provide inputs for planning coordination required at the country level.</p> <p>Activity 1.2: Support national and international coordination related to disease control. This includes active participation of the country programme with other projects or programmes, such as the European Union (EU) Highly Pathogenic Emerging Diseases (HPED) project and the Emerging Pandemic Threats (EPT) programme, and exploring collaboration with PREVENT on risk communication.</p>

Activity 1.3: Support the Government of Myanmar to participate in a laboratory quality assurance (QA) and quality control (QC) system for HPAI and regional HPAI laboratory networks.

Activity 1.4: Support LBVD staff in veterinary epidemiology training at the regional and country levels, including the Field Epidemiology Training Programme for Veterinarians (FETPV).

Output 2: Risk assessment and management strengthened along the poultry supply chain at the selected townships of Mandalay region

Activity 2.1: Establish a team and network. The network will consist of FETPV graduates/trainees from LBVD, laboratory experts from Central Veterinary and Mandalay Laboratories who have been trained previously, public health authorities and community workers, etc. Through consultation with relevant authorities, identify their roles and responsibilities for surveillance and outbreak response.

Activity 2.2: Conduct longitudinal surveillance in high-risk townships and animal populations (such as ducks, wild birds, live bird markets, environment, etc.), based on the risks identified by the previous supply chain studies.

Activity 2.3: Conduct 'active clinical surveillance' during the high-risk period through 'community networks'; and strengthen 'zero reporting' from selected communities and teams.

Activity 2.4: Design and organize simulation training exercises.

Activities undertaken during the reporting period (October 2012 to March 2013)

Output 1: Planning, coordination and policy support strengthened for effective management and control of HPAI and other emerging zoonoses

Activity 1.1: Support the Country team to provide inputs for planning coordination required at the country level.

- The national project team consists of a National Project Director, National Operations Officer and technical consultants. A new National Project Director was appointed overlapping with a one-month hand-over period with his retiring predecessor. A new National Consultant for biosecurity and risk management was also appointed, replacing the previous national consultant.
- A new Country Team Leader was appointed in mid-November, filling the post which had been vacant since June 2012. Available funding allows an eight-month input for the team leader of which three and one-half months were completed during this period.

Activity 1.2: Support national and international coordination related to disease control. This includes the active participation of the country programme with other projects or programmes such as the EU-HPED project and the EPT programme, and exploring collaboration with PREVENT on risk communication.

- The Country Team Leader and National Project Director have interacted regularly with implementing partners, including meetings with:
 - the Director-General of the Livestock Breeding and Veterinary Department (LBVD) and key directors at the LBVD headquarters in NayPyiTaw;

- the heads and staff of the Mandalay and Yangon regional veterinary laboratories;
- the LBVD epidemiology group; and
- the Myanmar Livestock Federation.
- Coordination with the World Health Organization and the United Nations Educational, Scientific and Cultural Organization officers in Yangon has been maintained. International agencies with which project staff have interacted include USAID (Yangon) and USAID (Washington), Regional Development Mission for Asia (Bangkok), the Australian Agency for International Development, the World Organisation for Animal Health (OIE), Japan International Cooperation Agency, International Atomic Energy Agency, EPT-PREVENT and the EU.
- In collaboration with PREVENT, a consultative workshop on risk communication was held in Naypyitaw on 28 March 2013.

Activity 1.3: Support the Government of Myanmar to participate in a laboratory QA and QC system for HPAI and regional HPAI laboratory networks.

- A meeting to identify the scope of FAO-LBVD collaboration on this activity was held on 6 December 2012 and details of the opportunity for the Government of Myanmar to participate in a regional QA/QC programme has been communicated to the LBVD.
- LBVD staff attended the fourth laboratory directors' forum organized in Nha Trang City, Vietnam from 10 to 11 October 2012.
- Under the regional laboratory capacity building programme, a laboratory proficiency testing was conducted at the Yangon diagnostic veterinary laboratory, Mandalay diagnostic veterinary laboratory and Yangon foot-and-mouth disease (FMD) laboratory in November 2012.

Activity 1.4: Support LBVD staff in veterinary epidemiology training at the regional and country levels, including the FETPV.

- The FAO Animal Health and Production team has met with the LBVD epidemiology group to discuss FAO support for the planned in-country FETPV training course and information received from FAO's Regional Office for Asia and the Pacific (RAP) on possible additional funding. The offer of a detailed curriculum based on previous FAO regional experience has been communicated to the group through a meeting held in Nay Pyi Taw on 28 March 2013.
- The project facilitated the attendance of FETPV graduates from the 2011 and 2012 cohorts at a workshop on assessment of FMD risk via social network analysis held from 12 to 14 February 2013 in Bangkok, Thailand.
- The project coordinated with FAO-Emergency Centre for Transboundary Animal Diseases (ECTAD)-RAP to include LBVD candidates in the next regional FETPV programme and a final decision on the candidates selected by the Department of Livestock Development of Thailand is awaited.

Output 2: Risk assessment and management strengthened along the poultry supply chain at the selected townships of Mandalay region

Activity 2.1: Establish a team and network.

- The project team has established links with the LBVD epidemiology group, with which it has conducted HPAI awareness workshops in January 2013 in seven high-risk locations, including five poultry production zones with 400 participants from private and public service sectors. The Country Team Leader gave a presentation to regional, district and township officers concerning their respective roles in disease detection. Orientation meetings were held with selected township veterinary officers and community animal

health workers in five Mandalay region townships in January 2013.

- The network approach has facilitated the completion of the commercial farm database in five townships during November and December 2012 with 194 participants in stakeholder meetings (152 males and 42 females).
- Similarly, working together with LBVD staff, the project completed biosecurity training in Mandalay region from November to December 2012, reaching 184 beneficiaries (153 male and 31 female) including broiler, layer, duck and quail farmers and egg and meat traders.

Activity 2.2: Conduct longitudinal surveillance in high-risk townships and animal populations based on the risks identified by the previous supply chain studies.

- This study aims to complement previous work which has shown that H5N1 antibodies are prevalent in adult ducks in township flocks in different parts of the country. The objective was to gain an understanding of the possible impact of HPAI during the period from day-old duckling to the pullet stage. The study was taken forward in December 2012 in Thanatpin and Hlegu townships in Bago and Yangon regions, respectively, when bleeding of ducks from the monitored flocks took place. In Amarapura, bleeding at the pullet stage commenced in March 2013. Once the results are available from the laboratories, the epidemiology unit will conclude the analysis.

Activity 2.3: Conduct 'active clinical surveillance' during the high-risk period through 'community network'; and strengthen 'zero reporting' from selected communities and teams.

- Five Mandalay region townships were selected (Pyawbe, Sintgaing, Madaya, Pyin Oo Wlin and Amarapura). Training sessions were conducted in each township. Participants included 59 community animal health workers, 5 township veterinary officers and 22 deputy township veterinary officers. Orientation was given on different aspects of HPAI surveillance and the role of the community animal health workers was explained. The surveillance period for these five pilot townships was set as March to May 2013. The Project National Consultant is following the programme with the respective township officers and with regional epidemiology and laboratory LBVD personnel.

Activity 2.4: Design and organize simulation training exercises.

- Following discussions held in Mandalay with the LBVD Director of Disease Control, it was agreed that field simulations were not appropriate for the present circumstances. The agreed plan now is to conduct table-top outbreak simulation exercises in the second semester.

Planned activities for the next reporting period (April to September 2013)

Output 1: Planning, coordination and policy support strengthened for effective management and control of HPAI and other emerging zoonoses

Activity 1.1: Support the Country team to provide inputs for planning coordination required at the country level.

- The project team will continue to provide technical support during the reporting period through periodic meetings with the Director-General of LBVD and interaction with relevant key staff at headquarters, appropriate regional offices and technical units

Activity 1.2: Support national and international coordination related to disease control.

- The project team will facilitate a three-day consultation in April 2013 on the Myanmar FMD control plan, jointly with OIE, FAO-ECTAD-RAP and LBVD and supported by

the EU-HPED project.

- The project team is working with the PREVENT project of the USAID EPT programme to formulate a training programme on risk communication in support of project implementation which PREVENT will carry out during the upcoming period.
- Interactions with FAO-RAP on regional programmes, including porcine reproductive and respiratory syndrome, will continue. The project will also continue to engage with other national and international actors on disease control.

Activity 1.3: Support the Government of Myanmar to participate in a laboratory QA and QC system for HPAI and regional HPAI laboratory networks.

- This will be implemented through the Southeast Asia regional laboratory network (RLN) supported by USAID-EPT-IDENTIFY and the EU-HPED programme and designed to strengthen laboratory capacity, assure the quality of lab services, improve biosafety and facilitate networking. A key element will be the lab proficiency testing scheme, which will take place this semester.

Activity 1.4: Support LBVD staff in veterinary epidemiology training at the regional and country levels including the FETPV.

- Curriculum material and financial support are being made available to the LBVD epidemiology unit to conduct domestic FETPV courses in July and August 2013.

Output 2: Risk assessment and management strengthened along the poultry supply chain at the selected townships of Mandalay region

Activity 2.1: Establish a team and network.

- The project, in collaboration with the established network, particularly the epidemiology team and laboratory services, will (i) conduct awareness training for dealers, collectors and processors at Live Bird Markets (LBM) in Mandalay and Yangon; (ii) conduct biosecurity training for farmers in the Shwe Bo poultry production zone and townships of the Sagaing region; and (iii) recommend improvements in biosecurity for the Mandalay LBM. The network approach will also facilitate the poultry supply chain risk assessment and commercial poultry farm database studies in selected townships.

Activity 2.2: Conduct longitudinal surveillance in high-risk townships and animal populations.

- The field work has been completed. Testing and analysis of the results remain to be done during this period.

Activity 2.3: Conduct 'active clinical surveillance' during the high-risk period through 'community network'.

- This programme is underway and will be monitored during April and May with analysis and report preparation in June.

Activity 2.4: Design and organize simulation training exercises.

- The project will conduct two table-top exercises in high-risk regions and states, engaging decision makers and appropriate field officers and stakeholders around a staged response to a developing threat with incrementally worsening scenarios to assess preparedness and identify gaps.

Main challenges encountered and response provided

- In the general context, recent political changes are likely to bring additional resources and missions into Myanmar, and this is challenging given the absorptive and coordination capacity of the LBVD.
- Due to the decentralization process within the Ministry of Livestock and Fisheries, and devolution of responsibility and authority to the state/regional level for livestock development and disease control issues, it is not clear how much influence the technical division will have over decision-making in the immediate response to H5N1. With respect to HPAI control, the major challenge is trying to maintain surveillance systems across the country in the context of reduced funding.
- The Animal Health and Production Programme Steering Committee meeting has been progressively delayed owing to busy schedules on the Government's side, transfer of key staff in LBVD and gaps in the fielding of the FAO Country Team Leader.

Main progress made towards the achievement of project outcomes *(from the start of the project activities)***1. Strengthened planning and cross-sectoral coordination**

Good relations with the Government are established. The coordination between the animal-human sectors has further improved with additional meetings, but further work needs to be done.

2. Strengthened laboratory capacity

The laboratory system is operating well, with recent outbreaks rapidly diagnosed and samples from field surveys being processed effectively. The laboratory information system has been developed and regularly updated to store data of samples, diagnostic results as well as laboratory inventory. Past and future participation in regional and international proficiency testing programmes is maintaining the quality of the laboratory service.

3. Strengthened disease control management capacity

There is now a much better understanding of the concepts of risk, supply chains, and of epidemiology of HPAI based on the national duck survey and national surveillance programmes, both of which were major achievements. The national commercial farm database proved to be an invaluable tool in responding to the outbreaks and identifying high-risk areas. Response capacity has developed well. During recent outbreaks in Sagaing, better understanding of epidemiology is providing LBVD with the confidence to try and reduce the number of farms to be culled. The establishment of an in-country Integrated Disease Control Training Programme is a major step forward. Although biosecurity has increased in production zones, further work needs to be done in this area.

Project Monitoring Sheet: **OSRO/MYA/702/USA**

Project title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)**

Reporting period: **April to September 2012**

Country: Myanmar
Project: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)
Code: OSRO/MYA/702/USA
Budget: USD 500 000 (Phase I), USD 750 000 (Phase II), USD 375 000 (Phase III), USD 150 000 (Phase IV), USD 279 000 (Phase V)
Total budget: USD 2 054 000
Effective starting date: 1 January 2008
Planned end date: 31 December 2012
<p>Context of the project</p> <p>Myanmar has experienced five waves of Highly Pathogenic Avian Influenza (HPAI) outbreaks in 2006, 2007, 2010, 2011 and 2012. The last outbreaks occurred in February and March 2012 in two townships (Chaung Oo and Tuangoo) in Sagaing and Bago regions, and were successfully managed. The country remains at risk from duck populations in which the virus is endemic, migrating wild birds and trade with neighbouring countries. The Food and Agriculture Organization of the United Nations (FAO) is implementing an avian influenza (AI) control programme funded by the United States Agency for International Development (USAID) during the reporting period. The programme is being implemented in collaboration with the Livestock Breeding and Veterinary Department (LBVD) of the Ministry of Livestock and Fisheries. The report describes activities funded by the project from April to September 2012.</p>
<p>Project impact</p> <p>The impact of the project is to reduce and stop the spread of H5N1 among flocks of poultry in the country, thus reducing the risk of contagion to other mammals and humans, and avoiding the possibility of a pandemic.</p>
<p>Project outcome</p> <p>The project outcome is to continue the improvement of capacities and capabilities of Myanmar to prevent, prepare for and respond to the outbreaks of HPAI in the animal population effectively so as to limit its impacts and risk of infection to humans.</p>
<p>Planned activities for the reporting period (April to September 2012)</p> <p>Output 1: Strengthened planning and cross-sectoral coordination</p> <p><i>Activity 1.1: Support the Emergency Centre for Transboundary Animal Diseases (ECTAD) Country Team Leader and the team to provide inputs for planning coordination required at country level</i></p> <ul style="list-style-type: none"> The project team, including the Chief Technical Advisor (CTA), and the national operations and technical consultants, will be in place throughout the reporting period, co-funded by other projects. <p><i>Activity 1.2: Support national and international coordination related to disease control</i></p> <ul style="list-style-type: none"> The project will coordinate with FAO regional projects on HPAI and other diseases, including IDENTIFY, and the Highly Pathogenic Emerging Diseases Project. The Animal Health and Production Programme Steering Committee (AHP-PSC) is expected to meet in March, and this will usher in a new structural arrangement for coordination across the whole livestock sector.

Activity 1.3: Support in-country linkages between public-private and animal-human health sectors relevant to HPAI control

- The project will participate in the national zoonosis workshop planned for March 2012 and consider follow-up actions depending on the outcome of the workshop.

Output 2: Strengthened laboratory capacity

Activity 2.1: Support improvement of laboratory management, including through technical advice of international experts to be provided through other regional projects related to regional laboratory networks

- The project will continue to update standard operating procedures (SOPs) and will further develop data management in the laboratory, including quality systems, routine data, assets and supplies management

Activity 2.2: Support development of a laboratory quality assurance and quality control system (QA/QC) for HPAI, including through regional HPAI laboratory networks, and through support of sample submissions to an international reference laboratory as part of the proficiency testing

- The project will develop and implement a domestic QA/QC programme, building on previous programmes implemented in-country.
- The project will coordinate with regional FAO projects conducting laboratory benchmarking and biosecurity assessments. The project will assist with the structured test of biosafety cabinets in Yangon laboratory.

Activity 2.3: Procurement of necessary laboratory equipment and supplies for HPAI activities as necessary

- The project will assess the need for supplies, taking into account supplies from other projects.

Output 3: Strengthened disease control management capacity

Activity 3.1: Support regional veterinary epidemiology trainees through in-country training and field work

- The project will continue to support the 2010 and 2011 Field Epidemiology Training Programme for Veterinarians (FETPV) trainees through in-country training. The 2011 trainee will need to complete outbreak investigations and a field study, and the 2010 trainee will complete a field study and final reports from previous activities.

Activity 3.2: Support Integrated Disease Control Training Programme (IDC-TP) in Myanmar, encompassing application of epidemiology, supply chain and institutional aspects to field disease control

- The IDC training will be a major focus, and staff from the laboratory, epidemiology and planning statistics will be enrolled in what will still be a pilot structure. Trainees will review existing data and collaborate on improved disease control at the field level.

Activity 3.3: Support risk-based biosecurity and surveillance activities

- The project will review biosecurity arrangements around the production zones which are showing steady improvement year-by-year and will also review biosecurity in the previous outbreak areas from both 2011 and 2012 outbreaks to see what lessons-learned can be made from these experiences.

Activity 3.4: Support response activities

- The project will continue to provide support for the outbreak currently underway in Myanmar and for any further outbreaks, and review the experience and lessons learned.

Activities undertaken during the reporting period (April to September 2012)

Output 1: Strengthened planning and cross-sectoral coordination

Activity 1.1: Support the Team Leader and the team to provide inputs for planning coordination required at country level

- The national project team consisting of national project director, national operations officer and technical consultants, was in place throughout the reporting period.
- Country team leader was funded for three months until May 2012 before being transferred to another project position in Mongolia. Technical backstopping was supported by the Regional Project Coordinator from June 2012 throughout the reporting period.

Activity 1.2: Support national and international coordination related to disease control

- The ECTAD country team coordinated with FAO regional project including the the European Union Highly Pathogenic Emerging Diseases Project (EU-HPED).

Activity 1.3: Support in-country linkages between public-private and animal-human health sectors relevant to HPAI control

- The project collaborated with the World Health Organization (WHO) on animal-human linkages. The first national zoonosis workshop focusing on rabies in March 2012 was organized jointly by the Ministry of Livestock and Fisheries and the Ministry of Health as well as WHO. The ECTAD country team planned to organize a joint national zoonosis workshop focusing on rabies during the last week of September 2012.

Output 2: Strengthened laboratory capacity

Activity 2.1: Support improvement of laboratory management

- SOPs on virology and serology were updated, and are being practised. Laboratory staff continued updating the database of the laboratory information system developed in the previous phases. The datasets from the system are being analysed and utilized when necessary.

Activity 2.2: Support Myanmar to participate in QA/QC for HPAI and regional HPAI laboratory network

- The country team facilitated the participation of laboratory staff to a workshop on basics of field and laboratory diagnosis training-of-trainers (ToT) in Chiang Mai, Thailand, and a Regional Laboratory Network Training on Diagnostics of Swine Diseases in Ho Chi Minh City, Viet Nam.
- The country team continued to facilitate the participation of the Central Diagnostic Laboratory in Yangon, LBVD in the regional proficiency testing programme as part of QA/QC programme. The team also supported LBVD in implementing a domestic QA/QC programme among laboratories in Myanmar.

Activity 2.3: Procurement of necessary laboratory equipment and supplies for HPAI activities

- Project procured reagents necessary for HPAI diagnosis and laboratory testing, including primers and probes for AI virus H5 and H7 as well as qRT-PCR and RNA/DNA kits during that reporting period.

Output 3: Strengthened disease control management capacity

Activity 3.1: Support regional veterinary epidemiology at regional levels through in-country training

- The project continued to support LBVD staff enrolled in the regional FETPV in the years 2010 and 2011 focusing on the assignments to be conducted in-country. The trainee enrolled in 2011 completed two outbreak investigations including the reports. The trainee enrolled in 2010 successfully completed his FETPV study and graduated in May 2012.

Activity 3.2: Support IDC-TP in Myanmar, encompassing epidemiology, supply chain and institutional aspects of disease control

- Surveillance of HPAI along poultry supply chain and training on biosecurity on poultry production in Yangon and Mandalay Regions were conducted in collaboration with LBVD.
- A multidisciplinary team of IDC-TP in collaboration with the University of Veterinary Science (UVS) conducted a field epidemiology study for the fourth year students of the UVS in Kyauksae Township in July 2012.

Activity 3.3: Support risk-based biosecurity and surveillance activities

- Post outbreak serosurveillance was conducted in Taze township.
- The project monitored biosecurity arrangements around the production zones, and the findings indicated that there has been improvement in movement control of dealers, animal feed, people living in nearby villages, vehicles, motorcycles, etc.

Activity 3.4: Support response activities

- The project continued to provide technical support for HPAI outbreaks that occurred during the reporting period.

Planned activities for the next reporting period (October to December 2012)

Output 1: Planning, coordination and policy support strengthened for effective management and control of HPAI and other emerging zoonoses

Activity 1.1: Support the country team to provide inputs for planning coordination required at the country level

- The project team, including the CTA, and the national operations and technical consultants, will be providing technical support during the reporting period.

Activity 1.2: Support national and international coordination related to disease control

- The project will coordinate with FAO regional projects on HPAI and other diseases, including active participation with other programmes or projects such as EU-HPED project and the EPT programme, and exploring collaboration with PREVENT on risk communication.
- The Animal Health and Production Programme Steering Committee (AHP PSC) meeting will be held in December 2012.

Activity 1.3: Support Myanmar to participate in a laboratory QA/QC for HPAI and regional HPAI laboratory networks

- The project will participate in the national zoonosis workshop planned for September 2012 and consider follow-up actions depending on the outcome of the workshop.
- The project will coordinate regional trainings and continue laboratory networks in the region.
- The project will assist with the structured test of biosafety cabinets in Yangon and Mandalay laboratories in November 2012.

Activity 1.4: Support LBVD staff to participate in the veterinary epidemiology training at regional and country levels including FETPV

- The project will coordinate with regional FAO projects to support LBVD staff to participate in the regional level FETPV programme, and will continue support LBVD staff at country level FETPV programme.

Output 2: Risk assessment and management strengthened along the poultry supply chain at the selected townships of Mandalay region

Activity 2.1: Establish a team and network. The network will consist of FETPV graduates/trainees from LBVD, laboratory experts from Central Veterinary and Mandalay Laboratories who have been trained previously, public health authorities and community workers, etc. Through consultation with relevant authorities, identify their roles and responsibilities for surveillance and outbreak response

- The project will support to conduct poultry supply chain risk assessment and management in selected townships in Mandalay and other regions.
- The project will facilitate the establishment of a disease control team consisting of FETPV graduates, laboratory experts from Central and Mandalay laboratories and Community Animal Health Workers, and will improve networking system among them.
- The project will facilitate the preparation of roles and responsibilities of the disease control team for surveillance and outbreak response activities.

Activity 2.2: Conduct longitudinal surveillance in high-risk townships and animal populations (such as ducks, wild birds, live bird markets, environment, etc.), based on the risks identified by the previous supply chain studies

- The project will conduct day old duck longitudinal surveillance in three high-risk townships which have high duck populations.
- The project will conduct duck longitudinal surveillance in risk-based areas.

Activity 2.3: Conduct 'active clinical surveillance' during the high-risk period through 'community network'; and strengthen 'zero reporting' from selected communities and teams

- The project will conduct active surveillance on poultry in five townships during high-risk period through community networks and disease control team.

Activity 2.4: Design and organize simulation training exercises

- The project will provide feedback on previous HPAI outbreak experiences and conduct refresher course on warning, precaution and preparation for upcoming high-risk season to the township veterinary officers.
- The project will develop simulation exercise design and will demonstrate the design for proper application of outbreak response in high-risk regions and states.

Main challenges encountered and response provided

- In the general context, recent political changes are likely to bring additional resources and missions into Myanmar, and this is challenging given the absorptive and coordination capacity of the LBVD.
- Because of decentralization process within the Ministry, and devolution of responsibility and authority to the State/Regional Level for livestock development and disease control issues, it is not clear how much influence the technical division will have over decision-making in the immediate response to H5N1. At a sectoral level, outbreaks of other infectious diseases in livestock stretched the capacity of the veterinary services. With respect to HPAI control, the major challenge is trying to maintain surveillance systems across the country in the context of reduced funding.
- Animal Health and Production Programme Steering Committee (AHP-PSC) meeting was delayed from March to December 2012, owing to busy schedules on the Government's side, and arrangement of movement of remaining staff and office facilities from Yangon to Naypyitaw in September 2012.

Main progress made towards the achievement of project outcomes *(from the start of the project activities)*

Output 1: Strengthened planning and cross-sectoral coordination

Good relations with the Government are established. The coordination between the animal-human sectors has further improved with additional meetings, but further work needs to be done.

Output 2: Strengthened laboratory capacity

The laboratory system is operating well, with recent outbreaks rapidly diagnosed and samples from field surveys being processed effectively. Laboratory information system has been developed and regularly updated to store data of samples, diagnostic results as well as laboratory inventory.

Output 3: Strengthened disease control management capacity

There is now a much better understanding of the concepts of risk, supply chains, and of epidemiology of HPAI based on the national duck survey and national surveillance programmes, both of which were major achievements. The national commercial farm database proved to be an invaluable tool in responding to the outbreaks and identifying high-risk areas. Response capacity has developed well. In recent outbreaks in Sagaing, better understanding of epidemiology is providing LBVD with the confidence to try and reduce the number of farms to be culled. The establishment of an in-country IDC-TP is a major step forward. The biosecurity in production zones has increased, although further work needs to be done in this area.

I Quarter 2010

Project Monitoring Sheet: OSRO/RAF/717/USA**Reporting period:** January – March 2010

Regional component: OSRO/RAF/717/USA
Country: Regional west and central Africa
Project title: HPAI early warning, early response and preparedness strategy support in western and central Africa
Code: OSRO/RAF/717/USA
Budget: USD 432 000 (Phase I), USD 1 000 000 (Phase II) Total budget: 1 432 000
Effective starting date: 01 March 2008
Planned end date: 30 June 2010
Context of the project Highly Pathogenic Avian Influenza (HPAI) in western and central Africa is effectively prevented and controlled through improved early warning and diagnosis capacities, effective national plans and enhanced coordination and information sharing between neighbouring countries.
Objectives of the project The main objective is to assist countries in western and central Africa to enhance their capacities to prevent the introduction of HPAI and to respond efficiently to HPAI outbreaks. The goal is to limit the spread of the disease in the sub-region and to minimize its negative social and economic impacts. Improving each country's capacity to prevent and control HPAI will accomplish the following: <ul style="list-style-type: none"> • Protect human health and prevent a human pandemic; • Maintain and develop the poultry sector as a valuable source of protein and income for all actors within the poultry chain (including women and the rural population); • Strengthen national and regional capacities to address other transboundary animal diseases.
Planned activities – second phase <u>A. Activities related to project Phase I</u> Recording commentary for PCR SOPs Video (English and French). SOPs for an operational contingency plan (online on the web site). <u>B. Activities related to project Phase II</u> Output 1.1: An active regional epidemio-surveillance network is established to support the national network. <i>1.1.1 Establish a comprehensive directory of epidemio-surveillance network actors.</i>

The finalized directory for networks in the region (laboratory and epidemiology) will be distributed to countries and partners.

1.1.2 Support passive and active surveillance in key countries.

Finalization of the LoA for Côte d'Ivoire .

Output 2.1: Through RESOLAB networking activities, diagnostic capacity at laboratory and field levels are strengthened.

2.1.1 Promote laboratory diagnostic test quality assurance and inter-laboratory proficiency testing rounds; Avian influenza and Newcastle disease inter-laboratory proficiency testing round; Ring test monitoring (PCR for group 3) and (Serology for group 2 and 1).

Output 3.1: Poultry associations are supported and private-public partnerships are enhanced (regional and national) for a better understanding of the sector and the identification of practical and cost-effective investments/measurements.

3.1.1 Building on previous poultry sector reviews, develop sustainable private-public partnerships to produce and maintain updated information and data (including geo-referenced maps) on poultry sector responses to veterinary services and private sector needs.

The project documents for Burkina Faso, Benin, Côte d'Ivoire, Ghana and Togo have not yet been finalized.

Output 3.2: Overall biosecurity is improved throughout the poultry chain.

3.2.1 Building on STOP AI/FAO training workshops, develop and disseminate multimedia modular training tools on biosecurity, including cost and benefit studies.

Finalize the development of the toolkit, including training modules, technical brochures, documented good biosecurity practices and guidelines on biosecurity. The training tools will be tested by targeted users for further improvement before publication.

3.2.2 Conduct biosecurity pilot operations on live bird markets in Benin, Togo, Guinea Bissau, Ghana, Côte d'Ivoire, Burkina Faso, Gambia and Niger.

The pilot operations should be completed in Côte d'Ivoire and Togo, and well advanced in Benin, Burkina Faso and Ghana.

Output 3.3: Poultry and poultry product zoo sanitary certificate has been tested and adapted with the Economic Community of West African States (ECOWAS) for use at the regional level.

3.3.1 Support ECOWAS for the promotion and adoption at the regional level of relevant zoo sanitary and trade regulations and support the use, in a pilot phase, of a harmonized zoo sanitary certificate for poultry and poultry products.

The field simulation at six road border control posts and two international airports should have been planned for the first quarter 2010.

Output 4.1: Epidemiology surveillance and laboratory network data collection and management are actively supported through national databases and specific gateways within the regional website and Geographic Information Systems (GIS) services are developed.

4.1.1 Support networking activities through the existing website to facilitate and strengthen overall information sharing and networking harmonization on laboratory diagnosis, epidemio-surveillance, socio-economics and production, and related communication. This is also a tool to improve the visibility of the donors in Africa.

News and updates from the network will continue to be published on the website.

4.1.2 Implement and improve data management on animal health issues (zoo sanitary database), including active collaboration with SRA/AU-IBAR project. This would facilitate a Pan-African information/knowledge management component linked to the other regional animal health centers (RAHCs).

During the first quarter, the transboundary animal disease (TAD) info was planned for installation in Guinea Bissau, Niger and Côte d'Ivoire.

Activities undertaken during the reporting period

A. Activities related to project Phase I

The head of virology at the Laboratoire Central Vétérinaire (LCV) Bamako was on mission, thus interrupting the finalization of a video describing SOPs for the installation of a polymerase chain reaction (PCR) diagnosis unit in a veterinary laboratory.

Activities related to project Phase II

Output 1.1: An active regional epidemio-surveillance network is established to support the national network.

1.1.1 Establish a comprehensive directory of epidemio-surveillance, laboratory, socio-economic and production and communications network actors.

The printed version of the directory was sent to all network members and partners.

1.1.2 Support passive and active surveillance in key countries.

Funds were made available to the FAO country team through an agreement with Côte d'Ivoire to implement surveillance activities.

Output 2.1: Through RESOLAB networking activities, strengthen diagnostic capacity at laboratory and field levels.

2.1.1 Promote laboratory diagnostic tests quality assurance and inter-laboratory proficiency testing rounds.

During this period the shipping of reagents and samples for all groups (1, 2 and 3) was completed. Upon receipt the samples were tested by each laboratory and the results sent to the Tri-Veneto Region Experimental Animal Health Care Institute (IZSVe) in Padua (except 3 countries) for analysis.

The terms of reference (TORs) of the second round of QA workshops were finalised and adopted by the different partners. These workshops will involve the participation of the quality assurance manager of each laboratory and will be focused on the study of standard 17025 for laboratories.

Output 3.1: Poultry associations are supported and private-public partnerships are enhanced (regional and national) for a better understanding of the sector and the identification of practical and cost-effective investments/measures.

3.1.1 Building on previous poultry sector reviews, develop sustainable private-public partnerships to produce and maintain updated information and data (including geo-referenced maps) on poultry sector responses to veterinary services and private sector needs. (Benin, Burkina Faso, Côte d'Ivoire, Ghana and Togo)

Consultations between public and private sector actors are ongoing in Benin, Burkina-Faso, Côte d'Ivoire and Togo. In each country, a national consultant facilitates the process. They have identified the main partners and developed a work plan which is currently being implemented. The work is most advanced in Togo and Burkina-Faso. However, in each country, more time than expected is needed to reach an agreement between the various stakeholders, possibly due to their interest and involvement in the project. As the consultations have not yet begun in Ghana, it was decided to concentrate on the four other countries at this time.

Exchanges between Togo, Cote d'Ivoire and Burkina Faso have been facilitated in order to complement and share each other's work.

Output 3.2: Overall biosecurity along the poultry chain is promoted and improved.

3.2.1 Building on STOP AI/FAO training workshops, develop and disseminate multimedia modular training tools on biosecurity, including cost and benefit studies.

The development of "Biosecurity self-training and communication toolkits" is ongoing. The second batch of training modules and technical brochures have been developed and submitted by the national consultant (Dr Yaghouba Kane from the Inter-States School of Veterinary Sciences and Medicine, Dakar, Senegal) to ECTAD Bamako for assessment, improvements and technical clearance.

The manual presenting guidelines to improve biosecurity on live bird markets, validated by poultry actors in Côte d'Ivoire, is being formatted for different target audiences prior to its publication, after inclusion of some suggested illustrations and pictures.

3.2.2 Conduct biosecurity pilot operations on live bird markets (Benin, Togo, Guinea Bissau, Ghana, Côte d'Ivoire, Burkina Faso, Gambia and Niger).

Biosecurity pilot operations on live bird markets are being conducted in Côte d'Ivoire, while

the preliminary work has been completed for Benin and Burkina Faso. In collaboration with the USAID-funded STOP AI Project, a preliminary operation has been initiated in Mali. Similar activities are planned for Togo, Ghana, Gambia and Niger, and will be considered and adopted according to funding availability and country willingness.

Output 3.3: Poultry and poultry product zoo sanitary certificate has been tested and adapted with ECOWAS for use at the regional level.

3.3.1. Support ECOWAS for the promotion and adoption at the regional level of relevant zoo sanitary and trade regulations and support the use, in a pilot phase, of a harmonized zoo sanitary certificate for poultry and poultry products.

A technical regional briefing meeting was held in Bamako, Mali on 23-24 March 2010 to present and discuss the prototypes of international veterinary certificates for the ECOWAS sub-region, and to plan the technical and operational aspects of field testing in six countries (Benin, Burkina Faso, Côte d'Ivoire, Ghana, Mali and Togo). The sixteen border posts involved have been identified, as well as the type of poultry or poultry products concerned.

Output 4.1: Epidemiology surveillance and laboratory network data collection and management are actively supported through national databases and specific gateways within the regional website and GIS services are developed.

4.1.1 Support networking activities through existing website in order to facilitate and strengthen overall information sharing and networking harmonisation on laboratory diagnosis, epidemio-surveillance, socio-economics and production, and related communication. This is also a tool to improve the donor visibility in Africa.

Since its development, the website www.fao-ectad-bamako.org has received 40 000 visitors with distinct IP addresses.

4.1.2 Implement and improve data management on animal health issues (zoo sanitary database) through active collaboration with the SRA/AU-IBAR project. This would facilitate a Pan-African information/knowledge management component linked to other Regional Animal Health Centres.

During this reporting period, the new version of TADinfo was installed in Côte d'Ivoire and Guinea Bissau and an update has been initiated in Togo. In these countries, staff has been trained and computers provided. The political problem that occurred in Niger has led to a postponement of the installation.

Planned activities for the next quarter

A. Activities related to project Phase I

Record the commentary for the PCR SOPs video (English and French).

Post on the website the SOPs for an operational contingency plan.

B. Activities related to project Phase II

Output 1.1: Establish regional epidemio-surveillance networks to support the national network.

1.1.1 Support passive and active surveillance in key countries.

Finalize the various studies on active surveillance in Burkina Faso, Côte d'Ivoire and Benin.

Output 2.1: Through RESOLAB networking activities, strengthen diagnostic capacity at laboratory and field levels.

2.1.1. Promote laboratory diagnostic test quality assurance and inter-laboratory proficiency testing rounds and avian influenza and Newcastle disease inter-laboratories proficiency testing round.

Analysis and distribution of 2009 Avian influenza and Newcastle disease proficiency test exercise that involved 21 out of 23 network labs.

Output 3.1: Poultry associations are supported and private-public partnerships are enhanced (regional and national) for a better understanding of the sector and the identification of practical and cost-effective investments/measures.

3.1.1 Building on previous poultry sector reviews, develop sustainable private-public partnerships to produce and maintain updated information and data (including geo-referenced maps) on poultry sector responses to veterinary services and private sector needs. (Benin, Burkina Faso, Côte d'Ivoire, Ghana and Togo)

Finalize the consultation process and prepare a project document for Benin, Burkina Faso, Côte d'Ivoire, Ghana and Togo.

Advocate for the development of a private-public database/information system on the poultry sector as a means to better prevent and control HPAI and any other existing or emerging disease in the poultry sector.

Output 3.2: Improve biosecurity throughout the poultry chain.

3.2.1 Building on STOPAI/FAO training workshop, develop and disseminate multimedia modular training tools on biosecurity, including cost and benefit studies.

Finalize the development of the toolkit, including training modules, technical brochures, and documented best practices for biosecurity. The training tools will be published and distributed to targeted users.

3.2.2 Conduct biosecurity pilot operations on live bird markets (Benin, Togo, Guinea Bissau, Ghana, Côte d'Ivoire, Burkina Faso, Gambia and Niger).

The implementation of operations in Benin, Burkina Faso and Côte d'Ivoire will be completed. Implementation should be well advanced in Mali.

Output 3.3: Poultry and poultry product zoo sanitary certificate has been tested and adapted with ECOWAS for use at the regional level.

3.3.1. Support ECOWAS for the promotion and adoption at the regional level of relevant zoo sanitary and trade regulations and support the use, in a pilot phase, of a harmonized zoo

sanitary certificate for poultry and poultry products.

The implementation of the field test operations will be launched and completed in Benin, Burkina Faso, Côte d'Ivoire, Ghana, Mali and Togo (covering 16 border posts). Results and recommendations resulting from these tests will be made available.

Output 4.1: Epidemiology surveillance and laboratory network data collection and management are actively supported through national databases and specific gateways within the regional website and GIS services are developed.

4.1.1 Support networking activities through the existing website to facilitate overall information sharing and networking harmonization on laboratory diagnosis, epidemio-surveillance, socio-economics and production and related communications. This is also a tool to improve the visibility of the donor in Africa.

News and updates from the network will continue to be published on the website.

4.1.2 Implement and improve data management on animal health issues (zoo sanitary database), including active collaboration with the SRA/AU-IBAR project. This will facilitate a Pan-African information/knowledge management component linked to other RAHCs.

Provide computers, install TADinfo and train veterinary service personnel in Niger and Gambia.

Main challenges encountered and response provided

There remains a need for closer cooperation with organizations such as the ECOWAS, the African Union Inter-African Bureau for Animal Resources (AU-IBAR), the International Office of Epizootics (OIE) and with implementing partners. This would enhance relevance, sustainability and impact of activities, but would require substantial additional resources.

The activities planned under this project pertained primarily to national capacity building to improve preparedness, early warning and response to HPAI outbreaks. A special range of activities was added at the time of the extension, including the improvement of disease intelligence and biosecurity, and better information and data management. These activities rely essentially on the expertise available at FAO ECTAD at the regional animal health centre in Bamako, as well as in the targeted countries (via national consultants). To date most of these activities have been implemented.

Some additional activities have proven more difficult to implement due to the high level political input required. This is the case for testing regional zoo sanitary certificates that would improve traceability and biosecurity in the trade of poultry and poultry products. The testing requires official commitments from voluntary countries as well as from the Economic and Monetary Union of West Africa (UEMOA) and/or ECOWAS.

Finally the success in implementing activities such as national databases, capacity building to run official websites for veterinarian services, and biosecurity in poultry markets resulted in a high number of requests from beneficiary countries. A lack of available funds has compelled us to limit any extra activities. It is hoped that the completion of remaining activities will attract more funds to extend activities to more countries.

In order to respond to the country requests and complete the planned activities, USAID has agreed to extend the completion date to 30 June 2010 and allow some of the saved funds to be re-allocated to sustain key technical staff.

Main progress made towards the achievement of project outcomes (from the start of the project activities)

This project has contributed significantly to the efforts made by countries, regional organisations, and technical and financial partners to build capacities and prevent and control HPAI in the sub-regions. In particular the project:

- Implemented timely and effective outbreak response capacities (under project Phase I);
- Enhanced the capacities of laboratories to perform timely and reliable HPAI diagnosis (under Phases I and II). For example, the last confirmations of H5N1 HPAI outbreaks were made within 48 hours in Togo and 24 hours in Nigeria.

Under Phase II, which started in April 2009, the project activities reported above accomplished the following:

- Improved surveillance capacities;
- Enhanced capacities to promote and implement good biosecurity practices;
- Assisted countries in establishing public-private partnerships for a more integrated approach towards controlling HPAI and other poultry diseases;
- Supported the revival of the poultry sector.

The regional networking approach and the sharing of information and expertise have significantly contributed to the harmonization of strategies and protocols and to capacity building, a key element for sustainability.

I Quarter 2010Project Monitoring Sheet: **OSRO/RAF/718/USA Phase II**Project title: **Strengthening capacity of the Eastern Africa Sub-region to prevent and control HPAI**Reporting period: **January – March 2010**

Regional component: Eastern Africa (Burundi, Djibouti, Ethiopia, Kenya, Rwanda, South Sudan, Tanzania and Uganda)
Project title: Strengthening capacity of the Eastern Africa Sub-region to prevent and control HPAI
Code: OSRO/RAF/718/USA Phase II
Budget : USD 1 209 601 (Phase I), USD 650 000 (Phase II)
Total budget: USD 1 859 601
Effective starting date: 01 October 2009
Planned end date: 30 September 2010
<p>Context of the project</p> <p>The outbreak of the Highly Pathogenic Avian Influenza (HPAI) in Africa in 2006 prompted national and international agencies to initiate programmes to contain and prevent the disease. At this time, eleven African countries have reported outbreaks of HPAI. There is an elevated risk that the disease will spread throughout eastern Africa due to unregulated intra-regional trade in poultry and poultry products. In addition, many of these countries engage in trade beyond the eastern Africa region. Some of these trading partners are located in the pathways of migratory birds, which are thought to play a role in the spread of HPAI.</p>
<p>Objectives of the project</p> <p>The objective of the project is to assist eastern African countries (Burundi, Djibouti, Ethiopia, Kenya, Rwanda, South Sudan, Tanzania and Uganda) to develop and implement effective plans for the prevention and control of HPAI and other transboundary animal diseases (TADs), including strengthening epidemiology and laboratory networks for improved surveillance. The prevention and control of HPAI and other TADs requires regional cooperation and collaboration. Such cooperation could be strengthened by networking and inter-country interactions between disease surveillance and diagnosis teams. Increased collaboration also would help to coordinate efforts against emerging zoonotic diseases, which are increasing due to climatic changes, human population dynamics and livestock/human/wildlife interactions.</p> <p>The principal objective of the project will be achieved through a regional and multidisciplinary approach implemented by the Food and Agriculture Organization of the United Nations (FAO) Emergency Centre for Transboundary Animal Disease Operations (ECTAD) unit of the Regional Animal Health Centre (RAHC) in Nairobi, facilitated by staff at FAO headquarters in Rome, and by working in close collaboration with national governments, regional economic communities (East African Community (EAC) and Intergovernmental Authority on Development (IGAD)), institutions of higher learning, other United Nations (UN) agencies such as the World Health Organization (WHO), non-governmental organizations (NGOs), African Union/Interafrican Bureau for Animal Resources (AU/IBAR) and the private sector. The project implementation will embrace the One World One Health concept particularly when addressing zoonosis.</p>

Successful implementation of the project will result in the following major outcomes:

1. Laboratory capacity and networks are strengthened and consolidated to improve the management of HPAI and other TADs

The various diagnostic laboratory systems in each country will be assessed and documented to enable harmonization of protocols and guidelines for surveillance, reporting, diagnoses, prevention and control of priority diseases.

2. Epidemiology capacity and networks are strengthened and consolidated to improve the management of HPAI and other TADs

Different systems of operation of the epidemio-surveillance systems in different countries will be assessed and documented to enable harmonization at the regional level. The project will assist the network to define terms of reference and operational frameworks, including detailed descriptions of the relationships, roles and responsibilities of stakeholders such as the private sector, research institutions, universities, AU/IBAR, FAO, World Organization for Animal Health (OIE), WHO and other NGOs. In order to ensure sustainability, the network plans will be presented for endorsement by regional and national leaders, with financial commitments for specific national requirements.

3. Animal health interventions and data will be used to analyse and improve poultry and livestock value chains

Policy makers, governments and network experts will be provided with evidence-based information to better understand the dynamics of poultry value chains as they relate to disease control and food safety. Evidence will be provided on cost-effectiveness, costs and benefits, suitability and appropriateness of disease control measures. The project will educate and develop best practices along the poultry value chain and strengthen partnerships between private and public sector through consultations, working with national governments and regional economic communities (RECs) to develop and implement policies.

Planned activities

Outcome 1: Laboratory capacity and networks are strengthened and consolidated to improve the management of HPAI and other TADs.

Activity 1.1 Assessment of diagnostic capacity of central veterinary laboratories for HPAI and other TADs.

Activity 1.2 Assist national laboratories in implementation of quality management systems (QMS).

Activity 1.3 Organize targeted training courses on disease recognition and diagnostic techniques for emerging zoonotic diseases in order to facilitate prevention and control actions.

Activity 1.4 Hold a joint five day epidemiology and laboratory networks meeting to share regional information including reaching a consensus on list of priority TADs for targeted prevention and control.

Activity 1.5 Hold a workshop with the chief veterinary officers and heads of central veterinary laboratories, RECs, AU-IBAR and development partners. The workshop will discuss the

findings of laboratory assessments, select regional laboratories for the network and promote integration of the network into the RECs structures.

Activity 1.6 Supply critical equipment, materials and reagents for diagnosis of HPAI and other priority TADs at the national laboratories.

Activity 1.7 Strengthen regional laboratory network web page and link it with other existing (epidemiology) and proposed thematic networks to increase the information sharing capacity.

Outcome 2: Strengthen and consolidate epidemiology capacity and networks in order to improve the management of HPAI and other TADs

Activity 2.1 Assess national epidemio-surveillance systems for HPAI and other TADs.

Activity 2.2 Hold a joint five day annual epidemiology and laboratory networks meeting to share regional information, and to reach a consensus on priority TADs for targeted prevention and control.

Activity 2.3 Supply critical equipment, materials and reagents for field surveillance of HPAI and other priority TADs at the national laboratories.

Activity 2.4 Prioritize TADs detection, reporting and preparedness in the region through structured qualitative national risk assessments including probable impacts of the disease.

Outcome 3: Animal health interventions and data will be used to analyse and improve poultry and livestock value chains

Activity 3.1 Consolidate information on cross-border trade in poultry and poultry products to enable a country-level poultry value chain analysis. Targeted disease surveillance and monitoring plans will be based on this analysis.

Activity 3.2 Conduct a cost-benefit analysis of functional laboratory and epidemiology surveillance systems. This analysis will be used to lobby national governments to include funding for the systems into their annual budgets.

Activity 3.3 Commission a study to identify and quantify the key drivers in public sector adoption of biosecurity and poultry health interventions along the poultry value chains. The study will be conducted in Sudan and Kenya in consultation with the International Livestock Research Institute (ILRI) and Winrock International non-profit organization.

Activity 3.4 Organize a stakeholder workshop to facilitate policy dialogue between public and private sector operators on restructuring the poultry industry and improving poultry health management in the region.

Activities undertaken during the reporting period

The project inception workshop was held on 3 and 4 February 2010 in Mombasa, Kenya. Attendees included officials from AU-IBAR and FAO-ECTAD, in addition to thirty epidemiology and laboratory experts from the eastern Africa region. The objectives of the workshop were to facilitate discussions between representatives of beneficiary countries and

other stakeholders regarding final project content, work plan and implementation time tables, and project roles and responsibilities. A workshop report has been prepared and technically cleared by the ECTAD Regional Manager.

Outcome 1: Laboratory capacities and networks are strengthened and consolidated to improve the management of HPAI and other TADs

Activity 1.2 Assist national laboratories in implementation of Quality Management Systems (QMS).

- Activity 1.2a Questionnaires have been sent to beneficiary countries to assess the current status of QMS implementation. In-country quality assurance training will be provided, including the development of quality manuals and the implementation of QMS.
- Activity 1.2b A Letter of Agreement (LoA) is being finalised with the Tri-Veneto Region Experimental Animal Health Care Institute (IZSVe) to carry out proficiency ring tests for central veterinary laboratories in the region.

Outcome 2: Epidemiology capacities and networks are strengthened and consolidated to improve the management of HPAI and other TADs

Activity 2.1 Assess national epidemio-surveillance systems for HPAI and other TADs.

- Activity 2.1a Questionnaires were prepared and sent to national epidemiology units in order to understand the level of epidemiologic activities in each country. This information will be used to design action plans for intra- and inter-regional collaboration.

Outcome 3: Animal health interventions and data will be used to analyse and improve poultry and livestock value chains

Activity 3.1 Consolidate information on cross-border trade in poultry and poultry products to enable a country-level poultry value chain analysis. Targeted disease surveillance and monitoring plans will be based on this analysis.

- Activity 3.1a Identification of experts to undertake trade flow mapping in Rwanda and Burundi has been initiated.

Planned activities for the second quarter of 2010 and future proposed actions

Outcome 1: Surveillance and diagnostic capacity will be strengthened

Activity 1.1 Assessment of diagnostic capacity of central veterinary laboratories for HPAI and other TADs.

- Activity 1.1a An LoA is being finalised with IZSVe to carry out the assessments. This activity is scheduled for June 2010.

Activity 1.2 Assist national laboratories in implementation of QMS.

- Activity 1.2a A five day regional training workshop on QMS will be held in Debre Zeit, Ethiopia from 31 May to 4 June 2010.
- Activity 1.2b Questionnaires completed by beneficiary countries will be analysed in order to understand the level of QMS implementation in diagnostic laboratory units.
- Activity 1.2c Proficiency ring tests should be carried out (through an LoA in preparation at HQ with IZSVe).

Activity 1.3 Organize targeted training courses on disease recognition and diagnostic techniques for emerging zoonotic diseases to facilitate prevention and control actions.

- **Activity 1.3a** A ten day training course on the laboratory diagnosis of avian influenza and Newcastle disease will be conducted from 7 to 20 April at Centre for Virtual Learning (CVL) Dar Es Salaam for four laboratory personnel from Burundi and South Sudan.

Activity 1.4 Supply critical equipment, materials and reagents for field surveillance of HPAI and other priority TADs at the national laboratories.

- **Activity 1.4a** Countries will be requested to provide lists of necessary equipment and materials. Procurement procedures will then be initiated to procure and distribute the equipment and materials.

Activity 1.5 Strengthen regional laboratory network web page and link it with other existing (epidemiology) and proposed thematic networks to increase information sharing capacity.

- **Activity 1.5a** A communications consultant will be recruited in April 2010 to train the FAO ECTAD staff to administer the web page.

Outcome 2: Strengthen and consolidate epidemiology capacity and networks to improve the management of HPAI and other TADs

Activity 2.1 Assess national epidemio-surveillance systems for HPAI and other TADs.

- **Activity 2.1a** A five day workshop is planned to take place from 7 to 11 June 2010 in Kigali, Rwanda. The workshop will bring together representatives of the national epidemiology units to discuss the results of the assessments carried out and to make recommendations for the adoption of harmonized surveillance systems.

Outcome 3: Animal health interventions and data will be used to analyse and improve poultry and livestock value chains

Activity 3.1 Consolidate information on cross-border trade in poultry and poultry products in order to enable a country-level poultry value chain analysis. Targeted disease surveillance and monitoring plans will be based on this analysis.

- **Activity 3.1a** Finalize recruitment of national consultants to undertake trade flow mapping in Rwanda and Burundi.

Activity 3.2 Conduct a cost-benefit analysis of functional laboratory and epidemiology surveillance systems. This analysis will be used to lobby national governments to include funding for the systems into their annual budgets.

- **Activity 3.2a** Identify an international consultant to undertake cost-benefit analysis of the epidemio-surveillance network in Kenya and Uganda.

Activity 3.3 Commission a study to identify and quantify the key drivers in public sector adoption of biosecurity and poultry health interventions along the poultry value chains. The study will be conducted in Ethiopia and Tanzania in consultation with ILRI and Winrock International.

- **Activity 3.3a** Hold meetings with Winrock International and ILRI.
- **Activity 3.3b** Identify national consultants to undertake the studies in both countries.

All outputs

- Carry out activities as proposed in the three outputs outlined above.

Reports

- Continue preparing project progress reports on the implementation of activities.

Main challenges encountered and responses provided

- The questionnaires on epidemiology and laboratory assessments were not returned on time despite a clearly stated deadline.

Main progress made towards the achievement of project outcomes (from the start of project activities)

- Completion of a project inception workshop at which participants agreed upon the final project content, work plan and implementation time tables, and project roles and responsibilities. A workshop report has been prepared and technically cleared by the ECTAD Regional Manager.
- Preparation and distribution of questionnaires to assess the status of central veterinary laboratories and national epidemiology units.

I Quarter 2010

Project Monitoring Sheet: OSRO/RAF/719/USA – Phase II**Project Title: Strengthening HPAI surveillance, preparedness and response capacity in Southern Africa****Reporting period: January to March 2010**

<p>Regional component: Southern Africa Project title: Strengthening HPAI surveillance, preparedness and response capacity in Southern Africa Code : OSRO/RAF/719/USA</p>
<p>Budget : USD 1 099 175 (Phase I), USD 500 000 (Phase II) Total budget: USD 1 599 175</p>
<p>Effective starting date: 1 January 2010</p>
<p>Planned end date: 30 September 2010</p>
<p>Context of the project</p> <p>Since the outbreak of the Highly Pathogenic Avian Influenza (HPAI) on the African continent in February 2006, the Southern African region has remained free from the infection. In response to the potential threat of incursion of the disease, African countries have formulated National Preparedness and Response Plans, which led to the development of a Regional Plan by the Southern African Development Community (SADC). The levels of implementation of the national plans, however, differ greatly between the countries. This project, therefore, aims at assisting the countries at both national and regional levels in retaining a disease free status.</p>
<p>Objectives of the project</p> <p><i>Impact of the project</i> Improvement and safeguarding of animal health and livelihoods from the threat of HPAI and mitigation of the risk of a human pandemic within the SADC region.</p> <p><i>Outcome of the project</i> Enhanced and harmonized regional preparedness, effective response to HPAI outbreak and strengthened regional and national surveillance of HPAI in the SADC region.</p> <p><i>Outputs of the project</i></p> <ol style="list-style-type: none"> 1. Expanded and consolidated risk analysis-based HPAI surveillance (Malawi, Mozambique, Zambia and Zimbabwe); 2. Enhanced capacity of regional and national veterinary laboratories for the diagnosis of Low Pathogenic Avian Influenza (LPAI) and HPAI and provision of essential material to second regional service laboratory (Botswana); 3. Regional coordination and networking.
<p><u>Activities that were planned for this quarter</u></p> <p>Output 1 Activity 1.1: Implementation of cross-border surveillance</p> <ul style="list-style-type: none"> • Identification of border points for cross border surveillance in respective countries and formalization of a timetable for joint surveillance activities by participating countries.

Activity 1.2: Promoting HPAI surveillance and its integration into ongoing national animal health activities

- Convening of a consultative meeting at the country level with national veterinary services with the view of integration of avian influenza surveillance into national animal health plans, particularly Newcastle Disease (ND) vaccination campaigns.
- Monitoring of the need for laboratory supplies and sampling material in order to facilitate the sampling activities in the four countries.

Activity 1.3: Enhancing integration of producers into surveillance activities

- Convening of national consultative meetings with poultry producer associations with the view of identifying *master farmers*.

Activity 1.4: Training of field personnel in surveillance techniques

- Training of relevant field personnel and distribution of sensitization and information material.

Activity 1.5: Training for expansion of the use of Data Point Type (DPT) in selected areas in Malawi and Zambia

- Training of Zambia's veterinary staff in the use of DPT with a special focus on the collection of information on poultry disease and expansion of its use to additional HPAI risk areas.

Output 2

Activity 2.1: Enhanced surveillance in the region via laboratory support

- Signing of the Letter of Agreement with Botswana National Veterinary Laboratory (BNVL) and finalizing of the work plan.
- Supporting BNVL in establishing and developing the capacity of new tests to diagnose LPAI/HPAI (enzyme linked immunosorbent assay (ELISA) and agar gel immunodiffusion (AGID)).
- Continuous supply of swab and serum samples to BNVL sent by all countries with enhanced surveillance.
- Transfer of the demand-supply hub from South Africa's Onderstepoort Veterinary Institute (OVI) to BNVL and procurement and distribution of reagents to recipient laboratories.

Output 3

Activity 3.1: Coordination

- Organizing of an Inception workshop by FAO ECTAD.
- Finalizing of a work plan (activities of Phase 2) and evaluation of its progress by the project management team.

Activities undertaken during the Reporting Period

Output 1

Activity 1.1: Implementation of cross-border surveillance

- During the Inception workshop on 16 and 17 February, the participating countries agreed with their respective neighbours on common cross-border posts to be sampled: Malawi identified five (sharing three with Mozambique and two with Zambia), Mozambique identified five (sharing three with Malawi and two with Zimbabwe), Zambia identified

three (sharing two with Malawi and one with Zimbabwe) and Zimbabwe identified three (sharing one with Zambia and two with Mozambique) border posts. The timing of the sampling by participating countries has been harmonized.

Activity 1.2: Promoting HPAI surveillance and its integration into ongoing national animal health activities

- All national project consultants agreed to hold a meeting with the authorities of the veterinary services in order to discuss the integration of Avian Influenza (AI) surveillance into their regular national animal health activities. During the reporting period, only Mozambique and Zimbabwe submitted a written statement on the outcome of this discussion; both countries agreed to harmonize the AI surveillance with an ND vaccination campaign.
- Two members (Dr Radosavljevic and Dr Costa) of the KYEEMA Foundation participated in the AI working group meeting on 23 and 24 March 2010. They presented the ND vaccination and surveillance program and its possible integration within the AI surveillance project. A Concept Note on collaboration during cross-border surveillance will be produced.
- The FAO ECTAD office in Gaborone ordered the field sampling material to be used for surveillance which was delivered by local suppliers and sent to the respective countries: red top blood collection tube, 21G luer lock needles, 5 ml luer lock syringes, 15ml conical bottom disposable sterile plastic tubes, 2 ml Cryotubes, sampling swabs, 100 mm scissors, disposable medical gloves and permanent markers. 4000 units of each item were supplied per country. The ECTAD office has also facilitated the purchase of additional laboratory and sampling material from country budgets on request.

Activity 1.3: Enhancing integration of producers into surveillance activities

- During the Inception workshop, the four participating countries presented their different approaches to identify *master farmers* through poultry associations (Zimbabwe), community leaders and vaccinators (Mozambique and Zambia) and existing agriculture development systems (Malawi). The training program for *master farmers* was discussed and training topics were suggested.

Activity 1.4: Training of field personnel in surveillance techniques

- All the participating countries identified high risk areas where retraining of field personnel is necessary based on high staff turn-over and capacity of field staff.
- The "Picture book" on infectious poultry disease has been revised and a second edition has been produced as a training tool for extension personnel and poultry producers involved in passive surveillance. A total of 4000 copies will be printed in English and Portuguese, 1000 booklets per country.

Activity 1.5: Training for expansion of the use of DPT in selected areas in Malawi and Zambia

- Dr Mokopasetso from FAO ECTAD Unit travelled to Zambia in mid February where field training was conducted for all newly identified high risk areas. The technology has been successfully implemented in both countries and so far outputs have been positive.

Activity 1.6: Dynamic mapping of surveillance results

- Geographic Information System (GIS) maps which indicate the high risk sampling areas covered during Phase I have been created for all four countries. At the same time, the second generation HPAI risk map was made available by International Livestock

Research Institute (ILRI) under the Early Detection, Reporting and Surveillance of Avian Influenza in Africa (EDRSAIA) project. After technical problems of projection compatibility were resolved, the two maps attached in Annex have been overlaid. The high risk areas identified by this project corresponded to those calculated by ILRI in all countries except in Mozambique. The high risk sampling areas for Phase II, including the cross border points, have also been mapped and overlaid with the HPAI risk map of ILRI.

- All four countries have been motivated to collect Global Positioning System (GPS) points during the sampling activities under Phase II. Based on these coordinates, more precise maps will be produced.

Output 2

Activity 2.1: Enhanced surveillance in the region via laboratory support

- The activities implemented by the Agricultural Research Council-Onderstepoort Veterinary Institute (ARC-OVI) between December 2008 and December 2009 under a Letter of Agreement (LoA) with FAO have been completed and the final report was supplied by Dr Phelix Majiwa of the ARC-OVI in February 2010. This report has been distributed to all SADC laboratories.
- BNVL is in the process of establishing ELISA, Neuraminidase Inhibition (NI) and Real-time reverse transcriptase PCR (r RT- PCR) tests, facilitated by their OIE twinning project with Veterinary Laboratories Agency (VLA).
- At the time of reporting, BNVL had received a total of 1199 serum and 1393 swab samples (199 sera and 387 swab samples from Mozambique, 1006 swab samples from Zambia and 1000 serum samples from Zimbabwe). During the Inception workshop, BNVL reported their experiences and challenges with the samples received so far. The participating countries took note of the suggestions for improvement to be made.
- The demand-supply hub has been transferred from the ARC-OVI to BNVL and restocking is in process. The first consignment of reagents, supplied by FAO arrived in January and early February 2010. The ARC-OVI handed over the remaining reagents of the hub to Botswana. Currently, the following reagents are available at the BNVL supply hub: ELISA kit (24 boxes), H5N1 antigen (91 ampoules), H5N8 antigen (35 ampoules), H5N9 antigen (20 ampoules), H7N1 antigen (46 ampoules), H7N7 antigen (12 ampoules), SPF sera (24 vials), H5N2 positive antisera (11 vials), H7N7 positive antisera (11 vials). The request form for the demand supply hub has been designed by BNVL and widely distributed to all SADC laboratories. So far, a request for reagents has been handed in by Zambia (CVRI Lusaka).
- During the AI working group meeting on 23 and 24 March, all laboratories which are running PCR for AI agreed to send their SOP to ECTAD. The intention is to harmonize the PCR protocols for AI in a similar manner as it was done for haemagglutination (HA) and haemagglutination inhibition (HI).

Output 3

Activity 3.1: Coordination

- During the reporting period, the Inception workshop (on 16 and 17 February) and three regional meetings were organized by FAO ECTAD and held in Gaborone. The regional events were the Epidemiology and Informatics Sub-Committee (EIS) meeting (from 2 to 4 March), the Laboratory Diagnostic Sub-Committee meeting (from 16 to 18 March) and the SADC AI working group meeting (on 23 and 24 March).
- A LoA on the provision of funds from FAO to the Governmental Department of Veterinary Services for Phase II of the project is in the process of being drafted by Zimbabwe, Zambia and Mozambique. In Malawi, no LoA will be signed between FAO and the Government and the funds will be managed by FAO.

Activities planned for the 2nd quarter**Output 1****Activity 1.1: Implementation of cross-border surveillance**

- Sampling at common cross-border points will be implemented between June and July and timing will be harmonized between neighbouring countries.

Activity 1.2: Promoting HPAI surveillance and its integration into ongoing national animal health activities

- Trained field personnel shall continue with the sampling activities and the AI surveillance program will be coupled with ND vaccination campaigns or integrated into other ongoing animal health activities, e.g. dipping programs. Monthly reports on the number of samples submitted from the field and tested at the CVLs will be submitted to FAO ECTAD.
- The KYEEMA foundation and the project will have integrated their activities and will work closer together.
- The project will continue to monitor the need for sampling material.

Activity 1.3: Enhancing integration of producers in surveillance activities

- Master farmers will have been identified and trained. Their role in conducting passive surveillance will be evaluated.

Activity 1.4: Training of field personnel in surveillance techniques

- Additional field personnel will have been trained in previously identified high risk areas.
- "Picture books" on infectious poultry diseases will be available at all high risk District Veterinary Offices and widely used in the field.

Activity 1.5: Training for expansion of the use of DPT in selected areas in Malawi and Zambia

- DPT shall be widely used for the collection of information on poultry disease, especially for HPAI in all identified high risk areas in Zambia and Malawi.

Activity 1.6: Dynamic mapping of surveillance results

- GPS coordinates will be collected during the sampling activities for further analysis and mapping.

Output 2**Activity 2.1: Enhanced surveillance in the region via laboratory support**

- Additional diagnostic tests for the detection of LPAI/HPAI, such as ELISA and Neuraminidase (NI) will be established while the development of the r-RT PCR will still be in progress.
- Regular reporting from BNVL on the number of samples they received from the different SADC laboratories and the test results will be submitted monthly.
- BNVL shall provide an update on the use of the demand-supply hub.
- The SOPs for PCR (Avian Influenza) will have been submitted by all SADC laboratories to ECTAD and harmonization shall have been finalized.

Output 3**Activity 3.1: Coordination**

- Will continue throughout the project implementation.

Main challenges encountered and response provided during 1st quarter 2010

The main challenge during this reporting period was the reduction of the budget from USD 750 000 to USD 500 000. This reduction had to be accommodated by the project and the participating countries had to adapt their national work plans to the decreased funds.

Main progress made towards the achievement of project outcome *(from the start of the project activities)*

The Inception workshop that took place in early February marked the start of Phase II of the project. The following contributions demonstrate the progress made towards achieving the expected outputs: 1) challenges and lessons learned in Phase I were identified and suggestions for improvement in Phase II were made; 2) the sustainability of the project was discussed and the necessity to integrate AI surveillance into an ongoing animal health activity was fully acknowledged by all participants; 3) the four participating countries agreed on common border posts and on harmonizing the time of sampling; 4) the work plan was designed and approved.

GIS maps were produced for the sampling areas in Phase I and were overlaid with the second generation high risk map produced by ILRI, showing concurrence for high risk areas, except for Mozambique.

The second SADC Service laboratory for HPAI has started its services: the demand supply hub has been established at the BNVL and is operational. BNVL has already received aliquots of serum samples and swab samples from SADC laboratories for testing using HA/HI and is now in the process of establishing ELISA, NI and Real-time reverse transcriptase PCR.

Three regional meetings were held in Gaborone between mid February and the end of March. The project was presented and discussed at all three meetings and valuable additional comments and suggestions were made. The transition to the regional ownership of the project was achieved.

Annex 1

Figure 1: Sampling areas during Phase I (2009) overlaid with EDRSAIA AI High Risk map

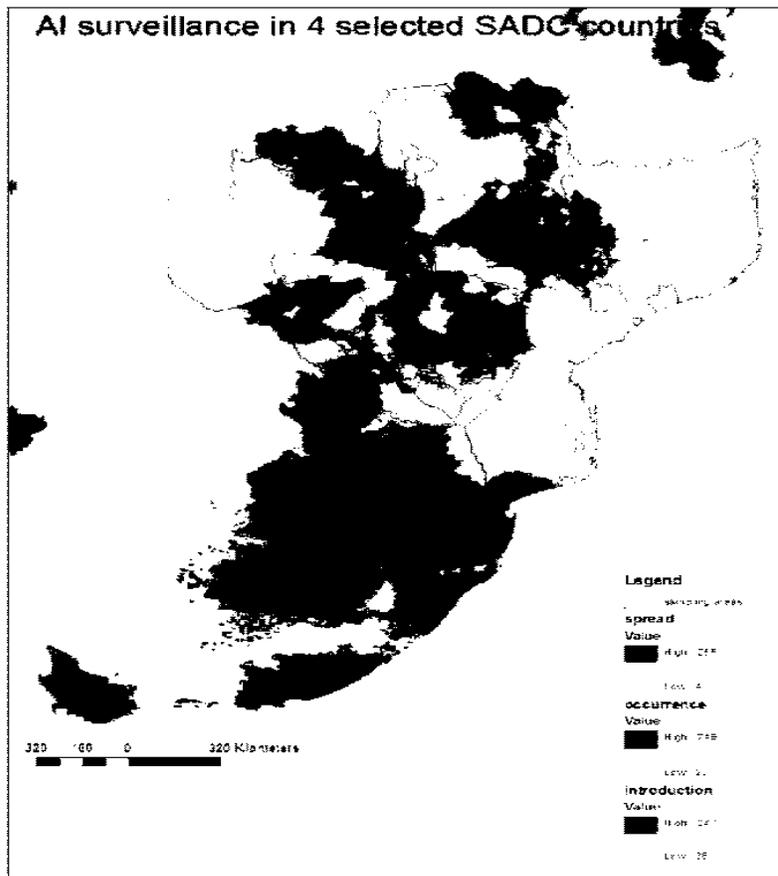

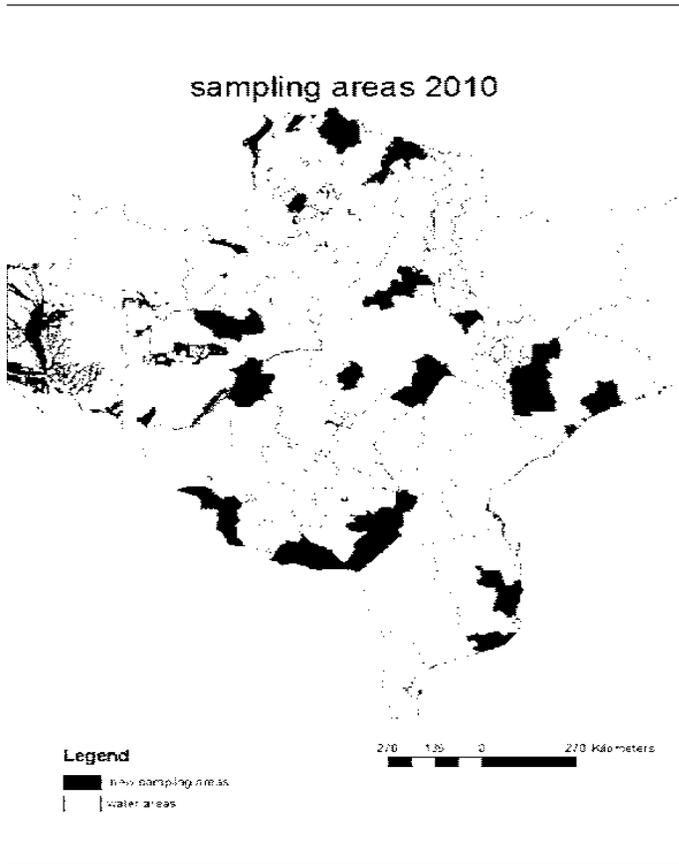

Figure 2: Sampling areas during Phase II (2010)

Project Monitoring Sheet: **OSRO/RAS/604/USA Baby 01**Project Title: **Support to Highly Pathogenic Avian Influenza Surveillance Programme in Cambodia**Reporting period: **April to September 2012**

Country: Cambodia
Project title: Support to Highly Pathogenic Avian Influenza Surveillance Programme in Cambodia
Code: OSRO/RAS/604/USA Baby 1
Budget: USD 1 150 000 (Phase I), USD 1 900 000 (Amendment no. 1), USD 600 000 (Amendment no. 2), USD 400 000 (Amendment no.3), USD 400 000 (Amendment no.4), USD 372 000 (Amendment no. 5) and USD 150 000 (Amendment no.6)
Total budget: USD 4 972 000
Effective starting date: 1 October 2006
Planned end date: 30 September 2013
Context of the project As stated in the previous reports, outbreaks of Highly Pathogenic Avian Influenza (HPAI) in poultry and humans indicate that the H5N1 virus is still circulating in Cambodia. Therefore, it is necessary to detect the outbreaks as early as possible and ensure that immediate and appropriate containment measures are taken to prevent the spread of the disease. The continued improvement of capacities and capabilities in Cambodia to prevent and control HPAI in animal population is necessary to limit its impacts in poultry sectors and minimize the risk of an infection in humans. The Food and Agriculture Organization of the United Nations (FAO) Avian Influenza (AI) Programme in Cambodia is currently funded by the United States Agency for International Development (USAID) in Cambodia for surveillance activities and by the World Bank for Village Animal Health Workers' (VAHWs) training and strengthening of the laboratory capacities and capabilities.
Objectives of the project The main objective of the project is to reduce and stop the spread of H5N1 among and between flocks of birds in Cambodia, and between Cambodia and neighboring countries (Viet Nam, Thailand and the Lao People's Democratic Republic [PDR]), thus reducing the risks of a pathogen spread to mammals and humans and of an emergence of pandemic influenza.
Planned activities for the reporting period (April to September 2012) Output 1: Strengthened planning and cross-sectoral coordination at national and international levels <ul style="list-style-type: none"> • Technical consultation on HPAI surveillance in lower Mekong was organized in Siem Reap on 25 and 26 September 2012. The key persons from the Cambodian Department of Animal Health and Production and the Vietnamese Department of Animal Health, provincial officers and technical officers from FAO Emergency Centre for Transboundary Animal Diseases (ECTAD) Cambodia, ECTAD in the Regional Office for Asia and the Pacific (RAP) and Viet Nam attended and actively shared information. At the time of this report, the proceedings of the meeting were not completed. A report will be made available soon. • Through advocacy effort from FAO, the livestock subsector is now being represented within the Technical Working Group on Agriculture and Water through the Livestock Subworking Group. • Seven HPAI risk communication fora were organized in six provinces bordering Viet Nam

and Thailand namely: Banteay Meanchey, Kandal, Kampong Cham, Kampot, Prey Veng and Takeo. Some 2 297 farmers attended the fora.

Output 2: Strengthened laboratory capacity

- The second round of biosafety risk assessment and annual biosafety cabinet testing and calibration service for the regional laboratory was conducted in the National Veterinary Research Institute (NaVRI). Biosafety risk assessment and training was conducted with NaVRI laboratory officers. This assessment is to be used to monitor the improvement of biosafety management (in comparison with the last assessment result), and to address the needs at NaVRI for further improvement on biosafety issues, including procurement of the relevant equipment.
- Supplied consumable equipment and reagents to NaVRI to maintain the ongoing testing.
- Provided support to NaVRI towards becoming a member of proficiency testing laboratories.
- Provided support for the assessment of the laboratory and fixed biosafety cabinets.
- Provided assistance to laboratory officers with international trainings and workshops.

Output 3: Strengthened veterinary epidemiology capacity

- A first three-week Cambodian Applied Veterinary Epidemiology Training (CAVET) was conducted in Takeo province. The cohort of trainees is now moving to a five-month on-the-job training. The 15 trainees are district veterinarians, human health officers (from Takeo and Kampong Cham) as well as wildlife protection officers. Five Cambodian former alumni of one-month Field Epidemiology Training Programme for Veterinarians (FETPV) in Bangkok served as trainers with the assistance from foreign supervisors from FAO RAP, United States Centers for Disease Control and Prevention and Kon Kaen University.
- A hand book for CAVET training was produced in Khmer language.
- In line with the World Bank-funded project “Animal and human influenza control and preparedness project”, under the new component “Healthy livestock, healthy village, better life,” village surveillance was planned in 15 villages of three provinces with the technical support of FAO.

Output 4: Improved surveillance system

- Owing to the lack of reporting, FAO jointly with the Department of Animal Health and Production (DAHP)/NaVRI conducted an assessment on the HPAI surveillance to better understand “WHY” a number of outbreaks are not reported and “HOW” the early warning information system can be improved.
- Organized a workshop on HPAI and emergency infectious diseases (EIDs) surveillance and response in Cambodia in March 2012, the objectives are to: (1) revisit the objectives and review experiences and lessons learned from implementation of the current HPAI surveillance strategy in Cambodia; and (2) to identify practical options to improve HPAI surveillance in Cambodia and apply to other diseases focusing on multi-sectoral collaboration under the One Health approach.
- Support to DAHP/NaVRI to conduct surveillance and investigation during HPAI outbreaks (outbreak in Kampong Speu on 31 May 2012).
- Following a 12-day mission (9 to 20 September 2012), a revised strategy for animal surveillance in Cambodia is under finalization. Activities on surveillance for the next phase will follow recommendations.
- The guide for HPAI outbreak investigation and response was reviewed and will be

expanded to other animal diseases.

- Specific period HPAI surveillance was conducted during the Chinese and Khmer New Year. See Annex 1: Table of HPAI surveillance in live bird markets (LBMs).

Output 5: Improved policy and legislation for trade purposes between Cambodia and its neighbouring countries

- Two consultative workshops with development partners and donors on animal health and production legislation were organized by MAFF. FAO assisted the Animal Health and Production Legislation Committee in terms of granting technical expertise from local and international experts. Cambodian Animal Health and Production Legislation document is now finalized, and was submitted to the Council Minister.
- In coordination with the World Bank-funded Avian and Human Influenza Preparedness and Response Project, FAO conducted a study of poultry value chain analysis for the Phnom Penh markets. Information on traded poultry products-, volumes-, sources- and disease transmission-related trading behaviour was collected from vendors in three different poultry wholesale/retail markets in Phnom Penh. The Report is available upon request.

Other related activities funded under the programme

The Annual Review of the Cambodia Zoonotic Diseases Technical Planning Workshop (on 5 and 6 June 2012) involved the four projects/components implementers (PREDICT, RESPOND, IDENTIFY AND PREVENT) of Emerging Pandemic Threats Program, United States agencies working in the field of animal and human health sectors and the Government of Cambodia, represented by the Ministry of Health (MoH) and MAFF. The workshop identified the needs of the Government counterpart, which is crucial to successful implementation of the strategic planning of zoonotic diseases. It was also a good opportunity that partners explored their available resources for matching with the needs of the government counterpart in term of activities implementation and technical support and strengthening partnerships between the Government of Cambodia, the United States Government and other organizations working in the field of zoonotic diseases. The fiscal year 2013 Action Plan for zoonotic diseases was developed and agreed upon by both ministries, MAFF and MOH.

Planned activities for the next six-month period (October 2012 to March 2013)

Output 1: Strengthened planning and cross-sectoral coordination at national and international levels

- Activity 1.1. Support from ECTAD Country Team Leader and the team to provide inputs for planning the coordination required at country level.
- Activity 1.2. Support national and international coordination related to disease control.

Output 2: Strengthened laboratory capacity

- Activity 2.1. Strengthen laboratory management through technical and management advice.
- Activity 2.2. Support Cambodia's participation in laboratory quality assurance and quality control system for HPAI and regional HPAI laboratory network, including support of sample sharing with the International Reference Laboratory and of proficiency testing.
- Activity 2.3. Procure necessary laboratory supplies (when needed).

Output 3: Strengthened veterinary epidemiology capacity

- Activity 3.1. Support veterinary epidemiology training at regional and country levels.
- Activity 3.2. Support community-based surveillance and response activities.

Output 4: Improved surveillance system

- Activity 4.1. Review disease surveillance strategy in collaboration with human health sector.
- Activity 4.2. Support risk-based surveillance activities focusing on where human cases are reported and along the areas identified as high-risk supply chains.
- Activity 4.3. Conduct workshops and training exercises to follow up on new surveillance modalities and facilitate planning of field work.
- Activity 4.4. Communicate the risks identified by the means of surveillance through public awareness campaigns, particularly during festival period by organizing fora and media spots on TV or radio.
- Activity 4.5. Provide logistic support to field activities (when needed).

Output 5: Improved policy and legislation for trade purposes between Cambodia and its neighbouring countries

- Activity 5.1. Support activities related to policy and legislation for trade purposes between Cambodia and neighbouring countries through the expertise provided to finalize the international animal trade component of the main law.

Main challenges encountered and response provided

- The disease surveillance in general and the diagnostic capacities need to be further strengthened.
- The surveillance in high-risk areas and cross-border issues needs to be addressed for a better control of transboundary animal diseases to improve food safety and livelihoods of smallholders.

Main progress made towards the achievement of project outcomes

- First CAVET cohort training successfully organized;
- Seven risk communication fora organized in bordering provinces to Viet Nam and Thailand;
- Animal Health and Production Legislation drafted;
- Current HPAI surveillance assessed;
- Technical consultation on HPAI surveillance in lower Mekong between Cambodia and Viet Nam carried out;
- Laboratory equipment well maintained and assessed; and
- HPAI Investigation and Response protocol reviewed and tentatively expanded to other animal diseases investigation and response.

Annex 1: Active surveillance in LBM

Name of province (or other similar administrative boundary market) or epidemiological unit (such as production zone, wetland)	Sampling farm (e.g. ducks in the areas with previous outbreak, LBM along the border, etc.)	Type of samples (sera, swab, feces, etc.)	Laboratory performing the results	Test to be used	No. of samples collected	No. of +ve	% of +ve	Remarks
Siem Reap, market	Poultry from different places to be slaughtered for high consumption demand	Swab (cloacal and tracheal) and sera	NaVRI	Egg inoculation for swabs & HA-HI test for sera	2 070 690 cloacal 690 tracheal 690 sera	0	0	Surveillance during 3 months (end of Jan./Feb./Mar/Apr. 2012)
Phnom Penh, Chbar Ampov market	Whole sale poultry and gathering place for poultry from different provinces	Swab (cloacal and tracheal) and sera	NaVRI	Egg inoculation for swabs & HA-HI test for sera	2 160 720 cloacal 720 tracheal 720 sera	LPAl, 1 of 720	0.14	Surveillance during 3 months (end of Jan./Feb./Mar/Apr. 2012)
Phnom Penh, O russey market	Whole sale poultry and gathering place for poultry from different provinces	Swab (cloacal and tracheal) and sera	NaVRI	Egg inoculation for swabs & HA-HI test for sera	2 160 720 cloacal 720 tracheal 720 sera	LPAl, 22 of 720	3.05	Surveillance during 3 months (end of Jan./Feb./Mar/Apr. 2012)
Prey Veng, Neak Luang ferry boat	Shared borders with Viet Nam, high population of ducks and chicken (main road between Ho Chi Minh City and Phnom Penh)	Swab (cloacal and tracheal) and sera	NaVRI	Egg inoculation for swabs & HA-HI test for sera	1 662 556 cloacal 556 tracheal 550 sera	0	0	Surveillance during 3 months (end of Jan./Feb./Mar/Apr. 2012)
Total	Cloacal = 2 686 (+ve = 0)		Tracheal = 2 686 (+ve = 0)		Scrum = 2 680 (+ve = 0.86% LPAl)			

Project Monitoring Sheet: **OSRO/RAS/604/USA Baby 02**

Project Title: **Immediate technical assistance to strengthen the surveillance and response capacity for Highly Pathogenic Avian Influenza (HPAI)**

Reporting Period: **April 2012 to September 2012**

Country: The People's Republic of China
Project title: Immediate technical assistance to strengthen the surveillance and response capacity for Highly Pathogenic Avian Influenza (HPAI)
Code: OSRO/RAS/604/USA Baby 02
Budget: USD 500 000 (Phase I), USD 500 000 (Phase II), USD 650 000 (Phase III), USD 1 150 000 (Phase IV), USD 1 250 000 (Phase V), USD 1 005 500 (Phase VI)
Total budget: USD 5 055 500
Effective starting date: 1 August 2006
Planned end date: 30 September 2012
Context of the project Despite efforts by the Government of the People's Republic of China to improve the surveillance and control of Highly Pathogenic Avian Influenza (HPAI) through the commitment of resources and development of widespread and comprehensive programmes in both animal disease surveillance and preventive vaccination, the disease remains endemic in some areas of the country. More specifically, the virus is still circulating widely in agro-ecological zones and traditional production systems where the implementation of the control policy requires major effort and commitment of human and financial resources at national and provincial levels. This project was designed to improve the country's capacities to detect and control HPAI in identified high-risk ecological and production systems at an early stage, through the implementation of intensified surveillance activities, epidemiological studies, socio-economic activities, capacity building and training.
Objectives of the project The main objectives under Phase VI of the United States Agency for International Development (USAID)-funded project are to continue working in Hunan, Yunnan, Guangxi, Guangdong Provinces and Chongqing Municipality, and to provide technical assistance and support in the areas of HPAI epidemiology, disease risk analysis and control. A significant part of Phase VI of the project will revolve around training and capacity building through the China Field Epidemiology Training Programme for Veterinarians (FETPV). The project will also follow up on new activities and approaches that have been initiated in previous phases, including improvement of public-private partnerships (PPPs) and biosecurity in live bird markets (LBMs) and investigation and reporting of outbreaks. Other activities include fostering exchanges of knowledge and good practices with neighboring countries on vaccination strategies, cross-border trade and controlling risks of transboundary animal diseases (TADs) using HPAI as a model, operationalizing the "One Health" concept, and addressing health issues at the human-animal-ecosystem interface with a special emphasis on a multi-disciplinary and cross-sectoral approach.
Planned activities for the reporting period (April to September 2012) Output 1: Cross-sectoral coordination at the national and international level strengthened Activity 1.1 Support national consultants in coordinating project implementation Activity 1.2 Organize regular meetings with the Veterinary Bureau/ Department of International Cooperation (DIC) of the Ministry of Agriculture (MoA) and the State Forestry Administration (SFA) to discuss project activities Activity 1.3 Contribute to and facilitate the coordination of surveillance and applied research activities at the wild bird/domestic poultry interface at Poyang Lake Reserve Activity 1.4 Strengthen cooperation with the World Organisation for Animal Health (OIE)/the Food and Agriculture Organization of the United Nations (FAO) Network of Expertise on Animal Influenza (OFFLU) and other laboratories and epidemiology networks - discuss and define joint

scientific collaboration perspectives and opportunities

Activity 1.5 Organize regular FETPV Steering Committee meetings and workshops (involving the Veterinary Bureau of MoA, the China Animal Health and Epidemiology Center (CAHEC), Harbin National Reference Laboratory (HNRL), provincial Centres for Animal Disease Prevention and Control (ACDCs), United States Center for Disease Prevention and Control (US CDC), China CDC/China Field Epidemiology Training Programme (FETP) and other stakeholders)

Activity 1.6 Coordinate the newly created United Nations Theme Group on Health (UNTGH) Subworking group on diseases at the human-animal interface

Activity 1.7 Foster dialogue and exchange of experiences with Viet Nam on vaccination strategies and cross-border trade as a follow-up of the Viet Nam-China Discussion Forum

Activity 1.8 Improve PPP cooperation through LBM restructuring in Guangdong Province

Activity 1.9 Introduce and promote the concept of One Health at the inter-institutional level; cooperate with the World Health Organization (WHO), Ministry of Health (MoH), China CDC and SFA on topics of mutual interest

Output 2: Capacity building in epidemiology strengthened - the China FETPV programme

Activity 2.1 Deliver the fourth module of China FETPV (advanced training on topics of disease surveillance, outbreak investigation, geographic information system [GIS], etc.)

Activity 2.2 Organize FETPV "Training through services (TTS)" activities on outbreak investigation and epidemiological survey at provincial level (including LBM surveillance)

Activity 2.3 Deliver the fifth module of China FETPV (TTS assignments coaching, simulation exercise, problem-based learning exercise, paper critique, etc.)

Activity 2.4 Work jointly with international experts from the Netherlands in veterinary epidemiology to develop outbreak investigation case studies for the FETPV teaching modules

Activity 2.5 support veterinary epidemiology training at regional level to reinforce collaboration with OFFLU network

Output 3: Knowledge of HPAI epidemiological, ecological and socio-economic risk factors improved

Activity 3.1 Assist national authorities in analysing national surveillance results, and provide guidance on improving national and provincial surveillance policies

Activity 3.2 Conduct follow-up socio-economic studies in Guangdong province: compile key information on poultry sector and its structure to analyse product flow along the market chains, determine the implications for disease surveillance, and control issues in combination with the results obtained in Hunan, Yunnan and Guangxi

Activity 3.3 Finalize the epidemiological studies at the domestic poultry/wildlife interface in Poyang Lake to uncover risk factors associated with the emergence of new virus strains

Output 4: HPAI control strategy improved through focused control actions

Activity 4.1 Refine the strategic vision for the national vaccination campaign

Activity 4.2 Provide guidance on improving the progressive control of HPAI through vaccination

Activity 4.3 Finalize the analysis of a ring trial among three provincial laboratories to provide guidance on testing capacity, results reliability and comparisons

Activity 4.4 Strengthen HPAI Disease Surveillance System and Response Capacity at national and subnational levels through the China FETPV and TTS activities

Activity 4.5 Procure necessary laboratory equipment and supplies for HPAI diagnosis, data analysis, and information sharing for national and provincial partners

Activity 4.6 Organize stakeholder meetings and group discussions in the framework of the PPP activities to develop minimum biosecurity standards for LBMs

Activity 4.7 Improve disease surveillance and control activities through an PPP approach based on the studies carried out in Guangdong Province

Activities undertaken during the reporting period (April to September 2012)

Output 1: Cross-sectoral coordination at the national and international level strengthened

Activity 1.1: Coordination and communication with national partners were further enhanced over the past six months. More specifically, a five-year summary report (in Chinese) covering ECTAD China's activities, achievements and progress was produced and shared with China MoA; The Chinese Version Monthly Bulletin was produced and distributed to MoA, SFA and other partners and stakeholders in a timely manner.

Activity 1.2: Several briefing meetings with the Veterinary Bureau and the Department of International Cooperation (DIC) of MoA were held during the reporting period; A transition meeting was held for the replacement of the Team Leader of ECTAD China by the Senior Technical Coordinator at the end of April.

Activity 1.3: The visit of China MoA Delegation led by the Director-General of the Veterinary Bureau, China MoA to FAO headquarters (HQs) in Rome from 14 to 20 May 2012 was coordinated. The visit involved meetings with senior FAO staff and the heads of the main technical sections. A follow-up briefing meeting was held with China MoA and the FAOR after the visit; A Memorandum of Understanding (MoU), Recommendation and Action Plan were prepared by the Office for further processing with MoA.

Activity 1.4: The sixth China FETPV Steering Committee Meeting was held on 28 August 2012 in China MoA and attended by representatives from China MoA, CAHEC, China FETPV, US CDC and ECTAD China. China MoA, CAHEC and ECTAD China reached preliminary consensus over the issue of co-funding more of the activities of the second cohort of the programme and increased focus on long-term sustainability.

Activity 1.5: A Seminar on "Veterinary public health in a changing world" was organized by ECTAD China on 30 July, under the umbrella of the UNTGH Subworking Group on Diseases at the Human-Animal Interface, during the visit of the Senior Officer - Veterinary Public Health from FAO HQs.

Activity 1.6: A UNTGH Subworking Group Meeting was held on 14 September 2012. The meeting focused on reviewing progress and refining the annual work plan as well as providing and updating on recent developments with HPAI and rabies in the country.

Activity 1.7: A training session was arranged at the Guangzhou Animal Health Inspection Institute (GAHII) to help local animal health authorities to have a better understanding of the PPP concept, and using the Guangzhou PPP project in the Jiangcun Poultry Wholesale Market as an example. Advanced ideas on animal disease prevention and control were also covered.

Output 2: Capacity building in epidemiology strengthened - the China FETPV programme

Activity 2.1: The fifth module of the China FETPV was held in Qingdao and Beijing during 21 May to 8 June 2012. The training was delivered by a team from RVC and mainly focused on mentoring of trainee's field practices, simulation exercises, problem-based learning exercises, scientific writing and paper critiques. This is the last training module for the first cohort of the programme.

Activities 2.2: Trainee's implementation of field practices activities (i.e. TTS assignments) - Field surveillance studies and outbreak investigations:

- 12 field surveillance studies were completed by trainees. Results were reviewed by national and international mentors and summarized in a final narrative report;
- In total, 18 outbreak investigations were carried out, and these covered the investigation of outbreaks of HPAI and other animal diseases;

Activity 2.3: An introductory and course summary CD of the China FETPV first cohort was designed and finalized; The design and construction of the China FETPV bilingual Web site (www.china-fetpv.org) was completed in July 2012. It will strengthen the branding of China FETPV as well as facilitate information exchange.

Activity 2.4: The second stakeholder meeting of the China FETPV was held on 7 and 8 June 2012 in Beijing. The two-day event attracted both the national and international stakeholders in the

country, and was attended by representatives from MoA, SFA, United Nations Development Program (UNDP), WHO, World Bank, USCDC, Royal Veterinary College (RVC), International Development Center for Agriculture and Research (CIRAD), CAHEC, provincial Animal CDCs, embassies, universities, FAO RAP and ECTAD China.

Activity 2.5: A two-day China FETPV course content review and module refining workshop was held from 4 to 6 July 2012. Trainee representatives, national mentors and staff from CAHEC and ECTAD China reviewed past training modules and refined the training programme framework and curriculum outline for the second cohort of China FETPV.

Activity 2.6: The sixth Steering Committee meeting was held to discuss the key issues for the second cohort development. The two-year training framework and some key issues were agreed by Steering Committee members, e.g. train and engage potential Chinese trainers/mentors for the long-term sustainability of the China FETPV programme; and address One Health approaches and facilitate joint activities between animal and public health sectors.

Activity 2.7: A final narrative report was submitted to HQs for the closure of the Netherlands-funded project (OSRO/CPR/001/NET) for the China FETPV; Regular communication is maintained for seeking further support for the second cohort.

Activity 2.8: A meeting with the European Union (EU)-China Trade Project II (EUTCP II) for co-funding of the second cohort of the China FETPV was held in the ECTAD China Office on 12 August 2012. A Concept Note for the funding of a joint workshop, seminars and other activities was prepared and submitted for consideration.

Activity 2.9: The participation of a national trainee from CAHEC in the Regional FETPV training in Bangkok was finalized.

Activity 2.10: The visit from FAO RAP was coordinated. A mission to Qingdao was carried out in September 2012 to advance the cooperation and resource mobilization for China FETPV and Regional FETPV.

Output 3: Knowledge of HPAI epidemiological, ecological, and socio-economic risk factors improved

Activity 3.1: Ten issues of the ECTAD China monthly bulletin (with five English versions of the China HPAI highlight and five Chinese correspondents), one China HPAI disease update (No. 6, June 2012) were produced and shared with all relevant stakeholders on a regular basis; All production documents of ECTAD China Office were collected and shared with HQs and RAP upon request;

Activity 3.2: A consultation meeting with partners from the Agriculture, Health and Forestry sectors was held on 24 September for the implementation of the EPT+ project in the country;

Activity 3.3: A specific report on source tracking for pet birds tested H5N1 HPAI positive in Taiwan was produced in August; An informal investigation in the pet market in Guangzhou was carried out by ECTAD China team to collect preliminary information to understand the risks associated with the pet bird market and to provide the basis for a more formal investigation along the pathway from the market to Taiwan.

Output 4: HPAI surveillance and control strategy improved through focused control actions

Activity 4.1: The final report of the Ring Trial Proficiency Test was finalized on 18 July by the *Istituto Zooprofilattico Sperimentale delle Venezie (IZSVe)* and shared with all three provincial partners of Chongqing, Hunan and Guangxi Animal CDCs;

Activities 4.2: The PPP Project in Guangzhou was successfully closed after the newly built vehicle cleaning and disinfection station was launched on 7 August 2012.

- A national consultant on construction and engineering and an international PPP expert were recruited during the reporting period;
- Five missions were carried out to Guangzhou for the construction work in the market and for final inspection and acceptance work of the station; and
- A launching ceremony was held with the local partner-GAHI and the market, and was attended by representatives from MoA, provincial and municipal veterinary/agricultural

authorities. The FAOR attended and officially opened the facility.

- Training sessions on PPP and animal disease prevention and control were arranged by GAHII in Guangzhou on 8 August 2012; and
- A brief meeting on the implementation of the PPP project in Guangzhou was held with China MoA on 29 August; The scaling-up of the LBM upgrading in other markets and other places was discussed.

Activities 4.3: Two important documents were translated and shared with RAP and HQ staff: (1) The National Medium and Long-term Plan for Animal Diseases Prevention and Control in China (2012–2020) and (2) Speech on Policy Measures and Achievements of the Veterinary Public Health in China by the Director-General of the Veterinary Bureau at a meeting of the Chinese Veterinary Medical Association held in June;

Activities 4.4: A two-day Global Animal Disease Information System (EMPRES-i) training was organized in Qingdao on 17 and 18 September 2012 for staff from the Veterinary Bureau, China Animal Disease Control Center and CAHEC.

Main challenges encountered and responses provided

Endeavors are being made to accelerate the transfer of the China FETPV programme to the national Government. However, MoA is still in the early stages of moving to full adoption of international standards for information sharing, transparency and strategies for targeted and effective management of TADs and Emerging Infectious Diseases (EIDs), and they need epidemiological knowledge and skills to do this. There is a severe lack of skilled Chinese epidemiologists in China, and this applies to the MoA, research agencies and universities. This project is the only coordinated approach to partly overcoming this problem, and the focus is now on developing a sustainable capacity for training future cohorts of the FETPV programme. For these reasons, the full adoption by the national Government requires additional time, but remains a realistic goal. The MoA and CAHEC are showing strong commitment and other international experts working in China recognize the importance of the initiative. Therefore, in the short to medium term, FAO and other partners must continue to play an important role in helping to fill the critical gaps and to accelerate the rate of change.

Main progress made towards the achievement of project outcomes

The project has made considerable progress towards achieving the expected outcomes, which can be summarized as follows:

- The visit of China MoA Delegation to FAO HQs has further strengthened the cooperation between China MoA and FAO on prevention and control of TADs and EIDs; The proposed MoU is expected to be signed between China and FAO in the near future;
- China FETPV is a pivotal activity of the USAID-funded HPAI programme in the country, which is also recognized by high-level officials from both the central and provincial governments. Beyond the original objective of creating a pool of skilled veterinary field epidemiologists in the country, China FETPV also aims at strengthening partnerships between national, provincial and international institutions and fostering greater synergy and collaboration among them;
- Building on the successful implementation of the PPP project in Guangzhou and experience in the LBMs, it is expected that good practices and the demonstration role of the model market will be used to further duplicate the approaches in other markets and other places;
- Under the UNTGH umbrella, ECTAD China Office is now taking the lead in coordination with national institutions and international partners in the country on zoonotic diseases and the application of One Health approaches. A platform of information exchange and coordination among the public health and the animal health sectors now exists among FAO, WHO, MoA, MoH and SFA;
- The HPAI project in the country is also in line with FAO's One Health Strategy and Global Programme, and is addressing emerging events involving human-animal-ecosystem health. The ultimate goal is to expand the country's capacities to be able to deal with other EIDs and TADs using HPAI as a model.

Project Monitoring Sheet: **OSRO/RAS/604/USA Baby 03**

Project title: **Immediate Technical Assistance to Strengthen Emergency Preparedness for Highly Pathogenic Avian Influenza (HPAI) in Lao PDR**

Reporting period: **April to September 2012**

Country: Lao People's Democratic Republic
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)
Code: OSRO/RAS/604/USA Baby 03
Budget: USD 1 000 000 (Phase I), 1 284 990 (Phase II), 900 000 (Phase III), 800 000 (Phase IV), 550 000 (Phase V), USD 372 000 (Phase VI)
Total budget: USD 4 906 000
Effective starting date: 1 August 2006
Planned end date: 30 September 2013
Context of the project The project assists the Government in responding to the consequences of a possible poultry disease epidemic that could not only cause serious damage to the poultry sector, but also cause serious consequences to human health and household livelihoods.
Objectives of the project The specific objectives of the project are to: <ul style="list-style-type: none"> • strengthen coordination and support of avian influenza (AI) control policy development; • strengthen risk-based surveillance for Highly Pathogenic Avian Influenza (HPAI) in target provinces; • improve disease response capability; and • strengthen risk management measures, including biosecurity measures and cross-border movement
Planned activities for the reporting period (April to September 2012)
Output 1: Planning, coordination and policy support <ul style="list-style-type: none"> • Continue the weekly meetings among the AI project staff • Participate at the United States Agency for International Development (USAID) Emerging Pandemic Threat (EPT) programme review meeting planned in April 2012 • Continue to participate in technical meetings organized by the National Emerging Infectious Diseases Coordination Office (NEIDCO) to support the multi-sectoral coordination and collaboration in the spirit of One Health • Regularly communicate and meet with the USAID Representative for Lao People's Democratic Republic (PDR) to keep them informed of the project work plan • Continue to support Department of Livestock and Fisheries (DLF)'s bilateral meetings with Thailand, Viet Nam and China • Continue to participate in the development of joint activities with other partners related to the implementation of the 2011–2015 National Work Plan for Emerging Infectious Diseases (EIDs) and Public Health Emergencies (PHEs)
Output 2: Strengthen veterinary legislation for animal disease control <ul style="list-style-type: none"> • Recruitment of an international consultant on veterinary legislation (for three weeks) to continue to assist in drafting further subsidiary legislations in the field of animal health as required by DLF • Organize a workshop on the development of secondary veterinary laws

Output 3: Strengthen laboratory capacity

- Recruitment of an international consultant on laboratory services (for three weeks) to evaluate the current laboratory operations and management system as well as implement standard operating procedures (SOPs) for the biosafety level (BSL)2 laboratory
- Provide necessary reagents and supplies for the laboratory
- Organize in-country training to support the development of a Laboratory Information Management System (LIMS) roadmap
- Under EPT IDENTIFY regional project:
 - Provide standardized diagnostic reagents
 - Organize a basic field and laboratory diagnosis training-of-trainers
 - Organize a training workshop on diagnosis of priority diseases
 - Support proficiency testing programme for HPAI and other priority diseases
 - Visit the Veterinary Research and Diagnostic Center for Eastern Region, Chonburi, Thailand, to provide exposure to LIMS
 - Provide LIMS
 - Recruit an international consultant to calibrate laboratory equipment (second mission)
 - Organize in-country training-of-trainers on laboratory/field epidemiology linkage
 - Recruit an international consultant to develop BSL3 biosafety and SOPs and provide training

Output 4: Strengthen veterinary epidemiology capacity

- Recruitment of an international consultant on veterinary epidemiology (for three weeks) to assist in synthesizing, analysing and interpreting the information generated from the past three years of active surveillance programme
- Participate in the surveillance working group (SWG) meeting for sharing surveillance data and updates on surveillance issues with human health sectors and other partners
- Provide necessary equipment and supplies for surveillance programme
- Continue with the second sampling of active surveillance in ten provinces from 13 to 23 June 2012
- Support disease investigations based on passive reporting (as necessary)
- Organize in-country training on veterinary epidemiology
- Organize training-of-trainers on One Health in collaboration with other partners
- Provide information technologies (IT) backup support for the Epidemiology Unit and the Laboratory of the National Animal Health Centre (NAHC)

Activities undertaken during the reporting period (April to September 2012)**Output 1: Planning, coordination and policy support**

- The project AI weekly meetings with staff to discuss technical and operational issues have continued
- The Team Leader (TL) assigned as the Food and Agriculture Organization of the United Nations Representative (FAOR) ad interim from 1 March to 30 April 2012, and started his duty on 1 May 2012
- Teleconference to discuss laboratory issues with the Regional Office for Asia and the Pacific (RAP) was held on 6 March 2012 and with USAID on 7 March 2012
- The TL, National Project Director (NPD), national consultant on veterinary epidemiology and national operation assistant participated in the roll-out face-to-face training on Manual Section 507 on Letters of Agreement organized by FAOR Office on 8 and 9 March 2012
- The TL attended the eco-health EIDS workshop in Vientiane from 12 to 16 March 2012 organized by the Canada's International Development Research Centre (IDRC)
- A country consultation meeting to discuss human resource issues attended by DLF, RAP,

Emergency Centre for Transboundary Animal Diseases (ECTAD) country team and USAID was held in Vientiane on 30 March 2012

- The TL and NPD attended the launching meeting for national EIDs and PHE programme monitoring and evaluation (M&E) at the Ministry of Health (MOH) on 8 April 2012 and the wrap-up meeting for national EIDs and PHE programme M&E on 15 April 2012
- The TL participated in the technical policy discussion on Improving the prevention and control of HPAI H5N1 in highly-affected country and neighbouring countries in Ho Chi Minh City, Viet Nam, from 23 to 25 April 2012
- The project supported the participation of 11 Lao PDR's delegation to the 9th Thai-Lao PDR bilateral meeting of the Livestock Development Committee and the 2nd bilateral meeting of Thai-Lao PDR Animal Quarantine Committee from 24 to 26 April 2012 in Chiang Mai, Thailand
- The TL (as the FAOR a.i.) and the Programme Officer from FAOR office in Lao PDR attended the round table meeting (RTM) 2012 for provincial consultation on the Northern Region in Xiengkhouang on 31 May 2012
- The TL and NPD participated in the inception workshop on foot-and-mouth disease (FMD) control in Southeast Asia through the application of the progressive control pathway (PCP) – GCP/RAS/283/ROK in Bangkok, Thailand, on 12 and 13 June 2012
- The TL and NPD participated in the workshop on National Animal Health Strategic Plan 2011–2015 in Vientiane Province from 25 to 27 June 2012
- The project supported the participation of nine Lao PDR's delegates to the 10th Lao PDR - Viet Nam annual bilateral meeting on transboundary animal disease control on 12 and 13 July 2012 in Nha Trang City, Khanh Hoa Province, Viet Nam
- The national consultation workshop on FMD control in Southeast Asia through application of PCP - GCP/RAS/283/ROK was organized in Vientiane Capital on 7 and 8 August 2012
- One Health symposium was organized on 3 September 2012 by MOH and the Ministry of Agriculture and Forestry in collaboration with the World Health Organization and FAO
- Training on One Health approach to achieve a better understanding of One Health, common zoonotic diseases, integrated surveillance, and intersectoral linkages in the prevention and control measures was organized on 4 and 5 September 2012 in Vientiane Capital

Output 2: Strengthen veterinary legislation for animal disease control

- The international consultant on veterinary legislation completed the three-week assignment from 18 June to 6 July 2012 to assist in drafting further subsidiary legislations in the field of animal health as required by DLF
- A workshop on Animal disease control policy development under the umbrella of the Livestock Production and Veterinary Law of 2008 was organized in Paksane, Bolikhamxay province, on 3 and 4 July 2012 to review the newly approved decrees and discuss the newly formulated regulation/decrees/guidelines under the umbrella of the Livestock Production and Veterinary Law to comply with the minimum World Organisation for Animal Health (OIE) requirement
- A workshop on the Socialization of the two newly approved decrees on prevention and control of animal diseases, and control movement of animal and animal products was organized in Vientiane Capital on 24 and 25 July 2012, and attended by the Provincial Agriculture and Forestry Office (PAFO) staff and livestock private sectors
- Discussions were continued to review the legislative development work with the FAO legal expert from the UTF/LAO/018/LAO project

Output 3: Strengthen laboratory capacity

- The TL and NPD participated regularly in coordination meetings with NEIDCO, DLF/NAHC and the World Bank from March to June 2012 to discuss the master plan for the new NAHC laboratory building finalization and commissioning
- The TL, NPD and the Regional Laboratory Network Coordinator from RAP Bangkok participated in the USAID EPT meeting organized by NEIDCO on 5 April 2012
- The TL and NPD attended the inauguration of the new laboratory building of National Centre for Laboratory and Epidemiology (NCLE) on 4 June 2012
- The inauguration of the new laboratory building of NAHC was held on 5 June 2012
- The TL involved in the discussion with NAHC and OIE Regional Representation in Tokyo, Japan on upgrading the sequencing skills for NAHC laboratory staff on 5 and 6 June 2012
- The procurement of reagents and supplies for NAHC laboratory to support the HPAI surveillance programme was finalized.
- The TL participated in the EPT planning meeting for Lao PDR for 2013 at the Regional Development Mission for Asia (RDMA) Office in Bangkok on 12 June 2012
- Under EPT IDENTIFY regional project:
 - The expert on laboratory relocation completed his first mission from 19 March to 5 April 2012 to prepare the list of laboratory equipment to be relocated, generate action plan for space allocation and equipment installation, and write up the moving plan; the second mission from 22 April to 12 May 2012 to develop cleaning and decontamination of equipment protocols, provide technical advice for layouts/fixtures of laboratory furniture and finalize the logistic plan for the equipment move; and the third mission from 5 to 11 August 2012 to run the decontamination of biosafety cabinets and advise the movement of equipment into the new NAHC building
 - The movement of laboratory equipment from the old to the new NAHC facilities was successfully completed from 5 to 11 August 2012
 - Two NAHC staff participated in the basics of field and laboratory diagnosis training-of-trainers workshop from 21 to 25 May 2012 in Chiang Mai, Thailand
 - Two NAHC staff participated in the regional workshop and training on diagnosis of rabies and Newcastle Disease from 6 to 17 August 2012 in Bangkok, Thailand
 - The biosafety cabinet testing and certification were conducted by biosafety professionals from Esco (the company that specializes in biological safety cabinets) from 27 to 30 August 2012
 - The expert for biosafety risk assessment and management completed his mission from 13 to 15 September 2012 to conduct the biosafety risk assessment and assess the specific needs on biosafety management and constraints at NAHC facility

Output 4: Strengthen veterinary epidemiology capacity

- The first and second samplings of active surveillance in ten provinces (Vientiane Capital, Vientiane, Savannakhet, Champasak, Luang Prabang, Luang Namtha, Xayabouly, Xiengkhouang, Oudomxay and Phongsaly) conducted from 14 to 23 March 2012, and 13 to 22 June 2012 respectively
- The TL, NPD and national consultant on veterinary epidemiology participated at the SWG meeting for sharing surveillance data and updates on surveillance issues with human health sector and other partners on 25 May 2012
- The international consultant on veterinary epidemiology completed the three-week assignment from 6 to 27 July 2012 to assist in synthesizing, analysing and interpreting the information generated from the past two years of active surveillance programme
- Provision of additional equipment (syringe, needles, vacutainers, etc.) and supplies

<p>(alcohol, transport media, etc.) for the HPAI surveillance to ten provinces</p> <ul style="list-style-type: none"> • Training on basic veterinary epidemiology and technical skills of epidemiology methods needed to conduct surveillance and disease investigation was organized in Thalang, Vientiane Province, from 13 to 16 August 2012
<p>Planned activities for the next six-month period (October 2012 to March 2013)</p> <p>Output 1: Planning, coordination and policy support strengthened for effective management and control of HPAI and other emerging zoonoses</p> <ul style="list-style-type: none"> • Process the Government of Lao PDR approval for the Phase 7 of the project • Recruit a national project director, national consultant on veterinary epidemiology, national operational assistant, national administrative/finance assistant and one driver • Organize an inception workshop to formally start the activities of the next phase (Phase 7) of the project • Continue regular project meetings among the HPAI project staff • Regularly communicate and meet with the USAID Representative for Lao PDR to keep them informed of the project work plan • Continue to participate in the technical meetings organized by NEIDCO to support the multi-sectoral coordination and collaboration in the spirit of One Health • Continue to participate in the development of joint activities with other partners related to the implementation of the 2011–2015 National Work Plan for EIDs and PHEs • Participation of NPD in the USAID partners' meeting <p>Output 2: Risk assessment and management along the poultry supply chain strengthened</p> <ul style="list-style-type: none"> • Recruitment of an international consultant on veterinary epidemiology for one month to provide recommendations on surveillance activities and data management • Organize a planning workshop to support the longitudinal risk-based surveillance in five target provinces • Conduct the first two samplings of the longitudinal risk-based surveillance in five target provinces • Participate at the SWG meeting for sharing surveillance data and updating on surveillance issues with human health sector and other partners • Provide necessary equipment and supplies for surveillance and response • Establish a team and network consisting of field staff trained in epidemiology (including the Field Epidemiology Training Programme for Veterinarians [FETPV] and the Field Epidemiology Training [FET] graduates/trainees) and laboratory experts from DLF to develop and link epidemiological and virological information for risk assessment and management <p>Main challenges encountered and response provided</p> <ul style="list-style-type: none"> • Failure to report HPAI outbreak early and inadequate outbreak investigation are still considered as gaps that need to be overcome to improve the capacity to respond to HPAI outbreak and other transboundary animal diseases. A sustainable number of staff from central, provincial and district level had been trained in outbreak investigation and simulation exercises during Phase 2, 3, 4 and 5, and should help to address this issue. • The limited availability of national veterinary human resources is a constraint to the absorption capacity of the governmental services in the country. The activities carried out under Output 2 in Phase 3, 4 and 5 and Output 4 in Phase 6 of this project addressed some of the capacity building needed. • There is a very low prevalence of antibodies and virus-positives detected in healthy ducks, but it is widely distributed in all nine out of ten surveillance provinces which indicates that HPAI H5N1 may still be circulating in Lao PDR as in other countries of the region. The extent and the diversity of the virus clades (2.3.2, 2.3.2.1, 2.3.4, 2.3.4.1 and 2.3.4.2)

suggests that these viruses may have been or continue to be introduced into the country from the surrounding territories.

- There are gaps in knowledge on the process by which H5N1 virus enters Lao PDR, and how it remains and spreads within the country, owing to insufficient outbreak investigation. More evidence is being gathered through active surveillance, but this needs to be reinforced by cross-border movements and value chains studies.
- There is a very limited local capacity to manage and analyse data. The limited capacity of an effective Epidemiology Unit at the central level and the heavy workload of the technical staff at the provincial level have exacerbated the problem. Phase 7 of the project should help to address this issue by assisting DLF to develop a human resources plan and support recruitment of additional staff.
- Legislative support to animal health control still remains a challenge - although progress is being made in this area. Activities under Output 2 in Phase 5 and 6 of this project addressed this challenge.

Main progress made towards the achievement of project outcomes

Output 1: Planning, coordination and policy support

- Continued emphasis on the control of HPAI and broadened scope of prevention, control and laboratory diagnosis to other high-impact diseases through the National Mid-Term Priority Plan for Animal Health (NMTPP-AH) for Lao PDR
- Strengthening of the multisectoral cooperation for the prevention and control of five priority zoonoses in Lao PDR through the national work plan for EIDs and PHEs

Output 2: Strengthen veterinary legislation for animal disease control

- Two important prime ministerial decrees were already finalized, which are the Decree on the Prevention and Control of Animal Diseases of 31 May 2012 and the Decree on the Control of the Movement of Animal and Animal Products of 4 June 2012
- The overall compendium of veterinary legislation for Lao PDR is almost complete, albeit largely only in draft forms at present. Seven draft decrees and one technical guidelines were produced, and are ready to be brought to the next step of legislative process

Output 3: Strengthen laboratory capacity

- The new laboratory building of NAHC was completed, and the laboratory equipment was successfully relocated and re-installed
- The new laboratory facility of NAHC is currently functioning

Output 4: Strengthen veterinary epidemiology capacity

- A more targeted and longitudinal active surveillance was implemented, although owing to administrative constraints, only two sampling rounds (March and June) were undertaken in 2011 and 2012
- The three-year risk-based active surveillance programme (2010–2012) in ten provinces improved the project staff ability to conduct descriptive data analyses to identify temporal and spatial patterns, interpretation and report preparation
- The provincial and district staff capabilities in conducting field surveillance and the cold chain for sample submission to the central laboratory were further improved
- The implementation of three-year risk-based active surveillance programme (2010–2012) in ten provinces should briefly describe the epidemiological status as well as risks of HPAI-H5N1 at target sites, which can be utilized for planning of risk management to be carried out in Phase 7 of the project

Project Monitoring Sheet: OSRO/RAS/604/USA Baby 05

Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)

Reporting period: April to September 2012

<p>Regional Component: Southeast Asia Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) Code: OSRO/RAS/604/USA Baby 05</p>
<p>Budget: USD 600 000 (Phase I), USD 1 435 000 (Phase II), USD 1 172 700 (Phase III), USD 937 800 (Phase IV), USD 1 000 000 (Phase V), USD 30 667 (from Mongolia Balance) USD 1 192 500 (Phase VI) Total budget: USD 6 368 667</p>
<p>Effective starting date: 1 August 2006</p>
<p>Planned end date: 30 September 2012</p>
<p>Context of the project The Highly Pathogenic Avian Influenza (HPAI) epidemic, caused by H5N1 viruses, began in late 2003 and in early 2004 in Asia and Southeast Asia and spread to many countries in the region. The effects were particularly severe in Indonesia, Thailand and Viet Nam, which saw widespread outbreaks in poultry and also human cases of H5N1 infection. The Food and Agriculture Organization of the United Nations (FAO), through its Emergency Centre for Transboundary Animal Diseases (ECTAD), established a decentralized unit in Bangkok, Thailand, located in the Regional Office for Asia and the Pacific (RAP), to provide technical backstopping for countries in the Asia and the Pacific region that were experiencing outbreaks of the infection or were at risk of it. ECTAD RAP was supported through a preliminary, regional project (OSRO/RAS/505/USA) funded by the United States Agency for International Development (USAID). This support has continued under FAO's present project.</p>
<p>Objectives of the project The objective of this regional component is to coordinate project activities with the target countries and also to ensure continuity from the previous project (OSRO/RAS/505/USA) to the current one. The project also aims to strengthen regional level cross-sectoral coordination and communication for HPAI control.</p>
<p>Planned activities for the reporting period (April to September 2012)</p> <p>Output 1: Strengthened cross-sectoral coordination at regional level</p> <ul style="list-style-type: none"> • continue to provide technical and operational inputs to country-level projects in collaboration with country teams • continue to provide technical inputs, resource persons or training support to the activities related to existing regional HPAI Control Framework for the Association of Southeast Asian Nations (ASEAN) or existing network systems or regional coordination mechanism related to HPAI and animal disease control • continue to coordinate and collaborate with other agencies on activities related to HPAI control • continue to provide technical inputs to support the activities of the USAID Emerging Pandemic Threats (EPT) programme, which are conducted by various partners as well as the EPT+ programme

Output 2: Strengthened regional and national human resources in epidemiology through regional Field Epidemiology Training Programme for Veterinarians (FETPV)

- continue activities to implement the regional FETPV programme, including the seeking of additional support for the programme through other potential partners
- continue to provide support to the development of China FETPV and India FETPV as well as related training programmes in Cambodia and Lao People's Democratic Republic (PDR)
- organize a regional workshop to develop the regional strategy to assist the countries to improve animal disease control systems at the grassroots level focusing on the Community Animal Health Worker System

Output 3: Strengthened coordination of epidemiology and laboratory network

- continue to support the implementation of the Global Animal Disease Information System (EMPRES-i) Asia to share expertise and information in a real-time manner across the network through meetings, workshops and online communication
- prepare the Strategic Framework of the Regional Laboratory and present it to ASEAN
- provide coordination, in collaboration with other regional projects implemented by FAO, to strengthen existing epidemiology and laboratory networks, as well as the epidemiology consortium
- continue to provide support for sample submission from member countries to international reference laboratories

Output 4: Conducting risk assessment for HPAI transmission through cross-border poultry trade

- continue to support the in-depth studies on the risks of HPAI spread along the poultry production and market chains at the border between Thailand and Lao PDR (Mukdaharn and Savannakhet Provinces) including price monitoring of livestock products
- support the organization of a bilateral meeting between the Government of Thailand and Lao PDR to discuss cross-border risk management
- organize regional coordination meetings on risk management at cross-border level among key potential partners including the representatives from participating governments

Output 5: Established regional emergency response services

- continue to provide technical and operational assistance to member countries to contain the HPAI outbreaks in the country

Activities undertaken during reporting period (April to September 2012)

Output 1: Strengthened cross-sectoral coordination at regional level

- The ECTAD RAP team continued to maintain international and national regional support staff for the project.
- The ECTAD RAP team continued to coordinate and collaborate with other United Nations (UN) agencies, donors and international organizations. Specifically, RAP:
 - organized the USAID Partners Meeting on 27 and 28 September 2012 in Bangkok, Thailand among USAID partners in the region. The theme for the meeting this year focused on a review of the HPAI situation and the virus clades circulating in the region, accomplishments and lessons learned on risk communication and advocacy as well as those on multisectoral collaboration and coordination at cross-border

level; and sharing experiences and lessons learned in three technical areas (risk based surveillance, field epidemiology training, and cross-border collaboration and coordination). The progress on the collaboration with ASEAN on developing regional strategies on veterinary epidemiology and laboratory capacity development and networking was also presented at the meeting.

- The ECTAD team participated in FAO-World Organisation for Animal Health (OIE)-World Health Organization (WHO) tripartite events to strengthen collaboration and coordination among the three organizations. The tripartite events included teleconferences and preparation for the following meeting:
 - “The Third Regional Workshop on Multi-Sectoral Collaboration on Zoonoses Prevention and Control” to be organized during 26-28 November 2012 in Bali, Indonesia. The meeting will be organized under the financial support of the European Union (EU) Highly Pathogenic and Emerging and Re-emerging Diseases (HPED) project with the aim to ensure the adoption of a One Health approach and promote collaboration among all relevant sectors.
- The ECTAD team provided technical inputs to support the activities of ASEAN including the development of the two Regional Strategies for Veterinary Epidemiology and Laboratory Capacity Development and Networking for Southeast Asia.
- The ECTAD team provided technical inputs to support the activities of USAID EPT and EPT+ programmes.
- The ECTAD team provided technical and operational inputs to country projects, in collaboration with FAO country teams and national counterparts, for the following activities:
 - recruitment of international consultants;
 - procurement of equipment and supplies;
 - issuance of contracts to conduct field activities/research;
 - provision of inputs and clearance to project proposals prepared by staff of ECTAD country teams for the new USAID funding cycle;
 - provision of clearance to technical reports prepared by staff of ECTAD country teams;
 - backstopping missions to monitor project progress in Myanmar and Lao PDR; and
 - a backstopping mission to Bangladesh to provide technical inputs to the meeting related to HPAI vaccination.

Output 2: Strengthened regional and national human resources in epidemiology through regional FETPV

- The fourth Letter of Agreement (LoA) was signed by FAO and the Thai Department of Livestock Development (DLD) authorities to support the Thai DLD to implement the regional FETPV during the year 2012.
- The Regional Veterinary Epidemiologist (RVE) and Regional Coordinator (RC) continued to work closely with DLD on activities related to FETPV. These included:
 - facilitating the submission of three abstracts by the three final-year FETPV trainees which were accepted for presentation at the Conference of Research Workers in Animal Disease (CRWAD) to be held in December 2012 in Chicago, USA;
 - organizing the second-round visits of the FETPV trainees who were enrolled in the class of 2011 for a series of trainings and workshops in Bangkok in August 2012 including a Data Analysis Workshop, a scientific writing session and mentoring to prepare abstracts to submit to CRWAD;
 - serving as regional programme mentors to the trainees from China and

- Myanmar;
- conducting missions to China, Indonesia, Myanmar and Viet Nam to advocate for the Regional FETPV programme to the Chief Veterinary Officers (CVOs) of the above-mentioned countries to support their trainees to complete their field assignments which were conducted at the country level; and seeking additional support for the programme including the collaboration with the Faculty of Veterinary Medicine, Chiang Mai University, Thailand; the Animal Population Health Institute, College of Veterinary Medicine and Biomedical Sciences, Colorado State University, Fort Collins; and the Center of Veterinary Public Health, College of Veterinary Medicine, University of Minnesota.
- participating in the annual Coordination Meeting on Evaluation and Development of FETPV held on 28 and 29 May 2012. Forty-four participants attended the workshop from DLD, universities, Ministry of Public Health, United States Center of Disease Control (CDC), FAO, Zoological Park Organization, and alumni from the Veterinary Field Epidemiology in Action (VFEA) Training course and regional FETPV. Evaluation focused on utilization of knowledge, training curriculum, collaboration and support, and programme coordination and logistics.
- The RVE continued to provide support to the development of China FETPV and India FETPV, as well as related training programmes in Cambodia. The activities included:
 - providing support to the second FETPV short course *Veterinary field epidemiology in action* which was conducted for 15 veterinarians in Khorda District, Orissa State, India from 12 to 20 July 2012 as part of the FETPV field epidemiology three-week short course.
 - providing technical inputs to the first FETPV short course organized by FAO Cambodia in collaboration with Cambodia Department of Animal Health and Production (DAHP). The training course was organized with technical support from the National Veterinary Research Institute of Cambodia (NaVRI), FAO, US CDC, and partly financially supported by RESPOND. Fifteen participants will conduct in-service training component and present the results of their work by February 2013.
 - participating in the second China FETPV stakeholder meeting from 6 to 9 June 2012. The meeting was attended by national and international stakeholders including trainees, international instructors, universities, provincial representatives, national representatives, China Ministry of Agriculture (MoA), FAO and international donors.

Output 3: Strengthened coordination of epidemiology and laboratory networks

- The ECTAD team continued to provide technical inputs and coordination, in collaboration with other regional projects implemented by FAO, to strengthen existing epidemiology and laboratory networks. This included:
 - The Regional Strategy for Veterinary Epidemiology Capacity Development and Networking for Southeast Asia. The draft strategic framework was developed at the workshop organized by ASEAN on 30 and 31 August 2012 at Chiang Mai, Thailand.
 - The Regional Strategy for Laboratory Capacity Development and Networking was prepared by the ECTAD team in collaboration with ASEAN and the framework was subsequently endorsed by ASEAN Working Group on Livestock (ASWGL) in May 2012 in Myanmar.
 - The FAO/OIE Regional Laboratory Technical Advisory Group meeting (Lab-

TAG meeting), on 30 and 31 July 2012, Bangkok, Thailand; The main objectives of the meeting were to update the partners on the ongoing activities related to laboratory policies, laboratory capacity building activities and laboratory networking in Southeast Asia. The meeting was attended by 25 representatives from key technical partners, the regional leading laboratories, international reference laboratories, major donors and implementing partners.

- The ECTAD team continued to provide technical inputs to the disease tracking system EMPRES-i Asia and information sharing via Transboundary Animal Disease Network Asia email circulation.

Output 4: Conducting risk assessment for HPAI transmission through cross-border poultry trade

- The ECTAD team provided inputs to the bilateral meeting between Cambodia and Viet Nam organized at Siem Reap on 25 and 26 September 2012.

Planned activities for the next six-month period (October 2012 to March 2013)

Output 1: Strengthened cross-sectoral coordination at regional level

- continue to provide technical and operational inputs to country-level projects in collaboration with country teams
- continue to provide technical inputs, resource persons or training support to the activities related to existing regional HPAI Control Framework for ASEAN or existing network systems or regional coordination mechanism related to HPAI and animal disease control
- continue to coordinate and collaborate with other agencies on activities related to HPAI control
- continue to provide technical inputs to support the activities of the USAID EPT programme, which are conducted by various partners as well as the EPT+ programme

Output 2: Strengthened regional and national human resources in the field of veterinary epidemiology

- continue activities to implement the Regional FETPV programme, including the seeking of additional support for the programme through other potential partners
- continue to provide support to the development of China FETPV as well as related training programmes in Cambodia, Lao PDR and South Asia

Output 3: Strengthened coordination of the epidemiology and laboratory networks

- continue to support the implementation of EMPRES-i Asia to share expertise and information in a real-time manner across the network through meetings, workshops and online communication
- provide coordination, in collaboration with other regional projects implemented by FAO, to strengthen existing epidemiology and laboratory networks, as well as the epidemiology consortium
- continue to provide support for sample submission from member countries to international reference laboratories

Output 4: Strengthened coordination of cross-border risk assessment and management for HPAI transmission

- Support the dialogue between or among member countries on cross-border cooperation and collaboration in management of critical control points at the key regional corridors

<p>Output 5: Established regional emergency response services</p> <ul style="list-style-type: none"> continue to provide technical and operational assistance to member countries to contain the HPAI outbreaks in the country
<p>Main challenges encountered and response provided</p> <ul style="list-style-type: none"> No main challenges encountered during the reporting period.
<p>Progress made towards the achievement of project outcomes (from the start of activities)</p> <p>Output 1: Strengthened cross-sectoral coordination at regional level</p> <ul style="list-style-type: none"> Coordination and collaboration between FAO and other international organizations and agencies was strengthened and continued. Engagement with the regional political organization particularly ASEAN through the adoption of strategies jointly developed by member countries and FAO. Coordination has been well established between the projects funded by USAID and the projects funded by other donors. <p>Output 2: Strengthened regional and national human resources in epidemiology through regional FETPV</p> <ul style="list-style-type: none"> FETPV continued smoothly with additional collaborations at national and international levels and approved joint funding for the programme. ASEAN member countries recognized the importance of integrating veterinary epidemiology activities in the national veterinary services and noted the fact that the Thai DLD has been hosting the Regional FETPV since 2009. Capacity building in the field of epidemiology has been included as one of the main components of the draft Regional Strategies for Veterinary Epidemiology Capacity Development and Networking to be considered for endorsement by ASWGL in their next meeting. There have been two graduating cohorts in the year of 2011 and 2012 consisting of 13 veterinary graduates. One hundred and thirty-four veterinarians from 11 countries were trained through the short course - <i>Veterinary Field Epidemiology in Action</i>. Eight training modules, an FETPV trainee manual and four structured case studies were developed and used for the training. A total of 44 epidemiology reports (13 surveillance, 18 outbreak investigations and 13 field epidemiology studies) were developed and some of these reports were presented at International Conferences including TEPHINET, European Scientific Conference on Applied Infectious Disease Epidemiology (ESCAIDE), CRWAD and Melbourne One Health Conference <p>Output 3: Strengthened coordination of the epidemiology and laboratory networks</p> <ul style="list-style-type: none"> The Strategic Framework for Regional Laboratory Networks for Southeast Asia was endorsed by the ASEAN Working Group on Livestock. The international partners for the regional laboratory network in Southeast Asia were recognized by the member countries as the Technical Advisory Group. <p>Output 4: Conducting risk assessment for HPAI transmission through cross-border poultry trade</p> <ul style="list-style-type: none"> A system for "Price Monitoring of Livestock Products" was developed and tested at a study site at the border between Thailand and Lao PDR (Mukdahan - Savannakhet Provinces).

Project Monitoring Sheet: **OSRO/RAS/604/USA Baby 06**

Project title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) in Viet Nam**

Reporting period: **April 2012 to September 2012**

Country: Viet Nam
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) in Viet Nam
Code: OSRO/RAS/604/USA Baby 06
Budget: USD 2 million (Phase I), USD 3.1 million (Phase II), USD 3.3 million (Phase III), USD 1.075 million (cost extension) ¹ , USD 2.2 million (Phase IV), USD 1.9 million (Phase V). Total budget: USD 14 083 373 ²
Effective starting date: August 2006
Planned end date: 30 September 2013
Context of the project The control and elimination of H5N1 Highly Pathogenic Avian Influenza (HPAI) demands a long-term approach. Viet Nam is moving from the control phase to the consolidation phase, with an ongoing need for capacity building in the veterinary services and livestock production sectors and support for vaccination and other risk reduction measures. This regional project supported by the United States Agency for International Development (USAID) is currently in its fifth phase of implementation.
Objectives of the project The overall objective of the project is to address the urgent short-term actions that need to be undertaken by the country to strengthen its capacity to rapidly detect the introduction of HPAI and minimize its spread in case of its occurrence.
Planned activities during the reporting period (April to September 2012) Component 1: Preparedness and planning component Output 1: Strategy development for HPAI control <i>Activity 1.1: Review of HPAI Control Strategy in Viet Nam</i> <ul style="list-style-type: none"> • Monitor progress of the passive surveillance being implemented in 22 provinces. • Work with the regional technical drafting team for preparation of a regional HPAI control plan through some key interventions to gather further evidence necessary for the regional HPAI control plan in the lower Mekong (Regional Animal Health Office [RAHO] 7+) and central Viet Nam (RAHO 3). • Develop a draft regional HPAI control plan for Region 3 and Region 7+. <i>Activity 1.2: Scenario planning to analyse the effects of cessation of vaccination</i> <ul style="list-style-type: none"> • Various scenarios were developed in consultation with the Government, and a draft recommendation was forwarded. The HPAI situation will be monitored, and appropriate technical assistance will be provided based on the situation prevailing, or in the event of a change in the vaccination strategy. • A policy brief will be developed based on the matrix of control options by scenario, including the use of a range of vaccine types indicating best options. Output 2: Coordination and communication with donors and other HPAI implementing partners <ul style="list-style-type: none"> • Continue to hold regular coordination meetings with USAID, and also to the extent possible with other implementing partners, e.g. Avian and Pandemic Influenza Initiative (APII).

¹ Project cost extension request from October 2009 to September 2010.

² A balance of USD 508 373 from OSRO/VIF/801/USA was transferred to OSRO/RAS/604/USA B 06. Additional contribution of USD 1.7 million is expected for the October 2012 to September 2013 period.

- Participate in the partner (e.g. APII) activities/events.

Activity 2.1: Core FAO Viet Nam team supported

- Continue to ensure that all required staff is in place.

Activity 2.2: Annual project meetings supported

- Technical and operational support will be provided for the Technical and Policy Discussion Meeting between high-burden HPAI countries and those bordering 'at risk' countries, proposed on 24 and 25 April 2012 in Viet Nam.
- Technical midterm project review and planning meeting will be organized in May 2012.
- Final project workshop and future planning will be held in September 2012.

Activity 2.3: Team meetings from provincial to national level

- Regional planning meeting will be held in July and August 2012.
- Two meetings will be held in April and August 2012 to monitor the implementation of the project with the project regional managers and provincial focal points as well as the core project staff.

Activity 2.4: Coordination and sharing of information with other players engaged in HPAI surveillance, risk assessment and value chain and risk mitigation in poultry sector

- Periodical coordination meetings will be held with Abt Associates, the Viet Nam Partnership on Avian and Human Pandemic Influenza (PAHI), the World Health Organization (WHO), USAID and others including advocacy coordination.
- A national knowledge sharing workshop with other animal influenza players will be organized in June 2012.
- Support the Department of Animal Health (DAH) in developing a bulletin to consolidate and communicate all animal health-related activities, projects and programmes implemented through DAH. The bulletin will be posted on the DAH Web site and printed copies distributed to RAHO and the Sub-Department of Animal Health (SDAH) offices for wider dissemination.
- DAH Quarterly bulletin for quarter II and III of 2012 will be developed and disseminated.
- Final standard operating procedures (SOPs) on outbreak investigation and response will be disseminated upon endorsement of the Government.
- Materials on duck waste management and hatchery biosecurity minimum standards will be finalized and disseminated to relevant stakeholders.

Component 2: Animal surveillance component

Output 3: Animal surveillance at the national, provincial, district and community level enhanced

Activity 3.1: Strengthening of veterinary laboratories, specifically biosafety and quality assurance supported

- Upgrade basic and advanced techniques in microbiology at all laboratories. Training courses will be held at the National Center for Veterinary Diagnosis (NCVD), National Institute of Veterinary Research (NIVR), RAHO 1, 2, 3, 4, 6 and 7, Central Vietnam Veterinary Institute (CVVI) between March and September 2012.
- Develop capacity for full characterization of influenza A virus at NCVD. Protocols for sequencing all eight segments of avian influenza (AI) virus will be introduced and applied between March and July 2012.
- Support small research activities at all laboratories. Characterization of H9N2 virus will be carried out at NCVD in March and July 2012.
- Support the laboratory network for strengthening biosafety and quality assurance including regular proficiency testing.
- Support DAH in development of a strategic roadmap for diagnostic services.
- Support the Emerging Pandemic Threats (EPT) IDENTIFY through technical assistance in identified laboratories including advisory service in laboratory protocol, biosafety and quality assurance.

- Support Epi-Laboratory network meeting in July and August 2012.

Activity 3.2: Strengthening of core capacities for animal health and disease control planning in focus provinces and selected regional planning structure

- Conduct risk analysis training course for the technical drafting team for the regional HPAI control plan for the Region 3 and Region 7+.
- Carry out technical situation analysis and draft strategic HPAI control plans for the Region 3 and Region 7+.
- Develop a final draft strategic control approach document.
- Constitution of a public-private partnership (PPP) Working Group in the focus regions.
- Implement passive surveillance, hatchery improvement, capacity building on outbreak investigation and good production practices in Hung Yen and Ha Nam in April and June 2012.
- Provide training to private veterinarians, Chief Animal Health Workers (CAHWs), Agrivet store owners and extension workers on poultry disease information and prevention in Hung Yen (see 6.1.3) in May and June 2012.

Activity 3.3: Further development of monitoring and evaluation (M&E) expertise in animal health

- Focus on gathering sub-IR1 (increased effectiveness of HPAI and EPT prevention and control in the animal health sector) and sub-IR3 (strengthened policies and systems for improved implementation and management of services and programmes) indicators as listed in the USAID Viet Nam HPAI and EPT Performance Management Plan document.
- Ensure that biannual reporting requirements are met.
- Conduct pre- and post-tests for the Applied Veterinary Epidemiology Training (AVET) courses and other trainings.

Activity 3.4: Veterinary epidemiology network supported

- Provide support to integrate the Transboundary Animal Disease Information System (TADInfo) with other suitable softwares (e.g. Decision Support System, developed by the Massey University under the New Zealand Agency for International Development [NZAID] programme, etc.), or any other TADInfo compatible programme.
- Provide support to develop the TADInfo system interface where map and statistic data could be obtained publicly.
- Carry out a needs assessment to determine further training requirements on the use of online disease data management.
- Continue to support the Epi-Lab Network.
- Provide organizational and technical support, in collaboration with DAH, to the AVET programme and carry out two more batches with 16 candidates per batch during the six-month period in coordination with the Hanoi University of Agriculture (HUA).
- Continue to support AVET alumni and the AVET Web site.
- The AVET alumni meeting is scheduled for August 2012.

Activity 3.5: Animal surveillance programme

- Continue to support passive surveillance in 22 pilot provinces and in the regional control plan with the following additional activities: (i) work with DAH to develop and present a policy paper on the need for adequate and timely compensation to the Ministry of Agriculture and Rural Development (MARD) and the Central Government; (ii) determine options and pilot a reward system as permissible within the laws of the land in the form of certificates of appreciation, publicity in the Animal Health Bulletin or similar incentives for encouraging reporting of unusual poultry deaths and suspect HPAI cases by CAHWs and District Veterinary Officers (DVOs); (iii) provide differential diagnosis for poultry disease outbreaks at RAHOs, including training staff in poultry health and zoonoses with differential diagnosis; and (iv) train CAHWs and DVOs on field investigation and data collection of a poultry health event.
- Continue the live bird market surveillance study for subclinical infection of adult ducks with AI in

selected markets of high-risk provinces.

- Implement a study on detecting AI in spent hens that are confiscated along the northern border of Viet Nam (Lang Son and Quang Ninh Provinces).

Output 4: Priority procurement for animal surveillance and laboratory supported

Activity 4.1: Procurement and maintenance

- Over the course of the project, laboratory consumables will be procured for HPAI diagnosis and surveillance including training courses and genomic and antigenic characterization of HPAI virus isolates. Equipment will also continue to be maintained as required.

Component 3: Animal response component

Output 5: Effective and timely animal response efforts promoted

Activity 5.1: HPAI risk-mapping and risk analysis updated at national level

Activity 5.1.1: Poultry subsector profiling

- Expand provincial profiling and value chain analysis work to cover production and marketing systems in the regional control zones (Regions 3 and 7).
- Engage and train provincial focal points.
- Present profile data/maps to stakeholders and review/finalize with risk assessments.

Activity 5.1.2: Applied risk analysis capacity building

- Review and summarize risk assessments and define the gaps from past regional workshops.
- Conduct further training in risk assessment, planning and mitigation in region 3 and 6/7.
- Conduct regional workshops to target risk mitigations and develop a strategic plan.

Activity 5.1.3: Updating risk assessment and mapping

- Develop regional poultry population and movement models.
- Develop spatio-temporal mapping of influenza viral clades.

Activity 5.2: Outbreak investigation capacity strengthened in focus provinces

- Once the SOP on outbreak investigation and response developed last year is adopted by the Government, training courses for the new SOP will be undertaken in the focus regions 3 and 7+.
- Suitable training material will be developed, and training will be organized on implementation of an incident command system (ICS) in one of the regions, as has been incorporated in the Livestock Emergency Preparedness Plan, developed last year under the project.

Activity 5.3: Cross-border analysis using a value chain methodology in three border areas

- Review existing information on cross-border trade and identify gaps.
- Investigate the value chain of these commodities.
- Conduct a serial cross-sectional survey to assess presence of AI in confiscated spent hens coming from China into Viet Nam.
- Develop options for risk mitigation.
- Hold bilateral meeting, Viet Nam-China and Viet Nam-Cambodia.

Activity 5.4: Vaccine efficacy monitoring and virus surveillance supported at national level

- Continue to support vaccine efficacy trials for Re-6 and any other vaccines.
- Support studies to carry out pathogenicity tests for new isolates of HPAI and Low Pathogenic Avian Influenza (LPAI) viruses on ducks.
- Support HPAI virus surveillance and virus characterization.

Activity 5.5: Support PPP and institutional strengthening in poultry production and health care system

Activity 5.5.1: Strengthening veterinary services delivery

- Prepare the Terms of Reference (ToRs) for the Veterinary Statutory Body through stakeholder consultations.
- Hold a consultation workshop on creation of a Veterinary Statutory Body.

Activity 5.5.2: Setting up PPP working groups

- Assess opportunities to set up a national industry forum.
- Establish PPP working groups at RAHO 3 and 6/7, if there is positive feedback from the sectors. Otherwise consider merging the PPP Working Group with the Biosecurity Working Group.
- Determine benefits and extend poultry clubs – Quang Nam and An Giang.

Activity 5.5.3: Poultry price monitoring

- Continue support for data collection and reporting.
- Develop options for dissemination of information.

Output 6: Improved biosecurity and market hygiene practices in commercial and scavenging poultry raising settings supported

Activity 6.1: Support biosecurity strengthening in pilot provinces

Activity 6.1.1: Pilot hatchery strengthening

- Conduct study tour for Quang Tri hatchery owners.
- Continue to establish hatchery demonstration pilots in Quang Tri.
- Promote certification with hatcheries.
- Assess options for a quality assurance.
- Pilot auditing and certification, M&E of poultry small hatcheries.

Activity 6.1.2: Reduce the risk of transmission along the value chain

- Continue to develop risk models for additional provinces in Region 3 and 7.
- Train provincial staff to assess development options and constraints in poultry production.
- Develop a strategic risk reduction plan at the aggregation points.
- Hold two risk mitigation workshops in Region 3 and Region 6/7 in March and August 2012.
- Capacity building for technical drafting team on risk analysis in April 2012 for developing the HPAI regional control plan.

Activity 6.1.3: Improving technical advice for poultry producers

- Continue to develop provincial pilot approach, identifying key stakeholders.
- Continue to develop training materials and disease fact sheets.
- Provide training to private veterinarians, CAHWs, Agrivet store owners and extension workers on poultry disease information and prevention.
- Develop farm economics models.
- Review/evaluate the programme.

Activity 6.1.4: Strategic planning for improving poultry production

- Implement a spatial planning process in two identified provinces.
- Set up a Letter of Agreement (LoA) with the Department of Livestock Production (DLP) to develop spatial planning process.
- Conduct training courses in strategic planning - at national and then provincial level (for the technical team in the regional approach in Region 3 and 6/7).

- Review/evaluate strategic plans.

Activity 6.2: Develop good poultry production guidelines and training for DAH, DLP and Regions/Zones

Activity 6.2.1: Develop good biosecurity practices and standards (GPPPs)

- Review/develop minimum biosecurity standards sector-wise.
- Consolidate and prepare guidelines for sectors, species and stakeholders.
- Conduct training workshops on guidelines.
- Print and distribute guidelines.

Duck waste management

- Pilot duck waste management measures.
- Monitor, review pilot and prepare draft outcome report.
- Workshop on duck waste management to share experiences will be held on July 2012.

Activity 6.2.2: Biosecurity working group

- Continue to hold bimonthly meetings.
- List all resource materials.
- Provide discussion forum for the development/finalization of guidelines.

Activities undertaken during the reporting period (April to September 2012)

Component 1: Preparedness and planning component

Output 1: Strategy development for HPAI control

Activity 1.1: Review of HPAI Control Strategy in Viet Nam

- Progress of the passive surveillance being implemented in 22 provinces monitored.
- A regional planning workshop to develop an HPAI control strategy for the Mekong region was held in Ho Chi Minh city from 3 to 6 April 2012 with a total of 54 participants (33 male and 21 female). A similar workshop to develop an HPAI control plan for the north-central provinces of Viet Nam was held in Hue on 24 and 25 May 2012 with a total of 36 participants (25 male and 11 female).
- Debriefings held for the progress on the Regional Strategic Planning process (with DoH and RAHO 3, 6 and 7). A mission was undertaken in Ho Chi Minh city to present the progress with the planning process to the DAH Southern Coordination Office and the Directors of RAHO 6 and 7. A similar meeting was held in Hanoi with the Director of RAHO 3 to discuss the further development of the Regional Strategy for the RAHO3 provinces.
- A consultation workshop to finalize the Mekong regional HPAI disease control strategy was held in Ho Chi Minh city on 24 July 2012 with a total of 39 participants (30 male and nine female), and a similar workshop to finalize the North-central regional HPAI disease control strategy was held in Vinh on 31 July 2012 with a total of 28 participants (20 male and eight female).
- The final drafts of the regional HPAI control plans for the North-central region (Region 3) and the Mekong Delta region (Region 7+) were completed.

Activity 1.2: Scenario planning to analyse the effects of cessation of vaccination

- The policy brief is yet to be developed. The matter has been discussed with DAH and is pending the development of the national HPAI control plan.

Output 2: Coordination and communication with donors and other HPAI implementing partners

Activity 2.1: Core FAO Viet Nam team supported

- The Team Leader left the Emergency Centre for Transboundary Animal Diseases (ECTAD) Viet Nam programme in May 2012. The acting Team Leader arrived in June 2012 to ensure

continuation of ongoing activities until the end of September 2012. The International Technical Advisor (for poultry production, risk assessment and biosecurity) is contributing to the programme on a work-as-required basis (alternating between in-country inputs and home-based work) since June 2012.

- No changes for the other core staff.

Activity 2.2: Annual project meetings supported

- Technical and operational support was provided for the Technical and Policy Discussion Meeting between high-burden HPAI countries and those bordering 'at risk' countries in Ho Chi Minh City from 23 to 25 April 2012 in Viet Nam.
- A consultation meeting with DLP to review project activities and discuss key activities proposed for the 2012–2013 work plan was held in Hanoi on 3 July 2012 with a total of ten participants (five male and five female).
- A consultation meeting with DAH to review project activities and discuss key activities proposed for the 2012–2013 work plan was held in Hanoi on 5 July 2012 with a total 16 participants (eight male and eight female).
- Since the project will be extended for another year (until 30 September 2013), no final workshop was held. Planning workshops were held in July 2012 as mentioned above.

Activity 2.3: Team meetings from provincial to national level

- The regional planning and consultation workshops held to support the formulation of the Regional Disease Control Strategies for the North-central region and the Mekong Delta region, as well as various debriefings were substituted as opportunities to liaise with the Regional Coordinators on planned activities.
- As of February 2012, the programme only supports two provincial focal points (one in Quang Tri and one in Hung Yen).

Activity 2.4: Coordination and sharing of information with other players engaged in HPAI surveillance, risk assessment and value chain and risk mitigation in poultry sector

- Periodic information sharing and/or coordination meetings were held with Abt Associates, PAHI, WHO, USAID, Centers for Disease Control (CDC), the Livestock Competitiveness and Food Safety Project (LIFSAP) and others actors/partners. Efforts were made to ensure FAO's participation in activities and events of other partners to the extent possible.
- Participated in the USAID API programme partners' planning meeting on 4 June 2012 in Hanoi to set the direction for crafting an integrated work plan for the API programme in Viet Nam.
- Participated in the workshop on slaughter and poultry market on 7 and 8 June 2012 supported by USAID-APII. A presentation on the live bird market surveillance was given by FAO.
- Participated in the USAID retreat in Da Nang on 10 and 11 July 2012 to review accomplishments, challenges and gaps over the past year, identify areas of focus for the coming year and explore collaborative opportunities among implementing partners.
- Participated in the 3rd working meeting on Policy and Advocacy Planning for Avian and Pandemic Influenza (API) on 20 August 2012 in Hanoi.
- Supported DAH in developing a bulletin to consolidate and communicate all animal health-related activities, projects and programmes implemented through DAH. Some 210 copies of the 2011 Animal Health Bulletin was printed and distributed to RAHO and SDAH offices for wider dissemination.

Component 2: Animal surveillance component

Output 3: Animal surveillance at the national, provincial, district and community level enhanced

Activity 3.1: Strengthening of veterinary laboratories, specifically biosafety and quality assurance supported

- Capacity developed for full characterization of influenza A virus at NCVD. Protocols for

sequencing all eight segments of AI virus introduced and applied.

- Laboratory network for strengthening biosafety and quality assurance supported through proficiency testing.
- DAH supported in the development of a strategic roadmap for diagnostic services.
- EPT IDENTIFY component supported through technical assistance for identified laboratories including advisory service in laboratory protocol, biosafety and quality assurance.
- Epi-Lab network meeting organized from 19 to 21 September 2012 in Ho Chi Minh city with a total of 50 participants (42 male and eight female). Laboratory diagnosis at all laboratories was reviewed, and results of surveillance and vaccine efficacy tests were presented and discussed.

Activity 3.2: Strengthening of core capacities for animal health and disease control planning in focus provinces and selected regional planning structure

- Refresher training on risk analysis along the poultry value chain in the Mekong region was held in Ho Chi Minh city on 2 April 2012 with a total of 20 participants (ten male and ten female).
- Refresher training on risk analysis along the poultry value chain in the Central region was held in Hue on 21 May 2012 with a total of 13 participants (11 male and two female).
- The final drafts of the regional HPAI control plans for the North-central region (Region 3) and the Mekong Delta region (Region 7+) were completed.

Activity 3.3: Further development of M&E expertise in animal health

- Submitted the PMP indicators for the period October 2011 to March 2012.
- Ensured that biannual reporting requirements were met.
- Conducted pre- and post-tests for AVET courses (AVET 10-12).
- Meeting held with MEASURE on 16 May 2012 on PMP templates.
- Meeting held with Abt M&E officer on 8 June 2012 on data cleaning and data reporting.

Activity 3.4: Veterinary epidemiology network supported

- Epi-Lab network meeting organized from 19 to 21 September 2012 in Ho Chi Minh city.
- Organizational and technical support provided for two more batches of the AVET programme, with a total of 32 participants (18 male and 14 female) in collaboration with DAH and HUA.
- Second AVET alumni meeting held in Danang on 6 and 7 September 2012 with a total of 132 participants (93 male and 39 female).

Activity 3.5: Animal surveillance programme

- A Letter of Agreement (LoA) to support passive surveillance in 22 provinces concluded at end of July 2012. A new LoA to continue support to passive surveillance in 20 provinces was signed with DAH in September 2012.
- The first phase of the live bird market surveillance completed. Live bird market surveillance results and analysis meetings held.
- LoA for the second phase of the live bird market surveillance signed with DAH.
- LoA on implementation of spent hen surveillance in Hanoi, Lang Son and Quang Ninh was signed with DAH.
- Participated in field missions to Region 3 provinces (Nghe An and Quang Tri) to visit SDAH and RAHO 3 to assess the passive surveillance project.
- Participated in field missions to Hai Phong and Quang Ninh province to implement spent hen surveillance activities.
- Participated in a field mission with DAH to Ha Vy market to investigate sampling procedures for the next round of live bird market surveillance.

Output 4: Priority procurement for animal surveillance and laboratory supported

Activity 4.1: Procurement and maintenance

- Over the course of the project, laboratory consumables were procured for HPAI diagnosis and surveillance including training courses and genomic and antigenic characterization of HPAI virus isolates. The maintenance of equipment also continued as required.

Component 3: Animal response component

Output 5: Effective and timely animal response efforts promoted

Activity 5.1: HPAI risk-mapping and risk analysis updated at national level

Activity 5.1.1: Poultry subsector profiling

- Provincial profiling and value chain analysis work expanded to cover production and marketing systems in the regional control zones (Regions 3 and 7). Profile data/maps presented to stakeholders.
- Provincial focal points engaged and trained.

Activity 5.1.2: Applied risk analysis capacity building

- Risk assessments reviewed/summarized and gaps from past regional workshops defined.
- Further training in risk assessment, planning and mitigation conducted in Region 6/7.

Activity 5.1.3: Updating risk assessment and mapping

- Regional poultry population and movement models developed to support regional risk assessments.

Activity 5.2: Outbreak investigation capacity strengthened in focus provinces

- SOPs on outbreak investigation and response developed last year yet to be officially adopted by the Government. The General Department of Legislation of MARD requested a new circular to replace the Circular 69.

Activity 5.3: Cross-border analysis using a value chain methodology in three border areas

- Bilateral meeting between Viet Nam and Cambodia held on 25 and 26 September 2012.

Activity 5.4: Vaccine efficacy monitoring and virus surveillance supported at national level

- LoA on Vaccine Efficacy and Pathogenicity Test and identification of the gene pool of AI viruses signed with DAH.
- Support to vaccine efficacy trials for Re-6 completed. It was demonstrated that Re-6 vaccine is effective to both cluster (A and B) of 2.3.2.1.A virus, but not to clade 1.1 virus.
- First round of vaccine efficacy test (Re-5 vs H5N1 viruses 2012) completed; the same results with the previous test with H5N1 viruses 2011.
- Support continued for HPAI virus surveillance and virus characterization.
- Haemagglutination gene of 175 viruses (120 from outbreaks and 55 from live bird market surveillance) sequenced. Results showed: (1) that three clusters of clade 2.3.2.1 virus are circulating in the north Viet Nam since July 2012, and that H5 viruses collected during live bird market surveillance are similar to those collected from outbreaks in terms of genetic sequences and distribution, except 2.3.2.1. A virus was newly identified in Dong Thap province by live bird market surveillance.
- The laboratory system quickly identified a new H5N1 variant cluster of viruses that initiated a minor epidemic of HPAI in July through September 2012 mostly in young ducks.

Activity 5.5: Support PPP and institutional strengthening in poultry production and health care system

Activity 5.5.1: Strengthening veterinary services delivery

- Discussions held with DAH to organize a study tour on the creation of a Veterinary Statutory Body.

Activity 5.5.2: Setting up PPP working groups

- Consultations held with a private poultry company PROCONCO, and potential areas for collaboration identified.

Activity 5.5.3: Poultry price monitoring

- Pilot completed.
- Options discussed for dissemination of information.

Output 6: Improved biosecurity and market hygiene practices in commercial and scavenging poultry raising settings supported*Activity 6.1: Support biosecurity strengthening in pilot provinces**Activity 6.1.1: Pilot hatchery strengthening*

- LoA on implementation of pilot hatchery model and certification in Can Tho and Quang Tri provinces signed with DLP. The following activities under this LoA were carried out:
 - First training course on Hatchery biosecurity minimum standards in Can Tho on 19 and 20 June 2012 with a total of 17 participants (14 male and three female);
 - Training course on Auditing procedures for small and medium hatcheries in Can Tho on 21 and 22 June 2012 with a total of ten participants (eight male and two female);
 - Second training course on hatchery biosecurity minimum standards in Quang Tri on 9 and 10 July 2012 with a total of 16 participants (14 male and two female);
 - Advanced auditing training course on biosecurity in Quang Tri on 11 July 2012 with a total of ten participants (seven male and three female);
 - Second training courses on Hatchery biosecurity minimum standards in Can Tho on 19 and 20 July 2012 with a total of 25 participants (16 male and nine female);
 - Provincial meeting on evaluation of hatchery models held in Quang Tri on 12 September 2012 and in Can Tho on 25 September 2012 with a total of 64 participants (48 male and 16 female); and
 - National workshop on the hatchery strengthening programme held on 28 September 2012 in Hanoi with a total of 29 participants (20 male and nine female).
- Six monitoring trips to selected hatchery models in Quang Tri and Can Tho.

Activity 6.1.2: Reduce the risk of transmission along the value chain

- Risk reduction models for small and medium scale hatcheries developed.
- Strategic risk reduction plan for hatcheries developed in consultation with key stakeholders.

Activity 6.1.3: Improving technical advice for poultry producers

- Training materials on hatchery biosecurity developed.

Activity 6.1.4: Strategic planning for improving poultry production

- Sustainable development of waterfowl production in southern provinces workshop (in collaboration with DLP) was held in An Giang on April 2012 with a total of 107 participants (94 male and 13 female).

*Activity 6.2: Develop good poultry production guidelines and training for DAH, DLP and regions/zones**Activity 6.2.1: Develop GPPPs*

- Minimum biosecurity standards sector-wise reviewed/developed.
- Guidelines for sectors, species and stakeholders prepared and consolidated.

Duck waste management

- Composting of duck waste training conducted in Vinh Thanh district, Can Tho province on 25 July 2012 with a total of 19 participants (17 male and two female).
- Composting of duck waste training conducted in Co Do district, Can Tho province on 26 July 2012 with a total of 19 participants (all male).
- Composting of duck waste training conducted in Thoi Lai district, Can Tho province on 27 July 2012 with a total of 17 participants (all male).
- Composting of duck waste training conducted in Hai Lang district, Quang Tri province on 17 July 2012 with a total of 25 participants (22 male and three female).
- Nine models on duck waste management in Can Tho and five models on duck waste management in Quang Tri piloted.
- Testing chemical composition of fertilizer in Can Tho is ongoing.

Activity 6.2.2: Biosecurity working group

- The 18th Biosecurity working group meeting, entitled "Duck waste management" was held in Vinh on 22 June 2012 with a total of 29 participants (25 male and four female).
- The 19th Biosecurity working group meeting, entitled "Duck waste management" was held in Can Tho on 23 August 2012 with a total 29 participants (21 male and eight female).

Activities proposed for the next reporting period (October 2012 to March 2013)**Component 1: Preparedness and Planning Component****Output 1: Strategy development for HPAI control*****Activity 1.1: Regional HPAI Control Strategy***

- Facilitate establishment of a coordination structure for the implementation of the regional strategy
- Develop advocacy strategy for implementation in conjunction with PAHI
- Support development of work plans for two zones. Activities should include improved surveillance, value chain mapping, risk planning and disease control
- Joint planning of activities with other partners to ensure linkage to zonal strategy

Activity 1.3 Training in regional control plan management and evaluation

- Conduct real-time training in regional control plan management in conjunction with RAHO meetings.

Output 2: Coordination and communication with donors and other HPAI implementing partners***Activity 2.1 Core FAO Viet Nam team supported and manages project activities******Activity 2.2 Annual project meeting supported******Activity 2.3 Coordination meetings to support regional HPAI control strategy implementation******Activity 2.4: Coordination and sharing of information with other players engaged in HPAI surveillance, risk assessment and value chain and risk mitigation in poultry sector*****Component 2: Animal surveillance component****Output 3: Animal surveillance at the national, regional/zonal, provincial, district and commune level enhanced*****Activity 3.1 Strengthening of core capacities for animal disease control and disease control planning within regional control strategies***

- Support capacity building to develop work plans to implement regional control strategies
- Support capacity building in risk management along value chains relevant to regional control strategies

- Support development of responses to risk analysis associated with value chains
- Outbreak investigation refresher training for SDAH and RAHO staff using standardized approach to support strategy
- Outbreak response refresher training for SDAH and RAHO staff using standardized approach to support strategy
- Mentoring of epidemiology units in data analysis and interpretation

Activity 3.2 Animal surveillance programme

- Support national surveillance plan for live bird markets, including where appropriate targeting spent hen trade
- Support surveillance plan for live bird markets linked to regional strategic objectives
- Support passive surveillance system under regional control strategy, including employing smart phone technology
- Support linkages in passive surveillance from community level to formal animal health reporting systems
- Training for differential diagnosis of poultry disease outbreak at RAHO and SDAH including poultry post-mortem examination
- Develop policy options for incentives to stimulate reporting of disease events and support advocacy for implementation
- Support DAH to conduct expert consultation on national surveillance system for HPAI and other priority diseases

Activity 3.3 Strengthening of veterinary laboratories diagnostic activities, including biosafety and quality assurance supported

- Supporting laboratory quality assurance through monitoring of performance and SOP review
- Continue support for rapid and differential diagnosis at RAHO level including other zoonoses/high-impact diseases
- Continue support for the full characterization of viruses isolated from outbreaks and live bird market surveillance
- Review the functions and role of the animal health laboratory system
- Support strategy for DAH to assume full technical responsibility for HPAI laboratory programme

Activity 3.4 Veterinary Epidemiology Network capacity supported

- Continue support for AVET programme with emphasis on an advanced course
- Define the framework for the epidemiology network at national level and commence development
- Support regional level epidemiology networks and conduct regular meetings
- Support AVET alumni meeting

Activity 3.5 Further development of M&E expertise in animal health

- Training of managers at RAHO and SDAH in the monitoring and evaluation principles that guide project management
- Support alignment of the overall APII M&E framework to local strategic plans
- Support managers at RAHO and SDAH in gathering and processing M&E data

Output 4: Priority procurement for animal surveillance and laboratory supported

Activity 4.1: Procurement of essential supplies and maintenance of laboratory equipment

Activity 4.2 Procurement of consumables to support laboratory activities

Activity 4.3 Determine and support maintenance requirements for laboratories

Activity 4.4 Procurement of supplies to support field surveillance activities

Component 3: Animal response component**Output 5: Effective and timely animal response efforts promoted***Activity 5.1: HPAI risk mapping and risk analysis updated to support regional strategies*

- Poultry sector profiling to support the regional strategy
- Applied risk analysis capacity building
- Updating risk assessment and mapping
- Detailed characterization of high-risk value chains including network analysis

Activity 5.2: Outbreak control capacity strengthened under regional control strategy

- Further review of SOPs for application to outbreak control, including local incident command system and culling principles
- Refresher training in outbreak control to support strategic control plans
- Assist partners to sensitize grassroots stakeholders to disease control activities
- Review application of carcass disposal in outbreak control in local situations within strategic plans
- Prepare and conduct desktop exercises with public health counterparts

*Activity 5.3 Conduct review of response capability in relation to scenarios developed under activity 1.2**Activity 5.4 Develop tailored compensation mechanisms to support control strategy*

- Support the development of locally feasible and practical compensation mechanisms to support farmers reporting disease.
- Review outbreak control procedures to enable effective audits to support compensation packages

Activity 5.5 Cross-border dialogue and coordinated surveillance

- Support bilateral meetings with China and Cambodia to exchange technical information including surveillance and risk assessment findings, and risk reduction plans
- Review cross border value chains of high-risk commodities
- Develop plans to conduct coordinated cross-border surveillance

Activity 5.6 Vaccine efficacy assessments and virus surveillance supported at the national level

- Conduct vaccine trials against key circulating clades with ranges of vaccines, species and breeds
- Monitoring pathogenicity of selected virus isolates from outbreaks and live bird market surveillance

Activity 5.7 Institutional strengthening in poultry production and animal health advisory systems

- Institutional and core function analysis for poultry production and support services
- Capacity needs assessment of key stakeholders
- Develop the poultry sector advisory services model in collaboration with partners and the Extension Department

Activity 5.8 Support engagement of private sector in execution of regional control strategies

- Develop a poultry industry forum at regional level to support the regional control plan
- Work with other APII partners to engage key value chain stakeholders in regional control strategy

*Activity 5.9 Support DAH to conduct review of the current draft of Veterinary Law**Activity 5.10 Support DAH to finalize guidelines to establish Veterinary Statutory Body, including structure, function and mechanism*

Output 6: Improved poultry production practices in poultry value chains supported

Activity 6.1 Support programme to strengthen safe poultry production practices including biosecurity

- Develop materials and methods with partners including extension service to scale up hatchery pilot programme in support of regional control strategies
- Facilitate development of policy and advocacy brief to support practical measures to upgrade the production of day-old ducks
- Support implementing partners with high-level training and advice on hatchery pilot programme
- Collaborate with DLP to develop upstream standards for parent flocks supplying hatcheries conforming to guidelines and pilot test practical implementation at field level
- Continue support for development of poultry waste disposal systems:
 - review workshop on composting of duck waste
 - national workshop on composting of duck waste
- Develop materials and methods with partners including extension service to scale up the good production practices in support of regional control strategies

Activity 6.2 Support ongoing activity of the Biosecurity working group

- Support national and regional meetings of the Biosecurity working group
- Support dissemination of the Biosecurity working group findings by partners within regional control strategy, including the extension service

Activity 6.3 Provide policy support brief on the inactivation of H5N1 under environmental conditions

- Investigate inactivation of H5N1 strains under simulated environmental conditions
- Develop a policy brief related to the implications of virus survival in the environment

Activity 6.4 Pilot training programme for private sector in various guidelines and GPPP developed

Activity 6.5 Training of provincial Department of Agriculture and Rural Development (DARD) staff in description and mapping of local poultry sector

Main challenges encountered and response provided

- Official government clearance for the project extension (October 2011–September 2012), following the approval of the Project Document by FAO and USAID, was only obtained in late March 2012. Consequently, many activities, which the counterpart government agency had primary responsibility for implementing, could not be initiated until then. Since then, the project has successfully signed several LoAs with the counterpart government agencies which is expected to accelerate implementation of planned activities.
- In the country context, the regional approach to HPAI control is a new concept. The Government administrative structure does not provide for a regional mechanism in-between the national and provincial authorities in Viet Nam. This is being resolved through advocacy with the national department and the provincial one through RAHOs.
- The Senior Technical Coordinator/Team Leader left the ECTAD Viet Nam programme in May 2012, and while an interim Team Leader was immediately recruited in June 2012, a new Team Leader is not yet in place. A vacancy announcement was launched for the position and interviews conducted. The internal selection process will be completed in early October 2012.

Main progress made towards the achievement of project outcomes (from the start of the project)

Output 1: Strategy development for HPAI control in 2006–2010 supported

- Consideration of a regional approach to HPAI control rather than a provincial one was promoted and is attracting interest as featured in the Green Book Review and several International Ministerial Conference on Avian and Pandemic Influenza (IMCAPI) documents. The final drafts of the regional HPAI control plans for the North-central region (Region 3) and the Mekong Delta region (Region 7+) were completed.

- A Livestock Emergency Preparedness Plan was developed and submitted to DAH for use in any unusual event in the livestock sector, keeping in view the state of unpreparedness that the Government experienced during the 2003–2004 emergence of HPAI.
- Provincial poultry subsector profiling was effective in describing provincial poultry populations (including the Poultry Atlas), and DLP is considering adopting such an approach more widely.
- Risk assessment and risk-based targeting of control measures are increasingly being included in technical and policy development (however still largely restricted to the control of HPAD). This approach is now expanded and was translated into an HPAI regional control plan particularly for two regions in Viet Nam.

Output 2: Coordination and communication with donors and other HPAI implementing partners

- Programme management, planning and coordination of activities with USAID and other partners were maintained. FAO made 11 major recommendations for the Green Book review, which were well received by the Government of Viet Nam as is evident from the newly released follow-up version of the Green Book as an Action Programme on Avian Influenza, Pandemic Preparedness and Other Emerging Infectious Diseases (AIPED) for the period covering 2011–2016.
- FAO and Abt Associates have a common strategy to risk reduction across the supply chain with a shared activity matrix consolidating the agencies' activities into a single overall approach.
- The first volume of DAH Animal Health bulletin was released in July 2011 (250 copies); and the second volume of DAH Animal Health bulletin was released in August 2012 (210 copies).

Output 3: Animal surveillance at the national, district and community level enhanced

- The project is carrying out animal surveillance activities, which include support in relation to the upgrading of TADinfo and LabNet, development of geographic information systems (GIS) at RAHO. So far, 210 officers from SDAH, 14 RAHO staff and five DAH Epidemiology staff were trained to use this software. Seven units of global positioning system (GPS) and seven licenses of mapping software (ArcView/ArcGIS 9.2) were provided to seven RAHOs (I-VII). A total of 55 SDAH/DAH staff were trained on its use.
- The project also developed a database system software for laboratory diagnostic management within the DAH's LabNet through the services of a local firm in Viet Nam. Laboratory biosafety and quality assurance are being supported and pursued. One laboratory (NCVD) was accredited for ISO17025, and the other laboratories are in process of accreditation.
- The SOPs for H5N1 real-time polymerase chain reaction (PCR) were developed and adopted. It has been used at nine veterinary laboratories extensively for passive and active surveillance. The use of real-time PCR was extended to the differential diagnosis of HPAI, such as Newcastle Disease and Duck Plaque.
- Capacity of genetic sequencing of H5N1 viruses was developed and applied. Genetic analysis of the viruses isolated from HPAI outbreaks in poultry in Viet Nam over several years indicates that Clade 1 is entrenched in south Viet Nam with sporadic forays to central Viet Nam. Clade 2.3.4 used to be the predominant clade for many years in north and central Viet Nam until the winter of 2009–2010. However, clade 2.3.2 viruses have totally replaced the dominance of clade 2.3.4 in late 2010, which continues until present (February 2012). Within the newly emerging clade of 2.3.2.1, an antigenic variant strain of virus was detected. Adequate technical and material support significantly improved the HPAI diagnostic capacity in the laboratories and antigenic and genomic characterization of H5N1 viruses.
- A revised and updated SOP for HPAI Outbreak Investigation and Control was developed comprising 19 sections and 14 job cards for various officials involved in HPAI outbreak management. The English and Vietnamese versions of the SOP were handed over to DAH for transmission to MARD for adoption as a national strategy.
- The awareness raising campaign to encourage poultry farmers to report any unusual occurrences of an infectious disease in poultry flocks and the necessity to report it on time was carried out through TV spots and loudspeakers during the risk period (e.g. the TẾT festival).

- The AVET initiative to improve basic epidemiological investigation capacity through Viet Nam-specific, nine-week long tailor-made course curricula, resulted in the training of 160 veterinarians in 12 cohorts in the period of 2010–2012. At least one veterinarian of each of the 63 provinces of Viet Nam now has specialized basic skills in veterinary field epidemiology. Two AVET alumni workshops were organized for strengthening the animal health epidemiologist network in Viet Nam and improving the sharing of information.
- Active surveillance for HPAI and other poultry diseases launched to complement the community-based surveillance of Abt Associates yielded valuable insight on the efficacy of the surveillance.
- In the event of an outbreak, a new component was launched in March 2011 to early detect any potential secondary outbreaks in the neighbouring area of the index case.
- A cost effectiveness study on surveillance for HPAI was completed. Preliminary findings suggest that there is a qualitative value in surveillance, but the cost of surveillance per outbreak reported is going up with a decrease in the number of outbreaks of HPAI in Viet Nam.
- Live bird market surveillance for subclinical infection of ducks sold at the markets in 30 high-risk provinces indicated widespread circulation of AI virus and also H5N1 viruses, in particular.
- More than 300 copies of the Wild Bird Manual were translated into Vietnamese and distributed to 63 provinces.

Output 4: Priority procurement for animal surveillance and laboratory supported

- Procurement of vehicles, information technologies (IT) equipment, equipment sprayers and most laboratory consumables is complete, and all are in use.

Output 5: Effective and timely animal response efforts promoted

- A cross-border study in the north of Viet Nam concluded that as a result of a high financial return for poultry, smuggling across the border has not decreased, but has become more elaborate, which will pose a constant risk of disease transmission. The market chain is increasingly being recognized as critical to the control of HPAI, particularly in northern Viet Nam, and FAO's strategic targeting of live bird markets was validated.
- Hatchery data collection and mapping in five pilot provinces was completed. Hatchery minimum biosecurity standards were developed through a stakeholders consultation process. A hatchery audit and certification tool was developed, and training was provided to the Government staff on the procedure for hatchery auditing and certification.
- Post-vaccination monitoring and virus circulating surveillance for influenza A/H5N1, supported by this project, shows that vaccinated poultry have a protection rate of 72.10 percent at the bird level. The protection rates of Muscovy ducks, turkey, other ducks, chicken and geese were: 80 percent, 80 percent, 78.90 percent, 68.05 percent and 50 percent, respectively. Prevalence of Type A and H5N1 AI viruses in ducks were 0.94 percent and 0.67 percent respectively, while in chickens, respective prevalence was 0.54 percent and 0 percent. There was no evidence of AI virus persistence found with the samples taken from Muscovy ducks. The AI positive samples were from Khanh Hoa and Quang Ngai provinces (Centre). Currently, the Government of Viet Nam halted mass vaccination of poultry against HPAI.
- A training course on good management practices to key stakeholders, the National Veterinary Company (NAVETCO), Viet Nam's Veterinary Vaccine Company (VETVACO) and DAH was conducted, which covered introductory level Good Manufacturing Practice (according to the 2009 Pharmaceutical Inspection Convention/Pharmaceutical Inspection Co-operation Scheme [PIC/S] Code of GMP) and quality systems applicable to the manufacture of AI H5N1 vaccines.
- The operational appraisal of cold chain integrity was completed, and 39 provinces were provided with walk-in cold rooms. A software for inventory maintenance of vaccine banks in provinces was developed.
- Capacity for animal challenge experiment was developed, following the completion of a high biosecurity animal isolation unit at NCVD. The unit applied for vaccine efficacy tests since 2007 to monitor the adequacy of vaccines against the evolving H5N1 viruses. An antigenic variant of H5N1 virus was found in 2011, for which the vaccine currently in use was not effective.

Output 6: Improved biosecurity practices in commercial and scavenging poultry raising settings supported

- Poultry sector profiling provides important tools for risk-analysis and strategic disease control planning. A guide to provincial poultry sector profiling was developed. Poultry sector profiling was completed for four of the five project provinces. The guidelines are currently being tested externally by an implementing partner in three non-USAID pilot provinces.
- A Biosecurity working group was established which provides a forum to network information and lessons learned, building technical understanding among a peer group of agencies working to strengthen biosecurity.
- A framework for a database on biosecurity materials was developed, and its consolidation is in progress. By now, over 100 documents were compiled in a searchable format. This is now ready for dissemination. Biosecurity activities of all agencies engaged in related work have also been mapped.
- The working group reviewed work on hatchery biosecurity. Training on the principles of biosecurity and on biosecurity auditing was provided to 16 members of the Biosecurity working group. Conventional approaches to biosecurity strengthening were reviewed and evidence gathered to support adoption of a supplementary approach focusing on private sector driven activities and adopting social marketing techniques from the human health sector.
- FAO and Abt Associates liaised on hatchery technical training and registration schemes.
- A regional risk analysis exercise was conducted, which provided information on the character of poultry movement and production in the lower Mekong Region, identifying poultry movements and risk pathways for inter-provincial transmission of infection.

Output 7: Communication capacity supported at DAH and technical inputs to communication activities of other USAID implementing partners are provided

- FAO supported the calendar and sticker production and distribution for pre-TÉT festival 2010, sending out the message to call the hotline or the SDAH landline to report ill and dead poultry under the Enhanced Reporting component.
- Under the Gathering Evidence for a Transitional Strategy (GETS) project (closed in February 2012), the Academy for Educational Development produced a commercial in which the second part encouraged poultry owners to report ill and dead poultry to SDAH via a hotline or SDAH phone numbers. This was used effectively in this project for awareness-raising purposes.
- Support to DAH communications and technical support to Abt Associates in implementing the field activities was maintained.

Project Monitoring Sheet: **OSRO/RAS/604/USA Baby 01**Project Title: **Support to Highly Pathogenic Avian Influenza Surveillance Programme in Cambodia**Reporting period: **October 2012 to March 2013**

Country: Cambodia
Project title: Support to Highly Pathogenic Avian Influenza Surveillance Programme in Cambodia
Code: OSRO/RAS/604/USA Baby 01
Budget: The budget of this project, which started in fiscal year 2006, was USD 1 150 000. It was increased by USD 1 900 000 under Amendment no. 1, by USD 600 000 under Amendment no. 2, by USD 400 000 under Amendment no. 3, by USD 400 000 under Amendment no. 4, and by USD 372 000 under Amendment no. 5. With the increase of USD 150 000 under this current Amendment (no. 6), the total budget amounts to USD 4 972 000.
Amendment no. 6: USD 150 000
Total budget: USD 4 972 000
Effective starting date: 1 October 2006
Planned end date: 30 September 2013
Context of the project As stated in the previous reports, outbreaks of Highly Pathogenic Avian Influenza (HPAI) in poultry and humans indicate that the H5N1 virus is still circulating in Cambodia. Therefore, it is necessary to detect the outbreaks as early as possible and ensure that immediate and appropriate containment measures are taken to prevent the spread of the disease. The continued improvement of capacities and capabilities in Cambodia to prevent and control HPAI in the animal population is necessary to limit its impacts in poultry sectors and minimize the risk of an infection in humans. The Food and Agriculture Organization of the United Nations (FAO) Avian Influenza (AI) Programme in Cambodia is currently funded by the United States Agency for International Development (USAID) in Cambodia for surveillance and response activities.
Objectives of USAID project The main objective of the project is to reduce and stop the spread of H5N1 among and between flocks of birds in Cambodia, and between Cambodia and neighboring countries (Viet Nam, Thailand and the Lao People's Democratic Republic), thus reducing the risks of a pathogen spread to mammals and humans and of an emergence of pandemic influenza.
Planned activities and expected outputs
Output 1: Strengthened planning and cross-sectoral coordination at national and international levels
<ul style="list-style-type: none"> After the first technical consultation meeting in September 2012 in Siem Reap, Cambodia, good surveillance practices were shared along with epidemiology findings and methodology used in the poultry monitoring programmes of each country (Cambodia and Viet Nam). Final recommendations were made by integrating HPAI monitoring in poultry in the lower Mekong Delta border areas, identifying focal points for future interactions/information exchange and reviewing the duck production/marketing systems. These were the first issues that needed to be addressed. Other recommendations were that the Department of Animal Health and Production (DAHP) of Cambodia and the Department of Animal Health (DAH) of Viet Nam share their presentations and/or recommendations from this meeting with their human health counterparts. The two

countries agreed to draft the joint lower Mekong sub-region surveillance proposal, which will be a new approach for the cross-border surveillance of HPAI in the region. The second technical consultation on HPAI monitoring in the lower Mekong region was organized on 21 January 2013 in Hanoi, Viet Nam to follow up activities of the first meeting in Siem Reap.

- On 13 February 2013, an ad hoc meeting was held in DAHP with 24 chiefs from the Offices of Animal Health and Production (OAHP) to discuss the current AI outbreaks and find the solutions to prevent and control AI outbreak. Key messages have been addressed by FAO and the Director of DAHP to all 24 OAHP chiefs:
 - Raise awareness among the public on the impact of AI.
 - Take effective preventive measures (cook poultry meat well, wash hands with soap or ash, ban children from playing with birds and immediately report in case of high fever and recent contact with poultry).
 - Take control measures (increase surveillance of poultry diseases, monitor poultry movement, report suspicious poultry disease and update and train village animal health workers).
 - Strengthen the control and prevention of animal movement from areas with sick/dead animals.
 - Take bio-security measures in poultry raising places, live bird markets (LBMs) and poultry slaughter places every two weeks.
 - For provinces bordering neighbouring countries, provincial Department of Agriculture shall strengthen cooperation with the neighbouring countries and relevant ministries or agencies to control the spread of this disease.
- On 15 February 2013, an ad hoc meeting was held with partners and donors on the recent 2013 AI outbreaks. The meeting was facilitated by FAO in order to let the human and animal authorities to effectively explain to the development partners the animal health situation and the efforts have been put in place by both sectors.
- Through FAO's advocacy efforts, the livestock sub-sector is now being set up as livestock sub-working group under the Technical Working Group of Agriculture and Water (TWG-AW). The Ministry of Agriculture, Forestry and Fisheries (MAFF) appointed the chairperson of livestock sub-working group. FAO is playing the facilitation role.

Output 2: Strengthened laboratory capacity

- supplied consumable equipment and reagents to the National Veterinary Research Institute (NaVRI) to maintain the ongoing testing;
- facilitated NaVRI to be the member of the proficiency testing laboratory;
- facilitated the assessment of the laboratory and bio-safety cabinets; and
- facilitated laboratory officers to be able to attend international trainings and workshops.

Output 3: Strengthened veterinary epidemiology capacity

- Cambodian Applied Veterinary Epidemiology Training (CAVET).
- The proposals for the 15 trainees of CAVET were translated and revised by FAO and DAHP. The 15 trainees (7 from Kampong Cham and 8 from Takeo) will send the finalized proposals along with questionnaires for animal disease survey to FAO on 5 April. Two designs of proposals have been agreed upon by trainees. For non-zoonotic diseases the focus will be on disease rate whereas for zoonotic disease the focus

will be on disease prevalence. On-the-job training will take place for five months, continuously from May 2013 onwards, and will be supported by Safetynet of the United States Center for Disease Control and Prevention (CDC). The mid-term evaluation of survey activities with all trainees is scheduled for June or July 2013.

- Joint AI outbreak and post AI outbreak investigations with DAHP.

Output 4: Improved surveillance system

- The project supported the team of DAHP/NaVRI to conduct surveillance and investigation during HPAI outbreaks.
- The strategy for animal surveillance in Cambodia has been finalized.
- The guide for HPAI outbreak investigation and response has been reviewed and will tentatively be expanded to others animal diseases.
- FAO signed a letter of agreement with *Institut Pasteur du Cambodge (IPC)* on twinning programme to strengthen capacities of NAVRI in order to operationalize the One Health approach, using a joint animal-human-environment survey for HPAI in LBMs. However, the field activities were carried out in first week of January 2013 with the financial contribution of WHO and IPC. The primary results revealed that 50-60 percent of samples collected from four markets of Kampong Cham, Phnom Penh and Takeo tested positive for HPAI H5N1.
- Harmonizing HPAI surveillance in LBMs based on the Vietnamese model is in process.
- The peak of AI outbreaks, both in poultry and humans, during the first two months of 2013 has drawn public attention. The Emergency Centre for Transboundary Animal Diseases (ECTAD) and FAO's Regional Office for Asia and the Pacific (RAP) sent two epidemiologists to conduct risk and pathway assessment of the recent AI outbreaks in three provinces: Kampong Speu, Kampot and Takeo. The mission aimed at better understanding the recent AI outbreaks, which claimed eight lives (out of the nine who had been contaminated), and the six AI outbreaks in poultry.
- AI prevention messages and spots produced by FAO are being used by the Government under the Avian and Human Influenza Control and Preparedness Emergency Project (AHICPEP) project funded by the World Bank.

Output 5: Improved policy and legislation for trade purposes between Cambodia and its neighbouring countries

- The animal health and production legislation is under revision at the Council of Ministers before the Parliament endorsement.
- Cambodian zoonotic policy has been drafted by WHO Consultant with the inputs from zoonotic technical working group members (MAFF, FAO, MOH, WHO, IPC).

Other related activities funded under the programme

- Rabies vaccination campaigns for dogs
Two thousand doses of dog rabies vaccine were administered in 15 villages of Battambang, Kampong Cham and Takeo provinces under "healthy livestock, healthy village, better life" programme. The 2 000 vaccines were provided by USCDC Thailand and 1 200 t-shirts and posters were provided by European Union-Highly Pathogenic Emerging Diseases FAO Regional Project (EU-HIPED project).
- Socio-economic impact assessment in healthy livestock, healthy village, better lives has been conducted in target villages of Battambang, Kampong Cham and Takeo,.
- Animal health and production manuals to be used for training animal health and production practitioners have been jointly revised and finalized by FAO and DAHP.

- Improving bio-security in LBM of Psar Leu, Siem Reap province, under the budget of Global Public and Private Partnership Project of FAO headquarters (OSRO/INT/805/USA).

The provincial department of agriculture of Siem Reap was contracted for implementation of bio-security improvement in LBM. Three bio-security trainings were conducted with poultry sellers, transporters and market management. The committee of LBM have been established and composed by PDA, OAHP, poultry sellers, market management and FAO. The LBM committee has been recognized and endorsed by PDA.

Planned activities for the next six-month period

Output 1: Strengthened planning and cross-sectoral coordination at national and international levels

- Activity 1.1. Support from ECTAD Country Team Leader (CTL) and the team to provide inputs for planning the coordination required at the country level.
- Activity 1.2. Support national and international coordination related to disease control.

Output 2: Strengthened laboratory capacity

- Activity 2.1. Strengthen laboratory management through technical and management advice.
- Activity 2.2. Work to promote laboratory expert's mission to support and train laboratory officers.
- Activity 2.3. Procure necessary laboratory supplies.

Output 3: Strengthened veterinary epidemiology capacity

- Activity 3.1. Facilitate veterinary officer of DAIP to attend the Field Epidemiology Training Programme for Veterinarians (FETPV) in Thailand.
- Activity 3.2. Organize second cohort of CAVET training.
- Activity 3.3. Support community-based surveillance and response activities.

Output 4: Improved surveillance system

- Activity 4.1. Review disease surveillance strategy in collaboration with human health sector.
- Activity 4.2. Support risk-based surveillance activities focusing on where human cases are reported and along the areas identified as high-risk supply chains.
- Activity 4.3. Organize AI school forums and AI field simulation exercises.
- Activity 4.4. Provide logistic support to field activities (when needed).

Output 5: Improved policy and legislation for trade purposes between Cambodia and its neighbouring countries

- Activity 5.1. Support activities related to policy and legislation for trade purposes between Cambodia and neighbouring countries through the expertise provided to finalize the international animal trade component of the veterinary law, which was drafted under FAO ECTAD support.
- Activities 5.2. Draft a joint lower Mekong sub-region surveillance proposal between Cambodia and Viet Nam.

Main challenges encountered and response provided

- The disease surveillance, early reporting and diagnostic capacities need to be further strengthened.
- The surveillance in high-risk areas and cross-border issues need to be addressed for a

improved control of the trans-boundary animal diseases which will result in better food safety and consequently improve the livelihood of smallholders.

Main progress made towards the achievement of project outcomes

- Fifteen proposals of the CAVET trainees have been translated to English and revised in a joint effort of FAO and the US CDC (Cambodia and Thailand).
- Animal health and production legislation has been drafted and is in the Council of Ministers.
- The Cambodian Zoonotic Policy has been drafted.
- Laboratory equipment has been well maintained and assessed.
- HPAI investigation and response protocol has been reviewed and will tentatively be expanded to the investigation of and response to others animal diseases.
- Requests for having two free hotlines have been granted by the Government to be used by DAHP.
- The Second Technical Consultation on HPAI Monitoring in the Lower Mckong Region was organized in Viet Nam.

Quarter II 2010

Project Monitoring Sheet: OSRO/RAS/604/USA Baby 01

Project Title: **Support to Highly Pathogenic Avian Influenza (HPAI) control programme in Cambodia**Reporting period: **April - June 2010**

Country: Cambodia
Project title: Support to Highly Pathogenic Avian Influenza (HPAI) control program in Cambodia
Code: OSRO/RAS/604/USA Baby 01
Budget: USD 1 150 000 (Phase I), USD 1 900 000 (Amendment I), USD 600 000 (Amendment II), USD 400 000 (Amendment III)
Total budget: USD 4 050 000
Effective starting date: 1 October 2006
Planned end date: 31 December 2010
Context of the project The sporadic outbreaks of Highly Pathogenic Avian Influenza (HPAI) in poultry and humans indicate that the H5N1 virus is still circulating in the country. Therefore, it is necessary to detect the outbreaks as early as possible and ensure that immediate and appropriate containment measures are taken to prevent the spread of the disease. The continued improvement of capacities and capabilities in Cambodia to prevent and control HPAI in animal population is necessary to limit its impacts in poultry sectors and minimize the risk of an infection in humans.
Objectives of the project The main objective of the project is to reduce and stop the spread of H5N1 among and between the flocks of birds in Cambodia and between Cambodia and the neighboring countries (Viet Nam, Thailand and the Lao People's Democratic Republic), thus reducing the risks of the pathogen spread to mammals and humans and of the emergence of pandemic influenza.
Planned activities Output: Surveillance activities in the cross-bordering area between Cambodia and neighbouring countries (especially Viet Nam and Thailand) strengthened. <i>Activity 1: Promote (whenever and if possible) a pre-notification system for trade purpose between Cambodia and neighboring countries.</i> <i>Activity 2: Continue active surveillance activities focusing on sentinel flocks, live bird markets (LBMs) and border inspection posts in targeted provinces following a risk assessment approach.</i> <i>Activity 3: Continue to improve the diagnosis service for poultry diseases and provide laboratory supplies to further enhance laboratory diagnostic capacity at national and regional levels in order to complete the surveillance activities.</i>

Activity 4: Continue to improve and facilitate sample dispatch from surveillance activities to national laboratory at the National Veterinary Institute (NaVRI) and in case of discovered outbreaks to national and/or regional and/or international reference laboratories.

Activities undertaken during the reporting period

Output: Surveillance activities in the cross-bordering area between Cambodia and neighbouring countries (especially Viet Nam and Thailand) strengthened.

Activity 1: Promote (whenever and if possible) a pre-notification system for trade purpose between Cambodia and neighboring countries.

- The activity is yet to be started.

Activity 2: Continue active surveillance activities focusing on sentinel flocks, live bird markets (LBMs) and border inspection posts in targeted provinces following a risk assessment approach.

- LBM surveillance of avian influenza (AI) in duck (through Letters of Agreement (LoA) with NaVRI) in eight markets of Phnom Penh (3), Takeo, Kampot, Siem Reap, Kampong Cham and Prey Veng is ongoing.
- Sentinel flock surveillance (through LoA with NaVRI) in 12 commercial duck farms of Takeo, Kampong Cham, Prey Veng, Kampot, Battambang and Sihanouk Ville is ongoing.
- All the collected swabs from the above surveillance were found negative for AI virus by egg-inoculation test and all the serum samples were negative for antibody of AI by haemagglutination (HA) and haemagglutination inhibition (HI) tests.
- Coordinated the following country activities for FAO-ASEAN H1N1 (TCP/RAS/3221 E) project:
 - A meeting was organized with participation of the Regional Project Director of TCP/RAS/3221/E, FAO-AI team and the Department of Animal Health and Production (DAHP)/NaVRI's management board on 6 May 2010 to seek an agreement from NaVRI to arrange a training programme on surveillance of animal influenza for DAHP/NaVRI's staff members. The swine influenza surveillance will use the existing AI mechanism and locations to be surveyed will be linked to AI surveillance targeted provinces, which are considered high risk provinces. The regional swine influenza principle guideline will serve as the surveillance guiding document.
 - The FAO, DAHP and Murdoch University jointly organized the training on surveillance of animal influenzas in Cambodia from 7 to 10 June 2010 at NaVRI. Six NaVRI staff and four provincial veterinarians attended the training. The training was aimed at promoting the implementation of harmonized surveillance protocols for animal influenza and at assisting in developing country-specific surveillance implementation plans.
- Coordinated the collection of weekly AI inputs from NaVRI for the UN coordination to include in AI bulletin and circulate to all concerned agencies.
- The AI Technical Working Group meeting was not organized during the reporting period because of time constraints and members' unavailability.
- FAO-AI team participated in the Information, Education and Communication meeting coordinated by the United Nations Children's Fund (UNICEF) for the Avian and Human Influenza (AHI) country programme to discuss Influenza A/H1N1 and its Knowledge, Attitude and Practices (KAP) survey and TV spots.

Activity 3: Continue to improve the diagnosis service for poultry diseases and provide laboratory supplies to further enhance laboratory diagnostic capacity at national and regional levels in order to complete the surveillance activities.

- The contract with the Center of Livestock and Agriculture Development (CelAgrid) for supplying fertilized eggs to support NaVRI for virus inoculation test is still ongoing.
- Continued to support consumable laboratory equipment to NaVRI.
- The local purchase order (LPO) of an incubator with KUANG HSIEN Medical Instrument Co, Ltd was cancelled because the company could not satisfactorily fulfil the requirement stated in the LPO. The incubator's specification has been sent to local World Vet Company for quotation.
- Ensured stability and safety of the electric system in the laboratory of NaVRI by providing the following:
 - an Auto Voltage Regulator (AVR);
 - installation of the AVR for the whole building with proper cable and connection;
 - installation of load shedding contactor; and
 - installation of new electrical line from the sub panel to the laboratory equipment.
- Procurement processes have been finalized and the project is in the process of identifying suitable suppliers.

Activity 4: Continue to improve and facilitate sample dispatch from surveillance activities to national laboratory at the National Veterinary Institute (NaVRI) and in case of discovered outbreaks to national and/or regional and/or international reference laboratories.

- The Ministry of Health (MOH) and World Health Organization (WHO) had a joint press release of the tenth AI human case, which was officially announced on 21 April 2010, after a 27 year-old man from Peam Sdey village, Prek Chrey commune, Kampong Leav district, Prey Veng province died on 17 April 2010 in Calmette Hospital.
- The investigation team of DAHP conducted disease investigation and sample collection in the village from 20 April to 23 April 2010. NaVRI reported that a sample was positive for H5N1 on 26 April 2010, and the positive sample was confirmed by the *Institut Pasteur de Cambodge* a day later. The Ministry of Agriculture Forestry and Fisheries (MAFF) officially declared (by Prakas No 144) the AI outbreak in Peam Sdey village on 27 April 2010.
- FAO assisted the investigation and culling of 209 chickens and 55 ducks in the outbreak area from 29 April to 30 April 2010.

Planned activities for the next quarter

Output: Surveillance activities in the cross-bordering area between Cambodia and neighbouring countries (especially Viet Nam and Thailand) strengthened.

Activity 1: Promote (whenever and if possible) a pre-notification system for trade purpose between Cambodia and neighboring countries.

Activity 2: Continue active surveillance activities focusing on sentinel flocks, live bird markets (LBMs) and border inspection posts in targeted provinces following a risk assessment approach.

Activity 3: Continue to improve the diagnosis service for poultry diseases and provide laboratory supplies to further enhance laboratory diagnostic capacity at national and regional

levels in order to complete the surveillance activities.

Activity 4: Continue to improve and facilitate sample dispatch from surveillance activities to national laboratory at the National Veterinary Institute (NaVRI) and in case of discovered outbreaks to national and /or regional and/or international reference laboratories.

Main challenges encountered and response provided

Additional funds need to be identified for public awareness component of the programme as this area is not funded fully by the current donors.

Main progress made towards the achievement of project outcomes

Output: Surveillance activities in the cross-bordering area between Cambodia and neighbouring countries (especially Viet Nam and Thailand) strengthened.

- Eight LBMs are being surveyed in six provinces and 960 ducks are to be sampled fortnight.
- Twelve duck commercial farms are being surveyed in six provinces and 360 identified ducks are to be sampled fortnight.
- Ten DAHP staff members (six from NaVRI and four from Takeo, Kampong Cham, Sihanoukville and Prey Veng OAHF) were trained on surveillance of animal influenza.

Quarter II 2010

Project Monitoring Sheet: **OSRO/RAS/604/USA Baby 02**

Project title: **Immediate technical assistance to strengthen the surveillance and response capacity for Highly Pathogenic Avian Influenza (HPAI)**

Reporting period: **April -June 2010**

Country: People's Republic of China
Project title: Immediate technical assistance to strengthen the surveillance and response capacity for Highly Pathogenic Avian Influenza (HPAI)
Code: OSRO/RAS/604/USA Baby 02
Budget: USD 500 000 (Phase I), USD 500 000 (Phase II), USD 650 000 (Phase III), USD 1 150 000 (Phase IV)
Total budget: USD 2 800 000
Effective starting date: November 2009
Planned end date: September 2010
Context of the project Despite efforts by the Government of the People's Republic of China to improve the surveillance and control of Highly Pathogenic Avian Influenza (HPAI), the disease is still endemic in some parts of the country, and some basic understanding about the disease and key ecological risk factors is still lacking. Vaccination has been used widely throughout the country to dampen down the infection and bring the disease under control. However, the virus is still circulating in some production systems where the implementation of the vaccination policy requires major effort and where regulation enforcement is difficult. This project was designed to improve the country's ability to detect and control HPAI infection and disease in identified high-risk ecological and production systems at an early stage, through the implementation of intensified surveillance activities, epidemiological studies, socio-economic activities, capacity building and training.
Objectives of the project The main objectives of the assistance under Phase IV of the United States Agency for International Development (USAID) project are to continue and expand the activities in southern China (Hunan and Guangxi with the addition of Yunnan Province and Chongqing Municipality during Phase III and IV) and provide technical assistance and support in the areas of HPAI epidemiological investigation, disease risk analysis and control strategy. Through project activities, a strengthened early detection and response mechanism will enable China to increase its capacity to detect and eliminate the disease in a timely manner, thereby minimizing production losses and risk to human safety. The immediate objective of the project is to improve the understanding of HPAI infection and disease distribution and to assist the country in defining high-risk areas for targeted control activities in order to minimize the risk to human health.
Planned activities (Phase IV) Output 1: Strengthened cross-sectoral coordination at the national level <i>Activity 1.1 Support national consultants to assist in coordinating project implementation with the Government.</i>

Activity 1.2 Organize regular meetings with the Ministry of Agriculture (MoA), Veterinary Bureau (VB) and Disease Investigation Center (DIC) and organize project steering committee meetings (involving MoA, VB, China Animal Health Epidemiology Center (CAHEC), National Harbin Reference Laboratory (NHRL) and provincial Center for Animal Disease Prevention and Control (CDC).

Activity 1.3 Contribute to and facilitate the coordination of surveillance and applied research activities at the wild bird/domestic poultry interface in Poyang Lake reserve including the organization of a joint meeting with State Forestry Administration (SFA), provincial veterinary and wildlife authorities to discuss, plan and coordinate field activities.

Activity 1.4 Coordination meeting with CAHEC and national CDC to improve data integration and analysis at national level.

Activity 1.5 Strengthened international cooperation with the World Organization for Animal Health (OIE) and the Food and Agriculture Organization of the United Nations (FAO) Network of Expertise on Animal Influenza (OFFLU) and other laboratory and epidemiology networks.

Activity 1.6 Organize steering committee workshop and inception workshop.

Activity 1.7 Organize an FAO HPAI team building workshop to optimize the resources, definition of tasks and responsibilities and to increase project delivery.

Activity 1.8 Organize final workshop at national level to report on the results and achievements of the Phase III and Phase IV of the project.

Activity 1.9 Organize a stakeholder meeting on FETPV.

Output 2: Strengthened HPAI disease surveillance system

Activity 2.1 Training and capacity building.

Activity 2.2 Establish a geographical information system (GIS) at the provincial level to support HPAI surveillance activities.

Activity 2.3 Procurement of necessary laboratory equipment and supplies for HPAI diagnosis, data analysis and information-sharing.

Activity 2.4 Produce the China HPAI quarterly bulletin – update on HPAI situation and analysis of surveillance results. Produce and disseminate the HPAI monthly highlight summarizing key achievements of the project on a monthly basis.

Output 3: Improved knowledge of HPAI epidemiological, ecological and socio-economic risk factors

Activity 3.1 Assist national authorities in analysing national surveillance results and provide guidance on improving national and provincial surveillance policies. Identify additional risk factors and data to be collected at local, provincial and national levels to refine HPAI risk assessment at national and provincial level in order to better advise on priority surveillance and control activities.

Activity 3.2 Strengthen the existing risk based surveillance approach through the longitudinal monitoring of selected live bird markets (LBMs) in order to identify seasonal changes in infection distribution in winter and define early warning indicators associated to HPAI emergence.

Activity 3.3 Follow-up on socio-economic studies: compile key information on poultry sector and its structure, analyse product flow along the market chains and determine the implications for disease surveillance and control issues in selected border provinces (Guangxi and Yunnan). Produce a report summarizing the main findings of the socio-economic studies performed in the provinces of Hunan, Yunnan and Guangxi, their application in risk assessment studies and the lessons learned.

Activity 3.4 Facilitate the implementation of studies at the domestic poultry/wildlife interface in Poyang Lake Reserve to uncover risk factors associated with the emergence of new virus strains and their subsequent spread.

Output 4: Improved HPAI control strategy through focused control actions

Activity 4.1 Assist national authorities in collating and organizing post-vaccination surveillance data from MoA and CAHEC for the evaluation of the nationwide vaccination surveillance campaign.

Activity 4.2 Assist in refining the strategic vision for the national vaccination campaign, provide guidance in improving the progressive control of HPAI H5N1 through vaccination and share views on defining a vaccination exit strategy.

Activity 4.3 Compile results of above-mentioned epidemiological and socio-economic studies into a final report that will present a framework for changes of national surveillance and control policy.

Activity 4.4 Using LBM survey results generated during the Phase III of the project assess biosecurity levels in LBM of the three pilot provinces, collect information on current regulations and plans for restructuring and advise national/provincial authorities accordingly.

Activities undertaken during the reporting period (April to June 2010)

Output 1: Strengthened cross-sectoral coordination at the national level

Activity 1.1 Support national consultants to assist in coordinating project implementation with the government.

- Initiate the recruitment of a national assistant training coordinator for the China Field Epidemiology Training Programme for Veterinarians (FETPV). This position was not initially planned but was deemed necessary after the Emergency Centre for Transboundary Animal Diseases (ECTAD) – China team held the FETPV stakeholder meeting in May and faced the heavy workload required to finalize the road map and preparation of training material before the launch of the FETPV program towards the end of the year. This position will be kept under the next phase of funding of the USAID project.

Activity 1.2 Organize regular meetings with MoA, VB and DIC and organize project steering committee meetings (involving MoA, VB, CAHEC, Harbin and provincial CDCs).

- The project team has maintained close contact/communication with MoA to ensure smooth implementation of the planned activities in the second quarter, i.e. LBM

surveillance, training workshops in the four project provinces/municipality and preparation for the establishment of the China FETPV.

- Continued efforts to seek feedback from the Russian Federation regarding the FAO Technical Cooperation Programme (TCP) proposal for a FAO regional project on transboundary animal diseases (TADs) surveillance, which has been endorsed already by China and Mongolia at the beginning of 2010.
- Coordinated FAO's technical activities in Mongolia related to cross-border issues:
 - Completed an Incident Response Information System (IRIS) mission to Mongolia from 8 to 14 April 2010 to help design an information system to manage surveillance, early warning and response for avian and human influenza.
 - Conducted the second FAO field mission on risk assessment to Mongolia in May/June 2010.

Activity 1.3 Contribute to and facilitate the coordination of surveillance and applied research activities at the wild bird/domestic poultry interface in Poyang Lake reserve including the organization of a joint meeting with SFA, provincial veterinary and wildlife authorities to discuss, plan and coordinate field activities.

- All the field activities have been completed. The laboratory testing is now ready to start.

Activity 1.4 Coordination meeting with CAHEC and national CDC to improve data integration and analysis at national level.

- Twenty officers/staff at the CAHEC in Qingdao attended the data integration and analysis workshop on 28 May 2010 in Qingdao, China, conducted by Marius Gilbert, veterinary epidemiologist (disease risk assessment and modeling). Participants learned the latest developments of disease modeling, which could be a powerful tool for improving animal disease control in China.

Activity 1.5 Strengthened international cooperation with OIE and FAO-OFFLU and other laboratory and epidemiology networks.

- Organized OFFLU visit to partner laboratory in China (Chongqing Municipality and Nanning/Guangxi) by the Istituto Zooprofilattico Sperimentale delle Venezie (IZSVE) – Padua/Italy in April 2010.

Activity 1.9 Organize a stakeholder meeting on FETPV.

- In close cooperation with MoA and with support from the Livestock Health and Extension Services Programme (LHESP) of Canada, the project team successfully organized a stakeholder meeting on China's FETPV in Beijing on 18 and 19 May 2010. The meeting achieved its intended purpose and identified a number of actions for the period between now and the launching of the first FETPV course in October this year, i.e. establishing a partnership network and a management and coordination mechanism to facilitate the development of the China FETPV, preparing a core curriculum and mobilizing the required technical/financial resources and support from stakeholders and donors. Sixty-five national and international participants attended the two-day meeting, representing the Chinese Government (MoA and the Ministry of Health [MoH]), national research institutions/academics and provinces/municipality project authorities, UN agencies, embassies and donors.

Output 2: Strengthened HPAI disease surveillance system and capacity building

Activity 2.1 Training and Capacity Building.

- Organized three training sessions in disease outbreak investigation and surveillance protocols in Hunan, Guangxi and Yunnan from April to June 2010. A total of 75 (28 women) veterinarians and animal health officers attended the training conducted by Drs Flavie Goutard, François Roger and Stéphanie Devaux, veterinary epidemiologists from the French Center for International Agricultural Research (CIRAD) with assistance from Ms Jia Beibei, ECTAD China veterinary epidemiologist (risk analysis).
- Organized theoretical and hands-on training in biosafety, management and test validation conducted by IZSve for the provincial laboratory staff in Chongqing (from 12 April to 16 April 2010) and in Nanning/Guangxi (from 18 April to 23 April 2010), following IZSve's visit to the laboratories in the two locations. A total of 60 veterinary officers/staff (34 women) joined the training sessions. During the training in Nanning, sequencing activity was performed in the provincial veterinary laboratory where the IZSve sequence primers and sequence SOP were shared with the participants.
- Carried out two follow-up advance training sessions in risk analysis conducted by Royal Veterinary College in London (RVC) from 17 May to 21 May 2010 in Qingdao and from 16 June to 23 June 2010 in Chongqing. The purpose was to familiarize the participants with risk analysis modeling environments and to gain expertise in conducting risk assessment systematically. A total of 47 participants (15 women) attended the training.
- Carried out an FETPV training programme assessment (by David Castellan – regional epidemiologist based at FAO/RAP) in NHRL-Harbin and CAHEC-Qingdao in April 2010 as part of FETPV roadmap implementation.
- Support two national staff to attend the regional FETPV training in Bangkok (January and June/July to August 2010).

Activity 2.2 Establish a geographical information system (GIS) at the provincial level to support HPAI surveillance activities.

- Conducted an initial training on GIS for provincial veterinary officials and staff in Chongqing from 8 June to 11 June 2010. Four veterinary staff (2 women) attended the training.

Output 3: Improved knowledge of HPAI epidemiological and ecological risk factors

Activity 3.1 Assist national authorities in analysing national surveillance results and provide guidance on improving national and provincial surveillance policies. Identify additional risk factors and data to be collected at local, provincial and national levels to refine HPAI risk assessment at national and provincial level in order to better advise on priority surveillance and control activities.

- Recruited two international consultants (veterinary epidemiology and ecology) to finalize the ongoing analysis on (i) HPAI environmental risk factors in China and (ii) role of LBM in HPAI spread to (a) review the results of the market chain analysis studies conducted in 2009 and to guide the ECTAD team in applying social network analysis (SNA) techniques in disease risk assessment and management from 18 April to 26 April 2010 and (b) provide guidance on disease risk mapping techniques and modeling. A training session was conducted on the subject at CAHEC in Qingdao from 23 May to 2 June 2010.

Activity 3.2 Strengthen existing risk based surveillance approach through the longitudinal monitoring of selected LBMs in order to identify seasonal changes in infection distribution in winter and define early warning indicators associated with HPAI emergence.

- Completed LBM surveys in Guangxi province and Chongqing municipality.

Activity 3.3 Follow-up on socio-economic studies: compile key information on poultry sector and its structure, analyse product flow along the market chains and determine the implications for disease surveillance and control issues in selected provinces (Yunnan and Hunan). Produce a report summarizing the main findings of the socio-economic studies performed in the provinces of Hunan, Yunnan and Guangxi, their application in risk assessment studies and the lessons learned.

- Plan for a poultry sector review in Yunnan and Hunan provinces is under review by MoA and faces the possibility of being cancelled.

Planned activities for the next quarter (July – September 2010)

Output 1: Strengthened cross-sectoral coordination at the national level

Activity 1.1 Support national consultants to assist in coordinating project implementation with the government.

- Recruit a national coordinator for the China FETPV.
- Recruit international expert on biosecurity on LBMs to conduct a mission to Guangxi province in July/August 2010. This mission was not originally planned but its relevance was discussed with Guangxi provincial authorities and USAID- Regional Development Mission in Asia (RDMA) delegation during their visit to China in June 2010. An expert was identified and would be available in early August 2010. If this plan suits the local authorities, this mission will be fielded using savings from other budget lines.

Activity 1.2 Organize regular meetings with MoA, Veterinary Bureau and DIC and organize project steering committee meetings (involving MoA, Veterinary Bureau, CAHEC, Harbin and provincial CDCs.)

- Regular meetings with MoA to discuss programmatic and operational matters and the objectives of Phase V.

Output 2: Strengthened HPAI disease surveillance system and capacity building

Activity 2.1 Training and capacity building.

- Implement FETPV Roadmap - finalize the curriculum and collect training material.
- Support two national staff to attend the regional FETPV training in Bangkok (January and June/July to August 2010).

Activity 2.4 Produce the China HPAI quarterly bulletin – update on HPAI situation and analysis of surveillance results. Produce and disseminate the HPAI monthly highlight summarizing key achievements of the project on a monthly basis.

- Compile information into the HPAI quarterly and monthly bulletins.
- Carry out ring trial activity in the project provinces (IZSVe).

Output 3: Improved knowledge of HPAI epidemiological and ecological risk factors

Activity 3.1 Assist national authorities in analysing national surveillance results and provide guidance on improving national and provincial surveillance policies. Identify additional risk factors and data to be collected at local, provincial and national levels to refine HPAI risk assessment at national and provincial level in order to better advise on priority surveillance and control activities.

- Share with MoA and publish the results of (1) HPAI environmental risk factors and (2) role of LBM in HPAI spread.

Output 4: Improved HPAI control strategy through focused control actions

Activity 4.3 Compile results of above-mentioned epidemiological and socio-economic studies into a final report that will present a framework for changes of national surveillance and control policy.

- Prepare the final report presenting findings of the different studies conducted in China and provide recommendations for policy changes regarding HPAI surveillance and control (achievement report from 2009 to 2010).

Main challenges encountered and responses provided

There are no major issues at present. As of 23 June 2010, overall project delivery rate was 87 percent (including hard commitments).

Main progress made towards the achievement of project outcomes

Over the period from October 2008 to June 2010, the project has made noticeable progress towards achieving the expected outputs of the project. FAO's technical assistance through the support provided by USAID, particularly the training and capacity building activities designed for and organized in the provinces have fostered a positive spirit and strengthened the relationships between FAO and the Central Government of China as well as with the provincial veterinary authorities. Some of the main achievements are:

(1) Strengthened cross-sectoral coordination and collaboration among all partners:

- increased MoA and national partners' involvement and support to the planning and implementation of field surveillance activities, reinforcing disease surveillance and disease outbreak investigation through promotion and understanding of the importance of animal epidemiology and common approach/practices in other regions and the world;
- improved project/activity planning process and increased involvement and support from the MoA and national partners, resulting in increased project delivery and better outcomes for the various inputs;
- routine functioning of the working groups and project focal points, resulting in better coordination and collaboration on HPAI at national and provincial levels;
- consolidated coordination between the MoA and SFA and among all the national partners, increased collaboration and improved relationship and trust with MoA through regular meetings;
- improved design and effective organization of HPAI studies, field missions and training activities targeting local veterinarian (provincial and prefecture levels) and laboratory staff; and
- increased networking among the Chinese project stakeholders and between the national and international project partners through introduction of knowledge/skills by international centers of excellence during training, exchange and information sharing activities supported by the project.

(2) Strengthened HPAI disease surveillance system and capacity building:

- key competencies and skills required for better HPAI detection and data analysis and the overall capacity of the provincial CDCs have been developed, providing future opportunity and collaboration with national partners during the next phase of the project;
- some changes and adaptation of provincial surveillance protocols and planning (strategy) were made in Guangxi and Hunan, following FAO trainings;
- initial success in the study around the Poyang Lake, which laid down a foundation for studies of similar nature to be carried out during the coming year;
- provincial veterinary authorities and staff learned new skills, obtained first hand data and information and gained the experience in organizing more complex LBM

survey and socio-economic studies. More locations could be included and follow these patterns;

- participants involved in the targeted surveillance activities, training workshops and studies focusing on animal epidemiology and risk analysis (LBM, cross-border socio-economic study, disease outbreak investigation, risk analysis and biosafety in laboratories) gained better understanding of the need for quality information/data for the HPAI disease surveillance system;
- MoA, national and international partners better understood and increased their interest/support for an FETPV programme in China;
- provincial laboratories and staff enhanced their capacities through additional training on laboratory protocol, exchanges with OFFLU laboratories and the provision of laboratory supplies and equipment; and
- continued efforts to involve national research/academies and international centres of excellence to help widen the horizon of the project and improve quality of training, knowledge sharing, networking and to increase the interest and participation of local veterinary authorities and staff.

(3) Contribution to improve knowledge of HPAI epidemiological, ecological and socio-economic risk factors through enhanced skills/knowledge and the overall capacity of provincial veterinary authorities and their staff, in particular:

- the concept, contents and benefits of FETPV in China;
- the role and use of GIS technology in HPAI surveillance and risk analysis;
- the skills and protocols involved in the LBM survey and importance of the studies; and
- the skills of epidemiologists in disease risk analysis and modelling techniques.

Through production of HPAI bulletins and monthly activities reports, the AI project team has shared project information with national counterparts, FAO headquarters and the donor on a regular basis.

(4) Improved HPAI control strategy through focused control actions:

- better understanding of poultry production structure and socio-economic issues for further integration into national response plan.

Project Monitoring Sheet: OSRO/RAS/604/USA Baby 03

Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) in Lao PDR

Reporting period: October 2012 to March 2013

Country: Lao People's Democratic Republic (PDR)
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) in Lao PDR
Code: OSRO/RAS/604/USA Baby 03
Budget: USD 1 000 000 (Phase I), USD 1 285 000 (Phase II), USD 900 000 (Phase III), USD 800 000 (Phase IV), USD 550 000 (Phase V), USD 372 000 (Phase VI), USD 50 000 (Phase VII)
Total budget: USD 4 957 000
Effective starting date: 1 August 2006
Planned end date: 30 September 2013
Context of the project The project assists the Government in responding to the consequences of a possible poultry disease epidemic that could not only cause serious damage to the poultry sector, but also have serious consequences in terms of human health and household livelihoods.
Objectives of the project The specific objectives of the project are to: <ul style="list-style-type: none"> • strengthen coordination and support of avian influenza (AI) control policy development; • strengthen risk-based surveillance for Highly Pathogenic Avian Influenza (HPAI) in target provinces; and • improve disease response capability.
Planned activities for the reporting period (October 2012 to March 2013) Output 1: Planning, coordination and policy support strengthened for effective management and control of HPAI and other emerging zoonoses <ul style="list-style-type: none"> • recruitment of an International Consultant on Veterinary Epidemiology, National Consultants (Project Director, Veterinary Epidemiology, National Operations Assistant, National Administrative and Finance Assistant), Driver and Cleaner; • inception workshop; • continue the monthly meetings among the AI project staff; • participate at the United States Agency for International Development (USAID) Emerging Pandemic Threats (EPT) programme review meeting planned in September 2013; • participate in the Annual Regional Emergency Management meeting in February 2013; • continue to participate in technical meetings organized by the National Emerging Infectious Diseases Coordination Office (NEIDCO) to support the multi-sectoral coordination and collaboration in the spirit of One Health; • regularly communicate and meet with the USAID Representative for Lao PDR to keep them informed of the project work plan; • continue to support veterinary epidemiology training at regional and country levels, including the Field Epidemiology Training Programme for Veterinarians (FETPV). Output 2: Risk assessment and management along the poultry supply chain strengthened <ul style="list-style-type: none"> • recruitment of an International Consultant on Veterinary Epidemiology for one month to

- provide recommendations and conduct the training course on Field epidemiology in action;
- support active surveillance in the high risk areas;
- conduct longitudinal risk-based surveillance in 3 rounds (Jan-Feb, April-May, July-August) in three high-risk districts of four selected provinces (Vientiane Capital, Vientiane Province, Luangnamtha and Oudomxay); and
- provide necessary equipment and supplies for surveillance and laboratory diagnosis.

Output 3: Strengthen laboratory capacity

- Under the EPT IDENTIFY regional project:
 - provide standardized diagnostic reagents;
 - support proficiency testing program for HPAI and other priority diseases; and
 - recruit an international consultant to evaluate the current laboratory operations and management system as well as implement standard operating procedures (SOPs) and provide in-country training.

Activities undertaken during the reporting period (October to March 2013)

Output 1: Planning, coordination and policy support strengthened for effective management and control of HPAI and other emerging zoonoses

- The inception workshop to discuss the planned activities for project implementation was conducted on 26-27 December 2012.
- The recruitment of the National Consultant was conducted from October 2012 to September 2013.
- The project's AI monthly meetings with staff to discuss technical and operational issues have continued.
- A teleconference was held on 6 January 2013 to discuss the planned activities for the HPAI project and linkages with the other ongoing projects as well as cost sharing and staff issues with the Regional Office for Asia and the Pacific (RAP).
- The National Project Director (NPD), National Consultant on Veterinary Epidemiology and National Administrative and Finance Assistant participated in the retreat workshop for staff from the Food and Agriculture Organization of the United Nations (FAO) organized by FAO Representation Office during 15-17 November 2012.
- The NPD attended the Prince Mahidol Awards Conference (PMAC) in Bangkok, Thailand from 27 January to 2 February 2013 organized by the Government of the Kingdom of Thailand, the PMAC Foundation and other international partners including USAID.
- The NPD attended a meeting on 15 February 2013 organized NEIDCO for jointly drafting the concept note for the implementation of a One Health approach to be funded by European Union.
- The NPD and National Operation Assistant attended the Good Emergency Management Practice training and Annual Regional Meeting for the Emergency Centre for Transboundary Animal Diseases (ECTAD) in Bangkok, Thailand from 26 February to 1 March 2013.
- The NPD participated in the quarterly meeting of USAID-funded EPT programme to update the work activities for FAO IDENTIFY on strengthening laboratory diagnosis. The meeting was organized by the National Centre for Laboratory and Epidemiology of Ministry of Health (NCLE).

Output 2: Risk assessment and management along the poultry supply chain strengthened

- A meeting to discuss the plan to conduct the active surveillance in the high risk areas was organized on 26-27 December 2013.
- The letter of agreement to support the field implementation of active surveillance was finalized and signed between the FAO Representation and the Directors of the Provincial Agriculture and Forestry Offices of Vientiane Capital, Vientiane, Luangnamtha and Oudomxay Provinces.
- The necessary equipment to conduct the active surveillance was ordered and distributed to the provinces on 20 February 2013.
- The reagents for testing samples were ordered and received while some items are under the procurement process.

Output 3: Strengthen laboratory capacity

- Under EPT IDENTIFY regional project:
 - The primers and probes were received on 7 March 2013.
 - Proficiency testing for porcine reproductive and respiratory syndrome (PRRS), classical swine fever, foot-and-mouth disease and other diseases were completed in December 2012.
 -

Planned activities for the next six-month period (April to September 2013)**Output 1: Planning, coordination and policy support strengthened for effective management and control of HPAI and other emerging zoonoses**

- continue the monthly meetings among the AI project staff;
- conduct the training course on field epidemiology in action for provincial staff;
- continue to participate in technical meetings organized by NEIDCO to support the multi-sectoral coordination and collaboration in the spirit of One Health;
- regularly communicate and meet with the USAID Representative for Lao PDR to keep him/her informed of the project work plan;
- continue to support veterinary epidemiology training at regional and country levels including FETPV;
- continue to participate in the development of joint activities with other partners related to the implementation of the 2011–2015 National Work Plan for Emerging Infectious Diseases (EIDs) and Public Health in Emergencies (PHEs); and
- participation of the NPD in USAID partners' meetings.

Output 2: Risk assessment and management along the poultry supply chain strengthened

- recruitment of an international consultant on veterinary epidemiology for one month to provide recommendations to conduct the training course on field epidemiology in action;
- conduct the longitudinal risk-based surveillance in four target provinces;
- provide necessary equipment and supplies for surveillance and response; and
- establish a team and network consisting of field staff trained in epidemiology (including the FETPV and FET graduates/trainees) and laboratory experts from DLF to develop and link epidemiological and virological information for risk assessment and management.

Output 3: Strengthen laboratory capacity

- Under the EPT IDENTIFY regional project:
 - recruitment of an international consultant to evaluate the current laboratory operations and management system as well as implement SOPs and provide in-country training.

Main challenges encountered and response provided

- Failure to report HPAI outbreak early and inadequate outbreak investigation are still considered to be gaps that need to be overcome in order to improve the capacity to respond to HPAI outbreak and other transboundary animal diseases. A sustainable number of staff from central, provincial and district levels had been trained in outbreak investigation and simulation exercises during Phases 2, 3, 4 and 5, and should help to address this issue.
- The limited availability of national veterinary human resources is a constraint to the absorption capacity of government services in the country.
- There is very limited local capacity to manage and analyse data. The limited capacity of an effective Epidemiology Unit at the central level and the heavy workload of the technical staff at the provincial level have exacerbated the problem. Phase 7 of the project should help to address this issue by assisting DLF to develop a human resources plan and support the recruitment of additional staff.
- Legislative support to animal health control still remains a challenge, although progress is being made in this area. Activities under Output 2 in Phase 5 and 6 of this project addressed this challenge.

Main progress made towards the achievement of project outcomes**Output 1: Planning, coordination and policy support**

- The project continued the emphasis on the control of HPAI and broadened scope of prevention, control and laboratory diagnosis to other high-impact diseases through the National Mid-Term Priority Plan for Animal Health for Lao PDR.
- The project is strengthening multi-sectoral cooperation for the prevention and control of five priority zoonoses in Lao PDR through the national work plan for EIDs and PHEs.

Output 2: Risk assessment and management along the poultry supply chain strengthened

- The provincial and district staff capabilities in conducting field surveillance and the cold chain for sample submission to the central laboratory were further improved.
- The laboratory facility of the National Animal Diagnostic centre is currently functioning.
- The implementation of longitudinal surveillance and more targeting will describe the epidemiological status as well as risk of HPAI H5N1 at the target sites, which can be utilized for planning management of HPAI prevention and control in the future.

Output 3: Strengthen laboratory capacity

- The staff at the national laboratory was trained on operations management as well as on implementation measures.

Quarter II 2010

Project Monitoring Sheet: **OSRO/RAS/604/USA Baby 03**

Project title: **Immediate technical assistance to strengthen emergency preparedness for highly pathogenic avian influenza (HPAI)**

Reporting period: **April – June 2010**

Country: Lao People's Democratic Republic
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)
Code: OSRO/RAS/604/USA Baby 03
Budget: USD 1 000 000 (Phase I), 1 284 990 (Phase II), 900 000 (Phase III), 800 000 (Phase IV)
Total budget: USD 3 984 990
Effective starting date: 1 August 2006
Planned end date: 30 October 2010
<p>Context of the project</p> <p>The project assists the Government in responding to the consequences of a possible poultry disease epidemic that could not only cause serious damage to the poultry sector, but also cause serious consequences to human health and household livelihoods.</p>
<p>Objectives of the project</p> <p>The specific objectives of the project are to:</p> <ul style="list-style-type: none"> ▪ strengthen coordination and support avian influenza (AI) control policy development; ▪ strengthen risk-based surveillance for Highly Pathogenic Avian Influenza (HPAI) in target provinces; ▪ improve disease response capability; and ▪ strengthen risk management measures, including biosecurity measures and cross-border movement.
<p>Planned activities</p> <p>Output 1: Coordinated project implementation and policy support</p> <ul style="list-style-type: none"> • request for the recruitment of the International Operation Officer as planned • continue the weekly meetings among the HPAI project staff • support the national Project Director to participate at the seventh International Ministerial Conference on Animal and Pandemic Influenza (IMCAPI) from 19 April to 21 April 2010 in Hanoi, Viet Nam. • participation of the Team Leader and the national Project Director in various international and regional meetings and workshops during the reporting period • organize information, education and communication (IEC) manuals and flipcharts training and distribution in conjunction with the implementation of village veterinary workers (VWVs) training of the World Bank (WB) project • conduct a national workshop on veterinary legislation framework in June 2010 in collaboration with the Asian Development Bank (ADB) funded regional project (OSRO/RAS/601/ASB)

Output 2: Strengthened surveillance

- continue to conduct the second round of active surveillance in nine provinces from 21 June to 3 July 2010
- finalize procurement of necessary equipment and supplies for surveillance and laboratory diagnosis for all four rounds of active surveillance
- support the national consultant on laboratory diagnosis to attend training covering quality assurances, biosafety, biosecurity and phylogenetic analysis in the Australian Animal Health Laboratory (AAHL) in Geelong, Australia from 19 to 30 April 2010
- conduct a training workshop on animal influenza surveillance in collaboration with the Food and Agriculture Organization of the United Nations (FAO) - Regional Office for Asia and the Pacific (RAP) for 14 central and provincial staff from Lao People's Democratic Republic (PDR) in May 2010

Output 3: Strengthened emergency response

- print and disseminate the standard operating procedures (SOPs) once approved by the Ministry of Agriculture and Forestry (MAF)
- conduct a simulation exercise in Phongsaly in April 2010
- finalize recruitment of an international consultant on Incident Command System (ICS)
- provide necessary equipment and supplies for outbreak response

Output 4: Strengthened risk management measures, including biosecurity improvement among the high-risk poultry populations

- organize a workshop to review the existing guidelines on biosecurity improvement at live bird markets (LBMs) and slaughter points in May 2010
- start the pilot implementation on biosecurity improvement in June 2010

Output 5: Strengthening capabilities to manage cross-border trade

- initiate recruitment of an international coordinator for cross-border activities to be responsible for organizing and supervising all cross-border activities planned for this phase of the project
- organize a scoping workshop with stakeholders in Savannakhet province to discuss and identify HPAI risk in relation with domestic poultry value chain and cross-border trade
- organize a study tour across the border of Quang Tri-Savannakhet-Mukdahan for representatives from the national and quarantine/border services of the three countries (Thailand, Viet Nam and Lao PDR) in June 2010
- conduct the tri-lateral workshop, hosted by Lao PDR, in Savannakhet province in June 2010.

Activities undertaken during the reporting period**Output 1: Coordinated project implementation and policy support**

- An international Operations Officer from FAO Viet Nam is on backstopping mission to assist in the daily operation of the project from 21 June to 13 August 2010.
- The AI weekly meetings are being held among HPAI project staff to discuss technical as well as operational issues.
- The national Project Director attended the IMCAPI in Hanoi, Viet Nam from 19 April to 21 April 2010.
- The Joint Implementation Review (JIR) of the National Avian Influenza Control and Pandemic Preparedness Plan 2006-2010 led by the WB was undertaken from 16 June to 30

June 2010. FAO was assigned as the leading agency for the review of Strategy 1 on animal health. The Team Leader and national Project Director participated in preparing the technical and financial review for Strategy 1 and attended the wrap-up meeting on the progress implementation with other collaborating partners on 30 June 2010.

- A new project secretary was recruited to replace the former staff who finished her contract on 31 March 2010. She started her assignment in the beginning of June 2010.
- The distribution of the IEC manuals and flipcharts was organized in conjunction with the implementation of VVW training of the WB project in April 2010.
- The Team Leader was in Bangkok, Thailand from 22 June to 25 June 2010 to participate in the following meetings and workshops:
 - meeting to discuss and consolidate the progress on the cross-border risk assessment works that have been conducted by Greater Mekong Subregion (GMS) member countries on 22 June 2010;
 - regional Communication Strategy Review Workshop on 23 June and 24 June 2010; and
 - meeting/discussion on the results of the cross-border studies conducted by the Royal Veterinary College on 25 June 2010.

Output 2: Strengthened surveillance

- The project conducted active surveillance in the yellow zone (3 km radius of the outbreak area) after the latest outbreak occurred in one commercial layer farm in Xaythany district, Vientiane Capital in May 2010.
- The second round of active surveillance in nine provinces (Luang Prabang, Champasack, Savannakhet, Vientiane, Vientiane, Luang Namtha, Xiengkhouang, Oudomxay and Phongsaly) was conducted from 21 June to 3 July 2010.
- The procurement of necessary equipment and supplies for surveillance and laboratory diagnosis has been finalized for all four rounds of active surveillance.
- The national consultant on laboratory diagnosis attended a training covering quality assurances, biosafety, biosecurity and phylogenetic analysis in AAHL in Geelong, Australia from 19 April to 30 April 2010.
- In collaboration with FAO RAP, a training workshop on animal influenza surveillance was conducted for 14 central and provincial staff from Lao PDR from 10 May to 14 May 2010.

Output 3: Strengthened emergency response

- A full scale simulation exercise for HPAI in Phongsaly province was carried out from 26 March to 19 April 2010.
- The printing of five SOPs on emergency response for HPAI is still awaiting MAF's approval.

Output 4: Strengthened risk management measures, including biosecurity improvement among the high-risk poultry population

- A workshop to review the existing guidelines on biosecurity improvement at LBMs and duck farms was organized in Vientiane province on 17 June and 18 June 2010.
- The LBM, slaughter points and duck farms for pilot implementation of biosecurity improvement have been identified by the Provincial Agriculture and Forestry Office (PAFO) of Oudomxay based on the criteria given by the project. Activities such as training and preliminary baseline data collection will start at the beginning of July.

Output 5: Strengthening capabilities to manage cross-border trade

- The recruitment of an international coordinator for cross-border activities is underway.
- A scoping workshop was organized in Savannakhet province to discuss and identify HPAI risk in relation with domestic poultry value chain and cross-border trade on 19 April and 20 April 2010 and attended by local authorities and other stakeholders.
- In collaboration with ADB funded regional project (OSRO/RAS/601/ASB), a study tour was conducted starting from Quang Tri in Viet Nam through Savannakhet in Lao PDR to Mukdahan in Thailand from 7 June to 9 June 2010. The representatives from Thailand, Lao PDR and Viet Nam were accompanied by FAO ECTAD officers to meet and collect information from various stakeholders at each side of the border.
- As a follow up to the study tour, a tri-lateral cross-border zonal workshop was conducted in Kaysone, Savannakhet province on 10 June and 11 June 2010 to assess the risk of the spread of HPAI along the eastern section of the East-West Economic Corridor (EWEC) of the Greater Mekong Sub-region that includes provinces of Quang Tri (Viet Nam), Savannakhet (Lao PDR) and Mukdahan (Thailand).

Planned activities for the next quarter

Output 1: Coordinated project implementation and policy support

- continue the weekly meetings among the HPAI project staff
- conduct a national workshop on veterinary legislation framework on 22 July and 23 July 2010 in collaboration with the ADB funded regional project (OSRO/RAS/601/ASB)
- support two bilateral meetings with Thailand and Viet Nam, planned to be conducted in August 2010
- participation of Team Leader and the national Project Director in the USAID Partners' Meeting in September 2010

Output 2: Strengthened surveillance

- continue to conduct the third round of active surveillance in nine provinces from 30 August to 12 September 2010
- procure and distribute the laboratory equipment and supplies as per recommendations of the short-term international laboratory consultant to the central laboratory and two provincial laboratories in Luang Prabang and Champasack as planned
- initiate preparation and discussion with Kon Khaen University, Thailand to provide the Field Veterinary Epidemiology in Action training course for ten Lao staff comprised of central and provincial government officers and lecturers from Nabong Agricultural College
- conduct training on risk assessment for disease control from 8 August to 11 August 2010
- conduct training for laboratory staff to improve HPAI capacity at the provincial level in August 2010
- conduct a cross sectional study in pig population in four provinces (Vientiane Capital, Luang Prabang, Savannakhet and Champasack) and syndromic surveillance in two provinces (Bolikhamsay and Khammouane) from July to August 2010 in collaboration with the FAO TCP project on H1N1

Output 3: Strengthened emergency response

- conduct training courses for outbreak investigation and response for PAFO and District Agriculture and Forestry Office (DAFO) staff in the provinces of Champasack and Xiengkhouang in September 2010
- train the recruited international consultant on Incident Command System (ICS) from 6 September to 24 September 2010

- conduct training on ICS in September 2010
- provide necessary equipment and supplies for outbreak response

Output 4: Strengthened risk management measures, including biosecurity improvement among the high-risk poultry populations

- start the pilot implementation on biosecurity improvement at selected LBMs and duck farms, as per reviewed guidelines, in Oudomxay province in July 2010
- conduct the first activity relating to the pilot implementation on biosecurity improvement to provide training on biosecurity for PAFO and DAFO officers from 6 July to 8 July 2010
- conduct a preliminary participatory survey to collect baseline information to determine present conditions on the LBMs and duck farms by the country team together with the PAFO Oudomxay staff from 6 July to 8 July 2010
- conduct a follow up activity on training for market vendors, cullers/slaughterers and duck farmers in July 2010
- conduct the monitoring of pilot activities by the project staff together with PAFO/DAFO staff on monthly basis to follow up on the progress of the biosecurity improvement at the LBMs and duck farms in Oudomxay province

Output 5: Strengthening capabilities to manage cross-border trade

- finalize the recruitment of an international coordinator for cross-border activities in charge of the organization and supervision of all cross-border activities planned for Phase IV of the project
- conduct a socio-economic workshop on cross-border trade in Luang Prabang on 18 August and 19 August 2010 in collaboration with the ADB funded regional project (OSR/RAS/601/ASB)

Main challenges encountered and response provided

- Failure to report HPAI outbreak early and insufficient outbreak investigation are still gaps that need to be overcome in order to improve the capacity to respond to HPAI outbreak and other transboundary animal diseases (TAD).
- The limited availability of national veterinary human resources is a constraint to the absorption capacity of the government services in the country. The activities carried out under Output 2 of the Phase III of this project have addressed some of the capacity building needed.
- For some time, the project used village chiefs and village veterinary workers as key contacts in conveying messages to poultry keepers. It is therefore essential that further training be carried out.
- There are gaps in knowledge on the process by which H5N1 virus enters Lao PDR and how it remains and spreads within the country due to insufficient outbreak investigation. More evidence is being gathered through active surveillance, but this needs to be reinforced by the specific socio-economic studies planned on cross-border movements and value chains.
- There is a very limited local capacity to manage and analyse data. The absence of an effective epidemiology unit at the central level and the heavy workload of the technical staff at the provincial level have exacerbated the problem. Phase IV of the project should help to address this issue.
- Legislative support to animal health control still remains a challenge - although progress is being made in this area.

Main progress made towards the achievement of project outcomes**Output 1: Coordinated project implementation and policy support**

- The project team revised further the work plan for 2010 and reached an agreement on the schedule of implementation of the work plan.
- The draft of sub-laws/decrees under the new Law on Livestock and Animal Health Matters has been developed and finalized.
- The National Animal Health Roadmap for Lao PDR has been drafted based on the inputs from the veterinary services staff.
- The HPAI prevention and control programme is incorporated into Strategy 1 of the National Avian Influenza Control and Pandemic Preparedness Plan 2006-2010 and will be further developed and expanded for the next five years.

Output 2: Strengthened surveillance

- The LoAs for four rounds of active surveillance during Phase IV were signed between the project and the nine provinces.
- The new design of risk-based active surveillance which incorporated the spatial and temporal distribution of HPAI has been finalized, and the first and second rounds have been conducted in nine provinces.
- The global positioning system (GPS) tools provided by the project have been utilized for recording the geo-coordinates of the active surveillance sites.
- The refresher training on TADinfo has supported the active surveillance data management system at central and four pilot provinces.
- The central and provincial laboratories' capabilities in animal virus influenza diagnosis were improved.

Output 3: Strengthened emergency response

- SOPs have been completed and are ready to be used for control zones, culling method, disease investigation in backyard poultry and commercial poultry farms and sample collection.

Output 4: Strengthened risk management measures, including biosecurity improvement among the high-risk poultry populations

- Practical biosecurity guidelines for LBMs, slaughter point and duck farms was developed with regard to the local situation. This will be used as operational guidance for pilot implementation in Oudomxay province.

Output 5: Strengthening capabilities to manage cross-border trade

- Cross-border trade flows and their links to domestic poultry value chain were mapped and documented for selected borders, such as with China (Luang Namtha and Oudomxay) and with Thailand and Viet Nam (Savannakhet).

Project Monitoring Sheet: **OSRO/RAS/604/USA Baby 05**

Project title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)**

Reporting period: **October 2012 to March 2013**

<p>Regional Component: Southeast Asia Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) Code: OSRO/RAS/604/USA Baby 05</p>
<p>Budget: USD 600 000 (Phase I), USD 1 435 000 (Phase II), USD 1 172 700 (Phase III), USD 937 800 (Phase IV), USD 1 000 000 (Phase V), USD 30 667 (from Mongolia Balance) USD 1 192 500 (Phase VI); USD 830 000 (Phase VII) Total budget: USD 7 198 667</p>
<p>Effective starting date: 1 August 2006</p>
<p>Planned end date: 30 September 2013</p>
<p>Context of the project The Highly Pathogenic Avian Influenza (HPAI) epidemic, caused by H5N1 viruses, began in late 2003 and in early 2004 in Asia and Southeast Asia and spread to many countries in the region. The effects were particularly severe in Indonesia, Thailand and Viet Nam, which saw widespread outbreaks in poultry and also human cases of H5N1 infection. The Food and Agriculture Organization of the United Nations (FAO), through its Emergency Centre for Transboundary Animal Diseases (ECTAD), established a decentralized unit in Bangkok, Thailand, located in the Regional Office for Asia and the Pacific (RAP), to provide technical backstopping for countries in the Asia and the Pacific region that were experiencing outbreaks of the infection or were at risk of it. ECTAD RAP was supported through a preliminary, regional project (OSRO/RAS/505/USA) funded by the United States Agency for International Development (USAID). This support has continued under FAO's present project.</p>
<p>Objectives of the project The objective of this regional component is to coordinate project activities with the target countries and also to ensure continuity from the previous project (OSRO/RAS/505/USA) to the current one. The project also aims to strengthen regional level cross-sectoral coordination and communication for HPAI control.</p>
<p>Planned activities for the reporting period (October 2012 to March 2013)</p> <p>Output 1: Strengthened cross-sectoral coordination at regional level</p> <ul style="list-style-type: none"> • continue to provide technical and operational inputs to country-level projects in collaboration with country teams; • continue to provide technical inputs, resource persons or training support to the activities related to the existing regional HPAI Control Framework for the Association of South East Asian Nations (ASEAN), existing network systems or regional coordination mechanism related to HPAI and animal disease control; • continue to coordinate and collaborate with other agencies on activities related to HPAI control; and • continue to provide technical inputs to support the activities of the USAID Emerging Pandemic Threats (EPT) programme, which are conducted by various partners as well as the EPT+ programme.

Output 2: Strengthened regional and national human resources in the field of veterinary epidemiology

- continue activities to implement the Regional (Field Epidemiology Training Programme for Veterinarians) FETPV programme, including the seeking of additional support for the programme through other potential partners; and
- continue to provide support to the development of the China FETPV as well as related training programmes in Cambodia, Lao People's Democratic Republic (PDR) and South Asia.

Output 3: Strengthened coordination of the epidemiology and laboratory networks

- continue to support the implementation of the Emergency Prevention System (EMPRES)-i Asia to share expertise and information in a real-time manner across the network through meetings, workshops and online communication;
- provide coordination, in collaboration with other regional projects implemented by FAO, to strengthen existing epidemiology and laboratory networks, as well as the epidemiology consortium; and
- continue to provide support for sample submission from Member States to international reference laboratories.

Output 4: Strengthened coordination of cross-border risk assessment and management for HPAI transmission

- support dialogue between or among Member States on cross-border cooperation and collaboration in the management of critical control points in key regional corridors.

Output 5: Established regional emergency response services

- continue to provide technical and operational assistance to Member States to contain the HPAI outbreaks in their respective countries.

Activities undertaken during reporting period (October 2012 – March 2013)

Output 1: Strengthened cross-sectoral coordination at regional level

- The ECTAD team continued to provide technical and operational inputs to country-level projects in collaboration with country teams:
 - The Regional Coordinator (RC) participated in the meeting between the delegation of the USAID Bureau for Global Health, Washington, USA and the Minister for the Ministry of Livestock and Fisheries from 24 to 25 October 2012 to discuss ongoing activities and future USAID support related to animal health and emerging infectious disease prevention and control.
 - The RC and the Regional Operation Officer visited Lao PDR from 29 to 30 October 2012 to assess the progress of the relocation of the National Animal Health Center (NAHC) Laboratory and to discuss activities related to the IDENTIFY project. The workplan, activities and budget of the USAID-funded HPAI project, as well as a new management structure for ECTAD-Laos, in the context of the departure of the International ECTAD Country Team Leader for Lao PDR, were discussed with the national team. Currently, the RC is providing technical backstopping to the USAID funded project in Lao PDR;
- The RC visited the ASEAN Secretariat Office in Jakarta, Indonesia from 12 to 14 November 2012 together with the coordinator of the Regional Support Unit (RSU) for ASEAN under the European Union (EU)-funded project to (i) support the activities related to the control of highly pathogenic emerging diseases; (ii) discuss the progress

of ongoing activities related to the existing regional HPAI Control Framework for ASEAN and existing network systems or regional coordination mechanisms related to HPAI and animal disease control; and (iii) seek their support for the implementation of relevant project activities for the year 2013.

- The ECTAD team participated in FAO-World Organisation for Animal Health (OIE)-World Health Organization (WHO) tripartite events to strengthen collaboration and coordination among the three organizations. The tripartite events included teleconferences and the following meeting:
 - “The Third Regional Workshop on Multi-Sectoral Collaboration on Zoonoses Prevention and Control” was held from 26 to 28 November 2012 in Bali, Indonesia. The meeting was organized under the financial support of the EU Highly Pathogenic and Emerging and Re-emerging Diseases project with the aim to ensure the adoption of a One Health approach and promote collaboration among all relevant sectors.
- The Seventh Annual Regional ECTAD Meeting (AREM) was held from 27 to 28 February and on 1 March 2013 in Bangkok, Thailand to review the H5N1 situation and the rapid spread and dominance of clade 2.3.2.1 and other co-circulating and interrelated influenza viruses (e.g. H9N2) in Asia as well as its implications for control and eradication of HPAI in the region and how to further broaden the ECTAD agenda from HPAI to One Health at the country level.
- The ECTAD team coordinated and facilitated the participation of national animal health authorities to the Prince Mahidol Award Conference (PMAC 2013) or One Health Congress 2, which was an annual international conference hosted by the Royal Thai Government, the Prince Mahidol Award Foundation and other international organizations and foundations. The main objective of the Conference was to foster cooperation and communication across sectors and borders at the country, regional and global level to combat the threat of infectious diseases, existing or emerging, at the human-animal ecosystems interface. The Conference was held in Bangkok, Thailand from 31 January to 2 February 2013 and included 5 plenary sessions and 21 parallel sessions. The ECTAD team also provided technical inputs to the PMAC 2013 by serving as speakers and moderators of the parallel sessions.
- The ECTAD team provided technical inputs to support the activities of the USAID EPT and EPT+ programmes. Specifically,
 - The RC and the Regional Laboratory Coordinator attended and provided inputs to the USAID-Avian and Pandemic Influenza (API) Partnership Meeting organized in Viet Nam on 9 October 2012. Objectives of the meeting were to review the USAID API Partners’ programme deliverables for the period of October 2012- September 2013 and to address coordination and communication plans and needs among the partners as well as EPT partners in Viet Nam.
 - The RC, ECTAD Animal Health Economists and the ECTAD Country Team in Myanmar participated in a Joint USAID-Australian Agency for International Development (AusAID)-FAO mission to introduce the PREVENT/EPT programme to support HPAI risk communication in Myanmar. In addition, the RC and the Country Team are providing technical and logistics support to PREVENT to organize the Consultative Workshop on HPAI Risk Communication in Myanmar; a scoping mission is to be organized during the week of 26-29 March 2013.
 - The ECTAD team provided technical and operational inputs to the organization of the IDENTIFY Inter-Regional Meeting from 4 to 6 March 2013 in Bangkok, Thailand. The objectives of the meeting were to review the activities and

progress of IDENTIFY in the Asian and African regions, to discuss specific technical and strategic issues implemented under IDENTIFY in both/each region(s) and attempt to develop a common approach/understanding on these technical issues.

- The ECTAD team provided technical and operational inputs to country projects, in collaboration with FAO country teams and national counterparts, for the following activities:
 - recruitment of international consultants;
 - procurement of equipment and supplies;
 - issuance of contracts to conduct field activities/research; and
 - provision of clearance to technical reports prepared by staff of ECTAD Country Teams or by consultants recruited for various project activities.

Output 2: Strengthened regional and national human resources in epidemiology through regional FETPV

- The Regional Veterinary Epidemiologist (RVE), the RC and the ECTAD team continued to work closely with the Thai Department of Livestock Development (DLD) on activities related to FETPV. These included:
 - serving as regional programme mentors to the trainees from China and Myanmar;
 - attending and providing technical inputs to the Workshop on Scientific Writing in Field Epidemiology; and
 - continuing to seek additional support for the programme and finalize the modality including the collaboration with the Faculty of Veterinary Medicine at Chiang Mai University (Thailand), the Animal Population Health Institute of the College of Veterinary Medicine and Biomedical Sciences at Colorado State University (USA) and the Center of Veterinary Public Health of the College of Veterinary Medicine at the University of Minnesota (USA).
- The RVE continued to provide support to the development of the China FETPV and India FETPV, as well as related training programmes in Cambodia. The activities included:
 - conducting missions to China in March 2013 to provide technical inputs for the FETPV-Executive Meeting with 24 Provincial Director-Generals and to advocate for sustainable sub-national implementation of the FETPV in China; and
 - providing technical support to the short course *Veterinary field epidemiology in action* which was conducted for 19 veterinarians from Bhutan, India, Nepal, Pakistan and Sri Lanka from 26 November to 14 December 2012 in Kathmandu.

Output 3: Strengthened coordination of epidemiology and laboratory networks

- The ECTAD team continued to provide technical inputs and coordination, in collaboration with other regional projects implemented by FAO, to strengthen existing epidemiology and laboratory networks. This included:
 - A Consultative Meeting of the Epidemiology Consortium for Emerging Zoonotic and TAD Control in Asia, which is part of the activities to support the regional epidemiology networking, was held on 28 January 2013 as a part of preconference activities of the PMAC 2013. Objectives of the meeting were to (i) update participants on consortium activities related to capacity building, information sharing, research and knowledge utilization themes using a *One Health* approach; and (ii) define roles and responsibilities, including activities

that are most relevant and serve the needs of the member countries within the region of Asia and the Pacific.

- The Fourth Laboratory Directors' Forum was co-organized by FAO, OIE and Department of Animal Health (DAH), Viet Nam from 10 to 11 October 2012. The main objectives of the meeting were to update the laboratory directors on the ongoing activities related to laboratory policies, laboratory capacity building activities and laboratory networking in Southeast Asia. The Forum agreed that the outputs of this meeting would be reported to the ASEAN Sectoral Working Group on Livestock (ASWGL) by the representative from Viet Nam. The Forum also agreed that the ASEAN Secretariat be consulted on the potential mechanism for linking this Forum with an ASEAN mechanism through the recently endorsed Regional Strategic Framework for Laboratory Capacity Building and Networking in Southeast Asia.
- The ECTAD team continued to provide technical inputs to the disease tracking system EMPRES-i Asia and information sharing via the Transboundary Animal Disease Network Asia email circulation.

Output 4: Conducting risk assessment for HPAI transmission through cross-border poultry trade

- The ECTAD team, particularly the Regional Animal Health Economist, participated in and provided inputs to the bilateral meeting between Cambodia and Viet Nam organized in Hanoi 20 and 22 January 2013. The meeting was held to discuss and agree on the integrated HPAI monitoring programme across the Cambodia-Viet Nam border in the lower Mekong delta.

Output 5: Established regional emergency response services

- The RVE conducted two missions to Cambodia from February to March 2013 to conduct a multi-disciplinary field risk assessment of recent outbreaks involving nine human cases. The team included the RVE, the Regional Animal Health Economist, a communications expert and the Regional Coordination Expert who provided inputs to the partners and to the donor coordination meeting.

Planned activities for the next six-month period (April – September 2013)

Output 1: Strengthened cross-sectoral coordination at regional level

- continue to provide technical and operational inputs to country-level projects in collaboration with country teams;
- continue to provide technical inputs, resource persons or training support to the activities related to existing regional HPAI Control Framework for ASEAN, existing network systems or regional coordination mechanism related to HPAI and animal disease control;
- continue to coordinate and collaborate with other agencies on activities related to HPAI control; and
- continue to provide technical inputs to support the activities of the EPT+ project as well as the other USAID EPT components implemented by various partners.

Output 2: Strengthened regional and national human resources in the field of veterinary epidemiology

- continue activities to implement the Regional FETPV programme, including the seeking of additional support for the programme through other potential partners; and

- continue to provide support to the development of field epidemiology related training programmes in Cambodia, Lao PDR and South Asia.

Output 3: Strengthened coordination of the epidemiology and laboratory networks

- continue to support the implementation of EMPRES-i Asia to share expertise and information in a real-time manner across the network through meetings, workshops and online communication;
- provide coordination, in collaboration with other regional projects implemented by FAO, to strengthen existing epidemiology and laboratory networks, as well as the epidemiology consortium; and
- continue to provide support for sample submission from Member States to international reference laboratories.

Output 4: Strengthened coordination of cross-border risk assessment and management for HPAI transmission

- support the dialogue between or among Member States on cross-border cooperation and collaboration in the management of critical control points in key regional corridors

Output 5: Established regional emergency response services

- continue to provide technical and operational assistance to Member States to contain the HPAI outbreaks in their respective countries.

Main challenges encountered and response provided

- No major challenges were encountered during the reporting period.

Progress made towards the achievement of project outcomes (from the start of activities)

Output 1: Strengthened cross-sectoral coordination at regional level

- Coordination and collaboration between FAO and other international organizations and agencies were strengthened and continued. Engagement was strengthened with ASEAN through the adoption of strategies jointly developed by Member States and FAO. Coordination has been well established between the projects funded by USAID and the projects funded by other donors. Success stories and lessons learnt from HPAI can be used to further broaden the scope of action to prevention and control of TADs and emerging infectious diseases (EIDs) using a *One Health* approach at the regional and country levels.

Output 2: Strengthened regional and national human resources in epidemiology through regional FETPV

- The FETPV continued smoothly with additional collaborations at the national and international levels and approved joint funding for the programme. ASEAN Member States recognized the importance of integrating veterinary epidemiology activities in the national veterinary services and noted the fact that the Thai DLD has been hosting the Regional FETPV since 2009. Capacity building in the field of epidemiology has been included as one of the main components of the draft Regional Strategies for Veterinary Epidemiology Capacity Development and Networking to be considered for endorsement by ASWGL in their next meeting.
- There have been two graduating cohorts, in 2011 and 2012, consisting of 13 veterinary graduates. One hundred and thirty-four veterinarians from 11 countries were trained through the short course - *Veterinary Field Epidemiology in Action*. Eight training

modules, an FETPV trainee manual and four structured case studies were developed and used for the training. A total of 44 epidemiology reports (13 surveillance, 18 outbreak investigations and 13 field epidemiology studies) were developed and some of these reports were presented at international conferences including the Training Programs in Epidemiology and Public Health Interventions Network (TEPHINET), European Scientific Conference on Applied Infectious Disease Epidemiology (ESCAIDE), the Conference of Research Workers in Animal Diseases (CRWAD) and the Melbourne *One Health* Conference.

Output 3: Strengthened coordination of the epidemiology and laboratory networks

- The Strategic Framework for Regional Laboratory Networks for Southeast Asia was endorsed by the ASEAN Working Group on Livestock. The international partners for the regional laboratory network in Southeast Asia were recognized by the Member States as the Technical Advisory Group. The Laboratory Directors' Forum has been used to advocate for the progression of ongoing activities to gain more support at the policy level.

Output 4: Conducting risk assessment for HPAI transmission through cross-border poultry trade

- A coordinated effort has been launched to develop cross-border collaboration between China and Viet Nam, and Cambodia and Viet Nam.

Quarter II 2010

Project Monitoring Sheet: **OSRO/RAS/604/USA Baby 06**

Project title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) to Viet Nam**

Reporting period: **April to June 2010¹**

Country: Viet Nam
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) to Viet Nam
Code: OSRO/RAS/604/USA Baby 06
Budget: USD 2 million (Phase I), USD 3.1 million (Phase II), USD 3.3 million (Phase III), USD 1.075 million (cost extension) ²
Total budget: USD 9.475 million
Effective starting date: August 2006
Planned end date: September 2010
Context of the project
The control and elimination of H5N1 Highly Pathogenic Avian Influenza (HPAI) demands a long-term approach. Viet Nam is moving from the control phase to the consolidation phase, with an ongoing need for capacity building in the veterinary services and livestock production sectors and support for vaccination and other risk reduction measures. This regional project supported by the United States Agency for International Development (USAID) is currently in its third year of implementation.
Objectives of the project
The overall objective of the project is to address the urgent short-term actions that need to be undertaken by the countries in the region to strengthen their capacities to rapidly detect the introduction of HPAI into the country and minimize its spread in case of its occurrence.
Planned activities
Component 1: Preparedness and Planning Component
Output 1: Strategy development for HPAI control in 2006-2010 supported
<i>Activity 1.1: Pandemic preparedness plan review</i>
<ul style="list-style-type: none"> • hold consultative meetings with the Department of Animal Health (DAH) and the World Health Organisation (WHO) on the feasibility of reviewing the animal health component unilaterally
<i>Activity 1.2: Contingency plan for animal disease outbreak</i>
<ul style="list-style-type: none"> • revise this activity within the project work plan, as both the Food and Agriculture Organization of the United Nations (FAO) and DAH made a recommendation to review the HPAI contingency plan and shape it into an Animal Disease Emergency Preparedness Plan in view of the Operational Strategy described in the Green Book

¹ Quarter 5 of the Project Cycle.

² Project Cost Extension Request from October 2009 to September 2010.

Activity 1.3: National HPAI control strategy review

- following the presentation of the Green Book mid-term review on 8 March 2010 by the Government of Viet Nam (GoVN), there is a probability that the Green Book will be replaced with a 'Blue Book' delineating further strategy for HPAI control covering the period from 2011 to 2015. FAO will wait for GoVN decision before planning further actions

Output 2: Coordination and communication with donors and other HPAI implementing partners*Activity 2.1: Core FAO Viet Nam team supported*

- extend and renew contracts of the current personnel as and when necessary
- continue the coordination and planning meetings with all stakeholders

Activity 2.2: Annual project meetings supported

- not planned for this quarter

Activity 2.3: Provincial to national level team meetings supported

- hold the field quarterly reporting meeting during the second quarter of 2010

Component 2: Animal Surveillance Component**Output 3: Animal surveillance at the national, district and community level enhanced***Activity 3.1: Strengthening of veterinary laboratories, specifically biosafety and quality assurance supported*

- continue providing technical inputs by national and international laboratory experts
- continue to provide support to the LabNet server and tele-hosting maintenance
- organize the maintenance of the laboratory equipment
- hold LabNet workshop from 11 May to 13 May 2010 in Hochiminh City (HCMC)
- support and coordinate the Regional Office for Asia and the Pacific (RAP) sponsored/organized training workshop on Animal Health Influenza Surveillance to be held in HCMC in April 2010

Activity 3.2: Strengthening of core capacities for animal health in five focus provinces, including surveillance activities supported

- continue providing technical inputs by national and international experts
- continue support for field activities.
- monitor the implementation of the passive surveillance programme
- a letter of agreement (LoA) with the Department of Animal Health (DAH) on the implementation of risk-based active surveillance will be prepared in April 2010
- continue providing stickers and calendars to veterinary medicine shops for distribution to farmers
- airing of TV commercials on local TV channels in each pilot province as planned (ongoing activity until the end of the project)
- monitor the LoA with the Rural Development Centre (RUDEC) on the cost-effectiveness study on surveillance
- final review of Standard Operating Procedures (SOPs) for outbreak investigation and response is planned in July 2010

Activity 3.3: Further development of Monitoring and Evaluation (M&E) expertise in animal health

- organize a joint FAO-Abt Associates monitoring and evaluation (M&E) one-day training workshop in April 2010 targeting provincial coordinators, focal points in pilot provinces, Abt Associates staff and Provincial Department of Preventive Medicine on the main topics such as general M&E principles and the USAID Project Management Plan (PMP)

Activity 3.4: Veterinary epidemiology network supported

- continue to provide support to TADinfo
- continue supporting Applied Veterinary Epidemiology Training Programme (AVET) coordination and activities. The second AVET training is planned to start on 10 May 2010. Trainees of this second AVET course will be selected in particular from SDAH of the project's (OSRO/RAS/604/USA Baby 06) ten pilot provinces for Year II and Year III
- prepare tentative schedule for the two other AVET training courses to be conducted in September 2010

Output 4: Priority procurement for animal surveillance and laboratory supported

Activity 4.1: Procurement and maintenance

- support lab equipment maintenance

Component 3: Animal Response Component

Output 5: Effective and timely animal response efforts promoted

Activity 5.1: Updating HPAI risk mapping at national level

- coordinate with the Risk Assessment Working Group (RAWG) on an approach to updating risk mapping for HPAI

Activity 5.2: Outbreak investigation capacity strengthened in five focus provinces

- coordinate the field teams and plan field visits to pilot provinces if suspicious cases are reported and if outbreak occurs
- continue providing support for the enhanced reporting and strengthened outbreak investigation and response

Activity 5.3: Capacity building for use of Standard Operating Procedures (SOPs) for response and investigation with linkage to human health activities

- the draft version of SOP for Outbreak Investigation and Outbreak Response to be tested and used under real conditions by the trained Regional Animal Health Office (RAHO), Sub-Department of Animal Health (SDAH) and District Veterinary Services (DVS) staff of the five pilot provinces; collect and consolidate their comments and feedback for the final review of these SOPs (planned in July 2010)
- identify field linkages with WHO with respect to human and animal health protocols

Activity 5.4: Cross border analysis using a value chain methodology, undertaken in three border areas

- review market risk analysis study (FAO-Royal Veterinary College (RVC)-DAH from OSRO/VIE/701/UNJ Project), risk assessment of market chain in Kien Giang and risk analysis work carried out by Abt Associates
- develop work plans for risk mitigation measures in the pilot poultry markets (Dong Ha Central market and Phu Ly Central market) through a stakeholder approach

Activity 5.5: Vaccine efficacy monitoring and virus surveillance supported at national level

- have DAH submit and finalize the report by May 2010 with the analysis of the data of the second round of 2009 post-vaccination monitoring and virus circulation surveillance programme for Influenza A/H5N1
- sign a new LoA with DAH for the first round of 2010 for post-vaccination monitoring and virus circulation surveillance
- review and finalize the report on vaccine efficacy trials

Activity carried over from Year II: vaccine inventory system

- finalize the development of a pilot excel spreadsheet-based system

Output 6: Improved bio-security practices in commercial and scavenging poultry raising settings supported*Activity 6.1: Support biosecurity strengthening in five pilot provinces*

- document an approach to hatchery registration based on experiences in the Can Tho district trial and launch a hatchery registration and mapping exercise in the remaining four provinces
- complete provincial profiling for future risk analysis assessment in Ha Nam and Can Tho using existing data and conclude with a series of stakeholder meetings and participatory mapping exercises
- conduct a risk analysis exercise for Region 7 including provincial risk analyses exercises for Can Tho and Kien Giang Provinces and pilot a regional approach to risk analysis, building capacity at the provincial level to carry-out risk assessments. The risk analysis exercise will utilize provincial profiles to develop a regional poultry profile. Outcomes of the risk analysis exercise will support strategic approaches and plans for vaccine, surveillance and other control measures within the region.
- commence implementation of monthly poultry commodity price monitoring in all five pilot provinces

Activity 6.2: Develop biosecurity guidelines and training for DAH and DLP

- develop a biosecurity training programme in the pilot provinces which will consist of the following three elements: (i) training for district level DAH and extension officers on biosecurity using a training module developed by FAO; (ii) training programme for private sector agri-vet store owners and vet pharmacies (those who advise commercial poultry farmers); and (iii) stakeholder *Field School like approach* which will develop and test biosecurity interventions at the farm level to ensure pilot approaches are effective and adopted by farmers
- continue to provide support to the Biosecurity Working Group through technical meetings and dissemination of documents
- provide technical biosecurity advice to partners
- consolidate the database of biosecurity materials
- carry out a review of biosecurity activities and provincial programmes to determine the nature of the activities that have been effective and the reasons for their effectiveness in order to support provinces in developing strategic approaches to biosecurity strengthening and good practices and lessons learned for biosecurity activities

Activity 6.3: Stakeholder review of biosecurity strengthening activities

- no planned activities for this quarter

Component 4: Communications Component

Output 7: Communication capacity supported at DAH and technical inputs to communications activities of other USAID implementing partners are provided

Activity 7.1: Support national communications officers

- continue to translate and disseminate the Disease Outbreak Update Report

Activity 7.2: Technical support for training and other materials for Animal Health Workers (AHWs) and Animal Extension Workers (AEWs)

- liaise with DAH and assess the need for technical and or financial support for the development and the production of a DAH bulletin
- compile all behavior change communication (BCC) material produced and transmit hard and /or soft copy to Abt Associates as requested by the BCC Working Group
- pilot a public-private sector model for the delivery of poultry farmer extension information

Activities undertaken during the reporting period

Component 1: Preparedness and Planning Component

Output 1: Strategy development for HPAI control in 2006-2010 supported

Activity 1.1: Pandemic preparedness plan review

Activity 1.2: Contingency plan for animal disease outbreak

- A meeting was held between FAO, WHO and DAH on 17 May 2010 followed by another meeting with FAO and DAH on 24 June 2010. One of the conclusions of this meeting was to revise Activity 1.1 and Activity 1.2 and to review the HPAI contingency plan, prepare a status paper on the strength and weaknesses of the current plan and shape it into Animal Disease Emergency Preparedness Plan. This approach would identify the national priorities, the gaps in capacity and an incident command system in the event of an unforeseen animal disease emergency. The proposed plan would be adopted under the upcoming cost-extension request.

Activity 1.3: National HPAI control strategy review

- FAO attended a meeting organized by the International Cooperation Department/Ministry of Agriculture and Rural Development (ICD/MARD) and Partnership for Avian and Human Influenza (PAHI), which was also attended by representatives of other UN agencies and international donors. The Government is still contemplating whether to develop a new plan or revise the existing plan in order to continue with the Avian and Pandemic Influenza (API) programme, possibly with a slightly larger focus to include other diseases threats emerging in human - animal ecosystem interface.

Output 2: Coordination and communication with donors and other HPAI implementing partners

Activity 2.1: Core FAO Viet Nam team supported

- The funding of core project staff has been extended.
- Regular meetings were held with DAH and the Department of Livestock Production (DLP) in MARD, USAID in Viet Nam, WHO and Abt Associates for coordination and planning of activities.

Activity 2.2: Annual project meetings supported

- The field quarterly reporting meeting did not take place as a result of the many field activities being implemented. However, submission of reports and regular interaction and feedback from the field has taken place.
- A joint mission was organized by Abt Associates and FAO with DAH in Hung Yen province on 14 May 2010 for monitoring projects activities and improving the coordination at the provincial level.

Activity 2.3: Provincial to national level team meetings

- The FAO and Abt Associates joint training workshop on monitoring and evaluation of USAID HPAI programs in Viet Nam was conducted on 16 April 2010 in Hanoi (refer to Activity 3.3).

Component 2: Animal Surveillance Component

Output 3: Animal surveillance at the national, district and community level enhanced

Activity 3.1: Strengthening of veterinary laboratories, specifically biosafety and quality assurance supported

- National and international laboratory continued to provide technical inputs.
- The project continued to provide support to LabNet server and tele-hosting maintenance.
- The LabNet Workshop review of the work carried out during last six months by the National Center for Veterinary Diagnosis (NCVD) and seven RAHO laboratories was held in HCMC from 11 May to 13 May 2010. The overall results of laboratories diagnostic for 2009 show a total of 71 samples submitted of which 45 percent were positive. On average, samples were sent 3.7 days after the onset of the disease. Laboratories received an average 2.4 birds per case. Information was given in 69 percent of the samples submitted. On average, laboratories reported within 1.7 days (with positive results reported in 1.1 days on average and negative results in 2.2 days).

Activity 3.2: Strengthening of core capacities for animal health in five focus provinces, including surveillance activities supported

- Continued support for field activities through a Field Project Assistant and provincial focal points.
- The LoA with DAH on the implementation of Risk-Based Active Surveillance in five pilot provinces has been signed. Training workshops were conducted for AHWs, with attendance of DVS and SDAH staff, in the pilot provinces for carrying out risk-based surveillance in the field and in coordination with community-based surveillance programme of Abt Associates. A reporting form was developed for the community animal health worker (CAHW) to collect information from informal interviews undertaken with key informants during each village visit and to quickly report any abnormal situation detected within a poultry flock. Another form was developed as a tool for CAHW for monitoring disease situation in poultry and in livestock in general for detecting any shift in the sale of medicine as an indirect indicator of an abnormal situation within the area covered by the veterinary drug stores.
- An FAO national Project Assistant joined Abt Community Based Surveillance (CBS) training in Kien Giang province on 27 and 28 May 2010 and in Quang Tri province

on 31 May 2010 to ensure good coordination and to identify any gap or overlap between FAO and Abt Associates CBS models at the commune-village levels. Based on the findings and recommendations from these field missions, FAO met with Abt Associates on 14 May 2010 and is strengthening the coordination between the two CBS models (sharing of the CBS reporting forms, the list of Abt Associates' collaborators and reinforcement of key roles of CAHWs as the junction point of the two CBS models).

- TV commercials are being aired on local TV channels in each pilot province for enhancing the reporting of any abnormal disease or mortality among poultry, and stickers and calendars have been provided to veterinary medicine shops for distribution to farmers. These activities are ongoing until the end of the project. Impacts of these activities have been assessed by looking into the log book/call register of emergency/hotline being maintained in the SDAH offices of the pilot provinces and by informal feedback from CAHW (who report receiving more phone calls since the communication materials have been distributed and since the TV commercials are being aired).
- RUDEC is carrying out the cost-effectiveness study on surveillance and had collected preliminary data from the field as well as from FAO project reports relating to surveillance activities. FAO provided comments on the first draft report submitted by RUDEC on the cost-effectiveness study on surveillance.
- Passive surveillance programme for HPAI has continued. So far, two outbreaks have been detected through the strengthened passive surveillance system in Quang Tri province (the first outbreak detected on 1 February 2010 in Trieu Phong district, Trieu Phuoc commune and the second outbreak detected on 22 April 2010 in Gio Linh district, Gio Mai commune).
- SDAH and DVS staff used the SOPs for Outbreak Investigation and Outbreak Response developed by FAO and DAH. Their experiences and feedback will be used and consolidated for the final review of these SOPs.
- The RAP sponsored/organized animal influenza surveillance training workshops held in HCMC in April 2010 was coordinated and supported.

Activity 3.3: Further development of Monitoring and Evaluation (M&E) expertise in animal health

- FAO and Abt Associates carried out a joint training workshop on monitoring and evaluation of USAID HPAI programmes in Viet Nam on 16 April 2010 in Hanoi. The training included all five focal points, five province coordinators, field assistants, project coordinator, FAO staff and representation from DAH, Provincial Department of Preventive Medicine and USAID. The morning session consisted of an overview of Monitoring & Evaluation (M&E) and Performance Management Plans (PMP), while the afternoon session involved in-depth working groups' discussion of the human and animal health indicators outlined in the new 2009 USAID Viet Nam Highly Pathogenic Avian Influenza and Emerging Pandemic Threats Performance Management Plan.

Activity 3.4: Veterinary epidemiology network supported

- Continue providing support to TADinfo.
- The second AVET training programme started on 10 May 2010 and targeted SDAH staff from the 10 pilot provinces of the OSRO/RAS/604/USA project Year II and Year III. The other four trainees were selected from Dien Bien & Ca Mau SDAH (considered as high risk provinces for occurrence of HPAI outbreaks), from RAHO

VI and from the Veterinary Faculty. The third AVET course, overlapping with the second, started on 21 June 2010 and targeted SDAH staff from provinces which reported HPAI outbreaks within 2009-2010 (total of 12 trainees selected).

Output 4: Priority procurement for animal surveillance and laboratory supported

Activity 4.1 Procurement and maintenance

- Work is currently ongoing to inspect the current 43 Biological Cabinet II (BSC II) that are located in nine laboratories throughout the whole country, with the objective of providing certification for each qualified BSC II and to recommend solution/correction for unqualified BSC II. Following the recommendation made under the inspection, the appropriate maintenance measures will be carried out in the next quarter.

Component 3: Animal Response Component

Output 5: Effective and timely animal response efforts promoted

Activity 5.1: Updating HPAI risk mapping at national level

- Coordination with the Risk Assessment Working Group (RAWG) and technical advisers for further inputs was carried out. The RAWG is largely focused on import of risk assessment and has limited capacity to focus on endemic disease. Through its risk capacity building work (OSRO/VIE/701/UNJ and OSRO/RAS/604/USA), FAO is seeking to engage the RAWG on regional risk assessments through the secondment of a technical officer from the RAWG. This is pending on identification by DAH of an appropriate technical officer, and FAO is now proposing that selecting a member of the epidemiology division may be a more practical solution.
- Region 7 Risk Analysis Exercise was conducted with representatives of SDAH in ten provinces in Region 7, two RAHOs (6 and 7) and DLP. This interactive workshop developed and tested a regional poultry sub-sector profiling methodology and introduced participants to applied risk analysis techniques building capacity in risk analysis at the province animal health offices and RAHOs (a second exercise in the final quarter will complete the Risk Analysis).

Activity 5.2: Outbreak investigation capacity strengthened in five focus provinces

- Passive surveillance activities supported veterinary staff to undertake field investigation whenever a rumor of HPAI is reported. The project funds the laboratory diagnostic of HPAI but also a differential diagnostic with testing for other main poultry diseases (Newcastle disease (ND), duck plague and pasteurellosis). So far, two HPAI outbreaks have been detected and officially reported in Quang Tri province, since the launching of these field activities with project support.
- Based on the training courses on SOPs and Job Cards, public veterinary staff, from the five pilot provinces, are requested to start using and applying these documents at the field level in real conditions. The objective is to pilot this draft version for a six month period (from January to June 2010) before carrying out a final review. The Quang Tri province experience in using these SOPs for investigating and responding to the two recent outbreaks will be used for the final review of these SOPs.

Activity 5.3: Capacity building for use of Standard Operating Procedures (SOPs) for response and investigation with linkage to human health activities

- Preliminary discussions were held between FAO and WHO on how to include one section for the joint human animal response to HPAI outbreak in the final version of

the SOPs for outbreak investigation and outbreak response developed by FAO and under field trial in the country.

Activity 5.4: Cross border analysis using a value chain methodology, undertaken in three border areas

- FAO and the Institute of Policy and Strategy for Agriculture and Rural Development (IPSARD) developed a draft policy paper on cross-border movement of poultry. This will be finalized when the outcomes of additional cross-border studies become available (next quarter).
- FAO has harmonized cross-border activities under an ADB funded regional project (OSRO/RAS/601/ASB) to ensure that activities were complimentary and mutually supportive. A preliminary analysis of the Quang Tri – Laos border carried out within the provincial profile for Quang Tri Province provided the basis of inputs into an ADB cross-border initiative covering the East-West economic corridor between Danang (invite Viet Nam) and Keysonc (in Lao PDR). FAO provided significant technical inputs into that tri-nation exercise through information and methodologies developed under the USA funded project (OSRO/RAS/604/USA) cross-border work. Outputs include highlighted key risk pathways from Viet Nam to Lao PDR and identification of potential control points (namely border-area LBMs), plus a heightened awareness of local and national authorities of this risk corridor.
- A systems analysis approach has been developed through consultations with MARD policy unit RUDEC and FAO. This considers the different characteristics of cross-border movement in the Mekong area compared with the northern border movements.
- Monthly poultry commodity price monitoring has been carried out in all five pilot provinces. This pilot approach will test the viability and utility of price monitoring and identify regional and temporal fluctuations in poultry product prices.

Activity 5.5: Vaccine efficacy monitoring and virus surveillance supported at national level

- Technical report on the “Round II 2009 - Post-vaccination monitoring and virus circulation surveillance” has been reviewed and cleared. The result shows that about 65 percent of vaccinated poultry birds and about 46 percent of poultry flocks that have had appropriate vaccination generate a good protection against influenza virus. However, virus circulation surveillance demonstrates that AI virus H5N1 is circulating in two flocks out of 449 flocks sampled in 16 provinces of Viet Nam.
- The vaccine efficacy trial at NCVD, DAH including HPAI vaccine testing in 2009 and HPAI virus pathogenicity testing in ducks is ongoing.
- With the aid of an international consultancy, FAO developed a report with recommendations for implementation of a modified post-vaccination sero-monitoring and virus surveillance in Viet Nam in order to gain a better understanding of the impact of vaccination and the overall epidemiological situation. This report was passed onto DAH.
- FAO participated in a DAH workshop on 21 May 2010 for a revised Post-vaccination Monitoring (PVM) and Virus Circulation Surveillance (VCS) programme, taking into account recommendations provided by FAOVN. Based on this new programme for PVM and VCS, a new LoA has been signed with DAH for the first round of 2010 for PVM and VCS.

Activity carried over from Year II: vaccine inventory system

- The final draft version of a pilot excel spreadsheet-based system, which was developed through a national consultancy in the previous year, has been received by FAO and is currently under review.

Output 6: Improved bio-security practices in commercial and scavenging poultry raising settings supported

Activity 6.1: Support biosecurity strengthening in five pilot provinces

- Can Tho and Kien Giang provincial profiling contributed to the regional profiling exercise within the risk analysis carried out in Region 7. This included a poultry movement and infrastructure mapping exercise for the region.
- A methodology has been developed to engage farmers in setting technical advisory priorities and in engaging the private sector in supporting the dissemination of advice (through feed distribution systems) and additional advice and materials through agri-vet stores (point of sale advice). Four poultry producer focus groups have been identified and these will be launched in the next quarter.
- Preliminary results from risk assessments in the poultry market chain were shared between FAO and Abt Associates, and a plan was developed for coordinated action in Quang Tri province to support improved market hygiene.

Activity 6.2 Develop biosecurity guidelines and training for DAH and DLP

- A consultancy was carried out to develop a training programme to strengthen biosecurity. Key findings included the need to engage public and private sector actors and the need to address good poultry production practices more broadly rather than biosecurity (recognizing the need to meet producer priorities of improved performance, not solely disease control). The consultancy therefore re-directed biosecurity strengthening to a more balanced approach of public sector farmer training approaches and private sector poultry technical advisor capacity strengthening.
- The Biosecurity Working Group convened two technical meetings during the reporting period. The first focused on presenting experiences and lessons learned in using value chain methodologies to better understand the poultry sector, risk pathways and the ways in which sub-sector strengthening can contribute to higher production standards. The second meeting focused on sharing the outcomes of the two biosecurity related studies carried out by FAO and described in this report. It shared the outcomes of a WB funded FAO consultancy to develop minimum biosecurity standards for commercial farms.

Activity 6.3: Stakeholder review of biosecurity strengthening activities

- A review of biosecurity strengthening pilot projects was conducted. The review highlighted the difficulties in implementing such projects and challenged the current approach of model/demonstration farms by noting the limited value in direct farmer training and awareness raising. Instead, it recommended a greater use of private sector technical advisers and risk assessment to better determine and focus entry points. Furthermore, the review also emphasized the need to provide poultry health information as an overall package, not solely focusing on biosecurity and HPAI. Technical and extension programme shortcomings were found to contribute to limited impact. Results were shared with the Government and USAID implementing partners. As a result, FAO is incorporating key findings into a revised strategic approach towards the strengthening of the biosecurity programmes.

Component 4: Communications Component

Output 7: Communication capacity supported at DAH and technical inputs to communications activities of other USAID implementing partners are provided

Activity 7.1: Support national communications officers

- Disease outbreak update reports continued to be translated and disseminated.

Activity 7.2: Technical support for training and other materials for Animal Health Workers (AHWs) and Animal Extension Workers (AEWs)

- A number of technical advisory resources were identified as needed during the International Biosecurity consultancy, and these will now be developed together with a private sector extension system to enhance the delivery of such materials.
- Footage of high risk activities has been filmed under direction of a technical expert, and this will form the basis of visual training resources to highlight risk behaviour in a medium which will stimulate poultry producers.
- FAO filled in the BCC working group list for compiling all IEC materials produced within the AI programme (from all projects, between 2006 to the present). Electronic copies and available hard copies have been delivered to Abt Associates as requested by the BCC working group.

Planned activities for the next quarter**Component 1: Preparedness and Planning Component****Output 1: Strategy development for HPAI control in 2006-2010 supported***Activity 1.1: Pandemic preparedness plan review**Activity 1.2: Contingency Plan for animal disease outbreak*

- activity delayed and newly proposed under the cost-extension, with a revised approach to review the HPAI Contingency Plan and to shape it into Animal Disease Emergency Preparedness Plan

Activity 1.3: National HPAI control strategy review

- refer to the activities as outlined in section 1.3 on page 2 of this report

Output 2: Coordination and communication with donors and other HPAI implementing partners*Activity 2.1: Core FAO Viet Nam team supported*

- extend and renew contract of the current personnel as and when necessary
- funding support for international Technical Advisor for the monitoring of epidemiology, surveillance and outbreak response related activities
- continue the coordination and planning meetings with all stakeholders

Activity 2.2: Annual project meetings supported

- the field quarterly reporting meeting will be held in the second quarter of 2010

Activity 2.3: Provincial to national level team meetings supported

- hold the field quarterly reporting meeting

Component 2: Animal Surveillance Component**Output 3: Animal surveillance at the national, district and community level enhanced***Activity 3.1: Strengthening of veterinary laboratories, specifically biosafety and quality assurance supported*

- continue providing technical inputs by national and international laboratory experts
- continue providing support to the LabNet server and tele-hosting maintenance
- organize the maintenance of the laboratory equipment (refer to section 4.1)

Activity 3.2: Strengthening of core capacities for animal health in five focus provinces, including surveillance activities supported

- continue providing technical inputs by national and international experts
- continue support for field activities
- continue providing stickers and calendars to veterinary medicine shops for distribution to farmers and promote the airing of TV spots
- the second draft report of the cost-effectiveness study on surveillance from RUDEC will be reviewed and finalized
- final review of SOPs for outbreak investigation and response is planned in July 2010
- monitor the implementation of the passive surveillance and the active surveillance (CBS) programmes in the five pilot provinces

Activity 3.3: Further development of Monitoring and Evaluation (M&E) expertise in animal health

- FAO will continue to support M&E activities as outlined in the 2009 USAID Viet Nam Highly Pathogenic Avian Influenza and Emerging Pandemic Threats Performance Management Plan

Activity 3.4: Veterinary epidemiology network supported

- continue to provide support to the TADinfo
- continue to support AVET coordination and activities: the second and third AVET courses are expected to end on 9 July 2010 and on 20 August 2010, respectively
- prepare tentative schedule for the fourth AVET training course to be conducted from August to September 2010 (rolling over with the third AVET course)

Output 4: Priority procurement for animal surveillance and laboratory supported

Activity 4.1 Procurement and maintenance

- carry out the appropriate maintenance measures following the recommendation made under the inspection

Component 3: Animal Response Component

Output 5: Effective and timely animal response efforts promoted

Activity 5.1: Updating HPAI risk mapping at national level

- coordinate with RAWG on an approach to updating risk mapping for HPAI
- complete the risk analysis exercise for region 7, including provincial risk analysis exercises for Can Tho and Kien Giang Provinces, piloting a regional approach to risk analysis and building capacity at the provincial level to carry out risk assessments. The risk analysis exercise will utilize provincial profiles to develop a regional poultry profile. Outcomes of the RA exercise will support strategic approaches and plans for vaccine, surveillance and other control measures within the region.
- carry out a short risk analysis training course for selected members of the RAWG and the Epidemiology Unit of DAH

Activity 5.2: Outbreak investigation capacity strengthened in five focus provinces

- coordinate the field teams and field visits to pilot provinces if suspicious cases are reported and if outbreak occurs
- continue providing support for the enhanced reporting and strengthened outbreak investigation and response

- collect feedback from Quang Tri SDAH on the use of SOPs in a real situation, during recent HPAI outbreaks, for the final review of SOPs for outbreak investigation and response in July 2010

Activity 5.3: Capacity building for use of Standard Operating Procedures (SOPs) for response and investigation with linkage to human health activities

- draft an additional SOP for a joint animal human response during HPAI outbreak linked to the human health sector during the final review of SOPs

Activity 5.4: Cross border analysis using a value chain methodology, undertaken in three border areas

- have FAO and IPSARD finalize a policy paper on cross-border movement of poultry to be completed when the outcomes of additional cross-border studies become available
- develop provincial profiles for Dong Thap and Long An Provinces to support understanding of poultry production and movements in border areas. The outputs of this work and the USAID funded risk analysis exercise will provide technical support to an ADB funded Viet Nam-Cambodia cross-border meeting.
- carry out a study to characterize the cross-border movement of poultry in the Mekong region, highlighting key risk pathways and identifying market chain nodes and potential control points

Activity 5.5: Vaccine efficacy monitoring and virus surveillance supported at national level

- provide support to DAH for undertaking a training on survey design and random selection for an improved implementation of the Post-Vaccination Monitoring programme, targeting SDAH staff from the provinces selected for the PVM programme implementation (based on the Guideline 987/TY-DT from 21 June 2010)
- DAH will submit and finalize the report with the analysis of the data of the first round of 2010 post-vaccination monitoring and virus circulation surveillance for influenza A/H5N1
- review and finalize the report on vaccine efficacy trials

Activity carried over from Year 2: vaccine inventory system

- finalize the development of a pilot excel spreadsheet-based system

Output 6: Improved bio-security practices in commercial and scavenging poultry raising settings supported

Activity 6.1: Support biosecurity strengthening in five pilot provinces

- document an approach to hatchery registration based on experiences in the Can Tho district trial and launch a hatchery registration and mapping exercise in the two southern provinces
- jointly present risk assessment findings with Abt Associates for the market chain in Quang Tri province and in conjunction with the stakeholders develop and agree on a risk mitigation plan
- develop an instructional guide on provincial poultry sector profiling and complete provincial profiles/assessments in Ha Nam and Can Tho to test the approach
- continue implementation of monthly poultry commodity price monitoring in all five pilot provinces

Activity 6.2: Develop biosecurity guidelines and training for DAH and DLP

- develop the biosecurity training programme for the pilot provinces, which will consist of three elements: (i) training for district level DAH and extension officers on biosecurity using a training module developed by FAO; (ii) training programme for private sector agri-vet store owners and vet pharmacies (those who advise commercial poultry farmers); and (iii) stakeholder *Field School* like approach which will develop and test biosecurity interventions at the farm level to ensure that pilot approaches are effective and adopted by farmers
- continue to provide support to the Biosecurity Working Group through one technical meeting, a strategic planning meeting and the dissemination of documents
- consolidate the database of biosecurity materials

Activity 6.3: Stakeholder review of biosecurity strengthening activities

- no activities planned

Component 4: Communications Component**Output 7: Communication capacity supported at DAH and technical inputs to communications activities of other USAID implementing partners are provided****Activity 7.1: Support national communications officers**

- continue to translate and disseminate the Disease Outbreak Update Report

Activity 7.2 Technical support for training and other materials for AHWs and AEWs

- liaise with DAH and assess the need for technical and or financial support for the development and production of a DAH bulletin
- pilot a public-private sector model for the delivery of poultry farmer extension information
- develop a DVD training resource to raise awareness of disease transmission and high risk practices and to promote good biosecurity and risk reduction

Main challenges encountered and response provided

No major challenges were encountered during the reporting period.

Main progress made towards the achievement of project outcomes (from the start of the project)**Output 1: Strategy development for HPAI control in 2006-2010 supported**

- A risk-based approach to disease control has been developed and the USAID project activities are being strengthened and developed to ensure that risk reduction is cross-cutting strategy in each. FAO is advocating and building capacity with partners for a progressive shift from mass application of disease control measures to smart disease control based on risk analysis and the optimum utilization of resources.
- Consideration of a regional approach to HPAI control rather than a provincial one has been promoted and is attracting interest as featured in Green Book review and several International Ministerial Conference on Avian and Pandemic Influenza (IMCAPI) documents.
- Provincial poultry sub-sector profiling has been effective in describing provincial poultry populations (including the Poultry Atlas) and DLP is considering adopting such an approach more widely.

Output 2: Coordination and communication with donors and other HPAI implementing partners

- Programme management and planning and coordination of activities with USAID and other partners have been maintained. FAO has made 11 major recommendations for the Green Book Review which were well received by the Government of Viet Nam. The recommendations were presented during the Government Green Book Review in November 2009 and presented in March 2010.
- The Biosecurity Working Group has networked information and lessons learned between a large number of agencies working on biosecurity and poultry production more widely. Significant capacity has been built through the information exchange and network created, which has now been taken over by the DLP.

Output 3: Animal surveillance at the national, district and community level enhanced

- The project is carrying out animal surveillance activities which include support in relation to the upgrading of TAD-info® and the Laboratory Information System (LabNet), development of Geographic Information Systems (GIS) at RAHO, Short Message Service (SMS) pilot study and Veterinary Epidemiology capacity building.
- TAD-info® has served as the official livestock disease reporting system of the Government of Viet Nam for HPAI and other priority diseases. The disease reporting system has been established in 64 provincial SDAHs.
- A database of the administrative map of Viet Nam has been procured and upgrading of TAD-info® modules has been completed and downloaded on DAH training server with technical support from FAO headquarters. Today 210 officers from SDAH, 14 RAHO staff and five DAH Epidemiology staff have increased their capacity to use this software through training.
- Seven units of Global Positioning System (GPS) and seven licenses of mapping software (ArcView/ArcGIS 9.2) have been provided to seven RAHOs (I-VII). A total of 55 participants from seven RAHOs were trained during the basic and refresher training course on ArcGIS and GPS along with on-site mapping which has increased the use of GIS application for animal surveillance in Viet Nam.
- The project has also developed a database system software for laboratory diagnostic management within the DAH's LabNet through the services of a local firm in Viet Nam. Laboratory biosafety and quality assurance is being upgraded and standardized by the introduction of powered air purification respirator and the homogenizer at NCVD at all diagnostic centres.
- The SOPs for H5N1 reverse transcriptase-polymerase chain reaction (RT-PCR) have been modified with new N1 primers. Genetic analysis of new virus isolates of early 2009 has been done for HA gene sequence, which showed that the similar virus continued to circulate in 2009. The initiative to add epidemiological information to the genetic sequence data from Viet Nam in the public domain has started. The follow-up on-site trainings at the NCVD and some RAHOs are ongoing including the validation of current protocol of molecular diagnosis with new viruses isolated in 2009.
- In 2009, FAO staff worked closely with DAH to finalize SOPs and Job Cards to create a sound foundation on which Viet Nam's veterinarians can standardize their approaches to the control of AI. This has been well received by the Government. DVS, SDAH and CAHW training will be carried out in 2010. Also, the animal health component can easily be modified for use with other important animal diseases such as duck plague, rabies and foot-and-mouth disease.
- The campaign to encourage poultry farmers to report any unusual occurrences in

poultry flocks, arising suspicion of an infectious disease, through TV spots and loudspeakers during the risk period (e.g. the TET festival), has created a better awareness on the necessity to report diseases on time.

- The AVET initiative, specifically on curriculum development and start up of short training courses, is one of the most important capacity building initiatives being undertaken to improve the planning, implementation and monitoring of HPAI control in Viet Nam. First batch of trainees have completed the AVET Programme and the second and third batches are ongoing. Availability of field staff with veterinary epidemiology training will enhance epidemiological skills at the field for a better understanding of HPAI disease transmission and maintenance cycle.

Output carried over from Year II: Wild bird surveillance

- More than 300 copies of the Wild Bird Manual have been translated into Vietnamese and distributed to 63 provinces.

Output 4: Priority procurement for animal surveillance and laboratory supported

- Procurement of vehicles, IT equipment, equipment sprayers and most lab consumables is complete to support AS3 and AR2, and all are in use.

Output 5: Effective and timely animal response efforts promoted

- Cross-borders study in the north of Viet Nam concluded that as a result of a high financial return for poultry, smuggling across the border has not decreased but has become more elaborate. The stakeholders place greater value on potential income than on the risk of disease infection for their flocks of domestic poultry. As a result, they do not apply adequate measures to prevent the disease. Prevention of cross-border movement is constrained by limited human resources, a large geographic area and active and sophisticated informal/illegal trading systems.
- Post-vaccination monitoring and virus circulating surveillance for influenza A/H5N1, supported by this project shows that about 65 percent of vaccinated poultry birds and about 46 percent of poultry flocks that have had appropriate vaccination generate a good protection against influenza virus. However, virus circulation surveillance demonstrates that AI virus is circulating widely throughout the national flock. FAO is providing epidemiological advisory to DAH to ensure that this important activity is carried out using a methodology which will meet the highest international standards.

Output carried over from Year II: Vaccine production

- A training course on good management practices (GMP) to key stakeholders, National Veterinary Company (NAVETCO), Viet Nam's Veterinary Vaccine Company (VETVACO) and DAH was conducted, which covered introductory-level Good Manufacturing Practice (according to the 2009 PIC/S³ Code of GMP) and quality systems applicable to the manufacture of AI⁴ vaccines. Audits of two vaccine production facilities were conducted, with a focus on the AI vaccine processes and emphasis on packaging of vaccines and the associated facilities including GMP compliance. The project has continued to provide technical support to the needs assessment and planning on domestic AI vaccine production, including hiring a national consultant to analyse the current situation of vaccine inventory at the field level and develop a database for vaccine inventory system.

Output carried over from Year II: cold chain appraisal

- The operational appraisal of cold chain integrity is complete, and 39 provinces were provided with walk-in cold rooms.

³ PIC/S = Pharmaceutical Inspection Convention / Pharmaceutical Inspection Co-operation Scheme

⁴ AI = Avian Influenza H5 N1

Output 6: Improved biosecurity practices in commercial and scavenging poultry raising settings supported

- Provincial profiling and risk analysis work is providing implementers with useful information to better target biosecurity initiatives. This includes assessments of LBMs and description of risk pathways to and from those markets.
- A Biosecurity Working Group has been established which provides a forum to network information and lessons learned and build technical understanding among a peer group of agencies working to strengthen biosecurity.
- A framework for a database on bi-security materials has been developed and its consolidation is in progress. The approach to develop this database was developed during one of the Biosecurity Working Group's meetings and over 100 documents have now been compiled in a searchable format. This is now ready for dissemination. Biosecurity activities of all agencies engaged in related work have also been mapped.
- The working group also reviewed work on hatchery biosecurity, and training on the principles of biosecurity and on biosecurity auditing was provided to 16 members of the biosecurity working group. Longer-term, tailored biosecurity technical materials and risk communication approaches will be developed through focus groups and stakeholder discussions to ensure that biosecurity measures are more demand-driven and appropriate. The selection of provincial focal points is an important first step in facilitating the dialogue between the stakeholders and has contributed to enhance strengthening of biosecurity practices in the five pilot provinces.
- Conventional approaches to biosecurity strengthening have been reviewed and evidence gathered to support adoption of a supplementary approach focusing on private sector driven activities and adopting social marketing techniques from the human health sector.
- FAO and Abt Associates have liaised on hatchery technical training and registration schemes. The biosecurity coordinator will document existing registration practices in operation in selected provinces, and Abt Associates and FAO will jointly develop an approach to be piloted in USAID funded provinces.

Output 7: Communication capacity supported at DAH and technical inputs to communications activities of other USAID implementing partners are provided

- Three thousand copies of calendar 2008 with 12 key messages on AI prevention and control have been produced and distributed to 63 provinces, 45 districts, 503 communes and other relevant government agencies, donors and NGOs. FAO is repeating the calendar and sticker production and distribution for pre-TÉT festival 2010 sending out the message to call the hotline or the SDAH landline to report ill and dead poultry under the Enhanced Reporting component. The USAID partners are participating in the review of materials.
- In 2008, FAO also produced a 10-minute documentary about Viet Nam's experiences in dealing with HPAI from the animal health perspective. A total of 200 Video CDs in Vietnamese, 300 DVDs in English and 200 DVDs in Vietnamese were prepared and widely distributed. Under the GETS project, AED produced a commercial, for which the second part will be used in the pilot provinces for this project, which encourages poultry owners to report ill and dead poultry to SDAH via hotline or SDAH phone numbers.
- Support to DAH communications has been maintained.
- Technical support to Abt Associates in implementing the field activities has been maintained.

Project Monitoring Sheet: **OSRO/RAS/604/USA Baby 06**

Project title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) in Viet Nam**

Reporting period: **October 2012 to March 2013**

Country: Viet Nam
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) in Viet Nam
Code: OSRO/RAS/604/USA Baby 06
Budget: USD 2 million (Phase I), USD 3.1 million (Phase II), USD 3.3 million (Phase III), USD 1.075 million (cost extension), USD 2.2 million (Phase IV), USD 1.9 million (Phase V), USD 508 373 (transferred as balance from OSRO/VIE/801/USA to OSRO/RAS/604/USA Baby06), USD 1.7 million (Phase VI).
Total budget: USD 15 783 373
Effective starting date: 01 August 2006
Planned end date: 30 September 2013
Context of the project The control and move towards eradication of H5N1 Highly Pathogenic Avian Influenza (HPAI) demands a long-term approach. Viet Nam is moving from the control phase to the consolidation phase, with an ongoing need for capacity building in the veterinary services and livestock production sectors and support for vaccination and other risk reduction measures. This regional project of the Food and Agriculture Organization of the United Nations (FAO) is supported by the United States Agency for International Development (USAID) and is currently in its sixth phase of implementation.
Objectives of the project The overall objective of the project is to increase the capacity to prevent, detect and respond to HPAI and other high impact livestock and zoonotic diseases and to reduce the risks of disease outbreaks occurring.
Planned activities during the reporting period (October 2012 to March 2013)
Component 1: Preparedness and Planning Component
Output 1: Strategy development for HPAI control
<i>Activity 1.1 Regional HPAI Control Strategy</i>
<ul style="list-style-type: none"> • facilitate establishment of a coordination structure for the implementation of the regional strategy; • develop advocacy strategy for implementation in conjunction with the Partnership for Avian and Human Influenza (PAHI); • support development of work plans for two zones – activities should include improved surveillance, value chain mapping, risk planning and disease control; and • joint planning of activities with other partners to ensure linkage to zonal strategy.
<i>Activity 1.2 Develop policy briefs for potential outcomes of the cessation of vaccination</i>
<ul style="list-style-type: none"> • review previous scenario development and revise as necessary; • develop concise policy brief based on review and submit to DAH; and • develop concise brief on scenarios for advocacy at the provincial level.
<i>Activity 1.3 Training in regional control plan management and evaluation</i>
<ul style="list-style-type: none"> • conduct real-time training in regional control plan management in conjunction with the Regional Animal Health Office (RAHO) meetings.

Output 2: Coordination and communication with donors and other HPAI implementing partners

Activity 2.1 Core FAO Viet Nam team supported and manages project activities

Activity 2.2 Annual project meeting supported

Activity 2.3 Coordination meetings to support regional HPAI control strategy implementation

Activity 2.4 Coordination and sharing of information with other players engaged in HPAI surveillance, risk assessment, value chain and risk mitigation in the poultry sector

Component 2: Animal surveillance component

Output 3: Animal surveillance at the national, regional/zonal, provincial, district and commune levels enhanced

Activity 3.1 Strengthening of core capacities for animal disease control and disease control planning within regional control strategies

- support capacity building to develop work plans to implement regional control strategies;
- support capacity building in risk management along value chains relevant to regional control strategies;
- support the development of responses to risk analysis associated with value chains;
- outbreak investigation refresher training for Sub-Department of Animal Health (SDAH) and RAHO staff using a standardized approach to support strategy;
- outbreak response refresher training for SDAH and RAHO staff using a standardized approach to support strategy; and
- mentoring of epidemiology units in data analysis and interpretation.

Activity 3.2 Animal surveillance programme

- support national surveillance plan for live bird markets, including targeting spent hen trade where appropriate;
- support surveillance plan for live bird markets linked to regional strategic objectives;
- support passive surveillance system under regional control strategy, including employing smart phone technology;
- support linkages in passive surveillance from community level to formal animal health reporting systems;
- training for differential diagnosis of poultry disease outbreak at RAHO and SDAH, including poultry post-mortem examination;
- develop policy options for incentives to stimulate reporting of disease events and support advocacy for implementation; and
- support the Department of Animal Health (DAH) to conduct an expert consultation on the national surveillance system for HPAI and other priority diseases.

Activity 3.3 Strengthening of veterinary laboratories diagnostic activities, including biosafety and quality assurance supported

- supporting laboratory quality assurance through monitoring of performance and review of standard operating procedures (SOPs);
- continue support for rapid and differential diagnosis at the RAHO level, including other zoonoses/high-impact diseases;
- continue support for the full characterization of viruses isolated from outbreaks and live bird market surveillance;
- review the functions and role of the animal health laboratory system; and
- support the strategy for DAH to assume full technical responsibility for the HPAI laboratory programme.

Activity 3.4 Veterinary Epidemiology Network capacity supported

- continue support of the Applied Veterinary Epidemiology Training (AVET) programme with emphasis on an advanced course;
- define the framework for the epidemiology network at the national level and commence development;
- support regional level epidemiology networks and conduct regular meetings; and
- support the AVET alumni meeting.

Activity 3.5 Further development of Monitoring and Evaluation (M&E) expertise in animal health

- training of managers at RAHO and SDAH in the M&E principles that guide project management;
- support alignment of the overall Avian and Pandemic Influenza Initiative (APII) M&E framework to local strategic plans; and
- support managers at RAHO and SDAH in gathering and processing M&E data.

Output 4: Priority procurement for animal surveillance and laboratory supported*Activity 4.1 Procurement of essential supplies and maintenance of laboratory equipment**Activity 4.2 Procurement of consumables to support laboratory activities**Activity 4.3 Determine and support maintenance requirements for laboratories**Activity 4.4 Procurement of supplies to support field surveillance activities***Component 3: Animal response component****Output 5: Effective and timely animal response efforts promoted***Activity 5.1: HPAI risk mapping and risk analysis updated to support regional strategies*

- poultry sector profiling to support the regional strategy;
- applied risk analysis capacity building;
- updating risk assessment and mapping; and
- detailed characterization of high-risk value chains, including network analysis.

Activity 5.2: Outbreak control capacity strengthened under regional control strategy

- further review of SOPs for application to outbreak control, including local incident command system and culling principles;
- refresher training in outbreak control to support strategic control plans;
- assist partners to sensitize grassroots stakeholders to disease control activities;
- review application of carcass disposal in outbreak control in local situations within strategic plans; and
- prepare and conduct desktop exercises with public health counterparts.

*Activity 5.3 Conduct review of response capability in relation to scenarios developed under activity 1.2**Activity 5.4 Develop tailored compensation mechanisms to support control strategy*

- support the development of locally feasible and practical compensation mechanisms to support farmers reporting disease; and
- review outbreak control procedures to enable effective audits to support compensation packages.

Activity 5.5 Cross-border dialogue and coordinated surveillance

- support bilateral meetings with the Governments of China and Cambodia to exchange technical information, including surveillance and risk assessment findings, and risk reduction plans;
- review cross border value chains of high-risk commodities; and
- develop plans to conduct coordinated cross-border surveillance.

Activity 5.6 Vaccine efficacy assessments and virus surveillance supported at the national level

- conduct vaccine trials against key circulating clades with a range of vaccines, species and breeds; and
- monitoring pathogenicity of selected virus isolates from outbreaks and live bird market surveillance.

Activity 5.7 Institutional strengthening in poultry production and animal health advisory systems

- institutional and core function analysis for poultry production and support services;
- capacity needs assessment of key stakeholders; and
- develop the poultry sector advisory services model in collaboration with partners and the Extension Department.

Activity 5.8 Support engagement of private sector in the execution of regional control strategies

- develop a poultry industry forum at the regional level to support the regional control plan; and
- work with other APII partners to engage key value chain stakeholders in regional control strategy.

*Activity 5.9 Support DAH to conduct review of the current draft of the Veterinary Law**Activity 5.10 Support DAH to finalize guidelines to establish Veterinary Statutory Body, including structure, function and mechanism***Output 6: Improved poultry production practices in poultry value chains supported***Activity 6.1 Support programme to strengthen safe poultry production practices including biosecurity*

- develop materials and methods with partners, including extension service to scale up hatchery pilot programme in support of regional control strategies;
- facilitate the development of policy and advocacy brief to support practical measures to upgrade the production of day-old ducks;
- support implementing partners with high-level training and advice on hatchery pilot programme;
- collaborate with the Department of Livestock Production (DLP) to develop upstream standards for parent flocks supplying hatcheries conforming to guidelines and pilot test practical implementation at field level;
- continue support for development of poultry waste disposal systems:
 - review workshop on composting of duck waste; and
 - national workshop on composting of duck waste.
- develop materials and methods with partners including extension service to scale up the good production practices in support of regional control strategies.

Activity 6.2 Support ongoing activity of the Biosecurity Working Group

- support national and regional meetings of the Biosecurity Working Group; and
- support the dissemination of the Biosecurity Working Group findings by partners within the regional control strategy, including the extension service.

Activity 6.3 Provide policy support brief on the inactivation of H5N1 under environmental conditions

- investigate inactivation of H5N1 strains under simulated environmental conditions; and
- develop a policy brief related to the implications of virus survival in the environment.

*Activity 6.4 Pilot training programme for private sector in various guidelines and Good Poultry Production Practices (GPPP) developed**Activity 6.5 Training of provincial Department of Agriculture and Rural Development (DARD) staff in description and mapping of local poultry sector*

Activities undertaken during the reporting period (October 2012 to March 2013)

Component 1: Preparedness and Planning Component

Output 1: Strategy for HPAI control developed

Activity 1.1 Regional HPAI Control Strategy

- facilitated the establishment of a coordination structure for implementation of the regional strategy. It was proposed in the Regional HPAI Control Strategies that RAHO 3,6 and 7 have the coordination roles to implement Regional HPAI Control Strategies;
- two Regional HPAI Control Strategies developed, including the work plans on improved surveillance, value chain mapping, risk planning and disease control;
- agreement between FAO, Abt Associates and the World Health Organization (WHO) on joint planning of activities to ensure linkage to zonal strategy;
- guidelines for the application of Progressive Control Pathway approach finalized into the National Operational Plan on Avian Influenza Control and Prevention (2013-2017); and
- detailed comments provided to DAI1 and PA111 on the National Operational Plan on Avian Influenza Control and Prevention (2013-2017) including incorporating the regional/zonal approach.

Output 2: Coordination and communication with donors and other HPAI implementing partners

Activity 2.1 Core FAO Viet Nam team supported and manages project activities

- arrival of a new Senior Technical Coordinator for the FAO Emergency Centre for Transboundary Animal Diseases (ECTAD) Viet Nam team in December 2012;
- arrival of a new International Epidemiologist on 14 November 2012;
- continue to ensure that all required staff is in place;
- series of briefings, meetings and e-mails with many HPAI implementing partners for coordination, including both USAID and non-USAID partners;
- bi-weekly written briefings provided to USAID on HPAI activities;
- regular coordination meetings between USAID and FAO on a bi- or tri-weekly basis; and
- meetings between FAO and DAI1 (usually the Director-General) on a bi-weekly basis for coordination purposes.

Activity 2.2 Annual project meetings supported

- A project review and planning meeting was held in Hanoi on 21 November 2012 with a total of 31 participants (17 male and 14 female). In addition to FAO, DAI1 and DLP staff involved in project implementation, representatives from USAID, WHO, Abt Associates, PA111 and the Livestock Competitiveness and Food Safety Project (LIFSAP) joined the afternoon session of the meeting.
- The ECTAD Viet Nam team meeting was held on 14 December 2012 to share information and update the project activities, both in technical and operational fields. All project staff took part in the meeting.
- The ECTAD Viet Nam team coordination meeting was held on 7 January 2013 to share information and update the project activities, both in technical and operational fields. All project staff, including those based at the DLP and DAI1, also took part in the meeting.
- Two more ECTAD Viet Nam team meetings were held on 22 January 2013 and 22 February 2013 to share information and update the project activities, both in technical and operational fields. All project staff took part in the meetings.

Activity 2.3 Coordination meetings to support regional HPAI control strategy implementation

- A consultation workshop for the national HPAI control programme was held on 24 October 2012 in Hanoi with a total of 49 participants (34 males and 15 females). This provided an effective

platform for dialogue and joint activities with national and international partners in a One Health context as well as sound technical linkage to overarching national strategies such as the Viet Nam Integrated National Operational Program on Avian Influenza, Pandemic Preparedness And Emerging Infectious Diseases (AIPED). A regional approach to disease control is also a key part of the ratified National Strengthening of Veterinary Services Strategy to 2020.

- Project staff participated in the USAID partners meeting held on 20 November 2012 in Hanoi.
- Project staff participated in the Workshop on Wildlife Farm Biosecurity Management and Supporting the Development of Good Production Practices on 25 January 2013 in Ho Chi Min City and gave an overview presentation and several supporting presentations.
- Project staff participated in the Good Emergency Practices (GEMP) training held in Bangkok in February 2013 and have approached DAH about their interest in having a Viet Nam GEMP training.
- Project staff participated in the Annual Regional ECTAD Meeting in Bangkok, Thailand from 26 February to 1 March 2013. The Annual Regional ECTAD Meeting:
 - (i) reviewed the H5N1 situation and the rapid spread and dominance of clade 2.3.2.1 and other co-circulating and interrelated influenza viruses (e.g.H9N2) in Asia as well as its implications on control and eradication of HPAI in the region;
 - (ii) discussed how to further broaden the ECTAD agenda from HPAI to One Health at the country level; and
 - (iii) discussed the modality of operating under the new system in light of decentralization and how to maintain synergy with FAO's corporate strategy.
- Project staff attended the FAO-USAID coordination meeting on 14 March 2013. The purpose of the meeting was to update the project progress from 2012 up to March 2013. The technical staff presented key project achievements from 2012 up to March 2013.
- Project staff participated in information sharing sessions including FAO-USAID, USAID-led swine influenza coordination, and United States Center for Disease Control and Prevention (CDC)-led Viet Nam influenza and presented updates about the phylogeography and clade information specific to 2.3.2.1.

Activity 2.4 Coordination and sharing of information with other players engaged in HPAI surveillance, risk assessment, value chain and risk mitigation in the poultry sector

- On 22 November, an FAO expert presented the HPAI H5N1 situation in Viet Nam from 2004 to 2012 to provide basic background knowledge on H5N1 in the animal sector to the media journalists attending the media training in Hanoi.
- On 23 November 2012, a meeting was held with Associated Professor, Viet Khong Nguyen and Ivo Claassen and Adriaan van Loon, a delegation from the Netherlands, visiting Viet Nam from 18 to 30 November 2012 on a feasibility study on avian influenza (AI) vaccine production in Viet Nam.
- A meeting was held with national experts from the Viet Nam Animal and Human Influenza Control and Preparedness Project (VAIHP) to discuss current HPAI surveillance programmes in Viet Nam.
- Project staff participated in a seminar at the National Institute of Veterinary Research, where a Dutch delegation presented their findings of "A feasibility study of avian influenza vaccine production in Viet Nam".
- A Senior Technical Coordinator and International Epidemiologists attended and contributed to the VAIHP surveillance workshop held in Hanoi from 19 to 20 December 2012.
- The fact sheet for the project – "Immediate Technical Assistance to Strengthen Emergency Preparedness for Highly Pathogenic Avian Influenza to Viet Nam" – has been updated.
- The final project document has been officially submitted to the Government of Viet Nam for approval.
- The annual project progress report for the period 1 October 2011 to 30 November 2012 (cycle 5) was prepared and sent to the DAH for submission to the Government of Viet Nam.
- Project staff participated in the Prince Mahidol Award Conference 2013 in Bangkok, Thailand from 28 January to 2 February 2013. Activities included 1) convening parallel sessions; 2) serving

as panelists in other sessions; and 3) supporting participation of VN government officials.

- Lectures on “One Health” and “Highly Pathogenic Avian Influenza in Viet Nam” was given at the Hanoi University of Agriculture on 24 January 2013, to an audience of teachers, professors and post-graduate students.
- FAO provided feedback through PAH to DAH as suggested revisions to the National Operational Plan on Avian Influenza Control and Prevention (2013-2017).
- Project staff attended a meeting with Agriculture Research for Development (CIRAD) and DAH on 12 March 2013. The objective of the meeting was to discuss results and practical implications and future activities/collaborations. CIRAD presented results of the Research for Evaluation of Avian Influenza Surveillance in South East Asia (REVASIA) project and results on the evaluation of surveillance systems in avian diseases in Viet Nam. FAO presented surveillance activities and briefings on other activities on biosecurity, livestock production, and the regional strategy under the project “Immediate Technical Assistance to Strengthen Emergency Preparedness for Highly Pathogenic Avian Influenza to Viet Nam”.
- Project staff attended a small expert group conference call to review biosecurity assessment tools for wildlife farms.

Component 2: Animal surveillance component

Output 3: Animal surveillance at the national, regional/zonal, provincial, district and commune level enhanced

Activity 3.1 Strengthening of core capacities for animal disease control and disease control planning within regional control strategies

- Analysing information and data collected during field visits in Region 3 and Region 7 and results of FAO supported active and passive surveillance programmes showed that HPAI outbreak investigations are conducted satisfactorily. Currently there is no need to conduct outbreak investigation refresher training for SDAH and RAHO staff using the standardized approach to support strategy.
- Talking to stakeholders and analysing information and data collected during field visits in Region 3 and Region 7 showed that HPAI outbreak responses are conducted satisfactorily. Currently there is no need to conduct outbreak response refresher training for SDAHs and RAHOs staff using the standardized approach to support strategy.
- There is good communication and collaboration with the Epidemiology Departments at RAHO 3 and RAHO 7, through the FAO Regional Coordinators and with the Epidemiology Division at DAH through epidemiologists and national consultants employed by FAO. If needed, FAO assists in data analysis and in mentoring of these epidemiology units in data analysis and interpretation.

Activity 3.2 Animal surveillance programme

- A workshop on guidelines for AI surveillance for Region 6 and 7 was held on 29 October 2012 in Ho Chi Minh City with a total of 60 participants (43 male and 17 female). The same workshop for Regions 3, 4 and 5 was held in Da Nang city on 1 November 2012 with a total of 48 participants (26 male and 22 female). The same workshop for Region 1 and Region 2 was held in Hanoi on 5 November 2012 with a total of 58 participants (32 male and 26 female).
- The Lead Epidemiologist made a field trip to Vinh city to explore current surveillance and reporting methods in Region 3. The different farming and marketing systems were investigated and levels of biosecurity were assessed.
- Ongoing analysis was carried out on the spatial distribution of VAHHP and FAO surveillance activities.
- The total number of HPAI outbreaks for 2012 was compiled and spatially referenced.
- A field mission was conducted from 14 to 18 January 2013 to the Mekong Delta to visit live bird markets at Can Tho and Ho Chi Minh City, RAHOs, Sub-departmental Animal Health offices, border area, EPT+ project sites and farms.

- Ha Vy Market was visited in order to:
 - (i) observe the collection of cloacal swabs from spent hens by staff of the SDAH office, as part of the FAO supported spent hens monitoring programme;
 - (ii) observe biosecurity implementation at HaVy market; and
 - (iii) study the marketing chains, hygiene and possible disease transmission pathways.
- A meeting was held with the Epidemiology Team at the DAH and the management of the National Center for Veterinary Diagnostics (NCVD), Hanoi. Three different animal health and surveillance data information systems were discussed and analysed and it was decided that a system currently developed in New Zealand by a Vietnamese PhD student was the most suitable and sustainable. The DAH has submitted a draft proposal for FAO consideration. This system will be developed and implemented on a small scale during 2013, with expansion of all RAHOs and SDAHs in 2014 and 2015.
- Analysing information and data collected from the FAO-supported active and passive surveillance programmes showed that there is a need to adjust the HPAI surveillance support. A meeting was organized with the DAH to discuss the future FAO support of HPAI-related surveillance and monitoring activities. It was decided that FAO will continue to support live bird market monitoring of virus circulation in ducks at 140 locations throughout the country. Support for passive surveillance and spent hen monitoring will discontinue.
- A meeting was held with DAH and counterparts from Cambodia, where it was decided to implement an HPAI support surveillance plan for live bird markets linked to regional strategic objectives. Live bird market monitoring in Viet Nam, in addition to duck sampling, also includes environmental sampling at selected markets in the Mekong region.
- FAO discontinued support of passive surveillance system under the regional control strategy.
- FAO recommended implementing smart phone technology as a reporting system at the community level. This advice was (politically) unacceptable for the Ministry of Agriculture and Rural Development (MARD). FAO will continue to support current linkages in passive surveillance from the community level to formal animal health reporting systems.
- Talking to stakeholders and analysing information and data collected during field visits in Region 3 and Region 7 showed that poultry disease investigations are conducted satisfactorily. Currently, there is no urgent need to conduct training for differential diagnosis of poultry disease outbreak at RAHOs and SDAHs, including poultry post-mortem examination.
- Several independent expert consultants conducted analysis and recommended improvements in the national surveillance system for HPAI and other priority diseases in 2009 and 2010. As the surveillance systems in place have not been adopted to the recommendations, there is currently no need to support DAH to conduct expert consultation on national surveillance system for HPAI and other priority diseases.

Activity 3.3 Strengthening of veterinary laboratories diagnostic activities, including biosafety and quality assurance supported

- Carried out efficiency test of real-time polymerase chain reaction (PCR) primers for the new variant of H5N1 clade 2.3.2.1 virus, the efficiency for which has been confirmed;
- Continued support for rapid and differential diagnosis at RAHO level including other zoonoses/high-impact diseases:
 - Laboratory training and needs assessment at the RAHO No. 5 was conducted from 26 to 28 November 2012. Seven staff participated in the hands-on training on the laboratory diagnosis for HPAI H5N1, Newcastle disease virus, and infectious bursal disease virus (IBDV). Needs for further training and small instruments were identified.
 - The NCVD has received samples of live bird market surveillance from RAHOs for virus isolation and characterization. A total of 80 viruses were isolated out of 175 samples that were positive for influenza A and confirmed by real-time PCR.
- Continued support for the full characterization of viruses isolated from outbreaks and live bird market surveillance:
 - HA gene of 171 H5 viruses collected from outbreaks during October 2012 to March 2013 was sequenced and analysed. The results showed that a variant of H5N1 clade 2.3.2.1 virus.

newly identified in July 2013 has made incursions to the south regions of Viet Nam in December 2012. It has spread to three provinces in the lower Mekong Delta by March 2013. During January and March 2013, three clusters of H5N1 clade 2.3.2.1 virus were circulating in the southern provinces.

- Sequencing of internal genes (PB2, PB1, PA, NP, MA, and NS) of selected H5N1 viruses started. Thirty-two Clade 1.1 viruses, collected during 2012-2013 from outbreaks and live bird markets, were selected for the first lot of sequencing. The results showed 3 out of 32 viruses had evidence of re-assortment with their internal genes.
- review the functions and role of the animal health laboratory system:
 - The discussion has initiated for the short-term and long-term targets of animal health laboratory system.
- support strategy for DAH to assume full technical responsibility for the HPAI laboratory programme:
 - The discussion is ongoing especially for the sustainability of both technical and financial aspects at diagnostic laboratories.

Activity 3.4 Veterinary Epidemiology Network capacity supported

- Continued support for the AVET programme;
- international epidemiologist attended and participated in the “Consultative meeting of epidemiology consortium for emerging zoonotic and transboundary animal disease” in Bangkok, to support regional level epidemiology networks;
- agreement from DAH for FAO including One Health and Risk Assessment and Modeling into the advanced AVET curriculum; and
- started liaising with internal and external partners to develop advanced AVET training course.

Activity 3.5 Further development of M&E expertise in animal health

- Project staff attended the M&E meeting held on 7 March 2013. The results of the meeting were: (i) list of issues, solutions and potential difficulties related to the Performance Management Plan (PMP) data for the period of 1 October 2009 to 31 March 2012 identified; (ii) some follow up actions agreed upon between FAO, WHO, Abt Associates and USAID to finalize the set of PMP indicators for the period of 1 October 2009 to 31 March 2012.
- The project is working together with the M&E Manager from another implementing partner (Abt Associates) on the improvement of the PMP reporting template and data analysis. As a result, the reporting template has been finalized.

Output 4: Priority procurement for animal surveillance and laboratory supported

Activity 4.2 Procurement of consumables to support laboratory activities

- Procurement of lab consumables for NCVD initiated; and
- Developed a list of priority needs for labs, based on request from USAID.

Component 3: Animal response component

Output 5: Effective and timely animal response efforts promoted

Activity 5.1: HPAI risk mapping and risk analysis updated to support regional strategies

- Primary information for hatchery mapping has been collected. Data has been provided by the District Veterinary Stations and SDAH in five provinces in Region 3. Hatchery mapping of Region 3 has been completed.
- Data on hatcheries in Region 6 and 7 have been collected and hatchery mapping in Region 7 and part of Region 6 is ongoing.
- Mapping of live bird markets in region 3, 7 and part of region 6 is ongoing.
- The epidemiologist is periodically updating the risk assessment and mapping. Spatial and temporal, as well as clade analysis, is being conducted as needed.

Activity 5.2: Outbreak control capacity strengthened under regional control strategy

- All 17 existing SOPs were reviewed and crosschecked with the current HPAI situation, animal health situation and Government capacities. The procedures described in the SOPs are still applicable currently and no further review of SOPs for application to outbreak control, including local incident command system and culling principles is needed.
- Talking to stakeholders and analysing information and data collected during field visits in Region 3 and Region 7 showed that poultry disease investigations and HPAI outbreak control are conducted satisfactorily. Currently there is no urgent need to conduct refresher training in outbreak control to support strategic control plans.
- Frequent meetings were held with VAHIP, Abt Associates, PAHI and WHO to assist partners to sensitize grassroots stakeholders on disease control activities.

Activity 5.5 Cross-border dialogue and coordinated surveillance

- A technical consultation between the Department of Animal Health and Production in Cambodia and the DAH in Viet Nam regarding complimentary HPAI activities across the border was held on 21 January 2013 in Hanoi with a total of 25 participants (18 male and 7 female). A proposal was made to conduct parallel/joint activities on surveillance, diagnostics, and market movements.
- A lunch meeting between FAO-ECTAD Viet Nam and China teams was held on 28 February 2013 during the Annual Regional ECTAD Meeting (AREM) in Bangkok to discuss the next Viet Nam-China cross-border dialogue. The two teams agreed that the meeting would be in Viet Nam and targeted 1-15 June 2013 for dates. It was agreed that the meeting should reflect AI and other transboundary animal diseases.
- A meeting between FAO-ECTAD Viet Nam and Cambodia teams was held on 1 March 2013 during AREM in Bangkok to discuss the follow-up actions after the Viet Nam-Cambodia cross-border meeting in January 2013.
- During two international meetings, FAO Viet Nam met with cross-border stakeholders (WHO, FAO and USAID). Follow-up Viet Nam-Cambodia and Viet Nam-China cross-border collaboration meetings are planned for the first half of 2013.
- A rapid assessment/identification of live bird markets and poultry production, poultry movement and trading patterns in the Vietnamese parts of the Mekong bordering Cambodia was conducted. A meeting was held in Dong Thap from 28 to 29 November 2012 to gather information on poultry movement across borders between Viet Nam and Cambodia in Dong Thap with a total of 34 participants (28 male and 6 female). A field visit was made to Hong Ngu district, Dong Thap province from 29 to 30 November 2012. A report on rapid assessment of poultry movement across Viet Nam and Cambodia border has been prepared after the field mission. The findings from the survey were presented in the Viet Nam-Cambodia cross border meeting and will be used as a resource to develop a cooperation plan.

Activity 5.6 Vaccine efficacy assessments and virus surveillance supported at the national level

- Conduct vaccine trials against key circulating clades with a range of vaccines, species and breeds:
 - The vaccine efficacy trial with new H5N1 viruses of 2013 is to be carried out in May 2013. The detailed antigenic analysis is going on for the selection of challenge viruses.
- Monitoring pathogenicity of selected virus isolates from outbreaks and live bird market surveillance:
 - This activity will be carried out at the same time with the vaccine efficacy trial. The selection of H5N1 viruses for challenge is underway by analysis based on genetic characterization.
- Letter of Agreement (LoA) on "Influenza A virus characterization and H5N1 Vaccine Efficacy test" signed with DAH in February 2013.
 - The objective under this LoA is to strengthen the laboratory for the NCVI in conducting vaccine efficacy and pathogen testing as well as influenza A virus characterization.

Output 6: Improved poultry production practices in poultry value chains supported

Activity 6.1 Support programme to strengthen safe poultry production practices including biosecurity

- supported DLP to develop hatchery biosecurity technical guidelines;
- reports on the first and second training courses on Hatchery Biosecurity and Auditing in Can Tho (under the LoA signed with the DLP) have been cleared;
- interim report on Hatchery Improvement (under the LoA signed with DLP) has been cleared;
- regional workshop on composting of duck waste was conducted in Hue on 30 November 2012 under the Biosecurity Working Group meeting to review the duck waste composting model in Quang Tri province;
- report with observations of composting results finalized;
- draft poultry manure management technical guidance developed; and
- planning for developing parent flock biosecurity standards started.

Activity 6.2 Support ongoing activity of the Biosecurity Working Group

- *Support national and regional meetings of the Biosecurity Working Group:*
 - The 20th Biosecurity Working Group meeting with the topic: "Livestock Production Waste Management by Composting" was held in Hue city on 30 October 2012 with a total of 34 participants (24 male and ten female).
 - The 21st Biosecurity Working Group meeting on biosecurity at slaughter houses was jointly held by FAO, Abt Associates and DLP in Can Tho on 27 November 2012 with a total of 42 participants (31 male and 11 female).
 - The 22nd Biosecurity Working Group meeting on the topic of "Hatchery Biosecurity Minimum Standards and Certificate Model in Region 3" was held in Hue on 19 December 2012 with a total of 39 participants (26 male and 13 female).
 - The 23rd Biosecurity Working Group meeting with the topic "Hatchery biosecurity minimum standards and certificate model in Region 6 and Region 7" was held on 3 January 2013 in Ho Chi Min City with a total of 41 participants (34 male and 7 female).
 - The Biosecurity Core Technical Group meeting with the topic "Hatchery biosecurity minimum standards and fumigating procedures" was held in Hanoi on 29 January 2013 with a total of 15 participants (seven male and eight female).
 - The Biosecurity Core Technical Group meeting with the topic "Hatchery Biosecurity technical Guideline" was held in Hanoi on 25 March 2013 with a total of 12 participants (six male and six female).
 - The Biosecurity Working Group meeting with topic "Dissemination of the hatchery hygiene improvement programme results and lesson learnt to provinces in Region 7" was held in Can Tho on 28 March 2013 with a total of 47 participants (33 male and 14 female).

Activities proposed for the next reporting period (April 2013 to September 2013)

Component 1: Preparedness and Planning Component

Output 1: Strategy development for HPAI control

Activity 1.1 Regional HPAI Control Strategy

- develop advocacy strategy for implementation in conjunction with PAII;
- joint planning of activities with other partners to ensure linkage to zonal strategy; and
- support review of progress and report to stakeholders.

Activity 1.2 Develop policy briefs for potential outcomes of the cessation of vaccination

- review previous scenario development and revise as necessary;
- develop concise policy brief based on review and submit to DAII; and
- develop concise brief on scenarios for advocacy at the provincial level.

Activity 1.3 Training in regional control plan management and evaluation

- conduct real-time training in regional control plan management in conjunction with RAHO meetings; and
- support real-time monitoring on the progress of the control plan and report

Output 2: Coordination and communication with donors and other HPAI implementing partners

Activity 2.1 Core FAO Viet Nam team supported and manages project activities

Activity 2.2 Annual project meeting supported

Activity 2.3 Coordination meetings to support regional HPAI control strategy implementation

Activity 2.4 Coordination and sharing of information with other players engaged in HPAI surveillance, risk assessment, value chain and risk mitigation in the poultry sector

Component 2: Animal surveillance component

Output 3: Animal surveillance at the national, regional/zonal, provincial, district and commune level enhanced

Activity 3.1 Strengthening of core capacities for animal disease control and disease control planning within regional control strategies

- support capacity building to develop work plans to implement regional control strategies;
- support capacity building in risk management along value chains relevant to regional control strategies;
- support the development of responses to risk analysis associated with value chains; and
- mentoring of epidemiology units in data analysis and interpretation as required.

Activity 3.2 Animal surveillance programme

- support national surveillance plan for live bird markets;
- support surveillance plan for live bird markets linked to regional strategic objectives;
- support linkages in passive surveillance from community level to formal animal health reporting systems;
- training for differential diagnoses of poultry disease outbreak at RAHO and SDAH including poultry post-mortem examination; and
- develop policy options for incentives to stimulate reporting of disease events and support advocacy for implementation.

Activity 3.3 Strengthening of veterinary laboratories diagnostic activities, including biosafety and quality assurance supported

- supporting laboratory quality assurance through monitoring of performance and SOP review;
- continue support for rapid and differential diagnosis at RAHO level including other zoonoses/high-impact diseases;
- continue support for the full characterization of viruses isolated from outbreaks and live bird market surveillance;
- review the functions and role of the animal health laboratory system; and
- support the strategy for DAH to assume full technical responsibility for HPAI laboratory programme.

Activity 3.4 Veterinary Epidemiology Network capacity supported

- FAO will continue to support for AVET programme. Three international experts will conduct an advanced epidemiology training on risk analysis and spatial epidemiology in May 2013. Two FAO international experts will conduct an eight-day One Health wildlife-farm animals-human

interphase workshop in May 2013 with two field visits included.

- During the planned third alumni meeting in August 2013 a framework for the epidemiology network at the national level will be defined and developed.
- To further support regional level epidemiology networks “The 5th International Workshop on Influenza Risk Assessment and Risk Modeling: Transitioning from Global to Local Assessments” meeting will be held in Hanoi in May 2013.
- The third AVET alumni meeting has been planned and will be supported by FAO in September 2013. This is part of FAO’s continuous support of AVET alumni meetings.

Activity 3.5 Further development of M&E expertise in animal health

- training of managers at RAHO and SDAH on the M&E principles that guide project management;
- support alignment of the overall APII M&E framework to local strategic plans; and
- support managers at RAHO and SDAH in gathering and processing M&E data.

Output 4: Priority procurement for animal surveillance and laboratory supported

Activity 4.1 Procurement of essential supplies and maintenance of laboratory equipment

Activity 4.2 Procurement of consumables to support laboratory activities

Activity 4.3 Determine and support maintenance requirements for laboratories

Activity 4.4 Procurement of supplies to support field surveillance activities

Component 3: Animal response component

Output 5: Effective and timely animal response efforts promoted

Activity 5.1: HPAI risk mapping and risk analysis updated to support regional strategies

- three international experts to conduct an advanced epidemiology training on risk analysis and spatial epidemiology in May 2013 to further enhanced analysis capacity building;
- implementation underway for an international expert to conduct a study in the Mekong region to provide detailed characterization of high-risk value chains including network analysis;
- poultry sector profiling to support the regional strategy;
- applied risk analysis capacity building;
- updating risk assessment and mapping; and
- detailed characterization of high-risk value chains including network analysis.

Activity 5.2: Outbreak control capacity strengthened under regional control strategy

- assist partners to sensitize grassroots stakeholders to disease control activities;
- review application of carcass disposal in outbreak control in local situations within strategic plans; and
- prepare and conduct desktop exercises with public health counterparts.

Activity 5.3 Conduct review of response capability in relation to scenarios developed under activity 1.2

Activity 5.4 Develop tailored compensation mechanisms to support control strategy

- support the development of locally feasible and practical compensation mechanisms to support farmers reporting disease; and
- review outbreak control procedures to enable effective audits to support compensation packages.

Activity 5.5 Cross-border dialogue and coordinated surveillance

- support bilateral meetings with the Governments of China and Cambodia to exchange technical information, including surveillance and risk assessment findings, and risk reduction plans;
- review cross border value chains of high-risk commodities; and
- develop plans to conduct coordinated cross-border surveillance.

Activity 5.6 Vaccine efficacy assessments and virus surveillance supported at the national level

- conduct vaccine trials against key circulating clades with a range of vaccines, species and breeds; and
- monitoring pathogenicity of selected virus isolates from outbreaks and live bird market surveillance.

Activity 5.7 Institutional strengthening in poultry production and animal health advisory systems

- institutional and core function analysis for poultry production and support service;
- capacity needs assessment of key stakeholders; and
- develop the poultry sector advisory services model in collaboration with partners and the Extension Department.

Activity 5.8 Support engagement of private sector in the execution of regional control strategies

- develop a poultry industry forum at the regional level to support the regional control plan; and
- work with other APII partners to engage key value chain stakeholders in regional control strategy.

*Activity 5.9 Support DAH to conduct review of the current draft of the Veterinary Law**Activity 5.10 Support DAH to finalize guidelines to establish Veterinary Statutory Body, including structure, function and mechanism***Output 6: Biosecurity improved and market hygiene practices in commercial and free-ranging poultry raising settings supported***Activity 6.1 Support programme to strengthen safe poultry production practices including biosecurity*

- develop materials and methods with partners, including extension service to scale up hatchery pilot programme in support of regional control strategies;
- facilitate the development of policy and advocacy brief to support practical measures to upgrade the production of day-old ducks;
- support implementing partners with high-level training and advice on hatchery pilot programme;
- collaborate with DLP to develop upstream standards for parent flocks supplying hatcheries conforming to guidelines and pilot test practical implementation at field level;
- continue support for the development of poultry waste disposal systems; and
- develop materials and methods with partners, including extension service to scale up the good production practices in support of regional control strategies.

Activity 6.2 Support ongoing activity of the Biosecurity Working Group

- support national and regional meetings of the Biosecurity Working Group
- support the dissemination of the Biosecurity Working Group findings by partners within the regional control strategy, including the extension service.

Activity 6.3 Provide policy support brief on the inactivation of H5N1 under environmental conditions

- investigate inactivation of H5N1 strains under simulated environmental conditions; and
- develop a policy brief related to the implications of virus survival in the environment.

*Activity 6.4 Pilot training programme for private sector in various guidelines and GPPP developed**Activity 6.5 Training of provincial DARD staff in description and mapping of local poultry sector*

Main challenges encountered and response provided

- The approval of the Government of Viet Nam of the Project Document by FAO and USAID for the project extension (October 2012–September 2013) is still in process. Consequently, many activities, which the counterpart Government agency had primary responsibility for implementing, could not be initiated, owing to this delay in project approval.
- In the country context, the regional approach to HPAI control is a new concept. The Government administrative structure does not provide for a regional mechanism in between the national and provincial authorities in Viet Nam. This is being resolved through advocacy with the Department of Animal Health at the central level, and with the Sub-Departments of Animal Health at the provincial levels, through RAHOs.

Main progress made towards the achievement of project outcomes *(from the start of the project)***Output 1: Strategy development for HPAI control in 2006–2010 supported**

- Consideration of a regional approach to HPAI control rather than a provincial one was promoted and is attracting interest as featured in the Green Book Review and several International Ministerial Conference on Avian and Pandemic Influenza (IMCAPI) documents. The final drafts of the regional HPAI control plans for the north-central region (Region 3) and the Mekong Delta region (Region 7+) were completed.
- A regional/zonal approach has been incorporated into the National Operational Plan on Avian Influenza Control and Prevention (2013-2017).
- A Livestock Emergency Preparedness Plan was developed and submitted to DAH for use in any unusual event in the livestock sector, keeping in view the state of unpreparedness that the Government experienced during the 2003–2004 emergence of HPAI.
- Provincial poultry subsector profiling was effective in describing provincial poultry populations (including the Poultry Atlas), and DLP is considering adopting such an approach more widely.
- Risk assessment and risk-based targeting of control measures are increasingly being included in technical and policy development (however still largely restricted to the control of HPAI). This approach is now expanded and was translated into an HPAI regional control plan particularly for two regions in Viet Nam.
- Guideline for the application of Progressive Control Pathway approach had been finalized.

Output 2: Coordination and communication with donors and other HPAI implementing partners

- Programme management, planning and coordination of activities with USAID and other partners were maintained. FAO made 11 major recommendations for the Green Book Review, which were well received by the Government of Viet Nam as is evident from the newly released follow-up version of the Green Book as an Action Programme on AIPED for the period covering 2011–2016.
- FAO and Abt Associates have a common strategy to risk reduction across the supply chain with a shared activity matrix consolidating the agencies' activities into a single overall approach.
- The first volume of DAH Animal Health bulletin was released in July 2011 (250 copies). The second volume of DAH Animal Health bulletin was released in August 2012 (210 copies).

Output 3: Animal surveillance at the national, district and community level enhanced

- The project provided support to the upgrading of TADinfo and LabNet, and the development of geographic information systems (GIS) at RAHO. A total of 210 officers from SDAH, 14 RAHO staff and five DAH epidemiology staff were trained to use this software. Seven global positioning systems (GPS) and seven licenses of mapping software (ArcView/ArcGIS 9.2) were provided to seven RAHOs (I-VII). A total of 55 SDAH/DAH staff was trained on its use.
- The project also developed a database system software for laboratory diagnostic management within the DAH's LabNet through the services of a local firm in Viet Nam. Laboratory biosafety and quality assurance are being supported and pursued. One laboratory (NCVD) was accredited for ISO17025, and the other laboratories are in the process of accreditation.
- The SOPs for H5N1 real-time PCR were developed and adopted. It has been used at nine veterinary laboratories extensively for passive and active surveillance. The use of real-time PCR was extended

to the differential diagnosis of HPAI, such as Newcastle disease and duck plaque.

- The capacity of genetic sequencing of H5N1 viruses was developed and applied. Genetic analysis of the viruses isolated from HPAI outbreaks in poultry in Viet Nam over several years indicates that Clade 1 is entrenched in south Viet Nam with sporadic forays to central Viet Nam. Clade 2.3.4 used to be the predominant clade for many years in north and central Viet Nam until the winter of 2009/2010. However, clade 2.3.2 viruses have totally replaced the dominance of clade 2.3.4 in late 2010, which continues today. Within the newly emerging clade of 2.3.2.1, an antigenic variant strain of the virus was detected. Adequate technical and material support significantly improved the HPAI diagnostic capacity in the laboratories and antigenic and genomic characterization of H5N1 viruses.
- A revised and updated SOPs for HPAI Outbreak Investigation and Control was developed, comprising 19 sections and 14 job cards for various officials involved in HPAI outbreak management. The English and Vietnamese versions of the SOPs were handed over to DAH for transmission to MARD for adoption as a national strategy.
- The awareness-raising campaign to encourage poultry farmers to report any unusual occurrences of an infectious disease in poultry flocks and the necessity to report it on time was carried out through TV spots and loudspeakers during the risk period (e.g. the TẾT festival).
- The AVET initiative to improve basic epidemiological investigation capacity through Viet Nam, specifically a nine-week-long tailor-made course curricula, resulted in the training of 160 veterinarians in 12 cohorts in the period of 2010–2012. At least one veterinarian of each of the 63 provinces of Viet Nam now has specialized basic skills in veterinary field epidemiology. Two AVET alumni workshops were organized for strengthening the animal health epidemiologist network in Viet Nam and improving the sharing of information.
- Active surveillance for HPAI and other poultry diseases launched to complement the community-based surveillance of Abt Associates yielded valuable insight on the efficacy of the surveillance.
- In the event of an outbreak, a new component was launched in March 2011 for the early detection of any potential secondary outbreaks in the neighbouring area of the index case.
- A cost effectiveness study on surveillance for HPAI was completed. Preliminary findings suggest that there is a qualitative value in surveillance, but the cost of surveillance per outbreak reported is going up with a decrease in the number of outbreaks of HPAI in Viet Nam.
- Live bird market surveillance for subclinical infection of ducks sold at the markets in 30 high-risk provinces indicated widespread circulation of AI virus and also H5N1 viruses, in particular.
- More than 300 copies of the Wild Bird Manual were translated into Vietnamese and distributed to 63 provinces.

Output 4: Priority procurement for animal surveillance and laboratory supported

- Procurement of vehicles, information technologies (IT) equipment, equipment sprayers and most laboratory consumables is complete, and all are in use.

Output 5: Effective and timely animal response efforts promoted

- A cross-border study in the north of Viet Nam concluded that as a result of a high financial return for poultry, smuggling across the border has not decreased, but has become more elaborate, which will pose a constant risk of disease transmission. The market chain is increasingly being recognized as critical to the control of HPAI, particularly in northern Viet Nam, and FAO's strategic targeting of live bird markets was validated.
- Hatchery data collection and mapping in five pilot provinces was completed. Hatchery minimum biosecurity standards were developed through a stakeholder consultation process. A hatchery audit and certification tool was developed, and training was provided to the Government staff on the procedure for hatchery auditing and certification. Hatchery data collection and mapping in five provinces in Region 3 (Thanh Hoa, Nghe An, Ha Tinh, Quang Binh, Thua Thien Hue) and all of Region 3 have been completed.
- Post-vaccination monitoring and virus circulating surveillance for influenza A/H5N1, supported by this project, shows that vaccinated poultry have a protection rate of 72.10 percent at the bird level. The protection rates of Muscovy ducks, turkey, other ducks, chicken and geese were: 80 percent, 80 percent, 78.90 percent, 68.05 percent and 50 percent, respectively. Prevalence of Type A and

H5N1 AI viruses in ducks were 0.94 percent and 0.67 percent, respectively, while in chickens, respective prevalence was 0.54 percent and 0 percent. There was no evidence of AI virus persistence found with the samples taken from Muscovy ducks. The AI positive samples were from Khanh Hoa and Quang Ngai provinces (Centre). Currently, the Government of Viet Nam halted mass vaccination of poultry against HPAI.

- A training course on good management practices to key stakeholders –the National Veterinary Company (NAVETCO), Viet Nam’s Veterinary Vaccine Company (VETVACO) and DAH – was conducted, which covered introductory level good manufacturing practices (according to the 2009 Pharmaceutical Inspection Convention/Pharmaceutical Inspection Co-operation Scheme [PIC/S] Code of GMP) and quality systems applicable to the manufacture of AI H5N1 vaccines.
- The operational appraisal of cold chain integrity was completed, and 39 provinces were provided with walk-in cold rooms. Software for inventory maintenance of vaccine banks in provinces was developed.
- Capacity for animal challenge testing was developed, following the completion of a high biosecurity animal isolation unit at NCVD. The unit applied for vaccine efficacy tests since 2007 to monitor the adequacy of vaccines against the evolving H5N1 viruses. An antigenic variant of H5N1 virus was found in 2011, for which the vaccine currently in use was not effective.

Output 6: Improved biosecurity practices in commercial and scavenging poultry raising settings supported

- Poultry sector profiling provides important tools for risk-analysis and strategic disease control planning. A guide to provincial poultry sector profiling was developed. Poultry sector profiling was completed for four of the five project provinces. The guidelines are currently being tested externally by an implementing partner in three non-USAID pilot provinces.
- A Biosecurity Working Group was established, which provides a forum to network information and lessons learned, building technical understanding among a peer group of agencies working to strengthen biosecurity.
- A framework for a database on biosecurity materials was developed, and its consolidation is in progress. By now, over 100 documents were compiled in a searchable format. This is now ready for dissemination. Biosecurity activities of all agencies engaged in related work have also been mapped.
- The Working Group reviewed work on hatchery biosecurity. Training on the principles of biosecurity and on biosecurity auditing was provided to 16 members of the Biosecurity Working Group. Conventional approaches to biosecurity strengthening were reviewed and evidence gathered to support adoption of a supplementary approach focusing on private sector driven activities and adopting social marketing techniques from the human health sector.
- FAO and Abt Associates liaised on hatchery technical training and registration schemes.
- A regional risk analysis exercise was conducted, which provided information on the character of poultry movement and production in the lower Mekong region, identifying poultry movements and risk pathways for inter-provincial transmission of infection.

Output 7: Communication capacity supported at DAH and technical inputs to communication activities of other USAID implementing partners are provided

- FAO supported the calendar and sticker production and distribution for pre-TÉT festival 2010, sending out the message to call the hotline or the SDAH landline to report ill and dead poultry under the Enhanced Reporting component.
- Under the Gathering Evidence for a Transitional Strategy (GETS) project (closed in February 2012), the Academy for Educational Development produced a commercial, which encouraged poultry owners to report ill and dead poultry to SDAH via a hotline or SDAH phone numbers. This was used effectively in this project for awareness-raising purposes.
- Support to DAH communications and technical support to Abt Associates in implementing the field activities was maintained.
- The interim Team Leader completed his assignment with the ECTAD Viet Nam programme in November 2012. The new Senior Technical Coordinator commenced his assignment as Senior Technical Coordinator/Team Leader for the ECTAD Viet Nam programme in December 2012.

Project Monitoring Sheet: **OSRO/RAS/605/USA Baby 03**Project Title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)**Reporting period: **April to September 2012**

Country: Nepal
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)
Code: OSRO/RAS/605/USA Baby 03
Budget: USD 1 215 000 (Phases I-V) and USD 279 000 (Phase VI)
Total budget: USD 1 494 000
Effective starting date: 1 August 2006
Planned end date: 30 September 2013
<p>Context of the project</p> <p>The project is supporting the Government of Nepal in strengthening its capacity to detect and contain Highly Pathogenic Avian Influenza (HPAI). The first outbreaks of HPAI in Nepal occurred during the period from January to March 2009. In 2010, multiple outbreaks occurred during the same months, with another single outbreak detected in the poultry-producing hub of Chitwan in October. The 2009 outbreaks were caused by H5N1 virus of clade 2.2, prevalent in West Bengal, while the 2010 outbreaks were attributed to clade 2.3.2.1, previously unrecorded in South Asia. Clade 2.3.2.1 reappeared in the Kathmandu valley in November 2011 (backyard poultry), and in January 2012 (crows) and again in March 2012 (commercial). Nine outbreaks occurred in the eastern region in January and February 2012. All isolates from 2010 onwards have been shown to be closely related, and this clade is now endemic in Nepal. The Government's resources, including those provided by international donors, have been severely stretched. The project has provided essential capacity building for preparedness and response.</p>
<p>Objectives of the project</p> <p>The overall objective of the project is that HPAI and other emerging infectious diseases are effectively prevented and controlled on a national scale, thereby minimizing risks to human health, food security and livelihoods. The anticipated outcome is that the Department of Livestock Services (DLS) is enabled for early detection, prompt and accurate diagnosis, and effective response to HPAI at national level.</p>
<p>Activities planned for the reporting period (April to September 2012)</p> <p>Output 1: Cross-sectoral coordination at national level strengthened</p> <p><i>Activity 1.1. Conduct regular meetings with DLS, the Directorate of Animal Health (DAH), Central Veterinary Laboratory (CVL) and Veterinary Epidemiology Centre (VEC)</i></p> <ul style="list-style-type: none"> • While some progress was made towards the standardization of reporting procedures for outbreaks of disease to internationally accepted standards and making use of reference laboratories to confirm or expand on CVL diagnostic outputs, questions remain over the failure to detect H5N1 in the western parts of the country or in Chitwan, and this demands further analysis at high level. <p><i>Activity 1.2. Maintain coordination with the subregional Emergency Centre for Transboundary Animal Diseases (ECTAD) management and regional support unit of the European Union (EU)-South Asian Association for Regional Cooperation (SAARC) Highly Pathogenic and Emerging Diseases (HPED) programme</i></p> <ul style="list-style-type: none"> • Continued support of and strengthened links between regional and national programmes, including ECTAD's ongoing commitment to the One Health approach.

Activity 1.3. Advise and support DLS in planning and implementing a sustainable programme for the prevention, early detection and rapid response to HPAI and other emerging infectious diseases

- Continue to work with the DLS to establish processes that meet scientific criteria, while being financially accessible (in the longer term, the department must target the development of self-supported and sustainable programmes to implement its activities as both disease surveillance and response are resource-hungry procedures).

Output 2: Aspects of disease surveillance related to outbreak investigation strengthened

Activity 2.1. Reinforce the use of enhanced surveillance at an additional four sites in targeted districts

- Continue the programme into April, collate and analyse data with a view to efficiency and effectiveness, and provide guidance on any adjustments to be made to the methodology or its implementation.

Activity 2.2. Provide technical guidance to the DLS, DAH and VEC on the planning, setup and monitoring of targeted active surveillance

- Continue to support VEC as the key DAH unit for designing and managing both active and passive disease surveillance and reporting, and ensure that the unit is fully staffed and adequately resourced.

Activity 2.3. Review the current surveillance strategy

- Organize a review workshop to match the surveillance approach to the realities of the epidemiology of HPAI in Nepal.

Output 3: Emergency preparedness and response capacity strengthened

Activity 3.1. Evaluate the appropriateness of current policies, strategies and standard operating procedures (SOPs) for response

- Review, and if necessary, update policies, strategies and SOPs considering the issues, such as culling strategies, compensation levels and possible use of vaccination.

Activity 3.2. Reinforce rapid response training in eight districts

- Conduct the planned training during the coming semester.

Activities undertaken during the reporting period (April to September 2012)

Output 1: Cross-sectoral coordination at national level strengthened

Activity 1.1. Conduct regular meetings with DLS, DAH, CVL and VEC

- The project team met monthly with the officers in charge of the technical units at DAH, CVL and VEC and relevant scientific officers both centrally and in the regions. The Country Team Leader (CTL) liaised with visiting scientific missions from the Food and Agriculture Organization of the United Nations (FAO) headquarters (Foot-and-Mouth Disease [FMD] field training), the IDENTIFY project (CVL biosafety audit) and Massey University (One Health project). Topics addressed during this period included the following:
 - April 2012: Procurement of Virkon S and personal protective equipment (PPE) (through the United States Agency for International Development [USAID] DELIVER project)
 - April 2012: Procurement of the International Air Transport Association (IATA)-approved virus transport containers for VEC (through FAO's Regional Office for Asia and the Pacific [RAP])
 - April 2012: Procurement of avian influenza Rapid Antigen Detection Kits for VEC and the Regional Veterinary Laboratories (RVLs) (through RAP)

- May 2012: Report on the outcome of HPAI surveillance from November to April.
- May/June 2012: Planning and logistics for FMD real-time training (FAO Rome)
- June 2012: Progressive control of FMD (DAH and the European Commission [EC]/FAO SAARC Regional Support Unit [RSU])
- June 2012: Avian Influenza vaccination policy (DAH with inputs from FAO Rome)
- July 2012: Biosafety at CVL (CVL staff in coordination with USAID IDENTIFY project)
- July 2012: Rabies control in Nepal (DAH in coordination with the Australian Animal Health Laboratory [AAHL])
- August 2012: One Health approach (in coordination with Massey University)

Activity 1.2. Maintain coordination with the subregional ECTAD management and regional support unit of the EU-SAARC HPED programme

- The CTL works closely with the EU-SAARC HPED project manager and facilitates the link between RSU members and relevant country programmes, participating in meetings at DAH on the progressive control of FMD and contributing to the regional workshop on communication.

Activity 1.3. Advise and support DLS in planning and implementing a sustainable programme for the prevention, early detection and rapid response to HPAI and other emerging infectious diseases

- The project provided the Director-General of DLS with a progress report of the targeted active surveillance programme including detailed conclusions and recommendations. In addition, reports have been made available of the recommendations on the outbreak response table-top exercises carried out regionally and of the training for village animal health workers and other community contact persons, which will assist the department in planning future interventions in this area. The CTL also worked with the DAH chief in preparing a response to poultry producers in relation to H9 virus vaccination.

Output 2: Aspects of disease surveillance related to outbreak investigation strengthened

Activity 2.1. Reinforce the use of enhanced surveillance at an additional four sites in seven targeted districts

- Data gathering was completed in April and monitoring visits were made to each site on a two monthly schedule, after which the data was collated and analysed. In May, round-up meetings with the participating district officers and field staff provided feedback on adjustments to be made to the methodology and implementation. Two one-day training sessions for 42 site technicians were held, and their community contacts were well received.

Activity 2.2. Provide technical guidance to the DLS/DAH/VEC on the planning, set-up and monitoring of targeted active surveillance

- The project management continued to advocate the adoption of the VEC as the key DAH unit for designing and managing both active and passive disease surveillance. Technical meetings took place monthly, and DAH/VEC officers fully participated in the field exercise and monitoring missions. VEC was strengthened through the placement of an additional officer.

Activity 2.3. Review the current surveillance strategy

- The surveillance data gathered during the first semester was assimilated into a review document, while a review workshop held in September with 45 participants provided a forum for additional consideration of the present strategies for detection.

Output 3: Emergency preparedness and response capacity strengthened

Activity 3.1. Evaluate the appropriateness of current policies, strategies and SOPs for response

- The current Bird Flu Order does not permit the use of avian influenza vaccination in Nepal.

Poultry entrepreneurs, through their associations, have pressed for an amendment to this policy to allow the vaccination against H9N2 avian influenza virus, as this is widespread in some areas (e.g. Chitwan and Kaski districts) and is of concern to producers. During field missions to Chitwan district, the project management was made aware of the use of a vaccine sourced from India said to contain avian influenza antigen while FAO forwarded information on inquiries directed at international procurement. The project management sought and provided to DAH information on H9 vaccine availability and use.

- The level of preparedness and response capacity achieved through project-led interventions may now be regarded as satisfactory, but the nature of the evolving threat from HPAI in Nepal necessitates a continual review of the DAH strategies and SOPs.

Activity 3.2. Reinforce rapid response training in eight districts

- The training was completed for field staff from five districts during September 2012. Districts participating were as follows:
 - Dhangadhi: Bajhang, Bajura and Acham districts (52 participants of which two were women)
 - Nepalgunj: Rolpa and Jarjakot districts (31 participants of which two were women)

Planned activities for the next six-month period (October 2012 to March 2013)

Output 1: Planning and cross-sectoral coordination at national level strengthened

In order to achieve the above output, the following activities will be carried out:

- Activity 1.1 Support the Government in planning and coordinating inputs at national level. Working closely with DLS, DAH, CVL, VEC and the World Bank-funded zoonoses control project team, the project management will seek to attain a holistic and synergistic government programme that adequately addresses the evolving challenges of avian influenza in Nepal and successfully coordinates the participating stakeholders.
- Activity 1.2 Support regional and international coordination related to disease control. Facilitating links between regional and international projects and programmes with national programmes to encourage effective and efficient use of available resources for disease prevention and control under a One Health approach.

Output 2: Surveillance methodologies assimilated and integrated into DLS' regular programmes

In order to achieve the above output, the following activities will be carried out:

- Activity 2.1 Conduct assessment and planning stakeholder workshops at development region level with inclusion of animal and human health and civil authorities. This activity will focus upon those districts currently deemed to be most at risk of appearance or re-appearance of HPAI and will benefit from the inclusion of local stakeholders and development partners to ensure that available resources are effectively applied to implement national strategies and SOPs.
- Activity 2.2 Provide technical guidance to VEC in designing, setting up, implementing and monitoring disease surveillance activities. The aim will be to ensure that all surveillance activities, however funded, fall under the guidance and overview of the VEC, such that data can be effectively collated and analysed to provide the Director-General of DLS through DAH with evidence-based information upon which control strategies can be dynamically directed. The principal mechanism to effect this will be through programmed meetings of a technical group under the chairmanship of the Programme Director, Animal Health through which the project management will provide technical guidance and links to appropriate ECTAD Technical Units.
- Activity 2.3 Provide technical orientation to the concerned field staff at district and regional level on the effective implementation of targeted active surveillance for HPAI.

The aim will be to encourage the incorporation of surveillance activities into the district and regional programmes to engender sustainability beyond the period of project support. This will build upon the experience of the development of this programme over the preceding three project years as well as reflect the current knowledge on the epidemiology of the disease in Nepal.

- **Activity 2.4** In coordination with DAH conduct six-monthly reviews and adjust programmes as necessary.

The challenges presented by HPAI have varied from a cross-border incident in 2009, appearing in the western districts through introduction via infected migratory birds, and more recently re-appearing in the eastern districts and in the capital city itself. This demands continuous assessment. To this end, the Project Management will present DAH with a report reviewing the situation at the conclusion of the major risk period and towards the conclusion of the project year. A workshop will be held to assist the Department in defining its strategy for the next risk period.

Output 3: VEC achieves a comprehensive and evidence-based knowledge on the endemicity of HPAI in Nepal.

In order to achieve the above Output, the following activities will be carried out:

- **Activity 3.1** Support and facilitate epidemiology working groups to analyse available data (national and international) and make recommendations.

Reflecting the need to gain a complete understanding of the epidemiology of H5N1 infection in Nepal to correctly align control measures, the project will facilitate and support epidemiology working groups to consider the implications arising from the information gathered through surveillance activities, laboratory diagnostic findings and also phylogenetic associations submitted to reference laboratories.

- **Activity 3.2** Provide technical guidance to field studies with particular emphasis on market chains and live bird markets in southeastern districts with reference to cross-border chains and Gangetic plain association.

As more government veterinarians are exposed to basic epidemiology training through the Field Epidemiology Training Programme for Veterinarians, the project will seek to guide and mentor epidemiological studies in the field of avian influenza to fill gaps in the knowledge base and provide an additional source of information to feed into the epidemiology working group.

Main challenges encountered and response provided

- Maintaining coordination at DLS level between all actors and agencies involved with the avian influenza programme remains a challenge, even to a greater extent with the entry of the latest World Bank-funded zoonoses project. Other smaller projects, such as the Massey University One Health project also overlap with certain HPAI control objectives while USAID's IDENTIFY element of the EPT project as well as the EU-funded FAO implemented regional SAARC project includes HPAI as one of its target diseases. FAO is well positioned through its ECTAD Unit in Nepal to support and assist the DLS in the task of coordinating animal health aspects, keeping abreast of developments and interacting with relevant partners.
- The pattern of HPAI outbreaks from year to year continues to pose questions to the authorities responsible for detection, diagnosis and control. The reappearance of the disease in the eastern region in 2012 was not anticipated, as the focus of disease in the preceding two years had been in the central and western regions. However, the 2012 outbreaks were shown to be owing to the same clade of the H5N1 virus that had caused the 2012 and 2011 outbreaks, but different from the clade associated with the earlier 2009 outbreaks. A full picture of the dispersal of avian influenza virus in Nepal is still lacking. The project has contributed significantly to the existing knowledge through support of an effective targeted active surveillance programme to enhance the information gathered through passive reporting of suspect HPAI cases, and continues to encourage the integration of this methodology into the regular government programme.

Main progress made towards the achievement of project outcomes**Output 1: Cross-sectoral coordination at national level strengthened**

- Notwithstanding its modest annual operating budget provisions, this USAID-funded project, active in Nepal over a six-year period, has developed a comprehensive understanding of the issues that bear upon HPAI prevention, detection and control in Nepal. The Project Management's close working relationship has ensured fruitful collaboration with DLS and the technical units of DAH, while FAO's standing in the forefront of global HPAI control strategy development and its leading position in adopting a One Health approach has contributed to the Project Management maintaining an overarching and effective communication with development partners and national stakeholders.

Output 2: Aspects of disease surveillance related to outbreak investigation strengthened

- In close collaboration with VEC, the project developed a comprehensive HPAI surveillance programme, including country-wide passive surveillance supported by active surveillance targeting districts categorized as high risk. Combined with support to the veterinary diagnostic laboratories, this has provided a basis for monitoring the avian influenza situation. The results from this programme have guided continued evaluation of national strategy and the mechanisms for its implementation.

Project Monitoring Sheet: **OSRO/RAS/605/USA Baby 03**

Project Title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)**

Reporting period: **October 2012 to March 2013**

Country: Nepal
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)
Code: OSRO/RAS/605/USA Baby 03
Budget: USD 1 494 000 (Phases I-VI) and USD 100 000 (Phase VII)
Total budget: USD 1 594 000
Effective starting date: 1 August 2006
Planned end date: 30 September 2013
<p>Context of the project</p> <p>The project supports the Government of Federal Democratic Republic of Nepal in strengthening its capacity to detect and contain Highly Pathogenic Avian Influenza (HPAI). The first outbreaks of HPAI in Nepal occurred during the period from January to March 2009. In 2010, multiple outbreaks occurred during the same months, with another single outbreak detected in the poultry-producing hub of Chitwan in October. The 2009 outbreaks were caused by H5N1 virus of clade 2.2, prevalent in West Bengal, while the 2010 outbreaks were attributed to clade 2.3.2 and is presently classified as 2.3.2.1. During the period from November 2011 to March 2012, nine outbreaks were detected in poultry in the eastern region and three in the Kathmandu valley. Two cases were also recorded in wild birds. Towards the end of 2012 two further outbreaks in the Kathmandu valley were confirmed as H5N1 in reference laboratories while during the first months of 2013, 14 suspected outbreaks were diagnosed as H5 infections at the Central Veterinary Laboratory (CVL), Kathmandu. All isolated cases from 2010 onward have been shown to be closely related; this clade is now endemic in Nepal. The Government's resources, including those provided by international donors, have been severely stretched. The project has provided essential capacity building for preparedness and response.</p>
<p>Objectives of the project</p> <p>The overall objective of the project is for HPAI and other emerging infectious diseases to be effectively prevented and controlled on a national scale, thereby minimizing risks to human health, food security and livelihoods. The anticipated outcome is that the Department of Livestock Services (DLS) is enabled for early detection, prompt and accurate diagnosis, and effective response to HPAI at the national level.</p>
<p>Activities planned for the reporting period (October 2012 to March 2013)</p> <p>Output 1: Planning and cross-sectoral coordination at national level strengthened</p> <p>In order to achieve the above output, the following activities were planned:</p> <p>Activity 1.1 Support the Government in planning and coordinating inputs at the national level.</p> <p>Working closely with DLS, CVL, Directorate of Animal Health (DAH) and the Veterinary Epidemiology Centre (VEC), the project management will seek to attain a holistic and synergistic government programme that adequately addresses the evolving challenges of avian influenza in Nepal and successfully coordinates the participating stakeholders.</p> <p>Activity 1.2 Support regional and international coordination related to disease control.</p> <p>Facilitating links between regional and international projects and programmes with national programmes to encourage effective and efficient use of available resources for disease prevention and control under a One Health approach.</p>

Output 2: Surveillance methodologies assimilated and integrated into DLS' regular programmes

In order to achieve the above output, the following activities were planned:

Activity 2.1 Conduct assessment and planning stakeholder workshops at development region level with the inclusion of animal health, human health and civil authorities.

This activity will focus on those districts currently deemed to be most at risk of appearance or re-appearance of HPAI and will benefit from the inclusion of local stakeholders and development partners to ensure that available resources are effectively applied to implement national strategies and standard operating procedures (SOPs).

Activity 2.2 Provide technical guidance to the VEC in designing, setting up, implementing and monitoring disease surveillance activities.

The aim will be to ensure that all surveillance activities, however funded, fall under the guidance and overview of the VEC, such that data can be effectively collated and analysed to provide the Director-General (DG) of DLS through DAH with evidence-based information upon which control strategies can be dynamically directed. The principal mechanism to effect this will be through programmed meetings of a technical group under the chairmanship of the Programme Director, Animal Health (PD-AH), through which the project management will provide technical guidance and links to appropriate ECTAD technical units.

Activity 2.3 Provide technical orientation to the concerned field staff at district and regional level on the effective implementation of targeted active surveillance for HPAI.

The aim will be to encourage the incorporation of surveillance activities into the district and regional programmes to engender sustainability beyond the period of project support. This will build upon the experience of the development of this programme over the preceding three project years and also reflect the current knowledge on epidemiology of the disease in Nepal.

Activity 2.4 In coordination with DAH conduct six-monthly reviews and adjust programmes as necessary.

The challenges presented by HPAI have varied from a cross-border incident in 2009, appearing in the western districts through introduction via infected migratory birds, and more recently re-appearing in the eastern districts and in the capital city itself. This demands continuous assessment. To this end, the Project Management will present DAH with a report reviewing the situation at the conclusion of the major risk period and towards the conclusion of the project year. A workshop will be held to assist the Department in defining its strategy for the next risk period.

Output 3: VEC achieves a comprehensive and evidence-based knowledge on the endemicity of HPAI in Nepal.

In order to achieve the above Output, the following activities were planned:

Activity 3.1 Support and facilitate epidemiology working groups to analyse available data (national and international) and make recommendations.

Reflecting the need to gain a complete understanding of the epidemiology of H5N1 infection in Nepal in order to correctly align control measures, the project will facilitate and support epidemiology working groups to consider the implications arising from the information gathered through surveillance activities, laboratory diagnostic findings and also phylogenetic associations submitted to reference laboratories.

Activity 3.2 Provide technical guidance to field studies with particular emphasis on market chains and live bird markets in south-eastern districts with reference to cross-border chains and Gangetic plain association.

Activities undertaken during the reporting period (October 2012 to March 2013)

Output 1: Planning and cross-sectoral coordination at national level strengthened

Activity 1.1 Support the Government in planning and coordinating inputs at the national level.

The project team has worked closely with DLS, DAH, CVL and VEC particularly in addressing the challenges posed by the several outbreaks of HPAI identified during the reporting period.

Activity 1.2 Support regional and international coordination related to disease control.

The project has facilitated participation of DLS officers in the Prince Mahidol Award Conference to encourage a One Health approach to disease control. In addition to ongoing coordination between the Food and Agriculture Organization of the United Nations (FAO) regional Emergency Centre for Transboundary Animal Diseases (ECTAD) unit and the DLS, the project team has assisted in the organization and implementation of real time foot-and-mouth clinical and epidemiological studies organized by FAO headquarters. Links have been maintained with the European Unions-Highly Pathogenic Emerging Diseases (EU-HPED), South Asian Association for Regional Cooperation (SAARC) regional project. A meeting with officers from the United States Embassy together with colleagues from the United States Agency for International Development (USAID) served to update the latter on the developing HPAI situation in Nepal.

Output 2: Surveillance methodologies assimilated and integrated into DLS' regular programmes

Activity 2.1 Conduct assessment and planning stakeholder workshops at development region level with the inclusion of animal health, human health and civil authorities.

This activity has been rescheduled to April and May 2013 owing to the prior demands on the regional and district offices of the re-emerging HPAI outbreaks during the winter semester.

Activity 2.2 Provide technical guidance to VEC in designing, setting up, implementing and monitoring disease surveillance activities.

The national project director has collaborated extensively with the PD-AH and the staff of the VEC in the planning and implementation of the HPAI surveillance programme. A joint monitoring programme has been set up with field visits to 19 district livestock service offices (DLSOs) and 26 service centres in three of the five development regions operating as active surveillance sites.

Activity 2.3 Provide technical orientation to the concerned field staff at district and regional levels on the effective implementation of targeted active surveillance for HPAI.

Nine surveillance orientation workshops have been completed to date, benefiting 265 field staff (including 10 female staff members), from 20 high-risk and 21 medium-risk districts in the five development regions. Information was given on the national surveillance programmes (both passive and active) and the methodology and practice of the active surveillance system was reinforced.

Activity 2.4 In coordination with DAH conduct six-monthly reviews and adjust programmes as necessary.

The project team has drawn on multiple data sources through: (i) face-to-face interaction with technical unit officers at the central, regional and district levels; (ii) interaction with field staff and farmers; (iii) results gathered from regional and central laboratories; and (iv) confirmatory and analytical tests conducted in overseas reference laboratories. This was aimed at assembling an accurate picture of the worrying developments and apparent expansion of the disease in the country. Project Management will present DAH with a report reviewing the situation at the conclusion of the major risk period (Oct-Mar) and

again towards the conclusion of the project year. The information presently at hand has been communicated to the Nepal office of USAID (Feb 2013) and also through the Annual Regional ECTAD-RAP (Regional Office for Asia and the Pacific) Meeting in Bangkok (28 Feb – 1 March 2013).

Output 3: VEC achieves a comprehensive and evidence-based knowledge on the endemicity of HPAI in Nepal.

Activity 3.1 Support and facilitate epidemiology working groups to analyse available data (national and international) and make recommendations.

In coordination with the regional support unit of the FAO-EU-SAARC programme, and with guidance from the relevant regional experts at ECTAD-RAP, the project encouraged the forming of the epidemiology working group which is now active and is conducting investigation into the status and relevance of the apparent high prevalence of H9N2 in the country and particularly in the major poultry production zones. The outcome is intended to guide the DLS on its attitude towards vaccination against this sub-type as demanded by the commercial producers.

Activity 3.2 The project team has provided technical guidance to the concerned parties based on the project's own poultry market chain studies in order to assist in the elaboration of study proposals on market chains involving other food producing species.

Planned activities for the next six-month period (April 2013 to September 2013)

Output 1: Planning and cross-sectoral coordination at national level strengthened

Activity 1.1 Support the Government in planning and coordinating inputs at national level.

The project team will work closely with the DLS and particularly with the DAH, CVL and VEC to address concerns relating to the HPAI diagnostic capability at the CVL and related Regional Veterinary Laboratories (RVLs). Together with FAO colleagues from the Kathmandu-based Regional Support Unit (RSU) of the FAO-EU-SAARC regional programme, the project team will facilitate the collection of data to assist in decision making on the question of vaccination against the H9N2 sub-type virus prevalent in Nepal and consider the findings in relation to the effects on poultry production and possible interference with H5N1 detection.

Activity 1.2 Support regional and international coordination related to disease control.

The project team will continue the coordination with FAO-ECTAD-RAP to provide an emergency expert mission to examine and investigate variations in the laboratory findings between the CVL and reference laboratories to identify possible causes and to make recommendations for improvement. As a first step, an FAO virologist is anticipated to be fielded in early April 2013 with financial support from this project. At the request of the PD-AH, the Country Team Leader will continue efforts to identify international technical assistance and associated funding to implement a follow-up mission to the IDENTIFY- funded bio-safety mission with particular regard to the completion of the post-mortem room facilities and the adoption of satisfactory SOPs to reduce possible cross contamination in that unit. Similarly, efforts will be continued to identify an appropriate expert and required funding to support a longer-term (one month) duration mission to review and upgrade the operating procedures in the CVL virology section. The Country Team Leader will continue interaction with relevant FAO-ECTAD-RAP experts to provide necessary tools to analyse the need for action to control H9N2 infection. The project team will coordinate with the USAID country office to ensure the latter is kept informed of developments and FAO's analysis of the situation and needed responses.

Output 2: Surveillance methodologies assimilated and integrated into DLS' regular programmes

Activity 2.1 Conduct assessment and planning stakeholder workshops at development region level

with inclusion of animal health, human health and civil authorities.

During the period, the project will organize three workshops, one each in the central, eastern and western development regions in advance of the next risk period. The focus will be on those districts currently deemed to be most at risk of appearance or re-appearance of HPAI and will benefit from the inclusion of local stakeholders and development partners to ensure that available resources are effectively applied to implement national strategies and SOPs.

Activity 2.2 Provide technical guidance to the VEC in designing, setting up, implementing and monitoring disease surveillance activities.

The project team will extend the gains already achieved in the handover of avian influenza surveillance activities to the VEC through technical collaboration with the PD-AH and joint field work with the VEC.

Activity 2.3 Provide technical orientation to the concerned field staff at district and regional level on the effective implementation of targeted active surveillance for HPAI.

The process of incorporation of surveillance activities into the district and regional programmes is advancing but the methodology is less well understood in some districts that have not benefited from direct FAO surveillance management in the past. The VEC will be supported in monitoring the implementation in those districts deemed deficient and training of surveillance site community contact persons will be conducted in two eastern region locations during this period.

Activity 2.4 In coordination with DAH conduct six-monthly reviews and adjust programmes as necessary.

The reappearance of H5N1 HPAI during the risk period of October to March appears to be well established. While the disease favours poultry-dense districts, it has shown the ability to appear over a wide area of the country from the far east to the far west. The department is tasked with maintaining stakeholder alertness and ensuring that the Government services are efficient in confirming infection and responding accordingly. The project will coordinate with the DAH in conducting six-monthly lessons learned review workshops.

Output 3: VEC achieves a comprehensive and evidence-based knowledge on the endemicity of HPAI in Nepal.

Activity 3.1 Support and facilitate epidemiology working groups to analyse available data (national and international) and make recommendations.

Earlier work has indicated that Nepal faces three significant risks for introduction of HPAI. Cross border introduction through informal trading patterns and introduction by infected migratory birds add to the possible resurgence from virus maintained in domestic duck populations. Value chain studies have given an understanding of the movement patterns that facilitate spread. The project team will assist the department in building on this basic knowledge with the additional information obtained through analysing the outbreak pattern from each new wave of outbreak and to interpret this data to identify required adjustments to the controls in place.

Activity 3.2 Provide technical guidance to field studies with particular emphasis on market chains and live bird markets in south-eastern districts with reference to cross-border chains and Gangetic plain association.

The project team has acquired a considerable database of information and extensive field based knowledge of the factors concerned in the maintenance of H5N1 infection in Nepal and is ready to share and discuss this information with colleagues within the department in order to contribute to efforts that throw light on issues that demand further study.

Main challenges encountered and response provided

- The early identification of outbreaks calls not only for awareness and alertness on the part of poultry keepers but also for their understanding of the importance of this poultry disease in terms of pandemic prevention and their cooperation with government policies and strategies for its control and elimination. Such cooperation is only possible if: (i) the measures imposed on the producers can be seen by them as reasonable in relation to the degree of threat; (ii) the compensation offered is adequate; and (iii) the assistance given in re-establishing production in commercial units is sympathetic to the economics of production. Without these inducements, owners will be tempted to limit their financial losses either by destroying their own flocks with a view to immediate replacement or, when possible, marketing their birds, even at reduced returns, which contributes to disease spread. Government policy with regard to response and compensation has moved significantly over time to reduce the negative impact of control measures on flock owners. Culling zones have been curtailed from a three kilometre radius around an infected premises to the actual premises itself and in contact properties. Although, compensation has been increased, in many cases, it remains below actual market value. Furthermore, restocking periods have been reduced. The adjustments made are still below producers' expectations and more needs to be achieved.
- Critical to the Government's strategy of early detection and rapid response is the capability to provide a rapid and accurate mechanism for confirming the presence of the H5N1 avian influenza virus. To this end, specific capacity development has been a corner stone of international assistance, mediated through technical assistance, in-house training and overseas placements in accredited reference centres. To some extent, this investment has been undermined through transfer of skilled staff members from the core diagnostic facilities to other units. Concerns have been raised over recent diagnostic outcomes that merit urgent attention to allay challenges. The project has responded by arranging for a short-term training mission by an FAO virologist skilled in this area. In the long term, there is a need for CVL participation in regional or international proficiency testing programmes to maintain confidence.

Main progress made towards the achievement of project outcomes

1: Planning and cross-sectoral coordination at national level strengthened

Notwithstanding its modest annual operating budget provisions, this USAID-funded project, active in Nepal over a six-year period, has developed a comprehensive understanding of the issues that bear upon HPAI prevention, detection and control in Nepal. The Project Management's close working relationship has ensured fruitful collaboration with DLS and the technical units of DAH, while FAO's standing in the forefront of global HPAI control strategy development and its leading position in adopting a One Health approach has contributed to the Project Management maintaining an overarching and effective communication with development partners and national stakeholders.

2: Aspects of disease surveillance related to outbreak investigation strengthened

In close collaboration with the VEC, the project developed a comprehensive HPAI surveillance programme, including country-wide passive surveillance supported by active surveillance targeting districts categorized as high risk. Combined with support to the veterinary diagnostic laboratories, this has provided a basis for monitoring the avian influenza situation. The results from this programme have guided continued evaluation of national strategy and the mechanisms for its implementation.

Quarter II 2010

Project Monitoring Sheet: **OSRO/RAS/605/USA Baby 03**

Project Title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) – Phase IV**

Reporting period: **April to June 2010**

Country: Nepal
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) – Phase IV Code: OSRO/RAS/605/USA
Budget: USD 815 000 (Phase I) and USD 150 000 (Phase II) Total budget: USD 965 000
Effective Starting Date: October 2006
Planned End Date: September 2010
Context of the Project <p>The project is addressing the short- and medium-term actions that are to be undertaken by the Government of Nepal to strengthen its capacity in preventing the introduction of Highly Pathogenic Avian Influenza (HPAI) into the country and minimize its spread in the case of its occurrence. HPAI is presently a serious problem of regional dimensions with continuing outbreaks occurring in the sub-region. During the first quarter of 2009, the first outbreaks in Nepal were recorded. After a ten month period that was free of clinical disease, multiple outbreaks occurred during the period of January to March 2010. In contrast to the previous year, the 2010 outbreaks were attributed to clade 2.3.2 of the H5N1 virus, previously unrecorded in South Asia, suggesting introduction through infected migrating wildfowl rather than cross-border. The Government's resources, including those provided by international donors, have been severely stretched. Under these circumstances, the project has provided an invaluable lifeline for preparedness and response. However, the scenario of declining international support for HPAI control is alarming, coupled with an increasing danger of the disease becoming endemic in Nepal with negative consequences for the livelihoods of smallholder farmers and the control efforts of neighbouring countries.</p>
Objectives of the Project <p>The execution of this project ensures assistance to the Ministry of Agriculture and Cooperatives (MOAC) to implement the National Contingency Plan for HPAI. The project is contributing to the rural development in the country by preventing and controlling the detrimental consequences of HPAI and other emerging infectious diseases in poultry.</p> <p>The outcome of the project is to create an effective mechanism for planning and coordination across sectors and key stakeholders involved in HPAI control activities, particularly with the United States Agency for International Development (USAID) supported projects in Nepal.</p>
Planned activities <p>Output 1: The avian influenza (AI) situation in the country is monitored and the national strategy and plans are updated.</p>

Activity 1.1. Working groups on Animal Health provided with appropriate guidance and technical assistance.

Activity 1.2. Workshops and training exercises conducted in each region to explain new surveillance modalities and facilitate planning of field work.

Activity 1.3. Simulation exercises conducted – one in each of the regions.

Activity 1.4. Emergency Disease Investigation Teams (EDIT) supported through material and logistical support.

Activity 1.5. Review of live bird markets (LBMs) conducted and model facilities established.

Activity 1.6. Design and construct new post-mortem facility at the central veterinary laboratory.

Activity 1.7. Enhanced surveillance programme developed for high risk districts.

Output 2: Improved communication between key stakeholders that share data, information and knowledge, including reports and publications on HPAI.

Activity 2.1. Functional linkages strengthened between projects funded by USAID and other key stakeholders.

Activity 2.2. Assist the Government in the improvement of the dissemination of information (i.e. bulletins, reports and updates).

Activities undertaken during the reporting period

Output 1: The avian influenza (AI) situation in the country is monitored and the national strategy and plans are updated.

Activity 1.1. Working groups on Animal Health provided with appropriate guidance and technical assistance.

- The enhanced surveillance programme, expanded in November 2009 to 12 districts funded through this project with the remaining 14 high risk districts funded through the Avian Influenza Control Project (AICP), played a major role in detecting outbreaks in the previous quarter. There is room for improvements in some districts, emphasizing the need for adequate monitoring and follow up. Overall, this targeted surveillance in the field is proving to be an effective tool, but it is costly and unlikely to be prioritized by the government once donors' support lapses. The targeted six months duration during the period of highest threat terminated at the end of April.
- The national strategy remains focused on early detection and effective response based on culling poultry on affected properties. The culling zone is restricted to the immediate area and drawn up using natural barriers where possible. Compensation is paid and the level of compensation has recently been raised although still well below market value. Secondary outbreaks detected through surveillance around outbreaks are similarly culled although the cull is further restricted, often to the affected household/farm. Standard Operating Procedures (SOPs) are under constant scrutiny. Presently, the Department of Livestock Service (DLS) is shackled by the need to declare outbreaks in newly affected districts through cabinet decision in order to activate the emergency provisions for resource provision to affected districts. Secondary outbreaks in the same or immediately

adjoining districts do not present this obstacle and are referred to as “hotspots”.

Activity 1.2. Workshops and training exercises conducted in each region to explain new surveillance modalities and facilitate planning of field work.

- Rapid response team (RRT) training modules (culling, disposal, decontamination, sampling and surveillance) were conducted in Biratnagar for field technicians from Panchthar, Dhankutta, Udayapur and Morang districts. Among the total of 49 trainees were five female technicians.

Activity 1.3. Simulation exercises conducted – one in each of the regions.

- Two simulation exercises were conducted during this quarter. These were carried out in Mahottari (in the Terai belt of the central region) and in Surkhet in the mid-western region. Three simulations have now been conducted in the central region which is the main poultry production area and one each in the western, mid-western and far-western development regions. The USAID funded STOP AI project has conducted short simulations in the eastern region districts.

Activity 1.4. Emergency Disease Investigation Teams (EDIT) supported through material and logistical support.

- The EDIT programme has been supported by the provision of a mobile laboratory which has been handed over to the Department of Animal Health (DAH). This facility will strengthen the Department’s ability to cope with multiple outbreaks, especially in districts with no or limited laboratory support. At the central veterinary diagnostic laboratory, a new post mortem room facility and incinerator room to allow safe and efficient handling of potentially infected poultry carcasses has been designed, tendered and contracted with construction now underway.

Activity 1.5. Review of live bird markets (LBMs) conducted and model facilities established.

- The poultry market chain study is continuing. An interim report has been received and reviewed through a short workshop resulting in a number of recommendations mainly directed at the quality of presentation. The study will produce updated information on poultry market chains and particularly on volumes, modalities and risks. The international consultant on poultry markets made two further missions to Nepal. Designs and costs for a model LBM have been prepared and the Kathmandu Municipality has fully supported this initiative. The market location has been agreed and scope of work completed to permit signature of a Letter of Agreement (LoA) with the Municipality for construction of LBM. Operational guidelines are in hand and the needs for training both municipality inspectors and vendors using the facility are under discussion.

Activity 1.6. Design and construct new post-mortem facility at the central veterinary laboratory.

- Following agreement on the design issues, detailed cost estimates and bid documents were prepared in April. After completing the selection process, a contract was signed with the selected construction company in May and work on the site commenced in early June.

Activity 1.7. Enhanced surveillance programme developed for high risk districts.

- The enhanced active surveillance programme operating in 12 key high risk districts at four strategic sites in each district during the anticipated high risk period (November to April) was brought to a close and the final sets of reports collected and analysed.

Output 2: Improved communication between key stakeholders that share data, information and knowledge, including reports and publications on HPAI.

Activity 2.1. Functional linkages strengthened between projects funded by USAID and other key stakeholders.

- Coordination meetings with the AICP and DAH take place routinely.
- A field visit to Chitwan in April was undertaken to follow up the HPAI outbreak control in that district and interchange ideas with the DLS Office and avian diseases laboratory staff. Every opportunity is taken during field missions to share information with regional and district stakeholders, from both technical and civil authorities.
- A number of meetings were held with officers from the marketing directorate and the Kathmandu municipality relating to the LBM programme in addition to a small workshop to discuss the expert's initial findings, which was held on 13 April 2010.
- Discussions with the Chief District Officer, Surkhet were held during the preparations for the mid-western region HPAI simulation exercise.
- A brainstorming session to discuss phase five activities was held with senior officers of the DLS and attended by a representative from the USAID office.
- The USAID office at the US Embassy was the location for the meeting to update USAID on the investigations into the causal virus of the 2010 outbreaks.
- Meetings to discuss funding gaps and other related issues have taken place with relevant staff at the Asian Development Bank (ADB) office in Kathmandu and with members of World Bank (WB) monitoring missions.
- Meetings have been maintained with the MOAC Secretary and Joint Secretary, Planning.
- Information sharing with the USAID funded cross-border project (OSRO/RAS/701/USA) and the Food and Agriculture Organization of the United Nations (FAO) Representative have also taken place frequently.

Activity 2.2. Assist the Government in the improvement of the dissemination of information (i.e. bulletins, reports and updates).

- The production of training films on simulation exercises using material gathered during the Kaski simulation with some additional footage is nearing completion.
- Continued updating of SOPs for dealing with outbreaks and further modification of the legislation for HPAI control have raised the need to update the existing compendium of documents on HPAI, which has been found so useful by concerned stakeholders and government staff. Updated documentation is being assembled with a view to producing a new edition during the next quarter.
- Reports and recommendations from short term consultants have been produced and distributed to appropriate sections of the DLS and a laboratory manual for real time reverse transcription – polymerase chain reaction (RT-PCR) work has been made available.

Planned activities for the next quarter

Output 1: The avian influenza (AI) situation in the country is monitored and the national strategy and plans are updated.

Activity 1.1. Working groups on Animal Health provided with appropriate guidance and technical assistance.

- No outbreaks were detected in the quarter under review. Climatic conditions in the coming quarter will not favor virus survival and consequently we believe the risk of

H5N1 outbreaks to be low. Taking into account economic constraints, the operation of the surveillance sites will be suspended during this period and reliance made on passive reporting of unusual mortality in susceptible species. The fate of the virus following the January to March epidemic is unknown. Outbreaks detected (or reported) were predominantly in backyard/village flocks with involvement of small commercial units in some villages. Control measures applied in conjunction with mortality caused directly by the infection combined with adverse climatic conditions for virus survival may have completely eliminated the virus, and the country may be truly free of infection. However, it is also possible that the virus may be surviving in ducks or other domestic or wild species capable of asymptotically harboring the infection. Under the conditions that are favourable to the virus survival, the environmental load builds up to a point where susceptible species succumb to the disease. Alternatively, the stresses of the winter period, both nutritional and climatic may lower the resistance of carriers and precipitate clinical disease or at least enhanced shedding of the virus. Subject to available funding, the project will seek to shed light on this issue through the conduct of sero-surveillance of ducks in areas where the disease was confirmed and also in buffer zones around wetlands and lakes known to be stop-over points for migrating wildfowl.

Activity 1.2. Workshops and training exercises conducted in each region to explain new surveillance modalities and facilitate planning of field work.

- The remaining RRT training planned for this year will be conducted.

Activity 1.3. Simulation exercises conducted – one in each of the regions.

- The planned field AI simulations have been completed. A manual will be prepared to facilitate future simulation exercise implementation.

Activity 1.4. Emergency Disease Investigation Teams (EDIT) supported through material and logistical support.

- The mobile lab has been delivered and may be employed on the planned surveillance exercise mentioned in 1.1. above.

Activity 1.5. Review of live bird markets (LBMs) conducted and model facilities established.

- The project management will work with the contracted consultants to ensure that anticipated outcomes of the poultry market chain study are met and the study is concluded during the coming quarter. Upon completion of the input from the LBM safety expert and conclusion of an LoA for construction of the facility by the Kathmandu Municipality, the project will follow through to completion of the construction phase. Working with the Directorate of Marketing and the municipality public health authorities, it will develop and implement a training and orientation programme for both inspectors and vendors.

Activity 1.6. Design and construct new post-mortem facility at the central veterinary laboratory.

- The construction of the new post mortem facility is underway and will be monitored by the civil engineer engaged under the WB funded project.

Activity 1.7. Enhanced surveillance programme developed for high risk districts.

- The expanded enhanced surveillance programme in the twelve districts now under the project's responsibility will be suspended through the low risk period. A report on the surveillance activities will be prepared and future surveillance plans, taking into account lessons learned from this year, will be developed and discussed with AICP, the Veterinary Epidemiology Centre and DAH.

Output 2: Improved communication between key stakeholders that share data, information and knowledge, including reports and publications on HPAI.

Activity 2.1. Functional linkages strengthened between projects funded by USAID and other key stakeholders.

- Coordination between stakeholders will continue to be encouraged by the project management through frequent interactions with the Director General-DLS, joint secretary, planning, MOAC, USAID office, the directorates of markets and promotion and of animal health. Also engaged will be the AICP management team and FAO Representative as well as related United Nations bodies, particularly the World Health Organisation (WHO) and United Nations Children's Fund (UNICEF) ad hoc meetings with representatives of non-governmental organizations working in the animal and human health field and from visiting missions may be anticipated. Close coordination and sharing of information with USAID funded cross-border project will continue as before.

Activity 2.2. Assist the Government in the improvement of the dissemination of information (i.e. bulletins, reports and updates).

- The production of a training video utilizing the material captured during the Kaski district simulation exercise should be completed during the coming quarter.

Activity 2.3. Provide technical advice to the Department of Livestock Services (DLS) concerning the national HPAI program improvement and implementation.

- The project will organize and fund a series of planned workshops including lessons learned from the 2010 outbreaks and share the outcomes of the market chain study and the programme to develop safe LBMs in the Kathmandu valley. A meeting to review the outcome of the Crisis Management Centre (CMC) mission of March 2010 will be organized with a view to discussing the adoption of recommendations.

Activity 2.4. Provide assistance to the project's working groups on animal health including annual plan, strategic meetings, monitoring and evaluation, translation and publication.

- The Compendium of AI documents will be updated.

Activity 2.5. Upgrade management and operation of Veterinary Epidemiology Units.

- Working groups will be facilitated as necessary with further work on the SOP and support to the laboratory and epidemiology unit development possible target areas.

Main challenges encountered and response provided

- While it appears most likely that the outbreaks experienced during 2010 were introduced through infected migratory wildfowl, it is, nonetheless, acknowledged that the major risk for Nepal is through cross-border trade practices. Current legislation bans the import of poultry or poultry products from infected countries and prohibits licensed imports across land borders with import, mainly of day old chicks, allowed only through the international airport in Kathmandu. Costs of production maintain a higher selling price for both eggs and birds in Nepal in comparison to neighbouring India. This, combined with a deficit in national supply relative to consumer demand, encourages cross-border trade. The prohibition of this trade leads to a substantial and profitable clandestine trade. The nature of the border and other factors that facilitate overcoming border point controls results in this trade while substantial are not being subject to veterinary or public health inspection. Government's strategy of endeavouring to limit or eliminate this trade through a strengthened quarantine service and legislation is doomed to failure. The

project management, supported by international consultant advice, has advocated examining alternative approaches which might include free entry through nominated border points subject to examination by department officials combined with disinfection procedure and allied to advise on monitoring the birds for signs of ill health. This approach may be further enhanced by negotiation on compartments from which importation could be permitted. Accepting this cross-border trade as a reality, the project has focussed upon strengthening surveillance in high risk (mainly border) districts. The ability to deal with outbreaks has been fine tuned through a programme of outbreak simulation exercises and training of field technicians in rapid response activities.

- The likely role of wild birds in the transmission of the 2010 HPAI epidemic poses an added dimension for the animal health authorities. It may be impossible to prevent such transmission of HPAI to Nepal in the future, but the system must be better able to detect cases at the earliest opportunity and to take measures which prevent or limit further spread.
- The outcome of the poultry market study may be important in refining control measures. At the same time, the control measures adopted must be as efficient and cost effective as possible in order to be sustainable by the Government and the role and participation of the private sector in developing and funding these controls addressed.
- Government's lack of adequate financial resources to properly implement the SOPs has lead to reluctance to declare outbreaks because of the financial implications, leaving district offices to struggle with controls with limited district resources.

Main progress made towards the achievement of project outcomes (*from the start of the project activities*)

Output 1: The AI situation in the country is monitored and the national strategy and plans are updated.

- The project programme involving capacity building of district staff in relation to disease identification, sampling, use of rapid tests, reporting, biosecurity and surveillance methodology as well as the support given to the diagnostic services have contributed significantly to the early detection and effective response to the recent outbreaks. Table top and particularly field simulation exercises have strongly contributed to this progress.

Output 2: Improved communication between key stakeholders that share data, information and knowledge, including reports and publications on HPAI.

- The project has established effective links with all the bodies concerned with delivering HPAI prevention and control programmes and is assisting the government in the management and dissemination of information relating to AI.

Quarter II 2010**Project Monitoring Sheet: OSRO/RAS/703/USA Baby 1 and 2**

Project title: **Highly Pathogenic Avian Influenza: strengthening cross-border surveillance and containment activities between Afghanistan and Pakistan**

Reporting period: **April – June 2010**

Regional component: Central Asia
Project title: Highly Pathogenic Avian Influenza: strengthening cross-border surveillance and containment activities between Afghanistan and Pakistan
Code: OSRO RAS 703 USA
Budget : 1 300 000 (Phase I), 1 300 000 (Phase II), USD 600 000 (Phase III)
Total budget: USD 3 200 000
Effective starting date: 1 April 2008
Planned end date: 30 September 2010
<p>Context of the project</p> <p>The Highly Pathogenic Avian Influenza (HPAI) H5N1 has been detected in the recent past, both in Afghanistan and Pakistan. In Afghanistan, the disease has had a limited spread in time and space, and outbreaks were all detected within a time frame of two months. In Pakistan, outbreaks have been occurring without a clear pattern, and it is likely that the disease is under-reported in the country. It was observed that the outbreaks in Afghanistan were preceded by the outbreaks detected in Pakistan. The introduction of the virus in Afghanistan could have originated from Pakistan, but this information was not confirmed. Therefore, there has been a need to develop joint activities to strengthen the veterinary collaboration between the two countries and to formulate common approaches and strategies.</p>
<p>Objectives of the project</p> <p>Impact</p> <p>The project aims at building a strategic platform where shared approaches - taking in consideration cultural and social features - can be jointly developed by the two countries. This will contribute to the intensification of information exchange and confidence building on both sides. The project aims at improving HPAI surveillance systems and enhance local capacities for early detection and control of HPAI to avoid further spread to non-infected areas of the countries.</p> <p>Outcomes</p> <ul style="list-style-type: none"> • inter-country consensus built on containment measures, communication interventions and socio-economic issues; • laboratory and field services capacity enhanced in Federal Administered Tribal Areas (FATA), Khost, Balochistan, Kandahar, Nangarhar, North Western Frontier Province (NWFP) in Peshawar and Abbotabad districts, Sindh and Balkh provinces; • procedures for border control inspections standardized; • strengthening of the surveillance activities in the different sub-sectors; and • common methodological approach to surveillance in live-birds markets (LBMs) elaborated and agreed upon.

Planned activities

Output 1.1 Common strategies and approaches to surveillance developed in the different sub-sectors in the concerned areas.

Activity 1.1.1 Regional training workshop on socio-economic issues;

- prepare agenda, select experts, identify the venue and conduct the workshop

Activity 1.1.2 Socio-economic studies on farming practices and market chains.

- after the workshop, prepare the questionnaires to be used for conducting socio-economic studies

Output 2.1 Diagnostic ability of field and laboratory staff enhanced.

Activity 2.1.1 Training on laboratory methods for avian influenza and other poultry diseases;

- enhance laboratory diagnostic capacity in the identified provinces in both countries (FATA, Balochistan, Herat, Kandahar, Nangarhar, NWFP [Peshawar and Abbotabad districts], Sindh and Balkh) through training and setting up of the laboratory equipment
- renovate facilities in the National Reference Laboratory for Poultry Diseases (NRLPD) in Islamabad

Activity 2.1.2 Training on clinical recognition of main poultry diseases.

- hold the bi-national training course on recognition of major poultry diseases (the venue will be identified in accordance with the security conditions, and therefore it may be held in a third country, should the security situation in Afghanistan and Pakistan not be improved)

Output 3.1 Procedures for inspection of poultry and poultry products at border control posts standardized.

Activity 3.1.1 Seminar on the legislation framework and procedures for import-export of animals and products of animal origin;

- review the current legislation in both countries

Activity 3.1.2 Review and upgrade inspection methodologies.

Output 4.1 Capacity enhanced to improve the overall surveillance system.

Activity 4.1.1 Regional training workshop on surveillance methods;

- conducted

Activity 4.1.2 National training for the surveillance teams operating in the commercial sector;

Activity 4.1.3 National training for field veterinarians (from the government, NGOs, private sector);

- identify the most suitable candidates for the Master Course in Epidemiology and the respective university to conduct the studies

Activity 4.1.4 Training for the surveillance teams that will operate in the rural areas (Participatory Disease Surveillance [PDS] training);

- develop Standard Operating Procedures (SOPs) and the manual for the establishment of the sentinel farms and sentinel vendor shops according to the risk factors “likely to be infected” in both countries in order to improve surveillance of avian influenza (AI) and monitoring of the vaccinated farms

Activity 4.1.5 Workshop on communication strategies for villagers; and

Activity 4.1.6 Field activities.

- initiate surveillance activities in the two new provinces (Balkh in Afghanistan and Sindh in Pakistan) after the recruitment of the field veterinarians and para-veterinarians.

Output 5.1 Surveillance in live-birds markets (LBMs) strengthened.*Activity 5.1.1 Workshop on methodology of surveillance in LBMs;**Activity 5.1.2 National training workshop for veterinarians operating in LBMs; and**Activity 5.1.3 Surveillance activities in LBMs.*

- evaluate the effects of LBMs on the trade movement in all provinces that are important for risk assessment purposes in case of outbreaks and have an economic impact on the areas

Activities undertaken during the reporting period**Output 1.1 Common strategies and approaches to surveillance developed in the different sub-sectors in the concerned areas.***Activity 1.1.1 Regional training workshop on socio-economic issues;*

- The bi-national training workshop on the economics of disease outbreaks was held in Istanbul, Turkey from 26 to 30 April 2010. The workshop was conducted by Dr Jonathan Rushton, Senior Lecturer in Animal Health Economics Veterinary Epidemiology and Public Health Group, and Barbara Häslér from Royal Veterinary College (RVC), UK. Eleven veterinarians from Pakistan and Afghanistan attended the training workshop. The workshop covered the following aspects: (i) update on FAO activities on HPAI control; (ii) HPAI risk factors and disease mitigation options in Pakistan and Afghanistan; and (iii) concepts of economics, such as opportunity cost, partial analysis, production and productivity. In addition, presentations were delivered on the economics of surveillance, cost benefit analysis and the impact of HPAI. All participants passed an evaluation test that was administered at the end of the training.

Activity 1.1.2 Socio-economic studies on farming practices and market chains;

- A template for LBM and Farm survey was designed and is used in the field to collect data for a descriptive study of the farming and marketing chains extending until the end of the project.

A bi-national (Afghanistan-Pakistan) Training of Trainers (ToT) on communication:

- The Emergency Centre for Transboundary Animal Diseases and Operations (ECTAD) Communication Team, with support from the ECTAD staff from the Headquarters, the South Asia Sub-regional office and the Afghanistan-Pakistan office, conducted a four-day training workshop for provincial level veterinary services participants from Afghanistan and Pakistan. The training workshop on communication strategies for the prevention and control of HPAI and other transboundary animal diseases (TADs) was held in Istanbul, Turkey from 6 to 9 April 2010. The focus of the workshop was to provide capacity development to participants in the fundamentals of current communication approaches. During this workshop, the participants were asked to identify priority areas for strategic communication, policy advocacy support and interventions and to assess the capacity gaps and practical solutions to overcome these gaps.

Field activities.

- The candidate for the position of the System Data Manager was hired in Afghanistan. The newly appointed system data manager attended a four-day training in Islamabad on the Avian Influenza Surveillance Information System (AI-SIS). In Pakistan, the system is undergoing technical and formal evaluation in order to ensure its proper performance and to make improvements to the original format according to the recommendations obtained from the workshop conducted in Pakistan and reviewed in Afghanistan. The

technical evaluation of the system is taking place with respect to the specifications of the software used to link the system to the Geographical Information System (GIS). The computers were distributed in the regions, and the training for the capture of the field information will be conducted in the next quarter.

Output 2.1 Diagnostic ability of field and laboratory staff enhanced.

Activity 2.1.1 Training on laboratory methods for avian influenza (AI) and other poultry diseases;

- A national workshop was organized in Islamabad, Pakistan on 4 June 2010 to harmonize the lab testing for AI in the project laboratories together with those laboratories involved in public and private sectors. Ten participants from different sectors participated in this workshop where the procedures adopted by the laboratories for haemagglutination inhibition (HI) and enzyme-linked immunosorbent assay (ELISA) were discussed for harmonization. As a follow-up, guidelines for undertaking proficiency testing in the participating laboratories will be initiated under the project in line with the harmonization procedures.
- Two day-long national training workshops were organized in Karachi and Hyderabad towns in Sindh province on 7 and 8 June 2010 to train district level laboratory technicians of livestock and poultry departments in disease surveillance, field sampling and rapid response practices. Twenty-five persons participated in each workshop.
- One laboratory technician training workshop was conducted in Quetta on 9 June 2010 with 20 participants, and a similar training was conducted in Peshawar (NWFP Province) on 12 June 2010 with nine participants. The trainees were exposed to relevant technical “know how” to undertake sample testing during AI surveillance activities.
- The renovation of the facilities at NRLPD in Pakistan was completed, and they are now used for processing samples from the field taken for virus isolation.

Activity 2.1.2 Training on clinical recognition of main poultry diseases.

- The training on recognition of major poultry diseases for differential diagnosis of AI was conducted in Istanbul, Turkey from 19 to 23 April 2010 with the participation of six veterinarians from both countries. The objective was a ToT in security measures for field veterinarians.

Output 3.1 Procedures for inspection of poultry and poultry products at border control posts standardized.

Activity 3.1.1 Seminar on the legislation framework and procedures for import-export issues of animals and products of animal origin;

- The review of the current legislation to import and export poultry and poultry products was completed in both countries, and now the recruitment is underway to identify an international regulations expert to prepare the August bi-national workshop with senior officials from the two countries. Approvals from the Chief Veterinary Officers (CVOs) from both countries were done, and they are working to select the senior officials for participation in the workshop.

Activity 3.1.2 Review and upgrade inspection methodologies.

- After the seminar, the proposal to upgrade the inspection methodologies will be prepared by the expert in trading regulations.

Output 4.1 Capacity enhanced to improve the overall surveillance system.

Activity 4.1.2 National training for the surveillance teams operating in the commercial sector;

- A one-day meeting was organized in Pakistan on 2 May 2010 to review the on-going AI

surveillance format in different areas of the project. In this regard, both project field veterinarians and those affiliated with national AI control programme participated in a meeting (of eight participants in total) to review and update the in-use surveillance protocols and data collection formats.

- In Afghanistan, the formats were reviewed based on the results obtained from the meeting in Pakistan and changed accordingly.

Activity 4.1.3 National training for field veterinarians (from the government, NGOs, private sector);

- CVOs from both countries were requested to nominate the candidates to conduct Master of Sciences Course in Epidemiology; the School of Veterinary Medicine in Melbourne, Australia has been identified as the most convenient school to conduct the formal course, since they offer the program to be completed in one scholar year.
- Trainings in the field were not conducted during this period since other activities were done in other subjects.

Activity 4.1.4 Training for the surveillance teams that will operate in the rural areas (PDS training);

- a ten-days national training course on PDS was conducted in Mazar-e-Sharif, Afghanistan from 1-10 April, 2010 for 16 provincial officers at the end of the course a questionnaire was developed to initiate the PDS activities with MAIL
- One-week training was conducted in Mazar-e-Sharif (12-16 April) for women involved in poultry production on how to establish PDS activities, as women are responsible for raising poultry in villages..

Activity 4.1.6 Field activities.

Afghanistan:

- During the reporting period, 1 639 serum samples were collected and 2 265 swabs were tested in the laboratory for ELISA and agar gel immunodiffusion (AGID). HI test, rapid serological test and real-time reverse transcriptase – polymerase chain reaction (rRT-PCR) for swabs were used. The samples tested positive for the matrix protein type A influenza.
- In Mazar-e-Sharif, the capital city of the Balkh province in Afghanistan, the European Union-funded project will finance the construction of a new laboratory facility, consisting of three rooms for serological diagnosis of AI. The selection of the company was finalized, and the construction work will start soon.
- The Central Veterinary Diagnostic and Research Laboratory (CVDRL) in Afghanistan, participated in a proficiency panel testing organized by FAO through PADOVA reference laboratory together with the other labs in the region. CVDRL demonstrated a success rate of 75 percent in identifying the un-known samples.
- The current security situation did not allow for the planned technical visit by the project Chief Technical Advisor (CTA) to Kandahar and Khost laboratories to monitor the progress made in the laboratory facilities.

Pakistan:

- A total of 3 843 serum samples, 6 391 swabs and 744 organs infected with suspicious cases of influenza were collected during the reporting period, and the laboratory results indicated a continuous circulation of AI H9N2 and Newcastle disease (ND) in the region. In this regard, all standard tests of virus isolation, ELISA, HI, PCR and gene sequencing were carried out to identify the causal agent in suspect cases. During this period, field isolates of H5 and H7 recovered from previous outbreaks were also sequenced, and data was submitted to the related gene bank.
- Training of the provincial laboratories technicians was conducted, as indicated before,

and antigen, antisera and ELISA kits were delivered to the laboratories in Peshawar, Abbottabad, Quetta and Karachi.

- Pakistan is producing its own antigen and antisera for HI test and has distributed them among the participating labs, including the central laboratory in Afghanistan.
- The NRLPD in Pakistan participated in a proficiency panel testing organized by FAO through PADOVA reference lab together with the other labs in the region. NRLPD demonstrated a success rate of 98 percent in identifying the un-known samples.
- The current security situation did not allow for the planned technical visit by the project CTA to Abbottabad and Peshawar laboratories to monitor the progress made in the laboratory facilities.

Output 5.1 Surveillance in live-birds markets strengthened.

Activity 5.1.3 Surveillance activities in LBMs.

- A two-day workshop was organized on 27 and 28 May 2010 in Islamabad, where ten veterinarians from different parts of the project were trained in conducting LBM surveillance.
- The surveillance outputs (for both countries) during the reporting period were included in the 4.1.6 activity above.

Planned activities for the next quarter

Third Project Steering Committee meeting:

As planned in the project document, the objectives of the third project Steering Committee meeting will be to review the project activities and achievements and to identify pending issues. The CVOs of Afghanistan and Pakistan, the project CTA, the project national managers and FAO- ECTAD relevant officers will attend this meeting.

Output 1.1 Common strategies and approaches to surveillance developed in the different sub-sectors in the concerned areas.

Activity 1.1.2 Socio-economic studies on farming practices and market chains.

- Questionnaires will be used in the field during the next quarter.

Output 2.1 Diagnostic ability of field and laboratory staff enhanced.

Activity 2.1.1 Training on laboratory methods for avian influenza (AI) and other poultry diseases;

- Short-term training on a joint reference FAO/ the World Organization for Animal Health (OIE) laboratory will be arranged for a person from the central laboratory in Pakistan involved in the production of AI reagents for the provincial diagnostic and surveillance units.
- National training courses will continue in Afghanistan and will be organized at the central and provincial laboratories to train the provincial laboratory staff to conduct serological tests.
- Pilots test will be used in provincial laboratories for conducting serological tests and reporting results to the central laboratory.
- The SOPs are under review, and the laboratory manual will be completed in the next reporting period.

Activity 2.1.2 Training on clinical recognition of main poultry diseases.

- The national trainings will be conducted during the next quarter.

Output 3.1 Procedures for inspection of poultry and poultry products at border control posts standardized.

Activity 3.1.1 Seminar on the legislation framework and procedures for import-export issues of

animals and products of animal origin;

- The bi-national review will be completed in the meeting on the subject that has been scheduled for 5 August and 6 August 2010 in Dubai.

Activity 3.1.2 Review and upgrade inspection methodologies.

- The review will take place after the seminar with the recommendations obtained.
- Trainings in both countries for inspectors on international inspection procedures will be conducted during the next quarters.

Output 4.1 Capacity enhanced to improve the overall surveillance system.

Activity 4.1.1 Regional training workshop on surveillance methods;

- The up-dated formats for AI will be distributed to the surveillance teams.
- A short training course will be conducted for data collection by using the new AI-SIS surveillance system developed in the project.
- Pilot tests will be conducted in both regions to facilitate the exchange of information between the regional epidemiological units, the central pilot unit and the central laboratory.
- Pilot tests for the analysis of the results collected under the AI-SIS will be conducted in the following quarter.
- The most suitable candidates for the Master Course in epidemiology will be identified, and the terms of the LoA will be finalized with the selected university to conduct the studies.

Activity 4.1.2 National training for the surveillance teams operating in the commercial sector;

- National trainings will continue in the provinces of both countries.

Activity 4.1.3 National training for field veterinarians (from the government, NGOs, private sector);

- National trainings on sample methodologies will be provided.

Activity 4.1.4 Training for the surveillance teams that will operate in the rural areas (PDS training);

- The PDS report formats will be distributed to the veterinary officials to conduct the studies.

Activity 4.1.5 Field activities.

- Surveillance activities will continue.

Output 5.1 Surveillance in live-birds markets strengthened.

Activity 5.1.1 Workshop on methodology of surveillance in LBMs;

- The workshop on methodology of surveillance in LBMs will be conducted in each country.

Activity 5.1.2 National training workshop for veterinarians operating in LBMs;

- A workshop will be conducted in both countries during the next quarter.

Activity 5.1.3 Surveillance activities in LBMs.

- The evaluation of the LBM with respect to the trade movement will be implemented in all provinces that can provide information on risk assessment in case of an outbreak and on economic impact on the areas.

Main challenges encountered and response provided

- The current situation related to the new Animal Health and Production Directorate structure that will be established soon in Afghanistan will need to be addressed, as the FAO actions have been discussed with the Technical Deputy Minister of Agriculture.
- The appointment of the new CVO in Pakistan has taken place, and care needs to be

taken to ensure that the newly appointed CVO is fully informed about the ongoing and planned project activities.

- As a result of the upcoming elections of the parliament authorities, the present security conditions in Afghanistan need to be taken into consideration while organizing the upcoming project activities. In Pakistan, the threats to international activities are also to be considered. Restrictions to the movement of UN staff may hinder the implementing of project activities.
- Central epidemiology units in both countries are not participating in the project despite the efforts made in the past to incorporate them. The central epidemiology unit in Afghanistan, in particular, needs to be re-established and provided with trained personnel in order to generate reliable disease information needed to implement a prevention and control plan.
- More time will be required to implement the earlier planned objectives because of the difficulties encountered as a result of the security reasons in both countries. As most of the provisions are on the ground, it may require a few more months to make them operational. As a result of this, the project activities may continue beyond the stipulated time period of September 2010 with the already allocated funds.

Main progress made towards the achievement of project outputs

Output 1.1 Common strategies and approaches to surveillance developed in the different subsectors in the concerned areas.

- Considering the high risk of virus transmission, the surveillance activities in the cross-border region were improved. During this reporting period, no evidence of the presence of HPAI virus in the countries was found. However, there is a need for awareness about the pandemic potential of H9N2 viruses, H7 viruses and ND, and an evaluation of the control strategies should be carried out.

Output 2.1 Diagnostic ability of field and laboratory staff enhanced.

- Routine surveillance in project areas detected consistent circulation of H9N2 AI virus and ND virus at their laboratories. It is, thus, recommended to establish a control program to reduce the incidence of the virus circulation.
- The new facility, established in Pakistan, for virus isolation at a level of biosecurity that is higher than level 2 will conduct the biosafety diagnosis for the region.
- A mission from OIE will review the conditions of the laboratory in Pakistan and its suitability in becoming a twin laboratory of the joint FAO/OIE reference laboratory, which will be important for the regional diagnosis of AI.

Output 3.1 Procedures for inspection of poultry and poultry products at border control posts standardized.

- Progress was limited as a result of a severe security situation at the border areas.

Output 4.1 Capacity building developed to improve the overall surveillance system.

- The advances made to the data management system for surveillance that will be implemented in both countries will facilitate the analysis of the results of laboratory and field research.

Quarter II 2010

Project Monitoring Sheet: OSRO/RLA/901/USA

Reporting period: April - June 2010

Regional Component: Latin America and the Caribbean	
Project Title: Strengthening regional capacity for surveillance of influenza A H1N1 virus and other subtypes of swine flu in pig populations in Central America and other countries in Latin America	
Code: OSRO/RLA/901/USA	
Budget:	USD 700 000
Effective Starting Date:	28 July 2009
Planned End Date:	30 September 2010
Context of the Project:	
<p>Pandemic H1N1 2009 has been reported in animals (pigs and turkeys) in several countries, including Argentina, Canada, Chile and the United States on the American continent, raising the concern of the international community. Pigs can harbour influenza viruses of both avian and mammalian origin and act as "mixing vessels" in which the re-assortment of human, swine influenza (SI) and avian influenza (AI) virus may occur, producing a virus capable of human-to-human transmission leading to human pandemics.</p> <p>Studies in the developed countries have shown that various subtypes (H1N1, H3N2 and H1N2) co-circulate in pig populations in those countries. However, it is still unknown whether these subtypes are also widespread in swine populations in Central America and the neighbouring countries because of the lack of appropriate monitoring and surveillance networks for SI.</p>	
Objectives of the Project:	
<p>The project aims at strengthening the surveillance capacities of the affected countries, or the countries at risk, to deal with Influenza A/H1N1, other influenza viruses and other transboundary animal diseases (TADs) in Central America and neighbouring countries.</p> <p>Specifically, the project will improve the knowledge of the epidemiology and ecology of Influenza type A viruses in swine populations in the target countries.</p>	
Planned activities for the reporting period:	
<p><i>Output 1: The ECTAD Decentralized Coordination Unit (DCU) for Central America is established and operational.</i></p> <p>Activity 1.4: Provision of services to the Central American and neighbouring countries.</p> <p>The Emergency Center for Transboundary Animal Diseases Operations (ECTAD) Decentralized Coordination Unit (DCU) in Panama is responsible for continuing the backstopping of the veterinary services of the beneficiary countries and reinforcing the regional epidemio-surveillance network in order to improve communication and the exchange of information on TADs and other respiratory diseases in swine populations, as well as to provide special support to countries facing outbreaks, if needed.</p> <p><i>Output 2: Surveillance activities implemented and the extent and intensity of possible influenza viruses type A in circulation better understood and a proposal for contingency plans prepared.</i></p> <p>Activity 2.1: Signing of a Letter of Agreement (LoA) with a research institution for field investigation/ training.</p> <p>Signing of an agreement with the National Veterinary Services Laboratory (NVSL) in Ames, USA is underway. This institution has agreed to provide: (i) diagnostic training to LADIVES (Vesicular Disease Diagnostic Laboratory, Panama City, Panama) premises; (ii) training of a LADIVES expert on virus sequencing; and (iii) its services as a reference laboratory for positive cases detected in LADIVES.</p>	

Activity 2.3: Training and conducting of field investigations and finalization of the guidelines.

A regional workshop is held in Panama on 13 and 14 May 2010 with participation of all national project coordinators to discuss biosecurity measures in the pig sector and to agree on common procedures for the forthcoming surveillance and sample collection activities to be carried out at the national level. The joint FAO/ International Office of Epizootics (OIE)/ World Bank (WB) document on good practices for biosecurity in the pig sector (<http://www.fao.org/docrep/012/i1435e/i1435e00.htm>) is used as a reference guide for the meeting.

Activity 2.5: Awareness raising and reporting of respiratory cases.

A regional workshop to be held in Panama on 11 and 12 May 2010 with the participation of 19 experts from all beneficiary countries (see activity 5.1). Participants will be requested to organize national workshops on awareness raising and reporting in collaboration with the International Regional Organization for Plant and Animal Health (OIRSA). First national workshops are organized in the beneficiary countries.

Output 3: National animal health information systems to collect, process and analyse data from surveillance activities reinforced.

Activity 3.1: Procurement and distribution of equipment and software.

Funds have been allocated and technical specifications have been prepared to purchase the necessary equipment to install TADInfo in four countries and to strengthen information management capacities in the others. Because the computers become outdated rapidly, the project is handling the purchase of the computers after the customization of the software is finalized.

Activity 3.3: Promotion and use of other animal health information systems including TADInfo and others.

TADInfo software is customized for Belize, Honduras, Guatemala and El Salvador. An international workshop to train the key staff on installation, use and maintenance of this information system is intended for the third quarter of this year.

Output 4: Laboratory diagnostic capacities reinforced and network established between national laboratories and international reference laboratories.

Activity 4.2: Procurement and distribution of laboratory equipment and supplies.

More than 100 items for laboratory diagnosis in three countries and sample collection in all beneficiary countries are being procured and distributed in order to enable the field surveillance, collection of samples from suspected pigs and laboratory diagnosis.

Activity 4.3: Signing of a Letter of Agreement (LoA) with a specialized laboratory.

The LoA with LADIVES, a Panamanian laboratory is underway. Under this agreement, LADIVES will provide the training at the national level on reverse transcriptase – polymerase chain reaction (RT-PCR) diagnosis and diagnose samples collected in Belize, El Salvador, Honduras, Nicaragua, Panama and the Dominican Republic. Guatemala and Costa Rica have agreed to diagnose their own samples and to send positive cases to LADIVES for confirmation.

Output 5: Early detection and notification of A/H1N1/2009.

Activity 5.1: Support national services and organizations in education and communication and reporting of respiratory cases in pigs.

A regional workshop is held in Panama on 11 and 12 May 2010 with the participation of 19 experts from all beneficiary countries. The aim of the workshop is to help improve the communication techniques of the participants in order to raise awareness and to promote the reporting of suspected cases in pigs in their countries.

Activities undertaken during the reporting period:

Output 1: The ECTAD Decentralized Coordination Unit (DCU) for Central America is established and operational.

Activity 1.4: Provision of services to the Central American and neighbouring countries.

The ECTAD DCU in Panama continued playing a major role in coordinating the information exchange on TADs among the countries in the region and timely reported any important issues to the relevant early warning

systems, including an outbreak of Equine Encephalitis in Panama in June 2010. To provide the required technical assistance, the ECTAD DCU staff has been in contact with the Panamanian veterinary authorities and the representatives of El Organismo Internacional Regional de Sanidad Agropecuaria (OIRSA) and Pan American Health Organization (PAHO).

Output 2: Surveillance activities implemented and extent and intensity of possible influenza viruses type A in circulation better understood and a proposal for contingency plans prepared.

Activity 2.1: Signing of a Letter of Agreement (LoA) with a research institution for field investigation/training.

A final version of an agreement with the NVSL in Ames, USA has been submitted to the United States Animal and Plant Health Insection Service (APHIS) authorities for final review and signature in May 2010. The NVSL has agreed to provide diagnostic training to beneficiary countries and act as a reference laboratory.

Activity 2.3: Training and conducting of field investigations and finalization of the guidelines.

The activities as outlined on page two of this report were carried out. The regional workshop was held in Panama on 13 and 14 May 2010 with participation of all national project coordinators to discuss biosecurity measures in the pig sector. The joint FAO/OIE/WB document on good practices for biosecurity in the pig sector (<http://www.fao.org/docrep/012/i1435c/i1435c00.htm>) was used as a reference guide for the meeting. Furthermore, the participants agreed on common procedures for the surveillance and sample collection activities to be carried out at the national level during the next quarter.

Activity 2.5: Awareness raising and reporting of respiratory cases.

Following the request addressed to participants during the regional workshop on communication held in Panama on 11 and 12 May 2010, the first national workshop, aimed at raising awareness and promoting the reporting of suspected cases in swine populations, was held in Honduras at the end of May with the participation of 50 veterinarians and physicians. Events in other countries will follow.

Output 3: National animal health information systems to collect, process and analyse data from surveillance activities reinforced.

Activity 3.1: Procurement and distribution of equipment and software.

A tender was launched to purchase the necessary computers to install TADInfo in four countries and to strengthen the information management capacities in the others. As soon as the results are evaluated, computers will be purchased and delivered to relevant countries.

Activity 3.3: Promotion and use of other animal health information systems including TADInfo and others.

A home-based specialist was recruited in June 2010 and is currently customizing TADInfo maps for Belize, Honduras, Guatemala and El Salvador. A Spanish-speaking TADInfo trainer has also been identified. The international workshop to train key staff on installation, use and maintenance of this information system will be carried out in Honduras during the third week of August 2010.

Output 4: Laboratory diagnostic capacities reinforced and network established between national laboratories and international reference laboratories.

Activity 4.2: Procurement and distribution of laboratory equipment and supplies.

The procurement process has been finalized. Three major international suppliers were selected. Goods for laboratory diagnosis and field surveillance are expected to arrive in the countries in July 2010.

Activity 4.3: Signing of a Letter of Agreement (LoA) with a specialized laboratory.

The LoA with LADIVES has been finalized, and it is ready to be signed. LADIVES has agreed to the terms as outlined on page two, activity 4.3 of this progress report: (i) the training at the national level on RT-PCR diagnosis; and (ii) analysis of samples collected in Belize, El Salvador, Honduras, Nicaragua, Panama and the Dominican Republic, with the exception of Guatemala and Costa Rica, who have agreed to diagnose their own samples and to send positive cases to LADIVES for confirmation.

Output 5: Early detection and reporting of A/H1N1/2009.

Activity 5.1: Support national services and organizations in education and communication and reporting of respiratory cases in pigs.

A regional workshop was held in Panama on 11 and 12 May 2010 with participation of 19 experts from all beneficiary countries. Participants learned communication techniques to raise awareness and to promote the reporting of suspected cases in pigs in their countries. Participants were requested to organize national workshops on this matter with the collaboration of the OIRSA.

During the workshop, communication materials (such as posters, brochures, leaflets and commercial breaks for radio stations) promoting the reporting of suspected cases and addressing different target groups (field veterinarians, small and commercial producers) were discussed and validated.

Planned activities for the next quarter:*Output 1: The ECTAD DCU for Central America is established and operational.*

Activity 1.4: Provision of services to the Central American and neighboring countries.

The ECTAD DCU in Panama will continue backstopping the veterinary services of the beneficiary countries and reinforcing the regional epidemio-surveillance network in order to improve the communication and exchange of information on TADs and other respiratory diseases in swine populations. All activities will be conducted in close coordination with other organizations, such as OIRSA and PAHO. Special support will be provided to countries facing outbreaks, if needed.

Output 2: Surveillance activities implemented and the extent and intensity of possible influenza viruses type A in circulation better understood and a proposal for contingency plans prepared.

Activity 2.1: Signing of Letter of Agreement (LoA) with a research institution for field investigation/training.

Upon finalization of the review and approval process by the counterpart, an agreement will be signed with the NVSL in Ames, USA. This institution will provide diagnostic training in LADIVES premises for three lab experts and will train a LADIVES staff on virus sequencing as well as will act as a reference laboratory for 25 samples of positive cases detected in LADIVES.

Activity 2.3: Training and conducting of field investigations and finalization of the guidelines.

Field investigations will be carried out in beneficiary countries and up to 500 samples (per country) of suspected swine populations will be collected and sent to LADIVES for RT-PCR diagnosis. Required field equipment and shipping costs will be covered by the project.

Activity 2.5: Awareness raising and reporting of respiratory cases.

National workshops aimed at raising awareness and reporting of suspected cases in pigs will be carried out with support of OIRSA, according to the methodology provided to the participants of the regional workshop on communication held in Panama in May 2010. FAO will provide assistance and follow up to these activities.

Output 3: National animal health information systems to collect, process and analyse data from surveillance activities reinforced.

Activity 3.1: Procurement and distribution of equipment and software.

Two desktop computers will be distributed to veterinary services in Guatemala, San Salvador, Honduras, Belize, the Dominican Republic and Panama to strengthen their capacity to process animal health-related information and to install TADInfo software.

Activity 3.2: Revision and updates of national animal health information systems used by countries (provided by FAO).

Customization of TADInfo maps for Belize, El Salvador, Guatemala and Honduras will be finalized. A one-week regional workshop on TADInfo will be carried out in August 2010 to train the key staff in the installation and use of this tailor-made software.

Output 4: Laboratory diagnostic capacities reinforced and network established between national laboratories and international reference laboratories.

Activity 4.2: Procurement and distribution of laboratory equipment and supplies.

Over 100 items will be distributed to beneficiary countries, especially those that will carry out RT-PCR diagnostic (Costa Rica, Guatemala and Panama). In addition, LADIVES in Panama will receive equipment (including a second block for PCR) in order to be able to process samples from other beneficiary countries and act as a project regional laboratory.

Activity 4.3: Signing of a Letter of Agreement (LoA) with a specialized laboratory.

Upon signature of the agreement with NVSL (see activity 2.1), an agreement will be signed with LADIVES. Under the agreement, this Panamanian laboratory will process up to 3 000 samples of suspected swine populations from Belize, El Salvador, Honduras, Nicaragua, Panama and the Dominican Republic.

Activity 4.4: Training of personnel working in animal health diagnostic laboratories at national level.

Under the framework of the agreement with NVSL and LADIVES, laboratory staff from Panama, Guatemala and Honduras will be trained on RT-PCR diagnostic and sequencing according to the protocol developed by NVSL.

Activity 4.6: Transport of samples to international reference laboratories for analysis, sequencing and molecular epidemiological analysis.

An agreement with an international carrier has been reached to enable national veterinary services to ship samples of suspected swine to LADIVES for RT-PCR diagnosis. Up to 25 of those samples diagnosed positively will be forwarded to NVSL for confirmation, sequencing and quality control.

Output 5: Early detection and notification of A/H1N1/2009.

Activity 5.1: Support national services and organizations in education and communication and reporting of respiratory cases in pigs.

FAO will provide assistance and follow up to the national workshops aimed at raising awareness and promoting the reporting of suspected cases in pigs to be carried out by the participants of the regional workshop on communication techniques conducted in May 2010. Moreover, communication materials developed under a consultancy on communication covered by TCP/RLA/3206 will be printed and distributed.

Activity 5.2: Coordination of veterinary authorities with national public health authorities to improve disease field investigation, detection and reporting of cases in particular from rural areas.

A final workshop will be organized in September 2010 in Panama with the participation of Chief Veterinary Officers (CVOs) and national coordinators in order to present the results of the project and to discuss continuity of activities and achievements beyond the end of the project.

Main challenges encountered and response provided:

- The signing of the agreement with NVSL/USDA is delayed owing to the counterpart's long approval procedures. Contacts have intensified with key USDA/APHIS staff to try to speed up the process. On the other side, the agreement with LADIVES is ready to be signed, but this laboratory is reluctant to provide diagnostic services as long as the training with NVSL has not been granted. As soon as the agreement between FAO and NVSL/USDA/APHIS is signed, the agreement with LADIVES will be signed, as well.
- The technical and financial evaluations of the tender for laboratory equipment and supplies have taken longer than initially planned owing to a large number of high-specific laboratory items to be purchased which required a detailed evaluation of offers. The process is finalized now, and goods are expected to be delivered to beneficiary countries during July 2010.

Main progress made towards the achievement of project outcomes:

- The ECTAD DCU in Panama has been established in the framework of this project and provides technical support to the national veterinary services in all beneficiary countries, including situations of outbreaks of TADs such as rabies, classical swine fever and equine encephalitis. Furthermore, the ECTAD DCU in Panama acts as a regional hub for reception and exchange of real-time information of animal health issues,

linked to the Global Early Warning and Response System (GLEWS) FAO team.

- Technical backstopping missions have been carried out to all beneficiary countries, especially to support the preparation of surveillance guidelines in the framework of national workshops with key staff, and as a first step in carrying out the surveillance and sample collection activities intended under the project.
- LADIVES of Panama has agreed to provide RT-PCR diagnostic services to other beneficiary countries and serve as a regional laboratory for swine influenza in the future. The diagnostic capacity of this laboratory (and other laboratories in Costa Rica and Guatemala) is being strengthened through training by NVSL (USA) and purchasing of a large number of laboratory equipment and supplies.
- The veterinary services of Belize, El Salvador, Guatemala and Honduras have decided to strengthen their capacities to analyse epidemiological information and are receiving support to install and properly operate TADInfo as their tailor-made animal health information system. Related equipment is also being procured and delivered to final users.
- Communication specialists from all beneficiary countries were trained on how to develop national trainings to raise awareness of respiratory diseases in swine and promote notification of suspected cases. Materials such as posters, radio commercial breaks, leaflets and brochures have been prepared considering countries' feedback and are being made available to all national veterinary services.
- Two documents on good practices for biosecurity in the pig sector and preparation of African swine fever contingency plans (<http://www.fao.org/docrep/012/i1435e/i1435e00.htm>) have been translated into Spanish and adapted to the region for distribution among key staff from the beneficiary countries.
- An agreement with OIRSA has been reached to include the differential diagnosis of other respiratory diseases in swine, in addition to pandemic influenza H1N1/2009, to the diagnostic activities to be carried out under the framework of the project. This is crucial not only to determine whether the pandemic influenza H1N1/2009 is circulating in the region but also to determine which other viral and bacterial diseases are more prevalent in swine populations.

I Quarter 2010

Project Monitoring Sheet: OSRO/UGA/711/USA

Project title: Support to the implementation of the National Plan of Action for Preparedness and Response to Highly Pathogenic Avian Influenza in Uganda

Reporting period: January-March 2010

Country: Uganda
Code: OSRO/UGA/711/USA
Budget: USD 417 850 (Phase I)
Total budget: USD 417 850
Effective starting date: 1 December 2007
Planned end date: 30 June 2010
<p>Context of the project</p> <p>Highly Pathogenic Avian Influenza (HPAI) is a highly infectious and contagious zoonotic viral disease and has the potential to cause a large-scale epizootic situation in Africa and subsequently a global human influenza pandemic. The threat in Africa has increased following detection of the avian influenza (AI) virus in several African countries, including the Republic of the Sudan. Uganda, one of the Sudan's southern neighbours, is at high risk of infection because it lies along major wild bird migratory routes and has large masses of water bodies and extensive wetlands. Moreover, the majority of the poultry in the country are raised in the free-range system with minimal or non-existent disease biosecurity.</p>
<p>Objectives of the project</p> <p>This project will improve the poultry production practices of smallholder farmers, contribute to the development of prevention strategies against HPAI, improve livelihoods and provide the relevant platform for collaboration on the prevention of HPAI and other transboundary animal diseases (TADs) and thereby contribute significantly to the achievement of the Millennium Development Goals.</p> <p>The specific objectives of the project are to enhance surveillance capacity for HPAI, to progressively reduce risk factors favourable to HPAI introduction and transmission, and to therefore reduce risk of human HPAI pandemic and to improve food security for the rural poor who rely on small-scale backyard poultry. There will also be increased local, regional and international trade in safe poultry products and strengthened and effective veterinary services.</p>

Activities planned for the reporting period January-March 2010**Output 1: Strengthening of the HPAI epidemio-surveillance network, including laboratory diagnostics**

- Continue to support the government in surveillance as needed.

Output 2: Enhancement of rapid response and outbreak containment capabilities

- Continue to follow up on the compensation policy with the government.

Output 3: Promotion of biosecurity and hygiene in market chains and the community

- Consultant to complete the development of biosecurity guidelines in poultry production and marketing in the country.
- Consultant to complete the development of by-laws for enforcing the developed biosecurity guidelines along the poultry value chain in the country.

Output 4: Communication and public awareness

- Identify key areas from the Knowledge, Attitude and Practice (KAP) study for improving communication aspects for government communication strategies.

Output 5: Support of the national command and control centre

- Facilitate payment of utility bills (hotline, fax and email).
- Monitoring of the project and reporting to the National Task Force (NTF), the National Security Council (NSC), the United States Agency for International Development (USAID) and other partners.

Activities undertaken during the reporting period January-March 2010**Output 1: Strengthening of the HPAI epidemio-surveillance network, including laboratory diagnostics**

- No surveillance activities were supported during this period; however, the Ministry continued to watch for any suspicious reports from the districts.

Output 2: Enhancement of rapid response and outbreak containment capabilities

- The compensation policy is still with the cabinet and is being followed up to get it through.

Output 3: Promotion of biosecurity and hygiene in market chains and the community

- The biosecurity guidelines on poultry production and marketing in the country were developed and are under review.
- The national consultant developing by-laws for enforcing biosecurity guidelines along the poultry value chain in the country was recruited and this work is in progress.

Output 4: Communication and public awareness

- The KAP study report undertaken under FAO project GCP/INT/010/GER has been cleared and will be shared with the communication technical working group of the national influenza task force.
- The national communication strategy plan developed by the communication technical working group of the national influenza task force was received with the request to be printed and distributed.

Output 5: Support of the national command and control centre

- Payment of utility bills (hotline, fax and email).
- Monitoring of the project and reporting to NTF, NSC, USAID and other partners.

Main challenges encountered and responses provided

- The consultant in charge of developing the by-laws started one month late, which delayed this output. The work is expected to be completed early in the next quarter, so it can be shared with the district local councils for inclusion in their district by-laws.

Main progress made towards the achievement of project outcomes *(from the start of the project activities)*

More personnel at local government level have been trained and have acquired knowledge and expertise in disease recognition, biosecurity, surveillance and outbreak response. This has further improved the national preparedness and response capacity.

The completion of the biosecurity study will enable the development of biosecurity guidelines in the poultry value chain, which is a critical element in the control of HPAI.

The KAP study completed under the project GCP/INT/010/GER will also help in redesigning the communication strategies to be more effective in the future.

The development of biosecurity guidelines and by-laws to be used by local authorities to improve biosecurity in the poultry production value chain is a significant step towards improving HPAI control and other diseases affecting poultry production in the country.

The revision of the work plan and its approval by the USAID will also ensure that all planned activities are implemented before the project's revised end date.

Quarter II 2010

Project Monitoring Sheet: OSRO/VIE/801/USA

Project title: **Gathering Evidence for a Transitional Strategy (GETS) for Highly Pathogenic Avian Influenza (HPAI) H5N1 vaccination in Viet Nam**

Reporting period: **April to June 2010¹**

Country: Viet Nam
Project title: Gathering Evidence for a Transitional Strategy (GETS) for Highly Pathogenic Avian Influenza (HPAI) H5N1 vaccination in Viet Nam
Code: OSRO/VIE/801/USA
Budget: USD 4 million (Phase I)
Total budget: USD 4 million
Effective starting date: October 2008
Planned end date: March 2011
Context of the project
<p>Viet Nam has been carrying out vaccination of poultry twice a year (October and April) since autumn of 2005 to control epidemic HPAI H5N1 with some considerable empirical evidence of success. However, it has been recognized that this control strategy is not sustainable over the whole country in the long term. Mass vaccination entails a large amount of financial resources from the government and ties up significant human resources in the agriculture sector. Therefore, an alternative or more likely a parcel of complementary alternative control strategies will have to be devised as Viet Nam moves from initial emergency measures to a period of consolidation and ultimately on to the stated aim of control/eradication beyond 2010 (Green Book). This project is investigating and gathering evidence on alternative vaccination strategies in provinces with high and low risk for HPAI H5N1 outbreaks.</p>
Objective of the project
<p>The main objective of the project is to provide field data to the Ministry of Agriculture and Rural Development (MARD) by testing a number of alternative vaccination strategies and the complementary strategy of improved surveillance. This data will assist MARD in its selection of a future vaccination strategy.</p>
Planned activities for this quarter

¹ Quarter VI of the project cycle

Activity 1.5&2.5 Equipment procured including vaccine

- provide further equipment as required to ensure smooth operation of the project
- provide a computer to each of the provinces for data entry activities with the Access database and provide auto-vaccinators to the districts for HPAI vaccination

Activity 1.6&2.6 Training undertaken

- implement and complete global positioning system (GPS) training for District Veterinary Service (DVS) staff
- implement and complete Access database training for the project assistants at each of the Sub-Department of Animal Health (SDAH) offices
- develop and commence a training programme, including workshops at the village level as well as events at the markets, for farmers and village animal health workers (AHWs), utilizing industry groups and unions
- implement the second phase of the community animal health worker (CAHW) training that will coincide with the end of the 2010 first round of vaccination and include training on data collection and completion of the revised data forms

Activity 1.7&2.7 Data gathering

- undertake the first round vaccination data gathering and the second round post-vaccination monitoring for 2010
- streamline data collection activities with an introduction to the Access database in each of the SDAH offices in the GETS provinces and provide training on the use of the database

Output 3: Cost-effectiveness of ‘Novel versus Standard’ (V2/V1) and ‘Standard versus Withdrawal’ (V1/V0) Vaccination Strategies undertaken*Activity 3.1 Component planning/oversight*

- implementation of the second phase of the cost-effectiveness programme by the national implementing agency, the Southern Office of the Institute of Policy Strategy for Agricultural and Rural Development (SCAPS)

Activity 3.2 Team recruited

- sign an LoA with the implementing partner for the second phase of the cost-effectiveness programme

Activity 3.3 Data gathering

- complete data gathering for the second phase of the cost-effectiveness programme

Output 4: Risk factors are defined for animal outbreaks via case series and/or case-control trial*Activity 4.1 Component planning/oversight*

- complete the supply chain analysis across the five GETS provinces and GPS mapping using the GPS units supplied to each district veterinary station
- continue monitoring of high risk mobile duck flocks in all communes in the GETS provinces and ensure vaccination of these flocks, which present a high risk for disease transmission owing to the shedding of the virus with minimal clinical signs if not adequately vaccinated
- commence a detailed poultry industry survey to assist in determining risk factors

Activity 4.2 Training DAH-Regional Animal Health Office (RAHO) and Ministry of Health (MoH)-Regional Health Office (RHO)

- undertake training of DVS staff in GPS use to prepare for the GPS mapping activities
- implement the second round of CAHW training workshops as well as the training for village animal health workers and extend invitations to public health workers and livestock extension officers as in Round 1 where attendance of these groups was high

Activity 4.3 Operational funds arranged/distributed

- continue to support outbreak investigation activities and supply chain mapping for risk factors

through operational funds

Activity 4.4 Data gathering from outbreaks nationwide (64 provinces)

- continue outbreak investigation activities with attendance at all outbreaks in the GETS and neighbouring provinces by the GETS regional coordinators with the aim of providing accurate disease investigation reports

Output 5: Sociological behaviours related to V2/V1 and V1/V0 are compared

Activity 5.1 Component planning/oversight

- following the poultry industry survey that will provide detailed data on farm activities and practices, plan behaviour studies that will evaluate potential motivation factors and key determinants for animal health workers and producers, the barriers to behaviour change and the behavioural changes that have occurred as a result of the project intervention

Activity 5.2 Team recruited

- recruit a sociologist to undertake behavioural case studies with AHWs and poultry producers

Activity 5.3 Data gathering

- continue data collection with attitudinal questions included in the chief animal health worker post-training questionnaire

Output 6: Policy analysis of HPAI strategy including public private sector collaboration and partnerships is undertaken

Activity 6.1 Component planning/oversight

- undertake supply chain analysis and mapping in the second quarter of 2010, identify the location of animal health product suppliers and undertake case studies to determine the governance of their activities
- investigate the governance of private/public partnerships and monitor the effect of the interventions on them
- following the completion of the supply chain analysis, design a detailed case study, including tracking of activities, of the meat trader system and investigate the governance of their activities

Activity 6.2 Team recruited

- complete the recruiting of a national partner to commence on the project at the end of January

Activity 6.3 Data gathering

- continue data gathering with the commencement of supply chain analysis and mapping to assist in the identification of private/public operations that will be used in the governance studies and policy analysis.

Activities undertaken during the reporting period

Outputs 1&2: Feasibility and logistics to implement a Novel Vaccination Strategy (V2) compared with maintaining Standard Vaccination Strategy (V1) and to withdraw routine vaccination (V0) compared with maintaining Standard Vaccination Strategy (V1)

Activity 1.1&2.1 Needs assessment undertaken and work plan finalized

- Implementation of the new LoA with DAH on “Enhanced surveillance, reporting and outbreak response and sentinel duck monitoring” was completed and funds were provided to DAH to support ongoing activities under the new LoA. Amendments were made to the DAH LoA for re-imbursment to provide support to the sentinel duck flock owners.

Activity 1.2&2.2 Public awareness campaigns

- Preliminary project findings were presented to the United States Agency for International Development (USAID), DAH and other partners including World Health Organization (WHO),

Abt Associates and SCAPS at a meeting at the USAID office in June 2010. Input was given by DAH as to their preferred format for the interim report.

- During the International Ministerial Conference on Avian and Pandemic Influenza (IMC-API), the FAO GETS team arranged a site visit for the US delegation to IMC-API and accompanied the delegation to the field. This included a presentation at the Sub-Department of Animal Health (SDAH) office in Ninh Binh explaining project activities as well as a field visit to a duck farm to view the vaccination process.
- The second round of the public awareness campaign with radio announcements of three key messages via 717 commune loudspeaker system was undertaken with the campaign reaching an estimated three million people.

Activity 1.3&2.3 & 1.4&2.4 Farms identified/sampled

- Contracts with sentinel duck flock owners were signed to ensure commitment to the programme. Sentinel ducks were identified with leg tags and a unique numbering system.
- The serum sampling component of the programme was initiated.

Activity 1.5&2.5 Equipment procured including vaccine

- A computer was provided to each of the provinces for data entry activities with the Access database.
- The procurement of auto-vaccinators for HPAI vaccination has commenced.

Activity 1.6&2.6 Training undertaken

- Five GPS training courses for 59 district and provincial veterinary staff were completed in five provinces.
- Access database training for the project assistants at each of the SDAH offices was implemented and completed.
- Expressions of interest have been sought for the training of village AHWs and CAHWs.

Activity 1.7&2.7 Data gathering

- Collection of supply chain data by DVS staff using GPS units was completed in four of the five GETS provinces.
- The first round of vaccination data gathering for 2010 was undertaken.
- The second round post-vaccination monitoring samples for 2010 have been collected.
- Data collection activities are being streamlined with the introduction of an Access database in each of the SDAH offices in the GETS provinces, and training has been provided in the use of the database.
- Data collection forms were revised and issued to the field to assist in gathering adequate data for analysis.

Output 3: Cost-effectiveness of 'Novel versus Standard' (V2/V1) and 'Standard versus Withdrawal' (V1/V0) Vaccination Strategies undertaken

Activity 3.1 Component planning/oversight

- The second phase of the cost-effectiveness programme was implemented by SCAPs - the national implementing agency.

Activity 3.2 Team recruited

- An LoA was signed with the implementing partner for the second phase of the cost-effectiveness programme.

Activity 3.3 Data gathering

- Data gathering for the second phase of the cost-effectiveness programme is underway.
- The report for the first phase of the cost-effectiveness programme was completed.

Output 4: Risk factors are defined for animal outbreaks via case series and/or case-control trial

Activity 4.1 Component planning/oversight

- Supply chain analysis commenced across the five GETS provinces and GPS mapping using the GPS units supplied to each district veterinary station has been completed in four of the five GETS provinces.
- Monitoring of high risk mobile duck flocks will continue in all communes in the GETS provinces and vaccination of mobile duck flocks has been undertaken. These flocks present a high risk for disease transmission because they shed virus with minimal clinical signs if they are not adequately vaccinated.
- A detailed poultry industry survey will commence to assist in determining risk factors.

Activity 4.2 Training DAH-RAHO and MoH-Regional Health Office (RHO)

- Training of 59 provincial and district veterinary staff in GPS use was undertaken to prepare for the GPS mapping activities.

Activity 4.3 Operational funds arranged/distributed

- Operational funds have continued to support outbreak investigation activities as well as supply chain mapping for risk factors.

Activity 4.4 Data gathering from outbreaks nationwide (64 provinces)

- No outbreaks were recorded in the five GETS provinces during the second quarter. Outbreak investigation activities will continue with attendance at all outbreaks in the GETS and neighbouring provinces by the GETS regional coordinators with the aim of providing accurate disease investigation reports.

Output 5: Sociological behaviours related to V2/V1 and V1/V0 are compared

Activity 5.1 Component planning/oversight

- A set of attitudinal and behavioural questionnaires were designed and integrated in the Poultry Industry Survey. It aims at understanding attitude and behaviours of poultry producers, motivation and/ barriers to behaviour change and the behavioural changes that have occurred as a result of the project interventions.

Activity 5.2 Team recruited

- A national partner was chosen to undertake the poultry industry survey and a service contract was finalized and signed.

Activity 5.3 Data gathering

- The national partner has begun training interviewers who will undertake the data gathering.

Output 6: Policy analysis of HPAI strategy including public private sector collaboration and partnerships is undertaken

Activity 6.1 Component planning/oversight

- Supply chain analysis and mapping has been carried out to identify the location of animal health product suppliers so that case studies can be undertaken to determine the governance of their activities.

Activity 6.2 Team recruited

- Discussions were held with the Centre for Agricultural Policy (CAP) regarding central policy decision making procedures.

Activity 6.3 Data gathering

- Data gathering on supply chain mapping was completed in four of the five GETS provinces in support of identifying private/public operations that will be used in the governance studies and policy analysis.

Planned activities for the next quarter

Outputs 1&2: Feasibility and logistics to implement a Novel Vaccination Strategy (V2) compared with maintaining Standard Vaccination Strategy (V1) and to withdraw routine vaccination (V0) compared with maintaining Standard Vaccination Strategy (V1)

Activity 1.1&2.1 Needs assessment undertaken and work plan finalized

- Field activities will be monitored and amendments made to agreements as required.

Activity 1.2&2.2 Public awareness campaigns

- The second round of the public awareness campaign will continue with TV announcements via five provincial TV stations.

Activity 1.3&2.3 & 1.4&2.4 Farms identified/sampled

- Sentinel duck flocks will be monitored to ensure continued commitment to the programme.
- The serum sampling and revised swabbing component of the programme will commence.

Activity 1.5&2.5 Equipment procured including vaccine

- Auto-vaccinators will be procured and provided to the provinces for HPAI vaccination.
- Cold chain extension will be provided to the three new communes in the project provinces.

Activity 1.6&2.6 Training undertaken

- A training programme, utilizing industry groups and unions, has been developed for farmers and village AHW's. This will include workshops at the village level as well as events at the local poultry markets.
- The second phase of the CAHW training will be implemented to coincide with the end of the 2010 first round of vaccination. It will include training on data collection and completion of the revised data forms.
- A training programme for village paravets, utilizing industry groups and unions, will be contracted to a national partner.

Activity 1.7&2.7 Data gathering

- The first round of vaccination data and the second round post-vaccination monitoring data for 2010 will be analysed.
- Data collection and data entry activities will be monitored in each province to ensure that the Access database is being utilized efficiently.

Output 3: Cost-effectiveness of 'Novel versus Standard' (V2/V1) and 'Standard versus Withdrawal' (V1/V0) Vaccination Strategies undertaken

Activity 3.1 Component planning/oversight

- The second phase of the cost-effectiveness programme will be completed by the national implementing agency, SCAPS.

Activity 3.2 Team recruited

- The national partner will complete activities for phase II.

Activity 3.3 Data gathering

- Data gathering for the second phase of the cost-effectiveness programme will be completed and a report provided as per the conditions of the LoA.

Output 4: Risk factors are defined for animal outbreaks via case series and/or case-control trial

Activity 4.1 Component planning/oversight

- Supply chain analysis will be completed across the five GETS provinces and an atlas produced for the five GETS provinces. GPS mapping using the GPS units will be completed in the Ninh Binh.
- Monitoring of high risk mobile duck flocks will continue in all communes in the GETS provinces and vaccination of these flocks will be ensured. These flocks present a high risk for

disease transmission because they shed virus with minimal clinical signs if they are not adequately vaccinated.

- A detailed poultry industry survey will be completed to assist in determining risk factors.

Activity 4.2 Training DAH-RAHO and MoH-Regional Health Office (RHO)

- The second round of CAHW training workshops will be implemented as well as the training of VAHWs. Invitations will be extended to public health workers and livestock extension officers as in the first round where attendance of these groups was high.

Activity 4.3 Operational funds arranged/distributed

- Operational funds will continue to support outbreak investigation activities as well as supply chain mapping for risk factors.

Activity 4.4 Data gathering from outbreaks nationwide (64 provinces)

- Outbreak investigation activities will continue with attendance at all outbreaks in the GETS and neighbouring provinces by the GETS regional coordinators with the aim of providing accurate disease investigation reports.

Output 5: Sociological behaviours related to V2/V1 and V1/V0 are compared

Activity 5.1 Component planning/oversight

- The attitudinal component of the poultry industry survey will be completed and analysed.

Activity 5.2 Team recruited

- A national partner will be contracted to undertake behavioural case studies with animal health workers (AHW) and poultry producers.

Activity 5.3 Data gathering

- Data collection will continue with attitudinal questions included in the chief animal health worker post-training questionnaire and the poultry industry survey.

Output 6: Policy analysis of HPAI strategy including public private sector collaboration and partnerships is undertaken

Activity 6.1 Component planning/oversight

- Supply chain analysis and mapping will be finalized in third quarter of 2010 and will identify locations of animal health product suppliers. Case studies will then be undertaken to determine the governance of their activities. The governance of private / public partnerships will be investigated and the effect of the interventions on this will be monitored.
- A detailed case study, including tracking of activities and of the meat trader system will investigate the governance of their activities. This component will commence following the completion of the supply chain analysis.

Activity 6.2 Team recruited

- Further discussions will be held with CAP with a view to contracting their services.

Activity 6.3 Data gathering

- Data gathering will continue with the commencement of supply chain analysis and mapping. This will assist in the identification of private/public operations that will be used in the governance studies and policy analysis.

Main challenges encountered and response provided

Difficulties were encountered in the Sentinel Duck Programme with contracting of flock owners and tagging and identification of individual sentinel ducks. Revised guidelines were provided to the field to clarify the duck tagging procedure and the reimbursement LoA was amended to support sentinel flock owners for production losses during sampling procedures.

During the first round of the public awareness programme, the release of the TV segment by provincial TV channels was appreciated by the SDAHs; however, it was recommended that local dialects should be dubbed to make it more appealing to poultry farmers. The TV spot therefore will be dubbed with Vietnamese central and western accents in the second round of the public awareness campaign.

Main progress made towards the achievement of project outcomes

Outputs 1&2: Feasibility and logistics to implement a Novel Vaccination Strategy (V2) compared with maintaining Standard Vaccination Strategy (V1) and to withdraw routine vaccination (V0) compared with maintaining Standard Vaccination Strategy (V1)

- Field missions to all provinces and the vaccine intervention plans have been completed.
- The project work plan has been completed and agreement has been gained from DAH/MARD for the intervention programme and the work plan.
- Implementation partners have been chosen and guidelines for all field activities have been completed. LoA's have been prepared and signed.
- The intervention was implemented to coincide with the second round of the Government of Viet Nam vaccination programme in October and November 2009.
- Implementation partners for the public awareness programme have been contracted and the initial capacity building training for over 900 district and commune veterinary staff, livestock extension officers and district public health officials has been completed.
- "A New Stage" public awareness campaign with the production of TV media, audio and leaflets has been completed. The media release commenced with the local TV advertisements started on the last week of October 2009, and they ran four times per day until the end of December 2009 in the five pilot provinces.
- Implementation partners for the second stage of the public awareness programme have been contracted. The media release, consisting of three key audio spots, was aired across 717 commune loudspeaker systems reaching an estimated three million people and was completed in May 2010.
- Enhanced surveillance, reporting and outbreak response activities, as well as sentinel duck monitoring and post-vaccination monitoring are ongoing in the field, and funds have been transferred to the provinces to support these activities. These activities have been reviewed during field missions to each of the five GETS provinces in March 2010 and revised agreements have been adopted to streamline project activities.
- Procurement and distribution of five vehicles, 42 GPS and 714 fridges were completed with the distribution of these to the provinces. For the first time in Viet Nam, continuous cold chain for vaccine storage has been extended to the commune level throughout the five GETS provinces.
- Data collection activities are being streamlined with the introduction of an Access database in each of the SDAH offices in the GETS provinces, and training will be provided in the use of the database.
- Field data collection and data entry procedures have been reviewed across the five project provinces and a database designed and commissioned to assist in streamlining the data entry procedure.
- Preliminary findings were presented to USAID, DAH and other partners including WHO, Abt Associates and SCAPS at a meeting at the USAID office in June 2010. Input was given by DAH as to their preferred format for the interim report.
- During IMCAPI, the FAO GETS team arranged a site visit for the US delegation to IMCAPI and accompanied the delegation to the field. This included a presentation at the SDAH office in Ninh Binh explaining project activities as well as a field visit to a duck farm to view the vaccination process.

Output 3: Cost-effectiveness of 'Novel versus Standard' (V2/V1) and 'Standard versus Withdrawal' (V1/V0) Vaccination Strategies undertaken

- The design of the cost-effectiveness component was subsequently reviewed and finalized with assistance from an international rural economist. Discussions were pursued with a national partner to implement this component and a work plan and budget were reviewed and finalized.
- Completion and signing of the LoA with the national partner, SCAPS, facilitated the commencement of field activities and data gathering. The SCAPS team, accompanied by the GETS regional coordinators, visited each of the five pilot provinces and commenced data collection activities. Phase I of the programme has been completed.
- Phase II of the cost-effectiveness programme has now been implemented, and data collection is underway.

Output 4: Risk factors are defined for animal outbreaks via case series and/or case-control trial

- Outbreak response activities have been finalized and accompanying documents completed.
- Training has been undertaken for the GETS Regional Coordinators whose role includes attending all outbreaks within the GETS provinces and the in bordering provinces to undertake disease investigation activities.
- An LoA with DAH has been finalized and signed and funds have been available for provincial staff for outbreak activities.
- An agreement has been signed with DAH detailing the reimbursement terms for poultry producers in the GETS provinces following culling of their flocks for HPAI outbreaks. Funds have been made available for provincial authorities to fund the reimbursement for eligible flocks.
- Workshops detailing enhanced disease reporting activities were held at the 42 districts involved in the project, and these were attended by 713 chief animal health officers, 178 district veterinary officers, 39 agricultural extension officers and 38 district public health officers - 48 were from SDAH and 14 were from RAHOs.
- Supply chain analysis has been implemented and completed across four of the five GETS provinces as well as GPS mapping using the GPS units supplied to each district veterinary station.
- A detailed case study of the meat trader system to investigate potential risk factors in outbreaks will be undertaken following completion of the poultry industry survey. Meat traders are a high-risk group because they constantly move from farm to farm and handle birds at each farm. Monitoring of high-risk mobile duck flocks is ongoing and is being undertaken by CAHWs throughout the GETS provinces and vaccination of these flocks is being pursued. These flocks present a high-risk for disease transmission because they shed virus with minimal clinical signs if they are not adequately vaccinated.

Output 5: Sociological behaviours related to V2/V1 and V1/V0 are compared

- Data collection consists of attitudinal questionnaires has commenced. A national partner has been chosen to continue with the implementation of this component, and a contract and TOR's were finalized and the partner commenced in January 2010.
- Data collection has commenced with an attitudinal questionnaire included in the chief animal health worker post-training questionnaire, and the attitudinal component of the poultry industry survey will address reaction to changes in the vaccination programme in the GETS provinces. Following completion of the survey, a national partner will be contracted to undertake behavioural case studies with animal health workers (AHW) and poultry producers. These studies will evaluate potential motivation factors and key determinants for AHW and the producers, the barriers to behavioural change and the behavioural changes that have occurred as

a result of the project intervention.

Output 6: Policy analysis of HPAI strategy including public private sector collaboration and partnerships is undertaken

- The governance of private/public partnerships will be investigated, and the effect of the interventions on this will be monitored. Supply chain analysis and mapping has been completed in four of the five GETS provinces and will identify the location of animal health product suppliers.
- Case studies will be undertaken to determine the governance of their activities. A detailed case study, including tracking of the activities of the meat trader system will be undertaken to investigate the governance of their activities. A national partner has been selected to continue with the implementation of this component. This component will commence following the completion of the supply chain analysis, which will assist in the identification of private/public operations that will be used in the governance studies and policy analysis. Discussions have been held with the Center for Agricultural Policy (CAP) in Hanoi regarding central policy decision making procedures.

Quarter II 2010

Project Monitoring Sheet: **OSRO/MYA/702/USA**

Project title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)**

Reporting period: April-June 2010

Country: Myanmar
Project: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)
Code: OSRO/MYA/702/USA
Budget: USD 500 000 (Phase I), USD 750 000 (Phase II), USD 375 000 (Phase III)
Total budget: USD 1 625 000
Effective starting date: January 2008
Planned end date: September 2010
<p>Context of the Project</p> <p>Myanmar experienced three waves of Highly Pathogenic Avian Influenza (HPAI) outbreaks in 2006 and 2007 and a resurgence of outbreaks in the first quarter of 2010. A national duck survey conducted from November 2009 until January 2010 showed that 40 percent of surveyed duck flocks had been exposed to the H5 virus, suggesting that avian influenza (AI) is endemic in duck flocks throughout the country. These issues resulted in a shift in strategy during the last quarter, with an emphasis on expanding the surveillance programme. The Food and Agriculture Organization of the United Nations (FAO) is implementing an integrated AI control programme, consisting of three projects with complementary activities: OSRO/MYA/702/USA, OSRO/MYA/801/WBK and OSRO/MYA/601/AUL. The report describes activities funded or co-funded by the project in the context of the overall programme.</p>
<p>Objectives of the project</p> <p>The major objective of the project is to address the urgent short-term actions to strengthen Myanmar's capacity to rapidly detect HPAI and minimize its spread. Specifically, the project aims to provide necessary assistance in:</p> <ul style="list-style-type: none"> • strengthening HPAI prevention and control in Myanmar, particularly the capacity to effectively contain the outbreak, including animal surveillance, collaboration and communication between the animal and human health sectors; • strengthening the capacity of the veterinary services at the field level; and • mobilizing stakeholders towards building a community-based rapid warning and response system to meet the challenge of an AI outbreak in Myanmar.
<p>Planned activities</p> <p>Output 1: Strengthened cross-sectoral coordination at the national level</p> <p><i>Activity 1.1: Recruit an International Technical Advisor (CTA) to assist in coordinating the project implementation with the Government.</i></p> <ul style="list-style-type: none"> • develop a management team and recruit an international operations officer • recruit six national consultants co-funded by the project

Activity 1.2: Organize coordination meetings of the working groups related to HPAI control in animals.

- organize National Steering Committee (NSC) meetings with the Department of Animal Health (DoH) and the World Health Organisation (WHO)

Activity 1.3: Support the review and revision of the National Strategy, Contingency plan and Standard Operating Procedures (SOPs) related to HPAI control measures.

- finalize the SOPs to support the expanded surveillance programme, including management guidelines and technical guidelines such as outbreak investigation
- review the SOPs on outbreak management in light of the recent outbreaks and conduct an assessment on outbreak management in backyard or duck farms

Activity 1.4: Support national staff of the Livestock Breeding and Veterinary Department (LBVD) to participate and give presentations/share information in international conferences, meetings or workshops.

- no activities planned

Output 2: Strengthened capacity in HPAI disease surveillance and response at the field level.

Activity 2.1: Recruit an international short term consultant (epidemiologist).

- no activities planned

Activity 2.2: Surveillance Rapid Response Team (SRRT) refresher training courses and cooperation between animal and human health sectors.

- training workshops are planned in Upper and Lower Myanmar

Activity 2.3: Strengthen SRRTs on effective investigation of AI outbreaks and response.

- see 2.2.

Activity 2.4: Procure necessary equipment and supplies for surveillance and response.

- purchase large quantities of syringes, masks, gloves, swab tubes, plastic bags, marker pens, containers and antibiotics

Activity 2.5: Support national staff to participate in Regional FETPV.

- have one LBVD staff member attend second session of the Field Epidemiology Training Programme for Veterinarians (FETPV) in Bangkok at the end of May for two months and the first session trainee undertake field work in Myanmar

Activity 2.6: Support passive and active surveillance for the high risk areas including wetlands, duck-raising and border areas.

- complete the investigation programme in 76 townships and begin field activities
- support a new letter of agreement (LoA) with LBVD for disease control/epidemiology, which will provide technical support to the field activities
- draft an additional LoA to support management of data generated from the recently-completed national duck survey, the soon-to-be completed national global positioning systems (GPS) census of commercial poultry farms and FETV related field activities

Output 3: Strengthened capacity in HPAI laboratory diagnosis

Activity 3.1: Organize local training by trainees previously trained overseas.

- ongoing through on the job training

Activity 3.2: Conduct semi-annual proficiency testing (PT) and quality assessment (QA) for serological and rapid tests by linking national labs with the Australian Animal Health Laboratory (AAHL).

- obtain lab results from samples submitted to AAHL and the National Institute of Animal Health, Thailand (NIAH) and take action for further QA accordingly

Activity 3.3: Manage a local quality assessment/quality control (QA/QC) program for the national laboratory network.

- see 3.4. Domestic QA/QC program is ongoing. Central Lab staff will travel to regional laboratories to conduct QA/QC on serology, virology and poultry post mortem under the LoA supporting the Surveillance and Outbreak Investigation Programme.

Activity 3.4: Procure necessary laboratory equipment and supplies.

- support the upgrading of cooling infrastructure at Yangon laboratory, including a larger chilling machine and larger ducts

Output 4: Enhanced risk management measures including biosecurity improvement among the high risk poultry population and selected live bird markets (LBMs).

Activity 4.1: Organize meetings/workshops among the stakeholders to discuss risk management for poultry production zone and cross-border trade.

- complete the LoA on risk assessment in Yangon and Mandalay and continue drafting the LoA on Ayeyewaddy and Inle Lake area for completion in the following quarter

Activity 4.2: Support activities related to biosecurity improvement in selected LBMs and production zones.

- complete the LoA on production zones biosecurity improvement and draft a follow-up LoA

Activity 4.3: Recruit an international consultant (epidemiology).

- no activity planned

Activity 4.4: Conduct studies to assess risk along the poultry supply chain.

- see 4.1.

Activities undertaken

Output 1: Strengthened cross-sectoral coordination at the national level

Activity 1.1: Recruit an International Technical Advisor (CTA) to assist in coordinating the project implementation with the Government.

- Management team was put in place with the addition of an international operations officer, who started her assignment in April 2010.
- Six national consultants were recruited throughout the quarter, with one of them (Risk assessment and management expert) funded by the project.

Activity 1.2: Organize coordination meetings of the working groups related to HPAI control in animals.

- The NSC meeting was held on 10 June with participation of all major institutional

stakeholders, including DoH. Discussions are ongoing with WHO and the Ministry of Health (MoH) to make progress on cross-sector collaboration on epidemiology, labs and zoonoses.

Activity 1.3: Support the review and revision of the National Strategy, Contingency plan and Standard Operating Procedures (SOPs) related to HPAI control measures.

- SOPs to support the expanded surveillance programme were completed and distributed to 78 townships in 17 States/Division. The SOPs included management guidelines and technical guidelines such as outbreak investigation.
- Discussions are ongoing on the structure of a compensation/relief system, on SOPs on outbreak management in light of the recent outbreaks and on assessment of outbreak management in backyard or duck farms.

Activity 1.4: Support national staff of LBVD to participate and give presentations/share information in international conferences, meetings or workshops.

- No activities were initially planned under 1.4. However, the opportunity arose for LBVD staff to take part in two international workshops under the programme.
- One senior staff member attended a meeting on “Learning exchange event on Avian and Human Pandemic Influenza (AHPI): the way forward” held in Ho Chi Minh City, Viet Nam. This meeting was sponsored by the World Bank and the Government of Viet Nam.
- One staff of the Myanmar Livestock Federation participated in a cross-border workshop held in Bangkok, Thailand on 28 and 29 April 2010.

Output 2: Strengthened capacity in HPAI disease surveillance and response at the field level.

Activity 2.1: Recruit an international short term consultant (epidemiologist).

- No activities undertaken.

Activity 2.2: Surveillance Rapid Response Team (SRRT) refresher training courses and cooperation between animal and human health sectors.

- No SRRT took place during the reporting period. However, in the framework of the planning meetings on the expanded surveillance and outbreak investigation programme held in all 17 States/Divisions, on-the-job training was provided to State/Division district and township staff.

Activity 2.3: Strengthen SRRTs on effective investigation of AI outbreaks and response.

- See 2.2.

Activity 2.4: Procure necessary equipment and supplies for surveillance and response.

- The project procured the following supplies: gloves, masks, needles and antibiotics for swabs preservation.

Activity 2.5: Support national staff to participate in Regional FETPV.

- One LBVD staff participant in the first FETPV training course is undertaking field work on outbreak reporting and field studies in Myanmar. The participant in the second training course attended the FETPV sessions in Bangkok, Thailand in May.

Activity 2.6: Support passive and active surveillance for the high risk areas including wetlands, duck-raising and border areas.

- The surveillance and outbreak investigation programme, focusing on 78 townships, began in late June 2010.
- The LoA with LBVD for technical support to surveillance and outbreak investigation programme was signed and began implementation in June 2010. The LoA supports epidemiology and laboratory staff to provide technical support to field teams.
- The LoA on Epidemiology Activity Improvement was finalized and will support management of data generated from the recently-completed national duck survey, the soon-to-be completed national GPS-integrated census of commercial poultry farms, the FETPV related field activities and data from risk assessment studies.

Output 3: Strengthened capacity in HPAI laboratory diagnosis.

Activity 3.1: Organize local training by trainees previously trained overseas.

- Ongoing through on the job training.

Activity 3.2: Conduct semi-annual PT and QA for serological and rapid tests by linking national labs with Australian Animal Health Laboratory.

- Lab results from samples submitted to AAHL and NIAH showed that the virus causing the recent outbreaks in Yangon were of clade 2.3.4, similar to the virus in Yangon outbreaks in 2007. Sera from the duck survey sent to AAHL reacted to N1-type virus, suggesting the ducks had been exposed to H5N1 virus.

Activity 3.3: Manage a local QA/QC program for the national laboratory network.

- Domestic QA/QC programme is ongoing in its attempts to have uniform standards of technology and staff expertise for all the laboratories (two main diagnostic laboratories and six regional laboratories). During the reporting period, an additional LoA with LBVD has been finalized, which will include support to the ongoing domestic QA/QC.

Activity 3.4: Procure necessary laboratory equipment and supplies.

- The project supported the upgrading of cooling infrastructure at Yangon laboratory. This included a larger chilling machine and larger ducts.

Output 4: Enhanced risk management measures including biosecurity improvement among the high risk poultry population and selected live bird markets.

Activity 4.1: Organize meetings/workshops among the stakeholders to discuss risk management for poultry production zone and cross-border trade.

- The LoA on risk assessment in Yangon and Mandalay is in final stages with final draft report received. The LoA on Ayeyewaddy and Inle Lake area is ongoing and is expected to be completed in the following quarter.

Activity 4.2: Support activities related to biosecurity improvement in selected live bird markets and production zones.

- The LoA on production zones biosecurity improvement has been completed. It included an assessment of the probability of introduction of HPAI in the production zones and of its potential impact and provided recommendations and training on risk management (including study tours and a post training survey). Technical advice was given on the establishment of a Zone Development Fund Account and on possible cost-sharing for zone infrastructures. Planning is well underway for a follow-up LoA, which will focus on additional production zones and concentrated poultry production areas.

Activity 4.3: Recruit an international consultant (epidemiology).

- No activities undertaken.

Activity 4.4: Conduct studies to assess risk along the poultry supply chain.

- See 4.1.

Future Planned Activities

Output 1: Strengthened cross-sectoral coordination at the national level

Activity 1.1: Recruit an International Technical Advisor (CTA) to assist in coordinating the project implementation with the Government.

- the entire project team will continue through the quarter

Activity 1.2: Organize coordination meetings of the working groups related to HPAI control in animals.

- meetings planned with WHO and the MoH on cross-sectoral collaboration

Activity 1.3: -Support the review and revision of the National Strategy, Contingency plan and Standard Operating Procedures (SOPs) related to HPAI control measures.

- ongoing review of SOPs on compensation and surveillance and outbreak guidelines

Activity 1.4: Support national staff of LBVD to participate and give presentations/share information in international conferences, meetings or workshops.

- no activities planned

Output 2: Strengthened capacity in HPAI disease surveillance and response at the field level

Activity 2.1: Recruit an international short term consultant (epidemiologist).

- no activities planned

Activity 2.2: Surveillance Rapid Response Team (SRRT) refresher training courses and cooperation between animal and human health sectors.

- have national consultants continue to provide support to the expanded surveillance and outbreak investigation program

Activity 2.3: Strengthen SRRTs on effective investigation of AI outbreaks and response.

- ongoing implementation of LoA providing epidemiology support to the expanded surveillance and outbreak investigation program

Activity 2.4: Procure necessary equipment and supplies for surveillance and response.

- no activities planned

Activity 2.5: Support national staff to participate in Regional FETPV.

- have the LBVD staff in the first FEPTV course continue in-country field work, and the second course candidate continue FETPV studies in Thailand until the end of July 2010

Activity 2.6: Support passive and active surveillance for the high risk areas including wetlands, duck-raising and border areas.

- see 2.3

Output 3: Strengthened capacity in HPAI laboratory diagnosis

Activity 3.1: Organize local training by trainees previously trained overseas.

- ongoing on the-job training

Activity 3.2: Conduct semi-annual PT and QA for serological and rapid tests by linking national labs with AAHL.

- no planned activities

Activity 3.3: Manage a local QA/QC program for the national laboratory network.

- finalize the LoA with the LBVD providing laboratory support to the expanded surveillance programme and to the ongoing domestic QA/QC programmes
- coordinate a two-day training on QA/QC in July 2010 for 20 participants from all the laboratories and with trainers from the Yangon laboratory that will include: sample collection, post mortem examination and HA-HI for harmonizing disease investigation with practical exercises
- undertake field visits to the laboratories to monitor sample testing and post mortem examination
- distribution of the QA/QC proficiency testing samples among laboratories in the country to start in August 2010 and to be completed by the end of the year

Activity 3.4: Procure necessary laboratory equipment and supplies.

- review the requirements for supplies and equipment with a view to the findings of the expanded surveillance programme

Output 4: Enhanced risk management measures including biosecurity improvement among the high risk poultry population and selected live bird markets

Activity 4.1: Organize meetings/workshops among the stakeholders to discuss risk management for poultry production zone and cross-border trade.

- incorporate meetings and workshops on planning within the planned biosecurity LoA, which will focus on production zones and market areas

Activity 4.2: Support activities related to biosecurity improvement in selected LBMs and production zones.

- finalize and implement a follow-up LoA focused on production zones that may also include market areas in Yangon and Mandalay and finalize the LoA on risk assessment in the Ayeyarwaddy and Inle Lake areas

Activity 4.3: Recruit an international consultant (epidemiology).

- no activities planned

Activity 4.4: Conduct studies to assess risk along the poultry supply chain.

- see 4.2

Main challenges encountered and response provided

The major challenge has been how to adequately respond to the findings of the cross-sectional studies. This challenge has been addressed by expanding the surveillance and outbreak investigation programme to include it as one of the project's main activities.

Main progress made towards the achievement of project outcomes (*from the start of the project activities*)

Output 1: Strengthened cross-sectoral coordination at the national level

The project team has now been stabilized with a CTA, an international operations officer, five national consultants and three national operations staff. There continue to be good relations with the Government, and the coordination between the FAO programme and the national AI programme is very good. Coordination between the animal-human sectors seems quite good, when there is an outbreak, but at other times remains a challenge, although some progress has been made.

Output 2: Strengthened capacity in HPAI disease surveillance

The finalization of the national duck survey, with improved data collection and management systems including the use of GPS and computer technology, was a major achievement. Expanding surveillance into 76 townships, utilizing community animal health workers and township veterinary officers in a systematic fashion, is a new approach for LBVD. Epidemiology capacity is steadily building, with the second FETPV trainee being accepted, and the first trainee making good progress. LBVD has attained a fair understanding of the value of good data management. The recent outbreaks indicated that disease reporting is adequate and response is well managed and transparent.

Output 3: Strengthened capacity in HPAI laboratory diagnosis

There is good capacity for HPAI diagnosis and HA/HI testing in Myanmar. The domestic QA/QC program is developing well. The prompt shipment of sera to AAHL for N testing and of the virus samples to AAHL and NIAH is a testament to the readiness of Myanmar to seek international support when needed. The results showed that the most recent outbreaks in Yangon were caused by clade 2.3.4, the same clade that caused the 2007 outbreaks in Yangon. The results from the third outbreak are still awaited.

Output 4: Enhanced risk management measures including biosecurity improvement among the high risk poultry population and selected live bird markets

The LBVD has developed a range of risk management strategies, most significant of them being the development of production zones and permit systems for poultry movement. The recently-developed risk assessment/management framework and its initial application has been a significant achievement that has received strong government support. On the basis of studies conducted, the LBVD is in a much better position to assess and manage risk. The LBVD now has a good understanding of risks in the major border areas, and of duck raising areas, based on the results of the duck survey. Recent studies have also elucidated risks in the Mandalay and Yangon market areas, and studies are ongoing in the Ayeyarwaddy and Inle Lake areas.

Project Monitoring Sheet: OSRO/RAS/604/USA Baby 02

Project Title: **Immediate technical assistance to strengthen emergency preparedness for highly pathogenic avian influenza (HPAI)**

Reporting Period: **October 2012 to March 2013**

Country: The People's Republic of China
Project title: Immediate technical assistance to strengthen emergency preparedness for highly pathogenic avian influenza (HPAI)
Code: OSRO/RAS/604/USA Baby 02
Budget: USD 500 000 (Phase I), USD 500 000 (Phase II), USD 650 000 (Phase III), USD 1 150 000 (Phase IV), USD 1 250 000 (Phase V), USD 1 005 500 (Phase VI), USD 670 000 (Phase VII)
Total budget: USD 5 725 500
Effective starting date: 1 August 2006
Planned end date: 30 September 2013
<p>Context of the project</p> <p>Despite efforts by the Government of the People's Republic of China to improve the surveillance and control of highly pathogenic avian influenza (HPAI) through the commitment of resources and development of widespread and comprehensive programmes in both animal disease surveillance and preventive vaccination, the disease remains endemic in some areas of the country. More specifically, the virus is still circulating widely in agro-ecological zones and traditional production systems where the implementation of the control policy requires major effort and commitment of human and financial resources at national and provincial levels. This project was designed to improve the country's capacities to detect and control HPAI in identified high-risk ecological and production systems at an early stage, through the implementation of intensified surveillance activities, epidemiological studies, socio-economic activities, capacity building and training. Ultimately, the project aims to reduce the spread of H5N1 in poultry in the country thus minimizing the risk of contagion to other mammals and humans and the possibility of a pandemic.</p>
<p>Objectives of the project</p> <p>The main objective under Phase VII of the project is to continue the improvement of China's capacities and capabilities to understand HPAI epidemiology, to acquire and analyze relevant information and, overall, to effectively prevent, prepare for, and respond to HPAI outbreaks in the animal population. A significant part of Phase VII of the project will revolve around training and capacity building through the China Field Epidemiology Training Programme for Veterinarians (FETPV). The project will also follow up on new activities and approaches that have been initiated in previous phases, including improvement of public-private partnerships (PPPs), biosecurity in live bird markets (LBMs) and investigation and reporting of outbreaks. Other activities include fostering exchanges of knowledge and good practices with neighboring countries on vaccination strategies, cross-border issues and controlling risks of transboundary animal diseases (TADs) using HPAI as a model, operationalizing the <i>One Health</i> concept, and addressing health issues at the human-animal-ecosystem interface with a special emphasis on a multi-disciplinary and cross-sectoral approach.</p>

Planned activities for the reporting period (October 2012 to March 2013)**Output 1: Cross-sectoral coordination at the national and international levels strengthened**

- 1.1 Support the country team including national and international consultants to assist in coordinating project implementation with the government.
- 1.2 Ensure active participation as appropriate and facilitate coordination of the country programme with other projects or programmes including the Emerging Pandemic Threats Plus (EPT+) and EPT programmes.
- 1.3 Organize regular meetings with the Chinese Ministry of Agriculture (MoA) – the Veterinary Bureau and Department of International Cooperation (DIC) – and the State Forestry Administration (SFA) to discuss project activities and implementation issues.
- 1.4 Strengthen cooperation with relevant laboratories and epidemiology networks.
- 1.5 Coordinate the United Nations Theme Group on Health (UNTGH) sub-working group on diseases at the human-animal interface using avian influenza coordination as a model.

Output 2: Veterinary epidemiology capacity strengthened

- 2.1 Organize stakeholder meeting/mentors workshop/Steering Committee meeting for the second cohort of China FETPV.
- 2.2 Organize three training modules under the framework of the China FETPV for the second cohort.
- 2.3 Arrange Trainings through Service (TTS) activities in the field: field surveillance and outbreak investigation.
- 2.4 Support the Veterinary Bureau and China Animal Health and Epidemiology Center (CAHEC) to organize epidemiology training at the national and provincial levels.
- 2.5 Support the participation of national staff in the Regional FETPV training in Bangkok, Thailand.
- 2.6 Engage the MoA and mobilize stakeholders support for a strategic plan for epidemiological capacity building.
- 2.7 Enhance practical *One Health* approaches in China FETPV training.

Output 3: Knowledge of HPAI epidemiological, ecological and socio-economic risk factors improved

- 3.1 Produce monthly bulletin, HPAI Disease Update, technical/scientific papers and analytical reports on HPAI situation.
- 3.2 Assist national authorities in investigating disease outbreaks, analyze national surveillance results and provide guidance on improving national and provincial surveillance policies.
- 3.3 Discuss with MoA, SFA, local agencies in Jiangxi Province and other national implementing partners the implementation of surveillance and epidemiological studies.

Output 4: HPAI surveillance and control strategies improved

- 4.1 Assist in refining the strategic vision for the national vaccination campaign, provide guidance on improving the progressive control of H5N1 HPAI through vaccination and share views on establishing vaccination exit strategies where appropriate.
- 4.2 Identify remaining difficulties and gaps of national and provincial surveillance through trainees'

implementation of TTS activities under China FETPV.

4.3 Assist MoA and provincial partners to establish models of good practice for disease control (this will include promoting the scaling up of the PPP project in Guangdong Province through the demonstration of a model market – Guangzhou Jiangcun Market).

Activities undertaken during the reporting period (October 2012 to March 2013)

Output 1: Cross-sectoral coordination at the national and international levels strengthened

Activity 1.1: Support by country team in coordinating project implementation:

- Recruitment of one National Project Coordinator (six months) and co-funding of one Programme Assistant (three months from July-September 2013) under Personal Service Agreement (PSA) contracts under the EPT+ project; and
- Recruitment of one National Consultant on PPP to work for the promotion and roll-out of the PPP project in Guangzhou LB (50 working days under a PSA contract).

Activity 1.2: Implementation of the EPT+ project in the country:

- Consultation with the MoA (Veterinary Bureau and DIC) for the official endorsement of the project proposal;
- Field mission to Harbin Veterinary Research Institute (HVRI), Chinese Academy of Agricultural Sciences (CAAS), negotiated with National Animal Influenza Laboratory for swine surveillance from 14 to 15 November 2012;
- A letter of agreement (LoA) on surveillance in Guangzhou and Hunan with HVRI prepared, approved and signed (total amount USD193856.55, cleared by the Procurement Service of the Food and Agriculture Organization of the United Nations [FAO]);
- Procurement of animal influenza Test Kits and laboratory equipment (total amount USD 50 948.86) with delivery completed and accepted by HVRI;
- Detailed sampling plans were discussed and confirmed with Guangdong and Hunan Animal Centers for Disease Control (CDCs) during the mission from 20 to 21 December 2012;
- The first-round of sampling was carried out by the sampling team from HVRI in January 2013 in Guangzhou and Hunan Provinces. A coordination meeting was organized at the Hunan Animal CDC on 17 January 2013 before the work commenced. In total 5800 sets of swine nasal swab and blood samples were collected. Among them, 2800 sets were from Changde (Dongting Lake area) and Changsha city, Hunan Province, and 3000 sets were from three cities in Guangdong Province. Samples were collected at slaughterhouses and pig farms;
- Virus isolation and Enzyme-linked immune-sorbent assay (ELISA) tests for two batches of samples were under testing in Harbin laboratory. Some preliminary results will be shared in the mid-term technical report in May-June 2013;
- An internal side-meeting for EPT+ country teams was organized during the seventh Annual Regional ECTAD [Emergency Centre for Transboundary Animal Diseases] RAP [Regional Office for Asia and the Pacific] Meeting (AREM) in Bangkok to review progress and share future arrangements;
- The second round of sampling will be carried out from 11 to 14 March 2013. A total of 2 000 set of samples were taken from two cities in Guangdong Province and 2200 sets of samples from the Dongting Lake area and Changsha city in Hunan Province. The total number of samples for the project will be more than 10000 from both provinces; and

- Human blood samples were collected by local CDCs, in Guangzhou and Hunan as part of a joint surveillance activity on farms and at slaughterhouses.

Activity 1.3: Meetings with national government partners for project/programme implementation:

- An official meeting with the Veterinary Bureau and the DIC of the MoA was held in the MoA's conference room on 19 September 2012. A number of important issues were discussed with Dr Song Junxia, the new Acting Director of the Division of Science, Technology and International Cooperation within the Veterinary Bureau; and
- A Strategic Planning Workshop for the ECTAD China Office was organized from 14 to 15 January 2013. Representatives from the FAO Representation Office, MoA (Veterinary Bureau) and CAHEC were actively engaged. Future programme/project priorities and directions were identified and agreed upon with the key national partners. These will be incorporated into plans for the next year.

Activity 1.4: cooperation with laboratories and epidemiology networks:

- Coordinate with the MoA and HVRI for the designation of the Animal Influenza Laboratory (AIL) as the FAO Reference Centre for Animal Influenza; and
- After the National Animal Influenza Laboratory, the Harbin Veterinary Research Institute was recognized by FAO as the FAO Reference Centre for Animal Influenza. A celebration ceremony was held in Harbin and attended by Dr Juan Lubroth (FAO Chief Veterinary Officer), Dr Subhash Morzaria (Regional Manager of ECTAD RAP), Mr Percy W. Misika (FAO Representation in China) and high level officials from the MoA and its affiliated institutes, including the CAAS, China Animal Disease Control Center (CADC) and CAHEC, as well as technical and administrative officials for the provincial and municipal governments.

Activity 1.5: UNTGH sub-working group meetings:

- A meeting of the Executive Committee held in December 2012;
- The second Rabies Technical Advisory Board meeting held on 17 January 2013, chaired by Prof. Edwards the outcomes of which included joint plans to assist the Government with planning for rabies control; and
- A sub-working group meeting organized on 5 March 2013 with the participation of Dr Subhash Morzaria, Regional Manager of ECTAD RAP. The annual Action Plan and a scoping paper on *One Health* Event, which is scheduled to be held in June-July 2013 were reviewed and discussed among all participants. There has been good progress with implementation of the action plan.

Output 2: Veterinary epidemiology capacity strengthened

Activity 2.1: The seventh Steering Committee Meeting was organized in January 2013. Representatives from the Veterinary Bureau, CAHEC, China Field Epidemiology Training Programme (FETP), United States Center for Disease Control and Prevention and European Union (EU)-China Trade Project Phase II attended the meeting to discuss key issues of programme development.

Activity 2.2: The activities of first cohort of the China FETPV are:

- The trainees from the first cohort completed their field practice assignments by the end of October 2012 as the training framework required. In total, trainees conducted

16 epidemiological studies and 14 outbreak investigations during the two-year programme; and

- Fourteen trainees graduated on 11 October 2012 after completion of the two-year training programme and a graduation ceremony for the China FETPV first cohort was held in Qingdao.

Activity 2.3: A four-week introductory course on basic epidemiology was held at Qingdao from 19 November to 14 December 2012. A total of 29 trainees from 17 provinces, three national institutions and one university attended the course. They were selected out of 60 applications from around the country according to established criteria.

Activity 2.4: A joint workshop on epidemiology of zoonotic disease and the interface between animal and human health was held from 14 to 15 December 2012. This involved 29 trainees of China FETPV and 48 trainees of China FETP. This was co-funded by the EU Trade project.

Activity 2.5: Following the recruitment criteria and process which was approved by the Steering Committee, 20 trainees were selected to enrol in the two-year training programme. They are from 12 provincial animal CDCs, three municipality animal CDCs, one university and CAHEC. The launching ceremony of the second cohort was held on 9 March 2013 in Beijing and formal training commenced in Qingdao on 11 March 2013.

Activity 2.6: A two-day Veterinary Epidemiology Training for Executives was organized from 9 to 10 March 2013 under the China FETPV framework. The workshop aimed to enhance senior Government officials' understanding of the basics of veterinary epidemiology and its role in disease control and thus strengthen their ability to develop effective animal and public health programmes. A total of 53 senior officials from national and provincial animal CDCs participated in the workshop which was facilitated by Prof. Edwards, Prof. Dirk Pfeiffer and Dr David Castellán. Participants indicated a high level of satisfaction and a commitment to support ongoing epidemiological activities in their provinces/workplaces.

Activity 2.7: The activities to strengthen the Chinese partners' capacity were organized both at the national and provincial levels:

- Prof. Edwards presented at the Sino-Dutch Veterinary Science and Technology Seminar organized by the Netherlands Embassy and the Veterinary Bureau on 12 December 2012;
- A training on epidemiological mapping and spatial analysis was organized for CADC in February 2013; and
- A training request from Beijing General Station on animal husbandry and veterinarians was proposed at the cooperation meeting held on 7 March 2013.

Activity 2.8: Nomination of national participants to attend the Regional FETPV training.

Output 3: Knowledge of HPAI epidemiological, ecological and socio-economic risk factors improved

Activity 3.1: In total, 12 issues of the Monthly Bulletin-China HPAI Highlights (six in English and six in Chinese) and one HPAI Disease Update and analysis report on the HPAI situation were produced during the past six months. These products were disseminated to all relevant stakeholders on a regular basis.

Activity 3.2: A template form for outbreak investigation was developed by the office to assist national authorities in investigating disease outbreaks, analyzing national surveillance results and providing guidance on improving national and provincial surveillance policies.

Activity 3.3: Consultation with the MoA, SFA and provincial partners to carry out surveillance and epidemiological studies were continued through technical workshops/meetings.

Output 4: HPAI surveillance and control strategies improved

Activity 4.1: A technical workshop on animal influenza research was organized with HVRI on 4 March 2013, during which Dr Subhash Morzaria gave a lecture on FAO's initiatives on HPAI and other influenzas in Asia. Dr Li Chengjun from HVRI shared information on research and vaccination development of the HVRI.

Activity 4.2: National and provincial partners agreed to provide support to facilitate trainees' field epidemiology surveillance and outbreak investigation under the second cohort of China FETPV.

Activity 4.3: The promotion of the PPP project in Guangzhou will start between March and June 2013 through demonstration of the model market – Guangzhou Jiangcun Wholesale Market.

Other activities:

- Consultation with the MoA to confirm the training on Good Emergency Management Practice (GEMP) in China. The training will be organized in Beijing from 13 to 15 May 2013;
- Discussion on China-Vietnam Bilateral Meeting was carried out between ECTAD Viet Nam and ECTAD China during the AREM meeting in Bangkok. The preferred date will be in June 2013 and the venue will be in Vietnam; and
- Provided technical advice to the World Bank funded emerging infectious diseases (EIDs) project in the country and participate in the joint missions in Inner Mongolia from 20 to 23 November 2012.

Main challenges encountered and responses provided

There was no significant challenge encountered during the reporting period. In most areas, there was a high level of completion of agreed activities.

Main progress made towards the achievement of project outcomes

The project has made considerable progress towards achieving the expected outcomes, which can be summarized as follows:

- Adoption of FAO recommendations on the control of HPAI was included in the National Medium- and Long-term Plan for Animal Epidemic Prevention and Control (2012-2020), thanks to the ECTAD China Office's ongoing efforts to provide technical advice to the national Government. The National Plan has included FAO's recommendations on the national surveillance programme, vaccination and exit strategies, risk-based animal control strategies, and the management of LBMs consistent with international standards for animal health. The beneficiaries of the new policy not only includes China itself, but also neighboring countries and other nations in the world, due to the profound implication on food safety and trade of animals and animal products;
- China FETPV is recognized by high-level officials from both the central and provincial

governments as a pivotal training programme for the development of veterinary epidemiology in the country. The MoA and its affiliated institute – CAHEC – have increased commitment and funding for the second cohort. China FETPV has gradually institutionalized and integrated into the Government’s national programme, while successfully attracting support and commitment from other collaboration partners, such as the EU;

- Under the UNTGH umbrella, the ECTAD China Office is now taking the lead in coordination with national institutions and international partners in the country on zoonotic diseases and the application of *One Health* approaches. A platform of information exchange and coordination among the public health and the animal health sectors now exists among FAO, the World Health Organization, the MoA, Ministry of Health and SFA;
- The successful and effective implementation of this project has won trust from not only the central and local governments, but also great support from the private sectors, including the market management and the individual vendors. With future commitment from both the public and private sectors, the experience and practice of this project can be further promoted in another seven LBMs in Guangzhou, and can also be duplicated in other provinces in the country; and
- The Office also obtained full support from national partners by organizing a joint strategic planning workshop for 2013/14, for which a set of principles were agreed to. They include alignment with priorities of key stakeholders and international good practices in each activity, applying *One Health* approaches wherever possible, achievement of results within current budgets and with affiliated projects.
- The relationships with MOA and CAHEC have been enhanced during this period.

II Quarter 2010

Project monitoring sheet: OSRO/EGY/701/USA

Project title: Strengthening avian influenza detection and response (SAIDR) in Egypt

Reporting period: January – March 2010

Country: Egypt Title: Strengthening avian influenza detection and response (SAIDR) in Egypt Code: OSRO/EGY/701/USA
Budget: USD 3 000 000 (Phase I), USD 3 000 000 (Phase II), USD 3 000 000 (Phase III) Total budget USD 9 000 000
Effective starting date: October 2007
Planned end date: September 2010
Context of the project Outbreaks of Highly Pathogenic Avian Influenza (HPAI) have spread in Egypt since February 2006 and the disease has become endemic. The Food and Agriculture Organization of the United Nations (FAO) has been providing technical assistance to the Ministry of Agriculture and Land Reclamation (MALR) through the implementation of the animal health component of the SAIDR project funded by the United States Agency for International Development (USAID).
Objectives of the project The overall objective of the project is to minimize human health risks and reduce the livelihood impacts posed by HPAI through its effective prevention and control. The specific objectives of the project are to: 1. ensure the regular updating of the national HPAI control/response plan; 2. facilitate the improvement of biosecurity measures to reduce virus circulation in poultry populations and bird-to-human transmission; 3. facilitate the improvement of surveillance activities of H5N1 in poultry and wild birds; and 4. facilitate the improvement of HPAI outbreak investigation and response measures in poultry populations.
Planned outputs and activities <ul style="list-style-type: none"> • An international consultant will review and update the animal health component of the integrated national Avian and Human Influenza (AHI) Plan. A consultative high-level workshop will be organized to discuss and agree on the updated national plan. • A draft active and passive HPAI surveillance plan will be prepared based on identified critical control points, covering all poultry production sectors and in accordance with the integrated national plan. • A technical workshop will be organized, involving relevant stakeholders and partners to gather inputs and to enrich the draft HPAI surveillance plan.

- Follow up will be carried out on the proper implementation of the various Letters of Agreement (LoAs) by national and international partners.
- The sampling and testing of domestic ducks residing near important resting sites for migratory bird (Al Fayoum) and around wetlands in Lake Manzala will be completed.
- An evaluation of the Participatory Epidemiology (PE)/Participatory Disease Surveillance (PDS) programme will be conducted (analysis of data collected from the pilot governorates since the start of the PDS programme in Egypt in November 2008).
- A one-day workshop will be organized for key decision-makers to present and discuss the results and lesson learned from the PDS activities and the way forward.
- The implementation of the current LoA with the International Livestock Research Institute (ILRI) will be re-assessed and a second agreement entered into with ILRI for the implementation of the remaining project activities.
- Three training courses will be carried out on the new community-based animal health outreach (CAHO) approach, each lasting for five days, involving 12 existing PDS trainers and 42 practitioners.
- Two consultative workshops will be conducted on the principles, linkage with other project activities and management of the CAHO programme in Egypt.
- The biosecurity guidelines will be finalized (with inputs from other FAO-implemented projects), translated into Arabic, printed and disseminated to downstream users.
- A workshop will be organized to gather inputs and enrich the draft biosecurity measures.
- Four training courses will be conducted for field veterinarians to support the improvement of biosecurity measures at the farm level.
- The HPAI hotlines system, established within the General Organization for Veterinary Services (GOVS) premises, will be operationalized.

Activities undertaken during the reporting period (October to December 2009)

Objective 1: Ensure the regular updating of the national HPAI control/response plan

- An international consultant (Dr. Antony Forman) was recruited to review and update the animal health component of the integrated national plan for controlling HPAI in Egypt.
- FAO, in collaboration with the MALR and the National AHI Supreme Council, revised the national strategy for the control of HPAI. The draft content of a revised strategy was discussed in two workshops:
 - The first was a technical workshop and took place in Cairo on 15-16 February 2010 with 80 participants from GOVS, the National Laboratory for Quality Control on Poultry Production (NLQP), the animal production sector, the Central Laboratory for Evaluation of Veterinary Biologics (CLEVB), FAO, United Nations System Influenza Coordination (UNSIC), the World Organisation for Animal Health (OIE), the United States Department of Agriculture (USDA), regional laboratories and veterinary directorates, and the Egyptian Poultry Producers Association.
 - The second workshop was organized on 18 February 2010, with attendance by over 100 stakeholders, including high-level political authorities, United Nations agencies, international organizations, donors, non-governmental organizations (NGOs), representatives of poultry producers and private service/input suppliers.

The strategy emphasizes the need for longer-term risk reduction interventions with a key focus on biosecurity, improving market chain management, and strengthening veterinary services. The strategy will be implemented over five years and requires an estimated USD 100 million. The English and Arabic versions of the revised strategy have been prepared

and will soon be officially submitted to MALR and the National AHI Supreme Council for formal endorsement.

- ECTAD, GOVS and NLQP have continued to produce and distribute the *Monthly HPAI News Review* to stakeholders in Egypt and worldwide via print and the Internet¹. The *Review* continues to provide relevant information on HPAI and related project activities in Egypt.
- The process for the refurbishment of 120 decentralized epidemiology units had been initiated through an assessment of local needs. Procurements required for these units are:
 - 50 desktop computers (already received and delivered to GOVS for distribution to various epi-units); and
 - 50 UPSs, 50 printers, 120 air conditioners, 120 computer tables and 240 chairs (in process).

Objective 2: Improvement of biosecurity measures to reduce virus circulation in poultry populations and bird-to-human transmission

- FAO signed 14 LoAs with governorate veterinary services identified as high-risk areas (Assuit, Banisuef, Beheira, Dakahlia, Fayoum, Gharbia, Helwan, Kafr El-Sheikh, Minya, Monufia, Qena, Sharqia, Six October, and Souhag). The aim of these LoAs is to provide financial assistance to the recipient organizations to support running costs for field implementation of approved biosecurity measures.
- Biosecurity guidelines for the different poultry production sectors and farming types are in the process of being finalized by other FAO-implemented projects.

Objective 3: Improvement of surveillance activities of A/H5N1 in poultry and wild birds

- The international surveillance expert, Dr Yvon Lebrun (seconded by the French Ministry of Foreign and European Affairs to FAO,) has started reviewing and updating the HPAI surveillance plan.
- An LoA was signed with ILRI. The main purpose of this is to support the development of professional modular courses and conduct of tailored short-term group training sessions for teams participating in the CAHO (formerly referred to as PDS) programme in selected governorates.
- The evaluation of the process of PE/CAHO introduction and impact of the methodology employed on the national surveillance system in Egypt was conducted by ILRI (consultant from the Royal Veterinary College [RVC] – Dr. Jonathan Rushton) in collaboration with FAO. The evaluation mission concluded that the CAHO approach has had a very positive short-term impact on disease detection and the data generated by these field trips has also stimulated the Egyptians involved to examine how the disease is spread and maintained. However, there is a need for the Egyptian Government to financially support this new approach and provision of continuous training for staff involved.
- A one-day workshop for key animal health decision-makers on CAHO was organized on 7 March 2010. The main objective was to present and discuss the results obtained to-date and lessons learned from CAHO field activities, as well as to agree on the way forward.
- From 8 to 12 March 2010, a four-day orientation workshop on the CAHO approach was organized, involving 12 CAHO practitioners from three governorates (Gharbia, Sharkia and Behera). The aim of the workshop was to provide support to carry out subsequent CAHO orientation and introductory training courses.
- A further two training workshops on the CAHO approach, each lasting five days, was organized. The purpose of these was to launch the CAHO programme in previously targeted governorates through the consolidation of achievements and adding value to the existing

¹ FAO ensures the newsletter is featured on SAIDR and United Nations Development Programme web sites.

programme, which was started in previous SAIDR project phases. The first workshop took place from 14 to 18 March and involved 19 CAHO practitioners, while the second workshop was held from 21 to 25 March and involved 21 CAHO practitioners.

- 22 CAHO teams continue to work in ten governorates. These teams visited 226 villages and detected 89 suspected HPAI outbreaks, of which 66 were confirmed by real-time polymerase chain reaction (RT-PCR) tests. During the reporting period, 41 percent of the HPAI reported from the household poultry sector was detected through the CAHO programme.
- In collaboration with GOVS and NLQP, sampling and testing of domestic ducks residing near important migratory bird resting sites around wetlands in Lake Manzala were completed.
- Diagnostic kits for RRT-PCR for testing 2 000 pool samples were received and delivered to NLQP. The kits are meant to support NLQP to enable it to play its role in HPAI surveillance activities in poultry.
- Two vehicles procured to support increased Emergency Centre for Transboundary Animal Diseases Operations (ECATD)-FAO field activities of the unit in Egypt were received.
- Procurement of the following items is in process:
 - consumables/plastic ware for RRT-PCR for NLQP to meet its requirements for routine HPAI diagnosis in poultry;
 - sampling kits and transport media as required by GOVS; and
 - various consumables required for outbreak investigation and response (disinfectants, detergents, gloves, masks, aprons, shoe covers).

Objective 4: Improvement of HPAI outbreak investigation and response measures in poultry populations

- FAO signed 22 LoAs with Directorates of Veterinary Services in infected governorates (Alexandria, Assuit, Aswan, Banisuef, Beheira, Dakahlia, Damietta, Fayoum, Gharbia, Giza, Helwan, Ismalia, Kafr El-Sheikh, Luxor, Matrouh, Minya, Monufia, Qena, Sharqia, Six October, Souhag, and Suez). The Agreements enable the provision of financial assistance to support recipient organizations (ROs') running costs for HPAI outbreak investigation and implementation of response measures.
- Eight technical training courses were provided to rapid response teams (RRTs) from 19 governorates (representing 154 districts). The main aim of the training was to enhance their performance and efficiency in responding to HPAI outbreaks.

Project management issues

- The Chief Veterinary Officer (CVO) in Egypt has been replaced. As the SAIDR project is jointly implemented with GOVS, it is assumed that the new CVO will take some time to thoroughly understand the nature and scope of the project. The ECTAD Team Leader and Programme Operations Officer held a meeting with the new CVO and explained the various collaborative projects that FAO is implementing with the Government of Egypt.
- A renovation of GOVS premises for the establishment of a HPAI hotline system is near completion.

Planned activities for the next quarter:

- Prepare a draft active and passive HPAI surveillance plan based on identified critical control points, covering all poultry production sectors and in accordance with the integrated national plan.
- Organize a technical workshop involving relevant stakeholders and partners to gather inputs and for the enrichment of the draft HPAI surveillance plan.
- Follow up on the proper implementation of the various LoAs by national and international

<p>partners.</p> <ul style="list-style-type: none"> • Re-assess the implementation of the current LoA with ILRI and enter a second agreement with the same for the implementation of the remaining project activities. • Conduct an introductory CAHO course (ten days) for 20 new practitioners. • Conduct a refresher workshop (five days) for the 20 new CAHO practitioners who will receive the introductory course mentioned above. • Conduct a training of trainers (ToT) course (six days) for 12 CAHO practitioners. • Organize and conduct two consultative workshops on principles and management of the CAHO programme in Egypt involving veterinary directors and other decision-makers at governorate level. • Finalize the procurement process for the remaining items to be delivered to GOVS and NLQP on time. • Operationalize the HPAI hotline system established within the GOVS premises.
<p>Main challenges encountered and solutions</p> <ul style="list-style-type: none"> • Lack of capacity in governorate veterinary services to implement and report according to terms specified in the various LoAs signed with FAO. ECTAD teams are regularly following up the implementation and reporting status of ROs and provide technical assistance as necessary. • Kalubiyia Governorate, being one of the high-risk governorates identified, declined to sign two LoAs. There has been no official reason provided for this. Therefore, ECTAD-FAO decided to leave out the LoAs for the specified governorate.
<p>Main progress made towards the achievement of project outcomes</p> <ul style="list-style-type: none"> • FAO has implemented, analyzed and compiled numerous field-level studies on livelihoods, poultry value chains and disease control constraints for use by GOVS. Project outputs have strengthened the institutional capacities (manpower, infrastructure, etc.) of veterinary services at both central and governorate levels. • The assessment study conducted in the framework of the SAIDR project on avian influenza vaccination of poultry in Egypt indicated that vaccination coverage and flock immunity level is low. The organization of vaccination campaigns is poorly managed. The study suggested that vaccination should be seen as only one of the many efforts required to make significant improvements to HPAI control and prevention in the country. FAO has developed and handed over to GOVS a risk-based, targeted vaccination scheme for the different production sectors, as well as an operational plan and exit strategy. • The strategic HPAI review meeting held in June 2009, jointly organized by USAID, GOVS, the Ministry of Health and FAO, urged stakeholders to refocus efforts for the future. As a result, the SAIDR project is focusing the majority of its efforts on the following key areas: i) sustainable and cost-effective biosecurity in all production sectors; ii) risk-based targeted surveillance; and iii) improved outbreak investigation and disease management capacities. • In close consultation with the primary stakeholders, FAO continually evaluated its project implementation. Government counterparts operating at various levels and private sector actors appreciated FAO's approach and demonstrated a high level of confidence. In close consultation with relevant partners, FAO has completed the process of reviewing the animal health component of the integrated national plan that needs to reflect the endemic nature of the disease and the need for longer-term risk reduction measures.

II Quarter 2010Project monitoring sheet: **OSRO/EGY/801/USA**Project title: **Avian influenza vaccine efficacy project (AIVPEP) in Egypt**Reporting period: **January to March 2010**

<p>Country: Egypt Title: Avian influenza vaccine efficacy project (AIVPEP) in Egypt Code: OSRO/EGY/801/USA</p>
<p>Budget: USD 2 416 500 (Phase I) Total budget: USD 2 416 500</p>
<p>Effective Starting Date: October 2008</p>
<p>Planned End Date: September 2010</p>
<p>Context of the project</p> <p>Outbreaks of Highly Pathogenic Avian Influenza (HPAI) spread in 18 governorates in Egypt within less than three months after the disease was originally diagnosed in three Governorates on 17 February 2006. The Government attempted to control the outbreak through a stamping-out procedure, which included culling of all poultry within a 1 km radius of the confirmed diagnosis. By the end of 2006, nearly 30 million birds had been culled. Outbreaks continue to be reported in 23 of the 29 governorates in the country and the disease has become endemic.</p> <p>In response to the continued threat of HPAI to Egypt, the Food and Agriculture Organization of the United Nations (FAO) and the World Organisation for Animal Health (OIE) have been providing technical assistance through the joint OIE/FAO Influenza Network (OFFLU) and other initiatives. Specifically, FAO has been providing the Ministry of Agriculture and Land Reclamation (MALR) with major technical assistance through the implementation of the AIVPEP and the strengthening avian influenza detection and response (SAIDR) project, both funded by the United States Agency for International Development (USAID).</p> <p>In collaboration with the Government of the Arab Republic of Egypt, FAO, OFFLU and USAID are working together to conduct virus characterization and mapping of Egyptian antigenic variants with intensified HPAI field isolate collection and analyses. Through antigenic mapping, challenge testing and transmission studies, this project has been developing strategic recommendations for Egypt, including on the development of clear criteria for the selection of vaccinal strains.</p> <p>FAO is providing key technical support through the AIVPEP as vaccination is considered part of the overall efforts to reduce HPAI infections and spread of the virus in Egypt, with the potential to benefit other countries in the region and worldwide.</p>

Objectives of the project

The overall project objective is to assist the Government of Egypt in its efforts to control HPAI in the domestic poultry population and avoid the risks of human infection.

The specific project objectives are to conduct:

1. screening and evaluation of genetic and antigenic variants among existing H5N1 HPAI field strains previously collected from 2006 until early 2008;
2. intensified collection of H5N1 HPAI field isolates from newly confirmed outbreaks (since mid-2008);
3. challenge testing of antigenic variants in specific pathogen free (SPF) birds and currently used avian influenza (AI) vaccines in Egypt; and
4. controlled transmission trials in the laboratory on birds raised and vaccinated in commercial poultry farms.

Planned activities

Output 1.1: Screening and evaluation of genetic and antigenic variants among existing field strains previously collected from 2006 until early 2008;

- Activity 1.a: Screening and evaluation of genetic and antigenic variants among existing field strains (2006 – early 2008 collections)
- Activity 1.b: Carry out sequencing and phylogenetic analysis
- Activity 1.c: Conduct antigenic profiling
- Activity 1.d: Perform antigenic cartography
- Activity 1.e: Selection of variants for challenge studies as specified under Output 1.3 below
- Activity 1.f: Assessment of biosecurity and biosafety of the National Laboratory for Veterinary Quality Control on Poultry Production (NLQP) and laboratory operations
- Activity 1.g: Capacity building (i.e. training of Egyptian scientists)

Output 1.2: Intensified collection of H5N1 HPAI field isolates from newly confirmed outbreaks (since mid-2008).

- Activity 2.a: Intensified HPAI field isolate collection
- Activity 2.b: Conduct real-time polymerase chain reaction (RT-PCR) analysis (support for laboratory consumables provided through SAIDR project)
- Activity 2.c: Identify all H5N1 HPAI isolates collected since mid 2008 to 2009
- Activity 2.d: NLQP conduct sequencing and analysis of 100 isolates under the supervision of and assessment by the Southeast Poultry Research Laboratory (SEPRL)
- Activity 2.e: Perform antigenic profiling and cartography

Output 1.3: Challenge testing of antigenic variants in SPF birds and currently used AI vaccines in Egypt

- Activity 3.a: Safety, purity and potency testing of currently used avian influenza vaccines in Egypt conducted at the Central laboratory for Evaluation of Veterinary Biologics (CLEVB)
- Activity 3.b: Selection and testing of vaccinal seed strains for challenge testing (planned to test six vaccinal seed strains against four challenge viruses [requiring a total of 24 isolation units] carried out at SEPRL [USA]).
- Activity 3.c: Second-year challenge testing carried out at NLQP (Egypt)
- Activity 3d: Capacity building (refurbishing one of the existing NLQP units to biosafety)

	level 2+ [BSL2 +] animal facility)
Output 1.4:	Controlled transmission trials in the laboratory on birds raised and vaccinated in commercial poultry farms
Activities:	FAO to organize and provide support through training and workshop (during the last quarter of the project) to enhance skills of NLQP staff in transmission trials.
Activities undertaken during the reporting period	
Output 1.1: Screening and evaluation of genetic and antigenic variants among existing field strains previously collected from 2006 until early 2008;	
<p>1. a .05 Selection of variants for challenge studies as specified under Output 1.3 below</p> <ul style="list-style-type: none"> • HI test and cartography analysis were conducted on 20 isolates submitted to SEPRL. Based on these results, a challenge test design was prepared, which was used to select three challenge isolates and four vaccinal seed strains. • The test was suppose to be completed as per the plan. However, some groups need to be re-tested (test repeated) due to the fact that some chickens had no antibodies after vaccination, implying that they may have not been vaccinated correctly. 	
Output 1.2: Intensified collection of H5N1 HPAI field isolates from newly confirmed outbreaks (since mid-2008).	
1. b Intensified HPAI field isolate collection 2009	
1. b. 01 Intensify field sampling (SAIDR project)	
From January to March 2010, NLQP, in close collaboration with the SAIDR project staff, has collected 110 676 samples from 5 718 suspected cases. Of these, 229 cases tested positive for HPAI avian influenza by RRT-PCR.	
1. b. 02 RRT-PCR analysis.	
Results of RRT-PCR tests undertaken from January to March 2010 include:	
<ul style="list-style-type: none"> • All collected samples from 5 718 suspected cases were tested for common gene by RT-PCR, and 229 of the cases were found positive for avian influenza. • All the above-indicated positive cases for common gene of avian influenza were also tested positive for H5 gene. However, the positive cases for common gene of avian influenza were tested negative for H7 gene. • The database of the new avian influenza-positive samples has been updated on a daily basis. 	
1. b. 03 Identifying all avian influenza isolates available from mid-2008 to 2009	
<ul style="list-style-type: none"> • Compilation of the list of positive samples and isolates from 2008 has been completed while the process for isolates from 2009 is still underway. • The trial for isolation of the 125 positive tested cases (with RRT-PCR) was started during the reporting period and is still underway. • Virus propagation and reactivation of 69 positive samples was carried out at NLQP. • Isolated samples were titrated using HA test and kept in -80°C; the database was updated daily. • NLQP finalized the sequencing of H5 gene for 3 and 24 isolates from 2009 and 2010 collections respectively. 	

- NLQP finalized the sequencing of N1 gene for 10, 8 and 8 isolates from 2008, 2009 and 2010 collections, respectively.
- A total of 65 HA genes (7 from 2008, 33 from 2009 and 25 from 2010 collections) and 45 NA genes (12 from 2008, 25 from 2009 and 8 from 2010 collections) were submitted to the Gene Bank and currently under publication.

Non-intermediate results (IRs) activities:

- Preparation of international bid to select consultant company for establishment of air ventilation system in animal facility area at NLQP to reach BSL3 quality, which is required for the challenge test.

Planned Activities for the next quarter:

1.b.01 Intensified field sampling – SAIDR project

- Collection and testing of laboratory samples will continue during the next reporting period.

1.b.02 RT-PCR analysis – SAIDR project. SEPRL could provide assessment if partially covered in AIVPEP

- Specific laboratory assays to be carried out include:
 - RNA extraction for the collected samples;
 - real-time RT-PCR to identify the common gene;
 - real-time RT-PCR to identify the H5 gene for the common gene positive samples;
 - real-time RT-PCR to identify the H7 gene for the common gene positive samples;
 - the positive samples will be subjected to further propagation and identification; and
 - updating the new AI positive samples list.

1.b.03 Identifying all AI isolates available mid-2008 to 2009

- NLQP will sequence and analyze 100 isolates.
- SEPRL will provide supervision and assessment.
- Phylogenetic analysis will be performed on the viruses. In addition, the viruses will be categorized as to virulence:
 - RNA extraction for 100 isolate;
 - PCR amplification and electrophoresis;
 - purification of the PCR product;
 - sequencing of the obtained PCR products; and
 - sequence analysis and submitting the sequences to the Gene Bank database.

1.b.04 Antigenic profiling and cartography.

- NLQP will conduct antigenic profiling on 100 representative isolates:
 - preparation and standardization of all reagents and equipment needed;
 - arrange the work plan according to the isolates list database;
 - record the results and analysis of the tested positive isolates; and
 - share the results of analysis with other partners.

2 Challenge testing of antigenic variants and existing vaccines

2.01 Safety, purity and potency testing of current AI vaccines

- SEPRL will interact with CLEVB on an evaluation of currently licensed vaccines to assess them against international standards.
- Initial testing will be done at SEPRL, but the majority of this work should be done at CLEVB with the interaction of SEPRL scientists.

- This includes providing training at CLEVB.

2.03 NLQP, SEPRL and Erasmus examine antigenic, genetic, potency, efficacy; and make recommendations to the Government of Egypt on the appropriateness of existing vaccine seed strains and currently used AI vaccines in Egypt.

Other:

- The project will continue developing the BSL3 capacity at NLQP through the technical assistance of NAMRU3.

Main challenges encountered and response provided

- The SEPRL scientists, for the second or third time, cancelled a mission to NLQP (Egypt) to conduct specialized training and to visit laboratory facilities in Egypt (NLQP, CLEVB). However, NLQP has managed to conduct the HI testing in accordance with the protocols set by SEPRL. SEPRL scientists were due to arrive on mission to Egypt in April 2010 and arrangements started where three scientists will visit Egypt from 3 to 18 April 2010.
- Re-testing of some groups of the challenge test conducted at SEPRL will be started in July 2010. This will lead to rescheduling of some activities, affecting the time plan of the project. As a result, a no-cost extension of the project beyond the scheduled end date is required and the same application was already received from SEPRL.
- Difficulties were faced in searching and finding a local experienced company specialized in design, construction, and follow up on the delivery of BSL3 laboratory and air ventilation systems. This has led to the delay in finalizing reconstruction of the animal facility area to reach BSL3 quality, an aspect essential for conducting challenge tests in order to determine the efficacy of vaccines. An international bid has been prepared and four companies were invited to deliver offers (one local and three non-Egyptian companies). This may also be a factor to be considered for a no-cost extension of the project time beyond the planned end date (30 September 2010), as the timeframe offered by the winning company may dictate events.

Project Monitoring Sheet: OSRO/RAS/604/USA Baby 05

Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)

Reporting period: October 2010–March 2011

<p>Regional Component: Southeast Asia Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) Code: OSRO/RAS/604/USA Baby 05</p>
<p>Budget: USD 600 000 (Phase I), USD 1 435 000 (Phase II), USD 1 172 700 (Phase III), USD 937 800 (Phase IV), USD 1 000 000 (Phase V), USD 30 667 (from Mongolia Balance) Total budget: USD 5 176 167</p>
<p>Effective starting date: 1 August 2006</p>
<p>Planned end date: 30 September 2011</p>
<p>Context of the project</p> <p>The Highly Pathogenic Avian Influenza (HPAI) epidemic, caused by H5N1 viruses, began in late 2003 and in early 2004 in Asia and Southeast Asia and spread to many countries in the region. The effects were particularly severe in Indonesia, Thailand and Viet Nam, which saw widespread outbreaks in poultry and also human cases of H5N1 infection. The Food and Agriculture Organization of the United Nations (FAO), through its Emergency Centre for Transboundary Animal Diseases (ECTAD), established a decentralized unit in Bangkok, Thailand, located in the Regional Office for Asia and the Pacific (RAP), to provide technical backstopping for countries in the Asia and the Pacific region that were experiencing outbreaks of the infection or were at risk of it. ECTAD RAP was supported through a preliminary, regional project (OSRO/RAS/505/USA) funded by the United States Agency for International Development (USAID). This support has continued under FAO's present project.</p>
<p>Objectives of the project</p> <p>The objective of this regional component is to coordinate project activities with the target countries and also to ensure continuity from the previous project (OSRO/RAS/505/USA) to the current one. The project also aims to strengthen regional level cross-sectoral coordination and communication for HPAI control.</p>
<p>Planned activities (for the reporting period)</p> <p>Output 1: Strengthened cross-sectoral coordination at regional level</p> <ul style="list-style-type: none"> • continue to provide technical and operational inputs to country-level projects in collaboration with country teams • continue to provide support to the Association of Southeast Asian Nations (ASEAN) to finalize the roadmap for HPAI Progressive Control and Eradication in Southeast Asia • continue to coordinate and collaborate with other agencies on activities related to HPAI control <p>Output 2: Strengthened regional and national human resources in epidemiology through regional Field Epidemiology Training Program for Veterinarians (FETPV)</p> <ul style="list-style-type: none"> • continue providing technical support to the Thai Department of Livestock Development (DLD), Ministry of Agriculture and Cooperatives (MoAC) in implementing regional Field Epidemiology Training Program for Veterinarians (FETPV)

- support the necessary operational research to be conducted by trainees of FETPV as part of the curriculum requirement and support the trainees to present their work at international conference/meeting/seminar
- support study visit conducted by regional FETPV trainees to international animal health centres or research institutes as part of the curriculum requirement
- continue to provide support to the development of China-FETPV, as well as related training programmes in Cambodia, Lao People's Democratic Republic (PDR) and Nepal

Output 3: Strengthened coordination of epidemiology and laboratory network

- provide coordination, in collaboration with other regional projects implemented by FAO, to strengthen existing epidemiology and laboratory networks
- continue to provide technical inputs for the establishment of a disease tracking system, the Global Animal Disease Information System (EMPRES-i) Asia, in collaboration with the senior technical adviser of FAO's HPAI programme in China and Information Technologies (IT) expert in FAO headquarters

Output 4: Conducting risk assessment for HPAI transmission through cross-border poultry trade

- continue to provide coordination for country teams conducting risk assessment studies on HPAI transmission through the cross-border poultry trade

Activities undertaken during reporting period

Output 1: Strengthened cross-sectoral coordination at regional level

- FAO continued to maintain international and national regional support staff for the project.
- The Regional Coordinator (RC) continued to coordinate and collaborate with other United Nations (UN) agencies, donors and international humanitarian actors by attending meetings in the region to ensure that support and approaches to HPAI control were harmonized at country and regional levels. Specifically, the RC:
 - attended UN system workshop on Animal and Pandemic Influenza in Asia and the Pacific organized by the United Nations System Influenza Coordination (UNSIC) on 3 and 4 February 2011 in Bangkok, Thailand. The objectives of the workshop were to provide a platform for UN country teams in Asia and the Pacific region to review the UN system response to animal and pandemic influenza since 2005, share lessons learned and experiences gained and identify ways for work in this area to continue in a coordinated and unified way in support of national governments.
- The regional team consisting of the RC, Regional Veterinary Epidemiologist (RVE) and operations team continued to provide technical and operational inputs to country-level projects in collaboration with country teams.
- The RC attended the side meeting of the 32nd ASEAN Ministerial of Agriculture and Forestry (AMAF) meeting. The theme for this meeting was "ASEAN cooperation on animal health and zoonosis: AI and beyond," which was held in Phnom Penh, Cambodia on 24 October 2010 to present the achievements of the HPAI campaign in ASEAN member countries. In addition, the ASEAN roadmap for HPAI prevention, control and eradication was launched during this side event.

- The RC attended “FAO- Animal Production and Health Commission for Asia (APHCA)- UK Department for International Development (DFID) pro-poor HPAI risk reductions: lessons from Southeast Asia and Africa workshop,” which was held in Phuket, Thailand from 25 to 28 October 2010.
- The ECTAD regional team organized an informal technical discussion among FAO technical staff at country levels and the World Organisation for Animal Health (OIE) experts on “HPAI vaccines and vaccination” on 11 and 12 January 2011.
- The ECTAD regional team organized the 5th annual regional ECTAD meeting among FAO technical country staff for information and experience sharing from 22 to 24 February 2011.
- The RC and RVE attended and provided technical inputs to the China and Viet Nam Forum on HPAI Risk Management and Control on 8 and 9 March 2011 in Beijing, China.
- The ECTAD team provided technical inputs to support the activities of USAID Emerging Pandemic Threat (EPT) program, which are conducted by various partners.
- The ECTAD team provided technical and operational inputs to country projects, in collaboration with FAO country teams and national counterparts, for the following activities:
 - recruitment of international consultants;
 - procurement of equipment and supplies; and
 - issuance of contracts to conduct field activities/research.

Output 2: Strengthened regional and national human resources in epidemiology through regional Field Epidemiology Training Program for Veterinarians (FETPV)

- The RVE and RC worked closely with DLD on activities related to FETPV. These included:
 - organizing the one-month course “Veterinary epidemiology in action” from 17 January to 11 February 2011;
 - organizing the second-round visit of the FETPV trainees who were enrolled in the class of 2010 in Thailand for a series of trainings and workshops; and
 - conducting a mission to Khon Kaen, Thailand to provide inputs to the Lao Country Team to organize a one-month course in collaboration with Khon Kaen University.
- The Letter of Agreement (LoA) was finalized to support Thai DLD to implement the regional FETPV during the year 2011.
- The RC and RVE provided technical support to the trainees of the regional FETPV to present the results of their operational research at the “One Health Congress” from 14 to 16 February 2011 in Melbourne, Australia.
- In collaboration with Thai DLD, the ECTAD team arranged a study visit to be conducted by regional FETPV trainees to the Center of Epidemiology and Animal Health, Colorado, USA as part of the curriculum requirements.
- The RVE continued to provide support to the development of China-FETPV and India-FETPV, as well as related training programmes in Cambodia, Lao PDR and Nepal.

Output 3: Strengthened coordination of epidemiology and laboratory network

- The RC continued to provide coordination, in collaboration with other regional projects implemented by FAO, to strengthen existing epidemiology and laboratory networks.
- ECTAD RAP continued to provide technical inputs to the disease tracking system, EMPRES-i Asia.

Output 4: Conducting risk assessment for HPAI transmission through cross-border poultry trade

- A joint work plan for a pilot project on management of HPAI risks along the market chain at the cross-border level between Thailand and Lao PDR was developed in collaboration with the Academy for Educational Development (AED) and Kenan Institute Asia (KIA). In addition, meetings were conducted to discuss joint activities in detail in November and December 2011.
- Methodology to monitor poultry and other livestock prices as an indicator for animal movement between Thailand and Lao PDR was developed by the Animal Health Economist based at ECTAD RAP.

Planned activities for the next six-month period

Output 1: Strengthened cross-sectoral coordination at regional level

- continue to provide technical and operational inputs to country-level projects in collaboration with country teams
- continue to provide technical inputs, resource persons or training support to the activities related to existing regional HPAI Control framework for ASEAN or existing network systems related to HPAI
- continue to coordinate and collaborate with other agencies on activities related to HPAI control
- continue to provide technical inputs to support the activities of the USAID EPT programme, which are conducted by various partners

Output 2: Strengthened regional and national human resources in epidemiology through regional FETPV

- continue activities to implement the two-year FETPV programme, including the seeking of additional support for the programme through other potential partners
- continue to provide support to the development of China-FETPV, as well as related training programmes in Cambodia, Lao PDR and Nepal
- organize a regional workshop to develop the regional strategy to assist the countries to improve animal disease control systems at the grassroots level focusing on the "Community Animal Health Worker System".

Output 3: Strengthened coordination of epidemiology and laboratory network

- continue to support the implementation of EMPRES-i-Asia to share expertise and information in a real-time manner across the network through meetings, workshops and on-line communication
- provide coordination, in collaboration with other regional projects implemented by FAO, to strengthen existing epidemiology and laboratory networks, as well as the epidemiology consortium
- continue to provide support for sample submission from member countries to international reference laboratories

Output 4: Conducting risk assessment for HPAI transmission through cross-border poultry trade

- continue to support the in-depth studies on the risks of HPAI spread along the poultry production and market chains at the border between Thailand and Lao PDR (Mukdaharn and Savannakhet Provinces)
- support the organization of a bilateral meeting between the Government of Thailand and

<p>Lao PDR to discuss cross-border risk management</p> <ul style="list-style-type: none"> organize regional coordination meetings on risk management at cross-border level among key potential partners including the representatives from participating governments
<p>Main challenges encountered and response provided</p> <ul style="list-style-type: none"> There were no major challenges during the reporting period.
<p>Progress made towards the achievement of project outcomes (from the start of activities)</p> <p>Output 1: Strengthened cross-sectoral coordination at regional level</p> <ul style="list-style-type: none"> Coordination and collaboration between FAO and other international organizations and agencies – as well as with regional political organizations such as ASEAN –continued and was strengthened. Linkages were established between the projects funded by USAID and the projects funded by other donors. <p>Output 2: Strengthened regional and national human resources in epidemiology through regional FETPV</p> <ul style="list-style-type: none"> FETPV continued smoothly with additional collaborations at national and international levels and approved joint funding for the programme. ASEAN member countries advocated for the importance of integrating veterinary epidemiology activities in the national veterinary services and approval by ASEAN working group on livestock, which is expected in the next six months. <p>Output 3: Strengthened coordination of the epidemiology and laboratory network</p> <ul style="list-style-type: none"> In order to facilitate collaboration among key international partners, a matrix was drafted with the aim of strengthening epidemiology and laboratory networks for HPAI in Southeast Asia. This matrix was adapted and endorsed as a Strategic Framework for Regional Laboratory Network for Southeast Asia. Approval by the ASEAN working group on livestock is expected in the next six months. <p>Output 4: Conducting risk assessment for HPAI transmission through cross-border poultry trade</p> <ul style="list-style-type: none"> A detailed work plan for AED, FAO and KIA for cross-border activities at Mukdahan Province was drafted and agreed upon by the three partners and USAID/Regional Development Mission for Asia (RDMA).

Project Monitoring Sheet: OSRO/INT/805/USA

Project title: **Developing and maintaining public-private partnerships for the prevention and control of Highly Pathogenic Avian Influenza H5N1 and other emerging infectious animal diseases and improved biosecurity and hygiene at production, collection points and live bird markets, including decontamination**

Reporting period: **October 2010 to March 2011**

Global component: Global cross-country
Countries: Bangladesh, Cambodia, China, Indonesia, Lao People's Democratic Republic (PDR), Myanmar, Nepal and Viet Nam
Project title: Developing and maintaining public-private partnerships for the prevention and control of Highly Pathogenic Avian Influenza (HPAI) H5N1 and other emerging infectious animal diseases and improved biosecurity and hygiene at production, collection points and live bird markets, including decontamination
Code: OSRO/INT/805/USA - no cost extension
Budget: USD 765 690 ¹
Effective starting date: 1 January 2009
Planned end date: 30 September 2011
<p>Context of the project</p> <p>The Public-Private Partnership (PPP)-Biosecurity Project (October 2010-September 2011) is a no-cost extension of two projects: OSRO/INT/805/USA - <i>Developing and Maintaining Public-Private Partnerships for the Prevention and Control of HPAI H5N1 and other Emerging Infectious Animal Diseases (EIADs) (PPP Project)</i> and OSRO/GLO/802/USA - <i>Improved biosecurity and hygiene at production, collection points and LBMs, including decontamination (Decon Project)</i>. The no-cost extension has a duration of 12 months, from 1 October 2010 to 30 September 2011 with a total budget of USD 765 690. Through project OSRO/INT/805/USA, the United States Agency for International Development (USAID) contributed in financial year 2009 an amount of USD 1 600 000 and an amount of USD 2 500 000 through project OSRO/GLO/802/USA. The unspent balances of these two projects amounting to USD 115 341 and USD 650 349 make up the budget of the no-cost extension.</p> <p>While USAID continues to support activities related to PPP and biosecurity, it has requested that new funding be provided at the country level. As a result, countries have integrated PPP and biosecurity-related activities in their 2010-2011 proposals for the period from October 2010 to September 2011. The no-cost extension allows HQ/the Regional Office for</p>

¹ The Government of the United States of America contributed in Financial Year 2009 to FAO a total of USD 1 600 000 through project OSRO/INT/805/USA and a total of USD 2 500 000 through project OSRO/GLO/802/USA; the unspent balances of these two projects amounting to USD 115 341 and USD 650 349 constitutes the budget of the no cost-extension.

Asia and the Pacific (RAP) to provide technical expertise to high-burden countries in Asia, and to a smaller extent to the high-risk countries in Asia, for their activities involving collaboration between the public and private sector and involving work on biosecurity/good hygiene practices on farm and along marketing chains. The no-cost extension also allows implementation of a limited number of activities that have not been included in country proposals in Bangladesh, China, Lao People's Democratic Republic (PDR), Myanmar and Nepal for a total amount of USD 255 000, distributed in the following way: Bangladesh (USD 80 000), Cambodia (USD 20 000), China (USD 100 000), Lao PDR (USD 25 000), Myanmar (USD 25 000) and Nepal (USD 25 000).

Objectives of the project

To create, strengthen and maintain PPP and biosecurity to support poultry health and production systems in countries affected by Highly Pathogenic Avian Influenza (HPAI), within a functional animal health system led by official veterinary services.

Planned activities

Output A: Expertise, technical advice and organizational support on PPPs and biosecurity will be available to countries for implementation of activities funded under Amendment 6 (countries' project proposals).

An expert in commercial poultry production and biosecurity will operate from HQ. Consultant time for a PPP specialist will be available. They will:

- Provide information and guidance on PPPs to government departments, the private sector and Food and Agriculture Organization of the United Nations (FAO) country teams.
- Assist in the improvement of biosecurity (including cleaning and disinfection) in commercial production and marketing chains, as biosecurity has proven to be a major area of interest to the private commercial poultry sector, as well as the public sector.

Output B: PPPs for safer poultry production will be supported. Poultry production and marketing will be made safer in high-burden and high-risk countries.

VIET NAM

Output A - Activities:

- Participate in a review of a pilot poultry supply chain strengthening project as part of a multi-project biosecurity review process being implemented by FAO and the Department of Livestock Production (DLP). This will also serve as an orientation to the field situation and current situation in Viet Nam and highlight the challenges of upgrading poultry supply chains.
- Provide technical support to a collaborative approach to hatchery strengthening in two select provinces (in close collaboration with FAO's implementing partner Abt Associates). This will include a review of existing hatchery management and biosecurity training materials and the development of a province-level training programme for hatcheries.
- Develop a training-of-trainers (ToT) biosecurity training course for public and private sector veterinarians to strengthen biosecurity practices in small-scale commercial farms.
- Develop an approach to strengthen technical support provided to small scale commercial poultry farmers through strengthening technical and advisory capacity of private agrivet store owners in two/three pilot districts of Ha Nam Province.
- Conduct a rapid assessment of two to three key live bird markets (LBMs) in Quang Tri province including a stakeholder mapping analysis and develop options for risk reduction

control measures in those markets (the potential control options will be reviewed through a stakeholder process, finalized into an action plan and implemented over the coming seven months).

- Participate in a technical consultation meeting on experiences and lessons learned on upgrading LBMs, focusing on Viet Nam, but the adviser will provide additional lessons learned from Bangladesh and Egypt, where considerable progress has been made.
- Support the establishment of a National Poultry Quality Improvement Plan.

LAO PDR

Output A - Activities:

- Assess the biosecurity situation in selected LBMs in Vientiane capital and Savanaket.
- Provide recommendations for biosecurity improvements at LBMs.
- Train LBM authorities and traders associations on biosecurity.
- Training workshop for the public and private sectors about poultry production and biosecurity measures to be implemented in commercial poultry farms in Vientiane and Savanaket areas for better production and profitability.

CAMBODIA

Output A - Activities:

- Assess the biosecurity situation in selected LBMs in Phnom Penh.
- Provide recommendations for biosecurity improvements or restructuring of LBMs.
- Train LBM traders in the Phnom Penh area on biosecurity.
- Assess the biosecurity situation of housed duck farms in Sihanouk Ville.
- Provide recommendations for farm biosecurity improvements.

NEPAL

Output A - Activities:

- Facilitate the development of national biosecurity guidelines.
- Train private & DLS veterinarians and poultry producers on farm biosecurity.
- Train selected veterinarians on biosecurity auditing and reviews.
- Assess the biosecurity situation in LBMs in eastern provinces (their gaps and needs) and provide recommendations for biosecurity improvements.

BANGLADESH

Output A - Activities:

- Assist in the improvement, organize and facilitate a workshop for the development of biosecurity standard operating procedures (SOPs) that will support the implementation of the national biosecurity guidelines.
- Develop, update, revise training materials on biosecurity for layer farms and LBMs.
- Support the establishment of National Poultry Improvement Plans.
- Facilitate and extend the process related to farm registration and licensing, including the revision of the existing farm registration protocol and link the farm registration system with the geospatial database of commercial farms and LBMs.
- Facilitate dialogue on compartmentalization and develop SOPs for the implementation of

disease-free compartments.

- Support the upgrade of selected LBMs.
- Support biosecurity (including cleaning and disinfection) in commercial production and marketing chains, as biosecurity has proven to be the major area of interest to the private commercial poultry sector, as well as the public sector.
- Develop a new and equitable compensation plan.

INDONESIA

Indonesia has not requested any assistance from the project.

CHINA

Output A – Activities: as planned.

Output B - Activities:

- Map stakeholders in selected LBMs, analyse existing platforms to establish a dialogue among the public and private stakeholders, propose platform improvements if required, use the platform to plan the restructuring of the markets.
- Develop monitoring and evaluation tools and indicators of success of impact of restructuring on livelihood of producers, sellers and impact of restructuring on virus circulation and spread.
- Provide training to public sector staff on PPPs and explore opportunities to work on compartmentalization.

MYANMAR

Output A - Activities:

- Review biosecurity practice at poultry production zones in Yangon, Monywa and Shwebo Districts and provide recommendations for biosecurity improvement at poultry production zones in Myanmar.
- Review biosecurity practice at the live poultry wholesale market in Yangon and provide recommendations for biosecurity improvement.
- Develop and deliver biosecurity ToT for government veterinarians and poultry producers.

Activities undertaken during the reporting period

BANGLADESH

Output A

Activity 1: Organize and facilitate a workshop for the development of biosecurity SOPs that will support the implementation of the national biosecurity guidelines.

During the first semester, the biosecurity SOPs writing workshop was conducted in Sirajganj from 19 to 21 January 2011, with 22 participants from the Department of Livestock Services (DLS) and the private sector, including broiler and layer producers, breeding farm managers, feed and poultry dealers. The objective of the workshop was to compile a booklet with a set of biosecurity SOPs for poultry producers and allied service providers that will support the implementation of the national biosecurity guidelines. An additional objective was the formation of a core group of participants and steering committee that would have a stake in the

process of implementing the national biosecurity plan for the poultry industry. Each step in the SOP describes three levels of biosecurity:

Minimum standard

- This includes the standardized protocols the industry should develop and implement to reduce the biosecurity risks on their farms. The implementation of the minimum standards is mandatory and linked to farm registration and licensing.

Best practices

- These are procedures for those individuals or companies that strive toward the most effective disease control systems on their farms, or by service providers who work together with their farmer-customers to provide a higher level of security. Implementation of these practices requires a higher financial investment and should lead to a farm accreditation programme for marketing purposes.

Enhanced security

- Includes the practices that should be put in place by producers and service providers working or driving through the area during the grey period, when a serious disease is suspected but not yet confirmed by the veterinary authorities (such as the DLS).
- The protocols were designed to be practical and written in simple and effective ways to prevent the transmission of diseases and to ensure maximum compliance.

Activity 2: Develop, update and revise training materials on biosecurity for layer farms and LBM.

Assistance was provided for the development of training materials on biosecurity for the egg production industry. A segment of the poultry industry appeared to be particularly vulnerable to HPAI outbreaks, owing to production practices that facilitate large volume of traffic on and off the farms. Therefore, a specific training programme for this sector was developed and delivered.

MYANMAR

Output A:

Activity 1: Review biosecurity practice at poultry production zones in Yangon, Monywa and Shwebo Districts and provide recommendations for biosecurity improvement at poultry production zones in Myanmar.

During this period the poultry production zones in Yangon, Monywa and Shwebo Districts were visited, their biosecurity practises were reviewed and recommendations for biosecurity improvements were provided, which include the following:

- Production zone committees must play a crucial role in the coordination and collaboration between all stakeholders involved in the production zone, such as producers, veterinary services, day-old chicks suppliers, feed suppliers, egg traders and others. The Livestock Breeding and Veterinary Department (LBVD) and FAO should closely collaborate and empower these committees.

- All production zones should aim to keep only one type of poultry in the zone, and separate production zones should be established and dedicated to layers, broilers or quails.
- Number of age groups at the zone should be reduced to two or three. A separate, highly biosecured area within the zone should be created for the establishment of pullet rearing farm/s that will supply the egg production farms within the zone. This will ensure better quality and healthier pullets, reduced number of age groups at the zone and reduced cost of pullet production.
- The development of future production zones should be planned with biosecurity in mind. High-risk production zones, such as the Shwebo production zone, must be avoided. No production zone should be constructed, spread along a main road, with farms on both sides of the road and with a large feed mill that sell feed across the district inside the zone.
- Stricter control over vehicle and visitor entry into the production zone and/or the farms is required. All vehicles should be parked outside the zone. If their entry is absolutely necessary, they should go through rigorous washing and disinfection procedures. Similarly, all visitors, including “special visitors”, should wash hands and feet and change clothes and footwear, provided at the main gate by the hosting farm, prior to entry into the zone.
- Plastic egg trays used on farm must stay on farm at all times and should not be rotated with traders’ trays that may have originated at diseased farms. All the collected eggs should be transferred into traders’ trays or into single use wooden boxes. Alternatively, disposable paper trays can be used.
- Water quality should be tested regularly (every six months) for total bacterial count, coliforms, salmonella and mineral contents.
- Regular laboratory testing of feed quality and serological tests to ensure vaccines intake should be encouraged.
- Integrated pest control for rodents, flies and wild birds should be implemented and monitored on zone and farm levels.
- The planting of trees and shrubs in the zone and around farms should take into consideration issues of wild birds and rodent control. Trees should be selected according to their ability to provide ample shade, while they should not attract wild birds. That is to say, they should be free of attractive fruits or nesting facilities. Low shrubs should not be planted near poultry houses, as they provide an attractive environment for rodent breeding.

Activity 2: Review biosecurity practice at the live poultry wholesale market in Yangon and provide recommendations for biosecurity improvement.

The wholesale LBM of Yangon was visited, and upon the observations and interviews made at the market, the following recommendations for biosecurity improvements were provided:

- All trucks and plastic crates should be washed and disinfected before leaving the market. This should be done to minimize the risk of carrying disease agents from the market back to poultry farms. A washing station should be established at the LBM exit gate. The market authorities were provided with a washing station plan and SOPs that had been previously developed by FAO in Indonesia.
- Within the market area, a designated corner for the housing of ducks and spent layers – high risk birds – in cages should be established, separated from the broilers and native chickens’ areas.
- The use of plastic crates should be encouraged, as they are easy to wash and disinfect. Bamboo cages, which are very difficult to wash or disinfect, should be used only once for transportation of poultry from the farm to the market. Additional use of these cages

may be permitted only for transportation of poultry from the wholesale market to retail markets.

- Traders' plastic and/or metal cages should be washed with detergent and then immersed into a disinfecting solution, for example: in a large plastic tub on wheels. This practice should replace the current practice of only spraying disinfectants. Dipping cages in disinfectant solution provides better destruction of disease agents.
- No live birds should be allowed to leave the market for individual home slaughter. All birds must be slaughtered and processed at the market.
- The slaughter area should be washed and disinfected daily. The current use of lime as a disinfectant should be replaced by chlorine products. These have better disinfection qualities and will also neutralize bad smells, while not affecting the characteristics or smell of slaughtered poultry meat.
- Disposal bins for dead birds, feathers and other slaughter leftovers should be placed at the market.

VIET NAM

Output A

Activity 1: Provide technical support to a collaborative approach to hatchery strengthening in two selected provinces (working closely with Abt Associates). This will include a review of existing hatchery management and biosecurity training materials and the development of a province-level training programme for hatcheries.

Traditional duck hatcheries were visited and biosecurity risks were assessed. Recommendations for biosecurity improvements were provided. The available training materials were reviewed, and due to lack of suitability of these materials, a new set of training materials were developed.

The following are the recommendations provided for biosecurity improvement in traditional duck hatcheries:

- The most effective way to reduce pathogen contamination of eggs and day-old ducklings (DODs) (HPAI included) would be achieved through egg fumigation with formalin and potassium permanganate in a fumigation chamber.
- When the breeding farm is attached to the hatchery and the only source of eggs, a single fumigation at the hatchery will suffice. Hatcheries that buy eggs from multiple breeding farms should ensure that eggs are fumigated at the breeding farms, and then a second fumigation should be applied at the hatchery upon the arrival of the eggs.
- Fumigation should replace any eggs cleaning/wiping by cloth practice that probably cause pathogen spread from egg to egg. A design of fumigation cabinet and SOPs for safe operation were provided.

When possible

- Two smaller setters should be used instead of a large one. This will enable periodical depopulation, cleaning and disinfection of setters.
- Erecting a separation wall between setting and hatching areas, with enclosed area for chicks take off (last two to three days of hatch), will enable trickle fumigation that will minimize cross-contamination between chicks during piping and take off.
- The hatchery should have clear procedures for washing and disinfection (possibly fumigation) of egg trays, baskets, equipment, etc.

- Hatchery specific cloth and footwear should be used inside the hatchery.
- Customers should use a well designated and marked door/window for DODs delivery.

Activity 2: Develop a ToT biosecurity training course for public and private sector veterinarians to strengthen biosecurity practices in small scale commercial farms.

A set of biosecurity training materials for small scale commercial farms that was developed for producers in Egypt was modified and adopted to suit local conditions.

Activity 3: Conduct a rapid assessment of two to three key LBMs in Quang Tri province including a stakeholder mapping analysis and develop options for risk reduction control measures in those markets (the potential control options will be reviewed through a stakeholder process, finalized into an action plan and implemented over the coming seven months).

LBMs (wholesale and retail markets) were assessed for biosecurity risks and recommendations for improvements were provided. An action plan for training and infrastructure improvement was initiated with the Abt Associates.

The following are the recommendations provided:

Recommendations for wholesale markets

- Establish a washing station for washing of vehicles and empty crates that leave the market. The washing station should consist of pressure washer and a draining system possibly linked to a septic tank.
- Set up a large tub for the socking of holding cages at the end of the trading day in detergent disinfectant solution.

Recommendations for retail markets

- Set up a washing station for vehicles and cages to be washed and disinfected prior to leaving the market area to minimize transfer of pathogens back to farms.
- Establish a dedicated area solely for poultry trading.
- Daily washing and cleaning of the whole LBM area.
- A possible use of the market organic solid waste materials by a digester for the production of bio gas, which can be used for boiling water for cleaning/disinfection by steam. This will eliminate the need for the ongoing purchase of chemicals and reduce environmental impact of the run off of the chemicals.
- Special attention should be paid to the safe slaughter and waste disposal at the home-based slaughter points. A design for an alternative centralized slaughter point was provided.

Planned activities for the next six-month period**BANGLADESH**

Output A - Activities:

- Support the establishment of National Poultry Improvement Plans.
- Facilitate and extend the process related to farm registration and licensing, including the revision of the existing farm registration protocol and link the farm registration system with the geospatial database of commercial farms and LBMs.
- Facilitate dialogue on compartmentalization and develop SOPs for the implementation of disease free compartments.
- Support the upgrade of selected LBMs.
- Support the development of a new and equitable compensation plan.

NEPAL

Output A - Activities:

- Facilitate the development of national biosecurity guidelines.
- Train veterinarians (private & DLS) and poultry producers on farm biosecurity.
- Train select veterinarians on biosecurity auditing and reviews.
- Assess the biosecurity situation in LBMs in eastern provinces (their gaps and needs) and provide recommendations for biosecurity improvements.

LAO PDR

Output A - Activities:

- Assess the biosecurity situation in selected LBMs in Vientiane capital and Savanaket.
- Provide recommendations for biosecurity improvements at LBMs.
- Train LBM authorities and traders associations on biosecurity.
- Training workshop for the public and private sectors about poultry production and biosecurity measures to be implemented in commercial poultry farms in Vientiane and Savanaket areas for better production and profitability.

CAMBODIA

Output A - Activities:

- Assess the biosecurity situation in selected LBMs in Phnom Penh.
- Provide recommendations for biosecurity improvements or restructuring of LBMs.
- Train LBM traders in the Phnom Penh area on biosecurity.
- Assess biosecurity situation of housed duck farms in Sihanouk Ville.
- Provide recommendations for farm biosecurity improvements.

CHINA

Output A

Output B - Activities:

- Develop monitoring and evaluation tools (M&E) and indicators of success of impact of restructuring on livelihood of producers, sellers and impact of restructuring on virus circulation and spread.

- Provide training to public sector staff on PPPs and explore opportunities to work on compartmentalization.

MYANMAR

Output Activities:

- Develop and deliver biosecurity training TOT for private and public veterinarians and leading producers at poultry production zones.
- Support the establishment of washing station at the wholesale LBM of Yangon.

VIET NAM

Output A - Activities:

- Participate in a review of a pilot poultry supply chain strengthening project as part of a multi-project biosecurity review process being implemented by FAO and DLP.
- Provide technical support to a collaborative approach to hatchery strengthening in two selected provinces (working closely with FAO's implementing partner Abt Associates). This will include a review of existing hatchery management and biosecurity training materials and the development of a province-level training programme for hatcheries, including ToT at the Quang-Tri province.
- Develop an approach to strengthen technical support provided to small scale commercial poultry farmers through strengthening technical and advisory capacity of private agrivet store owners in two to three pilot districts of Ha Nam Province.
- Participate in a technical consultation meeting on experiences and lessons learned on upgrading LBMs, focusing on Viet Nam, but the adviser will provide additional lessons learned from Bangladesh and Egypt where considerable progress has been made.
- Support the establishment of a National Poultry Quality Improvement Plan.

Main challenges encountered and response provided

- The candidate for the PPP consultancy position declined the offer, which left the project without a dedicated person to coordinate activities and support the countries in this area. The biosecurity consultant fills this role in biosecurity activities that overlap with PPP activities.

Main progress made towards the achievement of project outcomes**BANGLADESH**

- A biosecurity SOPs writing workshop for poultry producers and allied service providers was successfully conducted with the participation of members of the public and private sectors. A set of SOPs is under development and will support the implementation of the national biosecurity guidelines.
- Biosecurity training material for egg producing farms was developed and training was delivered to layer producers.

MYANMAR

- The biosecurity practices at production zones in three districts were reviewed and recommendations for biosecurity improvements provided.
- The biosecurity practices at the Yangon wholesale market were reviewed and recommendations for biosecurity improvements were provided, including the support in establishment of a washing station for the departing vehicles and crates. This will greatly reduce the risk of disease transmission (HPAI) from markets to farms.

VIET NAM

- The biosecurity practices in traditional duck hatcheries were reviewed and recommendations for biosecurity improvements provided. Egg fumigation appeared to be the single most effective method for the reduction in hatchery contamination, therefore a design for fumigation cabinet and SOPs for the safe use of the cabinet were developed. FAO Viet Nam will contract local manufacturer to build a model fumigation cabinets that will be used for demonstration purposes.
- The available training materials were reviewed and found to be inadequate, therefore a new set of training materials were developed.
- The biosecurity practices and the infrastructure needs at retail and wholesale LBMs were assessed and recommendations were provided. These include the formation of a washing station for vehicles and cages and the construction of a centralized slaughter point that will replace the current practice of home-based slaughter points. A design for a proposed centralized slaughter point was developed.

Quarter II 2010

Project Monitoring Sheet: OSRO/RAS/701/USA

Project title: **Strengthening cross-border activities among Bangladesh, India, Nepal and Myanmar to control possible cross-border spread of HPAI**

Reporting period: **April-June 2010**

Regional component: Subregional cross-border activities in Bangladesh, India, Nepal and Myanmar
Project Title: Strengthening cross-border activities among Bangladesh, India, Nepal and Myanmar to control possible cross-border spread of HPAI Code: OSRO/RAS/701/USA
Budget: USD 1 000 000 (Phase I), USD 1 000 000 (Phase II) Total budget USD 2 000 000
Effective starting date: October 2007
Planned end date: 30 September 2010
Context of the project <p>Porous, long and continuous land borders between the project's four countries (Bangladesh, India, Nepal and Myanmar), with minimal control points and quarantine facilities, continue to pose risks for the spread of Highly Pathogenic Avian Influenza (HPAI) in the region as a whole. Hence, it is necessary to have a better understanding of the pattern of the poultry supply chain and trade taking place across borders. There is also a lack of sufficient capacity both in terms of skilled human resources and also facilities to conduct effective management of transboundary movements of poultry and poultry products. Sharing expertise, information and biological samples among laboratories in the region is key for effective planning to prevent or prepare for cross-border outbreaks.</p> <p>It is envisaged that a longer-term national strategy will be drafted in consultation with various stakeholders during the implementation of this project to deal with the longer-term cross-border issues relevant to the avian influenza (AI) threat.</p>
Objectives of the project <p>The main goal of the project is to prevent HPAI spreading across borders because of the movements of poultry and poultry products. Specifically the project aims to: (i) develop a platform for dialogue and information exchange between countries in the region on issues related to potential cross-border spread of HPAI; (ii) strengthen capacities of institutions to deal with the threat of transboundary spread of HPAI; and (iii) increase the understanding of ways to manage cross-border trade to reduce the risk of HPAI outbreaks.</p>
Planned activities for the reporting period <p>Output 1: Project management and coordination mechanisms established and operating</p> <ul style="list-style-type: none"> • retain key technical personnel until the end of project date (i.e. September 2010) • further strengthen the modalities for better communication and dialogue in order to facilitate project coordination • continue to prepare bi-monthly information bulletins

- participate in regional and global meetings
- hold meetings of technical- and policy-level committees in the next quarter

Output 2: High-risk areas for introduction of HPAI via cross-border introduction routes identified and mapped

- finalize the study report on poultry value chain analysis across India, Nepal and Bangladesh's borders and also India and Myanmar's border (to date, the agency contracted to perform this study has not been performing satisfactorily)

Output 3: Increased capability for emergency response to HPAI outbreaks owing to cross-border spread of the disease

- conduct the study tour in India for staff from each participating country, from 26 to 29 April 2010, to strengthen emergency response capacities
- conduct trainings and workshops for border control personnel in Bangladesh in rapid confirmation of outbreaks
- upon receipt of technical clearance from the Emergency Centre for transboundary Animal Diseases – Regional Office for Asia and the Pacific (ECTAD-RAP), circulate the finalized standard operating procedures (SOPs) and recommendations for response in high-risk cross-border trade areas
- conduct two more rounds of training for laboratory personnel in India on the use of rapid antigen test kits in April 2010

Phase II

Output 2: Strengthened production and market systems approach to improve cross-border movement management and reduce HPAI risks

- conduct a study on livestock marketing systems in high risk corridors with a view to establishing monitoring processes for production and market chains of poultry, linked with animal disease monitoring data. The project is currently awaiting governmental clearances from Bangladesh and India.

Output 3: Developed policy and harmonized risk management procedures

- review and analyse country reports on policy issues, legislative frameworks and the development of legislative instruments to fill key gaps related to cross-border trade and risk management, through locally contracted experts
- conduct a sub-regional workshop on gaps in legislative frameworks for cross-border trading

Output 4: Improved capacity for response to cross-border emergencies

- convene meetings of provincial and district officers in high-risk cross-border corridors in India and Bangladesh
- provide rapid response training to host government personnel of India and Bangladesh at local levels in the selected high-risk movement corridors
- hold a special advocacy initiative in target border districts, as part of emergency response activities in India and Bangladesh, to mobilize and sensitize the following groups: (i) local, district-level and decentralized veterinarians; (ii) private and public news channels, journalists and media-persons; (iii) non-governmental organizations (NGOs); (iv) farmers; (v) traders; and (vi) women's groups
- conduct sensitization workshops for print and electronic media at the national level and

also in India's West Bengal and Tripura states for the prevention and control of HPAI in order to strengthen cross-border emergency preparedness and response mechanisms

Activities undertaken during the reporting period

Output 1: Project management and coordination mechanisms established and operating

- The meeting of technical and policy-level committees to monitor the project's progress was held on 12 May 2010 in New Delhi, India.
- The sixth volume of Information Bulletin (February-March 2010) was published and circulated. The seventh volume (April-May 2010) is under preparation.
- The subregional manager participated in the "Strategic communication for the prevention and control of Highly Pathogenic Avian Influenza (HPAI) and other transboundary animal diseases (TADs)" meeting in Istanbul, Turkey from 6 to 9 April 2010 to exchange experiences gained through the South Asia cross-border project.
- The subregional manager participated in the inception workshop for the "Regional risk assessment of HPAI in South and Southeast Asia: a socio-economic perspective" on 28 and 29 April 2010 in Bangkok, Thailand.
- The subregional manager participated in the inception workshop of OSRO/IND/802/USA project "Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) to India" on 10 and 11 May 2010 in New Delhi, India.
- The subregional manager and subregional advocacy coordinator participated in the regional communication workshop from 23 to 25 June 2010 in Bangkok, Thailand.

Output 2: High-risk areas for introduction of HPAI cross-border routes identified and mapped

- To date, the agency contracted to perform the poultry value chain mapping across India-Nepal, India-Bangladesh and India-Myanmar has not been performing satisfactorily and has not submitted the final report. The Food and Agriculture Organization of the United Nations (FAO) office in India is trying to obtain the report.

Output 3: Increased capability for emergency response to HPAI outbreaks owing to cross-border spread of the disease

- The study tour to West Bengal, India for staff from Bangladesh, India, Nepal and Myanmar to strengthen emergency response capacity was conducted from 26 to 29 April 2010. Four participants each from Bangladesh and Myanmar, five from India and six from Nepal participated in the study tour.
- The cross-border trade SOPs for response in high-risk areas were finalized in consultation with the Technical and Policy Level Committee at the meeting held on 28 and 29 January 2010 in Pokhara, Nepal. The finalized SOPs were circulated in the district level workshops to strengthen emergency preparedness and response mechanisms for HPAI in India and Bangladesh.
- A series of trainings and workshops in rapid confirmation of outbreaks in high-risk cross-border corridors were held in Bangladesh for district veterinarians and paraveterinarians. These trainings/workshops were held on 9 and 10 June (in Chapai Nababganj), 13 and 14 June (in Dinajpur) and 16 and 17 June (in Lalmonirhat).
- The two remaining rounds of training for laboratory personnel in India, on the use of rapid antigen test kits, were held on 3 and 4 May and on 6 and 7 May 2010 at the India's Western and Northern Regional Disease Diagnostic Laboratories. Thirty

laboratory personnel were trained on the use of rapid antigen kits.

Phase II

Output 2: Strengthened production and market systems approach, to improve cross-border movement management and reduce HPAI risks

- A series of orientation/sensitization workshops on strengthening cross-border emergency preparedness and response mechanisms for HPAI were held for provincial and district officers in high-risk cross-border corridors of Bangladesh. These workshops were held in the districts of Rajshahi Division on 9 and 10 June (in Chapai Nababganj), on 13 and 14 June (in Dinajpur), and on 16 and 17 June (in Lalmonirhat). Approximately 90 to 100 persons participated in each workshop. Very few participants were females. The objectives of these workshops were to:
 - orient/sensitize participants on key issues of risk/outbreak communication and advocacy interventions to prevent and control HPAI outbreaks; and
 - present district-level findings of the poultry value-chain mapping exercise conducted by the project.

To strengthen emergency response preparedness, the workshops were also used as an advocacy platform to sensitize the following border-district groups: (i) local, district-level and decentralized veterinarians; (ii) private and public news channels; (iii) journalists and media-persons; (iv) NGOs; (v) farmers; (vi) traders; (vii) women's groups; and (viii) police and border forces.

- The subregional animal health economist undertook the proposed study on livestock marketing systems in high-risk corridors of Bangladesh with a view to establishing poultry production- and market-chain-monitoring processes linked with animal disease monitoring data between 13 and 21 April 2010. The border markets of three districts (Chapi Nababganj, Dinajpur and Lalmonirhat) were covered in the first cycle. A similar study proposed for high-risk corridors in India could not be started because governmental clearance was not received from India.

Output 3: Developed policy and harmonized risk management procedures

- Experienced consultants in Bangladesh, India and Nepal were hired to review and analyse policy issues, legislative frameworks and the development of legislative instruments to fill key gaps related to cross-border trade and risk management. The reports were received from India and Nepal in May 2010.
- The reports from India and Nepal were cleared by the ECTAD regional manager.
- The subregional workshop on gaps in legislative frameworks in the context of cross-border trading will be organized in the next quarter, once the report from Bangladesh consultant is received and analysed.

Output 4: Capacity for response to cross-border emergencies improved

- A series of workshops were held in Bangladesh (in Rajshahi Division) to provide rapid response training to host government personnel, at local levels, in high-risk cross-border corridors of Bangladesh. These workshops were held on 9 and 10 June (in Chapai Nababganj), on 13 and 14 June (in Dinajpur), and on 16 and 17 June (in Lalmonirhat). Approximately 90 to 100 persons participated at each workshop. Very few participants were females. The objectives of these workshops were to:
 - determine which measures had been taken for the prevention and control of

- HPAI and provide sensitization on the clinical picture of HPAI; and
- provide technical guidance and training to veterinarians on the investigation of HPAI outbreaks.

To strengthen emergency response preparedness, the workshops were also used as an advocacy platform to sensitize the specific border-district groups as outlined in Output 2 on page 4 of this progress report.

Planned activities for the next quarter

Output 1: Project management and coordination mechanisms established and operating

- retain key technical personnel until the end of project date (i.e. September 2010)
- further strengthen the modalities for better communication and dialogue to facilitate project coordination
- continue to prepare bi-monthly information bulletins
- participate in regional and global meetings

Output 2: High-risk areas for introduction of HPAI via cross-border routes identified and mapped

- finalize the study report on poultry value-chain analysis across India, Nepal and Bangladesh's borders and also India and Myanmar's border (to date, the agency contracted to perform this study has not been performing satisfactorily)

Output 3: Increased capability for emergency response to HPAI outbreaks owing to cross-border spread of the disease

- conduct trainings and workshops on how to rapidly confirm outbreaks for border control personnel in Bangladesh

Phase II

Output 2: Strengthened production and market systems approach to improve cross-border movement management and reduce HPAI risks

- continue the study on livestock marketing systems in high risk corridors in Bangladesh, with a view to establishing monitoring processes for production and market chains of poultry, linked with animal disease monitoring data. The project is currently awaiting governmental clearance from India.

Output 3: Developed policy and harmonized risk management procedures

- review and analyse country report on policy issues, legislative frameworks and the development of legislative instruments to fill key gaps related to cross-border trade and risk management from Bangladesh
- conduct a subregional workshop on gaps in legislative frameworks for cross-border trading

Output 4: Improved capacity for response to cross-border emergencies

- convene meetings of divisional and district officers in high-risk cross-border corridors in Bangladesh
- provide rapid response training to host government personnel of Bangladesh, at local levels, in the selected high-risk movement corridors

- conduct a special advocacy initiative in target border districts, as part of emergency response activities in India and Bangladesh, in order to mobilize and sensitize the following groups: (i) local, district-level and decentralized veterinarians; (ii) private and public news channels, journalists and media-persons; (iii) NGOs; (iv) farmers; (v) traders; and (vi) women's groups
- conduct sensitization workshops for print and electronic media in India's West Bengal State for the prevention and control of HPAI to strengthen cross-border emergency preparedness and response mechanisms

Main challenges encountered and response provided

- delayed clearances from participating governments

Progress made towards the achievement of project outcomes (from the start of the project activities)

Output 1: Project management and coordination mechanisms established and operating

- All project staff have been recruited, and the coordinating office in Kathmandu, Nepal has been established and equipped. Coordinating units in Bangladesh, India and Myanmar have also been equipped. A vehicle has been procured for the project coordinating unit in Kathmandu.
- A project workshop, attended by high-level administrative and technical personnel from participating countries, was held on 24 and 25 March 2008.
- The project inception workshop was held on 2 and 3 July 2008. A related report has been provided to all countries and participants.
- A United States Agency for International Development (USAID) partners' meeting, on HPAI in South Asia, was organized on 17 and 18 November 2008 in New Delhi, India to discuss the progress of Fiscal Year (FY) 2007 activities and a work plan for FY 2008 funding.
- Technical and policy-level committees have been constituted. A meeting of these committees to monitor the project progress was held on 17 April 2009 in Kolkata, India, on 28 and 29 January 2010 in Pokhara, Nepal and on 12 May 2010 in New Delhi, India. A meeting of a technical-level committee to monitor the project's progress was held on 19 July 2009 in Dhaka, Bangladesh. The Governments of the three countries were very appreciative of these meetings and wished to continue these in the future.
- A poster prepared on the progress of the project was presented during the USAID Partners' Meeting held from 1 to 3 April 2009 in Bangkok.
- Six volumes of bi-monthly information bulletins were released, from May 2009 to March 2010, and circulated to ECTAD members, donors, countries and other agencies as an information sharing/knowledge management initiative.
- Engagement with the South Asia Association for Regional Cooperation (SAARC) was continued through organization of a FAO/World Organisation for Animal Health (OIE) subregional meeting of the Global Framework for the Progressive Control of Transboundary Animal Diseases (for the SAARC Region) on 4 and 5 June 2009 in Kathmandu, Nepal.
- The subregional manager participated in a meeting in Bangkok, on 16 and 17 July 2009, to develop a strategic framework, entitled "FAO regional strategy for Highly Pathogenic Avian Influenza and other emerging infectious diseases of animals in Asia and the Pacific: 2009 – 2014".
- A report on the progress of the project, from April to September, was presented at the USAID partners' meeting held on 24 and 25 September 2009 in Bangkok.

- The subregional manager participated in the second real-time evaluation of FAO's work on HPAI in the Asian region, held from 30 November to 1 December 2009 in Bangkok, Thailand. The evaluation team was briefed on the activities and impact of the South Asia cross-border project.
- The subregional manager and subregional advocacy coordinator participated in the fourth regional ECTAD meeting, from 23 to 25 February, and the ECTAD Asia information system workshop on 26 February 2010 in Bangkok, Thailand.
- The subregional manager participated in the inception workshop on the "Regional risk assessment of HPAI in South and Southeast Asia: a socio-economic perspective" on 28 and 29 April 2010 in Bangkok, Thailand.
- The subregional manager participated in the inception workshop of OSRO/IND/802/USA project "Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) to India" on 10 and 11 May 2010 in New Delhi, India.
- The subregional Manager and subregional advocacy coordinator participated in the regional communication workshop from 23 to 25 June 2010 in Bangkok, Thailand.

Output 2: High-risk areas for introduction of HPAI via cross-border routes identified and mapped

- The draft final report of the study on poultry value-chain analysis across Nepal and India's border and mapping of high-risk areas was received and cleared.
- The draft final report of the study on poultry value-chain analysis across Bangladesh, India and Myanmar's border and mapping of high-risk areas was received and cleared.
- The draft final report of the study on poultry value-chain analysis across Myanmar, India and Bangladesh's borders and mapping of high-risk areas was received and cleared.
- A study on the livestock marketing system in high risk corridors of Nepal, with a view to establishing monitoring processes of poultry production and market chains (linked with animal disease monitoring data), was conducted from 8 to 14 November 2009.
- The first round study on the livestock marketing system in high-risk corridors of Bangladesh, with a view to establishing monitoring processes of poultry production and market chains (linked with animal disease monitoring data), was conducted from 13 to 21 April 2010. The border markets of three districts, viz. Chapai Nababganj, Dinajpur and Lalmonirhat were covered.

Output 3: Increased capability for emergency response to HPAI outbreaks owing to cross-border spread of the disease

- Laboratory training for participants from Bangladesh, India, Nepal and Myanmar was held from 19 to 24 January 2009 in Bhopal, India.
- A subregional workshop to develop SOPs for emergency response to disease in high-risk cross border trade areas was held on 21 and 22 May 2009 in Kathmandu, Nepal. These SOPs were further discussed (and accepted by each party) in Bangladesh, India and Nepal through a series of brainstorming workshops from 4 to 6 November 2009 (in Nepal), on 4 December (in India) and on 10 December (in Bangladesh), and finally at the Technical and Policy Level Committees meeting on 28 and 29 January 2010 in Pokhara, Nepal. The finalized SOPs were circulated in the district level meetings held in the high risk corridors in India and Bangladesh.
- At the request of Government of the Republic of India, rapid antigen detection kits were procured and delivered for use, in high risk corridors, for the rapid screening of

outbreaks. Furthermore, in response to the Government's request, five cycles of laboratory trainings were conducted on the use of rapid antigen kits for 80 laboratory personnel. The kits were successfully used in the recent HPAI outbreaks in Murshidabad district, West Bengal, and were appreciated by the Government.

- Enzyme-linked immunosorbent assay kits (ELISA) were procured and delivered to the Government of Federal Democratic Republic of Nepal for surveillance of HPAI in ducks in Nepal's far eastern region, which formed a part of the project study area.
- A study tour to West Bengal, India for staff from Bangladesh, India, Nepal and Myanmar to strengthen emergency response capacity was conducted from 26 to 29 April 2010. Four participants each from Bangladesh and Myanmar, five from India and six from Nepal participated in the study tour.

Phase II

Output 2: Strengthened production and market systems approach to improve cross-border movement management and reduce HPAI risks

- Stakeholder meetings to present the results of poultry value-chain mapping across Nepal and India's border were held on 10 July 2009 in Kathmandu, Nepal; and for the Bangladesh-India and Bangladesh-Myanmar borders on 21 July 2009 in Dhaka, Bangladesh. The meetings were attended by senior staff representing the Department of Livestock Services (DLS) including the Chief Veterinary Officer (CVO), private sector representatives, national and international NGOs, Academy for Educational Development (AED) and FAO.
- A subregional workshop, entitled "Understanding and use of poultry value chain analysis in poultry production and marketing in the context of cross border trading", was held from 14 to 18 September 2009 in Kathmandu, Nepal. Delegates from Bangladesh, India and Nepal participated. The workshop was facilitated by FAO staff from headquarters, ECTAD-RAP Bangladesh and Nepal and also by the Royal Veterinary College, London.

Output 3: Developed policy and harmonized risk management procedures

- Consultancy reports from consultants in India and Nepal to review and analyse policy issues, legislative frameworks and the development of legislative instruments to fill key gaps related to cross-border trade and risk management were received and technically cleared by ECTAD-RAP.

Output 4: Improved capacity for response to cross-border emergencies

- A series of orientation and sensitization workshops, on strengthening cross-border emergency preparedness and response mechanism for HPAI, were held for provincial and district officers in high-risk cross-border corridors of Nepal (Jhapa and Morang districts) and India (Araria/Kishanganj, Darjeeling, Cooch Behar, Dakhshin Dinajpur, Malda, North 24 Parganas and West Tripura districts) between January and March 2010. Similar workshops were held in Bangladesh on 9 and 10 June (in Chapai Nababganj), on 13 and 14 June (in Dinajpur), and on 16 and 17 June (in Lalmonirhat) districts. Approximately 90 to 100 persons participated at each workshop. The workshops, which were part of the emergency response, were also used as a platform to sensitize local, district-level and decentralized veterinarians, private and public news channels, journalists, media-persons, NGOs, farmers, traders, border security personnel and women's groups in border districts.

I Quarter 2010

Project Monitoring Sheet: **OSRO/RAS/701/USA**Project title: **Strengthening cross-border activities among Bangladesh, India, Nepal and Myanmar to control possible cross-border spread of HPAI**Reporting period: **January–March 2010**

Regional component: Sub-Regional cross-border activities in Bangladesh, India, Nepal and Myanmar
Project Title: Strengthening cross-border activities among Bangladesh, India, Nepal and Myanmar to control possible cross-border spread of HPAI Code: OSRO/RAS/701/USA
Budget: USD 1 000 000 (Phase I), USD 1 000 000 (Phase II) Total budget: USD 2 000 000
Effective starting date: October 2007
Planned end date: 30 September 2010
<p>Context of the project</p> <p>Porous, long and continuous land borders between the project's four countries (Bangladesh, India, Nepal and Myanmar), with minimal control points and quarantine facilities, continue to pose risks for the spread of Highly Pathogenic Avian Influenza (HPAI) in the region as a whole. Hence, it is necessary to have a better understanding of the pattern of the poultry supply chain and trade taking place across borders. There is also a lack of sufficient capacity both in terms of skilled human resources and also facilities to conduct effective management of transboundary movements of poultry and poultry products. Sharing expertise, information and biological samples among laboratories in the region is key for effective planning to prevent or prepare for cross-border outbreaks.</p> <p>It is envisaged that a longer-term national strategy will be drafted, in consultation with various stakeholders during the project's implementation, to deal with longer-term cross-border issues relevant to the HPAI threat.</p>
<p>Objectives of the project</p> <p>The main goal of the project is to prevent HPAI spreading across borders because of movements of poultry and poultry products.</p> <p>Specifically the project aims to: (i) develop a platform for dialogue and information exchange between countries in the region on issues related to potential cross-border spread of HPAI; (ii) strengthen capacities of institutions to deal with the threat of transboundary spread of HPAI; and (iii) increase understanding of ways to manage cross-border trade to reduce the risk of HPAI outbreaks.</p>

Planned activities for the reporting period**Output 1: Project management and coordination mechanisms established and operating**

- Finalize the recruitment of an international operations consultant.
- Further strengthen modalities for communications and dialogue to facilitate project coordination.
- Continue to prepare bi-monthly information bulletins.
- Participate in regional and global meetings.
- Hold technical- and policy-level committee meetings from 28 to 29 January 2010.

Output 2: High-risk areas for introduction of HPAI via cross-border routes identified and mapped

- Finalize the study report on poultry value chain analysis across the India-Bangladesh and India-Myanmar borders, as well as the mapping of high-risk areas requiring further intervention.
- Seek technical clearances from the Food and Agriculture Organization of the United Nations (FAO) Emergency Centre for Transboundary Animal Diseases – Regional Office for Asia and the Pacific (ECTAD-RAP) and FAO headquarters.

Output 3: Increased capability for emergency response to HPAI outbreaks owing to cross-border spread of the disease

- Conduct the study tour in India for staff from each participating country, from 1 to 5 February 2010, to strengthen emergency response capacities.
- Conduct trainings/workshops for border control personnel in the rapid confirmation of outbreaks.
- Finalize standard cross-border trade operating procedures (SOPs) and recommendations for response in high-risk areas, in consultation with technical- and policy-level committees.
- Train laboratory personnel in India on the use of rapid antigen test kits in February 2010.

Phase II**Output 2: Strengthened production and market systems approach to improve cross-border movement management and reduce HPAI risks**

- Conduct a study on livestock marketing systems in high risk corridors, with a view to establishing monitoring processes for production and market chains of poultry, linked with animal disease monitoring data. The project is currently awaiting governmental clearances from Bangladesh and India.

Output 3: Developed policy and harmonized risk management procedures

- Review and analyse policy issues, legislative frameworks and the development of legislative instruments to fill key gaps related to cross-border trade and risk management, through locally contracted experts.
- Conduct a sub-regional workshop on gaps in legislative frameworks for cross-border trading.

Output 4: Improved capacity for response to cross-border emergencies

- Convene meetings of provincial and district officers in high-risk cross-border corridors

in India and Bangladesh.

- Provide rapid response training to host government personnel of India and Bangladesh, at local levels, in the selected high-risk movement corridors.
- Conduct a special advocacy initiative to mobilize and sensitize the following groups: local, district-level and decentralized veterinarians; private and public news channels, journalists and media-persons; non-governmental organizations (NGOs); farmers; traders; and women's groups. Hold this initiative in target border districts, as part of emergency response activities in India and Bangladesh.

Activities undertaken during the reporting period

Output 1: Project management and coordination mechanisms established and operating

- An International Operations Officer was recruited and joined the project on 22 February 2010.
- The meeting of technical and policy-level committees to monitor the project's progress was held from 28 to 29 January 2010 in Pokhara, Nepal.
- The fifth volume of Information Bulletin (December 2009–January 2010) was published and circulated. The sixth volume (February–March 2010) is under preparation.
- The Subregional Manager and Subregional Advocacy Coordinator participated in the fourth regional ECTAD meeting, from 23 to 25 February 2010 and the ECTAD-Asia Information System Workshop on 26 February in Bangkok, Thailand.

Output 2: High-risk areas for introduction of HPAI cross-border routes identified and mapped

- The draft final report, received from the recipient organization in India, to study poultry value-chain mapping across India, Bangladesh, Nepal and Myanmar's borders, was reviewed for technical contents. The finalized report is being awaited.
- The draft final report of poultry value-chain mapping between Myanmar, India and Bangladesh was received and cleared at the project level. The report will be ready for distribution during the next reporting period.

Output 3: Increased capability for emergency response to HPAI outbreaks owing to cross-border spread of the disease

- The study tour to India for staff from each participating country, to strengthen emergency response capacity, which was scheduled for first week of February 2010, was postponed by the West Bengal Government (in India) due to the occurrence of new outbreaks in the state. The new dates of 26 to 29 April 2010 have now been agreed by the West Bengal government.
- The cross-border trade SOPs, for response in high-risk areas, were finalised in consultation with the Technical and Policy Level Committee at the meeting held from 28 to 29 January in Pokhara, Nepal. Finalized SOPs are in the process of circulation.
- A series of trainings and workshops, in rapid confirmation of outbreaks in high risk cross-border corridors, were held in Bihar and in India's West Bengal and Tripura states, for district veterinarians and para-veterinarians. These trainings/workshops were held on 14 and 15 January (in Siliguri), on 18 and 19 February (in Agartala), on 4 and 5 March (in Kishanganj), on 8 and 9 March (in Malda), on 11 to 12 March (in South Dinajpur), on 15 and 16 March (in Cooch Behar) and on 19 and 20 March (in North 24 Parganas).

- Three rounds of training for laboratory personnel in India, on the use of rapid antigen test kits, were held on 8 and 9 February, on 11 and 12 February and on 22 and 23 March 2010 at the India's Regional Disease Diagnostic Laboratories. Fifty laboratory personnel were trained on the use of rapid antigen kits. Twenty-two percent of participants were females.

Phase II

Output 2: Strengthened production and market systems approach to improve cross-border movement management and reduce HPAI risks

- A series of orientation/sensitisation workshops on strengthening cross-border emergency preparedness and response mechanisms for HPAI were held for provincial and district officers in high-risk cross-border corridors of India. These workshops were held in India, in Bihar, West Bengal and Tripura states on 14 and 15 January (in Siliguri), on 18 and 19 February (in Agartala), on 4 and 5 March (in Kishanganj), on 8 and 9 March (in Malda), on 11 and 12 March (in South Dinajpur), on 15 and 16 March (in Cooch Behar) and on 19 and 20 March (in North 24 Parganas). Approximately 90–100 persons participated in each workshop. Around 5–10 percent participants were females. The objectives of these workshops were to:
 - orient/sensitize participants on key issues of risk/outbreak communication and advocacy interventions, to prevent and control HPAI outbreaks;
 - present district-level findings of the poultry value-chain mapping exercise conducted by the project.

To strengthen emergency response preparedness, the workshops were also used as an advocacy platform to sensitise the following border-district groups: local, district-level and decentralised veterinarians; private and public news channels; journalists and media-persons; NGOs; farmers; traders; women's groups; and border security forces. Some of the workshops were also attended by partner institutions, particularly the Academy for Educational Development (AED) and the United Nation Children's Fund (UNICEF).

- The proposed study on livestock marketing systems in high risk corridors – with a view to establishing poultry production- and market-chain-monitoring processes, linked with animal disease monitoring data – could not be started because governmental clearances were not received from Bangladesh and India. The project is working to resolve this issue.

Output 3: Developed policy and harmonized risk management procedures

- Experienced consultants in Bangladesh, India and Nepal were hired to review and analyze policy issues, legislative frameworks and the development of legislative instruments to fill key gaps related to cross-border trade and risk management. Their reports are expected by early April 2010.
- Subregional workshop on gaps in legislative frameworks, in the context of cross-border trading, will be organized in the next quarter, once the consultants' reports are received and analysed.

Output 4: Capacity for response to cross-border emergencies improved

- A series of workshops were held in India (in Bihar, West Bengal and Tripura states) to provide rapid response training to host government personnel, at local levels, in high-risk cross-border corridors of India. These workshops were held from 14 to 15 January

(in Siliguri), 18–19 February (in Agartala), 4–5 March (in Kishanganj), 8–9 March (in Malda), 11–12 March (in South Dinajpur), 15–16 March (in Cooch Behar) and 19–20 March (in North 24 Parganas). Approximately 90–100 persons participated at each workshop. Around 5–10 percent participants were females. The objectives of these workshops were to:

- orient/sensitize participants on key issues of risk/outbreak communication and advocacy interventions, to prevent and control HPAI outbreaks;
- present district-level findings of the poultry value-chain mapping exercise conducted by the project.

Planned activities for the next quarter

Output 1: Project management and coordination mechanisms established and operating

- Retain key technical personnel until the end of project date (i.e. September 2010).
- Further strengthen the modalities for better communication and dialogue, to facilitate project coordination.
- Continue to prepare bi-monthly information bulletins.
- Participate in regional and global meetings.
- Hold meetings of technical- and policy-level committees in the next quarter.

Output 2: High-risk areas for introduction of HPAI via cross-border routes identified and mapped

- Finalize the study report on poultry value-chain analysis across India, Nepal and Bangladesh's borders and also India and Myanmar's border (to date, the agency contracted to perform this study has not been performing satisfactorily).

Output 3: Increased capability for emergency response to HPAI outbreaks owing to cross-border spread of the disease

- Conduct the study tour to India for staff from each participating country between 26 and 29 April 2010 to strengthen emergency response capacities.
- Conduct trainings and workshops on how to rapidly confirm outbreaks for border control personnel in Bangladesh.
- After receipt of technical clearance from ECTAD-RAP circulate the finalized SOPs and recommendations for response in high-risk cross-border trade areas.
- Conduct two more rounds of training for laboratory personnel in India in April 2010 on the use of rapid antigen test kits.

Phase II

Output 2: Strengthened production and market systems approach to improve cross-border movement management and reduce HPAI risks

- Conduct a study on livestock marketing systems in high risk corridors, with a view to establishing monitoring processes for production and market chains of poultry, linked with animal disease monitoring data. The project is currently awaiting governmental clearances from Bangladesh and India.

Output 3: Developed policy and harmonized risk management procedures

- Review and analyse country reports on policy issues, legislative frameworks and the development of legislative instruments to fill key gaps related to cross-border trade and risk management, through locally contracted experts.

- Conduct a sub-regional workshop on gaps in legislative frameworks for cross-border trading.

Output 4: Improved capacity for response to cross-border emergencies

- Convene meetings of provincial and district officers in high-risk cross-border corridors in India and Bangladesh.
- Provide rapid response training to host government personnel of India and Bangladesh, at local levels, in the selected high-risk movement corridors.
- Conduct a special advocacy initiative to mobilise and sensitise the following groups: local, district-level and decentralised veterinarians; private and public news channels, journalists and media-persons; NGOs; farmers; traders; and women's groups. Hold this initiative in target border districts, as part of emergency response activities in India and Bangladesh.
- Conduct sensitization workshops for print and electronic media at the national level, and also in India's West Bengal and Tripura states, for the prevention and control of HPAI. This should be done, in particular, to strengthen cross-border emergency preparedness and response mechanisms.

Main challenges encountered and response provided

- None

Progress made towards the achievement of project outcomes (from the start of the project activities)

Output 1: Project management and coordination mechanisms established and operating

- All project staff have been recruited and the coordinating office in Kathmandu, Nepal has been established and equipped. Coordinating units in Bangladesh, India and Myanmar have also been equipped. A vehicle has been procured for the project coordinating unit in Kathmandu.
- A project workshop, attended by high-level administrative and technical personnel from participating countries, was held from 24 to 25 March 2008.
- The Project Inception Workshop was held from 2 to 3 July 2008. A related report has been provided to all countries and participants.
- A USAID Partners' Meeting, on HPAI in South Asia, was organized from 17 to 18 November 2008 in New Delhi, India, to discuss the progress of FY 2007 activities and a work plan for FY2008 funding.
- Technical and policy-level committees have been constituted. A meeting of these committees, to monitor the project progress, was held on 17 April 2009 in Kolkata, India and from 28 to 29 January 2010 in Pokhara, Nepal. A meeting of a technical-level committee, to monitor the project's progress, was held on 19 July 2009 in Dhaka, Bangladesh.
- A poster prepared on the progress of the project was presented during the USAID Partners' Meeting, held from 1 to 3 April 2009 in Bangkok.
- Five volumes of bi-monthly information bulletins were released, from May 2009 to January 2010, and circulated to ECTAD members, donors, countries and other agencies, as an information sharing/knowledge management initiative.
- Engagement with the South Asia Association for Regional Cooperation (SAARC) was continued through organization of a FAO/World Organisation for Animal Health sub-regional meeting of the Global Framework for the Progressive Control of Transboundary Animal Diseases (for the SAARC Region) on 4–5 June 2009, in Kathmandu.

- The Sub-regional Manager participated in a meeting in Bangkok, from 16 to 17 July 2009, to develop a strategic framework, entitled “FAO Regional Strategy for Highly Pathogenic Avian Influenza and other Emerging Infectious Diseases of Animals in Asia and the Pacific: 2009 – 2014”.
- A report on the progress of the project, from April to September, was presented at the USAID Partners’ Meeting held on 24 and 25 September 2009 in Bangkok.
- The Subregional Manager participated in the second real-time evaluation of FAO’s work on HPAI in the Asian region, held from 30 November to 1 December 2009 in Bangkok, Thailand. The evaluation team was briefed on the activities and impact of the South Asia cross border project.
- The Subregional Manager and Subregional Advocacy Coordinator participated in the Fourth Regional ECTAD Meeting, from 23 to 25 February, and the ECTAD Asia Information System Workshop on 26 February 2010, in Bangkok, Thailand.

Output 2: High-risk areas for introduction of HPAI via cross-border routes identified and mapped

- The draft final report of the study on poultry value-chain analysis across Nepal and India’s border, and mapping of high-risk areas, was received and cleared.
- The draft final report of the study on poultry value-chain analysis across Bangladesh, India and Myanmar’s border, and mapping of high-risk areas was received and cleared.
- The draft final report of the study on poultry value-chain analysis across Myanmar, India and Bangladesh’s borders, and mapping of high-risk areas, was received and cleared.
- A study on the livestock marketing system in high risk corridors of Nepal, with a view to establishing monitoring processes of poultry production and market chains (linked with animal disease monitoring data), was conducted from 8 to 14 November 2009.

Output 3: Increased capability for emergency response to HPAI outbreaks owing to cross-border spread of the disease

- Laboratory training for participants from Bangladesh, India, Nepal and Myanmar was held from 19 to 24 January 2009 in Bhopal, India.
- A sub-regional workshop to develop standard operating procedures for emergency response to disease in high risk, cross border trade areas was held from 21 to 22 May 2009 in Kathmandu, Nepal. These SOPs were further discussed (and accepted by each party), in Bangladesh, India and Nepal, through a series of brainstorming workshops from 4 to 6 November 2009 (in Nepal), on 4 December (in India) and on 10 December (in Bangladesh), and finally at the Technical and Policy Level Committees meeting between 28 and 29 January 2010 at Pokhara, Nepal.
- At the request of Government of the Republic of India, rapid antigen detection kits were procured and delivered for use, in high risk corridors, for the rapid screening of outbreaks. Furthermore, in response to the Government’s request, three cycles of laboratory trainings were conducted on the use of rapid antigen kits for 50 laboratory personnel. The kits were successfully used in the recent HPAI outbreaks in Murshidabad district, West Bengal, and were appreciated by the Government.
- Enzyme-linked immunosorbent assay kits were procured and delivered to the Government of Federal Democratic Republic of Nepal for surveillance of HPAI in ducks in Nepal’s far eastern region, which formed a part of the project study area.

Phase II**Output 2: Strengthened production and market systems approach to improve cross-border movement management and reduce HPAI risks**

- Stakeholder meetings to present the results of poultry value-chain mapping across Nepal and India's border were held on 10 July 2009 in Kathmandu, Nepal; and for the Bangladesh–India and Bangladesh–Myanmar borders, on 21 July 2009 in Dhaka, Bangladesh. The meetings were attended by senior staff representing the Department of Livestock Services including the Chief Veterinary Officer, private sector representatives, national and international NGOs, AED and FAO.
- A sub-regional workshop, entitled "Understanding and Use of Poultry Value Chain Analysis in Poultry Production and Marketing in the Context of Cross Border Trading", was held from 14 to 18 September 2009 in Kathmandu, Nepal. Delegates from Bangladesh, India and Nepal participated. The workshop was facilitated by FAO staff from headquarters, RAP, Bangladesh and Nepal, and also by the Royal Veterinary College, London.

Output 3: Developed policy and harmonized risk management procedures

- Experienced consultants in Bangladesh, India and Nepal were hired to review and analyse policy issues, legislative frameworks and the development of legislative instruments to fill key gaps related to cross-border trade and risk management were relevant.

Output 4: Improved capacity for response to cross-border emergencies

- A series of orientation and sensitization workshops, on strengthening cross-border emergency preparedness and response mechanism for HPAI, were held for provincial and district officers in high-risk cross-border corridors of Nepal (Jhapa and Morang districts) and India (Araria/Kishanganj, Darjeeling, Cooch Behar, Dakshin Dinajpur, Malda, North 24 Parganas and West Tripura districts) between January and March 2010. Approximately 90–100 persons participated at each workshop. The workshops, which were part of the emergency response, were also used as a platform to sensitise local, district-level and decentralised veterinarians, private and public news channels, journalists, media-persons, NGOs, farmers, traders, and women's groups in border districts.

Project Monitoring Sheet: **OSRO/RAS/604/USA Baby 05**

Project title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza**

Reporting period: **April to September 2013**

<p>Regional Component: Southeast Asia Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza Code: OSRO/RAS/604/USA Baby 05</p>
<p>Budget: Phase I: USD 600 000 Phase II: USD 1 435 000 Phase III: USD 1 172 700 Phase IV: USD 937 800 Phase V: USD 1 000 000 Mongolia Balance: USD 30 667 Phase VI: USD 1 192 500 Phase VII: USD 830 000 Phase VIII (current): USD 1 000 000</p>
<p>Total budget: USD 8 198 667</p>
<p>Effective starting date: 1 August 2006</p>
<p>Planned end date: 30 September 2014</p>
<p>Context of the project The Highly Pathogenic Avian Influenza (HPAI) epidemic, caused by the H5N1 virus, began to affect Asia and Southeast Asia late 2003 and early 2004 and spread to many countries in the region. The effects were particularly severe in Indonesia, Thailand and Viet Nam, which saw widespread outbreaks in poultry as well as human cases of H5N1 infection. The Food and Agriculture Organization of the United Nations (FAO), through its Emergency Centre for Transboundary Animal Diseases (ECTAD), established a decentralized unit in Bangkok, Thailand, located in the Regional Office for Asia and the Pacific (RAP), to provide technical backstopping for countries in the Asia and the Pacific region that were experiencing outbreaks of the infection or were at risk of it. ECTAD RAP was supported through a preliminary regional project (OSRO/RAS/505/USA) funded by the United States Agency for International Development (USAID). This support has continued under the current FAO project.</p>
<p>Objectives of the project The objective of this regional component is to coordinate project activities with the target countries and also to ensure continuity from the previous project (OSRO/RAS/505/USA) to the current one. The project also aims to strengthen regional level cross-sectoral coordination and communication for HPAI control.</p>
<p>Planned activities for the reporting period (April 2013 to 30 September 2013)</p>
<p>Output 1: Strengthened cross-sectoral coordination at regional level</p> <ul style="list-style-type: none"> • Continue to provide technical and operational inputs to country-level projects in collaboration with country teams. • Continue to provide technical inputs, resource persons or training support to the activities related to the existing regional HPAI Control Framework for ASEAN, existing network systems or regional coordination mechanism related to HPAI and animal disease control.

- Continue to coordinate and collaborate with other agencies on activities related to HPAI control.
- Continue to provide technical inputs to support the activities of the Emerging Pandemic Threats Plus (EPT+) project as well as the other USAID EPT components implemented by various partners.

Output 2: Strengthened regional and national human resources in the field of veterinary epidemiology

- Continue activities to implement the Regional Field Epidemiology Training Programme for Veterinarians (FETPV), including the seeking of additional support for the programme through other potential partners.
- Continue to provide support for the development of field epidemiology related training programmes in Cambodia, Lao People's Democratic Republic (PDR) and South Asia.

Output 3: Strengthened coordination of the epidemiology and laboratory networks

- Continue to support the implementation of FAO's EMPRES-i (Emergency Prevention System-i) Asia to share expertise and information in a real-time manner across the network through meetings, workshops and online communication.
- Provide coordination, in collaboration with other regional projects implemented by FAO, to strengthen existing epidemiology and laboratory networks, as well as the epidemiology consortium.
- Continue to provide support for sample submission from member countries to international reference laboratories.

Output 4: Strengthened coordination of cross-border risk assessment and management for HPAI transmission

- Support the dialogue between or among member countries on cross-border cooperation and collaboration in the management of critical control points in key regional corridors.

Output 5: Established regional emergency response services

- Continue to provide technical and operational assistance to member countries to contain the HPAI outbreaks in their respective countries.

Activities undertaken during the reporting period (April 2013 – September 2013)

Output 1: Strengthened cross-sectoral coordination at regional level

- The ECTAD team continued to provide technical and operational inputs to country-level projects in collaboration with country teams:
 - The Regional Coordinator continued to provide technical backstopping to the USAID funded project in Lao PDR and Myanmar in the absence of the International Team Leader.
- The Regional Coordinator made technical contribution to the following ASEAN meetings which are related to regional coordination mechanism for animal health and zoonoses in Southeast Asia:
 - **ASEAN Coordinating Center for Animal Health and Zoonoses (ACCAHZ) Advocacy Meeting** was organized on 22 August 2013 in Melaka, Malaysia. The Advocacy meeting aimed to: (i) familiarize the Senior Officers and Director General or Chief Veterinary Officer for the National Animal Health Authority from ASEAN Member States with ACCAHZ; and (ii) provide them with a more in-depth

understanding of its relevance, intent, status and future direction. The Meeting was also expected to provide a venue for the participating officials to provide invaluable insights and comments on ACCAHZ, as well as guidance on its establishment within the context of ASEAN.

- The **35th ASEAN Ministerial Meeting on Agriculture and Forestry** included the launching of the ASEAN Animal Health Collaboration Website. The Regional Coordinator provided technical inputs for the website, which was developed as an information-sharing platform for ASEAN, supported by the FAO component of the European Union's Highly Pathogenic Emerging Diseases Programme. The platform is envisaged to be a data warehousing facility that will facilitate dissemination and sharing of relevant documents and/or information relating to animal health initiatives in the region among the member countries, stakeholders, and relevant partners.
- The Regional Coordinator provide inputs to prepare for a FAO-World Organisation for Animal Health (OIE)-World Health Organization (WHO) tripartite event – the Fourth Asia-Pacific Workshop on Multisectoral Collaboration for Prevention and Control of Zoonoses, which will be held during 27-29 November 2013 in Kathmandu, Nepal to strengthen collaboration and coordination the three organizations and their members using a *One Health* approach.
- The Regional Coordinator and the National Operations Officer prepared the project document for the 8th Phase of the RAP component of the USAID funded project which was subsequently approved by USAID.
- The ECTAD team in Asia provided technical and operational inputs for the organization of the **Avian Influenza and Emerging Pandemic Threats Programme Discussions** organized in Bangkok, Thailand on 26 June 2013. The meeting brought the team leaders from ECTAD country programmes to review and discuss reprogramming the regional projects to address the current situation of HPAI.
- The ECTAD team provided technical inputs to support the activities of the USAID EPT and EPT+ programmes. Specifically:
 - The ECTAD team attended and provided inputs to the USAID EPT Program - Asia Regional Meeting organized by USAID during 18-19 June 2013 in Bangkok, Thailand. The objectives were to give updates on the status of project deliverables, share information among partners on proposed final-year work plans to achieve deliverables, and to brainstorm on how to better integrate emerging pandemic threats activities within existing host-country platforms.
 - The ECTAD team provided technical and operational inputs to the organization of the IDENTIFY Tripartite Meeting on 20 June 2013 in Bangkok, Thailand. The objectives of the meeting were to review the activities and progress of IDENTIFY FAO, OIE and WHO components in the Asian regions, to discuss specific technical and strategic issues implemented under IDENTIFY by each partner and attempt to develop a common approach/understanding and collaboration on these technical issues.
- The ECTAD team provided technical and operational inputs to the activities related to H7N9 emergency surveillance in the region, including the organization of four meetings:
 - **H7N9 Technical and Programmatic Coordination Meeting**, 2-3 May 2013 in Bangkok, Thailand. The objectives of the meeting were to review the current status of H7N9 in human and animal health sectors; review the preliminary risk analysis of H7N9 spread including information from the poultry supply chain and social network analysis; determine short-, medium- and longer-term surveillance strategies

including status diagnostic tests and protocols for H7N9 for at-risk countries; identify the opportunities for synergies of the human and animal health sectors as well as other sectors among the countries in the region and synergies between the countries and the relevant international organizations.

- **USAID Partners Meeting for China**, 6-7 May 2013 in Guang Zhou. The meeting discussed the H7N9 situation and identified opportunities for synergies between the human and animal health sectors as well as other sectors in China in order to deal with the H7N9 crises.
- **Technical and Policy Discussion on the Prevention and Control of Avian Influenza A(H7N9) in Asia**, 24-25 June 2013, Bangkok, Thailand. The meeting was jointly hosted by USAID and the Royal Thai Government. The objectives were to: share the lessons learned from actions undertaken by the Government of China in preventing and managing the situation of H7N9 influenza infections in poultry and humans as well as monitoring H7N9 influenza viral evolution; discuss specific unresolved issues related to viral transmission, surveillance, risk assessment and management as well as appropriate and practical interventions for H7N9 influenza infection based on capacity developed from the H5N1 crisis; discuss risks and scenarios of the H7N9 situation in the region and the possible mitigation measures in short-, medium- and longer-term; and identify the opportunities for synergies of the human health, animal health and other sectors among the countries in the region and between the countries and the relevant international organizations.
- **H7N9 Technical and Programmatic Meeting**, 12-13 September 2013, Rome, Italy. The meeting discussed the current disease situation in China, updated scientific information related to laboratory diagnosis and transmission of H7N9 virus and identified the ways forward to proactively deal with H7N9 in Asia.
- Implementation of the USAID funded project “Emergency surveillance of Influenza A(H7N9) virus in South and Southeast Asia” was carried out from May to September 2013 in collaboration with country teams and US Centers of Disease Control and Prevention.
- Other technical and operational inputs that the ECTAD team provided to country projects, in collaboration with FAO country teams and national counterparts, included:
 - recruitment of international consultants;
 - procurement of equipment and supplies;
 - issuance of contracts to conduct field activities/research; and
 - provision of clearance to technical reports prepared by staff of ECTAD Country Teams or by consultants recruited for various project activities.

Output 2: Strengthened regional and national human resources in the field of veterinary epidemiology

- The Senior Veterinary Epidemiologist, the Regional Coordinator and the ECTAD team continued to work closely with the Thai Department of Livestock Development on activities related to FETPV. These included:
 - serving as regional programme mentors to the trainees from Thailand and other countries;
 - attending and providing technical inputs to the Trainings/Workshops/Discussions during the first module of the training which was the joint training course with the Regional Field Epidemiology Training Programme organized by the Thai Ministry of Public Health for the public health personnel; and
 - continuing to seek additional support for the programme.
- The Senior Veterinary Epidemiologist continued to provide support to the training

programmes at the country and regional levels in South Asia including:

- The SAARC 2nd Epidemiology Network Workshop during 12-15 August 2013 in Bhutan; and
- The 2nd Regional Field Epidemiology Training Programme for Veterinarians in Nepal.

Output 3: Strengthened coordination of the epidemiology and laboratory networks

- The ECTAD team continued to provide technical inputs and coordination, in collaboration with other regional projects implemented by FAO, to strengthen existing epidemiology and laboratory networks. This included:
 - The **First Meeting of ASEAN Ad-hoc Veterinary Epidemiology Group (AVEG)** in Phuket, Thailand, 27-29 August 2013. The objectives of the meeting were to discuss and develop the draft Terms of Reference, and to discuss on the roadmap to establish a sustainable epidemiology group within ASEAN mechanisms.
- The ECTAD team continued to provide technical inputs to the disease tracking system EMPRES-i Asia and information sharing via the Transboundary Animal Disease Network Asia email circulation.

Output 4: Strengthened coordination of cross-border risk assessment and management for HPAI transmission

- The Regional Animal Health Economist, participated in and provided inputs to the following meetings:
 - The **Cross-border Livestock Value Chain Workshop** in South Asia in collaboration with the members from SAARC Regional Support Unit, was organized from 29 April to 1 May 2013 in Kathmandu, Nepal.
 - The **Viet Nam and China Bilateral Meeting on Collaboration to Address Transboundary Animal Diseases and Diseases of Public Health Concern** organized at Halong Bay 22 and 24 August 2013. The meeting was held to share information of situation and activities relevant to diseases with transboundary nature and to define technical collaboration between the two countries.

Output 5: Established regional emergency response services

- The Regional Veterinary Epidemiologist and Regional Animal Health Economist conducted missions to Cambodia and Nepal during the reporting period to conduct a multidisciplinary field risk assessment of recent outbreaks in these two countries. The team provided inputs to the partners and to the donor coordination meeting.
- The ECTAD team provided technical and operational inputs to:
 - Liaise with USAID Washington to distribute the personal protective equipment to member countries in Asia upon the request;
 - Assist the ECTAD Country team in Nepal procuring personal protective equipment as part of preparedness for further outbreaks in Nepal.

Planned activities for the next six-month period (October 2013 – March 2014)

Output 1: Strengthened cross-sectoral coordination at regional level

- Continue to provide technical and operational inputs to country-level projects in collaboration with country teams.
- Continue to provide technical inputs, resource persons or training support to the activities related to existing regional the HPAI Control Framework for ASEAN,

existing network systems or regional coordination mechanism related to HPAI and animal disease control.

- Continue to coordinate and collaborate with other agencies on activities related to HPAI and H7N9 surveillance and response.
- Continue to provide technical inputs to support the activities of the EPT+ project as well as the other USAID EPT components implemented by various partners.

Output 2: Strengthened regional and national human resources in the field of veterinary epidemiology

- Continue activities to implement the Regional FETPV, including the seeking of additional support for the programme through other potential partners.
- Continue to provide support to the development of field epidemiology related training programmes in Cambodia, Lao PDR and South Asia.

Output 3: Strengthened coordination of the epidemiology and laboratory networks

- Continue to support the implementation of EMPRES-i Asia to share expertise and information in a real-time manner across the network through meetings, workshops and online communication.
- Provide coordination, in collaboration with other regional projects implemented by FAO, to strengthen existing epidemiology and laboratory networks, as well as the epidemiology consortium.
- Continue to provide support for sample submission from member countries to international reference laboratories.

Output 4: Strengthened coordination of cross-border risk assessment and management for HPAI transmission

- Support the dialogue between or among member countries on cross-border cooperation and collaboration in the management of critical control points in key regional corridors.

Output 5: Established regional emergency response services

- Continue to provide technical and operational assistance to member countries to contain the HPAI outbreaks in their respective countries.

Main challenges encountered and response provided

- No major challenges were encountered during the reporting period.

Progress made towards the achievement of project outcomes (from the start of activities)

Output 1: Strengthened cross-sectoral coordination at regional level

- Coordination and collaboration between FAO and other international organizations and agencies were strengthened and continued. Engagement was strengthened with ASEAN through the adoption of strategies jointly developed by member countries and FAO. Coordination has been well established between the projects funded by USAID and the projects funded by other donors. Success stories and lessons learnt from HPAI can be used to further broaden the scope of action to prevention and control of transboundary animal diseases (TADs) and emerging infectious diseases (EIDs) using a *One Health* approach at the regional and country levels.
- Building on the existing capacities for H5N1, emergency surveillance for H7N9 incursion in the bordering countries and having poultry value chain connections with

China has been conducted. Such activities will be continuously conducted for the upcoming winter season.

Output 2: Strengthened regional and national human resources in epidemiology through regional FETPV

- The FETPV continued smoothly with additional collaborations at the national and international levels and approved joint funding for the programme. ASEAN Member States recognized the importance of integrating veterinary epidemiology activities in the national veterinary services and noted that the Thai Department of Livestock Development has been hosting the Regional FETPV since 2009. Capacity building in the field of epidemiology has been included as one of the main components of the draft Regional Strategies for Veterinary Epidemiology Capacity Development and Networking which has been endorsed at the Senior Official and Ministerial levels.
- There have been two graduating cohorts, in 2011 and 2012, consisting of 13 veterinary graduates. One hundred and thirty-four veterinarians from 11 countries were trained through the short course, *Veterinary Field Epidemiology in Action*. Eight training modules, an FETPV trainee manual and four structured case studies were developed and used for the training. A total of 44 epidemiology reports (13 surveillance, 18 outbreak investigations and 13 field epidemiology studies) were developed and some of these reports were presented at international conferences including the Training Programs in Epidemiology and Public Health Interventions Network (TEPHINET), European Scientific Conference on Applied Infectious Disease Epidemiology (ESCAIDE), the Conference of Research Workers in Animal Diseases (CRWAD) and the Melbourne *One Health* Conference. The training programme has now been revised to use a modular approach consisting of three modules, which are in logical sequence: 1) analysis of secondary data derived from surveillance system; 2) outbreak investigation; and 3) field epidemiology study.

Output 3: Strengthened coordination of the epidemiology and laboratory networks

- The Strategic Framework for Regional Laboratory Networks for Southeast Asia was endorsed by the ASEAN Working Group on Livestock. The international partners for the regional laboratory network in Southeast Asia were recognized by the Member States as the Technical Advisory Group. The Laboratory Directors' Forum has been used to advocate for the progression of ongoing activities to gain more support at the policy level.

Output 4: Conducting risk assessment for HPAI transmission through cross-border poultry trade

- A coordinated effort has been launched to develop cross-border collaboration between China and Viet Nam, and Cambodia and Viet Nam.

Quarter II 2010**Project Monitoring Sheet: OSRO/RAS/604/USA Baby 05**

Project title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)**

Reporting period: **April – June 2010**

<p>Regional Component: Southeast Asia Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) Code: OSRO/RAS/604/USA Baby 05</p>
<p>Budget: USD 600 000 (Phase I), USD 1 435 000 (Phase II), USD 1 172 700 (Phase III), USD 937 800 (Phase IV) Total budget: USD 4 145 500</p>
<p>Effective starting date: 1 August 2006</p>
<p>Planned end date: 30 September 2010</p>
<p>Context of the project</p> <p>The Highly Pathogenic Avian Influenza (HPAI) epidemic, caused by H5N1 viruses, began in late 2003 and in early 2004 in Asia and Southeast Asia and spread to many countries in the region. The effects were particularly severe in Indonesia, Thailand and Viet Nam, which saw widespread outbreaks in poultry and also human cases of H5N1 infection. The Food and Agriculture Organization of the United Nations (FAO), through its Emergency Centre for Transboundary Animal Disease Operations (ECTAD), established a decentralized unit in Bangkok, Thailand, located in the Regional Office for Asia and the Pacific (RAP), to provide technical backstopping for countries in the Asia and the Pacific region that were experiencing outbreaks of the infection or were at risk of it. ECTAD RAP was supported through a preliminary, regional project (OSRO/RAS/505/USA) funded by the United States Agency for International Development (USAID). This support has continued under FAO's present project.</p>
<p>Objectives of the project</p> <p>The objective of this regional component is to coordinate project activities with the target countries and also to ensure continuity and a smooth transition from the previous project (OSRO/RAS/505/USA) to the current one. The project also aims to strengthen regional level cross-sectoral coordination and communication for HPAI control.</p>
<p>Planned activities (for the reporting period)</p> <p>Output 1: Strengthened cross-sectoral coordination at regional level</p> <ul style="list-style-type: none"> • continue to provide technical and operational inputs to country-level projects in collaboration with the country teams • continue to provide implementation support to the Association of Southeast Asian Nations (ASEAN) for activities under the Second Regional Strategic Framework for HPAI Control in Southeast Asia • continue to coordinate and collaborate with other agencies on activities related to HPAI

control

Output 2: Strengthened regional and national human resources in epidemiology through Regional FETPV

- continue the activities to implement the two-year regional field epidemiology training programme for veterinarians (FETPV) and seek additional support for the programme through other potential partners

Output 3: Strengthened coordination of epidemiology and laboratory network

- provide coordination, in collaboration with other regional projects implemented by FAO, to strengthen existing epidemiology and laboratory networks
- continue to provide support for sample submission from member countries to international reference laboratories
- continue to provide technical inputs for the establishment of a disease tracking system, ECTAD Asia, in collaboration with the senior technical adviser of FAO's HPAI programme in China

Output 4: Conducting risk assessment for HPAI transmission through cross-border poultry trade

- continue to provide coordination for country teams conducting risk assessment studies on HPAI transmission through the cross-border poultry trade

Activities undertaken during reporting period

Output 1: Strengthened cross-sectoral coordination at regional level:

- FAO recruited or continued to recruit international and national staff for the project.
- The Regional Coordinator (RC) continued to coordinate and collaborate with other United Nations (UN) agencies, donors and international humanitarian actors by attending meetings in the region to ensure that support and approaches to HPAI control are harmonized at country and regional levels. Specifically, the RC:
 - participated and provided technical inputs to the "Second FAO/OIE/WHO Joint Scientific Consultation on Influenza and Other Emerging Infectious Diseases at the Human-Animal Interface" which was organized in Verona, Italy from 26 April to 30 April 2010.
 - attended the "Emerging Pandemic Threat (EPT) Planning Meeting," which was organized by USAID in Siem Reap, Cambodia on 4 June 2010.
 - attended an informal meeting with the United States' Centers for Disease Prevention and Control (US CDC) and RESPOND group to discuss the harmonization and collaboration of the work plans.
 - participated and provided technical inputs to the "Consultative Meeting on Regional Communication and Advocacy" organized under the support of the Asian Development Bank (AsDB), held from 23 June to 25 June 2010 in Bangkok, Thailand.
- The RC provided technical inputs to ASEAN HPAI Task Force in drafting the "ASEAN Roadmap for HPAI Progressive Control and Eradication" and participated in the "Second Meeting of Technical Working Group" responsible for drafting of the roadmap held in Hanoi, Viet Nam from 30 June to 1 July 2010.
- The RC provided inputs to the FAO country teams on the preparation of the project proposals for further funding by USAID in fiscal year 2010.
- The ECTAD team provided technical and operational inputs to country projects, in

collaboration with FAO country teams and national counterparts, for the following activities:

- recruitment of international consultants;
- procurement of equipment and supplies; and
- issuance of contracts to conduct field activities/research.

Output 2: Establishment of regional and national resource personnel in epidemiology

- In collaboration with the Regional Veterinary Epidemiologist (RVE), the RC worked closely with the Department of Livestock Development (DLD) on activities related to FETPV. These included:
 - meeting with the teams from US CDC, which are based in Thailand, to discuss collaboration in supporting FETPV and strengthening the linkage between FETP and FETPV at the regional and country level. The RVE joined the country visit jointly conducted by FAO and CDC to Lao PDR. During the mission in Bangkok, the RC and RVE attended the meeting held among CDC, FAO and EPT-RESPOND to discuss possible collaboration on capacity building in the Southeast Asia;
 - attending the steering committee on FETPV appointed by DLD to discuss programme management as well as the human and financial resources to be provided by DLD;
 - organizing the first-round visit of the FETPV trainees who were enrolled in the class of 2010 in Thailand for a series of trainings and workshops. The RVE jointly prepared with DLD a case study to be used for outbreak investigation for the training;
 - preparing for the “Animal-Human-Environment Interface Workshop: Socio-economic and Communication Module” to be held from 24 August to 26 August 2010; and
 - assisting the RVE in conducting a mission to China to provide inputs to the country team on the on-going efforts in the development of China-FETPV.

Output 3: Strengthened coordination of epidemiology and laboratory network

- The RC continued to provide technical inputs to help organize sub-regional and in-country workshops on surveillance and laboratory networks for HPAI and other forms of influenza in Asia. These workshops were supported by other regional projects (GCP/RAS/221/JPN, funded by the Government of Japan, and TCP/RAS/3211, funded by FAO) which were implemented by FAO from February to March 2010.
- ECTAD RAP continued to provide technical inputs to assist in the establishment of the disease tracking system. ECTAD Asia, in collaboration with the senior technical adviser of FAO’s HPAI programme in China. The system is now to be called “Global Animal Disease Information System (EMPRES-i)-Asia,” as it is part of EMPRES-i.
- The RC provided inputs to facilitate the planning and implementation of “EPT-IDENTIFY” project, which is related to regional laboratory networking initiative.

Output 4: Conducting risk assessment for HPAI transmission through cross-border poultry trade

- The RC, in collaboration with a socio-economic expert from FAO headquarters, organized a meeting among CTAs of GMS countries (Cambodia, Lao PDR, Myanmar and China) and a national consultant from Thailand to consolidate the studies on risk of HPAI spread along poultry production and market chains at cross-border level conducted at regional and country levels on 22 June 2010.

- The RC facilitated the discussion among USAID partners including FAO, Academy for Educational Development (AED) and Kenan Institute Asia to develop a collaborative framework on joint activities to be jointly conducted at the border point between Mukdahan Province of Thailand and Savannakhet of Lao PDR.

Planned activities for the next reporting period

Output 1: Strengthened cross-sectoral coordination at regional level

- prepare the project proposal of the “regional component” for further funding by USAID during the fiscal year of 2010 and continue to provide inputs to country teams in preparing the proposals for the country components
- continue to provide technical and operational inputs to country-level projects in collaboration with country teams
- continue to provide support to ASEAN to finalize the roadmap for HPAI Progressive Control and Eradication in Southeast Asia
- continue to coordinate and collaborate with other agencies on activities related to HPAI control

Output 2: Strengthened regional and national human resources in epidemiology through Regional FETPV

- continue activities to implement the two-year FETPV programme, including the seeking of additional support for the programme through other potential partners
- continue to provide support to the development of China-FETPV as well as related training programme in Cambodia and Lao PDR

Output 3: Strengthened coordination of epidemiology and laboratory network

- provide coordination, in collaboration with other regional projects implemented by FAO, to strengthen existing epidemiology and laboratory networks
- continue to provide support for sample submission from member countries to international reference laboratories
- continue to provide technical inputs for the establishment of a disease tracking system, EMPRES-i Asia, in collaboration with the senior technical adviser of FAO’s HPAI programme in China and IT expert in FAO headquarters

Output 4: Conducting risk assessment for HPAI transmission through cross-border poultry trade

- continue to provide coordination for country teams conducting risk assessment studies on HPAI transmission through the cross-border poultry trade

Main challenges encountered and response provided

- There were no major challenges during the reporting period.

Progress made towards the achievement of project outcomes (from the start of activities)

Output 1: Strengthened cross-sectoral coordination at regional level

- Coordination and collaboration between FAO and other international organizations and agencies – as well as with regional political organizations such as ASEAN – has continued and has been strengthened. Linkages have been made between the projects

funded by USAID and the projects funded or (or about to be funded) by other donors.

Output 2: Strengthened regional and national human resources in epidemiology through Regional FETPV

- FETPV has continued smoothly with additional collaborators at national and international levels and approved joint funding for the programme.

Output 3: Strengthened coordination of the epidemiology and laboratory network

- In order to facilitate collaboration among key international partners, a matrix was drafted with the aim of strengthening epidemiology and laboratory networks for HPAI in Southeast Asia.

Output 4: Conducting risk assessment for HPAI transmission through cross-border poultry trade

- A key operational research approach to study HPAI risk in the poultry sector, and the value chain at cross-border level, was discussed through consultative meetings between FAO country teams and key USAID partners, including Abt Associates, Academy for Educational Development and Development Alternatives, Incorporated. Methodology guidelines were finalized and the plans to conduct regional studies, focusing on two major poultry production areas, were discussed and are being finalized. Additional data has been collected at country and regional levels.

I Quarter 2010

Project Monitoring Sheet: **OSRO/RAS/604/USA Baby 05**

Project title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI)**

Reporting period: **January – March 2010**

<p>Regional Component: Southeast Asia Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) Code: OSRO/RAS/604/USA Baby 05</p>
<p>Budget: USD 600 000 (Phase I), USD 1 435 000 (Phase II), USD 1 172 700 (Phase III), USD 937 800 (Phase IV) Total budget: USD 4 145 500</p>
<p>Effective starting date: 1 August 2006</p>
<p>Planned end date: 30 September 2010</p>
<p>Context of the project</p> <p>The highly pathogenic avian influenza (HPAI) epidemic, caused by H5N1 viruses, began in late 2003 and in early 2004 in Asia and Southeast Asia, and spread to many countries in the region. The effects were particularly severe in Indonesia, Thailand and Viet Nam, which saw widespread outbreaks in poultry, and also human cases of H5N1 infection. The Food and Agriculture Organization of the United Nations (FAO), through its Emergency Centre for Transboundary Animal Disease Operations (ECTAD), established a decentralised unit in Bangkok, Thailand, located in the Regional Office for Asia and the Pacific (RAP), to provide technical backstopping for countries in the Asia and the Pacific region that were experiencing outbreaks of the infection or were at risk of it. ECTAD RAP was supported through a preliminary, regional project (OSRO/RAS/505/USA) funded by the United States Agency for International Development (USAID). This support has continued under FAO's present project.</p>
<p>Objectives of the project</p> <p>The objective of this regional component is to coordinate project activities with the target countries, and also to ensure continuity and a smooth transition from the previous project (OSRO/RAS/505/USA) to the current one. The project also aims to strengthen regional-level cross-sectoral coordination and communication for HPAI control.</p>
<p>Planned activities (for the reporting period)</p> <p>Output 1: Strengthened cross-sectoral coordination at the regional level</p> <ul style="list-style-type: none"> • Continue to provide technical and operational inputs to projects at the country level, in collaboration with the country teams. • Continue to provide support to the Association of Southeast Asian Nations (ASEAN) to implement activities under the Second Regional Strategic Framework for HPAI Control in Southeast Asia.

- Continue to coordinate and collaborate with other agencies on activities related to HPAI control.

Output 2: Strengthened regional and national human resources in epidemiology through Regional FETPV

- Continue the activities to implement the two-year regional field epidemiology training programme for veterinarians (FETPV) and seek further support for the programme through additional potential partners.

Output 3: Strengthened coordination of the epidemiology and laboratory network

- Provide coordination, in collaboration with other FAO regional projects, to strengthen existing epidemiology and laboratory networks.
- Continue to provide support for sample submission from member countries to international reference laboratories.
- Continue to provide technical inputs for the establishment of disease tracking systems, through ECTAD Asia, in collaboration with FAO's senior technical adviser for the HPAI Programme in China.

Output 4: Conducting risk assessment for HPAI transmission through the cross-border poultry trade

- Continue to provide coordination for country teams that are performing risk assessments of HPAI transmission through the cross-border poultry trade.

Activities undertaken during reporting period

Output 1: Strengthen cross-sectoral coordination at the regional level:

- FAO recruited or continued to recruit international and national staff for the project.
- The Regional Coordinator (RC) continued to coordinate and collaborate with other United Nations (UN) agencies, donors and international humanitarian actors by attending meetings in the region to ensure that support and approaches to HPAI control are harmonized at country and regional levels. Specifically, the RC:
 - in collaboration with World Organization for Animal Health (OIE), led a session related to animal health during a regional workshop on the UN System for avian and pandemic influenza control, which was organized by the United Nations System Influenza Coordination (UNSIC), in January 2010 in Bangkok, Thailand; and
 - attended the following events organized by USAID's Regional Development Mission for Asia (RDMA):
 - a discussion with Dr Dennis Carroll on the launching of the Emerging Pandemic Threat programme;
 - a planning meeting on technical discussions, which were being organized to take place in Bali on 30 and 31 March 2010, among five endemic countries;
 - a Chief of Party meeting to update USAID partners on work progress; and
 - a planning discussion on a USAID partners' meeting to be organized in June 2010.
- The RC provided technical inputs for the report submitted by the real-time evaluation team for FAO's Programme on Avian Influenza Control in Asia.

- The RC provided technical inputs, on the drafting of a regional wildlife strategy for Asia and the Pacific, to the Wildlife group of FAO's Emergency Prevention System for Transboundary Animal and Plant Pests and Diseases.
- In collaboration with the Asian Development Bank, the project supported the organization of the Fourth Annual Regional ECTAD Meeting, held from 23 to 25 February 2010 in Bangkok, Thailand.
- The RC provided inputs to the Crisis Management Centre (CMC) mission, which was helping Bhutan to prepare for HPAI outbreaks.
- The RC conducted a mission to Myanmar, on 16 and 17 February 2010, to accompany the RDMA team in following up on the progress of project activities there.
- The ECTAD team provided technical and operational inputs to country projects, in collaboration with FAO country teams and national counterparts, for the following activities:
 - recruitment of international consultants;
 - procurement of equipment and supplies; and
 - issuance of contracts to conduct field activities/research.

Output 2: Establishment of regional and national resource personnel in epidemiology

- In collaboration with the Regional Veterinary Epidemiologist (RVE), the RC worked closely with the Department of Livestock Development (DLD) on activities related to FETPV. These included:
 - acquiring Cabinet approval on a Letter of Agreement (LoA) with the Government of the Kingdom of Thailand to support the maintenance of the regional FEPTV coordination office based at the DLD;
 - meeting with teams from the United States' Centers for Disease Prevention and Control based in Thailand to discuss collaboration in supporting FETPV;
 - attending the steering committee on FETPV appointed by DLD to discuss programme management as well as the human and financial resources to be provided by DLD;
 - organizing a short course, entitled "Veterinary Epidemiology in Action", with participants from ten countries, including Cambodia, China, Indonesia, Lao People's Democratic Republic, Malaysia, Mongolia, Myanmar, the Philippines, Thailand and Viet Nam (during this course, the RC also gave a lecture on application of veterinary epidemiology in regulatory services); and
 - organizing a series of workshops under the regional FETPV, for students who had enrolled in 2009, which included the "Animal-Human-Environment Interface Workshop: WILD Module", held from 8 to 12 February 2010.

Output 3: Strengthened coordination of epidemiology and laboratory network

- The RC provided technical inputs to help organize subregional and in-country workshops on surveillance and laboratory networks for HPAI and other forms of influenza in Asia. These workshops were supported by other regional projects (GCP/RAS/221/JPN, funded by the Government of Japan, and TCP/RAS/3211, funded by FAO) which were implemented by FAO from February to March 2010.
- ECTAD RAP continued to provide technical inputs to assist in the establishment of the disease tracking system, ECTAD Asia, in collaboration with the senior technical adviser of FAO's HPAI programme in China. The first training session for FAO ECTAD country teams was organized on 26 February 2010 in Bangkok, Thailand.
- The RC and RVE provided inputs to facilitate the organization of meeting of the epidemiology consortium, scheduled on 3 and 4 March 2010, to develop a

<p>collaborative framework among key potential partners for activities related to epidemiology. These activities included: capacity building; networking; and knowledge generation and utilization.</p> <p>Output 4: Conducting risk assessment for HPAI transmission through cross-border poultry trade</p> <ul style="list-style-type: none"> • The RC, in collaboration with a socio-economic expert from FAO headquarters, followed up on activities and consolidated studies on poultry production and market chains at country level as well as associated HPAI risks at the cross-border level.
<p>Planned activities for the next reporting period</p> <p>Output 1: Strengthened cross-sectoral coordination at regional level</p> <ul style="list-style-type: none"> • Continue to provide technical and operational inputs to country-level projects, in collaboration with country teams. • Continue to provide implementation support to ASEAN for activities under the Second Regional Strategic Framework for HPAI Control in Southeast Asia. • Continue to coordinate and collaborate with other agencies on activities related to HPAI control. <p>Output 2: Strengthened regional and national human resources in epidemiology through Regional FETPV</p> <ul style="list-style-type: none"> • Continue activities to implement the two-year FETPV programme, including the seeking of additional support for the programme through other potential partners. <p>Output 3: Strengthened coordination of epidemiology and laboratory network</p> <ul style="list-style-type: none"> • Provide coordination, in collaboration with other regional projects implemented by FAO, to strengthen existing epidemiology and laboratory networks. • Continue to provide support for sample submission from member countries to international reference laboratories. • Continue to provide technical inputs for the establishment of a disease tracking system, ECTAD Asia, in collaboration with the senior technical adviser of FAO's HPAI programme in China. <p>Output 4: Conducting risk assessment for HPAI transmission through cross-border poultry trade</p> <ul style="list-style-type: none"> • Continue to provide coordination for country teams conducting risk assessment studies on HPAI transmission through the cross-border poultry trade.
<p>Main challenges encountered and response provided</p> <ul style="list-style-type: none"> • There were no major challenges during the reporting period.
<p>Progress made towards the achievement of project outcomes (since the start of activities)</p> <p>Output 1: Strengthened cross-sectoral coordination at the regional level</p> <ul style="list-style-type: none"> • Cooperation, coordination and collaboration between FAO and other international organizations and agencies – as well as with regional political organization such as

ASEAN – has continued and has been strengthened. Linkages have been made between projects funded by USAID and projects funded or (or about to be funded) by other donors.

Output 2: Strengthened regional and national human resources in epidemiology through Regional FETPV

- FETPV, at the regional level, has continued smoothly with additional collaborators at national and international levels and approved joint funding for the programme.

Output 3: Strengthened coordination of the epidemiology and laboratory network

- A matrix, to facilitate collaboration among key international partners, was drafted with the aim of strengthening epidemiology and laboratory networks for HPAI in Southeast Asia.

Output 4: Conducting risk assessment for HPAI transmission through cross-border poultry trade

- A key operational research approach to study HPAI risk in the context of the poultry sector, and the value chain at cross border level, was discussed through consultative meetings between FAO country teams and key USAID partners (which included: Abt Associates; Academy for Educational Development; and Development Alternatives, Incorporated). Methodology guidelines were finalized; plans to conduct regional studies, focusing on two major poultry production areas, were discussed and are being drafted. Additional data has been collected at country and regional levels.

2nd Quarter 2010**Project Monitoring Sheet: OSRO/RAF/719/USA – Phase II****Project Title: Strengthening HPAI surveillance, preparedness and response capacity in Southern Africa****Reporting period: April to June 2010**

<p>Regional Component: Southern Africa Project Title: Strengthening HPAI surveillance, preparedness and response capacity in Southern Africa Code : OSRO/RAF/719/USA</p>
<p>Budget : USD 1 099 175 (Phase I), USD 500 000 (Phase II) Total budget : USD 1 599 175</p>
<p>Effective Starting Date: 1 January 2010</p>
<p>Planned End Date: 30 September 2010</p>
<p>Context of the Project</p> <p>Since the outbreak of the Highly Pathogenic Avian Influenza (HPAI) on the African continent in February 2006, the Southern African region has remained free from the infection. In response to the potential threat of incursion of the disease, African countries have formulated National Preparedness and Response Plans, which led to the development of a Regional Plan by the Southern African Development Community (SADC). The levels of implementation of the national plans, however, differ greatly between the countries. This project, therefore, aims at assisting the countries at both national and regional levels in retaining a disease free status.</p>
<p>Objectives of the Project</p> <p><i>Impact of the project</i> Improvement and safeguarding of animal health and livelihoods from the threat of HPAI and mitigation of the risk of a human pandemic within the SADC region.</p> <p><i>Outcome of the project</i> Enhanced and harmonized regional preparedness, effective response to HPAI outbreak and strengthened regional and national surveillance for HPAI in the SADC region.</p> <p><i>Outputs of the project</i></p> <ol style="list-style-type: none"> 1. Expanded and consolidated risk analysis-based HPAI surveillance (Malawi, Mozambique, Zambia and Zimbabwe); 2. Enhanced capacity of regional and national veterinary laboratories for the diagnosis of Low Pathogenic Avian Influenza (LPAI) and HPAI and provision of essential material to second regional service laboratory (Botswana); 3. Regional coordination and networking.
<p><u>Activities that were planned for this quarter</u></p> <p>Output 1 Activity 1.1: Implementation of cross-border surveillance</p> <ul style="list-style-type: none"> • Sampling at identified common border posts with the respective neighboring countries

during the month of June

- Contracting the KYEEMA Foundation to join the cross-border surveillance to carry out a socio-anthropological survey

Activity 1.2: Field implementation of HPAI surveillance and its integration into ongoing animal health activities

- Start of the sampling in the previously identified high risk districts and its integration into an ongoing national animal health programme

Activity 1.3: Integration of producers into surveillance activities

- Start of the training of identified master farmers

Activity 1.4: Training of veterinary field personnel in surveillance techniques

- Training of relevant field personnel

Activity 1.5: Dynamic mapping of surveillance results

- Gathering of Global Positioning System (GPS) coordinates during the sampling activities for further analysis and mapping

Output 2

Activity 2.1: Laboratory support to enhance surveillance in the region

- Continuous supply of swabs and serum samples sent by all countries with enhanced surveillance to Botswana National Veterinary Laboratory (BNVL)
- Ensuring the proper functioning of the Demand-Supply Hub at BNVL, ordering reagents and distributing them to all recipient laboratories
- Submission of all SADC laboratories polymerase chain reaction (PCR) protocols (Standard operation procedures (SOPs)) for harmonization

Activity 2.2: Upgrade of virology section for AI diagnostics

- Establishing additional diagnostic tests for the detection of LPAI/HPAI, such as enzyme linked immunosorbent assay (ELISA)

Output 3

Activity 3.1: Regional coordination and networking

- Reports to be submitted by the four countries on results and progress of activities
- Evaluation of the project's progress by the project management team and close follow up on the activities noted in the work plan

Activities undertaken during the Reporting Period

Output 1

Activity 1.1: Implementation of cross-border surveillance

- Cross-border surveillance at nine common border locations, shared between Malawi, Mozambique, Zambia and Zimbabwe has been synchronized, and the necessary preparations for sampling activities were undertaken by the national consultants (NCs)

during April and May.

- At four out of the nine cross border posts, avian influenza (AI) surveillance activities are combined with a socio-anthropological study/survey conducted by the KYEEMA Foundation, contracted through a Letter of Agreement (LoA). A socio-anthropologist is conducting questionnaires and interviews in four villages (two in each country) located within 5 km from the border. The socio-anthropologist is targeting four different groups per village: 1. veterinary staff; 2. traders; 3. chicken producers (focusing on female chicken producers); and 4. commercial producers. Within groups 1., 2. and 4., information is collected on production systems, biosecurity, movements, transport routes, market places, ND vaccination and cross-border trade. Within group 3., information will be collected on consumption, communication behavior, and transport and trading.
- The surveillance teams and KYEEMA are visiting together the four border locations on the following dates: Malawi (Muloza)/Mozambique (Milanje): from 21 to 26 June; Zambia (Livingstone)/Zimbabwe (Vic Falls)/Malawi (Michinji): from 28 June to 9 July; and Zimbabwe (Nyamapanda)/Mozambique (Changara): from 12 to 17 July.
- At the time of the reporting, the cross-border surveillance has been conducted at the border of Muloza (Malawi)/Milanje (Mozambique) and the cross-border surveillance at Nyamapanda (Zimbabwe)/Michinji (Malawi) is under way.

Activity 1.2: Field implementation of HPAI surveillance and its integration into ongoing animal health activities

- HPAI surveillance is currently taking place in previously identified high risk areas (see AI surveillance 2009 maps) and at the newly identified cross-border locations (see activity 1.1). At present, the sampling has been conducted in Malawi at two border posts and in Mozambique at one border post and two districts. In Zambia, three districts and one border post have been sampled, while in Zimbabwe, sampling has been conducted in two different districts.
- In Zimbabwe, Newcastle Disease (ND) vaccination campaign and AI surveillance have been integrated in two provinces (Masvingo and Mashonaland West). However, more funding for ND vaccine production is expected, which will allow Zimbabwe to expand their campaign to further provinces.

In Mozambique, at the moment of reporting, no ND vaccination campaign is in process. Nevertheless, the campaign has been planned for the month of July and will be integrated within the AI surveillance project in a few provinces.

In Malawi, there is, at present, no national animal health program which could be linked to AI surveillance.

In Zambia, the Central Veterinary Research Institute (CVRI) is in process of increasing their capacity for ND vaccine production (funded by the KYEEMA foundation). The goal is to produce enough vaccines for starting a large ND vaccination campaign at the beginning of 2011, which will be integrated within the AI surveillance project.

Activity 1.3: Integration of producers into surveillance activities

- Master farmers have been selected through poultry associations (Zimbabwe), community leaders and vaccinators (Mozambique and Zambia) and existing agricultural development

systems (Malawi). The content of their training was covering poultry disease recognition with specific emphasis on AI and ND, disease reporting and passive surveillance. The master farmers have been encouraged to disseminate their gained knowledge to their fellow farmers in their community. The second edition of the "picture book" on infectious poultry diseases has been distributed to the master farmers and was used during the training.

Training took place during the month of June in the following countries:

In Malawi, a total of 350 Master Farmers from seven high risk areas (50/district) have been trained (from 14 June to 16 June).

In Mozambique, a total of 88 master farmers (11/province) are being trained between June and July. This training is taking place during the HPAI surveillance activities. This one-day training course is held by the field veterinary officers.

Training is planned for the month of July in the following countries:

In Zambia, a training course for master farmers is scheduled for the third week of July. A total of 48 master farmers will be trained in Lusaka coming from 12 different high risk areas (three master farmers/district).

In Zimbabwe, a total of 80 Master farmers have been trained in four high risk areas (20 farmers/district) (from 1 June to 22 June).

Activity 1.4: Training of veterinary field personnel in surveillance techniques

- A refresher training for field livestock officers has been organized and planned during the month of May/June. The training is focusing on AI surveillance techniques (blood collection, transport, storage and labeling).

In Malawi, at the time of the reporting, the training of 24 veterinary assistants (four per newly identified border district) has been completed.

In Mozambique, a refresher training has been organized for a total of 12 veterinary livestock officers (two per province), who will also be conducting training for master farmers in their respective provinces.

In Zambia, a refresher training for field veterinary officers is taking place during the sampling activities in the different high risk provinces. Three veterinary officers per province are trained during this sampling exercise.

In Zimbabwe, a one-day training for veterinary field staff has been completed in four different provinces during the same week when the training of master farmers took place.

- A copy of 4000 "picture books" on infectious poultry disease has been produced and sent to the four countries: 3000 in English and 1000 in Portuguese. These books are now available at all high risk District Veterinary Offices and have been used for training purposes, both for farmers and veterinary field personnel.

Activity 1.5: Dynamic mapping of surveillance results

- GPS coordinates have been collected in Malawi and Zimbabwe at the respective AI surveillance sites. Malawi has produced detailed Geographic Information System (GIS)

maps indicating the villages where cross-border surveillance is taking place.

Output 2

Activity 2.1: Laboratory support to enhance surveillance in the region

- Reagents for AI testing and ELISA kits have been requested to the demand-supply hub hosted at the BNVL by the four countries: the request from Malawi, Zambia and Zimbabwe has been processed and reagents/kits have been distributed to the respective central veterinary laboratories (CVLs). The request for reagents/kits has been placed by Mozambique and is in process.
- BNVL has received no serum and swab samples for AI testing during this quarter.
- Preparations for the proficiency test (PT), to be carried out in the next quarter, have started through discussions with BNVL and the Veterinary Laboratories Agency (VLA) in UK, which will participate in this trial.

Activity 2.2: Upgrade of Virology Section of the BNVL for AI diagnostics

- Orders for laboratory equipment to upgrade the virology section for AI testing have been placed by FAO ECTAD and 70 percent of the equipment has been delivered and installed. The autoclave and two pH meters are expected to be delivered in July.
- ELISA test, as an additional diagnostic test for AI, is in the process of being established. ELISA plate reader has been installed and pilot tests, using positive and negative serum controls, are currently used to verify the expected results.

Output 3

Activity 3.1: Coordination and regional networking

- Two progress reports have been submitted by Mozambique and Zambia (February/March & April/May), and one progress report has been submitted by Malawi and Zimbabwe (April/May).
- During the reporting period, the Operations Officer has completed three missions to Malawi, Mozambique and Zambia between May and June. The purpose of the visits was to assist the three NCs with the finalization of their budget/programme needs and to facilitate the finalization of the LoAs between the Food and Agriculture Organization of the United Nations (FAO) country offices and the National Veterinary Departments in Mozambique and Zambia.
- The organization and synchronization of cross-border surveillance in close collaboration with KYEEMA foundation has been coordinated by FAO Emergency Centre for Transboundary Animal Diseases Operations (ECTAD) Gaborone.
- The FAO ECTAD office in Gaborone has facilitated the procurement of additional laboratory and sampling material from the countries budget on each country's request: additional vacutainer needles, syringes, blood collection tubes, cryotubes, pipette tips (of five different sizes), microtitre plates, glass bottles and beakers, measuring cylinders, gel cutter, agarose gel. Ten GPS equipments have been procured for Mozambique and Zimbabwe.

Activities planned for the third quarter

Output 1

Activity 1.1: Implementation of cross-border surveillance:

- Sampling at common cross-border points will continue throughout the month of July
- The cross-border surveillance/survey in collaboration with KYEEMA foundation will be finalized in mid-July

Activity 1.2: HPAI surveillance

- HPAI surveillance will continue in high risk areas of the four countries throughout the months of July and August

Activity 1.3: Integration of producers into surveillance activities

- The role of previously trained master farmers in conducting passive surveillance will be evaluated

Activity 1.4: Dynamic mapping of surveillance results

- GPS coordinates will be collected during the sampling activities, and GIS maps will be produced indicating the AI surveillance locations in 2010

Output 2

Activity 2.1: Laboratory support to enhance surveillance in the region

- BNVL will receive samples from the four CVL for AI testing. All samples will be tested using the established ELISA test
- BNVL shall provide an update on the use of the demand-supply hub
- The SOPs for PCR (AI) will have been harmonized for the use by all SADC laboratories

Output 3

Activity 3.1: Coordination and regional networking

- Coordination by FAO ECTAD will continue throughout the project implementation

Main challenges encountered during the second quarter 2010

The main challenge during this reporting period was to coordinate the cross-border surveillance between the four countries taking into consideration the availability of the KYEEMA foundation's expert. Another challenge was to finalize the countries programme/budget needs and to have the LoAs signed in Zambia and Mozambique. In the meantime, LoAs with each targeted province have been finalized in Mozambique and in Zambia, the work and budget plans have been approved by the FAO representative and activities are on-going.

Main progress made towards the achievement of project outcome *(from the start of the project activities)*

Cross-border surveillance has been harmonized between the four countries, and at present, surveillance has been completed at three border posts.

Training of master farmers has been completed in Zimbabwe and Malawi and is organized for the month of July in Mozambique and Zambia.

A revised second edition of the "picture book" on infectious poultry disease has been printed and distributed to the four countries. It has also been posted on the ECTAD website.

Project Monitoring Sheet: **OSRO/RAS/604/USA Baby 06**

Project title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza in Viet Nam**

Reporting period: **April 2013 to September 2013**

Country: Viet Nam
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza in Viet Nam
Code: OSRO/RAS/604/USA Baby 06
Budget: Initial budget: USD 2 000 000 Amendment No. 1: USD 3 100 000 Amendment No. 2: USD 3 300 000 Amendment No. 3: USD 1 075 000 Amendment No. 4: USD 2 200 000 Amendment No. 5: USD 1 900 000 Amendment No. 6: USD 1 700 000 Transfer from project OSRO/VIE/801/USA in 2012: USD 508 373 Amendment No. 7 (current): USD 1 300 000 .
Total budget: USD 17 083 373
Effective starting date: August 2006
Planned end date: 30 September 2014
Context of the project The control and move towards the eradication of H5N1 Highly Pathogenic Avian Influenza (HPAI) demands a long-term approach. Viet Nam is moving from the control phase to the consolidation phase, with an ongoing need for capacity building in the veterinary services and livestock production sectors as well as support for vaccination and other risk reduction measures. This regional project of the Food and Agriculture Organization of the United Nations (FAO) is supported by the United States Agency for International Development (USAID) and is currently in its sixth phase of implementation.
Objectives of the project The overall objective of the project is to increase the capacity to prevent, detect and respond to HPAI and other high impact livestock and zoonotic diseases and to reduce the risks of disease outbreaks occurring.
Planned activities for the reporting period (April 2013 to September 2013)
Component 1: Preparedness and Planning Component
Output 1: Strategy development for HPAI control
<i>Activity 1.1 Regional HPAI Control Strategy</i>
<ul style="list-style-type: none"> • Develop advocacy strategy for implementation in conjunction with the Partnership for Avian and Human Influenza (PAHI). • Joint planning of activities with other partners to ensure linkage to zonal strategy. • Support review of progress and report to stakeholders.
<i>Activity 1.2 Develop policy briefs for potential outcomes during the transition period to the cessation of vaccination</i>
<ul style="list-style-type: none"> • Review previous scenario development and revise as necessary. • Develop concise policy brief based on review and submit to the Department of Animal Health (DAH). • Develop concise brief on scenarios for advocacy at the provincial level.

Activity 1.3 Training in regional control plan management and evaluation

- Conduct real-time training in regional control plan management in conjunction with the Regional Animal Health Office (RAHO) meetings.
- Support real-time monitoring on the progress of the control plan and report.

Output 2: Coordination and communication internally and with donors and other HPAI implementing partners*Activity 2.1 Core FAO Viet Nam team supported and manages project activities**Activity 2.2 Annual project meeting supported**Activity 2.3 Coordination meetings to support regional HPAI control strategy implementation**Activity 2.4 Coordination and sharing of information with other players engaged in HPAI surveillance, risk assessment, value chain and risk mitigation in the poultry sector***Component 2: Animal surveillance component****Output 3: Animal surveillance at the national, regional/zonal, provincial, district and commune levels enhanced***Activity 3.1 Strengthening of core capacities for animal disease control and disease control planning within regional control strategies*

- Support capacity building to develop work plans to implement regional control strategies.
- Support capacity building in risk management along value chains relevant to regional control strategies.
- Support the development of risk management and other responses to risk analysis associated with value chains.
- Mentoring of epidemiology units in data analysis and interpretation as required.

Activity 3.2 Animal surveillance programme

- Support national surveillance plan for live bird markets (LBMs).
- Support surveillance plan for LBMs linked to regional strategic objectives.
- Support linkages in passive surveillance from community level to formal animal health reporting systems.
- Training for differential diagnoses of poultry disease outbreak at RAHO and the Sub-Department of Animal Health (SDAH) including poultry post-mortem examination.
- Develop policy options for incentives to stimulate reporting of disease events and support advocacy for implementation.

Activity 3.3 Strengthening of veterinary laboratories diagnostic activities, including biosafety and quality assurance supported

- Support laboratory quality assurance through monitoring of performance and review of standard operating procedures (SOPs).
- Continue support for rapid and differential diagnosis at RAHO level including other zoonoses/high-impact diseases.
- Continue support for the full characterization of viruses isolated from outbreaks and LMB surveillance.
- Review the functions and role of the animal health laboratory system.
- Support the strategy for DAH to assume full technical responsibility for HPAI laboratory programme.

Activity 3.4 Veterinary Epidemiology Network capacity supported

- Continue to support the Applied Veterinary Epidemiology Training (AVET) programme. Three international experts will conduct an advanced epidemiology training on risk analysis and spatial

epidemiology in May 2013. Two FAO international experts will conduct an eight-day *One Health* wildlife-farm animals-human interphase workshop in May 2013, including two field visits.

- During the planned third alumni meeting in August 2013, define and develop a framework for the epidemiology network at the national level.
- Further support regional level epidemiology networks at “The 5th International Workshop on Influenza Risk Assessment and Risk Modeling: Transitioning from Global to Local Assessments” to be held in Hanoi in May 2013.
- Support the planned third AVET alumni meeting in September 2013. This is part of FAO’s continued support of AVET alumni meetings.

Activity 3.5 Further development of monitoring and evaluation (M&E) expertise in animal health

- Train managers at RAHO and SDAH on the M&E principles that guide project management.
- Support alignment of the overall Avian and Pandemic Influenza Initiative (APII) M&E framework to local strategic plans.
- Support managers at RAHO and SDAH in gathering and processing M&E data.

Output 4: Priority procurement for animal surveillance and laboratory supported

Activity 4.1 Procurement of essential supplies and maintenance of laboratory equipment

Activity 4.2 Procurement of consumables to support laboratory activities

Activity 4.3 Determine and support maintenance requirements for laboratories

Activity 4.4 Procurement of supplies to support field surveillance activities

Component 3: Animal response component

Output 5: Effective and timely animal response efforts promoted

Activity 5.1: HPAI risk mapping and risk analysis updated to support regional strategies

- Three international experts to conduct an advanced epidemiology training on risk analysis and spatial epidemiology in May 2013 to further enhanced analysis capacity building.
- Implementation underway for an international expert to conduct a study in the Mekong region to provide detailed characterization of high-risk value chains including network analysis.
- Poultry sector profiling to support the regional strategy.
- Applied risk analysis capacity building.
- Updating risk assessment and mapping.
- Detailed characterization of high-risk value chains including network analysis.

Activity 5.2: Outbreak control capacity strengthened under regional control strategy

- Assist partners to sensitize grassroots stakeholders to disease control activities.
- Review application of carcass disposal in outbreak control in local situations within strategic plans.
- Prepare and conduct desktop exercises with public health counterparts.

Activity 5.3 Conduct review of response capability in relation to scenarios developed under activity 1.2

Activity 5.4 Develop tailored compensation mechanisms to support control strategy

- Support the development of locally feasible and practical incentives including compensation mechanisms to support farmers reporting disease.
- Review outbreak control procedures to enable effective audits to support compensation packages.

Activity 5.5 Cross-border dialogue and coordinated surveillance

- Support bilateral meetings with both the Governments of China and Cambodia to exchange technical information, including surveillance and risk assessment findings, and risk reduction plans.
- Review cross border value chains of high-risk commodities.

- Develop plans to conduct coordinated cross-border surveillance.

Activity 5.6 Vaccine efficacy assessments and virus surveillance supported at the national level

- Provide support for post-vaccination serological monitoring
- Conduct vaccine trials against key circulating clades with a range of vaccines, species and breeds.
- Monitoring pathogenicity of selected virus isolates from outbreaks and LMB surveillance.

Activity 5.7 Institutional strengthening in poultry production and animal health advisory systems

- Institutional and core function analysis for poultry production and support service.
- Capacity needs assessment of key stakeholders.
- Develop the poultry sector advisory services model in collaboration with partners and the Extension Department.

Activity 5.8 Support engagement of private sector in the execution of regional control strategies

- Develop a poultry industry forum at the regional level to support the regional control plan.
- Work with other APII partners to engage key value chain stakeholders in regional control strategy.

Activity 5.9 Support DAH to conduct review of the current draft of the Veterinary Law

Activity 5.10 Support DAI to finalize guidelines to establish Veterinary Statutory Body, including structure, function and mechanism

Output 6: Biosecurity improved and market hygiene practices in commercial and free-ranging poultry raising settings supported

Activity 6.1 Support programme to strengthen safe poultry production practices including biosecurity

- Develop materials and methods with partners, including extension service to scale up hatchery pilot programme in support of regional control strategies.
- Facilitate the development of policy and advocacy brief to support practical measures to upgrade the production of day-old ducks.
- Support implementing partners with high-level training and advice on hatchery pilot programme.
- Collaborate with the Department of Livestock Production (DLP) to develop upstream standards for parent flocks supplying hatcheries conforming to guidelines and pilot test practical implementation at field level.
- Continue support for the development of poultry waste disposal systems.
- Develop materials and methods with partners, including extension service to scale up the good production practices in support of regional control strategies.

Activity 6.2 Support ongoing activity of the Biosecurity Working Group

- Support national and regional meetings of the Biosecurity Working Group.
- Support the dissemination of the Biosecurity Working Group findings by partners within the regional control strategy, including the extension service.

Activity 6.3 Provide policy support brief on the inactivation of H5N1 in relation to environmental conditions

- Investigate inactivation of H5N1 strains under simulated environmental conditions.
- Develop a policy brief related to the implications of virus survival in the environment.

Activity 6.4 Pilot training programme for private sector in various guidelines and Good Poultry Production Practices (GPPP) developed

Activity 6.5 Training of provincial staff from the District Department of Agriculture and Rural Development (DARD) in description and mapping of the local poultry sector

Activities undertaken during the reporting period (April 2013 to September 2013)

Component 1: Preparedness and Planning Component

Output 1: Strategy development for HPAI control

Activity 1.1: Viet Nam-Based Regional HPAI Control Strategy

- The Government of Viet Nam did not implement the FAO proposed Viet Nam-based regional strategy, so no advocacy strategy was developed for implementation in conjunction with PAHI.
- Joint planning of activities with other partners to ensure linkage to zonal cross border strategy: FAO participated in and contributed to table top exercises, simulations and workshops organized by the World Health Organization (WHO) and the United States Centers for Disease Control and Prevention (CDC) on Influenza in humans. These workshops were held in Hanoi and Ho Chi Minh City. FAO organized two regional bilateral meetings, Viet Nam-Cambodia and Viet Nam-China to develop a regional (cross-border) control strategy.
- No Viet Nam based regional control strategy was implemented so no review of progress and report to stakeholders.

Activity 1.2: Develop policy briefs for potential outcomes of the cessation of vaccination

- The assumption was based on stop vaccination, but is no longer valid. FAO will continue to support use of vaccination including phasing out over time as necessary. With regards to the use of vaccine in the low-, medium- and high-risk areas being incorporated into the national strategy, a technical evaluation deemed this activity unnecessary.

Activity 1.3 Training in the Viet Nam based regional control plan management and evaluation

- The Government of Viet Nam did not implement the FAO proposed Viet Nam based regional strategy, so no real-time training in regional control plan management was conducted.
- The Government of Viet Nam did not implement the FAO proposed Viet Nam based regional strategy, so real-time monitoring of progress of the control plan was not conducted.

Output 2: Coordination and communication with donors and other HPAI implementing partners

Activity 2.1 Core FAO Viet Nam team supported and manages project activities

- continued to ensure that all required staff is in place;
- conducted a series of briefings, meetings and e-mails with many HPAI implementing partners for coordination, including both USAID and non-USAID partners;
- bi-weekly written briefings provided to USAID on HPAI activities;
- regular coordination meetings between USAID and FAO on a bi- or tri-weekly basis;
- meetings between FAO and DAH (usually the Director-General) on a bi-weekly basis for coordination purposes;
- semi-annual progress report for the period April-September 2013 has been prepared;
- released the first quarterly E-Newsletter and widely distributed to donors, implementing partners, Emergency Centre for Transboundary Animal Diseases (ECTAD) members list, and others in the *One Health* contact list. The E-Newsletter was also uploaded on the FAO Viet Nam website:

Activity 2.2 Annual project meeting supported

- The ECTAD Viet Nam team coordination meeting was held on 18 April 2013 to share information and update the project activities, both in technical and operational fields. All project staff, including those based at DLP and DAH, also took part in the meeting.
- The ECTAD Viet Nam team meeting was held on 16 July 2013 to share information and to update the project activities, both in technical and operational fields. All project staff took part in the meeting.
- Internal brainstorming/planning meeting was held on the next phase of the

OSRO/RAS/604/USA project on 30 July 2013. Preparation for the next phase of the OSRO/RAS/604/USA project was undertaken. The first draft for the next phase of the OSRO/RAS/604/USA project has been finalized and submitted to USAID and FAO's Regional Office for Asia and the Pacific (RAP) for comments.

Activity 2.3 Coordination meetings to support regional HPAI control strategy implementation

- Project staff attended and updated the FAO-USAID-CDC-WHO influenza meeting on H5N1 and on influenza A(H7N9) in Bangkok.
- FAO applied with partners in the South-East Asia One Health University Network (SEAOHUN) for additional funding to conduct additional "WILD" training, conduct a communication workshop and to research the relationship between *Streptococcus Suis* and porcine reproductive and respiratory syndrome (PRRS) in pigs. SEAOHUN is part of the USAID Emerging Pandemic Threats (EPT) RESPOND programme.
- Project staff participated in the USAID partners meeting on 17 May 2013.
- Project staff attended a PAHI meeting on 31 May 2013.
- FAO supported DAH in the organization of a National Consultation Workshop on the finalization of a circular on reporting avian influenza and updates on influenza A(H7N9) prevention, surveillance and response. The workshop was held in Hanoi from 13 to 14 June 2013. The consultation workshop was a final step of the circular development process before submitting to the Minister of Agriculture and Rural Development for approval.
- FAO provided inputs on economic impact of emerging infectious diseases (EIDs) for PAHI's study.
- FAO supported DAH in organizing a consultation workshop for replacement of the Circular 69/2005/TT-BNN on HPAI prevention and control:
 - Letter of agreement (LoA) on "Organizing consultation workshops for a new Circular to replace Circular 69/2005/TT-BNN on prevention and control of HPAI" was signed with the Department of Animal Health in June 2013.
 - The National Consultation Workshop for the replacement of Circular 69/2005/TT_BNN on prevention and control of HPAI was held on 5 July 2013 in Hanoi and 10 July 2013 in Ho Chi Minh City, in collaboration with the DAH.
- Project staff participated in the USAID planning meeting on 6 August 2013.
- Separate meetings with the DAH and DLP were held to discuss areas of focus and activities as preparation for the next phase of the OSRO/RAS/604/USA project.

Activity 2.4: Coordination and sharing of information with other players engaged in HPAI surveillance, risk assessment and value chain and risk mitigation in poultry sector

- Project staff participated in the workshop on the introduction of Joint Circular No16/2013/TTLT-BYT-BNN and PTNT on Guidelines for coordinated prevention and control of zoonotic diseases held by the Ministry of Agriculture and Rural Development (MARD) and Ministry of Health (MOH) on 27 June 2013 in Hanoi.
- Project staff participated in the FAO-USAID Avian Influenza Annual Review meeting in Bangkok on 26 June 2013.
- Project staff participated in the EPT Asia Regional Meeting from 18 to 19 June 2013.
- Project staff participated in the Tripartite IDENTIFY Regional Meeting, Asia held in Bangkok on 20 June 2013.
- Project staff participated in the Applied Veterinary Bioinformatics Workshop in Bangkok from 26 June to 1 July 2013.
- FAO attended in the workshop "Enhancing Coordination on Emerging Infectious Diseases in Viet Nam: Building on the Avian Influenza Response for a *One Health* approach" organized by PAHI. The objectives of the workshop were to: 1) present the key findings from the draft report on Enhancing Coordination on Emerging Infectious Diseases in Viet Nam and discuss the report's recommendations and proposed options for enhanced EID coordination; and 2) present

and discuss the preliminary findings on the mapping exercise for *One Health* mainstreaming and linkages to the Integrated National Action Program on Avian Influenza, Pandemic Preparedness and Other Emerging Infectious Diseases (AIPED) 2011-2015.

- Senior Technical Adviser travelled to China from 7 to 10 August 2013 to participate in and deliver two presentations on the application of *One Health* approaches.
- Project staff undertook discussions with EPT Prevent regarding collaboration on conducting wildlife farming baseline survey and questionnaire to determine risks to public health associated with wildlife farming.
- FAO provided financial support to DAH for publishing the book "Animal Health Sector Strategy" which was released in September 2013 (170 copies).

Component 2: Animal surveillance component

Output 3: Animal surveillance at the national, regional/zonal, provincial, district and commune level enhanced

Activity 3.1 Strengthening of core capacities for animal disease control and disease control planning within regional control strategies

- Support capacity building to develop work plans to implement regional control strategies:
 - On-the-job training was conducted for RAHO staff on risk mitigation strategy development. Two RAHOs regional work plans have been developed; however the Government of Viet Nam did not implement the FAO-proposed, Viet Nam based regional strategy so no regional activities were carried out.
- Support capacity building in risk management along value chains relevant to regional control strategies:
 - The advanced epidemiological skills training workshop for animal health professionals from Viet Nam was held in Hanoi from 20 to 24 May 2013 with a total of 13 participants (male: 8, female: 5). One of the subjects taught was "qualitative risk assessment".
 - The 5th international Workshop "Influenza Risk Assessment and Risk Modeling: Transitioning from Global to Local Assessments" was held in Hanoi on 27 and 28 May 2013 with a total of 53 participants (male: 34, female: 19).
- Mentoring of epidemiology units in data analysis and interpretation as required:
 - The epidemiology units at DAH, RAHO III and RAHO VI were visited and assessed. Mentoring was not required.

Activity 3.2 Animal surveillance programme

- Support national surveillance plan for LMBs:
 - An LoA on "Implementation of Avian Influenza Monitoring National Programme in 2013" was signed with the DAH in June 2013. This is an extension of the LBM monitoring programme up to 30 September 2013.
 - Nationwide LMB H5N1 monitoring of ducks in 140 markets continued monthly. Monthly Influenza-A surveillance of ducks in LMBs in 140 locations continued. As this successful surveillance project is likely to continue in 2014, planning and procurement of laboratory consumables have been initiated.
- Support surveillance plan for LMBs linked to regional strategic objectives:
 - FAO ECTAD worked with the DAH to develop a surveillance strategy to detect influenza A(H7N9) virus in the north of Viet Nam. An LoA was signed with the DAH to start collecting diagnostic samples from poultry in 60 markets in nine northern provinces in June and July 2013.
 - A protocol was developed to evaluate the AnigenR Rapid AIV Ag test. This has been recommended by international experts and was added in the OSRO/RAS/604/USA project document to be conducted in 2013. Four hundred AnigenR Rapid AIV Ag tests have been procured and laboratory and field trials started in August 2013.
 - International partners have been briefed on the China influenza A(H7N9) situation at several meetings during the reporting period:

- FAO ECTAD participated in the Workshop on Implementing Guidelines of the Viet Nam Prime Minister on influenza A(H7N9) Control and Prevention held in Hanoi on 13 April 2013. The Senior Technical Adviser at FAO Viet Nam was asked to provide information about influenza A(H7N9) and emphasized the challenge before the Government to prepare for, detect and respond to a novel A(H7N9) virus that poses risks to people, livelihoods, food security, economies, and biodiversity.
- FAO ECTAD Viet Nam co-chaired the Briefing on the International Influenza A(H7N9) Disease Situation and Viet Nam's Prevention, Control and Preparedness Activities and Resource Mobilization Workshop with the MOH, MARD, and WHO on 6 May 2013. FAO released a joint statement with MARD, MOH and WHO on influenza A(H7N9) preparedness demonstrating a *One Health* message among sectors.
 - o FAO ECTAD and DAH released a joint statement on influenza A(H7N9).
 - o More than 500 archived Influenza-A positive samples collected during the last six months from poultry were tested for H7, and all samples were negative for H7.
- Support linkages in passive surveillance from community level to formal animal health reporting systems:
 - o Initially, DAH refused to consider handheld recording devices as part of an integrated animal health disease data-base, but after further consideration FAO has now been given permission to pilot such system. FAO hired two consultants and purchased a computer server, but contracts with the software developing university and international consultant were not signed. For the coming year DAH is considering a system developed by Defense Threat Reduction Agency (DTRA) of the United States Department of Defense (DOD).
- Training for differential diagnosis of poultry disease outbreak at RAHO and SDAH including poultry post-mortem examination:
 - o Talking to stakeholders and analysing information and data collected during field visits in Region 3 and Region 7 showed that poultry disease investigations are conducted satisfactorily. Currently, there is no urgent need to conduct training for differential diagnosis of poultry disease outbreak at RAHOs and SDAHs including poultry post-mortem examination.
- Develop policy options for incentives to stimulate reporting of disease events and support advocacy for implementation:
 - o Twice previously, the animal disease surveillance system was reviewed. Recommendations were noted. It was not necessary to develop policies to improve passive surveillance.

Activity 3.3 Strengthening of veterinary laboratories diagnostic activities, including biosafety and quality assurance supported

- Supporting laboratory quality assurance through monitoring of performance and SOP review:
 - o SOPs were established for laboratory detection by real-time polymerase chain reaction (PCR) of influenza A subtype H7 in general and also the specific strain of H7N9 that caused human mortality in China. The testing algorithm was also finalized.
 - o At RAHO2, 157 influenza A virus positive RNA samples collected since July 2012 were tested for H7, and all were found to be negative.
 - o In the emergency surveillance of H7N9, 1740 pooled chicken swab samples were tested for influenza A and H7. The results showed high prevalence (31 percent) of influenza A virus among chickens, but no positives for H7.
- Continue support for rapid and differential diagnosis at RAHO level including other zoonoses/high-impact diseases:
 - o Training on laboratory diagnosis of H7N9 was carried out for all RAHOs on 21 June 2013 in Ho Chi Minh City with a total of 37 participants (male: 20, female: 17).
 - o Primers and probes for detecting avian influenza A virus and for subtyping H7 and N9 were distributed to laboratories (RAHOs 1-7, National Institute of Veterinary Research, Central Viet Nam Veterinary Institute in Nha Trang city, Ho Chi Minh SDAH).
- Continue support for the full characterization of viruses isolated from outbreaks and LMB surveillance:

- 120 influenza A viruses were isolated from 500 influenza A PCR-positive samples by the end of May. Full genome sequencing was carried out with 43 of those isolated viruses. HA clade of those sequenced viruses were 2.3.2.1.A (1 isolate), 2.3.2.1.C (29 isolates), 1.1 lineage 5 (4 isolates), and 1.1 lineage 6 (9 isolates). Re-assortment of H5N1 viruses were found. All 9 isolates of clade 1.1 lineage 6 were reassortants having all internal genes from clade 2.3.2.1.C virus. One isolate of clade 2.3.2.1.C was also a reassortant having genes of M, NP, PA, and PB2 from clade 2.3.2.1.A.
- Review the functions and role of the animal health laboratory system:
 - Discussions are ongoing by e-mail, and they will be further discussed and finalized in October 2013 during 12th Epi-Lab network meeting.
- Support strategy for DAH to assume full technical responsibility for HPAI laboratory programme:
 - This will be discussed at 12th Epi-Lab network meeting in October 2013.

Activity 3.4 Veterinary Epidemiology Network capacity supported

- An LoA on Organization of Advanced Applied Veterinary Epidemiology Training and related workshop has been signed with DAH in April 2013.
- The advanced epidemiological skills training workshop for animal health professionals from Viet Nam was held in Hanoi from 20 to 24 May 2013 with a total of 13 participants (male: 8, female: 5). Participants were from RAHOs, National Centre for Veterinary Diagnostics, National Institute of Animal Health, Hanoi University of Agriculture and DAH.
- The Wildlife Investigation in Livestock Disease and Public Health: An Introductory Training course in *One Health* was implemented from 3 to 10 May 2013 with total 30 participants (male: 24, female: 6) representing human health, animal health and wildlife/ecology sectors. The course included lectures, problem-based learning exercises and field site visits.
- The 3rd AVET Alumni Conference and the 1st Epidemiology One Health Network Forum was held on 12 and 13 September 2013 in Ho Chi Minh city with total 184 participants (male: 128, female: 56). The main objectives of the meeting were:
 - strengthening the network of professionals involved in applied veterinary epidemiology;
 - sharing scientific knowledge and field experience in human health, ecology and animal health in Viet Nam;
 - providing a dedicated platform for AVET, Field Epidemiology Training Program (FETP) and Field Epidemiology Training Program for Veterinarians (FETPV) fellows to present their work; and
 - providing a platform to bring all *One Health* stakeholders together, to network, liaise and collaborate.
- The 5th International Workshop "Influenza Risk Assessment and Risk Modeling: Transitioning from Global to Local Assessments" was held in Hanoi on 27 and 28 May 2013 with a total of 53 participants (male: 34, female: 19). The workshop was coordinated by FAO, US National Institutes of Health and the University of Oklahoma. This workshop brought together more than 50 multi-disciplinary international experts, national government representatives and experts, technical staff and other partners to explore disease risk factors at the local level. The workshop helped determine how influenza risk assessment and modelling should best be used to benefit national priority-setting for the prevention, response and control of HPAI.
- A field trip on Influenza Risk Assessment and Risk Modeling funded by the University of Oklahoma was carried out in Cat Ba Island (Hai Phong province), and slaughter houses and LMB in Quang Ninh province during 29-31 May 2013.

Activity 3.5 Further development of M&E expertise in animal health

- Submitted the performance management plan (PMP) data for the period from 1 October 2009 to 30 September 2012 to USAID.
- Worked with the Monitoring and Evaluation Manager from Abt on 22 and 23 April 2013 to review the implementation of the USAID Viet Nam Avian and Pandemic Influenza Performance Management Plan.

Output 4: Priority procurement for animal surveillance and laboratory supported

Activity 4.2 Procurement of consumables to support laboratory activities

- Primers and probe for H7N9 testing were distributed to 7 RAHOs, the National Institute of Veterinary Research, and the Central Viet Nam Veterinary Institute.

Component 3: Animal response component

Output 5: Effective and timely animal response efforts promoted

Activity 5.1: HPAI risk mapping and risk analysis updated to support regional strategies

- Poultry sector profiling to support the regional strategy:
 - Mapping key LMBs in Region 6 and Region 7 has been completed.
 - Mapping hatcheries in Region 6 and Region 7 has been completed.
 - Mapping LMBs in 15 northern provinces has been completed.
- Applied risk analysis capacity building:
 - Three international experts conducted an advanced epidemiology training on risk analysis and spatial epidemiology in May 2013 to further enhance analysis capacity building.
 - Conducted on-the-job training for SDAHs and DARD staff in the 15 northern provinces on risk analysis.
- Updating risk assessment and mapping:
 - Conducted risk assessment on layers production and spent hen trading in the northern provinces.
 - Reports on risk assessment and risk maps were developed as requested.
- Detailed characterization of high-risk value chains including network analysis:
 - An international consultant was hired to conduct characterization of high-risk value chains including network analysis. The work is still continuing.
 - Spent hen value chains in the northern provinces have been developed. The high-risk nodes of each value chain were identified and characterized.
 - Layer production practices and spent hen trading practices of key stakeholders were described.
 - Market network in the northern provinces was developed and its analysis is ongoing.
 - Key spent hen trade routes in the northern provinces were identified.

Activity 5.2: Outbreak control capacity strengthened under regional control strategy

- Assist partners to sensitize grassroots stakeholders to disease control activities:
 - This was deemed unnecessary.
- Review application of carcass disposal in outbreak control in local situations within strategic plans:
 - This was deemed unnecessary.
- Prepare and conduct desktop exercises with public health counterparts:
 - FAO provided technical input and attended one WHO table top simulation exercise and one CDC simulation in Influenza in humans

Activity 5.4 Develop tailored compensation mechanisms to support control strategy

- Support the development of locally feasible and practical compensation mechanisms to support farmers reporting disease:
 - DAH did not develop new tailored compensation mechanisms and FAO agrees that this was necessary in 2013.
- Review outbreak control procedures to enable effective audits to support compensation packages:
 - SOPs on outbreak control procedures were studied and technically cleared. The Government has not officially approved nor directed these SOPs to be used in the field. No field assessment was carried out owing to staff shortages.

Activity 5.5 Cross-border dialogue and coordinated surveillance

- The Viet Nam and China Bilateral Meeting on Collaboration to Address Transboundary Animal Diseases and Diseases of Public Health Concern was held from 22 to 24 August 2013 in Ha Long

city, Quang Ninh province with a total of 53 participants (male: 40, female: 13). A draft resolution is being prepared.

- Spent hen value chain analysis:
 - Technical consultation meetings were conducted with VAHIP, Abt, DAH, DLP to consult stakeholders on the LMB survey and spent hen value chain analysis in July 2013.
 - A field trip to Bac Giang province was conducted from 7 to 10 August 2013 and Nam Dinh province from 13 to 15 August 2013. The following tasks during the field trips have been completed: (i) focus group discussion with layer chicken farmers conducted to collect information on layer production systems; (ii) one-day consultation meeting held in Bac Giang on 9 August 2013 with a total of 22 participants and in Nam Dinh province in 15 August 2013 with a total of 46 participants. The participants came from provincial SDAH, DARD, District Veterinary Stations' staff, layer chicken farmers, poultry traders and transporters, poultry slaughterers and market management board members. The meetings' objectives were to: describe layer chicken production systems and spent hen value chains in Viet Nam; describe the unofficial movement and value chains of imported spent hens; and identify overlap between the two value chains; (iii) held a meeting with Government staff of the quarantine station and observed uncertified spent hens which were caught and kept at this station during the time of the visit; and (iv) interviewed poultry traders/transporters, poultry slaughterers and LMB managers.
 - A field trip to Bac Thang Long LMB was conducted on 11 and 12 August 2013 to interview poultry traders at the wholesale market.
 - A field trip to Ha Vy LMB was conducted on 17 and 18 August 2013 to interview poultry traders.
 - A meeting was held with TNS, a marketing research company, to discuss a potential contract to conduct LMB surveys.
 - A technical workshop to map and rank LMBs and to develop a value chain analysis of spent hens in northern Viet Nam was held on 19 and 20 August 2013 in Hanoi with a total of 54 participants (male: 37, female: 17).
 - A survey in Ha Vy LMB was conducted to collect information on spent hen value chains from poultry traders, transporters and market managers.
 - A field trip to Vinh Phuc province was undertaken to hold discussions with JAPFA, one of the biggest poultry production companies, on the collection of information on spent hen value chains and opportunities for strengthening public private partnership in poultry sub-sector.
 - A draft report on spent hen value chains has been prepared.
 - The result on ranking the largest LMBs in 15 northern provinces has been double checked with the AVET alumni participants.
 - The 12 biggest LMBs were selected for mapping in each province of the 15 provinces of northern Viet Nam. The links between LMBs in each province were also mapped. As a result, 180 LMBs in 15 northern provinces were mapped.
 - Mapping the 45 biggest LMBs in the northern region of Viet Nam and the main spent hen trade roads from China across Viet Nam's northern provinces.
 - Questionnaires for LMB survey have been designed. All comments from the stakeholders on the questionnaires were incorporated and the second draft of the questionnaires has been revised.
 - Pre-test live bird survey in one market in Nam Dinh city was conducted.
 - LMB survey questionnaires and methodology have been finalized.
- Develop plans to conduct coordinated cross-border surveillance:
 - At the bilateral Viet Nam-Cambodia meeting a coordinated cross-border surveillance strategy was proposed. Since July 2013, environmental samples from 4 LBMs have been collected. Results will be compared with findings from Cambodia. Environmental sampling will continue till at least April 2014.

Activity 5.6 Vaccine efficacy assessments and virus surveillance supported at the national level

- An H5N1 challenge experiment of chickens vaccinated with Re-6 and Re-5 was carried out at National Center for Veterinary Diagnostics.
- Support for H5N1 vaccine efficacy test in quail was requested by DAH upon the emergence of H5N1 in quails, and an LoA was signed. Vaccination of quails with Re5 and Re6 was carried out in September 2013, and the challenge experiment will be carried out in October 2013.

Activity 5.7 Institutional strengthening in poultry production and animal health advisory systems

- Capacity needs assessment of key stakeholders:
 - A consultation was held with JAPFA on their need to strengthen poultry production and capacity building for poultry farmers on biosecurity.
 - A consultation was held with the National Agricultural Extension Centre on their need to strengthen capacity on hatchery biosecurity training.
- Develop the poultry sector advisory services model in collaboration with partners and the Extension Department:
 - Cooperated with the extension system to extend hatchery biosecurity strengthening programme in the southern provinces.

Output 6: Biosecurity improved and market hygiene practices in commercial and free-ranging poultry raising settings supported

Activity 6.1 Support programme to strengthen safe poultry production practices including biosecurity

- Develop materials and methods with partners including extension service to scale up hatchery pilot programme in support of regional control strategies:
 - Hatchery mapping for provinces in Region 6 and 7 have been completed.
 - Draft concept notes on biosecurity standards for parent breeding farms and on parent breeding farm auditing system have been developed.
 - Draft training manuals on biosecurity for parent breeding farms and on parent flock breeding farm auditing have been developed.
 - Contract on "Video documentation of identified hatchery biosecurity and hygiene best practices with lessons learned in Quang Tri and Can Tho province" was signed with the Song Ngu Advertisement Company Ltd. in June 2013.
 - The concept note for a hatchery film was finalized by incorporating comments from additional stakeholders. Consultations held with the DLP and the National Agricultural Extension Centre on film script for hatchery biosecurity and hygiene best practices. All comments from Vietnamese partners were consolidated. The 2nd draft of the film script has been developed.
 - Field trips in Can Tho city were conducted on 19 and 20 July 2013 and in Quang Tri province on 29 and 30 July 2013 for the preparation of the film production on hatchery biosecurity and hygiene best practices.
 - Project staff attended the Forum of Extension and Agriculture on the topic of "Biosecurity for waterfowl husbandry development" on 18 July 2013 in An Giang province. Hatchery technical guidelines and duck waste management guidelines were incorporated into the workshop proceedings and distributed to the workshop participants.
- Facilitate development of policy and advocacy brief to support practical measures to upgrade the production of day-old ducks:
 - Legislation on Hatchery biosecurity minimum standards was approved by MARD on 10 May 2013.
- Support implementing partners with high-level training and advice on hatchery pilot programme:
 - Training materials on poultry parent breeding farm biosecurity have been developed and tested including training session plan, key messages, training handouts, presentations, pre and post tests. Training on Poultry parent breeding farm biosecurity was held in Can Tho on 26 and 27 June 2013 with a total of 23 participants (male: 14, female: 9). Participants came from Can Tho, An Giang, Long An and Vinh Long SDAH, District Veterinary Stations (Thoi Lai, Vinh Thanh, Co Do, Thot Not district), Long An and Vinh Long DARD, and

- breeding farm owners.
 - Training materials on poultry parent breeding farm auditing have been developed and tested. Training on poultry parent breeding farm auditing was held in Can Tho on 28 and 29 June 2013 with a total of 14 participants (male: 8, female: 6). The participants came from Can Tho, Long An, An Giang, Vinh Long SDAH, District Veterinary Stations staff (Thoi Lai, Vinh Thanh, Co Do, Thot Not district), Long An and Vinh Long DARD.
- Collaborate with DLP to develop upstream standards for parent flocks supplying hatcheries conforming to guidelines and pilot test practical implementation at field level:
 - A mission by the Biosecurity International consultant was undertaken from 15 June to 3 July 2013 on biosecurity standards and auditing system for poultry parent flock breeding farms in Viet Nam.
 - The technical consultation workshops on draft biosecurity minimum standards for poultry parent flocks was held in Hanoi on 19 June 2013 with a total of 28 participants (male: 18, female: 10).
 - The technical consultation workshop on the auditing system for poultry parent flocks was held in Hanoi on 20 June 2013 with a total of 28 participants (male: 18, female: 10).
 - The survey on biosecurity levels of duck parent breeding farms and farmers' knowledge of biosecurity was conducted in Thot Not district, Can Tho city on 24 June 2013.
 - The consultation meeting on biosecurity minimum standards for breeding farms was held in Thot Not district, Can Tho city on 24 June 2013; 22 breeding farms owners (male: 14, female: 8) attended the meeting.
 - The consultation meeting on biosecurity minimum standards was held in Can Tho city on 25 June 2013 with a total of 21 participants from provincial DARD, SDAH (Can Tho, Long An, An Giang and Vinh Long provinces) and Can Tho District Veterinary Stations (male: 11, female: 10).
 - A set of criteria for selection of duck parent breeding farm models was developed. Two duck parent breeding farms were selected in Thot Not and Co Do districts, Can Tho city.
 - Two action plans to develop duck parent breeding farm models have been developed in consultation with the farm owners.
 - The first draft of the LoA with DLP on the parent flock programme has been prepared.
 - A consultation was held with the key stakeholders to select a suitable water treatment system for parent flock models in Quang Tri province and Can Tho city.
- Continue support for development of poultry waste disposal systems:
 - Poultry waste management guidelines were finalized in June 2013. DLP will integrate the poultry waste management guidelines with the DLP waste management project to issue legislation on waste management.
- Develop materials and methods with partners including extension service to scale up the good production practices in support of regional control strategies:
 - Involvement of National Agricultural Extension Center in development of training material on good poultry production practices and the hatchery biosecurity film script.

Activity 6.2 Support ongoing activity of the Biosecurity working group

- Support national and regional meetings of the Biosecurity working group:
 - Preparing for the first meeting of wildlife farming sub-group.
 - A meeting with Mr. Ha Cong Tuan, Vice-minister of MARD, on wildlife farming issues and the role of biosecurity working group in strengthening wildlife farming was held on 31 May 2013.
 - The wildlife farming subgroup under Biosecurity Working Group (BSWG) was established.
 - The first meeting of the wildlife farming sub-group of the BSWG was held in Hanoi on 11 June 2013 with a total of 36 participants (male: 25, female: 11).
- Technical guidelines and training materials have been widely distributed to DARDs, SDAHs, Agricultural Extension Centers at national and provincial levels.

Activity 6.3 Provide policy support brief on the inactivation of H5N1 under environmental conditions

- Investigate inactivation of H5N1 strains under simulated environmental conditions:
 - Heat stability trials were conducted in September 2013.

Activity 6.5 Training of provincial DARD staff in description and mapping of local poultry sector

- Training on mapping LBMs and hatcheries for provincial and district staff has been completed.

Activities proposed for the next reporting period (October 2013 to March 2014)

Component 1: Coordination, Communication and Advocacy

Output 1: Coordination, Communication, and Advocacy Enhanced

Activity 1.1 Support core FAO Viet Nam Team

Activity 1.2 Organize monthly coordination meetings and periodic larger stakeholder (province, RAHO, district) workshops:

- Continue implementation of HPAI control strategy: biosecurity, vaccines, surveillance, outbreak response management, movement control, quarantine, market closures, differential dx, etc. (monthly).
- Identify priorities for sustainability and sustainability mechanisms (funding and technical) workshop (late October-November) with follow-up workshops as needed to facilitate transitions, national hand-over and sustainability of the HPAI programme (as needed with programme closing workshop in August 2014).
- HPAI lessons learned and programme results dissemination workshops (March-May 2014).

Activity 1.3 Develop Communication, Outreach and Legacy Materials

- Prepare and Produce two films on poultry biosecurity and hatchery improvement.
- Prepare a Legacy Document "HPAI Lessons Learned in Viet Nam over the past 7 Years".
- Develop six succinct fact sheets for Viet Nam HPAI Influenza Lessons Learned in the areas of on capacity development, surveillance, diagnostics, biosecurity, benefits of improved livestock production, and outbreak response.
- Produce the 604 monthly updates for USAID, FAO ECTAD Viet Nam quarterly newsletter, and ECTAD Viet Nam brochure (Linked to Activity 1.4).

Activity 1.4 Support and develop expertise in M&E as it relates to animal health

- Internal mapping, monitoring and monthly dissemination of avian influenza activities and preparation of progress and financial monitoring reports.
- Develop training course on M&E framework (DAH benefits) for managers at RAHO and SDAH to aid them in gathering and processing M&E data (supporting and benefiting DAH).
- Support alignment of overall national M&E framework with strategic plans (AIPED book M&E aligned with DAH, RAHO and Laboratory M&E).
- Support Performance Management Plan including data collection and analyses.
- Assist DAH in developing an M&E plan based on specific activities envisioned by the signing of Circular 16 and the soon to be signed circular for animal disease reporting.

Component 2: Animal Surveillance and Laboratory Strengthening

Output 2: Animal Surveillance at National, Provincial, District and Commune Levels Enhanced

Activity 2.1 Implement Animal Surveillance programme

- Support national animal disease surveillance (poultry, swine and other relevant species) including linkage and synergies with human surveillance and other influenza programmes including EPT+.
- Support passive surveillance including provincial level advocacy for reporting events, incentives to

stimulate provincial reporting, and use of a smart phone animal disease reporting application linked to the animal disease.

- Conduct a national surveillance efficacy review and develop recommendations for sustaining surveillance upon completion of the 604 programme, including a results dissemination workshop.

Activity 2.2 Strengthen core capacity for animal disease information collection and management

- Support the development and piloting of an animal disease information system including step-wise implementation of a linked laboratory data management system and smart phone animal disease reporting application.
- Develop on-line instructions and training materials for the use of the animal disease information system, linked laboratory data management system, and smart phone animal disease reporting application.
- Conduct surveillance information system trainings for SDAH, RAHO, and laboratory staff.

Activity 2.3 Strengthen core capacities for animal disease response and disease control planning

- Develop a live animal market disease control strategy and intervention options including a Closure Contingency Plan based on risk analysis associated with value chains into and out of LBMs.
- Prepare and conduct desktop exercises with public health counterparts simulating live animal market closures and other management actions considering cross border elements.

Activity 2.4 Strengthen influenza risk assessment and modelling to identify the most important risk factors for management in Viet Nam

- Improve the geocuration and date-curation of the 451 public Viet Nam virus sequences.
- Run an analysis of evolutionary rate and spatial evolutionary dynamics at the national level in Viet Nam.
- Link the analysis of virus evolution to the risk factor analysis, niche maps, and collated historical vaccination data.

Activity 2.5 Support the Veterinary Epidemiology Network capacity

- Conduct a national epidemiology needs assessment and strategy for short and medium term epidemiology training programmes.
- Implement additional advanced AVET trainings including WILD (*One Health* short course), advanced epidemiology and statistical analyses, risk assessment and modelling, and mentoring of RAHO epidemiology units in data analysis and interpretation of their provincial or RAHO data.
- Refine the national level framework for the epidemiology network including linkages to LabNet and development of a national epidemiology sustainability strategy.
- Support national and international cross-border level epidemiology (and laboratory) networking including 4-way linking with health counterparts (linked to Activity 4.1).

Activity 2.6 Strengthen veterinary laboratory diagnostic capacities

- Support laboratory biosafety and quality assurance through performance and SOPs.
- Expand and broaden RAHO diagnostic capacity for the diagnosis of animal diseases and zoonoses.
- Conduct full characterisation of viruses isolated from animal samples.
- Promote national and international laboratory networking in support of information sharing and sustainable development.
- Support a strategy for DAH to assume full technical responsibility for the laboratory programme by reviewing the functions and role of the animal health laboratory system.
- Support operational research on HPAI influenza control (vaccine efficacy trials, etc.).

Activity 2.7 Evaluate vaccination strategies and efficacy nationally to include Viet Nam border countries

- Support monitoring the efficacy of vaccines currently in use against H5 viruses circulating at the time.

- Support the development of new immunization strategies for the Mekong Delta including an ecozone vaccination workshop.
- Implement a cross-border duck vaccine trial in the Mekong Delta (linked to Activity 4.1).

Component 3: Animal Disease Prevention and Preparedness

Output 3: Animal Production and Biosecurity Improved to Prevent Disease Incursion

Activity 3.1 Support programmes to strengthen safe animal production practices including biosecurity

- Develop minimum biosecurity standards, technical guidelines, and certification advice for (i) parent flocks supplying hatcheries; (ii) poultry waste management; (iii) boar farms (artificial insemination stations, small-/medium-scale breeding farms, and fattening farms including guidance on the boar program; and (iv) select types of wildlife farms.
- Conduct a sector-wide Biosecurity legislation and standards review.
- Develop a Draft Circular addressing the management of poultry waste, hatcheries and parent flocks.
- Develop training materials for SDAH, DARD staff, extension services, university staff and students on minimum biosecurity standards, technical guidelines, and certification advice for poultry, pig and select wildlife species.
- Conduct master trainings on minimum biosecurity standards, technical guidelines, and certification advice for poultry, pig and select wildlife species.
- Develop poultry profile and mapping of local poultry sector.

Activity 3.2 Support ongoing activities of the Biosecurity Working Group (BSWG) including the sub-group on wildlife farming

- Support national and regional meetings of the BSWG and the sub-group on wildlife farming.
- Review and update the terms of reference of the BSWG.
- Liaise with the United Nations Development Programme One Health Coordination Unit, the Vietnam One Health University Network, PAHI, and other multi-disciplinary programmes to facilitate the dissemination of BSWG information with partners.
- Support capacity building for BSWG members (linked to Activity 3.1).

Component 4: Improved Networks to Address Animal Diseases Within Viet Nam and along its Borders

Output 4: Cross Border Ecozone Approach Implemented to Improve Disease Prevention and Control

Activity 4.1 Cross-border collaborative activities defined and promoted

- Support bilateral meetings with the Governments of China, Cambodia and Lao PDR to exchange technical information, including surveillance and risk assessment findings, and risk reduction plans.
- Develop plans and conduct coordinated cross border surveillance, diagnostics value chain studies and risk mitigation.
- Review cross border value chains of high risk commodities (within country and across borders).
- Determine management interventions to minimise disease transmission across borders and support risk reduction.
- China meeting outcomes: (i) future meetings to engage public health, quarantine authorities and social sciences; and (ii) facilitate management committee finalization of joint projects for the Viet Nam southern China epizone, considering:
 - a) real-time information exchange mechanisms;
 - b) corridor approach for poultry and poultry products; and
 - c) safe pathways for movement of species susceptible to foot-and-mouth disease.

Activity 4.2 Public-Private Partnership Strategy Developed for Animal Sectors

- Conduct advocacy workshop(s) on benefits of public-private partnerships.
- Conduct stakeholder workshop to identify interests, capacity needs, benefits, communication forum, etc.
- Capacity building for farmers and the private sector based on needs assessment.
- Establish a sustainable traceability system and improved supply management along the poultry value chain as an example of public-private partnerships and as a model for other provinces and cities in Viet Nam.
- Value chain and network analyses to support interventions and disease management decisions.

Main challenges encountered and response provided

- The approval of the Government of Viet Nam on the Project Document by FAO and USAID for the project extension (October 2013–September 2014) is still in process. Many activities, which the counterpart Government agency had primary responsibility for implementing, could not be initiated, owing to this delay in project approval.
- In the country context, the Viet Nam-based regional approach to HPAI control is a new concept. The Government administrative structure does not provide for a regional mechanism among the national and provincial authorities in Viet Nam and so the Government did not implement the FAO-proposed regional strategy. Therefore, no Viet Nam based regional activities were carried out from a provincial perspective. However, FAO has made the argument that cross-border activities (south China-north Viet Nam and south Viet Nam-Cambodia) are regional approaches supported by epizones or ecozones in which viruses differ. This seems supported and acceptable as a way of thinking about regional approaches which can also be applied within Viet Nam.

Main progress made towards the achievement of project outcomes (from the start of the project)**Output 1: Strategy development for HPAI control in 2006–2010 supported**

- Consideration of a Viet Nam based regional approach to HPAI control, rather than a provincial one, was promoted and is attracting interest as featured in the Green Book Review and several documents from the International Ministerial Conference on Avian and Pandemic Influenza (IMCAPI). The final drafts of the regional HPAI control plans for the north-central region (Region 3) and the Mekong Delta region (Region 7+) have been completed.
- A regional/zonal approach has been incorporated into the National Operational Plan on Avian Influenza Control and Prevention (2013–2017).
- A Livestock Emergency Preparedness Plan was developed and submitted to DAH for use in any unusual event in the livestock sector, keeping in view the state of unpreparedness that the Government experienced during the 2003–2004 emergence of HPAI.
- Provincial poultry subsector profiling was effective in describing provincial poultry populations (including the Poultry Atlas), and DLP is considering adopting such an approach more widely.
- Risk assessment and risk-based targeting of control measures are increasingly being included in technical and policy development (however still largely restricted to the control of HPAI). This approach is now expanded and was translated into an HPAI regional control plan particularly for two regions in Viet Nam.
- A guideline for the application of the progressive control pathway approach had been finalized.

Output 2: Coordination and communication with donors and other HPAI implementing partners

- Programme management, planning and coordination of activities with USAID and other partners were maintained. FAO made 11 major recommendations for the Green Book Review, which were well received by the Government of Viet Nam as is evident from the newly released follow-up version of the Green Book as an Action Programme on AIPED for the period covering 2011–2016.
- FAO and Abt Associates have a common strategy to risk reduction across the supply chain with a shared activity matrix consolidating the agencies' activities into a single overall approach.
- The first volume of the DAH Animal Health bulletin was released in July 2011 (250 copies). The second volume of DAH Animal Health bulletin was released in August 2012 (210 copies). FAO

provided financial support to DAH for publishing the book "Animal Health Sector Strategy" which was released in September 2013 (170 copies).

Output 3: Animal surveillance at the national, district and community level enhanced

- The project provided support to the upgrading of TADinfo and LabNet, and the development of geographic information systems (GIS) at the RAHO level. A total of 210 officers from SDAH, 14 RAHO staff and five DAH epidemiology staff were trained to use this software. Seven global positioning systems (GPS) and seven licenses of mapping software (ArcView/ArcGIS 9.2) were provided to seven RAHOs (I-VII). A total of 55 SDAH/DAH staff was trained on its use.
- The project also developed a database system software for laboratory diagnostic management within the DAH's LabNet through the services of a local firm in Viet Nam. Laboratory biosafety and quality assurance are being supported and pursued. One laboratory, the National Centre for Veterinary Diagnostics (NCVD), was accredited for ISO17025, and the other laboratories are in the process of accreditation.
- The SOPs for H5N1 real-time PCR were developed and adopted. It has been used at nine veterinary laboratories extensively for passive and active surveillance. The use of real-time PCR was extended to the differential diagnosis of HPAI, such as Newcastle disease and duck plaque.
- The capacity of genetic sequencing of H5N1 viruses was developed and applied. Genetic analysis of the viruses isolated from HPAI outbreaks in poultry in Viet Nam over several years indicates that Clade 1 is entrenched in south Viet Nam with sporadic forays to central Viet Nam. Clade 2.3.4 was once the predominant clade for many years in north and central Viet Nam until the winter of 2009/2010. However, clade 2.3.2 viruses have totally replaced the dominance of clade 2.3.4 in late 2010, which continues today. Within the newly emerging clade of 2.3.2.1, an antigenic variant strain of the virus was detected. Adequate technical and material support significantly improved the HPAI diagnostic capacity in the laboratories and antigenic and genomic characterization of H5N1 viruses.
- A revised and updated set of SOPs for HPAI Outbreak Investigation and Control was developed, comprised of 19 sections and 14 job cards for various officials involved in HPAI outbreak management. The English and Vietnamese versions of the SOPs were handed over to DAH for transmission to MARD for adoption as a national strategy.
- The awareness-raising campaign to encourage poultry farmers to report any unusual occurrences of an infectious disease in poultry flocks and the necessity to report it on time were carried out through TV spots and loudspeakers during the risk period (e.g. the Tét festival).
- The AVET initiative to improve basic epidemiological investigation capacity in Viet Nam, specifically a nine-week-long tailor-made course curriculum, resulted in the training of 160 veterinarians in 12 cohorts in the period of 2010-2012. At least one veterinarian of each of the 63 provinces of Viet Nam now has specialized basic skills in veterinary field epidemiology. The advanced epidemiological skills training workshop for animal health professionals from Viet Nam was held in May 2013 with a total of 13 participants. The Wildlife Investigation in Livestock Disease and Public Health: An Introductory Training Course in *One Health* was implemented in May 2013 with total 30 participants representing human health, animal health and wildlife/ecology sectors. Three AVET alumni workshops and the 1st Epidemiology One Health Network Forum were organized for strengthening the animal health epidemiologist network in Viet Nam and improving the sharing of information.
- Active surveillance of HPAI and other poultry diseases launched to complement the community-based surveillance of Abt Associates yielded valuable insight on the efficacy of the surveillance.
- In the event of an outbreak, a new component was launched in March 2011 for the early detection of any potential secondary outbreaks in the neighbouring area of the index case.
- A cost-effectiveness study on surveillance for HPAI was completed. Preliminary findings suggest that there is a qualitative value in surveillance, but the cost of surveillance per outbreak reported is going up with a decrease in the number of outbreaks of HPAI in Viet Nam.
- LMB surveillance for subclinical infection of ducks sold at the markets in 30 high-risk provinces indicated widespread circulation of avian influenza virus and also H5N1 viruses, in particular.
- More than 300 copies of the Wild Bird Manual were translated into Vietnamese and distributed in 63 provinces.

Output 4: Priority procurement for animal surveillance and laboratory supported

- Procurement of vehicles, information technology (IT) equipment, sprayers and most laboratory consumables is complete, and all are in use.

Output 5: Effective and timely animal response efforts promoted

- A cross-border study in the north of Viet Nam concluded that as a result of a high financial return for poultry, smuggling across the border has not decreased, but has become more elaborate, which will pose a constant risk of disease transmission. The market chain is increasingly being recognized as critical to the control of HPAI, particularly in northern Viet Nam, and FAO's strategic targeting of LMBs was validated.
- Hatchery data collection and mapping in five pilot provinces was completed. Hatchery minimum biosecurity standards were developed through a stakeholder consultation process. A hatchery audit and certification tool was developed, and training was provided to the Government staff on the procedure for hatchery auditing and certification. Hatchery data collection and mapping in Region 3, Region 6 and Region 7 have been completed.
- Mapping of LMBs in Region 3, Region 6, Region 7, and along the border with Cambodia (including Long An, Dong Thap, An Giang and Tay Ninh province) and 15 northern provinces have been completed.
- Post-vaccination monitoring and virus circulating surveillance for influenza A/H5N1, supported by this project, shows that vaccinated poultry have a protection rate of 72.10 percent at the bird level. The protection rates of Muscovy ducks, turkey, other ducks, chicken and geese were: 80 percent, 80 percent, 78.90 percent, 68.05 percent and 50 percent, respectively. Prevalence of Type A and H5N1 avian influenza viruses in ducks were 0.94 percent and 0.67 percent, respectively, while in chickens, respective prevalence was 0.54 percent and 0 percent. There was no evidence of avian influenza virus persistence found with the samples taken from Muscovy ducks. The avian influenza positive samples were from Khanh Hoa and Quang Ngai provinces (Centre). Currently, the Government of Viet Nam halted mass vaccination of poultry against HPAI.
- A training course on good management practices for key stakeholders – a national veterinary company (NAVETCO), Viet Nam's veterinary vaccine company (VETVACO) and DAH – was conducted, which covered introductory level good manufacturing practices (according to the 2009 Pharmaceutical Inspection Convention/Pharmaceutical Inspection Co-operation Scheme [PIC/S] Code of good manufacturing practices) and quality systems applicable to the manufacture of avian influenza H5N1 vaccines.
- The operational appraisal of cold chain integrity was completed, and 39 provinces were provided with walk-in cold rooms. Software for inventory maintenance of vaccine banks in provinces was developed.
- Capacity for animal challenge testing was developed, following the completion of a high biosecurity animal isolation unit at NCVD. The unit applied for vaccine efficacy tests since 2007 to monitor the adequacy of vaccines against the evolving H5N1 viruses. An antigenic variant of H5N1 virus was found in 2011, for which the vaccine currently in use was not effective.
- A Viet Nam-Cambodia cross border meeting held in January 2013 and Viet Nam-China cross border meeting held in August 2013 to exchange technical information, including surveillance and risk assessment findings, and risk reduction plans. As a result of the meetings, cross-border surveillance strategy between Viet Nam and Cambodia was developed in January 2013.

Output 6: Improved biosecurity practices in commercial and scavenging poultry raising settings supported

- Poultry sector profiling provides important tools for risk-analysis and strategic disease control planning. A guide to provincial poultry sector profiling was developed. Poultry sector profiling was completed for four of the five project provinces. The guidelines are currently being tested externally by an implementing partner in three non-USAID pilot provinces.
- A BSWG was established, which provides a forum to network information and lessons learned, and build technical understanding among a peer group of agencies working to strengthen biosecurity.
- A framework for a database on biosecurity materials was developed, and its consolidation is in

progress. By now, over 100 documents have been compiled in a searchable format. This is now ready for dissemination. Biosecurity activities of all agencies engaged in related work have also been mapped.

- The BSWG reviewed work on hatchery biosecurity. Training on the principles of biosecurity and on biosecurity auditing was provided to 16 members of the BSWG. Conventional approaches to biosecurity strengthening were reviewed and evidence gathered to support the adoption of a supplementary approach focusing on private sector driven activities and adopting social marketing techniques from the human health sector.
- A wildlife farming subgroup was established under the BSWG.
- FAO and Abt Associates liaised on hatchery technical training and registration schemes.
- A regional risk analysis exercise was conducted, which provided information on the character of poultry movement and production in the lower Mekong region, identifying poultry movements and risk pathways for inter-provincial transmission of infection.

Output 7: Communication capacity supported at DAH and technical inputs to communication activities of other USAID implementing partners are provided

- FAO supported the calendar and sticker production and distribution prior to the 2010 Tết festival, sending out the message to call the hotline or the SDAH landline to report ill and dead poultry under the enhanced reporting component.
- Under the Gathering Evidence for a Transitional Strategy (GETS) project (closed in February 2012), the Academy for Educational Development produced a commercial, which encouraged poultry owners to report ill and dead poultry to SDAH via a hotline or SDAH phone numbers. This was used effectively in this project for awareness-raising purposes.
- Support to DAH communications and technical support to Abt Associates in implementing the field activities was maintained.
- The first quarterly E-Newsletter was released and widely distributed to donors, implementing partners, ECTAD Members and others in the *One Health* contact list.

I Quarter 2010**Project Monitoring Sheet: OSRO/VIE/801/USA**

Project title: **Gathering Evidence for a Transitional Strategy (GETS) for Highly Pathogenic Avian Influenza (HPAI) H5N1 Vaccination in Viet Nam**

Reporting period: **January to March 2010¹**

Country: Viet Nam
Project title: Gathering Evidence for a Transitional Strategy (GETS) for Highly Pathogenic Avian Influenza (HPAI) H5N1 Vaccination in Viet Nam
Code: OSRO/VIE/801/USA
Budget: USD 4 million (Phase I)
Total budget: USD 4 million
Effective starting date: October 2008
Planned end date: March 2011
<p>Context of the project</p> <p>Viet Nam has been carrying out vaccination of poultry twice a year (October and April) since autumn of 2005 to control epidemic Highly Pathogenic Avian Influenza (HPAI) H5N1 with some considerable empirical evidence of success. However, it has been recognized that this control strategy is not sustainable over the whole country in the long term. Mass vaccination entails a large amount of financial resources from the government and ties up significant human resources in the agriculture sector. Therefore, an alternative or more likely a parcel of complementary alternative control strategies will have to be devised as Viet Nam moves from initial emergency measures to a period of consolidation and ultimately on to the stated aim of control/eradication beyond 2010 (Green Book). This project is investigating and gathering evidence on alternative vaccination strategies in provinces with high and low risk for HPAI H5N1 outbreaks.</p>
<p>Objective of the project</p> <p>The main objective of the project is to provide field data to the Ministry of Agriculture and Rural Development (MARD) by testing a number of alternative vaccination strategies and the complementary strategy of improved surveillance. This data will assist MARD in its selection of a future vaccination strategy.</p>
<p>Planned activities for this Quarter</p> <p>Outputs 1&2: Feasibility and logistics to implement a Novel Vaccination Strategy (V2) compared with maintaining Standard Vaccination Strategy (V1), and to withdraw routine vaccination (V0) compared with maintaining Standard Vaccination Strategy (V1)</p> <p><i>Activity 1.1&2.1 Needs assessment undertaken and work plan finalized</i></p> <p>Amendments to letters of agreement (LoAs) with the Department of Animal Health (DAH) will be made to address logistical issues raised by the provinces during the project implementation phase.</p> <p><i>Activity 1.2&2.2 Public awareness campaigns</i></p> <p>Radio announcements via loud speaker will be made and leaflets will be distributed throughout the communes.</p>

¹ Quarter 5 of the project cycle

Activity 1.3&2.3 & 1.4&2.4 Farms identified/sampled

Sampling for the sentinel duck baseline survey will be completed and identification of unvaccinated sentinels will be undertaken and sampling commenced.

Activity 1.5&2.5 Equipment procured including vaccine

A review will be undertaken of the status of the equipment at the Sub-Department of Animal Health (SDAH) and District Veterinary Service (DVS) offices to ensure that they are supplied with the necessary equipment for project reporting and communication.

Activity 1.6&2.6 Training undertaken

The second round of training workshops for district and commune veterinary authorities will be organized. A training programme, utilising industry groups and unions, will be developed for farmers and village animal health workers (AHW's). The next round of training will incorporate the recommendations based on lessons learnt from the first training including: (1) It is necessary to organize the training for local authorities including the mass organisation staff to improve their coordination and support when implementing the project later; and (2) To improve the ownership of the local DVS, the training sessions should be combined with DVS activities such as community animal health worker (CAHW) routine meetings every two or three months.

Activity 1.7&2.7 Data gathering

Data gathering activities will be fine tuned to address logistical issues raised by the provinces during the project implementation phase.

Output 3: Cost-effectiveness of 'Novel versus Standard' (V2/V1) and 'Standard versus Withdrawal' (V1/V0) Vaccination Strategies undertaken

Activity 3.1 Component planning/oversight

The first phase of the cost-effectiveness programme will be completed by the national implementing agency, the Southern Office of the Institute of Policy Strategy for Agricultural and Rural Development (SCAP).

Activity 3.2 Team recruited

An LoA will be prepared with the implementing partner for the second phase of the cost-effectiveness programme.

Activity 3.3 Data gathering

Data gathering for the first phase of the cost-effectiveness programme will be completed.

Output 4: Risk factors are defined for animal outbreaks via case series and/or case-control trial

Activity 4.1 Component planning/oversight

- Supply chain analysis will commence across the five GETS provinces and geographical positioning system (GPS) mapping using the GPS units supplied to each DVS will commence.
- A detailed case study of the meat trader system will be planned to investigate potential risk factors in outbreaks. Meat traders are a high risk group because they constantly move from farm to farm and handle birds at each farm.
- Monitoring of high risk mobile duck flocks will be undertaken by CAHW's in all communes in the GETS provinces and vaccination of these flocks will be ensured. These flocks present a high risk for disease transmission because they shed virus with minimal clinical signs if they are not adequately vaccinated.
- Outbreak investigation activities will continue.
- Amendments to the LoA with DAH will be made to address logistical issues raised by the

provinces during the project implementation phase.

Activity 4.2 Training DAH-Regional Animal Health office (RAHO) and MoH-Regional Health Office (RHO)

Training of DVS staff in GPS use will be undertaken to prepare for the GPS mapping activities.

Activity 4.3 Operational funds arranged/distributed

Amendments to LoAs with DAH will be made to address logistical issues raised by the provinces during the project implementation phase and to ensure adequate funds are provided to the provinces for project activities.

Activity 4.4 Data gathering from outbreaks nationwide (64 provinces)

GETS regional coordinators will attend outbreaks that occur in the GETS provinces and in the provinces that border the GETS provinces to investigate potential routes of virus transmission and to determine whether outbreaks in bordering provinces.

Output 5: Sociological behaviours related to V2/V1 and V1/V0 are compared

Activity 5.1 Component planning/oversight

- A national partner will commence work on this component and will coordinate its implementation.
- Monitoring of perception and behavioral changes will be among poultry producers and within the government veterinary services in response to the interventions implemented by the GETS project
- Attitudinal surveys will be used as a tool to assist with the monitoring process.

Activity 5.2 Team recruited

The recruitment of a national partner will be completed and the partner will start on the project at the end of January 2010.

Activity 5.3 Data gathering

Data collection will continue with attitudinal questionnaires and behavioural case studies among poultry producers and within the government veterinary services.

Output 6: Policy analysis of HPAI strategy including public private sector collaboration and partnerships is undertaken

Activity 6.1 Component planning/oversight

- The governance of private/public partnerships will be investigated and the effect of the interventions on this will be monitored.
- Supply chain analysis and mapping will identify the location of animal health product suppliers and case studies will be undertaken to determine the governance of their activities.
- A detailed case study of the meat trader system will be designed and governance of their activities will be investigated.

Activity 6.2 Team recruited

The recruitment of a national partner will be completed and the partner will start on the project at the end of January 2010.

Activity 6.3 Data gathering

Data gathering will continue with the start of supply chain analysis and mapping.

Activities undertaken during the reporting period**Outputs 1&2: Feasibility and logistics to implement a Novel Vaccination Strategy (V2) compared with maintaining Standard Vaccination Strategy (V1), and to withdraw routine vaccination (V0) compared with maintaining Standard Vaccination Strategy (V1)***Activity 1.1&2.1 Needs assessment undertaken and work plan finalized*

- Missions were undertaken to each of the five GETS provinces to review the project activities as well as the data collection activities. Amendments to LoAs with DAH were made to address logistical issues raised by the provinces during the project implementation phase. These included LoAs covering Enhanced Surveillance, Reporting and Outbreak Response, Sentinel flock monitoring and Post-vaccination Monitoring. Enhanced Surveillance, Reporting and Outbreak Response and Sentinel flock monitoring has now been incorporated into a new LoA covering the next twelve months.

Activity 1.2&2.2 Public awareness campaigns

Radio announcements via loud speaker were made and leaflets were distributed throughout the communes.

Activity 1.3&2.3 & 1.4&2.4 Farms identified/sampled

Sampling for the sentinel duck baseline survey was completed and identification leg bands were supplied to each SDAH for the identification of unvaccinated sentinels.

Activity 1.5&2.5 Equipment procured including vaccine

Equipment requirements were discussed at the SDAH and DVS offices during the missions to the provinces.

Activity 1.6&2.6 Training undertaken

A national consultant has been contracted to assist with the training. GPS training for DVS staff has been planned, a partner chosen and a contract drafted. Access database training has been planned for the project assistants at each of the SDAH offices. A consultant has been chosen to assist with this activity and a contract finalized. A training programme, utilising industry groups and unions, has been developed for farmers and village AHW's. This will include workshops at the village level as well as events at the markets. The second phase of the CAHW training is being planned to coincide with the end of the 2010 first round of vaccination. It will include training on data collection and completion of the revised data forms.

Activity 1.7&2.7 Data gathering

Data gathering activities were reviewed during the missions to the provinces in March 2010. Data collection activities are progressing as planned. Data entry procedures will be fine tuned by the introduction of an Access database which will be set up in each province.

Output 3: Cost-effectiveness of 'Novel versus Standard' (V2/V1) and 'Standard versus Withdrawal' (V1/V0) Vaccination Strategies undertaken*Activity 3.1 Component planning/oversight*

The first phase of the cost-effectiveness vaccination programme was completed by the national implementing agency, SCAP.

Activity 3.2 Team recruited

An LoA has been prepared with the implementing partner for the second phase of the cost-effectiveness programme.

Activity 3.3 Data gathering

Data gathering for the first phase of the cost-effectiveness programme has been completed and data analysis is ongoing. Emphasis has been placed on the historical data so that comparisons can be made between pre-GETS vaccination costs and post-GETS vaccination costs.

Output 4: Risk factors are defined for animal outbreaks via case series and/or case-control trial*Activity 4.1 Component planning/oversight*

- Outbreak investigation has been undertaken for outbreaks in the GETS provinces and in those provinces neighbouring the GETS provinces.
- Monitoring of high risk mobile duck flocks has been successfully undertaken by CAHW's in communes in the GETS provinces and vaccination of these flocks has been undertaken where a vaccination certificate cannot be produced. These flocks present a high risk for disease transmission because they shed virus with minimal clinical signs if they are not adequately vaccinated
- Supply chain analysis has been planned across the five GETS provinces and a contract drafted with the implementing partner to undertake the training of DVS staff who will be undertaking the GPS mapping using the GPS units supplied to each district veterinary station.
- A detailed case study of the meat trader system has been planned to investigate potential risk factors in outbreaks. Meat traders are a high risk group because they constantly move from farm to farm and handle birds at each farm.

Activity 4.2 Training DAH-Regional Animal Health(RAHO) and MoH-Regional Health Office (RHO)

GPS training for DVS staff has been planned, a partner chosen and a contract drafted. Training of DVS staff in GPS use will be undertaken in April to prepare for the GPS mapping activities.

Activity 4.3 Operational funds arranged/distributed

Amendments to LoAs with DAH have been made to address logistical issues raised by the provinces during the project implementation phase and to ensure adequate funds are provided to the provinces for project activities.

Activity 4.4 Data gathering from outbreaks nationwide (64 provinces)

GETS regional coordinators have attended to outbreaks that occurred in the GETS provinces and in the provinces that border the GETS provinces to investigate potential routes of virus transmission and to determine whether outbreaks in bordering provinces originated from GETS provinces. This included four outbreaks during the Tet high risk period of January, February and March in the GETS provinces compared with 15 in 2009. Investigations were also undertaken at eight outbreaks sites in neighbouring provinces. The province of Quang Binh, which has a zero vaccination GETS intervention programme in four districts, implemented an intensified monitoring and movement controls programme and succeeded in preventing disease spread from outbreaks in neighbouring provinces

Output 5: Sociological behaviours related to V2/V1 and V1/V0 are compared*Activity 5.1 Component planning/oversight*

- The behavioural studies will evaluate potential motivation factors and key determinants for AHW and producers, the barriers to behaviour change and the behavioural changes that have occurred as a result of the project intervention
- Attitudinal surveys will be used as a tool to assist with the monitoring process.

Activity 5.2 Team recruited

A national partner has been chosen to continue with the implementation of this component and a

contract and terms of reference (TOR's) were finalized and the partner commenced in January 2010. A sociologist is being contracted to undertake behavioural case studies with animal health workers (AHW) and poultry producers.

Activity 5.3 Data gathering

Data collection will consist of attitudinal questionnaires and behavioural case studies and commenced with an attitudinal questionnaire included in the chief animal health worker post-training questionnaire.

Output 6: Policy analysis of HPAI strategy including public private sector collaboration and partnerships is undertaken

Activity 6.1 Component planning/oversight

- Supply chain analysis and mapping has identified the location of animal health product suppliers and case studies have to be undertaken to determine the governance of their activities.
- A detailed case study, including tracking of activities, of the meat trader system is being designed and will investigate the governance of their activities.

Activity 6.2 Team recruited

The recruiting of a national consultant, to continue with the implementation of this component, has been completed and the consultant commenced on the project at the end of January 2010.

Activity 6.3 Data gathering

Data gathering will continue with the completion of the supply chain analysis.

Planned activities for the next quarter

Outputs 1&2: Feasibility and logistics to implement a Novel Vaccination Strategy (V2) compared with maintaining Standard Vaccination Strategy (VI), and to withdraw routine vaccination (V0) compared with maintaining Standard Vaccination Strategy (VI)

Activity 1.1&2.1 Needs assessment undertaken and work plan finalized

Implementation of the new LoA with DAH on Enhanced Surveillance, Reporting and Outbreak Response and Sentinel Duck Monitoring will be undertaken.

Activity 1.2&2.2 Public awareness campaigns

Round 2 of the public awareness campaign will commence with radio announcements via loud speaker.

Activity 1.3&2.3 & 1.4&2.4 Farms identified/sampled

Contracts with sentinel duck flock owners will be signed to ensure commitment to the programme. The serum sampling component of the programme will commence.

Activity 1.5&2.5 Equipment procured including vaccine

Further equipment will be provided as required to ensure smooth operation of the project. A computer will be provided to each of the provinces for data entry activities with the Access database and auto-vaccinators will be provided to the districts for HPAI vaccination.

Activity 1.6&2.6 Training undertaken

- GPS training for DVS staff will be implemented and completed.
- Access database training for the project assistants at each of the SDAH offices will be implemented and completed.
- A training programme, utilising industry groups and unions, has been developed for farmers

and village AHW's. This will include workshops at the village level as well as events at the markets.

- The second phase of the CAHW training will be implemented to coincide with the end of the 2010 first round of vaccination. It will include training on data collection and completion of the revised data forms.
- A training programme, utilising industry groups and unions, will be organized for farmers and village AHW's.

Activity 1.7&2.7 Data gathering

- 2010 Round 1 vaccination data gathering will be undertaken. Round 2 post-vaccination monitoring will be undertaken.
- Data collection activities are being streamlined with the introduction of an Access database in each of the SDAH offices in the GETS provinces and training will be provided in the use of the database.

Output 3: Cost-effectiveness of 'Novel versus Standard' (V2/V1) and 'Standard versus Withdrawal' (V1/V0) Vaccination Strategies undertaken

Activity 3.1 Component planning/oversight

The second phase of the cost-effectiveness programme will be implemented by the national implementing agency, SCAPS.

Activity 3.2 Team recruited

An LoA will be signed with the implementing partner for the second phase of the cost-effectiveness programme.

Activity 3.3 Data gathering

Data gathering for the second phase of the cost-effectiveness programme will be completed.

Output 4: Risk factors are defined for animal outbreaks via case series and/or case-control trial

Activity 4.1 Component planning/oversight

- Supply chain analysis be completed across the five GETS provinces and GPS mapping using the GPS units supplied to each district veterinary station will be completed.
- Monitoring of high risk mobile duck flocks will continue in all communes in the GETS provinces and vaccination of these flocks will be ensured. These flocks present a high risk for disease transmission because they shed virus with minimal clinical signs if they are not adequately vaccinated.
- A detailed poultry industry survey will start assisting in determining risk factors.

Activity 4.2 Training DAH-Regional Animal Health Unit (RAHO) and MoH-Regional Health Office (RHO)

Training of DVS staff in GPS use will be undertaken to prepare for the GPS mapping activities. The second round of CAHW training workshops will be implemented as well as the training for village animal health workers. Invitations will be extended to public health workers and livestock extension officers as in Round 1 where attendance of these groups was high.

Activity 4.3 Operational funds arranged/distributed

Operational funds will continue to support outbreak investigation activities as well as supply chain mapping for risk factors.

Activity 4.4 Data gathering from outbreaks nationwide (64 provinces)

Outbreak investigation activities will continue with attendance at all outbreaks in the GETS and neighbouring provinces by the GETS regional coordinators with the aim of providing accurate disease investigation reports.

Output 5: Sociological behaviours related to V2/V1 and V1/V0 are compared

Activity 5.1 Component planning/oversight

Behaviour studies are being planned that will evaluate potential motivation factors and key determinants for animal health workers and producers, the barriers to behaviour change and the behavioural changes that have occurred as a result of the project intervention. These will take place following the poultry industry survey that will provide detailed data on farm activities and practices.

Activity 5.2 Team recruited

A sociologist will be contracted to undertake behavioural case studies with AHW and poultry producers.

Activity 5.3 Data gathering

Data collection will continue with attitudinal questions included in the chief animal health worker post-training questionnaire.

Output 6: Policy analysis of HPAI strategy including public private sector collaboration and partnerships is undertaken

Activity 6.1 Component planning/oversight

- Supply chain analysis and mapping will be undertaken in the second quarter of 2010 and will identify the location of animal health product suppliers. Case studies will then be undertaken to determine the governance of their activities. The governance of private/public partnerships will then be investigated and the effect of the interventions on this will be monitored.
- A detailed case study, including tracking of activities, of the meat trader system will be designed to investigate the governance of their activities. This component will start following the completion of the supply chain analysis.

Activity 6.2 Team recruited

The recruitment of a national partner will be completed and the partner will start on the project at the end of January 2010.

Activity 6.3 Data gathering

Data gathering will continue with the commencement of supply chain analysis and mapping. This will assist in the identification of private/public operations that will be used in the governance studies and policy analysis.

Main challenges encountered and response provided

Data gathering activities were reviewed during the missions to the provinces in March. Whilst data collection activities are progressing as planned, data entry procedures need to be refined so that raw data can be entered and not aggregated data. Data entry procedures will be fine tuned by the introduction of an Access database which will be set up in each province. Access database training has been planned for the project assistants at each of the SDAH offices so that they can enter raw data from the communes directly into the database.

During the first phase of the cost-effectiveness study, detailed data were collected on the costs of the GETS interventions. The historical data collected were not representative of the vaccine usage prior to

the GETS project being implemented and would not allow useful comparisons to be made for pre- and post-GETS programmes. The national partner has been requested to make clear separation of pre- and post-GETS data in their report from Phase 1 of the cost-effectiveness programme. This issue has also been addressed in the new agreement for Phase 2 with the implementing partner where increased focus will be placed on gathering accurate historical data to allow a twelve month comparison to be made of pre- and post-GETS costs.

During Round 1 of the public awareness programme, the release of the audio segment by community loudspeakers was not consistent across the five GETS provinces as it was being organised by many different local authorities. This is being corrected for Round 2 by contracting the activity to a single national partner who will be responsible for ensuring consistent coverage across the five GETS provinces.

Reporting requirements for the agreements with DAH were not being met due to resource issues within the department. The project national coordinator has assisted with this task and an assistant has been contracted to assist the national coordinator to meet the reporting requirements.

Main progress made towards the achievement of project outcomes *(from the start of the project activities)*

Outputs 1&2: Feasibility and logistics to implement a Novel Vaccination Strategy (V2) compared with maintaining Standard Vaccination Strategy (VI), and to withdraw routine vaccination (V0) compared with maintaining Standard Vaccination Strategy (VI)

- Field missions to all provinces and the vaccine intervention plans have been completed.
- The project work plan has been completed and an agreement has been obtained from DAH/MARD for the intervention programme and the work plan.
- Implementation partners have been chosen and guidelines for all field activities have been completed. LoA's have been prepared and signed.
- The intervention was implemented to coincide with the second round Government of VietNam's vaccination programme in October and November 2009.
- Implementation partners for the public awareness programme have been contracted and the initial capacity building training for over 900 district and commune veterinary staff, livestock extension officers and district public health officials has been completed.
- Production of TV media, audio and leaflets has been completed. The media release commenced with the local TV advertisements started in the last week of October 2009 and they ran four times per day until the end of December 2009 in the five pilot provinces.
- Implementation partners for the second stage of the public awareness programme have been contracted and the media release is due to start in April 2010.
- Enhanced surveillance, reporting and outbreak response activities, as well as sentinel duck monitoring and post-vaccination monitoring are ongoing in the field and funds have been transferred to the provinces to support these activities. These activities have been reviewed during field missions to each of the five GETS provinces in March 2010 and revised agreements have been adopted to streamline project activities.
- Procurement and distribution of five vehicles, 42 GPS, and 714 fridges was completed to the provinces. For the first time in Viet Nam, continuous cold chain for vaccine storage has been extended to the commune level throughout the five GETS provinces.
- Data collection activities are being streamlined with the introduction of an Access database in each of the SDAH offices in the GETS provinces and training will be provided in the use of the database.

Output 3: Cost-effectiveness of 'Novel versus Standard' (V2/V1) and 'Standard versus Withdrawal' (V1/V0) Vaccination Strategies undertaken

- An international expert undertook a mission to Viet Nam and prepared the design of the cost-effectiveness component which was subsequently reviewed and finalised. Discussions were pursued with a national partner to implement this component and a work plan and budget were reviewed and finalised.
- Completion and signing of the LoA with the national partner, SCAPS, facilitated the commencement of field activities and data gathering. The SCAPS team, accompanied by the GETS regional coordinators, visited each of the five pilot provinces and commenced data collection activities. Phase 1 of the programme has been completed and Phase 2 will commence in April 2010.

Output 4: Risk factors are defined for animal outbreaks via case series and/or case-control trial

- Outbreak response activities have been finalized and accompanying documents completed.
- Training has been undertaken for the GETS Regional Coordinators whose role includes attending all outbreaks within the GETS provinces and in bordering provinces to undertake disease investigation activities.
- An LoA with DAH has been finalised and signed and funds have been available for provincial staff for outbreak activities.
- An agreement has been signed with DAH detailing the re-imburement terms for poultry producers in the GETS provinces following culling of their flocks for HPAI outbreaks. Funds have been made available for provincial authorities to fund the re-imburement for eligible flocks.
- Workshops detailing enhanced disease reporting activities were held at the 42 districts involved in the project and these were attended by 713 chief animal health officers, 178 district veterinary officers, 39 agricultural extension officers and 38 district public health officers, 48 were from SDAH and 14 were from RAHOs.
- Supply chain analysis has been planned and will be undertaken across the five GETS provinces as well as GPS mapping using the GPS units supplied to each district veterinary station.
- A detailed case study of the meat trader system is planned to investigate potential risk factors in outbreaks. Meat traders are a high-risk group because they constantly move from farm to farm and handle birds at each farm.
- Monitoring of high-risk mobile duck flocks has commenced and is being undertaken by CAHWs throughout the GETS provinces and vaccination of these flocks is being pursued. These flocks present a high-risk for disease transmission because they shed virus with minimal clinical signs if they are not adequately vaccinated.

Output 5: Sociological behaviours related to V2/V1 and V1/V0 are compared

- An international expert undertook a mission to Viet Nam to assist in preparing the design of this component. Data collection consists of attitudinal questionnaires and behavioural case studies. A national partner has been chosen to continue with the implementing of this component and a contract and TOR's were finalized and the partner started in January 2010. Data collection has initiated with an attitudinal questionnaire included in the chief animal health worker post-training questionnaire.
- A sociologist is being contracted to undertake behavioural case studies with AHW and poultry producers. These studies will evaluate potential motivation factors and key determinants for AHW and producers, the barriers to behaviour change and the behavioural changes that have occurred as a result of the project intervention.

Output 6: Policy analysis of HPAI strategy including public private sector collaboration and partnerships is undertaken

- A detailed case study, including tracking of activities of the meat trader system is being designed and will investigate the governance of their activities.
- A national partner has been selected to continue with the implementation of this component. This component will start following the completion of the supply chain analysis which will assist in the identification of private/public operations that will be used in the governance studies and policy analysis

Project Monitoring Sheet: **OSRO/RAS/604/USA Baby 06**

Project title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) to Viet Nam**
Reporting period: **October 2010 to March 2011**

Country: Viet Nam
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) to Viet Nam
Code: OSRO/RAS/604/USA Baby 06
Budget: USD 2 million (Phase I), USD 3.1 million (Phase II), USD 3.3 million (Phase III), USD 1.075 million (cost extension) ¹ , USD 2.2 million (Phase IV)
Total budget: USD 11.675 million
Effective starting date: August 2006
Planned end date: September 2011
Context of the project The control and elimination of H5N1 Highly Pathogenic Avian Influenza (HPAI) demands a long-term approach. Viet Nam is moving from the control phase to the consolidation phase, with an ongoing need for capacity building in the veterinary services and livestock production sectors and support for vaccination and other risk reduction measures. This regional project supported by the United States Agency for International Development (USAID) is currently in its fourth phase of implementation.
Objectives of the project The overall objective of the project is to address the urgent short-term actions that need to be undertaken by the country to strengthen its capacity to rapidly detect the introduction of HPAI into the country and minimize its spread in case of its occurrence.
Planned activities for this quarter
Component 1: Preparedness and Planning Component
Output 1: Strategy development for HPAI control
<i>Activity 1.1: Review of HPAI Control Strategy in Viet Nam</i>
<ul style="list-style-type: none"> Attend the National Workshop on Developing a One Health Approach for 2011-2015, addressing high impact infectious diseases at the Animal Human Interface before the OPI review.
<i>Activity 1.2: Transforming the HPAI Contingency Plan</i>
<ul style="list-style-type: none"> Review of the H5N1 drafting animal disease emergency preparedness plan.
Output 2: Coordination and communication with donors and other HPAI implementing partners
<i>Activity 2.1: Core FAO Viet Nam team supported</i>
<ul style="list-style-type: none"> Extend and renew contract of the current personnel, as and when necessary.
<i>Activity 2.2: Annual project meetings supported</i>
<ul style="list-style-type: none"> Organize a strategic Planning Meeting with all stakeholders in November 2010.
<i>Activity 2.3: Team Meetings from Provincial to National level</i>
<ul style="list-style-type: none"> Hold one meeting will be held with provincial and national stakeholders.
<i>Activity 2.4: Coordination and sharing of information with other players engaged in HPAI surveillance, risk assessment and value chain and risk mitigation in poultry sector</i>
<ul style="list-style-type: none"> Initiate a national workshop with stakeholders to exchange information on surveillance and risk analysis; and Initiate the preparation of a DAH bulletin by November 2010 for the first volume.
Component 2: Animal Surveillance Component
Output 3: Animal surveillance at the national, provincial, district and community level enhanced
<i>Activity 3.1: Strengthening of veterinary laboratories, specifically biosafety and quality assurance supported</i>
<ul style="list-style-type: none"> Continue providing technical inputs by national and international laboratory experts; continue providing support to the LabNet server and tele-hosting maintenance; organize the maintenance of the laboratory equipment (refer to section 4.1); initiate a working plan to develop a roadmap for animal disease diagnostics;

¹ Project Cost Extension Request from October 2009 to September 2010.

- hold a laboratory workshop at the National Centre for Veterinary Diagnosis (NCVD) and the Regional Animal Health Office (RAHO) 6 to build capacity for microbial and pathological investigation of animal disease;
- initiate activities in gene sequencing for more AI virus isolates; and
- initiate small laboratory based research component on HPAI virus survivability and host factors associated with the virus.

Activity 3.2: Strengthening of core capacities for animal health in 5 focus provinces, including surveillance activities supported

- Extend the letter of Agreement (LoA) extension with the DAH to monitor the implementation of the active surveillance (CBS);
- consult with DAH to review the CAHW guidelines;
- continue coordination with USAID implementing partner Avian Pandemic Influenza Initiative (APII); and
- conduct an evaluation of awareness campaign for enhanced reporting from previous year.

Activity 3.3: Further development of Monitoring and Evaluation (M&E) expertise in animal health

- Continue to support M&E activities as outlined in the 2009 USAID Viet Nam Highly Pathogenic Avian Influenza and Emerging Pandemic Threats Performance Management Plan.

Activity 3.4: Veterinary epidemiology network supported

- Review AVET curriculum;
- initiate fifth and sixth AVET programme;
- exchange information with other epidemiological trainings (Field Epidemiology Training Programme [FETP], Field Epidemiology Training Programme for Veterinarians [FETPV], etc.); and
- continue providing support to TADinfo and support hosting the server.

Activity 3.5: Piloting surveillance for animal influenza in poultry and pig production interface

- Initiate activity with national counterpart.

Activity 3.6: Active surveillance programme in a selected poultry marketing system

- Initiate a plan for analysis of a market catchment area in a particular zone.

Output 4: Priority procurement for animal surveillance and laboratory supported

Activity 4.1: Procurement and maintenance

- Carry out personal protection equipment (PPE) needs assessment in five pilot provinces;
- Continue procurement of laboratory consumables HPAI diagnosis and surveillance, as required; and
- Continue to maintain equipment, as required.

Component 3: Animal Response Component

Output 5: Effective and timely animal response efforts promoted

Activity 5.1: HPAI risk-mapping and risk analysis updated at national level

- Carry out poultry sub-sector profiling and training on spatial analysis.

Activity 5.2: Outbreak investigation capacity strengthened in focus provinces

- Provide support for carrying out investigation in the event of HPAI outbreaks occurring in the pilot provinces or in the neighbouring provinces (field trips);
- continue support for lab diagnosis; and
- continue training of CAHW for improved reporting.

Activity 5.3: Cross-border analysis using a value chain methodology in three border areas

- Initiate northwest cross-border trade analysis for HPAI.

Activity 5.4: Vaccine efficacy monitoring and virus surveillance supported at national level

- initiate PVM and the H5 VCS among poultry for round two of 2010; and
- initiate vaccine efficacy trial of new vaccine strains against 2.3.2 clade virus.

Activity 5.5: Support public private partnership (PPP) and institutional strengthening in poultry production and health care system

- Initiate the setting up of a regulatory board for monitoring veterinary service delivery and quality of veterinary education; and
- initiate a poultry price monitoring structure in three major cities in Viet Nam; and

<ul style="list-style-type: none"> • support creation of a PPP working group for development and restructuring of the poultry sector. <p>Output 6: Improved bio-security and market hygiene practices in commercial and scavenging poultry raising settings supported</p> <p><i>Activity 6.1: Support biosecurity strengthening in pilot provinces</i></p> <ul style="list-style-type: none"> • Continue with the stakeholder process to develop local risk reduction action plans. This activity will support the completion of those plans; and • Conduct mapping of hatcheries in two provinces. <p><i>Activity 6.2: Develop biosecurity guidelines and training for DAH and DLP</i></p> <ul style="list-style-type: none"> • Continue to support two working groups in biosecurity. The first is planned for October 2010. <p>Activities undertaken during the reporting period (October 2010 to March 2011)</p> <p>Component 1: Preparedness and Planning Component</p> <p>Output 1: Strategy development for HPAI control</p> <p><i>Activity 1.1: Review of HPAI Control Strategy in Viet Nam</i></p> <ul style="list-style-type: none"> • None . <p><i>Activity 1.2: Transforming the HPAI Contingency Plan</i></p> <ul style="list-style-type: none"> • On-going mission for the drafting of an Animal Disease Emergency Preparedness Plan to improve national preparedness to respond to an incursion of a transboundary disease, the emergence of a new disease or an epidemic of a disease already in the country. Animal Disease Emergency Preparedness Plan technical meeting held with DAH on 25 March 2011. <p>Output 2: Coordination and communication with donors and other HPAI implementing partners</p> <p><i>Activity 2.1: Core FAO Viet Nam team supported</i></p> <ul style="list-style-type: none"> • All key staff recruited and in place for the project implementation period. <p><i>Activity 2.2: Annual project meetings supported</i></p> <ul style="list-style-type: none"> • Annual Planning Workshop took place in November 2010. Participants from USAID, WHI, DAH, DLP, VAHIP, RUDEC, HAU, FAO, AVET, pilot province SDAH, Abt and NCVD attended. 43 Participants, 28 males and 15 females). • Initiated preparation of a FAO/DAH Information Sharing Workshop on “Recent advances in the knowledge of the epidemiology of HPAI in Viet Nam and identification of research priorities” proposed for 28-29 April 2011, in Hanoi. <p><i>Activity 2.3: Team Meetings from Provincial to National level</i></p> <ul style="list-style-type: none"> • FAO delegation undertook missions to the 5 pilot provinces in December 2010 and January 2011 for meetings with provincial Sub-DAH and DARD officials. Project achievements of the last year and the plan for the current year were jointly reviewed, discussed and feed-back obtained. • A Quarterly FAO Abt meeting took place in Hanoi to explain the Risk Reduction in the Market Chain jointly showing the FAO and APII activities in a Provincial Matrix format including the surveillance activities and give the field an opportunity to share information, discuss bottlenecks and propose solutions (21 participants, 11 males, 10 females). <p><i>Activity 2.4: Coordination and sharing of information with other players engaged in HPAI surveillance, risk assessment and value chain and risk mitigation in poultry sector</i></p> <ul style="list-style-type: none"> • FAO provides a weekly report which is submitted to USAID and USAID partners. • Update the Google Viet Nam PPI calendar regularly. • FAO finalized and submitted detailed work plan and logical framework for all key outputs of this project to USAID and USAID partners. • Two coordination meetings with FAO and Abt took place to discuss and design the Work-Plans for market surveillance and risk mitigation measures in the poultry value chain in the pilot provinces. • FAO Participated in FAO-Abt joint meeting to review the proposed BCC plan and provided additional technical input. • FAO participated to the BCC Working group in December 2010. • Development of a shared supply chain risk reduction working strategy between FAO and Abt Associates. • Technical meetings held with Abt Associates relating to risk assessment, risk reduction within the market chain and linkages between communication activities, technical interventions and supply
--

chain strengthening (including technical support to DLP on supply chain risk reduction approaches) (approach also presented at regional ECTAD meeting and a bilateral meeting between China and Viet Nam).

- Participated in Abt led technical consultation on implementation of recent slaughter-house legislation and practical issues to be tested through the USA project.
- National Vaccination Strategy Meeting was held on 22 October 2011 (participants included USAID, FAO, Abt, DAH, NCVD, RAHOS, NIVR, MARD, MONRE, VAPM, MPI, MoF, Gov office, PAHI, HUA, VAHIP and National Center for VET drugs and bio-products control No1; 48 participants, 29 males and 19 females). Government of Viet Nam incorporated lessons learnt from active and passive surveillance based on work done under this project, along with key recommendations under the GETs project.
- DAH bulletin underway, but first volume will be delayed until May 2011.
- FAO participated in AI partners' coordination meeting in USAID office on 24 January, 2011 and USAID Partner's Meeting on March 29th.

Component 2: Animal Surveillance Component

Output 3: Animal surveillance at the national, provincial, district and community level enhanced

Activity 3.1: Strengthening of veterinary laboratories, specifically biosafety and quality assurance supported

- The Manual for Biosafety in Veterinary Laboratories in Viet Nam and the SOP for adoption of Biosafety and Biosecurity in the laboratories have been finalized. These documents were developed through a National Consultancy and with technical inputs from FAO country team. Both these documents have been submitted to the Department of Animal Health in December 2010. FAO is strongly advocating the DAH to adopt appropriate biosafety and biosecurity measures in the laboratories, particularly those, handling highly infectious and pathogenic microbes and also those organisms having zoonotic potential.
- The Labnet software for creating a network among the HPAI reference laboratories for on-line and data-entry and submission of results to the Central Hub has been created. It was developed earlier but had a glitch for which it failed to work. Now it is ready for use in the laboratories, which will be taken up after two sets of one-day training, one in NCVD and the other in RAHO 6 in HCMC.
- Epidemiological Lab network workshop was carried out in December 2010 for capacity building for microbial and pathogenic investigation of animal diseases (participants included USAID, CDC, FAO, WCS, VAHIP, DAH, NCVD, NIVR, RAHO3,4,5,6,7. Total participants 47, 30 males and 17 females).

Activity 3.2: Strengthening of core capacities for animal health in 5 focus provinces, including surveillance activities supported

- Final reports of Active and Passive Surveillance carried out in the year 2009-10 were received, reviewed and finalized.
- Final report on the Cost-effectiveness of Surveillance was reviewed, finalized and formally handed over to the DAH in December 2010 for information which is expected to help develop policy directives for future surveillance activities against HPAI and possibly other Trans-boundary Animal Diseases.
- SOPs and Job Cards for HPAI outbreak investigation and response were completed, translated in Vietnamese and formally handed over to the DAH for information which is expected to be nationally adopted.
- Evaluation mission of awareness campaign for enhanced reporting from previous year completed.
- FAO participated in an Abt meeting for the launching of the CBS model in Ha Nam and Can Tho provinces.
- FAO attend the Abt meeting for the review of CBS activities done from August 2010 to December 2010 and plan for next step.
- LoAs for the strengthening the passive surveillance system and the routine active disease surveillance, initiated in Q1 and Q2 2010 extended until May 2011.
- In consultation with DAH and taking into account the CAHW guidelines, an additional approach has been launched for the active surveillance model with an event-based component taking place whenever there is a new HPAI outbreak reported in a pilot province or in a district neighbouring a

pilot province. During 1 month, CAHWs of 50 communes neighbouring the infected commune carry out field visits to early detect any potential secondary outbreak. LoA has been launched early March and will run until end of May.

- Briefing to provincial SDAH authorities on supply chain risk reduction approach
- Updating of provincial animal health authorities on developments in epidemiology of HPAI (through provincial risk analysis meetings).
- With a new HPAI outbreak reported in Hai Que commune, Hai Lang district, the event-based active disease surveillance model has been launched. Increased surveillance will be carried over during one month in 50 neighbouring communes.

Activity 3.3: Further development of Monitoring and Evaluation (M&E) expertise in animal health

- FAO provided training to Provincial Coordinators and Focal Points on PMP indicator data collection in February 2011 under subIR-1 and subIR-3.
- FAO completed and submitted the annual PMP report, along with key recommendations to MEASURE in March 2011.

Activity 3.4: Veterinary epidemiology network supported

- Technical reports for AVET courses 1 to 4 were finalized.
- A technical meeting between FAO and NZAID took place to discuss the epidemiological data gathering and analysis and also epidemiological training programmes being carried out by the two agencies in Viet Nam. Training materials of AVET and NZAID were respectively shared.
- A review of the AVET Chapters was undertaken to include more examples and practical exercises and avoid overlaps between chapters. Additionally, the set of questions for the pre & post-course tests was revised.
- A short course on public health epidemiology is now included in the AVET curriculum and is delivered by Dr Nguyen Tran Minh (Topi), the Course Coordinator of the FETP.
- The 5th AVET course was launched on 28th February with 13 trainees involved from DAH, RAHOs and Universities.
- A TAG meeting was held for preparing the 6th AVET course which will be launched on 13 April 2011.

Activity 3.5: Piloting surveillance for animal influenza in poultry and pig production interface

- Deferred

Activity 3.6: Active surveillance programme in a selected poultry marketing system

- A field assessment was carried out of the 10 LBMs in Quang Tri province including information on the markets and based on this and the risk assessment key markets in the network selected.
- A protocol for the approach including sampling, processing and testing of samples has been drafted together with an experience sharing consultation with GETS and Word Bank (VAHIP) projects.

Output 4: Priority procurement for animal surveillance and laboratory supported

Activity 4.1: Procurement and maintenance

- Procurement and PPE needs assessment was carried out in each of the pilot studies to determine procurement, stocking and maintenance requirements. Results are currently with the Department of Animal Health to review the provincial requests and ensure there is no overlap with contribution from other potential sources.
- Field missions to all laboratories completed to review inventory and ensure USAID visibility with correct labelling.
- 20 new car stickers ordered and received on 5 December (2 per car) to be sent to the 10 provinces (GETS and 604) to replace any damaged/lost car stickers.
- 2 Printer , 2 Computer Dell Optiplex 380DT, 2 Fax machine ,02 Santax UPS offline 500VA, 02 Fax modem have been provided to 2DVSs in Kien Giang province, as a result of new districts set up.

Component 3: Animal Response Component

Output 5: Effective and timely animal response efforts promoted

Activity 5.1: HPAI risk-mapping and risk analysis updated at national level

- Outbreaks have been spatially and temporarily mapped and together with molecular epidemiological evidence, understanding of risk factors and HPAI epidemiology have been

significantly strengthened.

- Poultry profiling technical reports completed in 5 pilot provinces.
- Risk analyses have been carried out in Ha Nam and Hung Yen (through UNJP), completing risk analysis exercises in all 5 provinces.
- A regional risk analysis has been planned and technical material prepared for central provinces (to be held Apr 6-8) and material also developed for the Red River Delta.
- Post test evaluation on the Risk Assessment carried out in Kien Giang and Can Tho were completed on 25 and 26 October 2011. The relevancy of training activities with actual works, content of training activities, training methods and guidance, documents and materials, overall logistics were highly appreciated by informants. Many of the informants confirmed that they benefitted from the training workshops and they could apply what they have learnt into their areas of operation. 66 percent of the total participants said that they have been involved in the coordination or organization of risk analysis activities after the training workshops.

Activity 5.2: Outbreak investigation capacity strengthened in focus provinces

- Mapping temporal and spatial distribution outbreaks of HPAI in poultry in Viet Nam and dissemination to other stakeholders (includes translation of DAH and Ministry of Health (MoH) reports disseminated via email, updating excel list of HPAI outbreaks, reporting any new outbreaks, and analyses of epidemiological data and mapping).
- Evaluation on hotline, calendars, stickers and roadshow in Ha Nam and Can Tho were completed on 28 Dec 2010. It was recommended that the hotline should be used not only to report HPAI suspicious cases but also for other diseases such as PRRS, FMD and for other purpose such as providing advice on animal production and vaccination to farmers, etc.

Activity 5.3: Cross-border analysis using a value chain methodology in three border areas

- Technical support provided to a bilateral meeting between Chinese and Vietnamese authorities at which value-chain approaches and results from studies were presented and important future recommendations made
- Implementing partner identified for future study on *cross border trade and study outline developed emphasising movement and assimilation of spent hens into Vietnamese domestic markets*

Activity 5.4: Vaccine efficacy monitoring and virus surveillance supported at national level

- Technical report of the LoA for the Round I of 2010 of Post-vaccination monitoring and virus circulation surveillance was reviewed, finalized and cleared.
- Round II of 2010 of Post-vaccination monitoring and virus circulation surveillance cancelled by DAH as a result of Circular No. 136/2010/TT-BTC dated 13 September, 2010, which proposed revised rates of various laboratory tests. As the newly proposed cost norms were debated by Government, FAO was requested by DAH to defer post-vaccination monitoring until Round I 2011.
- Detailed description of sub-optimal performance of vaccination in selective districts, provinces and regions requirements complete for planned activities.
- In the current set of trials on the vaccine efficacy against the circulating virus strains, it was observed that with one shot of Re-1 vaccine, chickens were protected 100 percent when challenged with a recently isolated H5N2 virus (of slightly lesser virulence) and 80 percent when challenged with the currently circulating H5N1 HPAI virus clade 2.3.2, predominantly in North Viet Nam. Since the recommended procedure is to inoculate two doses of the vaccine three weeks apart, the next phase of the trial is looking into the efficacy of Re-1 vaccine against the above two virus stains in chickens, vaccinated with two doses of the vaccine as per the manufacturer's instruction.

Activity 5.5: Support public private partnership (PPP) and institutional strengthening in poultry production and health care system

- Scoping study on PPP carried out (under UNJP) in anticipation of project extension approval.

Output 6: Improved bio-security and market hygiene practices in commercial and scavenging poultry raising settings supported

Activity 6.1: Support biosecurity strengthening in pilot provinces

- Training materials and approaches for hatchery hygiene, public and private sector adviser Training of Trainers (ToT) technically reviewed.
- Bio-security risk communication DVD developed for inclusion into training/awareness raising packages.
- Hatchery mapping has been undertaken in Can Tho and Kien Giang provinces and preparation for GPS marking activities are in place. Hatchery data collection and GPS marking has also been organised to initiate in Ha Nam, Hung Yen and Quang Tri.

Activity 6.2: Develop biosecurity guidelines and training for DAH and DLP

- A bio-security working group annual strategic planning meeting was held in October 2010 and an action plan developed through stakeholder consultation. Participants included Phu Tho SDAH, Viet Nam Veterinary Association, VSF-CICDA, PAHI, RUCED, NAFEC, AFAP, Hung Yen DARD, Institute of Animal Husbandry, DLP, Abt, FAO, USAID. Total participants 25, 15 males and 10 females. (Training for provincial technical officers: see public sector training of trainers programme 6.1)

Planned activities for the next six-month period

Component 1: Preparedness and Planning Component

Output 1: Strategy development for HPAI control

Activity 1.1: Review of HPAI Control Strategy in Viet Nam

- The consultancy for this review will be initiated when the DAH road map and the new “green book” are finalized.
- Additional technical inputs and advice will be provided by FAO technical officers. This will emanate from outputs of field work, technical meetings (such as risk assessments, HPAI epidemiology consultation etc).

Activity 1.2: Transforming the HPAI Contingency Plan

- Framework for the Animal Disease Emergencies Preparedness plan will be reviewed, finalized, translated in Vietnamese and formally handed over to DAH.

Output 2: Coordination and communication with donors and other HPAI implementing partners

Activity 2.1: Core FAO Viet Nam team supported

- Continue to ensure that all staff is in place.

Activity 2.2: Annual project meetings supported

- FAO/DAH Information Sharing Workshop on “Recent advances in the knowledge of the epidemiology of HPAI in Viet Nam and identification of research priorities” completed.

Activity 2.3: Team Meetings from Provincial to National level

- Hold quarterly FAO-Abt meeting with field staff in third and fourth quarter of the project.

Activity 2.4: Coordination and sharing of information with other players engaged in HPAI surveillance, risk assessment and value chain and risk mitigation in poultry sector

- Regular technical and coordination meetings will be held with implementing partner Abt Associates providing support to project implementation and monitoring, support and benefit from technical consultancies of mutual interest and exchange experiences including through additional technical resources (Rome based)
- Ad hoc technical meetings with government counterpart agencies and implementing partners to share results and disease control developments and to conduct expert analysis
- Continue to provide a weekly report which is submitted to USAID and USAID partners.
- Continue to update the Google Viet NamPPI calendar regularly.
- Release first volume of DAH bulletin by May 2011.

Component 2: Animal Surveillance Component

Output 3: Animal surveillance at the national, provincial, district and community level enhanced

Activity 3.1: Strengthening of veterinary laboratories, specifically biosafety and quality assurance supported

- Carry out two sets of one-day training for Tad-Info, one in NCVD and the other in RAHO 6 in HCMC.

Activity 3.2: Strengthening of core capacities for animal health in 5 focus provinces, including surveillance activities supported

- Support provided through LoAs for passive and active surveillance will end by May 2011.
- A review of the project support for the passive surveillance system is planned in June 2011.
- An evaluation of the active disease surveillance model (Routine and event-based component) will be conducted in August 2011.
- When the SOPs for HPAI Outbreak Investigation and Response are officially adopted, FAO will support on DAH's request the adequate awareness and dissemination of SOPs on HPAI OIR (adoption and implementation) and will implement SOPs training of local authorities / AISC leaders in the 5 pilot province following Government Adoption.
- Support to provinces to develop HPAI disease control plans based on risk assessments and risk analysis exercises and technical support to package USAID programme and regular provincial resources into coherent province-level disease control action plans (also linked to activity 1.1)

Activity 3.3: Further development of Monitoring and Evaluation (M&E) expertise in animal health

- FAO complete and submit the bi-annual PMP report (01 October 2010 to 31 March 2011), along with key recommendations to MEASURE in April 2011.

Activity 3.4: Veterinary epidemiology network supported

- Three more AVET courses will be carried out targeting trainees from the remaining SDAH that were not involved in previous AVET courses.
- Two Alumni Workshop of AVET Trainees will be organised for strengthening the animal health epidemiologist network in Viet Nam and improve the sharing of information.
- Preparation of risk assessment training materials and case studies to be accessible to AVET trainees and DAH epidemiology core team

Activity 3.5: Piloting surveillance for animal influenza in poultry and pig production interface

- Deferred at the request of USAID.

Activity 3.6: Active surveillance programme in a selected poultry marketing system

- This active live bird market surveillance programme will be carried out in 1 or 2 markets of Quang Tri province.

Output 4: Priority procurement for animal surveillance and laboratory supported

Activity 4.1: Procurement and maintenance

- To decide on procurement and maintenance needs based on needs assessment.

Component 3: Animal Response Component

Output 5: Effective and timely animal response efforts promoted

Activity 5.1: HPAI risk-mapping and risk analysis updated at national level

- Training course for Provincial DARD and sDAH staff on value chain analysis and practical techniques for sub-sector mapping and analysis
- Technical update/refresher training on risk assessment approaches for provincial and national epidemiologists
- Regional risk assessments/ analyses will be carried out covering the central and Red river Delta areas of Viet Nam and involving provincial sDAH and DARD offices in those areas beyond the pilot provinces
- A meeting will present the findings of the risk analysis studies and capacity building approaches carried out by the project.

Activity 5.2: Outbreak investigation capacity strengthened in focus provinces

- Continue mapping temporal and spatial distribution outbreaks of HPAI in poultry in Viet Nam and dissemination to other stakeholders as outlined above.

Activity 5.3: Cross-border analysis using a value chain methodology in three border areas

- A risk analysis study will be carried out focusing on the north-western cross-border trade corridor between Viet Nam and China and also analysing the integration of Chinese poultry into the market chains of northern Viet Nam.
- Study to propose options for managed safe cross-border poultry trade conducted and finding presented in a policy meeting

Activity 5.4: Vaccine efficacy monitoring and virus surveillance supported at national level

- Round I 2011 of PVM and VCS will be prepared in consultation with DAH with potentially a

revised protocol for the sampling based on the new vaccination programme for 2011-2012.

- A consultancy will be conducted for investigating the sub-optimal performance of vaccination in selective districts, provinces and regions.
- Experimental infection of ducks with H5N1 and H5N2 will be initiated in April 2011 to determine pathogenicity of these viruses.
- Vaccine efficacy test (Re-1, Re-5 vs. H5N1 2-3-2, H5N2 2-3-2) will continue.

Activity 5.5: Support public private partnership (PPP) and institutional strengthening in poultry production and health care system

- Design appropriate PPP action plans in target areas (PPPs will be implemented in areas where existing market chain risk reduction activities are being carried out)
- Conduct an analysis of the poultry sub-sector, identifying medium and long term trends and drivers affecting the sector with an emphasis on related veterinary public health issues.
- Area-based action plans to be implemented.

Output 6: Improved bio-security and market hygiene practices in commercial and scavenging poultry raising settings supported

Activity 6.1: Support biosecurity strengthening in pilot provinces

- Implement bio-security capacity strengthening programmes in 5 provinces (focusing on the private sector advisers) (Abt Associates to focus on the government advisory services)

Activity 6.2: Develop biosecurity guidelines and training for DAH and DLP

- Review and adapt National Guidelines developed for Industrial poultry producers under the VAHIP into a version more appropriately targeting the small holder sector.
- Training for government officers on the standards and guidelines developed (delivered at the province level).
- Carry-out evaluation of bio-security initiatives to develop good bio-security practices and ensure consolidation of lessons learned
- Hatchery data collection will be completed in Ha Nam, Hung Yen and Quang Tri. GPS marking will be completed in all five pilot provinces, including hatchery mapping.

Main challenges encountered and response provided

Government approval for the extension of this project was received on 14 February 2011, which was 4.5 months after planned start date of 01 October 2010. FAO was able to continue implementation of on-going activities related to the previous work plan but not able to initiate the new activities proposed in the project proposal covering the period 01 October 2010 to 30 September 2011.

Main progress made towards the achievement of project outcomes (from the start of the project)

Output 1: Strategy development for HPAI control in 2006-2010 supported

- Consideration of a regional approach to HPAI control rather than a provincial one has been promoted and is attracting interest as featured in the Green Book Review and several International Ministerial Conference on Avian and Pandemic Influenza (IMCAPI) documents.
- Provincial poultry sub-sector profiling has been effective in describing provincial poultry populations (including the Poultry Atlas) and DLP is considering adopting such an approach more widely.
- Risk assessment and risk-based targeting of control measures are increasingly being included in technical and policy development (however still largely restricted to the control of HPAI).

Output 2: Coordination and communication with donors and other HPAI implementing partners

- Programme management and planning and coordination of activities with USAID and other partners have been maintained. FAO has made 11 major recommendations for the Green Book Review, were well received by the Government of Viet Nam.
- FAO and Abt have a common strategy to risk reduction across the supply chain with a shared activity matrix consolidating the agencies activities into a single overall approach.

Output 3: Animal surveillance at the national, district and community level enhanced

- The project is carrying out animal surveillance activities which include support in relation to the upgrading of TAD-info and the Laboratory Information System (LabNet), development of Geographic Information Systems (GIS) at RAHO. So far, 210 officers from SDAH, 14 RAHO staff and five DAH Epidemiology staff have increased their capacity to use this software through training. Seven units of Global Positioning System (GPS) and seven licenses of mapping software

(ArcView/ArcGIS 9.2) have been provided to seven RAHOs (I-VII). A total of 55 SDAH/DAH staff have been trained on its use.

- The project has also developed a database system software for laboratory diagnostic management within the DAH's LabNet through the services of a local firm in Viet Nam. Laboratory biosafety and quality assurance are being supported and pursued.
- The SOPs for H5N1 real-time PCR have been developed and adopted. Genetic analysis of haemagglutination (HA) gene of the new virus isolates of 2009-10 showed that besides clade 1 and clade 2.3.4, there is increasing evidence of involvement of clade 2.3.2.
- A revised and updated SOP for HPAI outbreak investigation and control has been developed comprising 19 sections and 14 job cards for various officials involved in HPAI outbreak management. The English and Vietnamese versions of the SOP have been handed over to DAH for transmission to MARD for adoption as a national strategy.
- The campaign to encourage poultry farmers to report any unusual occurrences in poultry flocks, arising suspicion of an infectious disease, through TV spots and loudspeakers during the risk period (e.g. the TẾT festival), has created an increased awareness on the necessity to report diseases on time.
- The AVET initiative, to build up basic epidemiological investigation capacity in the country through Viet Nam-specific, tailor-made course curricula of nine weeks duration resulted in training of 52 veterinarians in four cohorts in 2010 and of 13 veterinarians so far in 2011.
- Active surveillance for HPAI and other poultry diseases has been launched on a pilot scale in project provinces, which will complement the community-based surveillance of Abt Associates.
- In addition, an new component has been launched in March 2011 in the event of an outbreak to early detect any potential secondary outbreaks in the neighbouring area of the index case.
- A cost effectiveness study on surveillance for HPAI has been completed. Preliminary findings suggest that there is a qualitative value in surveillance, but the cost of surveillance per outbreak reported is going up with a decrease in the number of outbreaks of HPAI in Viet Nam.
- More than 300 copies of the Wild Bird Manual have been translated into Vietnamese and distributed to 63 provinces.
- Live bird market active surveillance approaches are for the first time being adopted under the USA project approach in Viet Nam in keeping with emerging best international practices

Output 4: Priority procurement for animal surveillance and laboratory supported

- Procurement of vehicles, Information Technologies (IT) equipment, equipment sprayers and most lab consumables is complete to support AS3 and AR2, and all are in use.

Output 5: Effective and timely animal response efforts promoted

- A cross-border study in the north of Viet Nam concluded that as a result of a high financial return for poultry, smuggling across the border has not decreased but has become more elaborate, which will pose a constant risk of disease transmission. The market chain is increasingly being recognized as critical to the control of HPAI, particularly in northern Viet Nam and FAO's strategic targeting of LBMs has been validated.
- Post-vaccination monitoring and virus circulating surveillance for influenza A/H5N1, supported by this project, shows that vaccinated poultry have a protection rate of 72.10 percent at bird level. The protection rates of Muscovy ducks, Turkey, other ducks, chickens and geese were 80 percent, 80 percent, 78.90 percent, 68.05 percent and 50 percent, respectively. Prevalences of Type A and H5N1 avian influenza viruses in ducks were 0.94 percent and 0.67 percent respectively while in chickens, respective prevalences were 0.54 percent and 0 percent. There was no evidence of AI virus persistence found with the samples taken from Muscovy ducks. The AI positive samples were from Khanh Hoa and Quang Ngai provinces (Center).

Output carried over from Year II: Vaccine production

- A training course on good management practices (GMP) to key stakeholders, National Veterinary Company (NAVETCO), Viet Nam's Veterinary Vaccine Company (VETVACO) and DAH was conducted, which covered introductory-level Good Manufacturing Practice (according to the 2009 Pharmaceutical Inspection Convention / Pharmaceutical Inspection Co-operation Scheme [PIC/S] Code of GMP) and quality systems applicable to the manufacture of AI H5N1 vaccines.
- The operational appraisal of cold chain integrity is complete, and 39 provinces were provided with walk-

in cold rooms. A software for inventory maintenance of vaccine banks in provinces has been developed.

Output 6: Improved biosecurity practices in commercial and scavenging poultry raising settings supported

- Poultry sector profiling provides important tools for risk-analysis and strategic disease control planning. A guide to provincial poultry sector profiling has been developed. Poultry sector profiling has been completed for four of the five project provinces. The guidelines are currently being tested externally by an implementing partner in three non-USAID pilot provinces.
- A Biosecurity Working Group has been established which provides a forum to network information and lessons learned and build technical understanding among a peer group of agencies working to strengthen biosecurity.
- A framework for a database on biosecurity materials has been developed and its consolidation is in progress. By now, over 100 documents have been compiled in a searchable format. This is now ready for dissemination. Biosecurity activities of all agencies engaged in related work have also been mapped.
- The working group reviewed work on hatchery biosecurity, and training on the principles of biosecurity and on biosecurity auditing was provided to 16 members of the biosecurity working group. Conventional approaches to biosecurity strengthening have been reviewed and evidence gathered to support adoption of a supplementary approach focusing on private sector driven activities and adopting social marketing techniques from the human health sector.
- FAO and Abt Associates have liaised on hatchery technical training and registration schemes.
- A regional risk analysis exercise was conducted, which provided information on the character of poultry movement and production in the lower Mekong Region, identifying poultry movements and risk pathways for inter-provincial transmission of infection.

Output 7: Communication capacity supported at DAH and technical inputs to communications activities of other USAID implementing partners are provided

- FAO is supporting the calendar and sticker production and distribution for pre-TÊT festival 2010, sending out the message to call the hotline or the SDAH landline to report ill and dead poultry under the Enhanced Reporting component.
- Under the Gathering Evidence for a Transitional Strategy (GETS) project, the Academy for Educational Development (AED) produced a commercial in which the second part encouraged poultry owners to report ill and dead poultry to SDAH via a hotline or SDAH phone numbers. This has been effectively used in this project for awareness-raising purposes.
- Support to DAH communications has been maintained.
- Technical support to Abt Associates in implementing the field activities has been maintained.

I Quarter 2010

Project Monitoring Sheet: **OSRO/RAS/604/USA Baby 06**

Project title: **Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) to Viet Nam**

Reporting period: **January to March 2010¹**

Country: Viet Nam
Project title: Immediate technical assistance to strengthen emergency preparedness for Highly Pathogenic Avian Influenza (HPAI) to Viet Nam
Code: OSRO/RAS/604/USA Baby 06
Budget: USD 2 million (Phase I), USD 3.1 million (Phase II), USD 3.3 million (Phase III), USD 1.075 million (cost extension) ²
Total budget: USD 9.475 million
Effective starting date: August 2006
Planned end date: September 2010
Context of the project
The control and elimination of H5N1 Highly Pathogenic Avian Influenza (HPAI) demands a long-term approach. Viet Nam is moving from the control phase to the consolidation phase, with an ongoing need for capacity building in the veterinary services and livestock production sectors and support for vaccination and other risk reduction measures. This regional project supported by the United States Agency for International Development (USAID) is currently in its third year of implementation.
Objectives of the project
The overall objective of the project is to address the urgent short-term actions that need to be undertaken by the countries in the region to strengthen their capacities to rapidly detect the introduction of HPAI into the country and minimize its spread in case of its occurrence.
Planned activities
Output 1: Strategy development [AIMEBA code PP1]
<i>Activity 1.1 Pandemic preparedness plan review</i>
Hold preliminary discussions with the World Health Organisation (WHO) on public health planning outcomes.
<i>Activity 1.3 National HPAI control strategy review</i>
Prepare for an international workshop on the Food and Agriculture Organization of the United Nations (FAO's) Strategy Review with reference to the Green Book.
Output 2: Coordination and communication [AIMEBA code PP2]
<i>Activity 2.1 Core FAO Viet Nam team recruitment</i>
<ul style="list-style-type: none"> Recruit national biosecurity technical personnel and extend the contracts of the current personnel as per work plan.

¹ Quarter 4 of the Project Cycle.

² Project Cost Extension Request from October 2009 to September 2010.

- Determine with USAID additional fine tuning and coordination and collaboration partnerships for provincial packages developed by FAO for cycle III activities.

Activity 2.3 Annual project meeting supported

Schedule the field quarterly reporting meeting.

Output 3 : Animal surveillance [AIMEBA code AS1]

Activity 3.1 Strengthening veterinary laboratories

- National and international laboratory experts continue providing technical inputs.
- Continue conducting follow-up on-site trainings at Regional Animal Health Office (RAHO) I.
- Continue providing support to the LabNet server and tele-hosting maintenance.
- Finalize list of laboratory equipment maintenance.
- LabNet workshop is scheduled in March 2010.

Activity 3.2 Strengthening of the core capacities for animal health staff

- Continue support for field activity.
- Support DAH to improve active surveillance at risk locations (based on selected criteria) using risk mapping (based on area and season) through a Letter of Agreement (LoA). FAO is assisting Abt Associates (USAID partner) in the criteria requirements and risk analysis of district and communes selected for their activities. FAO is participating and presenting in their provincial workshops and carrying out joint missions in January 2010 to select the appropriate district and commune. FAO is also using these districts and commune selected for the above mentioned LoA with the Department of Animal Health (DAH).
- Holding of a joint National Workshop on Behaviour Change Communication (BCC) in February 2010 and presentation of an active surveillance model as determined on the basis of risk analysis carried out jointly by FAO and Abt Associates in consultation with the five pilot provinces to be proposed at the provincial level and presented to the National Government.
- Dissemination of stickers and calendars to target groups including pharmacies, Provincial Peoples Committee, Sub-Department of Animal Health (SDAH), District Veterinary Services (DVS), District People's Committee, and Chief Animal Health Works in January 2010. Distribute some to local community poultry owners along with loud speaker roaming and communicating the reporting telephone number per province. Submit samples to USAID partners before printing and distribution.
- Airing of TV spot to enhance reporting using second section of Gathering Evidence for a Translational Strategy (GETS) commercial, i.e. report dead and ill poultry to your animal health worker (AHW) and through provincial phone number report using the appropriate number per province, in February 2010.
- Carry out into 2010 implementation of cost effective study on surveillance (looking at most cost effective surveillance approaches in Viet Nam).
- Introduce the new Standard Operating Procedures to SDAH (at provincial level) and DVS (district level) during January 2010, then to community animal health worker (CAHW) in March 2010. Tailor the training to different audiences. The first training is taking place for Ha Nam and Hung Yen from 14 to 15 January 2010 and the remaining provinces are trained from 1 to 3 February 2010 in Ho Chi Minh (HCM). The five pilot provinces are using the SOPs and Job Cards for field testing for six months period. Post the edited SOPs and annexed Job Cards on DAH website for six months for unstructured feedback.
- Carry out computer skill training in five pilot provinces on 20 and 21 January 2010 in

Hung Yen, on 21 and 22 January 2010 in Ha Nam, January 2010 in Quang Tri, on 14 and 15 January 2010 in Cantho, and February 2010 in Kien Giang).

Activity 3.3 Development of M&E expertise

Continue to support Monitoring & Evaluation activities.

Activity 3.4 Support of the epidemiology network

- Continue to provide support to TADinfo.
- Continue to support the Applied Veterinary Epidemiology Training Program (AVET) coordination and activities.
- Conduct the field projects and the third module of the first session of training courses during the first quarter of 2010. Undertake the third module, following the field project to develop skills on managing disease control programs, communication and scientific report writing. Request each trainee to run their field project in their own place of work on a subject/area to be decided on the basis of the disease situation in that area and in consultation with the mentor appointed for the trainee. Mentor guidance for the implementation of the project and for a final written and oral presentation of their work at the end of the training.
- Review the AVET program based on comments and evaluation of the first session. Adjust as necessary before initiating the second training course.
- Prepare tentative schedule for the three other AVET training courses to be conducted by September 2010.

Outputs 4 and 5: Priority procurement [AIMEBA code AS3 & AR1]

Continue to support lab equipment maintenance.

Output 6: Effective and timely animal response [AIMEBA code AR2]

Activity 6.1 HPAI risk mapping updated

Coordinate with the Risk Assessment Working Group and technical advisers for further inputs.

Activity 6.2 Outbreak investigation

- Field teams in place and field visits to pilot provinces if suspicious cases reported and if outbreak occurs.
- Carry out computer skill training in five pilot provinces This is linked to Activity 3.2.
- Support global positioning system (GPS) and geographic information system (GIS) training for SDAH staff planned for March 2010 to enhance capacity for outbreak investigation.
- Continue providing support for the national telephone hotline.

Activity 6.3 Epidemiology with human health

Identify field linkages with WHO with respect to human and animal health protocols.

Activity 6.4 Value chain analysis in border areas

- Share results of the Cross-border Poultry Movement Analysis in the north of Viet Nam with various stake holders through a presentation meeting in January 2010.
- Pilot good live bird market management practices in one North and one South pilot province. Cost effectiveness of surveillance study will be conducted during the first quarter of 2010.

Activity carried over from Year 2: vaccine inventory system

Finalise development of a pilot excel spreadsheet-based system.

Activity 6.5 Vaccination monitoring

- Finalize samples lab testing and analysis of the data of the second round of 2009 post-vaccination surveillance for Influenza A/H5N1, and DAIH finalize and submit the report by February 2010.

- Produce a documented report for FAO for further transmission to DAH with recommendations for implementation of a modified post-vaccination sero-monitoring and virus surveillance in Viet Nam in order to have a better understanding of the impact of vaccination and the overall epidemiological situation.
- Review and finalize the report on vaccine efficacy trials.

Output 7: Better biosecurity practices [AIMEBA code AR3] (from Year 2)

Activity 7.1 Biosecurity strengthening in five pilot provinces

- Conduct a situation analysis for the poultry sectors, building on the baseline work carried out by Abt Associates to include greater analysis and take into consideration farm density and farm systems, market chains, and eventually, a risk assessment to better guide the allocation of resources. This work is conducted by five provincial focal points and three project coordinators. Explore avenues for collaboration with the Department of Livestock Production (DLP) for biosecurity activities.
- Recruit FAO National Biosecurity Consultant in February 2010.
- Recruit the Regional Animal Production Project Officer to support biosecurity activities in January 2010.
- Continue to conduct mapping and update the database on hatchery and breeding farm registration.
- Carry out provincial profiling for future risk analysis assessment in Kien Giang, Ha Nam, Can Tho, Quang Tri in January 2010, using existing data and conclude with a series of stakeholder meetings and participatory mapping exercises (note poultry atlas, value chain studies).
- Hatchery Registration training planned for Kien Giang and Can Tho from 20 to 22 January 2010. FAO has piloted an approach to registration of hatcheries in Can Tho that is now repeated in Ha Nam together with mapping of hatchery locations. This activity is linked to a hatchery training programme planned by Abt Associates.
- FAO and Sub-DAH is identifying a pilot poultry market in Ha Nam and Quang Tri, and working through a stakeholder approach to support measures to strengthen that market through training and infrastructure improvements.
- Pilot the Provincial Risk Analysis and Disease Control Planning Exercise. This approach is utilizing the information in the profiling studies and FAO experts are working with provincial authorities to support strategic approaches and plans for vaccine, surveillance and other control measures.

Activity 7.2 Biosecurity guidelines and training

- Develop Biosecurity Training Programme in the pilot provinces consisting of three elements (1) *Training district level DAH and Extension Officers* on biosecurity using a training module developed by FAO (2) *Training programme for Private Sector agri-vet store owners and vet pharmacies* (those who advise commercial poultry farmers); and (3) *Stakeholder Field Schools* to develop and test biosecurity interventions at the farm level to ensure that pilot approaches are effective and adopted by farmers.
- Continue to provide support to the Biosecurity Improvement Working Group.
- Provide technical biosecurity advice to partners.
- Consolidate the database of biosecurity materials.

Output 8: Communications capacity [AIMEBA code CC1]

Activity 8.1 Support National Communications Officer

Continue to translate and disseminate the *Disease Outbreak Update Report*.

Activity 8.2 Technical support for training and other materials

Continue to provide technical support to Abt Associates.

Activities undertaken during the reporting period

Output 1: Strategy development [AIMEBA code PP1]

Activity 1.1 Pandemic preparedness plan review

FAO had a preliminary discussion with WHO and it was decided that FAO will carry out a review of the Animal Health Sector and Pandemic Preparedness Plan.

Activity 1.3 National HPAI control strategy review

- The organization of an international workshop in the first quarter of 2010 on FAO's Strategy Review with reference to the Green Book was delayed.
- FAO participated to the mid-term Green Book review presentation by the Government of Viet Nam and Partnership for Avian and Human Influenza on 8 March 2010
- The output from the international mission for Green Book review has been published and is being widely distributed.

Output 2: Coordination and communication [AIMEBA code PP2]

Activity 2.1 Core FAO Viet Nam team

- A Biosecurity and Poultry Production Adviser and a new AVET Programme Coordinator have been appointed and the contracts of the current staff extended.
- Project parameters for cycle III have been analyzed with USAID and have been implemented in the project provinces.

Activity 2.3 Annual project meeting supported

The field quarterly reporting meeting was delayed.

Output 3: Animal surveillance [AIMEBA code AS1]

Activity 3.1 Strengthening of veterinary laboratories

- National and international laboratory experts continued to provide technical inputs.
- Continued to provide support to LabNet server and tele-hosting maintenance.
- List of lab equipment maintenance has been finalized.
- LabNet Workshop was postponed to May 2010.

Activity 3.2 Strengthen the core capacities of the animal health staff

- Continued support for field activities through Field Project Assistant and provincial focal points. In consultation with Abt Associates, the Terms of Reference (ToR) of the four provincial coordinators were modified.
- The methodology for Risk-Based Active Surveillance in the five project pilot provinces has been finalized in consultation with implementing partners i.e. DAH and Abt Associates.
- The stickers and calendars to enhance suspicious case reporting via hotlines were produced and distributed to target groups including AHWs and poultry farmers through Veterinary Medicines Shops.
- Television spots to enhance suspicious case reporting to animal health workers and to SDAH by hotlines in five provinces were aired particularly targeting the time of Tet Festival in February 2010.
- Similar campaign was also launched through loudspeakers campaign in risk prone borders and markets during Tet Festival.
- A cost-effectiveness study on surveillance has been launched through an LoA with

the Rural Development Centre (RUDEC) following a series of discussions between FAO, DAH and RUDEC with technical backstopping mission from FAO headquarters.

- Computer skill trainings were delivered as planned to a total of 101 DVS and SDAH staff in several provinces as follows: Hung Yen (20 participants – 13 men and 7 women); Ha Nam (14 participants – 8 men and 6 women); Quang Tri (25 participants – 21 men and 4 women); Can Tho (16 participants – 8 men and 8 women); and Kien Giang (26 participants – 25 men and 1 woman).
- The LoA FAVIE 09/54 to improve passive surveillance (cycle III) with a greater focus on strengthened field investigation in five pilot provinces of Ha Nam, Hung Yen, Quang Tri, Can Tho, Kien Giang is being implemented.
- A consultation workshop for developing a risk-based approach as a preliminary step for the Community-Based Surveillance model was held in Ha Nam province on 11 January, Hung Yen on 12 January and in HCMC on 4 February 2010 with combined staff drawn from Kien Giang Can Tho and Quang Tri SDAH and DVS. Representatives from DAH, RAHO 6 and Abt Associates also attended the Workshop.
- Linked to the above was the Joint National Workshop on Community-based Surveillance model which took place in Hanoi on 5 February 2010. Sixty-two participants (45 men and 17 women) attended the Workshop from USAID, SDAHs (Hung Yen, Ha Nam, Quang Tri, Can Tho, Kien Giang), Abt Associates, DAH, DAH branch in Ho Chi Minh City (HCMC), Regional Coordinator Unit of the Asian Development Bank (ADB) Greater Mekong Sub-Region Communicable Disease Control Project, CARE, Viet Nam Animal and Human Influenza Control and Preparedness Project (VAHIP), National Institute of Hygiene and Epidemiology (NIHE), Hanoi Agricultural University (HAU), RUDEC, Institute for Policy and Strategy for Rural Development (IPSARD), RAHO 1, RAHO 2, WHO, FAO, Academy for Educational Development (AED), Hanoi School of Public Health (HSPH), US Center for Disease Control and Prevention, General Department of Preventive Medicine and Environmental Health, Partnership for Avian and Human Influenza (PAHI), Public Health University, and Provincial Department of Preventive Medicine (Ha Nam, Can Tho, Kien Giang, Quang Tri, Hung Yen).

Activity 3.3 Development of M&E expertise

FAO reviewed and commented upon the new/revised USAID Project Management Plan (PMP) M&E Strategy forwarded by USAID.

Activity 3.4 Support epidemiology network

- Continued to provide support to TADinfo.
- The field projects undertaken by the AVET training were reviewed and mentorship was provided to all trainees. The trainees presented the final results of their field project in Hanoi on the 9th and 10th of March 2010 (last days of the third week of AVET programme) in front of some of the trainers and mentors.
- The AVET programme was reviewed by an independent national consultant on the basis of evaluation results and comments to the first training course. The recommendations of the review were discussed in the technical advisory group on 26th March and have been appropriately included for subsequent courses.
- Training on Geographic Information System (GIS) was delivered in January 2010 to 22 staff (18 men and 4 women) from DAH, RAHOs, Agriculture University of Hanoi, National Veterinary Institute and FAO staff.
- The on-site mapping to increase the use of GIS application for animal surveillance is ongoing and is being piloted in Can Tho.

Output 4 and 5: Priority procurement [AIMEBA code AS3 and AR1]

Procurement for lab equipment maintenance was deferred to the next quarter.

Output 6: Effective and timely animal response [AIMEBA code AR2]*Activity 6.1 HPAI risk mapping updated*

- The requirement to update field data has been confirmed and appropriate agencies need to be identified to carry out the task.
- Coordination with the Risk Assessment Working Group (RAWG) and technical advisers for further inputs is pending. Communication with RAWG has been carried out but RAWG is largely focused on import risk assessment and has limited capacity to focus on endemic disease. FAO through its risk capacity building work (OSRO/VIE/701/UNJ and OSRO/RAS/604/USA) is seeking to engage the RAWG on regional risk assessments through the secondment of a technical officer from the RAWG.

Activity 6.2 Outbreak investigation

- Passive surveillance under the LoA FAVIE 09/54 supported veterinary staff to undertake field investigation whenever a rumor of HPAI is reported. The project funds the laboratory diagnostic of HPAI but also a differential diagnostic with testing for other main poultry diseases (Newcastle, Duck Plague and Pasterellosis).
- Telephone hotlines and answering machines have been set up in the pilot provinces to enhance disease reporting and TV spots were aired at regular intervals to encourage reporting of HPAI.
- FAO with DAH delivered two training courses on the new SOPs and Job Cards for HPAI Outbreaks Investigation and Outbreak Response. Both courses were held in HCMC in February and March 2010 respectively, and targeted a total of 55 staff (49 men and 6 women) from DAH, SDAH, RAHOs and DVS.
- Based on these SOPs and Job Cards training courses, public veterinary staff from the five pilot provinces were requested to start using and applying these documents in real conditions at the field level. The objective is to pilot this draft version for a 6-months period (from January to June 2010) before carrying out a final review.

Activity 6.3 Epidemiology with human health

Preliminary discussions were held between FAO and WHO on how to include one section on the public health epidemiology of H5N1 influenza in human in the final version of the SOP for outbreak investigation and outbreak response developed by FAO and under field trial in the country.

Activity 6.4 Value chain analysis in border areas

- Results of the Cross-border Poultry Movement Analysis in the north of Viet Nam was shared with various stake-holders through a presentation workshop on 5 January 2010. A total of 40 representatives (28 men and 12 women) from DAH, DLP, NAFIQAD, Quarantine Station Divisions and SDAH in Lang Son and Quang Ninh, ICD (MARD), Marketing Management Sub-departments in Lang Son and Quang Ninh, USAID, CDC, USDA, Abt Associates, AVSF, FAO, Marketing Management Department (MOIT), RUDEC and IPSARD attended the workshop. Subsequently, IPSARD have drafted a policy paper on cross-border movement of poultry which FAO have provided comments on, and with FAO support will be revised based on those comments.
- Cross-border analysis of the Kien Giang- Cambodia border was assessed through the Kien Giang provincial poultry profiling exercise which included a field trip to the border. There will be a prioritisation of this specific border to include movement

corridors of greater risk in the Mekong. This work will be harmonised with that of an ADB project during a planned cross-border meeting in Cambodia in July 2010.

- A preliminary analysis of the Quang Tri – Laos border has been carried out as part of the Quang Tri provincial poultry profile. Initial findings suggest that further information is required from Laos and this cross-border work will now be linked to an ADB project, and a cross-border meeting will be held in June 2010.

Activity 6.5 Vaccination monitoring

- The report of the post-vaccination sero-monitoring and virus circulation surveillance following round 2 vaccinations for the year 2009 is awaited from DAH.
- The vaccine efficacy trial by the National Centre for Veterinary Diagnosis (NCVD), DAH including HPAI vaccine testing in 2009 and HPAI virus pathogenicity testing in ducks is ongoing.
- FAO through an international consultancy developed and passed on to DAH a report with recommendations for implementation of a modified post-vaccination sero-monitoring and virus surveillance in Viet Nam in order to have a better understanding of the impact of vaccination and the overall epidemiological situation.

Activity carried over from Year 2: vaccine inventory system

The final draft version of a pilot excel spreadsheet-based system which was developed through a national consultancy in the previous year has been received by FAO and is currently under review.

Output 7: Better biosecurity practices [AIMEBA code AR3] (from Year 2)

Activity 7.1 Biosecurity strengthening in five pilot provinces

- An international consultancy to provide advice on strengthening biosecurity programmes was carried out. This included a debriefing with DLP and Abt Associates. Recommendations included the greater use of private sector technical advisers and limited value in direct farmer training and awareness raising, the use of risk assessment to better determine and focus entry points and the need to provide poultry health information as an overall package, not solely focusing on biosecurity and HPAI.
- An informative meeting with private sector on biosecurity was held in Hanoi on 5 March 2010. The event was attended by representatives from Luong My Poultry Company, Charoen Pookhapand (CP) group, Vietnam Poultry Association, Animal Feed Company, DLP, VIRI, Directorate for Standards, and Phap Luat Newspaper.
- The Poultry Production and Biosecurity Adviser to support biosecurity activities was recruited in January 2010. ToR finalized during the last quarter of 2009.
- Hatchery and breeding farm registration pilot and design activity implementation has been completed in Can Tho (10 Communes of Co Do District). Data collection for mapping and updating the database on hatchery and breeding farm registration is now complete for Can Tho and results have already been presented to Can Tho provincial government. Based on feedback from the sub-DAH, a modified approach is being developed to launch the remaining four pilot provinces.
- Preliminary actions were carried out to develop a participatory approach for developing biosecurity guidelines. The selection of the provincial focal points has been an important step in facilitating the dialogue between the stakeholders and is ongoing. Two potential focus groups have been identified and further 2-4 groups are needed before launching the field work.
- Assessment on current animal production situation in Kien Giang and Quang Tri has been conducted through provincial poultry profiling exercises. Additionally, data is now complete for Can Tho and almost complete for Hung Yen. The data collection for current animal production is ongoing.

- A discussion paper was prepared which proposes that HPAI control programmes be subdivided into geographically distinct areas based on the emerging understanding of production systems and disease epidemiology.

Activity 7.2 Biosecurity guidelines and training

- The eight Biosecurity Working Group Meeting took place on 19 January 2010 in HCMC. A total of 48 participants (32 men and 16 women) attended the meeting. They were from the Development Alternative (DAI) Stop AI project, USAID, FAO, DLP, RAHO 6, RAHO 7, National Agriculture Extension Center in the South, Center for Animal Research and Development of Southern Viet Nam (VIGOVA), IPSARD, Institute of Agricultural Economics and Techniques in the South, HCMC University, Berkeley University, An Giang Department of Agriculture and Rural Development (DARD), An Giang AEC, Dong Thap DARD, Abt Associates, CARE, AusAID, VAHIP, Asian Veterinary and Livestock Services (ASVELIS), Vietnam Poultry Association (VIPA), and SDAH-HCMC. The working group considered duck production and how to improve biosecurity within the duck production systems. FAO produced a discussion paper for the meeting.
- The database of biosecurity materials is being consolidated and will be shared with relevant partners. Currently ongoing.
- FAO continued to provide technical biosecurity advice to partners.

Output 8: Communications capacity [AIMEBA code CC1]

Activity 8.1 Support provided to the National Communications Officer

Disease outbreak update reports continued to be translated and disseminated.

Activity 8.2 Technical support for training and other materials

- Identification of key information, education and communication materials including how they will be delivered is ongoing and coordinated by the technical expert and the communications assistant.
- A number of resources were identified as needed during the International Biosecurity consultancy and these will now be developed together with a private sector extension system to enhance the delivery of such materials.
- A road show was carried out in the five pilot provinces from 4 to 6 February 2010. A car with speakers and one large sticker on each side of the car circulated around main cities in the pilot provinces (Hung Yen, Ha Nam, Quang Tri, Can Tho and Kien Giang). Furthermore, 200 stickers, banners and 100 calendars were distributed among the provinces' population to enhance awareness on the risk of HPAI outbreak, especially during the TET festival period.

The project funded Communication Assistant and FAO staff participated in the BCC Working Group meeting on 22 January 2010.

Planned activities for the next quarter

Output 1: Strategy development AIMEBA code PP1]

Activity 1.1 Pandemic preparedness plan review

FAO will carry out a discussion with potential international consultants to explore if the Animal Health component of the Pandemic Preparedness Plan could be carried out even if the Human Health component is taken up later by WHO. Consultative meetings will be held with DAH and WHO on the feasibility of reviewing the Animal Health component unilaterally.

Activity 1.2 Contingency plan for animal disease outbreak

Review of the contingency plan for animal disease outbreak was discussed with DAH and the opinion emerged that the contingency plan is not much in use any more in view of the

Operational Strategy described in the Green Book. Therefore, this activity needs to be removed from the project workplan.

Activity 1.3 National HPAI control strategy review

Following the presentation of the Green Book mid-term review on 8 March 2010 by the GoVN, there is a probability that the Green Book will be replaced with a 'Blue Book' delineating further strategy for HPAI control from year 2010 - 2015. FAO waits for GoVN decision before planning further actions.

Output 2: Coordination and communication [AIMEBA code PP2]

Activity 2.1 Core FAO Viet Nam team

- Extend and renew contract of staff as and when necessary.
- Continue coordination and planning meetings with all stakeholders.

Activity 2.3 Annual project meeting supported

Schedule the field quarterly reporting meeting.

Output 3 : Animal surveillance [AIMEBA code AS1]

Activity 3.1 Strengthening of veterinary laboratories

- Continue providing technical inputs by national and international laboratory experts.
- Continue providing support to the LabNet server and tele-hosting maintenance.
- Organize the maintenance of the lab equipment.
- Labnet Workshop will be held from 11 to 13 May 2010 in Ho Chi Minh City (HCMC).
- Support and coordinate the RAP sponsored/organized training on Animal Health Influenza Surveillance Training Workshop to be held in HCMC in April 2010.

Activity 3.2 Strengthening of the core capacities for animal health staff

- Continue providing technical inputs by national and international experts.
- Continue support for field activity.
- A LoA with DAH on the implementation of Risk-Based Active Surveillance will be prepared in April 2010.
- Stickers and calendars have been provided to veterinary medicine shops for distribution to farmers whenever they have issue among their poultry flock. This activity is ongoing until the end of the project.
- Monitor the LoA with RUDEC on the cost-effectiveness study on surveillance.
- A final review of SOPs for outbreak investigation and response is planned in July 2010.
- Monitor the implementation of the passive surveillance programme.

Activity 3.3 Development of M&E expertise

- A joint FAO-Abt M&E 1-day training Workshop will be organized in April 2010 targeting provincial coordinators focal points in pilot provinces, Abt Associates staff and Provincial Department of Preventive Medicine. The main topics would include general M&E principles and USAID PMP.

Activity 3.4 Support of the epidemiology network

- Continue providing support to TADinfo.
- Continue supporting AVET coordination and activities. The second AVET training is planned to start on 10 May 2010. Trainees of this second AVET course will be selected particularly from SDAH of the project's (OSRO/RAS/604/USA Baby 06)10 pilot provinces for Year 2 and Year 3.
- Prepare tentative schedule for the two other AVET training courses to be conducted in September 2010.

Outputs 4 and 5: Priority procurement [AIMEBA code AS3 & AR1]

Support procurement for lab equipment maintenance.

Output 6: Effective and timely animal response [AIMEBA code AR2]*Activity 6.1 HPAI risk mapping updated*

Coordinate with RAWG on an approach to updating risk mapping for HPAI.

Activity 6.2 Outbreak investigation

- Field teams in place and field visits to pilot provinces if suspicious cases reported and if outbreak occurs.
- Continue providing support for the enhanced reporting and strengthened outbreak investigation and response through the LoA FAVIE 09/54.

Activity 6.3 Epidemiology with human health

Identify field linkages with WHO with respect to human and animal health protocols.

Activity 6.4 Value chain analysis in border areas

- Cost-effectiveness of surveillance study will be ongoing during the second quarter of 2010.
- Review market risk analysis study (FAO-RVC-DAH from OSRO/VIE/701/UNJ Project), risk assessment of market chain in Kien Giang and risk analysis work carried out by Abt Associates.
- Develop work plans for risk mitigation measures in the pilot poultry markets (Dong Ha Central market and Phu Ly Central market) through a stakeholder approach.

Activity carried over from Year 2: vaccine inventory system

Finalise the development of a pilot excel spreadsheet-based system.

Activity 6.5 Vaccination monitoring

- DAH will submit and finalise the report based on LoA FAVIE 09.15 by May 2010 with the analysis of the data of the second round of 2009 post-vaccination surveillance for Influenza AH5N1.
- FAO will sign a new LoA with DAH for the first round of 2010 for post-vaccination monitoring and virus circulation.
- Report on vaccine efficacy trials will be reviewed and finalized.

Output 7: Better biosecurity practices [AIMEBA code AR3] (from Year 2)*Activity 7.1 Biosecurity strengthening in five pilot provinces.*

- Document an approach to hatchery registration based on experiences in the Can Tho district trial and launch a hatchery registration and mapping exercise in the remaining four provinces.
- Complete provincial profiling for future risk analysis assessment in Ha Nam and Can Tho using existing data, and conclude with a series of stakeholder meetings and participatory mapping exercises.
- Conduct a risk analysis (RA) exercise for region 7 including provincial risk analyses exercises for Can Tho and Kien Giang Provinces and pilot a regional approach to risk analysis, building capacity at the provincial level to carry out risk assessments. The risk analysis exercise will utilize provincial profiles to develop a regional poultry profile. Outcomes of the RA exercise will support strategic approaches and plans for vaccine, surveillance and other control measures within the region.
- Commence implementation of monthly poultry commodity price monitoring in all five pilot provinces.

Activity 7.2 Biosecurity guidelines and training

- Biosecurity Training Programme will be developed in the pilot provinces and will consist of three elements (1) *Training for district level DAH and Extension Officers* on biosecurity using a training module developed by FAO (2) *Training programme for Private Sector agri-vet store owners and vet pharmacies* (those who advise commercial poultry farmers); and (3) *Stakeholder Field Schools* which will develop and test biosecurity interventions at the farm level to ensure pilot approaches are effective and adopted by farmers.
- Continue to provide support to the Biosecurity Working Group through technical meetings and the dissemination of documents.
- Provide technical biosecurity advice to partners.
- Consolidate the database of biosecurity materials.
- Carry-out a review of biosecurity activities and provincial programmes to determine what has been effective and why, and to support provinces to develop strategic approaches to biosecurity strengthening and to develop good practices and lessons learned for biosecurity activities.

Output 8: Communications capacity [AIMEBA code CC1]

Activity 8.1 Support National Communications Officer

Continue to translate and disseminate the Disease Outbreak Update Report.

Activity 8.2 Technical support for training and other materials

- FAO will liaise further with DAH and assess the need for technical and or financial support for the development and the production of a DAH bulletin.
- FAO will compile all BCC material produced and will transmit hard and /or soft copy to Abt Associates as requested by the BCC Working Group.
- FAO will pilot a public-private sector model for the delivery of poultry farmer extension information.

Main challenges encountered and response provided

No major challenges were encountered during the reporting period.

Main progress made towards the achievement of project outcomes (since the start of the project)

Output 1: Strategy development [AIMEBA code PP1]

- A risk-based approach to disease control has been developed and USAID project activities are being strengthened and developed to ensure that risk reduction is cross-cutting strategy in each. FAO is advocating and building capacity within partners for a progressive shift from mass application of disease control measures to smart disease control based on risk analysis and the optimum utilization of resources.
- Consideration of a regional approach to HPAI control rather than a provincial one has been promoted and is attracting interest, featuring in Green Book review and several International Ministerial Conference on Avian and Pandemic Influenza (IMCAPI) documents.
- Provincial poultry sub-sector profiling has been effective in describing provincial poultry populations (including the Poultry Atlas) and DLP is considering adopting such an approach more widely.

Output 2: Coordination and communication [AIMEBA code PP2]

- Programme management and planning, and coordination of activities with USAID and other partners have been maintained. FAO has made 11 major recommendations for the Green Book Review which were well received by the Government of Viet

Nam and the recommendations were taken into consideration during the Government Green Book Review in November 2009 and presented in March 2010.

- The Biosecurity Working Group has widely networked information and lessons learned between a large number of agencies working on biosecurity and poultry production. Significant capacity has been built through the information exchange and network created which has now been taken over by DLP

Output 3: Animal surveillance [AIMEBA code ASI]

- The project is carrying out animal surveillance activities which include support in relation to upgrading of TAD-info® and the Laboratory Information System (LabNet), development of GIS at the Regional Animal Health Office (RAHO), Short Message Service (SMS) pilot study and Veterinary Epidemiology capacity building.
- TAD-info® has served as the official livestock disease reporting system of the Government of Viet Nam for HPAI and other priority diseases. The disease reporting system has been established in 64 provincial SDAHs.
- A database of the administrative map of Viet Nam has been procured and upgrading of TAD-info® modules has been completed and downloaded on DAH training server with technical support from FAO headquarters. Today 210 officers from SDAH, 14 RAHO staff and five DAH Epidemiology staff have increased their capacity to use this software through training.
- Seven units of Global Positioning System GPS and seven licenses of mapping software (ArcView/ArcGIS 9.2) have been provided to seven RAHOs (I-VII). A total of 55 participants from 7 RAHOs were trained during the basic and refresher training course on ArcGIS and GPS along with on-site mapping which has increased the use of GIS application for animal surveillance in Viet Nam.
- The project has also developed a Database System Software for Laboratory Diagnostic Management within the DAH's LabNet through the services of a local firm. Laboratory biosafety and quality assurance is being upgraded and standardized by the introduction of powered air purification respirator and the homogenizer at NCVD at all diagnostic centres.
- The SOPs for H5N1 Reverse Transcriptase Polymerase Chain Reaction (RT-PCR) has been modified with new N1 primers. Genetic analysis of new virus isolates of early 2009 has been done for HA gene sequence, which showed that the similar virus continued to circulate in 2009. The initiative to add epidemiological information to the genetic sequence data from Viet Nam in the public domain has started. Follow-up on-site trainings at the NCVD and some RAHOs are ongoing including the validation of current protocol of molecular diagnosis with new viruses isolated in 2009.
- In 2009 FAO staff working closely with DAH to finalise SOP and Job Cards to create a sound foundation on which Viet Nam's veterinarians can standardise their approaches to the control of Avian Influenza. This has been well received by the government. DVS, SDAH and CAHW training will be carried out in 2010. Also the Animal Health component can easily be modified for use with other important animal diseases such as Duck Plague, Rabies and Foot and Mouth Disease.
- The campaign on encouraging poultry farmers to report any unusual event in poultry flocks leading to suspicion of an infectious disease through TV spots and loudspeakers during the risk period, e.g. TET festival, has created better awareness on the necessity to report diseases on time.
- The AVET initiative, specifically on curriculum development and start up of short training courses, is one of the most important capacity building initiatives being undertaken to improve the planning, implementation and monitoring of HPAI control

in Viet Nam. The first batch of trainees have completed the AVET Programme and the second batch is expected to start from 10 May 2010. Availability of field staff with veterinary epidemiology training will enhance epidemiological skills at the field for better understanding of HPAI disease transmission and maintenance cycle.

Output carried over from Year 2: Wild bird surveillance [AIMEBA code AS2]

More than 300 copies of the Wild Bird Manual have been translated into Vietnamese and distributed to 63 provinces.

Output 4 and 5: Priority procurement [AIMEBA code AS3 & AR1]

Procurement of vehicles, IT equipment, equipment sprayers and most lab consumables is complete to support AS3 and AR2 and all are in use.

Output 6: Effective and timely animal response [AIMEBA code AR2]

- Cross-borders study in the North of Viet Nam concluded that due to high financial return for poultry, smuggling across the border has not decreased but has become more elaborate. The stakeholders place greater value in potential income than the risk of disease infection for their domestic poultry flocks. As a result, they do not apply adequate measures to prevent the disease. Prevention of cross-border movement is constrained by limited human resource, a large geographic area, plus active and sophisticated informal/illegal trading systems.
- Post-vaccination monitoring and virus circulating surveillance for Influenza AH5N1, supported by this project shows that about 60 percent of vaccinated poultry birds and about 75 percent of poultry flocks that have had appropriate vaccination generate a good protection against influenza virus. However, virus circulation surveillance demonstrates that AI virus is circulating widely throughout the national flock. FAO is providing epidemiological advisory to DAH to ensure that this important activity is carried out using a methodology which will meet the highest international standards.

Output carried over from Year 2: Vaccine production

- A training course on GMP was conducted for key stakeholders such as Viet Nam's National Veterinary Company (NAVETCO), Viet Nam's Veterinary Vaccine Company (VETVACO) and DAH. The training course covered introductory-level Good Manufacturing Practice (according to the 2009 PIC/S³ Code of GMP) and quality systems applicable to the manufacture of AI⁴ vaccines. Audits of two vaccine production facilities were conducted, with a focus on the AI vaccine processes and emphasis on packaging of vaccines and the associated facilities including GMP compliance. The project has continued to provide technical support to the needs assessment and planning on domestic AI vaccine production, including hiring a national consultant to analyse the current situation of vaccine inventory at the field level and develop a database for vaccine inventory system.

Output carried over from Year 2: cold chain appraisal

The operational appraisal of cold chain integrity is complete and 39 provinces were provided with walk-in cold rooms.

³ PIC/S = Pharmaceutical Inspection Convention / Pharmaceutical Inspection Co-operation Scheme

⁴ AI = Avian Influenza H5 N1

Output 7: Better bio-security practices [AIMEBA code AR3] (from Year 2)

- Provincial profiling and risk analysis work is providing implementers with useful information to better target biosecurity initiatives. This includes assessments of live bird markets and description of risk pathways to and from those markets.
- A Biosecurity Working Group has been established to act as a focal point to implement the biosecurity activities considered to be a major long-term risk reduction initiative (also see above- Coordination).
- A framework for a database on biosecurity materials has been developed and its consolidation is in progress. The approach to develop this database was developed during one of the Biosecurity Working Group's meetings and over 100 documents have now been compiled in a searchable format. This is now ready for dissemination. Biosecurity activities of all agencies engaged in related work have also been mapped.
- The working group also reviewed work on hatchery biosecurity, and training on the principles of biosecurity and on biosecurity auditing was provided to 16 members of the biosecurity working group. Longer-term, tailored biosecurity technical materials and risk communication approaches will be developed through focus groups and stakeholder discussions to ensure that biosecurity measures are more demand-driven and appropriate. The selection of provincial focal points is an important first step in facilitating the dialogue between the stakeholders and has contributed to enhance strengthening of biosecurity practices in the five pilot provinces.
- Continuing technical support has been provided to partners including technical reviews and extensive comments to provincial package implementing partners, Abt Associates and AED, relating to their biosecurity training programmes.
- FAO and Abt associates have liaised on hatchery technical training and registration schemes. The biosecurity coordinator will document existing registration practices in operation in selected provinces. Abt and FAO will jointly develop an approach to be piloted in USAID funded provinces.

Output 8: Communications capacity [AIMEBA code CCI]

- A total of 3 000 copies of calendar 2008 with 12 key messages on avian influenza prevention and control have been produced and distributed to 63 provinces, 45 districts, 503 communes and other relevant government agencies, donors and NGOs. FAO is repeating the calendar and sticker production and distribution for pre-Tet 2010 giving one message: to call the hotline or SDAH landline to report ill and dead poultry under the Enhanced Reporting Component. USAID partners are participating in the review of materials.
- In 2008, FAO also produced a 10-minute documentary about Viet Nam's experiences in dealing with HPAI from the animal health perspective. A total of 200 Video CD in Vietnamese, 300 DVDs in English and 200 DVDs in Vietnamese were prepared and widely distributed. Under the GETS project, AED produced a commercial, for which the second part will be used in the pilot provinces for this project, which encourages poultry owners to report ill and dead poultry to SDAH via Hotline or SDAH phone numbers.
- Support to DAH communications has been maintained.
- Technical support to Abt Associates in implementing field activities has been maintained.

2nd Quarter 2010

Project Monitoring Sheet: OSRO/RAF/717/USA**Reporting period:** April – June 2010

Regional component: OSRO/RAF/717/USA
Country: Regional West and Central Africa
Project title: HPAI early warning, early response and preparedness strategy support in western and central Africa
Code: OSRO/RAF/717/USA
Budget: USD 432 000 (Phase I), USD 1 000 000 (Phase II) Total budget: USD 1 432 000
Effective starting date: 1 March 2008
Planned end date: 30 September 2010
Context of the project Highly Pathogenic Avian Influenza (HPAI) in western and central Africa is effectively prevented and controlled through improved early warning and diagnosis capacities, effective national plans and enhanced coordination and information sharing between neighbouring countries.
Objectives of the project The main objective is to assist countries in western and central Africa in enhancing their capacities to prevent the introduction of HPAI and to respond efficiently to HPAI outbreaks. The goal is to limit the spread of the disease in the sub-region and to minimize its negative social and economic impacts. Improving each country's capacity to prevent and control HPAI will accomplish the following: <ul style="list-style-type: none"> • Protect human health and prevent a human pandemic; • Maintain and develop the poultry sector as a valuable source of protein and income for all actors within the poultry chain (including women and the rural population); • Strengthen national and regional capacities to address other transboundary animal diseases (TADs).
Planned activities <u>A. Activities related to project Phase I</u> Record the commentary for polymerase chain reaction (PCR) standard operating procedures (SOPs) video (English and French). Post on the website the SOPs for an operational contingency plan (CP). <u>B. Activities related to project Phase II</u> Output 1.1: Establish regional epidemio-surveillance networks to support the national network. <i>1.1.1 Support passive and active surveillance in key countries.</i> Finalize the various studies on active surveillance in Burkina Faso, Côte d'Ivoire and Benin.

Output 2.1: Through RESOLAB networking activities, strengthen diagnostic capacity at laboratory and field levels.

2.1.1. Promote laboratory diagnostic test quality assurance and inter-laboratory proficiency testing rounds and avian influenza (AI) and Newcastle disease inter-laboratories proficiency testing round.

Analysis and distribution of 2009 AI and Newcastle disease proficiency test exercise that involved 21 out of 23 network labs.

Output 3.1: Poultry associations are supported and private-public partnerships are enhanced (regional and national) for a better understanding of the sector and the identification of practical and cost-effective investments/measures.

3.1.1 Building on previous poultry sector reviews, develop sustainable private-public partnerships to produce and maintain updated information and data (including geo-referenced maps) on poultry sector responses to veterinary services and private sector needs. (Benin, Burkina Faso, Côte d'Ivoire, Ghana and Togo)

Finalize the consultation process and prepare a project document for Benin, Burkina Faso, Côte d'Ivoire, Ghana and Togo.

Advocate for the development of a private-public database/information system on the poultry sector as a means to better prevent and control HPAI and any other existing or emerging disease in the poultry sector.

Output 3.2: Improve biosecurity throughout the poultry chain.

3.2.1 Building on Stamping out Pandemic and Avian Influenza (STOP AI)/FAO training workshop, develop and disseminate multimedia modular training tools on biosecurity, including cost and benefit studies.

Finalize the development of the toolkit, including training modules, technical brochures and documented best practices for biosecurity. The training tools will be published and distributed to targeted users.

3.2.2 Conduct biosecurity pilot operations on live bird markets (LBM) (Benin, Togo, Guinea Bissau, Ghana, Côte d'Ivoire, Burkina Faso, Gambia and Niger).

The implementation of operations in Benin, Burkina Faso and Côte d'Ivoire will be completed. Implementation should be well advanced in Mali.

Output 3.3: Poultry and poultry product zoo sanitary certificate has been tested and adapted with the Economic Community of West African States (ECOWAS) for use at the regional level.

3.3.1. Support ECOWAS for the promotion and adoption at the regional level of relevant zoosanitary and trade regulations and support the use, in a pilot phase, of a harmonized zoosanitary certificate for poultry and poultry products.

The implementation of the field test operations will be launched and completed in Benin, Burkina Faso, Côte d'Ivoire, Ghana, Mali and Togo (covering 16 border posts). Results and recommendations resulting from these tests will be made available.

Output 4.1: Epidemio-surveillance and laboratory network data collection and management are actively supported through national databases and specific gateways within the regional website and Geographic Information System (GIS) services are developed.

4.1.1 Support networking activities through the existing website to facilitate overall information sharing and networking harmonization on laboratory diagnosis, epidemio-surveillance, socio-economics and production and related communications. This is also a tool to improve the donor visibility in Africa.

News and updates from the network will continue to be published on the website.

4.1.2 Implement and improve data management on animal health issues (zoo sanitary database), including active collaboration with the Strategy for Revitalization of Agriculture (SRA)/African Union – Inter-African Bureau for Animal Resources (AU-IBAR) project. This will facilitate a Pan-African information/knowledge management component linked to other Regional Animal Health Centres (RAHCs).

Provide computers, install TADinfo and train veterinary service personnel in Niger and Gambia.

Activities undertaken during the reporting period

A. Activities related to project Phase I

- Record the commentary for PCR SOPs video (English and French): still to be done.
- Post on the website the SOPs for an operational CP: As an example for the sub-region, the compensation operational plan developed for Togo has been posted (<http://www.fao-ectad-bamako.org/fr/Modalites-de-paiement-des>) as well as the World Bank (WB), International Office of Epizootics (OIE) and Food and Agriculture Organization of the United Nations (FAO) recommendations on this subject.

B. Activities related to project Phase II

Output 1.1: Establish regional epidemio-surveillance networks to support the national network.

1.1.1 Support passive and active surveillance in key countries.

AI active surveillance protocol among domestic ducks has been finalized with Padova and International Cooperation Centre of Agricultural Research for Development (CIRAD) for Burkina Faso, Côte d'Ivoire and Benin. Financial supports for sampling and lab testing have been granted to the said countries.

Output 2.1: Through West and Central Africa Veterinary Laboratory (RESOLAB)

networking activities, strengthen diagnostic capacity at laboratory and field levels.

2.1.1. Promote laboratory diagnostic test quality assurance and inter-laboratory proficiency testing rounds for AI and Newcastle disease.

The results of the 2009 inter-laboratory proficiency testing rounds for AI and Newcastle disease have been disseminated in April 2010. The analysis of compiled results is ongoing. This exercise involved 18 out of the 23 labs of the RESOLAB network.

Output 3.1: Poultry associations are supported and private-public partnerships are enhanced (regional and national) for a better understanding of the sector and the identification of practical and cost-effective investments/measures.

3.1.1 Building on previous poultry sector reviews, develop sustainable private-public partnerships to produce and maintain updated information and data (including geo-referenced maps) on poultry sector responses to veterinary services and private sector needs. (Benin, Burkina Faso, Côte d'Ivoire, Ghana and Togo)

In Burkina Faso and Togo a quite dynamic consultation process between stakeholders took place and resulted in a first version of a project document formulated in a fully participatory way. Further exchanges are happening including the Emergency Centre for Transboundary Animal Disease Operations (ECTAD)-Bamako to jointly improve the document, particularly in view of its submission to donors and the sustainability of the structure to be set.

In Benin and Cote d'Ivoire, there was a disagreement between stakeholders on where to locate the database, which had delayed the work. Difficulties seem to have been overcome, and it is expected that the first version of the project documents will be submitted during the first fortnight of July.

On various occasions (missions, meetings, etc.), the ECTAD-Bamako experts had the opportunity to advocate for the development of such a private-public database/information system on the poultry sector, as a means to better prevent and control HPAI and any other existing or emerging diseases in the poultry sector.

Output 3.2: Improve biosecurity throughout the poultry chain.

3.2.1 Building on STOPAI/FAO training workshop, develop and disseminate multimedia modular training tools on biosecurity, including cost and benefit studies.

The developed toolkit, including training modules, technical brochures and documented best practices for biosecurity, will be widely distributed to targeted users and parts of it will be posted on the FAO-ECTAD website: www.fao-ectad-bamako.org.

3.2.2 Conduct biosecurity pilot operations on LBM (Benin, Togo, Guinea Bissau, Ghana, Côte d'Ivoire, Burkina Faso, Gambia and Niger).

The biosecurity pilot operations, designed in close collaboration with market actors and administrators as well as the respective national veterinary services are being implemented in Benin, Burkina Faso and Côte d'Ivoire.

Output 3.3: Poultry and poultry product zoo sanitary certificate has been tested and adapted with ECOWAS for use at the regional level.

3.3.1. Support ECOWAS for the promotion and adoption at the regional level of relevant zoosanitary and trade regulations, and support the use, in a pilot phase, of a harmonized zoosanitary certificate for poultry and poultry products.

Sixteen border posts in Benin, Burkina Faso, Côte d'Ivoire, Ghana, Mali and Togo had been identified in March to perform a field test of the zoosanitary certificate. During the reporting period, Letters of Agreement (LoAs) have been signed in each country with the veterinary services who will be responsible for the implementation of the test.

Output 4.1: Epidemio-surveillance and laboratory network data collection and management are actively supported through national databases, and specific gateways within the regional website and GIS services are developed.

4.1.1 Support networking activities through the existing website to facilitate overall information sharing and networking harmonization on laboratory diagnosis, epidemio-surveillance, socio-economics and production and related communications. This is also a tool to improve the donor visibility in Africa.

News and updates from the network will continue to be published on the website.

4.1.2 Implement and improve data management on animal health issues (zoo sanitary database), including active collaboration with the SRA/AU-IBAR project.

National Epidemiology Units of Côte d'Ivoire and Guinea Bissau were provided with computers and TADinfo software. The training for the software use was carried out by an ECTAD expert from Bamako.

The *coup d'Etat* that occurred in Niger has led to a postponement of the installation in that country.

Planned activities for the next quarter

A. Activities related to project Phase I

Record the commentary for PCR SOPs video (English and French).

B. Activities related to project Phase II

Output 1.1: Established regional epidemio-surveillance networks to support the national network.

1.1.1 Support active surveillance in key countries (Burkina Faso, Côte d'Ivoire and Benin)

Output 3.1: Poultry associations are supported and private-public partnerships are enhanced (regional and national).

3.1.1 Building on previous poultry sector reviews, develop sustainable private-public partnerships to produce and maintain updated information and data on poultry sector responses to veterinary services and private sector needs.

Finalize the national project documents for Benin, Burkina Faso, Côte d'Ivoire and Togo.

Output 3.3: Poultry and poultry product zoo sanitary certificate has been tested and adapted with ECOWAS for use at the regional level.

3.3.1. Support ECOWAS for the promotion and adoption at the regional level of relevant zoosanitary and trade regulations, and support the use, in a pilot phase, of a harmonized zoosanitary certificate for poultry and poultry products.

Output 4.1: Epidemio-surveillance and laboratory network data collection and management are actively supported through national databases and specific gateways within the regional website, and GIS services are developed.

4.1.1 Support networking activities through the existing website to facilitate overall information sharing and networking harmonization on laboratory diagnosis, epidemio-surveillance, socio-economics and production and related communications.

Main challenges encountered and response provided

There is still a need for closer cooperation with technical organizations such as: the AU-IBAR, the OIE and other implementing partners (USDA/APHIS, STOP-AI). There is also a need for a better support by or anchorage with Regional Economic Communities (RECs) such as ECOWAS and West African Economic and Monetary Union (UEMOA) in western Africa and Economic Community of Central African States (ECCAS) and Central African Economic and Monetary Community (CEMAC) in central Africa. This would enhance the impact and sustainability of the various activities and networks put in place by FAO-ECTAD under USAID financial support in the region.

Some activities were difficult to implement owing to the high level of political input required. This was the case for testing the regional zoo sanitary certificates in order to improve the traceability and biosecurity in the trade of poultry and poultry products.

The adoption of participatory approach in the design of biosecurity operations in LBMs and the setting of national poultry data centre delayed the beginning of the implementation of such activities.

Main progress made towards the achievement of project outcomes (from the start of the project activities)

The activities planned under this project were aimed at national and regional technical capacity building in order to improve preparedness and early warning and response to HPAI outbreaks. For the project extension phase, a range of activities was carried out: disease intelligence and biosecurity, information and data management. On the human resources side, these activities relied mainly on FAO-ECTAD expertise at the regional animal health centre in Bamako, but also on national expertise in some selected countries (via national consultants (NCs)). To date, most of these activities have been implemented.

This project contributes significantly to the efforts made by countries, regional organizations, and technical and financial partners to build capacities for prevention and control of HPAI and other similar TADs in the region.

This USAID support contributed significantly to the following major achievements:

- Livestock sector and animal health issues in particular are gaining more recognition/attention from the general public and the policy decision-makers;
- Good biosecurity practices promoted by livestock actors (producers, traders, transporters, etc.) to cope with disease-related constraints and to improve the management of their flocks for safe animal production;
- Public-private partnerships to encourage a better integrated approach towards controlling HPAI and other poultry diseases;
- Useful and updated data were collected, analyzed and disseminated to target audiences through the various networks put in place: RESOLAB (laboratory network), RESEPI (epidemiology network), RESECOP (socio-economics and productions network) and RESOCOM (communication network). Information in both English and French is made available to animal health stakeholders through the FAO-ECTAD website: www.fao-ectad-bamako.org;
- Support to all AI outbreak containment in West Africa and Cameroon through provision of personal protective equipment (PPE), technical advice, etc;
- Laboratories were provided with required equipment and their technical staff regularly trained;
- Capacities of national epidemio-surveillance and diagnostic laboratories were enhanced for timely and efficient outbreak investigation, disease laboratory confirmation and response.

Indeed one of the most significant achievements was also the launching and support of the RESOLAB network in December 2007 in collaboration with the United States Department of Agriculture (USDA)/ Animal and Plant Health Inspection Service (APHIS). This launching of RESOLAB was done in collaboration with OIE and AU-IBAR within the framework of the RAHC of Bamako, Mali. The RESOLAB network is coordinated by FAO-ECTAD with the objective to enhance the effectiveness and efficiency of the 23 national veterinary diagnostic laboratories of western and central Africa. Since its launching, the RESOLAB organized the training of more than 170 lab technicians from the 23 countries on HPAI laboratory diagnosis and on quality assurance including CPs and emergency procedures. The network's main laboratories were assessed, and all technicians participated in two proficiency test rounds organized in collaboration with OIE/FAO reference laboratory for AI and Newcastle disease of Padova. Three annual coordination meetings were held and publications on West Africa isolates of AI virus strain were made in scientific journals¹. The most significant achievements of RESOLAB thus far, owing to its local collaborative arrangements put in place, is the reduction of HPAI laboratory confirmation delay from an average of 30 days in 2006 (Niger, Nigeria, Cameroon, etc.) to two days (Togo) and one day (Nigeria) in 2008.

The regional networking approach and the sharing of information and expertise have significantly contributed to the harmonization of strategies and protocols and to capacity building, a key element for sustainability.

Biannual Report for the IDENTIFY Project

Reporting institutions: FAO

Reporting period: 1 April - 30 September 2011

Planned activities: 1 October 2011 - 31 March 2012

Project Title: IDENTIFY

Regional component: Global
<p>Countries: 4 "hot spots":</p> <ul style="list-style-type: none"> - Congo Basin: Uganda, Democratic Republic of Congo, Cameroon, Republic of Congo, Tanzania, Gabon, Equatorial Guinea, Rwanda, Central African Republic, South Sudan - Southeast Asia: Cambodia, China, Indonesia, Lao Peoples Democratic Republic, Malaysia, Myanmar, Philippines, Thailand, Vietnam - South Asia: Bangladesh, India, Nepal (future activities pending)
Project title: IDENTIFY
Code: OSRO/INT/902/USA
Budget: US\$ 16.5 million (US\$ 13 million without OIE : US\$ 3 million for first year, US\$ 4 million for second year, 6 million for October 2011-September 2012)
Effective starting date: December 2009
Planned end date: 30 September 2012
<p>Context of the project</p> <p>This project is part of a complex program--Emerging Pandemic Threats (EPT)--designed by USAID and aimed to find and implement mechanisms to detect disease emergences, especially from wild life. The One Health concept is an important component of the whole program. The IDENTIFY project is implemented jointly by the Food and Agriculture Organization of the United Nations (FAO), the World Organisation for Animal Health (OIE), and the World Health Organization (WHO).</p>
<p>Objectives of the project</p> <p>The IDENTIFY project is intended to strengthen diagnostic capacities through the development of laboratory networks spanning animal and human sectors with the ultimate aim of enabling countries to meet international obligations for disease reporting. Accurate and timely detection of known pathogens should facilitate the rapid recognition of newly emerging pathogens. International reference laboratories capable of fully characterizing the emerging pathogens are an integral part of these networks.</p> <p>The project focuses on several parts of the world defined by the USAID as "hot spots" for emerging diseases where they are more likely to happen: Congo Basin, Southeast Asia, Amazon Basin and Gangetic Plains.</p> <p>The project will collaborate with the other arms of the EPT program: PREDICT, RESPOND, PREVENT, and USAID's DELIVER project. Collaborations are defined through the Lines of Work (LoW) defined by USAID: Pathogen Detection, Outbreak response, Risk determination, and Risk reduction. Each LoW has a defined work plan with activities and sub-activities to which every project team has agreed upon their level of participation (support, participate or lead).</p>
<p>Planned activities</p> <p>A tripartite work plan had been established for years 1 and 2 at the headquarters level. The approach to the project had been fully developed and agreed to among the three partners. For the description of outputs, activities and sub-activities, refer to Work plan Year Two.</p> <p>The planned activities and sub-activities (1 October 2011 - 31 March 2012) are described in the</p>

FAO IDENTIFY Year three Work Plan (submitted on 1 Sept 2011), FAO Log Frame and Gantt Chart (submitted on 6 Oct 2011) and the supplement to the FAO IDENTIFY Year three work plan (submitted on 28 Oct 2011).

Table of Contents

Activities undertaken during the reporting period (1 April 2011 – 30 September 2011).....	9
1.1 GLOBAL and activities across more than one region.....	9
1.1.1 Activity 3.1.G: Ongoing tripartite project management and coordination, monitoring, and planning.....	9
1.1.2 Activity 3.2.G: Recruitment of project staff (headquarters and regionally) to support IDENTIFY activities.....	9
1.1.3 Activity 3.3.G: Develop annual IDENTIFY work plan - preparation and review of global, regional, and country-level work plans and other project documents	9
1.1.4 Activity 3.4.G: Communication tool development and resource building	10
1.1.5 Activity 3.5.G: Review and update of the tripartite Laboratory Networking Strategy (LNS) and future planning.....	10
1.1.6 Activity 3.6.G: Follow-up of laboratory mapping exercise activities.....	11
1.1.7 Activity 3.7.G: Engage with stakeholders to support the development of cross-sectoral approach (es) concerning laboratories.....	11
1.1.8 Activity 3.8.G: Support to and participation in conferences, trainings or workshops related to laboratory capacity building, and national laboratory policies, guidelines, and standards	11
1.1.9 Activity 3.9.G: Development of joint meetings and conferences to support networking and promote national laboratory	12
1.1.10 Activity 3.10.G: Promote and support laboratory quality management	12
1.1.11 Activity 3.11.G: Provide laboratory equipment and supplies in a coordinated manner	13
1.1.12 Activity 3.12: Support and promote laboratory networks	13
1.1.13 Activity 1.13.G: FAO/OIE/WHO laboratory twinning initiatives and partnerships	15
1.2 SOUTH/SOUTHEAST ASIA. Activities undertaken during the reporting period (1 April 2011 – 30 September 2011).....	16
1.2.1 Activity 3.1.S: Ongoing tripartite project management and coordination, monitoring, and planning.....	16
1.2.2 Activity 3.3.S: Develop annual IDENTIFY work plan - preparation and review of global, regional, and country-level work plans and other project documents	16
1.2.3 Activity 3.4.S: Communication tool development and resource building.....	16
1.2.4 Activity 3.5.S: Review and update of the Laboratory Networking Strategy (LNS) and future planning.....	16
1.2.5 Activity 3.6.S: Follow-up of laboratory mapping exercise activities.....	16
1.2.6 Activity 3.7.S: Engage with stakeholders to support the development of cross-sectoral approach(es) concerning laboratories.....	18
1.2.7 Activity 3.8.S: Support to and participation in [non-IDENTIFY] conferences, trainings or workshops related to laboratory capacity building, and national laboratory policies, guidelines, and standards	19

1.2.8	Activity 3.9.S: Development of joint meetings and conferences to support networking and promote national laboratory	19
1.2.9	Activity 3.10.S: Promote and support laboratory quality management	20
1.2.10	Activity 3.11.S: Provide laboratory equipment and supplies in a coordinated manner	21
1.2.11	Activity 3.12.S: Support and promote laboratory networks	21
1.3	CONGO BASIN	23
1.3.1	Activity 3.1.C: Ongoing tripartite project management and coordination, monitoring, and planning	23
1.3.2	Activity 3.2.C: Recruitment of project staff (headquarters and regionally) to support IDENTIFY activities	23
1.3.3	Activity 3.3.C: Develop annual IDENTIFY work plan - preparation and review of global, regional, and country-level work plans and other project documents	23
1.3.4	Activity 3.4.C: Communication tool development and resource building	23
1.3.5	Activity 3.5.C: Review and update of the tripartite Laboratory Networking Strategy (LNS) and future planning	24
1.3.6	Activity 3.6.C: Follow-up of laboratory mapping exercise activities	24
1.3.7	Activity 3.7.C: Engage with stakeholders to support the development of cross-sectoral approach (es) concerning laboratories	25
1.3.8	Activity 3.8.C: Support to and participation in conferences, trainings or workshops related to laboratory capacity building, and national laboratory policies, guidelines, and standards	25
1.3.9	Activity 3.9.C: Development of joint meetings and conferences to support networking and promote national laboratory	25
1.3.10	Activity 3.10.C: Promote and support laboratory quality management	25
1.3.11	Activity 3.11.C: Provide laboratory equipment and supplies in a coordinated manner	26
1.3.12	Activity 3.12.C: Support and promote laboratory networks	26
1.3.13	Activity 3.13.G: FAO/OIE/WHO laboratory twinning initiatives and partnerships	27
2	Planned activities for the next six-month period (1 October 2011 – 31 March 2012)	28
2.1	Planned activities for GLOBAL	28
2.2	Planned activities for SOUTH and SOUTHEAST ASIA	32
2.3	Planned activities for CONGO BASIN	34
	Main challenges encountered and response provided	38
	Main progress made towards the achievement of project outcomes (since the start of the project activities)	34

Activities undertaken during the reporting period (1 April 2011 – 30 September 2011)

1.1 GLOBAL and activities across more than one region

1.1.1 Activity 3.1.G: Ongoing tripartite project management and coordination, monitoring, and planning

For description and listing of activities completed, see Annex 1 Table 1

- Routine project management at HQ and regional levels continued through weekly/biweekly conference calls, videoconferences as needed, daily email communication, and tripartite face to face meetings between FAO, OIE and WHO as well as the use of the IDENTIFY SharePoint.
- Participation in monthly teleconferences with IDENTIFY project management team and USAID/W AOTR on 19 April, 3 August and 22 September or face to face meetings on 15-16, 28 June and 13 July. .
- Continued rotating system of responsibility sharing on a monthly basis between the three partners in order to more effectively and rapidly handle communication with program partners, day-to-day operations, and logistic arrangements. This system also applies to document creation, revision and meeting hosting. FAO hosted the IDENTIFY secretariat on April, June and September 2011.
- Moreover, project planning was discussed during the following meetings:
 - Tripartite HQ meeting on the Year 3 planning process, Lyon, France, 10-11 May 2011
 - EPT Quarterly Partners meeting, Washington, DC, 27-28 June 2011.
 - USAID and Tripartite Meeting to discuss IDENTIFY and EPT +, Rome, 15-16 Jun 2011

Additionally, side meetings with OIE and/or WHO are indicated in Annex 1, tables 1 to 4.

1.1.2 Activity 3.2.G: Recruitment of project staff (headquarters and regionally) to support IDENTIFY activities

During the reporting period, the following staff were recruited, only for short consultancies:

- FAO consultant (4 months) for further development of the EMPRES-i virus genetic module (exploring the possibility to link with other sequence databases) and updating the national and international laboratory directory.
- IT FAO Consultant (half time- 10 months) for the linkage between the FAO EMPRES-i database and the OpenFlu Influenza database, in the context of the development of the FAO virus genetic module and development of national and international laboratory directory.
- External consultant (8 days) to (1) finalize the review of available diagnostic assays for several IDENTIFY targeted diseases, submit each chapter to a panel of OIE/FAO experts for review and explore potential applications for large scale multiple disease screening; (2) assist with training materials under the OFFLU Technical Activity on Capacity Building.
- External consultant (5 days) to assist in the process for designation of FAO Reference Centres.

1.1.3 Activity 3.3.G: Develop annual IDENTIFY work plan - preparation and review of global, regional, and country-level work plans and other project documents

- During the reporting period, the HQ project team, along with regional IDENTIFY coordinators, developed the IDENTIFY Year 3 Work plans for HQ, Congo Basin, Southeast Asia and South Asia (covering the period from 1 Oct 2011-30 Sept 2012) following the guidance provided by USAID on April 2011 to the EPT partners and on September 2011 to IDENTIFY partners. This process had to be of a consultative nature at the regional level and the identification of areas of coordination among different EPT projects. A tripartite meeting was organized 10-11 May 2011 in Lyon, France, to initiate the tripartite discussions and to define the internal timeline for the tripartite work plan submission.
- USAID presented on 15-16 June a shift in the project's administrative framework, indicating that each organization would prepare a separate work plan and budget. The FAO work plan was developed at Global, regional and country level. Collaboration with OIE and WHO were maintained in the case of bi/tripartite activities. The FAO work plan was initially submitted on 1 September, with revision to log frame format on 6 October, and additional supplemental information submitted on 28 October 2011.
- Project indicators were developed by FAO during the formulation of the work plan and presented in the FAO Log Frame. Indicators were developed at Outcome, Outputs and Activity levels. For the detailed description of the baseline indicators for the FAO contributions to the IDENTIFY project, please see Annex 3. The recruitment of an M&E specialist is being considered to finalize the baseline indicators for FAO contribution to IDENTIFY project.
- The first tripartite biannual report for Year 2 (1 Oct 2010-31 Mar 2011) describing Global and Regional activities was submitted to USAID on 12 May 2011.

1.1.4 Activity 3.4.G: Communication tool development and resource building - to ensure circulation of information, coordination and harmonization of initiatives, implement standard methods of sharing critical project documents for access by project members

- In order to ensure communication and coordination, the IDENTIFY HQ coordinator uploaded key IDENTIFY documents on the SharePoint, as well as reference documents.
- The joint IDENTIFY leaflet (English version) was finalized and validated by the three partners and shared with IDENTIFY project stakeholders.
- A tripartite document was developed in August 2011 together with and agreed by the USAID AOTR (see Annex 2: "USAID EPT/IDENTIFY Project Position on Provision of Laboratory Equipment and supplies"). This document is intended to be shared with the other EPT partners in order to clarify the position of the three organizations regarding the provision of lab equipment under IDENTIFY.

1.1.5 Activity 3.5.G: Review and update of the tripartite Laboratory Networking Strategy (LNS) and future planning

- Within the framework of the GLNS:
FAO consultant continued with the FAO IDENTIFY team the review of available diagnostic assays and cross-cutting technologies for IDENTIFY targeted diseases and large scale multiple disease screening to explore potential applications for large scale multiple disease screening, in particular in the context of developing countries. The draft document comprises tables proposing diagnostic methods of eight different diseases and is still under review of FAO/OIE Reference Laboratories. Tables for ten other priority diseases will be finalized in the next reporting period. (see Annex 3). The animal influenza table has been peer reviewed by experts from FAO/OIE Reference Centres and has been finalized was

submitted in September 2011 to the OFFLU Steering and Executive committee for validation and posting on the OFFLU website.

- In May-June 2011, the three partners updated the Laboratory Networking Strategy (LNS) based upon feedback from the regions, outcomes of the stakeholder's meetings and data from the laboratory mapping. This document provides the framework for the IDENTIFY project activities (see Annex 4).

1.1.6 Activity 3.6.G: Follow-up of laboratory mapping exercise activities

- This effort includes several phases, such as assessment, identification of gaps, and progress monitoring. Mapping of laboratory capacity assessments in FAO networks in Congo Basin and SE Asia has been undertaken using a similar approach in both regions. The compilation of existing documents accessible by FAO on laboratories in beneficiary countries in the two hotspots (e.g. analysis of National Laboratories Annual Reports and FAO laboratory assessments/mission reports, etc.) will be ongoing and will help update current data. For those laboratories that have already been assessed, the mapping activity can now enter the progress monitoring phase. This process will be repeated for any new laboratories nominated by national authorities to receive support under IDENTIFY.
- Following the laboratory mapping results in each region, appropriate action was determined based on the needs of each laboratory in the following areas: follow-up laboratory visits, trainings, workshops, conferences, and procurement and delivery of equipment and supplies. These activities will continue throughout the next reporting period.
- The lists for national and regional laboratories nominated receive support under IDENTIFY has been updated for both regions and were shared with USAID and the EPT partners. The updated lists including the Laboratory focal points for the regional laboratory network were included in the IDENTIFY FAO Year 3 work plan (see Annex 5). The regional service laboratories already nominated to provide disease-based support to each region are also included on these lists. The newly designated FAO Reference Centres will be contacted in the near future to further define their involvement in laboratory networking activities and capacity building serving each hot spot region in support of the laboratory networking strategy in the context of the IDENTIFY project and will be included in the list in the next reporting period.

1.1.7 Activity 3.7.G: Engage with stakeholders to support the development of cross-sectoral approach (es) concerning laboratories

- FAO HQ assisted in the preparation of the SE Asia meeting including contributions to the concept note and agenda; integration of the outcomes from the Third Laboratory Director's Forum (4-5 August 2011); expansion of the existing network to include China (Bangladesh, Cambodia, Indonesia, Lao PDR, Malaysia, Nepal, Philippines, Thailand, Vietnam); participation of key laboratories representing wildlife and PREDICT; liaison with WHO regarding planning for the joint sessions, contributions to working group development and format for joint sessions. This represents the first formal opportunity in the region for a joint meeting of laboratories in both animal and public health sectors.

1.1.8 Activity 3.8.G: Support to and participation in conferences, trainings or workshops related to laboratory capacity building, and national laboratory policies, guidelines, and standards

For description and listing of meetings/trainings supported, see Annex 1, Table 2

1.1.9 Activity 3.9.G: Development of joint meetings and conferences to support networking and promote national laboratory

For description and listing of workshop and trainings completed, see Annex 1, Table 3

- The three partners continue to share training opportunities and collaborate where possible, particularly where public health and veterinary professionals can work together. FAO implemented targeted training programmes based on the outcomes of the AHS/M and the laboratory mapping under the framework of the GLNS/RLNS. Under the effort for validation and transfer of new techniques for multiple disease diagnosis (PCR using the FRET system) (FAO/IAEA), a multiple pathogens detection tool for ruminants poxviruses based on FRET technology and peste des petits ruminants (PPR) virus was developed and validated by FAO/IAEA. For poxviruses, the capripoxviruses were used as model to develop an alternative to FRET assay which can perform on any qPCR machine without the need of FRET Channel. 15 scientists from 11 different countries (Uganda, Democratic Republic of Congo, Cameroon, Republic of Congo, Tanzania, Gabon, Equatorial Guinea, Rwanda, and Central African Republic, Kenya and Ethiopia) were trained to use the PPR real time PCR during the training course in Uganda (20 June-1 July 2011, refer to Annex 1, Table 3) conducted under this reporting period. During the next reporting period, this approach will be extended to other poxviruses, with the aim to differentiate the viral strain within each genus.

For peste des petits ruminants, an internally controlled real time PCR is being validated for an accurate and quality assured detection of PPR virus. This tool will provide a more robust and accurate technique for PPRV molecular diagnosis by real time PCR. It will also provide an alternative method to FRET validated for capripox detection and differentiation, with the potential to be applied to IDENTIFY priority diseases for multiple pathogen detection.

This is an ongoing activity that will continue through the next reporting period; genotyping tools are ready for transfer in Congo basin region. This tool will be disseminated through peer-review paper with acknowledgement made to IDENTIFY financial contribution. Furthermore, the number of labs using these tools will be assessed.

- A revision and adaptation of the existing train-the-trainer system for enhancing field and laboratory diagnosis was initiated by an international FAO Consultant to prepare and conduct a simple, sustainable, regional Train-the-Trainer system on field necropsy, pathology, and linking with laboratories (to be conducted during the next reporting period).

1.1.10 Activity 3.10.G: Promote and support laboratory quality management

- The publication of data from the second part on External Quality Assessment Schemes (proficiency testing) as an EQAS database on the websites of the four organizations (WHO, OIE, FAO and IAEA for the benefit of laboratories and Member States) was discussed and will be finalized during the next reporting period. WHO has finalized the dataset.
- Proficiency testing for PPRV by molecular detection was organized by FAO/IAEA early 2011 and involved 11 countries in total, including 3 IDENTIFY countries (China, Bangladesh and Cameroon). The results were analysed by FAO/IAEA and the feedback provided to the laboratories in April 2011. The preparation of the 2012 proficiency

testing for molecular detection of PPRV for Congo basin and Asian countries was initiated by FAO/IAEA staff and FAO regional coordinators for the Congo Basin. Targeted countries are: DR Congo, Cameroon, Gabon, Central African Republic, Congo, Uganda, Rwanda, Tanzania, Ethiopia and Kenya, China, Vietnam, Bangladesh. This activity will continue through the next reporting period.

1.1.11 Activity 3.11.G: Provide laboratory equipment and supplies in a coordinated manner

- FAO HQ assisted the Congo Basin regional team in the provision of metrology kit, on April 2011, in support of Quality management system (QMS) implementation to Cameroon, DR Congo, Congo, CAR, Gabon, Rwanda, Tanzania and Uganda.
- FAO HQ together with regional team and WHO provided to USAID the preliminary list and justification for the selection process of laboratories to receive 5 real time PCRs, PPE and equipment that remained from the USAID 2009 H1N1 procurement. FAO regional coordinators for IDENTIFY linked with the two regional laboratories suggested for animal health side: LNERV in Senegal and BNVL in Botswana.

1.1.12 Activity 3.12: Support and promote laboratory networks: Assess the role and activities of existing FAO/OIE/WHO networks in improving the laboratory capacity and networking in hot spot regions. Coordinate regional networking to test for normative diseases and detect emerging or unknown pathogens in wildlife, domestic animals and humans

For description and listing of meetings completed, see Annex 1, Table 4

- The first phase of development of the Genetic Module in EMPRES-i (FAO animal disease information database) was completed in June. Webservices were developed to enable the transfer of information between the OpenFlu and EMPRES-i databases. An algorithm was developed to link EMPRES-i outbreak data with publicly available influenza sequences in OpenfluDB (SIB). A validation tool for the linkages proposed in the algorithm was created. Shape files with virus characteristics to overlay on other EMPRES-i maps (e.g. animal densities) were generated. A final meeting was held at FAO HQ with the main partner: the Swiss Institute for Bioinformatics (SIB), 30-31 May to review the results and prepare for the next phase, for validation and production (launch to the public) and development of applications (maps, analytic tools). The Genetic module was presented at several occasions to potential users (e.g. WHO; GISAIID foundation) and was endorsed by OFFLU in April 2011.

The development of a genetic module for other diseases is being discussed. The next Letter of Agreement describing the next phase of work has been prepared and is pending for internal clearance. The frame of a scientific paper that describes the Genetic Module has been drafted with the external partner and the manuscript is planned; the next phase to test and validate the FAO EMPRES-i influenza genetic module will start in November; discussions will be conducted with two other specialized influenza databases to explore linkages between EMPRES-i, and the possibility of a newly developed algorithm will be introduced. The work for integration of future results from the EPT+ project will start shortly.

- The joint "Four-way linking of epidemiological and virological information on human and animal influenza" project assessment mission in Viet Nam in June 2011 reviewed the national-level functional and communication linkages among the 4 sectors critical to controlling health risks from H5N1 influenza at the human-animal interface: Public

Health Epidemiology, public health virology (NIHE), animal health epidemiology (DAH) and animal health virology (NCVD). Twenty-four visits were made to various stakeholders, and details of the mapping were presented to all stakeholders for their inputs in a final workshop. During this workshop, linkages were mapped and gaps identified. The main conclusions of the assessment mission focused around the need for data sharing, improving joint working for case investigation, and improving surveillance systems. A workshop was conducted in Egypt in September (supported under another project) and included didactic presentations, group work, and scenario-based training: the setup of this workshop in Egypt will serve as a blue print for the future workshop in Viet Nam (planning meeting is scheduled for Oct 2011). The didactic materials developed for Egypt are available for workshops in third countries.

- OFFLU developments:

{1} Contribution to WHO Vaccine Selection Process. FAO is involved - together with the OFFLU secretariat based at OIE- in coordination and gathering of data. OFFLU laboratories (i.e. any animal health laboratories that have animal influenza activities and that wish to contribute to OFFLU) are engaged, and a subset of these representing international reference and key regional laboratories are involved in the biannual preparation of data on zoonotic influenza virus strains for the OFFLU contribution to the WHO Vaccine Composition meeting selection process. FAO carries out the compilation, analysis and reporting of information on animal influenza viruses of public health concern from institutions within the OFFLU network. The OFFLU contribution includes the report generated from these collaborations, and a presentation is provided by a nominee from one of the international reference laboratories with an FAO/OIE OFFLU representative. For the last consultancy meeting (26-28 September 2011), OFFLU provided a summary of available epidemiological and molecular data for highly pathogenic avian influenza (HPAI) H5N1 and avian influenza H9N2 for the period 1 February until 20 September 2011. For H5, OFFLU shared new and previously unreported sequences from Bangladesh, Egypt, India, Indonesia, Israel, Lao PDR, Myanmar, and Viet Nam, representing clades 1, 2.1.3, 2.2, 2.2.1, 2.3.2, 2.3.4. The report included 245 H5 sequences (120 non-public and 12 public domain sequences from 2011; 113 non-public 2009-2011). For H9, the OFFLU network contributed 20 pre-2011 sequences (majority from 2009) and one 2011 sequence from Bangladesh. The outcomes of this consultancy process are published on the WHO web under "Antigenic and genetic characteristics of zoonotic influenza viruses and development of candidate vaccine viruses for pandemic preparedness":

(http://www.who.int/influenza/resources/documents/characteristics_virus_vaccines/en/). In support of this ongoing effort, SOPs to aid in the coordination and analysis of data were prepared by FAO for the next VCM scheduled in February 2012 and submitted to the OFFLU Executive Committee on the 15 September 2011.

{2} An FAO international consultant worked 8 days on the selection of many online training materials and resources; the approach for this review was initially discussed with the OFFLU Technical Activity on Capacity building and the outcomes subsequently validated by the same group. In particular, an influenza E-learning Training Module developed under an EU project (FLUTRAIN) was reviewed and comments provided to the developers to aid in improvement of the The outcomes of this review were submitted to the OFFLU Steering Committee (Paris, September 2011), who agreed on the creation of a training webpage with the selected material on the OFFLU website. Contacts with the WHO library (<http://www.influenzatraining.org/en/>) on influenza training were made and OFFLU experts were invited to provide training material to this library.

{3} Inputs provided to the OFFLU secretariat for the establishment of new OFFLU website: www.offlu.net, to improve visibility of the OFFLU network and to facilitate data

sharing, transfer of knowledge and training materials. The new updated site was launched in April 2011. FAO provides regular check-up and update for the website.

(4) Establishment of the OFFLU Swine Influenza Group to work towards a worldwide surveillance network for influenza in pigs that includes timely data collection, analyses, and sharing. The first meeting was held at OIE, Paris 6-7 April 2011. The meeting report is posted on offlu.net. FAO has suggested TORs and governance for the SIV group and submitted to the OFFLU Steering Committee in Sept 2011. The TORs for SIV group are to be endorsed in the coming months.

1.1.13 Activity 1.13.G: FAO/OIE/WHO laboratory twinning initiatives and partnerships

- Progress has been made on this long and complex designation process of FAO Reference Centres. 5 Reference Centres in animal health have so far been designated according to the 2006 Corporate Policy while the Animal Health Service expects to have 48 designated Ref. Centres in the near future. Applications have been reviewed, missing information has been requested to the applications, workplans have been established and agreed with the applications, evaluations have been submitted for clearance by the FAO DG, government endorsements have been requested and final designation letters have been prepared, after discussions with the LEGAL office. Dossiers stand at various stages of the process. A comparison between OIE and FAO Reference Centres and terms for designation and partnership has been made to look for complementary and common work.
- Further IT developments of the EMPRES-i directory were conducted. The directory is now functional but will need to be more populated. Once fully populated, this directory will allow to get an easy access to information related to reference, regional and national laboratories and geographically map these laboratories and attach any related information that FAO may want to store on each laboratory (eg letter of Reference Centre designation, annual reports, Letters of Agreement, etc).

1.2 SOUTH/SOUTHEAST ASIA. Activities undertaken during the reporting period (1 April 2011 - 30 September 2011)

1.2.1 Activity 3.1.S: Ongoing tripartite project management and coordination, monitoring, and planning

For description and listing of meetings completed, see Annex 1 Table 1

1.2.2 Activity 3.3.S: Develop annual IDENTIFY work plan - preparation and review of global, regional, and country-level work plans and other project documents

SE ASIA

- Development of the Year 3 work plan included participation in many tripartite and EPT planning meetings both at country and regional levels (Annex 1, Table 1).

1.2.3 Activity 3.4.S: Communication tool development and resource building - to ensure circulation of information, coordination and harmonization of initiatives, implement standard methods of sharing critical project documents for access by project members

SE ASIA

- EMPRES-i Asia platform open for public access will continue to reinforce communication and share documents with IDENTIFY stakeholders in the region. On-going
- In addition, updates to the AI Network Asia email list serve are made on a weekly basis by the regional FAO IDENTIFY coordinator. On-going

SOUTH ASIA

- EMPRES-i Asia platform and AI Network Asia as above. On-going

1.2.4 Activity 3.5.S: Review and update of the Laboratory Networking Strategy (LNS) and future planning

For description and listing of meetings completed, see Annex 1 Table 1 FAO communication and coordination for IDENTIFY (including laboratory networking meetings and communication with EPT Partners)

SE ASIA

- The Southeast Asia RLNS will be updated to reflect the outcomes of the Regional Laboratory Network Technical Advisory Group Meeting (4-5 Aug)

SOUTH ASIA

- The South Asia / SAARC network is in the process of reviewing inputs such as the Global and Regional LNS examples and will be discussing ways forward at upcoming meetings.

1.2.5 Activity 3.6.S: Follow-up of laboratory mapping exercise activities

- Follow-up of ongoing desktop review of existing data on laboratory capacity and networks from existing laboratory assessments

Additional assessments (both self-assessment and expert visits) from 4 laboratories and updated information from 8 laboratories have been integrated and overall laboratory capacities are summarized in Table 1.A.1 below. This data was updated using a streamlined version of the FAO Laboratory mapping tool (Annex 6) which summarizes 18 indicators by 93 different criteria. For the eight laboratories assessed in the previous time period, improvements as indicated from the criteria based upon updated training and additional equipment received ranged from zero (for 1 lab) to 23%.

Type of laboratory	Number
Advanced labs	2
In progress -> advance	1
Routine labs	4
In progress -> intermediate	1
Basic labs	4

Table 3.6: Laboratory assessment data by 18 major indicators

Indicator	Southeast Asia National Laboratories								Sub-national	South Asia National		
	+	*	*	*	*	*	*	*				
Geographic location	66.7	77.8	88.9	66.7	22.2	55.6	66.7	88.9	66.7	88.9	22.2	11.1

+ = to be confirmed, * = laboratory with regional responsibilities

- Follow-up of the additional targeted data collection, including laboratory visits and/or follow-up assessments if necessary, to fill in gaps in knowledge on laboratory capacity

SE ASIA

- The list of potential national and regional laboratories compiled by FAO has been updated (Annex 5)

- Data from multiple sources is being compiled to visualize regional capacities by priority disease.
- The FAO laboratory mapping tool presented at the SE Asia Animal Health Stakeholders Awareness Meeting, 20-21 Jan 2011 in Bangkok, Thailand, was adapted used to monitor the progress of laboratory capacities.
- FAO with OIE completed visits to national and sub-national laboratories in Lao PDR, Viet Nam, Thailand, Nepal, and Indonesia:
 - Laboratory mapping conducted at Hanoi Agriculture University, Hanoi, Viet Nam, June 2011 by FAO Laboratory Expert in Viet Nam. Results compiled and preliminary analysis results available. HAU share similar limitations in biosafety-biosecurity, staff security and health with the majority of laboratories in SE Asia.
 - Laboratory mapping conducted for Bangladesh Livestock Research Institute and Central Veterinary Diagnostic Laboratory in Bangladesh in March 2011 has been integrated into the overall data.

1.2.6 Activity 3.7.S: Engage with stakeholders to support the development of cross-sectoral approach(es) concerning laboratories

- Regional and national stakeholders meeting (primarily the directors of national public health and veterinary laboratories and representatives from the MoH and MoA. This meeting is scheduled for October 2011, to take place in Kuala Lumpur, Malaysia
 - Preparations for the upcoming IDENTIFY regional stakeholders meeting for SE Asia planned for October 2011 included integration of the outcomes from the Third Laboratory Director's Forum (4-5 August 2011); expansion of the existing network to include China (Bangladesh, Cambodia, Indonesia, Lao PDR, Malaysia, Nepal, Philippines, Thailand, Vietnam); participation of key laboratories representing wildlife and PREDICT; planning and drafting questions for breakout groups during animal health and tripartite joint sessions, format for tripartite sessions, and finalizing the concept note, agenda, and invitations. This represents the first formal opportunity in the region for a joint meeting of laboratories in both animal and public health sectors.
 - May 2011: The report for the IDENTIFY Animal Health Stakeholders Awareness Meeting on 20-21 January 2011 in Bangkok Thailand was finalized after receiving Stakeholders' comments and submitted to USAID HQ.
- Develop the four-way linking framework for assessing health risks at the human-animal interface, to be applicable to various countries and to various diseases (Viet Nam, other pilot countries TBD)
 - June 2011, Viet Nam: The joint "Four-way linking of epidemiological and virological information on human and animal influenza" project assessment mission in Viet Nam reviewed the national-level functional and communication linkages among the 4 sectors critical to controlling health risks from H5N1 influenza at the human-animal interface: Public Health Epidemiology, public health virology (NIHE), animal health epidemiology (DAH) and animal health virology (NCVD). 24 visits were made to various stakeholders, and at a final workshop details of the mapping were presented to all stakeholders for their inputs. Finally, the relationships were mapped and gaps identified. The main conclusion of the assessment mission was that problems are mainly occurring in enabling and supporting data sharing, improving joint working for case investigation and improving surveillance systems. A workshop was conducted in Egypt in September (supported under another project) and included

didactic presentations, group work, and scenario-based training: the setup of this workshop in Egypt will serve as a blue print for the future workshop in Viet Nam (planning meeting is scheduled for Oct 2011). The didactic materials developed for Egypt are available for workshops in third countries.

1.2.7 Activity 3.8.S: Support to and participation in [non-IDENTIFY] conferences, trainings or workshops related to laboratory capacity building, and national laboratory policies, guidelines, and standards

For description and listing of activities completed, see Annex 1 Table 2. List of [non-IDENTIFY] conferences, trainings or workshops related to laboratory capacity building, and national laboratory policies, guidelines, and standards to which participants were supported

1.2.8 Activity 3.9.S: Development of joint meetings and conferences to support networking and promote national laboratory

For description and listing of activities completed, see Annex 1 Tables 3 and 4: List of FAO/OIE/WHO-organized **trainings or workshops** to build laboratory capacity and to promote national laboratory policies, guidelines, and List of joint **meetings and conferences** organized by FAO/OIE/WHO to support networking and promote national laboratory policies

- **Advanced Biorisk Training: Building regional biosafety resource people including biosafety managers and biosafety engineers.** The training curriculums were designed to specifically target advanced laboratories with BSL3 and/or BSL4.
 - Preparations are underway for this activity scheduled for November 2011. This activity builds upon Biosafety Management Training organized under IDENTIFY in Year 2. Targeted country support for six advanced laboratories in China (CADCC, CAHEC and Langzhou), India (HSADL), Lao PDR (NAHC), Malaysia (VRI), Thailand (NIAH, RRL) and Viet Nam (RAHO6).
- **Laboratory Engineering and Equipment Maintenance Training.** Building regional biosafety resource people including biosafety managers and biosafety engineers. The training curriculums were designed to specifically target advanced laboratories with BSL3 and/or BSL4.
 - Preparations are underway for this activity scheduled for November 2011. This activity builds upon Biosafety Management Training organized under IDENTIFY in Year 2. Targeted country support for six advanced laboratories in China (CADCC, CAHEC and Langzhou), India (HSADL), Lao PDR (NAHC), Malaysia (VRI), Thailand (NIAH, RRL) and Viet Nam (RAHO6).
- **Strengthen capabilities /capacities through workshops to support diagnosis of pathogens significant to the region and for emerging and unknown pathogens**
 - Details contained in Table 3 for: 21 - 22 July 2011 The Workshop on Diagnosis of Priority and Emerging Diseases in Swine, and 11 – 20 July 2011 The Training on Diagnosis and Characterization of Classical Swine Fever and Porcine Reproductive and Respiratory Syndrom. The evaluations of the completed workshop and training can be found in Annex 7.
- **Laboratory Information Management Systems (LIMS): Workshop to Identifying Needs, Resources, and Ways Forward**

- Based on previous experience in providing assistance to LIMS implementation, FAO is collaborating with the Australian Animal Health Laboratory (AAHL) to develop guidelines for selecting LIMS. A Letter of Agreement with collaborating partner (Australian Animal Health Laboratory) has been finalized and planning initiated. The goal of this workshop is to address laboratory needs and provide information on potential open-source database solutions. Guidelines for selecting LIMS including need assessment tool for the laboratory is being developed and will be presented during the workshop planned for 8-9 December 2011 in Bangkok, Thailand where IDENTIFY supported laboratories will be invited to attend including China (CAHEC, CADCC), Cambodia (NaVRI), Lao PDR (NAHC), Malaysia (VRI), Philippines (PAHC), Thailand (NIAH) and Viet Nam (RAHO6).
- Adaptation of animal health laboratory (individual and country-level) assessment tools for monitoring and evaluation – refer to 3.6: The FAO laboratory mapping tool presented at the SE Asia Animal Health Stakeholders Awareness Meeting, 20-21 Jan 2011 in Bangkok, Thailand, was adapted used to monitor the progress of laboratory capacities.

1.2.9 Activity 3.10.S: Promote and support laboratory quality management

- Assessment of biosafety infrastructure, biosafety cabinet testing, procurement and calibration
 - Under the Letter of Agreement (LoA) with FAO, A-PBA conducted the assessment of biosafety infrastructure, biosafety cabinet testing (24 cabinets), and practices of 5 laboratories in Cambodia, Lao PDR, Philippines, Malaysia, and Thailand (Nov-Dec 2010). The report was submitted and awaiting clearance. Reports including recommendations for improving laboratory biosafety-biosecurity are available for national animal health laboratories in Cambodia (NaVRI), LaoPDR (NAHC), Malaysia (VRI), Philippines (PAHC), Thailand (NIAH), Bangladesh (CDIL, BLRI) and Nepal(CVL) – refer to 3.11. S for procurement detail.
- Laboratory support visits to assist with development and implementation of laboratory quality management systems
 - Under the Letter of Agreement (LoA) with the Australian Animal Health Laboratory signed in May 2011, Backstopping missions was planned to ensure implementation of appropriate diagnostic protocols under a quality assurance system. Specifically, AAHL laboratory experts would 1) Follow up on proficiency testing result for PRRS, CSF and HPAI ,2) Trouble shooting any technical problem reveal by proficiency testing result, 3)Provide in-house training on equipment usage and maintenance, 4) Follow up on laboratory quality systems, 5) Provide inputs on biosafety and biosecurity and 6) Advocate laboratory support for surveillance. These missions are planned to be carried out between October 2011 – November 2011 at IDENTIFY supported laboratories in China (CAHEC, CADCC), Cambodia (NaVRI), Lao PDR (NAHC), Malaysia (VRI), Thailand (NIAH) and Viet Nam (RAHO6)
- Provision of Laboratory Information Management Systems (LIMS)
 - Under the Letter of Agreement (LoA) with the Australian Animal Health Laboratory, a guidelines for selecting LIMS including need assessment tool for the laboratory is being developed and will be presented during the workshop planned for 8-9 December 2011 in Bangkok, Thailand (refer to Activity 3.9)

- Training to build national laboratories capacity to design, implement and analysis national proficiency testing program for priority diseases
 - 5-19 September 2011, Geelong, Australia. Training on Quality Assurance and Standardization of Diagnostic Reagents. The objective of this training was to equip laboratories with necessary skill to develop their own proficiency testing programme. A total of 15 participants from IDENTIFY supported laboratories in Cambodia (NavRI), China (CAHEC), Lao PDR (NAHC), Malaysia (VRI), Philippines (PAHC), Thailand (VRI) and Viet Nam (DAH) participated in the 12-day training. The training program at the Australian Animal Health Laboratory (AAHL) reviewed the requirements under ISO17025 for quality assurance of laboratory tests and training in providing Proficiency Testing (PT) to ensure laboratories are producing accurate and correct results for tests carried out in the laboratory. It is foreseen that the developed capacity to provide proficiency testing will allow national animal health laboratories to develop their own external quality assurance programme for their national laboratory network.

- Provision of validated standardized veterinary diagnostic reagents -antigens and antisera- targeting priority TADs – refer to 3.11.

1.2.10 Activity 3.11.S: Provide laboratory equipment and supplies in a coordinated manner

SE ASIA and SOUTH ASIA

- Procurement by FAO to address immediate needs:
 - A total of three (3) replacement HEPA filters were procured, delivered and installed for laboratories in Thailand (NIAH) and Bangladesh (BLRI and CDIL). A total of eight (8) replacement biosafety cabinets were procured and delivery to laboratories in Cambodia (NavRI 1 cabinet), LaoPDR (NAHC 2 cabinets), Malaysia (VRI 2 cabinets), Bangladesh (BLRI 1 cabinet) and Nepal (CVL 2 cabinets) is in process – refer to 3.10. S;
 - Delivery for other items such as laboratory diagnostic reference books, IATA biocontainers for samples shipment, and proficiency testing panels is ongoing.

1.2.11 Activity 3.12.S: Support and promote laboratory networks : Assess the role and activities of existing FAO/OIE/WHO networks in improving the laboratory capacity and networking in hot spot regions. Coordinate regional networking to test for normative diseases and detect emerging or unknown pathogens in wildlife, domestic animals and humans

- Strengthen linkages among existing regional laboratory networks and between laboratory and epidemiological networks and across human and animal health, including implementation of regional guiding principles for surveillance and diagnosis

SE ASIA

For description and listing of completed meetings, see Annex 1 Table 4 FAO communication and coordination for IDENTIFY (including laboratory networking meetings and communication with EPT Partners)

Other activities included:

- 13 – 17 June 2011, Hanoi: FAO|IDENTIFY SE Asia coordinator together with OIE|IDENTIFY SE Asia coordinator visited Animal Health Laboratories in Viet Nam including the National Center for Veterinary Diagnosis, Regional Animal Health Office Number 6 and Hanoi Agriculture University from. Presentation and discussion on Regional Laboratory Networking activities including the Emerging Pandemic Threat Programme and IDENTIFY were made. Details of FAO Regional Laboratory Network activities including IDENTIFY activities in Viet Nam were discussed and agreed upon with the Director General of the Department of Animal Health, Ministry of Agriculture and Rural Development.
 - 18 July 2011, Bogor, Indonesia: FAO|IDENTIFY HQ Liaison with the OIE|IDENTIFY SE Asia coordinator Meeting with Heads of Departments of Bbalitvet laboratory, various technical staff. Presentations were provided by both focal points to provide background information on EPT/IDENTIFY, identify opportunities to build upon the existing network of Disease Investigation Centres and other national veterinary labs, and to determine disease focus needs and current collaborations.
 - 24-26 August 2011, Hanoi, Viet Nam: FAO|IDENTIFY SE Asia coordinator supported the mission for the Field Epidemiology Training Programme for Veterinarians. The mission team including the ROs, Thailand FETPV and FETP staff had two meetings with both administrative and epidemiology staff of the RAHO6 to discuss support for FETPV trainee from Viet Nam. RAHO6 and Viet Nam Department of Animal Health (DAH) expressed their kind support for FETPV trainee and agreed upon the objectives, the data sources and work plan covering the next six months. The mission team also attend the FETP graduation ceremony at the Ministry of Health, Hanoi, Viet Nam and have informal consultation with USAID Viet Nam on EPT and IDENTIFY activities in Viet Nam.
- Strengthen collaboration and communication platforms and pathways in order to encourage the sharing of samples, data, reports, etc. within regional and global networks
 - 30 May – 2 June 2011, Rome, Italy: FAO|IDENTIFY SE Asia coordinator participated in the meeting between FAO EMPRES Laboratory unit and the Swiss Institute of Bioinformatics from. The goal of the meeting was to follow up on the outcome and way forward for the development of EMPRES-i Genetic Module. The EMPRES-i genetic module was developed as a collaborative activities between FAO EMPRES laboratory unit and the Swiss Institute of Bioinformatics (SIB) with the goal to provide an integrate Influenza outbreak information on FAO – EMPRES system together with virus gene sequence information on SIB – OpenFlu. The linkage between Empres-i outbreak ID and OpenFlu ID was established along with validation interface and web-service tools. SOP for data analysis across OpenFlu and Empres-I was recommended including analysis of large scale viruses, visualization and analysis from phylogeny to sequence similarity maps.

1.3 CONGO BASIN

1.3.1 Activity 3.1.C: Ongoing tripartite project management and coordination, monitoring, and planning

For description and listing of activities completed, see Annex 1 Table 1

- Project management and planning at regional level continued through conference calls between Tripartite regional coordinators, and tripartite face to face meeting on 29 July 2011.

1.3.2 Activity 3.2.C: Recruitment of project staff (headquarters and regionally) to support IDENTIFY activities

- FAO consultant (April 2011) analyzed data on animal disease surveillance system in IDENTIFY project countries by focusing on the collaboration between epidemiology and laboratory staff, and identify constraints, roles and responsibilities to improve relation between laboratory and epidemiology networks in IDENTIFY beneficiary countries and suggest ways to alleviate these constraints. The report is available and the outcomes will be presented during the 2011 annual RESOLAB meeting.

1.3.3 Activity 3.3.C: Develop annual IDENTIFY work plan - preparation and review of global, regional, and country-level work plans and other project documents

- During the reporting period, the regional FAO|IDENTIFY coordinators, along with HQ team, developed the IDENTIFY Year 3 Work plans for Congo Basin, from the country (done in conjunction with each country), region to the global level following the guidance provided by USAID. During the process, FAO regional coordinators requested, assessed and reviewed the workplans, budgets and lists of needs for capacity building from all National Laboratories.
- The FAO|IDENTIFY coordinators presented the FAO planned activities for year 3 during the tripartite IDENTIFY side meeting (Kinshasa, 29 July 2011) and discussed collaboration with OIE and WHO in the case of tripartite and cross-sectoral activities.
- IDENTIFY regional coordinators participated and presented the planned FAO Year 3 Congo region activities to USAID/W, USAID country missions and EPT partners during the EPT Congo Regional Planning Meeting organized from 27-28 July 2011 in Kinshasa. Contacts and discussions were made with the newly appointed EPT coordinator in Uganda, PREDICT and RESPOND. FAO delegation visited RESPOND Office in Kinshasa and have had a fruitful working discussion.

1.3.4 Activity 3.4.C: Communication tool development and resource building - to ensure circulation of information, coordination and harmonization of initiatives, implement standard methods of sharing critical project documents for access by project members

- There is regular contact on activities implemented between FAO|IDENTIFY coordinators (Bamako, Nairobi and Gaborone) and with stakeholders, in particular laboratory directors through emailing list.
- FAO|IDENTIFY coordinators regularly posted documents and information on IDENTIFY events on FAO-ECTAD websites (RESOLAB <http://www.fao-ectad-bamako.org/>, EARLN <http://www.fao-ectad-nairobi.org/spip.php?rubrique57> and LAB NET [23](http://www.fao-</div><div data-bbox=)

ectad-gaborone.org/en/spip.php?rubrique55). A specific tab for IDENTIFY has been created in RESOLAB website (<http://www.fao-ectad-bamako.org/fr/-Projet-IDENTIFY-?lang=en>) and will be created on the other ECTAD websites during the next reporting period to contribute to IDENTIFY project visibility.

- Production of tripartite awareness materials (banners and leaflets with IDENTIFY and USAID logos are produced for IDENTIFY supported workshops).
- IDENTIFY poster (French version) was produced and distributed to each of the following laboratory Cameroon, CAR, DR Congo, Eq. Guinea, Gabon and Congo. English version under printing for Rwanda, Tanzania and Uganda during Kinshasa workshop on Necropsy and sampling. One copy will be sent to FAO Representatives of all the said countries.

1.3.5 Activity 3.5.C: Review and update of the tripartite Laboratory Networking Strategy (LNS) and future planning

- Tripartite finalization of the Regional lab networking strategy (RLNS) expected by end of 2011. A draft of Regional Laboratory Networking Strategy (RLNS) was proposed by OIE and circulated between the three regional coordinators.

1.3.6 Activity 3.6.C: Follow-up of laboratory mapping exercise activities

- Additional targeted data collection, including laboratory visits and/or follow-up assessments if necessary, to fill in gaps in knowledge on laboratory capacity: FAO focal point visited the Laboratoire vétérinaire of Kinshasa, 26 and 29 July., and the additional data collected was the for example the organigram, vaccine production status, other activities carried out, strength of financial sustainability from own generated resources.
- The data review and compilation of national laboratories reports from the West and Central regional laboratory network (RESOLAB), Eastern Africa network (EARLN), SADC Laboratory Network (LABNET) meetings and from FAO laboratory assessments/mission reports were consolidated with additional data collected through questionnaires on rabies and FMD (the RESOLAB FMD subnetwork facilitators posted an updated biannual table on confirmed FMD cases in the region <http://www.fao-ectad-bamako.org/fr/-FMD-Sub-Network-?lang=en>), country status reports presented during training workshops (Kinshasa, 15-19 August; Libreville, 12 – 16 September), coordination meetings (e.g. EARLN/EAREN joint meeting in Kigali from 5 – 7 September 2011) and opportunistic visits to the national laboratories in Uganda, Rwanda, Tanzania and DRC.).
- Follow-up of ongoing desktop review and analysis of existing data on laboratory capacity and networks from existing laboratory assessments : the FAO laboratory scoring and gap analysis preliminary findings presented to the IDENTIFY OIE and WHO coordinators at the tripartite Gabon meeting (Libreville, March 2011) were further developed (see annex 8) . The completed report on veterinary laboratory data analysis and mapping exercise and the integration of the outcomes of the lab mapping into the Lab Networking Strategy will be finalized by FAO by end November 2011. Congo Basin laboratories individual laboratory scoring and gaps analysis shall be submitted at the same time to IDENTIFY coordinators .
- Agreement on each laboratory's desired and feasible role in the regional context: the discussions with each laboratory started informally at the stakeholder meetings and were further elaborated during the FAO laboratory visits and assessments. Regional service laboratories will be contacted to define their mandate, as opposed to reference Centres during the next reporting period.

1.3.7 Activity 3.7.C: Engage with stakeholders to support the development of cross-sectoral approach (es) concerning laboratories

- IDENTIFY activities have been adjusted according to the recommendations from Entebbe Stakeholders' meeting in the Congo Basin region (2-4 Nov 2010 in Entebbe, Uganda).
- Preliminary discussions were initiated between the IDENTIFY partners on next stakeholders meeting for the Congo region, tentatively projected for early 2012.

1.3.8 Activity 3.8.C: Support to and participation in conferences, trainings or workshops related to laboratory capacity building, and national laboratory policies, guidelines, and standards

For description and listing of activities completed, see Annex 1 Table 2

1.3.9 Activity 3.9.C: Development of joint meetings and conferences to support networking and promote national laboratory

For description and listing of activities completed, see Annex 1 Tables 3 and 4

- Information on planned trainings for Year 2 of the project was shared between FAO/IAEA/OIE/WHO. Opportunities for joint trainings were discussed and training for public health professionals and veterinary scientists together will be explored under the planned trainings for the next reporting period.

1.3.10 Activity 3.10.C: Promote and support laboratory quality management

- Under the LoA with FAO and IZSve of Padova, all IDENTIFY countries in Congo Basin were invited in February 2011 to participate in the third round of Avian influenza and Newcastle disease proficiency test. The panels were shipped in March 2011 and all countries submitted their results. The results were analyzed by IZSve, made available on September 2011, and will be presented to the countries during the next RESOLAB and EARLN annual meetings in 2011.
- Provision of metrology kit, on April 2011, in support of Quality management system (QMS) implementation to Cameroon, DR Congo, Congo, CAR, Gabon, Rwanda, Tanzania and Uganda. This procurement was followed up by the training on "Management of laboratory equipment and basic metrology" (12-16 September 2011, Libreville, see Annex 1, table 3) to train Cameroon, Central African Republic, DRC, Congo, Gabon, Equatorial Guinea for the use of the metrology equipment provided to the countries.
- Provision of manuals and standard operating procedures in support of QMS implementation (DRC, Congo, CAR, Rwanda, Tanzania and Uganda): training manuals including SOPs on implementation of laboratory QMS based on ISO/17025 were provided to participants from Rwanda, Tanzania and Uganda during a regional training course in Dar es Salaam, Tanzania in July 2011. Manuals on laboratory biosafety and biosecurity were also provided during this meeting.
- Installation and staff training for an open-source LIMS platform by FAO/IAEA in order to improve laboratory information management in the national animal health laboratories of one pilot country (Cameroon) : One expert mission was conducted at LANAVET (Cameroon) on 11-15 April 2011, to identify the laboratory needs for Vet- LIMS and advice on the establishment of LIMS and various LIMS systems used in veterinary laboratories, Evaluate the existing facilities, infrastructures and system requirement for LIMS and determine interfacing technology. Work with counterpart to outline workflow for necessary task in the lab. (Visual workflow), provide technical advice on data

collection, validation of system, implementation methodology and monitoring and provide feedback to FAO/IAEA on equipment and training requirements. Furthermore, one staff from LANAVET attended the Bioinformatic training in Vienna (11-22 July 2011, see Annex 1 Table 3) for which the second week was focused on databases and LIMS.

- Training manuals including SOPs on implementation of laboratory QMS based on ISO/17025 were provided to participants from Rwanda, Tanzania and Uganda during a regional training course in Dar es Salaam, Tanzania in July 2011. Manuals on laboratory biosafety and biosecurity were also provided during this meeting.
- The preparation of the proficiency testing for the serodiagnosis of Rift Valley Fever (RVF): comparison of the efficiency of two RVF Inhibition ELISA kits in the Congo basin region was initiated in June and an agreement was made between FAO/IAEA and the head of the special pathogen unit of the National Institute for Communicable Diseases (NICD, South Africa) for the practical organization. The targeted countries (DR Congo, Cameroon, Gabon, Central African Republic, Congo, Uganda, Rwanda, Tanzania, Ethiopia and Kenya) have been invited to participate and already provided their agreement. The kits for RVF Competition ELISA were ordered in September 2011. This activity will continue through the next reporting period.

1.3.11 Activity 3.11.C: Provide laboratory equipment and supplies in a coordinated manner

- The provision of metrology kit by FAO to address immediate needs defined by the countries during the stakeholder meeting (November 2010) was finalized in July 2011 in Cameroon, DR Congo, Congo, CAR, Gabon, Rwanda, Tanzania and Uganda.
- The list of equipment and supplies required by Cameroon, CAR, DR Congo, Eq. Guinea, Gabon, Congo, Rwanda, Tanzania and Uganda were collected during the work planning process (see activity 3.3.C), compiled by FAO Coordinators and shared with OIE and WHO during the EPT planning meeting (July, Kinshasa). The procurement process will be continued during the next reporting period.

1.3.12 Activity 3.12.C: Support and promote laboratory networks : Assess the role and activities of existing FAO/OIE/WHO networks in improving the laboratory capacity and networking in hot spot regions. Coordinate regional networking to test for normative diseases and detect emerging or unknown pathogens in wildlife, domestic animals and humans

For description and listing of activities completed, see Annex 1 Table 4

- FAO has been facilitating the selection of a regional laboratory (applications received from Ethiopia, Tanzania, Sudan (North), and Kenya) for Eastern Africa : FAO-ECTAD Eastern Africa received formal applications from the four countries for designation as regional service laboratories for Avian Influenza and Newcastle disease. Subsequently ECTAD convened a meeting of a regional networks secretariat composed of OIE, FAO, AU-IBAR, representative of Livestock (Ethiopia), Wildlife (Tanzania) and VS (Kenya) in May 2011 to consider the applications. The outcome of the meeting is that the National Animal Health Diagnostic and Investigation Centre (NAHDIC, Sebeta) Ethiopia was selected as the regional AI/ND laboratory for Eastern Africa. A report on the procedure and outcome of the selection process has been prepared. It is expected that a summary of the report will be published in the FAO EMPRES Bulletin.
- Laboratory subnetworks (established during the RESOLAB 2010 Annual meeting at Bamako, December 2010) on rabies and FMD including Cameroon, CAR, Congo, DR

Congo, Guinea Equatorial and Gabon and other laboratories from Western Africa (See also activity 3.6).

- The FMD subnetwork aims to assess the relevance of tests/papers for use in the region; Discuss and share the FMDV findings by the national labs and/or the FAO/OIE WRL; Translate and/or comments on published FMD papers relevant to West/Central Africa; Share information on relevant projects in the region; Share information on important epidemic events.
- The Rabies subnetwork aims to: Define priorities for rabies control; Identify the needs for veterinary laboratories; Interact with the human health sector and advocate with public sector. During the reporting period, a survey on rabies diagnostic was initiated in collaboration with IZSVe laboratory of Padova. The purpose of this study is to assess the diagnostic capabilities of rabies in the laboratories of the network
- Similarly an FMD for Eastern Africa (EARLN-FMD) has been established. Its activities are supported mainly by EU-FMD secretariat that is based at FAO Headquarters, Rome.
 - EARLN-FMD conducted an in-house training on sample collection, shipment and processing in August 2011. Other activities were indicated in the table.
- National laboratories quarterly reports were posted on protected space of ECTAD website. Access username and password have been provided to OIE and WHO/AFRO focal points. These reports provide information on animal diseases diagnosed, tests performed, constraints faced by the laboratories during the period and the action plan for the next quarter.
- FAO commissioned a study on animal disease surveillance systems across all RESOLAB including IDENTIFY supported countries. The focus was on national epi system capability and their relationship between Epidemiology and Laboratory to address the limited number of samples submitted and tested through the establishment of collaborations with epidemiosurveillance units and participation in disease surveillance programs.

1.3.13 Activity 3.13.C: FAO/OIE/WHO laboratory twinning initiatives and partnerships

- From FAO side, no progress reported during the reporting period

2 Planned activities for the next six-month period (1 October 2011 – 31 March 2012)

For further detail, please refer to the FAO Workplan Year 3.

2.1 Planned activities for GLOBAL

Activity code	Activity description	2011			2012			PARTNERS	Focal Person
		10-11	11-11	12-11	01-12	02-12	03-12		
Output 1 Capacity of national animal health laboratories to detect and diagnose diseases under a quality management system enhanced									
1.A.	Follow-up of laboratory mapping exercise activities						OIE, WHO	Mia Kim, FAO HQ	
	<i>1.A.1 Review of historic data from EMPRES-i</i>						OIE, WHO	Mia Kim, FAO HQ	
	<i>1.A.2 Disease prioritization</i>						OIE, WHO	Mia Kim, FAO HQ	
	<i>1.A.3 Improved data collection from FAO Reference Centres</i>						OIE	Mia Kim, FAO HQ	
	<i>1.A.4 Update of regional data on laboratory capacity and networks</i>						FLI	Mia Kim, FAO HQ	
	<i>1.A.5 Identification of regional service laboratories by disease focus based on the outcomes of the laboratory mapping</i>						OIE, FAO/IAEA	Mia Kim, FAO HQ	
	<i>1.A.6 Adaptation of animal health laboratory (individual and country-level) assessment tools</i>								
1.B.	Support to and participation in conferences, trainings or workshops related to laboratory capacity building, and national laboratory policies, guidelines, and standards							Gwenaelle Dauphin, FAO HQ	
1.C	Develop and conduct trainings or workshops to build laboratory capacity and to promote national laboratory policies and guidelines							Gwenaelle Dauphin, FAO HQ	
	<i>1.C.1 Organizational support for regional workshops, "Laboratory Information Systems (LIMS): Open-Source Platforms and Tools to Aid in Needs Assessment."</i>						FAO/IAEA	Mia Kim, FAO HQ	
	<i>1.C.2 Regional pathology train-the-trainer workshops on "Basics of Field and Laboratory Diagnosis" coordinated and conducted in both regions</i>						OIE, RESPOND, UGA	Mia Kim, FAO HQ	

1.C.3	Training on classical and molecular virology						FAO/IAEA	Gwenaelle Dauphin, FAO HQ
1.C.4	Regional training courses on "Major Transboundary and zoonotic animal diseases in the region: early detection, surveillance and epidemiology"						FAO/IAEA	Gwenaelle Dauphin, FAO HQ
1.C.5	Consultation on good laboratory practices for conducting multiple disease diagnosis						FAO/IAEA	Gwenaelle Dauphin, FAO HQ
1.C.6	Validation and transfer of new techniques for multiple disease diagnosis (PCR using the FRET system)						FAO/IAEA	Gwenaelle Dauphin, FAO HQ
1.C.7	Workshop on Good Emergency Management Practice (GEMP) in coordination with FAO/CMC and RESPOND						OIE, WHO, RESPOND	Gwenaelle Dauphin, FAO HQ
1.D	Promote and support laboratory quality management							Gwenaelle Dauphin, FAO HQ
1.D.1	Development of training/mentoring Programme						OIE, AAHL, IZSVe	Gwenaelle Dauphin, FAO HQ
1.D.2	Installation of updated laboratory information system (LIMS) in targeted laboratories						FAO/IAEA	Gwenaelle Dauphin, FAO HQ
1.D.3	External Quality Assurance for targeted diseases						FAO/IAEA, IZSVe, AAHL	Gwenaelle Dauphin, FAO HQ
1.D.4	Joint FAO/IAEA/OIE/WHO Global Survey on External Quality Assessment (proficiency testing) Schemes						OIE, WHO, FAO/IAEA	Gwenaelle Dauphin, FAO HQ
1.D.5	Access to standardized veterinary diagnostic reagents and international standards						FAO/IAEA	Gwenaelle Dauphin, FAO HQ
1.E	Provide laboratory equipment and supplies in a coordinated manner							Gwenaelle Dauphin, FAO HQ
Output 2 Linkages and communication pathways across national, regional and global laboratory and epidemiologic networks for the management of emerging zoonotic pathogens strengthened								Gwenaelle Dauphin, FAO HQ
2.A	Communication tool development and resource building							Gwenaelle Dauphin, FAO HQ
2.A.1	Develop communication tool(s) for different audiences, stakeholders and partners						OIE, WHO	Gwenaelle Dauphin, FAO HQ
2.A.2	Resource Building – Provision of documents, manuals, books and database access to scientific literature							Béatrice Mouillé, FAO HQ

2.A.3	<i>Development of a glossary of the available diagnostic assays and cross-cutting technologies for selected animal diseases, including zoonoses</i>							FLI, laboratory experts	Gwenaelle Dauphin and Mia Kim , FAO HQ
2.A.4	<i>Development of a self assessment tool for laboratories to identify the elements needed for a laboratory information management system (LIMS)</i>							AAHL, LIMS users and developers	Mia Kim, FAO HQ
2.A.5	<i>Support ongoing development of the EMPRES-I genetic module</i>							SIB	Gwenaelle Dauphin, FAO HQ
2.A.6	<i>Development of e-learning modules on bioinformatics (phylogeny and sequence analysis)</i>							FAO/IAEA, SIB	Gwenaelle Dauphin, FAO HQ
2.A.7	<i>Centralized resource for genomic characterization and molecular reagents</i>							FAO/IAEA, TBD	Gwenaelle Dauphin, FAO HQ
2.A.8	<i>Sample referral guidelines for transboundary animal diseases (TADs)</i>								
2.B	Development of joint meetings and conferences to support networking and promote national laboratory policies								Gwenaelle Dauphin, FAO HQ
2.C	Review and update of the tripartite Laboratory Networking Strategy (LNS) and future planning								Gwenaelle Dauphin, FAO HQ
2.C.1	<i>Tripartite coordination meetings</i>							OIE, WHO, Regional Lab Network partners, Ref Labs	Gwenaelle Dauphin, and Mia Kim , FAO HQ
2.D	Engage with stakeholders to support the development of cross-sectoral approach (es) concerning laboratories								Gwenaelle Dauphin, FAO HQ
2.D.1	<i>Coordination and development with regional counterparts of global framework for regional and national stakeholders meeting in each hot spot region</i>							PREDICT, RESPOND, DELIVER	Gwenaelle Dauphin, FAO HQ
2.D.2	<i>Four-way linking framework to improve the linkage between laboratory and epidemiological data (for H5N1 zoonotic influenza) for assessing health risks at the human-animal interface</i>							OIE, WHO, PREDICT	Gwenaelle Dauphin, FAO HQ
2.E	Support and promote laboratory networks								Gwenaelle Dauphin, FAO HQ
2.E.1	<i>Support to routine regional and global networking meetings</i>							OFFLU, CDC, Ref Laboratories/Centers	Gwenaelle Dauphin, FAO HQ

2.E.2	Linking laboratory and epidemiologic networks						CMC, RESPOND	Gwenaelle Dauphin, FAO HQ
2.E.3	Support for sharing of information and biological materials						OIE, WHO	Gwenaelle Dauphin, FAO HQ
2.E.4	Monitoring regional capacities for targeted diseases						National labs	Gwenaelle Dauphin, FAO HQ
2.E.5	Support and promote OFFLU network activities						CDC, WHO collaborating centers, Ref Laboratories/Centers	Gwenaelle Dauphin, FAO HQ
2.F	Support and promote laboratory partnerships							Gwenaelle Dauphin, FAO HQ
2.F.1	Identification of FAO Reference Centres in the regions and beyond prepared to offer expertise in diseases or technical areas relevant to each region						Ref Laboratories/Centers, OIE, WHO	Gwenaelle Dauphin, FAO HQ
2.F.2	Support and promote the establishment/development of regional service laboratories						Ref Laboratories/Centers, OIE, WHO	Gwenaelle Dauphin, FAO HQ

2.2 Planned activities for SOUTH and SOUTHEAST ASIA

Activity code	Activity description	2011			2012			Focal Person	PARTNERS
		10-11	11-11	12-11	01-12	02-12	03-12		
	Output 1 Capacity of national animal health laboratories to detect and diagnose diseases under a quality management system enhanced								
1.A.	Follow-up of laboratory mapping exercise activities								
1.B.	Support to and participate in conferences, trainings or workshops related to laboratory capacity building, and national laboratory policies, guidelines, and standards								
1.C	Develop and conduct trainings or workshops to build laboratory capacity and to promote national laboratory policies and guidelines								
1.C.1	<i>Biosafety trainings</i>						Pawin Padungtod, FAO-RAP		
1.C.2	<i>Hands-on training for diagnosis of selected regional priority disease</i>						Pawin Padungtod, FAO-RAP		
1.C.3	<i>LIMS workshop: Open-Source Platforms and Tools to Aid in Needs Assessment</i>						Pawin Padungtod, FAO-RAP	Thai Department of Livestock Development, AAHL	
1.C.4	<i>Regional training-the-trainer pathology workshop on Basics of Field and Laboratory Diagnosis</i>						Pawin Padungtod, FAO-RAP	UGA	
1.C.5	<i>Regional training courses on "Major transboundary and zoonotic animal diseases in the region: early detection, surveillance and epidemiology"</i>						Pawin Padungtod, FAO-RAP	PREDICT	

1.C.6	Workshop on diagnosis of selected regional priority disease							Pawin Padungtod, FAO-RAP	OIE/WHO, TBD
1.D	Promote and support laboratory quality management								
1.D.1	Assessment of biosafety infrastructure, biosafety cabinet testing, procurement and calibration							Pawin Padungtod, FAO-RAP	APBA
1.D.2	Laboratory support visits to assist with development and implementation of laboratory quality management systems							Pawin Padungtod, FAO-RAP	International lab experts
1.D.3	Develop training tool for laboratory logistics management							Pawin Padungtod, FAO-RAP	DELIVER
1.D.4	Provision of Laboratory Information Management Systems (LIMS)							Pawin Padungtod, FAO-RAP	AAHL
1.D.5	Laboratory Management Mentoring program between laboratory directors and/or managers of IDENTIFY-supported laboratories							Pawin Padungtod, FAO-RAP	International lab experts, AAHL
1.D.6	External Quality Assurance for targeted diseases							Pawin Padungtod, FAO-RAP	AAHL
1.D.7	Access to standardized veterinary diagnostic reagents and international standards							Pawin Padungtod, FAO-RAP	AAHL
1.E	Provide laboratory equipment and supplies in a coordinated manner								
	Output 2 Linkages and communication pathways across national, regional and global laboratory and epidemiologic networks for the management of emerging zoonotic pathogens strengthened							Pawin Padungtod, FAO-RAP	
2.A	Communication tool development and resource building								
2.A.1	Resource Building - Provision of documents, manuals, books and database access to scientific literature							Pawin Padungtod,	

								FAO-RAP		
2.A.2	<i>Sample referral guidelines for transboundary animal diseases (TADs)</i>								Pawin Padungtod, FAO-RAP	
2.B	Development of joint meetings and conferences to support networking and promote national laboratory policies									
2.B.1	<i>Regional Laboratory Technical Advisory Group Meeting</i>								Pawin Padungtod, FAO-RAP	OIE/WHO
2.C	Review and update of the tripartite Laboratory Networking Strategy (LNS) and future planning									
2.D	Engage with stakeholders to support the development of cross-sectoral approach(es) concerning laboratories									
2.D.1	<i>Regional and national stakeholders meeting</i>								Pawin Padungtod, FAO-RAP	OIE/WHO
2.D.2	<i>Four-way linking framework to improve the linkage between laboratory and epidemiological data (for H5N1 zoonotic influenza) for assessing health risks at the human-animal interface</i>								Pawin Padungtod, FAO-RAP	OIE, WHO, PREDICT
2.E	Support and promote laboratory networks									
2.F.	Support and promote laboratory partnerships									
2.F.1	<i>Support and promote the establishment/development of regional service laboratories</i>								Pawin Padungtod, FAO-RAP	OIE

2.3 Planned activities for CONGO BASIN

Activity code	Activity description	2011			2012			Focal Person	PARTNERS
		10-11	11-11	12-11	01-12	02-12	03-12		
	Output 1 Capacity of national animal health laboratories to detect and diagnose diseases under a quality management system enhanced								
1.A.	1.A. Follow-up of laboratory mapping exercise activities						B.M. Seck;	OIE, WHO	

								J.K. Litamoi	
	1.A.1	Follow-up of ongoing desktop review of existing data on laboratory capacity and networks from existing laboratory assessments						B.M. Seck; J.K. Litamoi	OIE, WHO
	1.A.2	Follow-up of review and compilation of national laboratories annual/biannual reports and information generated by members of the West and Central regional laboratory network (RESOLAB), Eastern Africa network (EARLN), SADC Laboratory Network (LABNET) and FAO laboratory assessments/mission reports						B.M. Seck; J.K. Litamoi	
	1.A.3	Additional targeted data collection, including laboratory visits and/or follow-up assessments if necessary, to fill in gaps in knowledge on laboratory capacity						B.M. Seck; J.K. Litamoi	OIE, PREDICT
	1.A.4	Integrate the outcomes of the laboratory mapping into the Laboratory Networking Strategy						B.M. Seck; J.K. Litamoi	OIE, WHO, FI
	1.A.5	Adaptation of animal health laboratory (individual and country-level) assessment tools							
1.B.	1.B.	Support to and participation in conferences, trainings or workshops related to laboratory capacity building, and national laboratory policies, guidelines, and standards						B.M. Seck; J.K. Litamoi	OIE, WHO
1.C	1.C	Develop and conduct FAO/OIE/WHO trainings or workshops to build laboratory capacity and to promote national laboratory policies, guidelines						B.M. Seck; J.K. Litamoi	OIE, WHO
	1.C.1	Regional workshop: "Targeting the needs for genetic sequencing"						B.M. Seck; J.K. Litamoi	OIE, WHO
	1.C.2	Regional workshop, "Diagnostic laboratory quality Assurance: Workshop on Process Control - Quality Control (Sample Management; Quality Control for Quantitative Tests; Quality Control for Qualitative Tests)"						B.M. Seck	FVI
	1.C.3	Regional training course on "Major transboundary and zoonotic animal diseases in the region: early detection, surveillance and epidemiology"						B.M. Seck; J.K. Litamoi	EISMV, PREDICT
	1.C.4	Regional train-the-trainer pathology workshops "Basics of Field and Laboratory Diagnosis"						B.M. Seck; J.K. Litamoi	UGA, OIE
	1.C.5	Regional workshop: Laboratory equipment calibration and maintenance						B.M. Seck; J.K. Litamoi	APHIS,EISMV
	1.C.6	National trainings with field epidemiologists for samples collection, storage, shipping						B.M. Seck; J.K. Litamoi	WHO, OIE
1.D	1.D	Promote and support laboratory quality management						B.M. Seck; J.K. Litamoi	OIE,WHO

1.D.1	Support QMS implementation in providing standard documents and samples of SOPs							B.M. Seck; J.K. Litamoi	OIE,WHO
1.D.2.G	On-site audit/backstopping missions for assessing quality assurance system implementation and development of quality documentation.							B.M. Seck	IAEA
1.D.2	On-site audit/backstopping missions for assessing quality assurance system implementation and development of quality documentation (DRC, Congo, CAR, Rwanda, Tanzania and Uganda).							B.M. Seck; J.K. Litamoi	FVI
1.D.3	Laboratory support trainings to assist in equipment maintenance and calibration							B.M. Seck; J.K. Litamoi	APHIS
1.D.4	Promotion of laboratory management mentoring program between laboratory directors and/or managers of IDENTIFY-supported laboratories							B.M. Seck; J.K. Litamoi	National lab
1.D.5	Assessment missions (Cameroon, DRC) for biosafety and biosecurity infrastructures, equipment and practices								APHIS
1.D.6	Develop partnership with regional biosafety association							B.M. Seck; J.K. Litamoi	AfBSA
1.D.7	Participation of selected countries to external quality assessment (EQA) schemes targeting avian influenza/Newcastle disease, Rift Valley Fever, Peste des Petits Ruminants, and Foot-and-Mouth Disease							B.M. Seck; J.K. Litamoi	IAEA, IZSVe
1.D.8	Provision to the nine beneficiary countries with validated standardized veterinary diagnostic reagents -antigens and antisera- targeting priority TADs laboratory diagnosis							B.M. Seck; J.K. Litamoi	IAEA, IZSVe
1.D.9	Development of specific technical competence to face emergent disease situations in the region							B.M. Seck; J.K. Litamoi	National lab
1.E	1.E Provide laboratory equipment and supplies in a coordinated manner							B.M. Seck; J.K. Litamoi	National labs, WHO, PREDICT
Output 2 Linkages and communication pathways across national, regional and global laboratory and epidemiologic networks for the management of emerging zoonotic pathogens strengthened									
2.A	2.A Communication tool development and resource building							B.M. Seck; J.K. Litamoi	OIE, WHO
	2.A.1 Develop communication tool(s) for different audiences, stakeholders and partners (all 9 IDENTIFY-supported countries)							B.M. Seck; J.K. Litamoi	OIE, WHO
	2.A.2 Resource Building - Provide documents, manuals, books and database access to scientific literature (all 9 IDENTIFY-supported countries)							B.M. Seck; J.K. Litamoi	OIE, WHO

2.A.3		<i>Second phase of the study on the development of collaborations and/or partnerships between public veterinary laboratories and the animal industry</i>								B.M. Seck; J.K. Litamoi	National lab
2.A.4		<i>Sample referral guidelines for transboundary animal diseases (TADs)</i>									
2.A.5		<i>Production, printing and dissemination of case definition and recommended test repertoire for IDENTIFY listed priority diseases to help animal health personnel (both field and lab) in the identification and prompt reporting of diseases</i>									
2.B	2.B	Organize and conduct joint meetings and conferences to support networking and promote national laboratory policies								B.M. Seck; J.K. Litamoi	
2.C	2.C	Review and update of the Laboratory Networking Strategy (LNS) and future planning								B.M. Seck; J.K. Litamoi	
	2.C.1	<i>Tripartite regional coordination meetings</i>								B.M. Seck; J.K. Litamoi	OIE, WHO
2.D	2.D	Engage with stakeholders to support the development of cross-sectoral approach(es) concerning laboratories								B.M. Seck; J.K. Litamoi	OIE, WHO
2.E	2.E	Support and promote laboratory networks								B.M. Seck; J.K. Litamoi	
	2.E.1	<i>Support to routine regional and global networking meetings</i>								B.M. Seck; J.K. Litamoi	OIE, OFFLU, EDPLN, GFN, AU-IBAR
	2.E.2	<i>Linking laboratory and epidemiologic networks</i>								B.M. Seck; J.K. Litamoi	APHIS, CIRAD, FVI, AU-IBAR
	2.E.3	<i>Support for sharing of information and biological materials</i>								B.M. Seck; J.K. Litamoi	
2.F.	2.F.	Support and promote laboratory partnerships								B.M. Seck; J.K. Litamoi	
	2.F.1	<i>Identification of FAO Reference Centres in the regions and beyond prepared to offer expertise in diseases or technical areas relevant to each region</i>								B.M. Seck; J.K. Litamoi	OIE
	2.F.2	<i>Support and promote the establishment/development of regional service laboratories</i>								B.M. Seck; J.K. Litamoi	OIE

Main challenges encountered and response provided

- Several major issues were encountered in this reporting period, some of which should ultimately allow activities to progress more smoothly and some that remain new challenges to solve. Significant emphasis on country-level impacts and the subsequent review of the current approach has uncovered the need to re-evaluate present implementation strategies and develop new solutions, which are still in development. These efforts have been further complicated with lack of clarity in reporting / planning process at the country and regional levels where duplicative requests from regional and country USAID offices continue and our officers seek to comply.

As EPT+ comes online, there will be new opportunities for building on current country level approaches that integrate the field and laboratory activities in priority countries. These opportunities can also include synergy and coordination with other EPT partners, which has been suboptimal, but is improving and expected to gain momentum in Year 3.

- The separation of the work plan process (announced at the June meeting in Rome) resulted in an unexpected drop in the frequency and quality of the communication between the IDENTIFY partners, especially at HQ level. Renewed efforts have improved the coordination, and will continue – particularly with regards to implementation of One Health activities at the country level where coordination is needed to identify opportunities, ensure linkages, and provide clear messages across sectors.
- Some activities in both regions were slowed or postponed from March to June following the request by USAID to conserve funds, and additional delays have been experienced from July to September due to the significant time devoted to the Year 3 work planning process and revisions. Where needed, activities have been brought forward to Year 3.
- The issue of veterinary laboratory sustainability is complex and is not yet being sufficiently addressed, in particular in Central Africa, where the animal industry is not developed. Significant support to national strategy development, identification of resources, and monitoring of laboratory progress is needed, accompanied with regulatory measures. FAO|IDENTIFY will only be able to partially address these issues.

Main progress made towards the achievement of project outcomes (since the start of the project activities)

- The support provided by IDENTIFY to date has contributed to greater understanding of the regional animal health priorities, assessment of laboratory capacities, and identification of regional and national gaps and resources.
- The direct support afforded to laboratories is substantial and has allowed expansion of activities to include quality assurance, biosafety, and maintenance and calibration of equipment, which contribute to laboratories' ability to conduct their work at internationally accredited standards (e.g. ISO 17025). Many national laboratories had never had the opportunity to consider these major issues. This support is not provided in an isolated and sequential manner but builds upon previous and current investments in laboratory networking and allow for a programmatic approach, proper approbation of planned activities by countries, and supports a regional approach to transboundary animal diseases (TADs).
- As many priority diseases are TADs, a regional approach (where agreed) allows for rapid disease detection/identification, and response measures can be coordinated regionally for more effective control. The networks in the West/Central, Eastern Africa and South-East Asia regions have set a good example with both the formal and informal exchange of information, collective effort, and responsibility to build laboratories in the regions. While laboratory capacities and national needs are heterogeneous within each region, the mapping tool developed by FAO has contributed to producing a regional perspective of laboratory capacities and gaps, identifying the required regional and individual support in those laboratories and offering a visualization tool to policy makers. Other partners such as APHIS-USDA, EU-FMD commission and CIRAD have demonstrated increasing interest in and support for these laboratory networks. This growing confidence lends credence to the regional approach, and FAO has a comparative advantage in the coordination of such supports and inputs.
- This project has enabled launching of innovative initiatives, such as the genetic module in the EMPRES-i database, the 4-way linking framework and the laboratory mapping tool. The genetic module represents an ideal example of a multidisciplinary success, linking virology, epidemiology and bioinformatics, and is receiving increasing interest from the scientific community and from policy makers.
- Building on the investments made with support under avian influenza, this project sustains previously established mechanisms such as collaborations and communication pathways between organizations, global –OFFLU- and regional networks, and benefits from momentum gained through “public good concepts” such as recognition of the importance of early detection and intervention, and impacts of pathogens with pandemic potential; these investments facilitate the interest and willingness for further development of technical laboratory capacities, especially molecular techniques, to other transboundary and priority diseases.

Event Title	Dates	Venue	Organizer(s)	Other Information
Global				
Tripartite face-to-face meetings	10-11 May; 15-16 June, 27-28 June 2011			Project management and planning
Regular tripartite teleconferences (TC) or videoconferences	since Oct 2011			Project management and planning; biannual report; laboratory networking strategy; Year 3 Work Plans; Global Survey
TC and Face-to-face meetings with IDENTIFY AOTR, USAID/W	19 Apr; 3 Aug; 22 Sept; 15-16 June, 28 June; 13 July 2011			Face to face meetings replacing monthly TCs, on the occasion of the EPT Quarterly Partners meeting and of the SE Asia EPT planning meeting
EPT Program Quarterly meetings	27-28 June 2011	Washington DC, USA	USAID	HQ team participated to the EPT quarterly meeting together with OIE and WHO, including the Lab working group discussion (Participants: USAID, PREDICT, RESPOND, CDC, DELIVER)
Congo Basin				
EPT planning meeting organized by USAID	27-29 July 2011	Kinshasa, DR Congo	USAID	Coordination and planning meeting between all EPT partners
Side meeting of IDENTIFY focal points after EPT meeting	29 July 2011	Kinshasa, DR Congo	FAO, OIE, WHO HQ and AFRO	The FAO IDENTIFY Regional coordinators attended on behalf of IDENTIFY to coordinate the EPT work plan and fine-tune details on activities
Regional tripartite TCs between regional coordinators	7 Apr; 2 May, 19 May; 12 July 2011		FAO, OIE, WHO	Project management and planning

Preparatory meeting between FAO and OIE	26 July 2011	Kinshasa, DR Congo	FAO, OIE	Review of ongoing activities and identification of possible Year 3 areas for collaboration in animal health sector
SE Asia				
Informal Consultation on a Draft Asia Pacific Laboratory Action Plan (2011 - 2015) for Emerging Infectious Diseases, +	19-20 May 2011	Manila, Philippines	WHO WPRO	IDENTIFY HQ and SE Asia coordinator participated in the Informal Consultation on a Draft Asia Pacific Laboratory Action Plan (2011 2015) for Emerging Infectious Diseases organized by WHO Western Pacific Regional Office (WPRO). Fourteen participants from WPRO countries attended the meeting along with representatives from ASEAN secretariat, USAID, FAO and OIE. IDENTIFY HQ coordinator(Mia Kim) presented the Tripartite (FAO-OIE-WHO) Laboratory Capacity Building and Networking while IDENTIFY SE Asia coordinator (Pawin Padungtod) presented FAORAP regional approach to animal health laboratory networking under IDENTIFY project of the Emerging Pandemic Threat (EPT) programme supported by USAID and the Regional Cooperative Programme on Highly Pathogenic and Emerging Diseases (HPED) supported by the European Commission (EC) . Subsequent discussion among the tripartite on collaborative laboratory networking activities in SE Asia was focusing on upcoming meeting schedule. In was agreed that the tripartite would pursue in-country collaborative activities including organization of the Zoonoses conference, training in laboratory management and biosafety.
EPT Viet Nam country work plan development workshop, +	20-21 June 2011	Hanoi, Viet Nam	USAID Viet Nam	A spreadsheet describing activities in Viet Nam implemented by all EPT partners was developed. Activities were grouped under five themes including; Livestock Disease Surveillance, Outbreak response, Laboratory Capacity Development, Risk Determination and Risk Reduction. Potential areas of collaboration across EPT components were identified. A summary of EPT contribution for Viet Nam was presented to USAID mission director at the end of the meeting
EPT Thailand country work plan development	23 June 2011	Bangkok,	USAID RDMA	A spreadsheet describing activities in Thailand implemented by all EPT partners was developed. Activities were grouped under five

workshop		Thailand	(Thailand)	themes including; Livestock Disease Surveillance, Outbreak response, Laboratory Capacity Development, Risk Determination and Risk Reduction. Potential areas of collaboration across EPT components were identified.
EPT LaoPDR country work plan development workshop	24 June 2011	Bangkok, Thailand	USAID RDMA (Thailand)	A spreadsheet describing activities in LaoPDR implemented by all EPT partners was developed. Activities were grouped under five themes including; Livestock Disease Surveillance, Outbreak response, Laboratory Capacity Development, Risk Determination and Risk Reduction. Potential areas of collaboration across EPT components were identified.
Tripartite IDENTIFY South and SE Asia Meeting, +	11 July 2011	Bangkok, Thailand	FAO-OIE- WHO	Participants including FAORAP, FAOHQ, OIE SRR SEA, WPRO, SEARO and WHO-IHR agreed upon regional and country work plan for 2012. The overall IDENTIFY regional and country work plan of each organization were presented and agreed upon. Gantt chart and presentation were prepared. The outcomes from this meeting were presented at the regional EPT meeting in Bangkok, 12-13 July 2011.
EPT Asia Regional Workshop, +	12-13 July 2011	Bangkok, Thailand	USAID	The objectives of the workshop were ; 1) Building a shared vision for EPT as a "program", 2)Share "current thoughts" about FY12 country and regional work plans and 3) Highlight the relevance of "non-EPT" platforms in the region
EPT Indonesia country work plan development workshop, +	15-16 July 2011	Jakarta, Indonesia	USAID Indonesia	IDENTIFY HQ liaison together with OIE IDENTIFY SE Asia coordinator participated in the Indonesia EPT planning meeting. EPT partners delivered prospective activities across the five themes: Livestock Disease Surveillance, Outbreak response, Laboratory Capacity Development, Risk Determination and Risk Reduction. A draft work plan was developed for IDENTIFY. Potential areas of collaboration across EPT components were identified.
Stakeholder' planning meeting	1 September, 2011	Bangkok, Thailand	FAO-OIE	Internal planning meeting

* = side meetings with OIE , + = side meetings with OIE and WHO

1 st International Congress on Pathogens at the Human-Animal Interface (ICOPHAI): Impacts, Limitations and Needs in Developing countries.	15-17 September 2011	Addis Ababa, Ethiopia	ICOPHAI		No country invited but poster on the One Health approach presented by FAO
Congo					
Joint regional AU-IBAR/FAO-RAF Technical workshop on a regional strategy for African swine fever (ASF) control in Central Africa	21-23 June- 2011	N'Djamena, Chad	AU-IBAR/FAO-RAF	DRC, Eq. Guinea, CAR	Participation of the Directors of national veterinary lab of DR Congo, Equatorial Guinea and Central African Republic
One Health for Central and East Africa alliance (OHCEA)	4-6 May:	Brazzaville, Congo	USAID		IDENTIFY focal point Bamako participated. Meeting purpose was to Participate in One Health brainstorming meeting called by USAID at the WHO-AFRO office to

					enhance cooperation between public health and veterinary faculties and the interaction between Ministries of Agriculture and Health. 20 participants (USAID, RESPOND, OHCEA, WHO-AFRO, AU-IBAR and FAO)
EAC/EAPHLN Experts Meeting on viral haemorrhagic fevers and integrated diseases surveillance and response for EAC countries	11-15 July :	Entebbe, Uganda			ECTAD Nairobi focal point participated. The purpose of the workshop was to discuss the status of the regional plan on viral hemorrhagic fevers (VHFs) as the VHFs have been occurring frequently in the region in the past ten years. Uganda gave an account of their experiences with the recent outbreaks of VHFs (Ebola and Yellow fever) in the past one year. The workshop participants visited the recent Ebola outbreak areas in Central and northern Uganda (Kitgum and Lacon hospital in Gulu) and assessed the capacity of the country to manage such outbreaks in the future. Community and field simulation scenarios were developed and discussed. The positive gains by Uganda in the management of VHFs should be consolidated in the other countries and the region as a whole.
SE Asia					

Asia Pacific Biosafety Association Conference, *	5-6 May	Singapore	Asia Pacific Biosafety Association	FAO/IDENTIFY SE Asia Coordinator supported to deliver joint presentation on One Health approach to Biosafety, including EPT with OIE/IDENTIFY SRR Coordinator	A joint presentation entitled "One Health Approach to Biosafety", on One-Health approach to laboratory capacity building including description of the Emerging Pandemic Threat Programme and IDENTIFY was presented by FAORAP and OIE SRR SEA IDENTIFY coordinators
Avian Virology Diagnostic Training and Workshop	11-22 July 2011	Weybridge, UK	Veterinary Laboratory Agency	Philippines	Requested for supported by Philippines Animal Health Center, Bureau of Animal Industry. IDENTIFY supported participation of Dr Edna Felipe, Head of Avian Influenza Diagnostic unit. This training contribute to improve national laboratory staff capacity and competence in diagnostic of priority diseases in the region, which ultimately strengthen laboratory support for surveillance of priority and emerging diseases in the region.

Workshop on OIE Standards for Collection & Shipment of Biological Samples	9-11 August 2011	Nairobi, Kenya	OIE	All IDENTIFY countries (supported by OIE)	FAO IDENTIFY focal point for Eastern Africa attended and gave a presentation on FAO Reference Centres and described FAO's technical assistance programmes, and projects to its member countries (e.g. TCPs, GCPs, UTFs, Pas, SPFS, LoAs, SPPs, and TeleFood projects).
SE Asia					
Training and workshop on Diagnosis and Characterization of CSF and PRRS Viruses  CSF-PRRS_Training_and_Workshop_Final.	11-20 July 2011	RAH06 (Ho Chi Minh City, Viet Nam)	FAO, Viet Nam DAH and AAHL	Cambodia (NaVRI), China (CAHEC, Yunnan), Indonesia (DGLAHS), LaoPDR (NAHC), Malaysia (VRI), Philippines (PAHC), Thailand (NIAH) and Viet Nam (RAH06)	This training aimed to harmonize the protocols for diagnostic and characterization of the two priority animal diseases in Southeast Asia. Seventeen laboratory staff attended this training. The training contents covered swine viral diseases diagnostic and characterization procedures including gross pathology, immunohistochemistry and molecular techniques. The post-training evaluation showed that the participants were satisfied with the training organization and gained satisfactory level of understanding and skills in diagnostic of CSF and PRRS
The Workshop on Diagnosis of Priority and Emerging Diseases	21 - 22 July 2011	Ho Chi Minh City, Viet Nam	FAO, Viet Nam DAH and AAHL	Cambodia (NaVRI), China (CAHEC, Yunnan), Indonesia (DGLAHS), LaoPDR	The objective of this workshop was to draft the strategic framework for capacity building for diagnosis and characterization of priority and emerging diseases in swine. A total of 43

in Swine				(NAHC),Malaysia (VRI), Philippines (PAHC), Thailand (NIAH) and Viet Nam (RAHO6)	participants including laboratory staff from 7 countries in ASEAN, China, experts in swine diseases from academic institution, vaccine production company, Viet Nam Department of Animal Health and the Emerging Pandemic Threat programme partners involving in conducting surveillance in Viet Nam participated in the workshop. Presentations were made to provide the participants with update on CSF and PRRS disease situation in the region, diagnostic, surveillance and control techniques for CSF, PRRS and other emerging diseases in wild and domestic animals. The outcome of the workshop included recommendation of capacity building activities under 5 key areas; biosafety, laboratory support for surveillance, legislation, networking and laboratory quality
Training on Quality Assurance and Standardization of Diagnostic Reagents	5-19 September 2011	Geelong, Australia	FAO-AAHL (LoA)	China, Cambodia, Indonesia, LaoPDR, Malaysia, Myanmar, Philippines,Thailand and Viet Nam	The objective of this training was to equip laboratories with necessary skill to develop their own proficiency testing programme. A total of 15 participants from IDENTIFY supported laboratories in Cambodia (NaVRI), China (CAHEC), Lao PDR (NAHC), Malaysia (VRI), Philippines (PAHC), Thailand (VRI) and Viet Nam (DAH) participated in the 12-day training. The training program at the Australian Animal Health Laboratory (AAHL) reviewed the requirements under ISO17025 for quality assurance of laboratory tests and training in providing Proficiency Testing (PT) to ensure laboratories are producing accurate and correct results for tests carried out in the laboratory. It is foreseen that the developed

					capacity to provide proficiency testing will allow national animal health laboratories to develop their own external quality assurance programme for their national laboratory network.

Congo Basin					
9 – 10 May 2011	Second EARLN Interim joint network meeting	Nairobi, Kenya	The Interim Secretariat was coordinated and hosted by FAO ECTAD EA in collaboration with AU-IBAR and OIE Sub Regional Representative in Eastern Africa	No IDENTIFY supported country invited	The FAO ECTAD EA IDENTIFY coordinator attended the meeting, facilitated and presented IDENTIFY. The partners involved included OIE, AU-IBAR, EAC, IGAD. The establishment of Interim Secretariat was endorsed by the CVOs meetings in order to better coordinate the two networks (cpi and laboratory) in Eastern Africa. Livestock representative (Ethiopia), Wildlife representative (Tanzania) and VS (Kenya) also attended the meeting.
5-7 September 2011	2nd Joint Eastern Africa Epidemiology and Laboratory network meeting	Kigali, Rwanda	FAO ECTAD Nairobi	Uganda, DRC, Tanzania and Rwanda.	The participation of the RESOLAB coordinator (FAO) enabled the development of stronger linkages between RESOLAB and EARLN networks. Meeting also attended by AU-IBAR, OIE, CDC, EARLN-FMD and other Eastern African countries. Wildlife sector represented by

					participants from Kenya and Rwanda.
SE Asia					
Consultation for establishing a network of Regional Leading Diagnostic Laboratories, *	27-29 July 2011	Kathmandu, Nepal	FAO Sub Regional ECTAD, Nepal	FAO IDENTIFY SE Asia Coordinator supported to deliver presentation on the SE Asia Regional approach to laboratory networking and EPT	The Consultative Workshop for Epidemiology and Laboratory Network in the SAARC Region was organized from 27 to 29 July 2011 involving the epidemiology and laboratory experts of animal health and wild life sectors of SAARC countries and various other organizations like WHO, OIE, EU and wild life personnel. The workshop was attended by 43 country participants from the entire eight SAARC member states. The workshop participants recommended how the epidemiology and laboratory networks should be set up and functioned in the SAARC region including mechanisms for networking among sub-national laboratories, linkage between national laboratory and epidemiology networks, sharing of diseases information among member states and communication models. Also highlighted during the meeting was the importance of communication framework for the region and the need to have one
Regional Laboratory Network Technical Advisory Group Meeting, *	4-5 August 2011	Bangkok, Thailand	FAO-OIE	16 representatives from ASEAN Regional Reference Laboratory for HPAI (VRI), Australian Animal Health Laboratory	Regional Framework for Laboratory Capacity Building and Networking in Asia was developed taking into account other regional strategies including IDENTIFY Regional Laboratory Networking Strategy, Asia Pacific Strategy for Emerging Diseases

				(AAHL), FAO, National Institute of Animal Health (NIAH) of Thailand, OIE, OFFLU, USDA(USAID.	(APSED), ASEAN HPAI Regional Strategy
Meeting to Initiate a Strategic Plan and Strategic Framework for Epidemiology Capacity Development in Asia	18-19 August 2011,	Bangkok, Thailand	FAO - RESPOND	FAO IDENTIFY SE Asia Coordinator supported to deliver presentation on the SE Asia Regional approach to laboratory networking	Recommendations relevant to the current developments in animal health in Asia were developed for a Strategic Framework by national, regional and international participants to represent the core elements of a five-year Strategic Plan for building epidemiology capacity in Asia.
The 4th OIE Regional Meeting on Strengthening Animal Health Information Networking in Asia	14-16 September 2011	Chiangmai, Thailand	OIE Tokyo	FAO IDENTIFY SE Asia Coordinator supported to share experiences and lessons learnt in HPAI control and present Regional Laboratory Network activities including the Emerging Pandemic Threat Programme and IDENTIFY.	The main objectives were:(1) To share updated information and experience in animal health information networking , (2) To review progress made by OIE Members in Asia in line with the previous meeting recommendations, (3) To discuss how to improve animal health information networking to strengthen animal disease control and prevention measures at national and regional level, (4) To discuss and review current H5N1 HPAI control measures in OIE Members in Asia in particular focusing on vaccination. The meeting was attended by participants from 21 countries/territories namely: Bangladesh, Brunei, Bhutan, Cambodia, PR

					China, Chinese Taipei, Hong Kong SAR, Indonesia, Japan, RO Korea, Laos, Malaysia, Maldives, Mongolia, Myanmar, Nepal, the Philippines, Singapore, Sri Lanka, Thailand and Vietnam, local observers (Thai-DLD) and FAO. The IDENTIFY SE Asia coordinator shared experience and lessons learnt in HPAI control and present Regional Laboratory Network activities including the Emerging Pandemic Threat Programme and IDENTIFY.
WHO South East Asia Regional Workshop on the Emerging and Dangerous Pathogens Laboratory Network, +	20-22 September 2011	Jakarta, Indonesia	WHO-SEARO	FAO IDENTIFY SE Asia Coordinator supported to share experiences and lessons learnt in HPAI control and present Regional Laboratory Network activities including the Emerging Pandemic Threat Programme and IDENTIFY	WHO regional workshop aims to convene key national, regional and global public health and animal health diagnostic laboratory scientists and EDP experts, and other stakeholders for developing the way forward for a collaborative regional laboratory preparedness and response network coordinated with Global EDPLN to enhance the region's capacity for detecting, responding to and preventing outbreaks of EDPs in SE Asia.

* = side meetings with OIE , + = side meetings with OIE and WHO

Annex 2: USAID EPT/IDENTIFY Project Position on Provision of Laboratory Equipment and Supplies
August 30, 2011

The IDENTIFY project seeks to strengthen national laboratory capacity for rapid and accurate detection of known key pathogens and appropriate handling of material from cases of disease with no identified cause. FAO/OIE/WHO are jointly implementing the IDENTIFY project through their existing institutional frameworks, mechanisms and networks. These project efforts by IDENTIFY are often implemented alongside a variety of host governments', donors' and international organizations' laboratory capacity building efforts and investments, and coordinating and rationalizing IDENTIFY's efforts among these other efforts needs to be done in a transparent manner.

The IDENTIFY project aims to provide sustainable inputs into: 1) the development of guidance and policy for national laboratories; 2) promoting laboratory quality (e.g. biosafety/biosecurity, quality assurance, accurate diagnosis, and specimen collection, handling and shipping); 3) strengthening laboratory capacity in support of surveillance and response; and 4) enhanced laboratory networking.

Given the EPT program's focused mission and limited funds, the IDENTIFY project doesn't intend to routinely provide or pay for partner laboratories' recurring material costs. On a case-by-case basis, where the absence of particular pieces of laboratory equipment or reagents are seriously limiting the laboratory's ability to perform normative disease testing, or where specific laboratory investments may improve a laboratory's ability to serve as a national and/or regional resource for normative disease testing, and where there is reasonable expectation that the government involved will sustain the efforts of the laboratory(ies) in question, then in these instances IDENTIFY will consider financing these needs, and then only in full cooperation with the relevant national authorities and in consultation with other EPT Partners.

While all three organizations recognize the need to engage regional parties in order to ensure sustainability and continued collaboration within and between the animal and public health sectors, the three organizations operate under separate mandates and the approach to achieving their goals sometimes differs. For example, provision of laboratory equipment and consumables in support of points 2 and 3 above is considered by all three organizations based upon need and in line with the national authority, with the following distinctions:

- For FAO, a regional approach is followed where a programmatic strategy exists in order to provide consumables such as reference reagents to countries equally, and national inputs are coordinated where need is identified and in agreement with the Ministry of Agriculture.
- While the OIE may provide laboratory equipment and supplies on a limited basis within the context of the OIE Twinning Programme, the OIE is not planning wide-spread procurement of equipment or supplies under the IDENTIFY Project.
- For WHO, both a regional and national approach is followed under existing regional platforms such as the Asia Pacific Strategy for Emerging Diseases (APSED), the Asia Pacific Strategy for Strengthening Health Laboratory Services and the Integrated Disease Surveillance and Response (IDSR) Strategy. Unlike FAO and OIE, WHO allocates funds under IDENTIFY directly to some of its Country Offices. These funds may be used to procure equipment and laboratory supplies following the agreement of the Ministry of Health of those countries.

Practically, should a USAID Mission or EPT partner in a given country wish to inquire about current or planned support for laboratory equipment or supplies through the IDENTIFY project, if the IDENTIFY Project has local representatives from WHO and FAO in that country/region,

they may approach those people to convey their request or suggestion. For inquiries regarding public health laboratories, the WHO representative may be contacted. Inquiries pertaining to support for animal health laboratories should be addressed to the FAO representative. Alternatively, if local or regional representatives are not available, USAID Mission and EPT partners may convey queries to IDENTIFY's headquarters' representatives, or to the USAID Washington AOTR. Requests or suggestions for provision of laboratory equipment can be best considered by the IDENTIFY Project if they are submitted early, when upcoming yearly work plans are being developed.

When the IDENTIFY Project has queries related to planned support for laboratory equipment or supplies coming from USAID Missions or EPT partners, these will be directed to the USAID/Washington AOTR, or the EPT Partner headquarters counterparts, who will attempt to collect and share any details on such provisions that would be of help to IDENTIFY, and its own laboratory strengthening efforts.

Should there be an extraordinary need, for example a disease outbreak that has exhausted local supplies, a country may request additional support from the IDENTIFY Project for their laboratory services. FAO, OIE and WHO, as IDENTIFY partners and also in keeping with their respective organizations' mandates, will attempt to meet such requests. The three organizations would coordinate their response with the other EPT partners under the leadership of the relevant national authorities as appropriate.

Annex 3: Current status of the progress of the Veterinary Glossary presenting an overview for validated (new) diagnostic techniques in addition to OIE recommended methods.

DISEASE		TABLE MATRIX	Review process
1	African Swine Fever	available	Reviewed by 3 reference labs, comments still awaited from expert review

Annex 4: Global Laboratory Networking Strategy - June 2011

Emerging Pandemic Threats Program

IDENTIFY Project

Background:

The IDENTIFY project is the component of the USAID-funded Emerging Pandemic Threats (EPT) programme that focuses on the capacity of laboratories in the public-health and animal-health sectors to contribute to the management of emerging zoonotic pathogens through rapid detection of known pathogens and appropriate handling of material from cases of unidentifiable diseases. The IDENTIFY project is specifically designed to strengthen diagnostic capacities in the geographic "hot spot" regions identified by USAID where new diseases have previously emerged. In addition to IDENTIFY, the EPT Program has projects called PREDICT, RESPOND, and PREVENT which cover the areas of wildlife monitoring, field epidemiology and training, behavior change communications, and national planning. IDENTIFY activities have necessary connections and interactions with the activities of several of the other components of the EPT programme.

IDENTIFY is jointly implemented by the U.N. Food and Agriculture Organization (FAO), the World Organization for Animal Health (OIE), and the U.N. World Health Organization (WHO). These organizations have long-established networks of laboratories which are an integral part of their public-health or animal-health function. Under the framework of the IDENTIFY project, the three organizations will enhance the diagnostic capacity and improve networking of these laboratories – both geographically and across the public-health and animal-health sectors. The networks will include international reference laboratories which will support national and regional laboratories, when necessary, by performing full characterization and investigation of "unknown" agents. The ultimate aim of the five-year project is to link together a global cooperative network that is fully capable of rapidly diagnosing and reporting to OIE on listed animal diseases and unusual epidemiological events or emerging diseases, and investigating events of potential international public health concern and reporting to WHO as required by the International Health Regulations (IHR).

Laboratory networks, often vertical or disease-oriented in nature, exist and will be the foundation to which the IDENTIFY project will look to meet its goals. Gaps, both disease-specific and with respect to geographical coverage, exist. The IDENTIFY project intends to determine gaps and propose, in collaboration with national partners, mechanisms for capacity building to fill these gaps. National and regional ownership of capacity building and networking activities is critical. Regional parties are already active in regional networking and need to be engaged as early as possible in the planning process in order to ensure sustainability and continued collaboration within and between the animal and public health sectors.

Steps to support enhanced laboratory capacity and networking

A. Identification of priority diseases and laboratories

1. Identification of targeted normative diseases and emerging pathogens [*Note: steps A.1 and A.2 conducted concurrently*]
 - a. For each hot spot region, IDENTIFY project partners will compile a list of targeted diseases among humans and animals (including wildlife) in each region for which improved rapid and accurate diagnosis is needed within the framework of national and regional priorities. This list is based on official disease notifications, country disease data review, regional existing disease lists and priorities, literature review, input from national and regional stakeholders, previous regional occurrence, predictive modeling, and other relevant sources.
 - b. Once the list of targeted diseases is finalized following the stakeholders awareness meetings, IDENTIFY project partners will catalog recommended and updated testing methods, identify associated pathogens or syndromes, and identify diseases which use similar testing technology, in order to better coordinate and increase impact of project activities, specifically laboratory-based training on testing methods.
2. Identification of laboratories and networks in or providing services to the hot spot regions and countries [*Note: continuous and evolving approach for Congo Basin and SE Asia regions*]
 - a. Within each of the hot spot regions, laboratory capacity of national animal and public health laboratories will be assessed using standard criteria in agreement with national authorities.
 1. Results of assessments previously conducted by the three IDENTIFY partners will be summarized and will act as the basis for additional data collection. This step could include incorporating available assessments conducted by other EPT partners.
 2. Additional targeted data collection on capacity will be conducted if necessary (by self-assessment and questionnaire) by IDENTIFY partners to fill in gaps in knowledge on laboratory capacity.
 - b. This information plus additional information from other EPT projects on geographic areas with the highest risk of pathogen emergence and spread, and in consultation with local stakeholders such as Ministries of Health and Agriculture, will also be considered in better targeting national laboratories for support, within the framework of national and regional priorities.
 - c. National laboratories (public health and animal health) will be the lowest level of engagement within a country for IDENTIFY. Exceptions will be made in cases where another laboratory has been specified by national authorities, or where this relationship could be defined and/or strengthened, and could provide the capacity to fill in gaps at national or regional levels.
 - d. Continuous support to regional networking will enable information and experience sharing between countries, development of trust, regional decisions on laboratory strengthening

- e. International and regional reference laboratories serving the hot spot regions, most of which are affiliated with the IDENTIFY partners' existing networks, will be incorporated to provide technical support to national laboratories in accordance with existing Terms of References or mandates if appropriate. These laboratories, along with high-capability national laboratories, can also support quality control/assurance for other national laboratories in the hot spot regions.
- f. The IDENTIFY partners will support development or adaptation of standard procedures and mechanisms, and reinforcement of linkages and communication to refer specimens (or strains) between the above-mentioned laboratories. This could include decision trees and algorithms for referring specimens associated with human or animal outbreaks for which all tests for known pathogens are negative to high capability laboratories and the referral of unusual or unidentified pathogens to reference laboratories.

B. Strengthening of national laboratories in regional networks

1. For the laboratories identified (step A.2.b above), more detailed assessments may be conducted in agreement with national authorities to fill information gaps and to identify specific needs (step A.1.a above) - which could include training, supplies for shipping, equipment, reagents, etc. - that are needed to ensure that overall laboratory functioning, accuracy, and timeliness is improved according to the national laboratory's priorities with the ultimate goal of improving disease reporting to the proper national authorities.
2. Within the framework of national priorities and following laboratory assessments (see B.1), partners will provide strengthening support, such as training, protocols and documentation, quality assurance systems, proficiency testing, networking opportunities, equipment, reagents, supplies, etc. for national laboratories.
 - a. Development/adaptation and provision of protocols and/or in-service training for laboratory staff related to testing, sample handling, laboratory biosafety, reporting, quality control, sample shipping, etc. Follow-up training may be required at certain intervals.
 - b. Procurement and delivery of equipment, reagents, supplies, etc. For sustainability reasons, it would be ideal for national authorities to include equipment and commodities costs in their budgets or to phase in coverage of the costs so the country is fully supporting recurrent costs for commodities and maintenance of equipment. At the stakeholders meetings, participants expressed their desire to develop a strategy for ensuring sustainability (see B.3 below).

Note: These steps will be coordinated with national, regional, and global partners to ensure that this support is not already being provided by others.

3. In collaboration with national authorities, the development of a sustainability plan by country will be facilitated to assist the identification of sources of funding, including reinforced budget lines for national laboratories, to ensure optimal use of resources.

C. Establishing/strengthening linkages among existing regional and global laboratory networks across public and animal health (e.g. OFFLU, GFN, EDPLN) and with relevant disease control authorities.

1. Within each hot spot region, the mapping exercise will include the inventory of activities of existing geographical/specialized laboratory networks that already contribute to meeting IDENTIFY's goals.
2. Discussions with the key global specialized networks (e.g. OFFLU, GFN, EDPLN) will occur for the strengthening of linkages and increased collaboration between national laboratories and regional networks.
3. IDENTIFY will advocate for new and enhanced linkages between laboratory networks and epidemiological networks both within the animal and public health sectors, and across sectors.
4. For the laboratories in each hot spot region, collaborations and communication pathways will be strengthened in order to share samples, data, reports, etc. with disease control authorities. Development of mutual trust and interest within regional networks will be promoted.

Annex 5: List of Laboratories – SSEA

Region	Country	Veterinary laboratories	Abbr	Laboratory Focal point	Disease specialty/focus *	National Laboratory	PREDICT Laboratory
Southeast Asia	Cambodia	National Veterinary Research Institute	CA-NAVRI	Dr. Sorn San	n/a	Yes	Yes
	China	Langzhou Veterinary Research Institute	CH-LVRI	Hong Yin	FMD

L	Isolated compound outside of residential area	Isolated compound in low populated area	Single building in low populated area	Building within residential area
O				
C				
A	Proper containment + guard (24 hr) + Restricted access to building with Identity card (employees) only	Proper containment + guard (24 h)	Insufficient containment / low biosecurity level / guard present	Easy access to laboratory compound by visitor / stranger / containment insufficient / no guard
T				
I				
O				
N	Access to highway, airport, harbour <i>and / or</i> station within 30 minutes	Access to highway, airport, harbour <i>or</i> station within 60 minutes	Access sometimes difficult	Limitations in access to transport means (traffic jams, bad road, airport far)

	3	2	1	0
L	Lab is financially autonomous, funds for lab from public source and/or self-generated	Lab is almost financially autonomous, funds for lab from public or self-generated AND development programmes	Lab has insufficient own budget, activities dependant on development partners	Lab has no own budget; all activities exclusively rely on external funding source
A				
B				
B	Lab budget allows ample opportunity for research	Lab budget allows a little research	Lab finances are insufficient for proper research	No research activity due to insufficient lab budget
U				
D				
G	Lab budget sufficient for independent upgrading of larger lab infrastructure	Lab budget would allow a little independent upgrading of infrastructure	Upgrading by use of lab budget only for small and cheap infrastructural changes	Upgrading only with external funding
E				
T				

	3	2	1	0
B	Constant stable electricity supply and automatic switch-on generator	Stable electricity supply and generator (manually operated)	Frequent electrical instability/voltage irregularity, manually operated generator	Electricity supply less than 10 hours per day, generator does not run permanently or not existent
A				
S				

I C	Constant supply of good-quality water (pipe)	Constant supply of water through pipe or tank; back-up tank available	Supply of water through tank, sometimes insufficient or quality low	Irregular water supply
S U P P L Y	Unlimited access to purified water; own production of deionised and distilled water	Access to deionised and distilled water (external source)	Limited access to deionised and/or distilled water [external/internal source]	Difficult access to deionised and/or distilled water
	3	2	1	0
O R G.	Organigram and organization system in place + written description of responsibilities	Organigram and organization system in place; staff mostly know their roles	Organization system in place, but frequent changes, staff not always aware of their roles	Frequent shifting of personnel, no consequent organization system
	3	2	1	0
L I N K A G E	Close collaboration with and constant support of satellite labs* (hereafter: satlab)	Close contact with satellite labs, but support limited due to insufficient lab budget	Contact with satellite labs, but collaboration difficult	Collaboration with satellite labs insufficient
L A B S	Support of satlabs by training on regular basis	Support of satlabs by training on irregular basis	Support of satlabs by rare training	No transmission of training to satlabs
	Support of satlabs by provision of material/reagents/kits on regular basis	Support of satlabs by irregular provision of material/reagents/kits	Rare provision of material/reagents/kits	No possibility for provision of material/reagents/kits
	3	2	1	0
C O M M U N I C A T I O N	Constant telephone/fax connectivity with good quality	Good telephone/fax connectivity, sometimes interrupted	Connectivity and quality of phone/fax sometimes poor	Bad connectivity of phone/fax due to problems with line or electricity
	Good and speedy internet connection, all staff has access in all areas (labs, office...)	Good internet connection in offices; not all staff member have access	Internet connection limited, but in general fairly well	Internet is slow and interrupted; only selected staff member have access
	Staff has free access to scientific publications (library, online journals)	Free access to library, limited access to online-journals	Library might be existent, but not up-to-date, limited access to online-j.	No access to library, and only to few online journals (non-restricted)
	Institute has website and	Institute has website and irregularly publishes	Inhouse and external informations are published	No website, no regular

	3	2	1	0
O	produces regular bulletin	information	on request	information sharing
N				
I	All lab departments are clearly separated and well contained by use of disinfections, change of lab coats; identity badges or other means	Lab departments are separated but can be accessed by lab staff from other department	Separation in place but not strictly followed	No clear separation
N				
F				
R	Facilities (labs) of all departments well-maintained and well looked after by lab staff	Facilities of most of departments well-maintained and well looked after by lab staff	Only some labs are well-maintained and well looked after	Most labs of the departments are in poor status.
A				
S	BSL-3/4 Virology lab (BSC-III)	BSL-2/3 Virology Lab (2xBSC-II)	BSL-1/2 Virology lab (1xBSC-II)	No biosafe Virology lab (BSC-II not functioning or not existent)
T				
R	BSL-3/4 Postmortem room + BSC-III	BSL-2/3 PM-room + BSC-II	BSL-1/2 PM-room (BSC-II)	No biosafe PM-room, no BSC
U	BSL-3/4 Bacteriology lab + BSC-II	BSL-2/3 Bacteriology lab + BSC-II	BSL-1/2 Bacteriology lab + 1xBSC-II	No biosafe Bacteriology lab (BSC-II not functioning or not existent)
C				
T	BSL-3 Animal facility in use for experiments and bioproducts (diagnosis)	Animal facility in use production of diagnostic reagents (SPF-eggs, sera etc.)	Animal facilities available but not in use	Animal facilities not available
U				
R	PCR set-up (extraction, MM, template, machine) separated including change of lab clothes (coats and shoes)	PCR set-up (extraction, MM, template, machine) separated, but no change of lab clothes	Different rooms available, but not in consequent use for PCR set-up separation	No separation of PCR set-up
E				
	All labs are closed rooms and harbour Air Conditioner in all departments	Labs in most of departments are closed rooms and harbour Air Conditioner	Only labs in specific departments (e.g. AI-Lab) have closed rooms and harbour Air Conditioner	Lab doors or windows do not properly close, hardly any AC in rooms
E	Virology/Serology department sufficiently equipped to carry out safe diagnosis of <i>various viral</i> diseases including	Virology/Serology department sufficiently equipped to carry out safe diagnosis of <i>only selected</i> disease (e.g. HPAI)	Virology/Serology department lacks <i>modern</i> equipment for diagnosis of viral diseases	Virology/Serology department lacks <i>basic</i> equipment for diagnosis of viral diseases
Q

Other comments (Training)

Strength

- Good cooperation of laboratory personnel in RAH06
- Best capacity of trainers
- Full support of donor and host country to prepare the facilities needed
- Organization, practice, knowledge, taking care
- Should start on time to avoid finish late
- More hands-on work were conducted by participants
- First two days were a bit dis-organized laboratory work start late
- Enhance relationship among countries

Weakness

- Training document
- PM room need more light and air condition
- Few inverted microscope available
- Only 2 BSC for participants to practice, should have 4

Suggestion

- Should rotate host country to see facilities of others
- Can split into two small groups (PCR and VI) then switch after one week so there are enough equipment for each group

Annex 8: Mapping Exercise –Congo Basin.

IDENTIFY Project: CONGO BASSIN NATIONAL VETERINARY DIAGNOSTIC LABORATORIES MAPPING Background

One of the specific objective of the IDENTIFY project is to strengthen detection and reporting of common human and animal pathogens using existing laboratory networks that include regional- and country-level laboratories. These laboratories will be linked with regional- or global-level reference laboratories which can provide diagnosis confirmation services as well as additional advanced testing, including pathogen characterization, as needed.

In order to fulfil the objectives of the IDENTIFY project, laboratories will be prioritized for capacity building and other support (e.g., supply of equipment, reagents, etc.) so as to achieve adequate coverage within the hot spot region across all tiers. Additional project activities will focus on strengthening the connectivity of these laboratories with each other across tiers, sectors and disease programs.

Sub-activities

- Review of existing data on laboratory capacity and networks from existing laboratory assessments available; Analysis of National Laboratories annual reports and laboratory capacity in the region compiled, Data input into laboratory capacity matrix;
- Laboratory visits and/or follow-up assessments planned and conducted; Additional targeted data collection, including laboratory visits and/or follow-up assessments if necessary, to fill in gaps in knowledge on laboratory capacity; Data input into laboratory capacity matrix; Laboratories placed into tier corresponding to actual capacity
- Identification of laboratories to target for strengthening support of capabilities/capacities to diagnose normative and emerging/unknown pathogens significant to the region so as to achieve adequate coverage within the region

Achievements

This mapping exercise was carried out within the framework of the USAID funded IDENTIFY project on its beneficiary laboratories in Congo Basin region:

- *Laboratoire National Vétérinaire - LANAVET (Cameroon)*
- *Laboratoire Vétérinaire de Bangui – LACEVET (Central African Republic)*
- *Laboratoire Vétérinaire de Kinshasa- LCVK (Democratic Republic of Congo),*
- *Laboratoire de diagnostic vétérinaire de Brazzaville - LDVB (Republic of Congo)*
- *Laboratoire National Vétérinaire de Libreville – LNVB (Gabon)*
- *Laboratoire National ECCA (Equatorial Guinea)*
- *Central Laboratory, Rubirizi – CL_Rw (Rwanda)*
- *Central Veterinary Laboratory of Dar es Salam – CVL_Tz (Tanzania)*
- *National Animal Disease Diagnostics and Epidemiology Centre – NADDEC (Entebbe, Uganda).*

The survey covered 8 out of these 9 laboratories as one of them, the *Laboratoire National ECCA* of Equatorial Guinea, is under construction.

1. Methodology

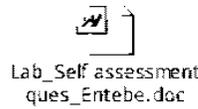

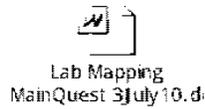

The methodology consisted in the analysis of data collected from a questionnaire prepared and distributed in 2010 during the preparation of IDENTIFY Stakeholders meetings (2-5 Nov. 2010, Entebbe, Uganda), from the presentations made in 2009 and 2010 by each laboratory during the EARLN and the RESOLAB respective annual coordination meetings and during the two specific

workshops on Quality Assurance organized by FAO in Eastern and Central Africa. The answers from the questionnaire and reports were grouped into the following 7 group of criteria:

- *Laboratory General profile- Administrative organization;*
- *Infrastructure;*
- *Main functional equipment and materials in place;*
- *Technical platform available (lab analysis or tests routinely performed);*
- *Number of diagnostic cases received and processed annually for laboratory diagnosis;*
- *Quality Assurance (QA) System - status of QA system implementation- including biosafety and biosecurity;*
- *Collaboration and partnership.*

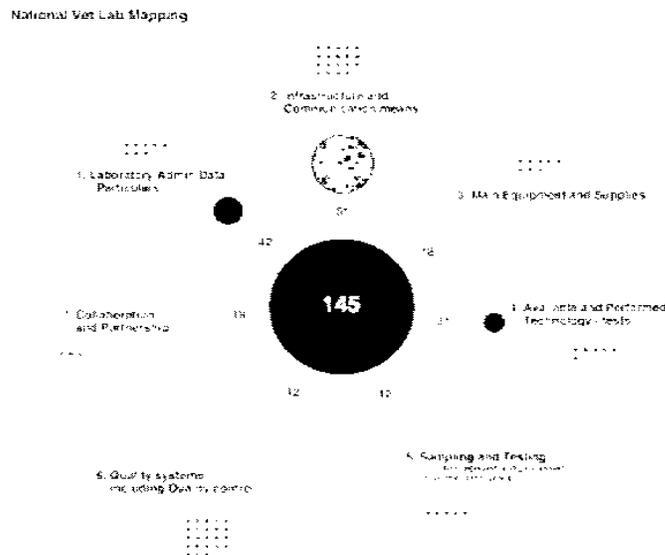

Other data collected, to have better picture on each individual laboratory functional status, were on “ List of major diseases confirmed” and on “Main factors hindering the laboratory diagnosis and Quality Assurance System implementation”.

Samples of questionnaires sent to all supported labs:

Scoring:

The collected data are grouped in the form of quantified indicators. These indicators are the distributed across seven groups of criteria according to their nature. The score for each group of criteria is the sum of the scores of its indicators. The overall score, for a given laboratory, is the sum of scores of his seven sets of criteria.

2. Preliminary Results

Conclusion on Individual laboratories Scoring

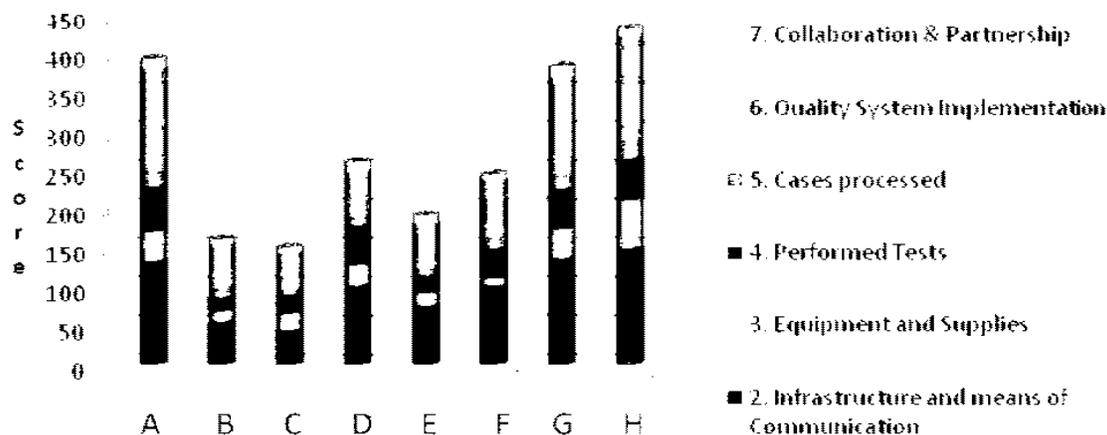

According to the individual scores recorded, three laboratories are grouped as “Basic Laboratory”, two are grouped as “Basic laboratory +”, while the remaining three are among the “Routine diagnostic laboratories”. No laboratory is ranged in “routine diagnostic laboratory +” or “advanced diagnostic lab¹” for the time being.

Table 1: Laboratories' categories Scores

Basic lab		Basic lab +		Routine Diagnostic Lab.		Routine Diagnostic Lab +		Advanced lab.	
Low		In progress -> intermediate		Medium		In progress -> advance		High	
from	to	from	to	from	to	from	to	from	to
0	245	246	320	321	566	567	641	642	887

Table 2 and graphic: Total score for Individual laboratory

Criteria	Max	Lab A	Lab B	Lab C	Lab D	Lab E	Lab F	Lab G	Lab H
1. Laboratory Admin Data/ Particulars	91	43	25	26	40	26	26	42	36
2. Infrastructure and means of Communication	188	91	31	19	62	50	76	95	115

4. Performed Tests	110	58	18	25	51	23	38	52	54
5. Cases processed	70	20	12	6	12	8	16	18	24
6. Quality System Implementation	289	131	56	47	57	58	72	125	133
7. Collaboration & Partnership	30	13	7	7	12	11	7	14	10
	887	394	162	151	261	193	245	384	433

The specific objective of the IDENTIFY project is to strengthen detection and reporting of common human and animal pathogens using existing laboratory networks that include regional- and country-level laboratories. These laboratories will be linked with regional- or global-level reference laboratories which can provide diagnosis confirmation services as well as additional advanced testing, including pathogen characterization, as needed.

¹ Laboratories capable of more advanced diagnostic methods to identify and characterize pathogens causing animal or human disease, including novel agents with pandemic potential

The mapping exercise has been undertaken to assess the technical level and needs of the project supported laboratories so that specific "tailored and focused" assistance could be provided to them in order to achieve the project objective. This exercise data show that, in Congo Basin region², only "Basic Testing²" and "Routine Diagnostic³", as defined in the "Laboratory Networking Strategy" distributed during Entebbe Stakeholders meeting. The collected data shall be used as indicators for further monitoring of the project achievement.

Conclusion on laboratory diagnosis work across Congo Basin IDENTIFY Supported labs

The major constraints reported by the laboratories for the adequate performing of their laboratory diagnosis works *sensu stricto* are: the weaknesses of financial and material resources (29%), inadequate number of qualified human resources (26%), difficulty in procurement of reagents and consumables (23%) and the difficulties for metrology and equipment maintenance (6%). At the same time, and sometimes at the same place, the quality system development and/or implementation faces difficulties ranging from the insufficiency of financial and material resources (26%), the lack of trained personnel (23%), the suboptimal metrology and equipment maintenance operations (13%) to the irregular provision of water and electricity (7%).

With regard to the percentage of a criteria maximum score, it is seen that this percentage is below 30% for most of the criteria amongst the least advanced laboratories (colored in blue in table 3). Nevertheless, for the most advanced one it is barely above 50% for some criteria only (colored in blue in table 3).

Table 3: Individual lab % of score

Criteria	Lab A	Lab B	Lab C	Lab D	Lab E	Lab F	Lab G	Lab H
1. Laboratory Admin Data/ Particulars	47,25	27,47	28,57	43,96	28,57	28,57	46,15	39,56
2. Infrastructure and means of Communication	48,40	16,49	10,11	32,98	26,60	40,43	50,53	61,17
3. Equipment and Supplies	34,86	11,93	19,27	24,77	15,60	9,17	34,86	55,96
4. Performed Tests	52,73	16,36	22,73	46,36	20,91	34,55	47,27	49,09
5. Cases processed	28,57	17,14	8,57	17,14	11,43	22,86	25,71	34,29
6. Quality System Implementation	45,33	19,38	16,26	19,72	20,07	24,91	43,25	46,02
7. Collaboration & Partnership	43,33	23,33	23,33	40,00	36,67	23,33	46,67	33,33

These identified constraints to properly carry out laboratory diagnosis works or to implement sound quality system give a good indication on needs to fill (in term of financial, human and material resources) in order to put this lab in a position to fulfil its mission with satisfaction and to fully meet its customers' expectations with timely and reliable lab results not leading to any complaint.

² Laboratories with the capacity to perform basic testing using a limited range of techniques

³ Laboratories which are capable of consistently and accurately conducting the tests necessary to diagnose diseases endemic to their area or region

IDENTIFY | FAO

BIANNUAL REPORT

(SIX-MONTHLY PROGRESS REPORT)

REPORTING PERIOD: 1 APRIL 2013 - 30 SEPTEMBER 2013

PLANNED ACTIVITIES: 1 OCTOBER 2013 - 31 MARCH 2014

TO BE SUBMITTED TO:

UNITED STATES AGENCY FOR INTERNATIONAL DEVELOPMENT (USAID)

UNDER COOPERATIVE AGREEMENT

SUBMITTED BY

IDENTIFY PROJECT PARTNER: FOOD AND AGRICULTURE ORGANIZATION OF THE UNITED NATIONS (FAO)

Regional component: Global/Inter-regional
Three hot spot areas (with countries):
<ul style="list-style-type: none"> • Congo Basin: Uganda, Democratic Republic of the Congo, Cameroon, Republic of Congo, Tanzania, Gabon, Equatorial Guinea, Rwanda, Central African Republic and South Sudan. • Southeast Asia: Cambodia, China, Indonesia, Lao People's Democratic Republic, Malaysia, Myanmar,* Philippines, Thailand and Viet Nam. • South Asia: Bangladesh, India and Nepal (future activities pending).
Project title: Support for strengthening animal health laboratory capacities in hot spot regions to combat zoonotic diseases that pose a significant public health threat - IDENTIFY
Code: OSRO/INT/902/USA
Total budget: USD 18 794 372 (of which USD 3 500 000 were allocated for implementation of activities by the World Organisation for Animal Health (OIE) through funds transferred by FAO to OIE through a Letter of Agreement (LoA)). The activities of OIE will be reported separately by OIE. Note : An additional amount of USD 3 000 000 has been approved by USAID of which USD 400 000 is allocated to OIE. This budget increase is allocated to cover the Year 5 work plan from 1 October 2013 to 30 September 2014.
Effective starting date: 1 October 2009
Planned end date: 30 September 2014
Context of the project This project is part of a complex programme – Emerging Pandemic Threats (EPT) – designed by the United States Agency for International Development (USAID) and aimed at identifying and implementing mechanisms to detect disease emergencies, especially from wildlife. The One Health concept is an important component of the programme. The IDENTIFY project is implemented jointly by FAO, OIE and the World Health Organization (WHO).
Objectives of the project
<ul style="list-style-type: none"> • enhance laboratories' ability to detect – to the appropriate level of characterization for the laboratories' capability – IDENTIFY targeted diseases¹; • enhance/support laboratories' timely reporting of IDENTIFY targeted diseases to national authorities, in support of their official notification to the appropriate regional and international organizations; • laboratories have adopted or improved quality assurance (QA) practices, inclusive of biosafety and biosecurity measures, and a comprehensive quality management system; • laboratories are participating in relevant regional and international laboratory networks according to their respective abilities, disease priorities and responsibilities.

* Myanmar is included in regional activities under separate funding.

¹ "IDENTIFY targeted disease" indicates those diseases selected at the regional level for support under IDENTIFY. Some IDENTIFY laboratories have no mandate/interest to detect all IDENTIFY targeted diseases, and data will not be reported for diseases in those cases.

Short summary of main activities planned for the reporting period (1 April 2013 - 30 September 2013)

Main activity headings are as follows; for further details, please refer to the FAO | IDENTIFY year four work plan.

Output 1. Capacity of national animal health laboratories to detect and diagnose diseases under a quality management system enhanced.**USAID | IDENTIFY OBJECTIVE 1: Enhance Laboratories' ability to detect - to the appropriate level of characterization for the laboratory's capability - IDENTIFY targeted diseases.**

- 1.A Mapping national and regional laboratory resources for animal health.
- 1.B Provide laboratory equipment and supplies in a coordinated manner.
- 1.C Strengthening the linkage between the field and laboratory.
- 1.D Develop and conduct trainings or workshops to build diagnostic laboratory capacity and support laboratory management.
- 1.E Strengthening global and regional resources for selected animal diseases.
- 1.F Targeted support for strengthening diagnostic capacity and laboratory management.

USAID | IDENTIFY OBJECTIVE 2: Enhance/Support Laboratories' timely reporting of IDENTIFY targeted diseases to national authorities, in support of their official notification to the appropriate regional and international organizations.

- 2.G Support timely diagnosis and reporting for priority animal diseases, including support of laboratory policy, to ensure flow of samples and sharing of information.

USAID | IDENTIFY OBJECTIVE 3: Laboratories have adopted or improved quality assurance (QA) practices, inclusive of biosafety and biosecurity measures, and a comprehensive quality management system.

- 3.H External quality management (EQA) for diagnosis of targeted animal diseases.
- 3.I Develop and conduct trainings or workshops to promote laboratory quality management, excluding biosafety/biosecurity (refer to activity group J).
- 3.J Develop and conduct trainings or workshops to promote laboratory biosafety and biosecurity.
- 3.K Targeted support for laboratory quality management systems, including biosafety.

Output 2. Linkages and communication pathways across national, regional and global laboratory and epidemiologic networks for the management of emerging zoonotic pathogens strengthened.**USAID | IDENTIFY OBJECTIVE 4: Laboratories are participating in relevant regional and international laboratory networks according to their respective abilities, disease priorities, and responsibilities.**

- 4.L Regional laboratory network support and coordination for animal health.
- 4.M Enhancing the role of Regional Leading/Support Laboratories.
- 4.N Supporting national laboratory networks for animal health.
- 4.O One Health initiatives: strengthening linkages between veterinary and public health.
- 4.P Support for participation in scientific conferences, trainings or workshops.

5	Main progress made towards the achievement of project outcomes (from the start of the project activities)	43

1 ACTIVITIES UNDERTAKEN DURING THE REPORTING PERIOD (1 APRIL 2013 – 30 SEPTEMBER 2013) AND PLANNED ACTIVITIES FOR THE NEXT REPORTING PERIOD (1 OCTOBER 2013 - 31 MARCH 2014)

1.1 ACTIVITIES GLOBAL COMPONENT (FAO HEADQUARTERS AND FAO/INTERNATIONAL ATOMIC ENERGY AGENCY (IAEA))

Output 1. Capacity of national animal health laboratories to detect and diagnose diseases under a quality management system enhanced.

USAID | IDENTIFY OBJECTIVE 1: Enhance Laboratories' ability to detect - to the appropriate level of characterization for the laboratory's capability - IDENTIFY targeted diseases.

G1.A Mapping national and regional laboratory resources for animal health.

Activities undertaken during the current reporting period (1 April - 30 September 2013)

- Contributed to the monitoring and evaluation (M&E) effort:
 - Initiated revision of the laboratory mapping tool (LMT) together with *France Vétérinaire International* (FVI) experts and Food and Agriculture Organization of the United Nations (FAO) staff.
 - Developed and completed on a regular basis individual laboratory sheets for all IDENTIFY supported laboratories, describing mapping data, activities conducted, follow-up actions required and progress made.
 - Integrated African national letters of agreement (LoAs) and monitored results in each laboratory sheet.

Planned activities for the next reporting period (1 October 2013 - 31 March 2014)

- Global compilation of updated regional data on laboratory capacity and networks (*sub activity G1.A.1*).
- Contribute to the M&E effort (*sub activity G1.A.2*): M&E retreat organized at headquarters before December 2013 to prepare all M&E activities for year five.
- Revision of the LMT (*sub activity G1.A.3*):
 - Finalize the LMT revision and share the new version with IDENTIFY supported laboratories. A guide for LMT's application will also be developed and agreed upon by all users.
 - Link the LMT with other assessment reports (e.g, biosafety/biosecurity assessment and quality assurance (QA) auditing) to measure specific progress made. Compile and review all new data obtained from the LMT (using the results of self and external assessments in both regions), and analyse the progress made.
- Develop a laboratory biosafety/biosecurity assessment questionnaire (100 questions) for a one or two day laboratory visit.
- Laboratory sheets completed on a regular basis for all IDENTIFY supported laboratories and shared with regions (*sub activity G1.A.4*).
- Help to prepare for and conduct laboratory interviews (*sub activity G1.A.5*).

G1.B Provide laboratory equipment and supplies in a coordinated manner.**Activities undertaken during the current reporting period (1 April - 30 September 2013)**

- Followed-up on the safe delivery of items procured for all laboratories, especially in Africa:
 - Finalized delivery and installation of the dry ice machine in Uganda (shipped in October 2013 to the Uganda Virus Research Institute in Entebbe).

G1.C Strengthening the linkage between the field and laboratory.**Activities undertaken during the current reporting period (1 April - 30 September 2013)**

- Supported ongoing development of the FAO Global Animal Disease Information System (EMPRES-i) genetic module, following its launch to the public:
 - Submitted scientific paper on the genetic module to the journal *Databases* in September 2013, as an interface between EMPRES-i and OpenFluDB.
 - Requested the Joint World Organisation for Animal Health (OIE)/FAO Network of Expertise for Animal Influenza (OFFLU) community to test the module and review the questionnaire in order to understand the influenza scientific community's needs regarding the sequence databases.
 - Further developed and maintained the publicly accessible genetic module for the linkage of outbreak (epidemiological) and sequence (genetic) data under the LoA with the Swiss Institute of Bioinformatics (SIB).
 - Created a list of additional developments required for the genetic module in the next period, including visual genetic analysis tools and mapping functions within EMPRES-i, which support epidemiological risk assessment and FAO early warning activities.
 - Officially invited Influenza Research Database to connect with EMPRES-i for further complementarities on epidemiological and virological data.

Planned activities for the next reporting period (1 October 2013 - 31 March 2014)

- Support further developments of the EMPRES-i genetic module.
- Meet with SIB to discuss further developments of the influenza genetic module, as well as foot-and-mouth disease (FMD) and African swine fever (ASF).

G1.D Develop and conduct trainings or workshops to build diagnostic laboratory capacity and support laboratory management.**Activities undertaken during the current reporting period (1 April - 30 September 2013)**

- Developed e-modules on bioinformatics:
 - Integrated practical scenario-based learning material with the SIB's existing phylogenetic module, in collaboration with the joint FAO/IAEA division.
 - Under the new LoA signed with SIB in April 2013, two new e-learning modules were developed on virus analysis: (i) molecular database analysis and searching by sequence similarity; and (ii) multiple sequence alignments. Technical discussions took place between the FAO/IAEA joint division and SIB to agree on the scope, expected content and structure of the two new modules on multiple sequence alignment and sequence similarity search. The draft modules were prepared by SIB and reviewed by the FAO/IAEA joint division to ensure that the global scope was met and that the expected content was in agreement with the technical discussions. The multiple sequence alignment module contains 35 slides, and the sequence similarity search module 45 slides. These versions work properly on Internet Explorer 10. Tests and video tutorials were also provided.

Planned activities for the next reporting period (1 October 2013 - 31 March 2014)

- Released new bioinformatics distance-learning module (multiple alignments) (*sub activity G1.D1*):
 - Exercise sessions will be added to the two e-learning modules. Additionally the previously developed phylogenetic module will be improved to include more exercises based on scenarios.

G1.E Strengthening global and regional resources for selected animal diseases.

Activities undertaken during the current reporting period (1 April - 30 September 2013)

- Developed communication tool(s) for different audiences, stakeholders and partners (*activity G1.E.1*):
 - Finalized brochures on FAO regional laboratory networking and the Emergency Prevention System (EMPRES) Laboratory Unit.
 - Finalized leaflet content on "Public/private partnerships and sustainability of veterinary laboratories in sub-Saharan Africa" in English and French; design in process.
 - Designed and printed three tripartite IDENTIFY posters at global, Africa and Asia levels.
- FAO HQ provided input on H7N9 laboratory protocols to the Emergency Centre for Transboundary Animal Diseases (ECTAD) in regions and countries, as well as data: documentation on H7N9 laboratory testing; support for adaptation of regional protocols for diagnosing AI-H7N9 in Southeast Asia; and linkage with OFFLU; <http://www.fao.org/docrep/018/aq251e/aq251e.pdf>.
- Provided laboratories with access to sequencing services (*activity G1.E.5*):
 - Selected the sequencing services provider for both Africa and Asia; sent contract to selected service provider for final signature.
 - Initiated discussions with Agricultural Research for Development (CIRAD) to prepare an LoA to assist African countries in genotyping contagious bovine pleuropneumonia (CBPP) strains through sequencing, in accordance with the validated protocol proposed under this project.

Planned activities for the next reporting period (1 October 2013 - 31 March 2014)

- Finalize laboratory cards (available diagnostic assays and cross-cutting technologies for selected animal diseases, including zoonosis) for IDENTIFY priority diseases, and disseminate to the laboratories (*sub activity G1.E.1*).
- Support the development of disease cards (case definitions and recommended tests repertoire for IDENTIFY listed priority diseases) (*sub activity G1.E.2, linked with Congo Basin C1.E1*).
- Develop communication tools for different audiences, including stakeholders and partners, and finalize communication documents (including tripartite publications) for the IDENTIFY project (*sub activity G1.E.3*).
- Continue to provide inputs to FAO ECTAD in regions and countries on H7N9 laboratory protocols and data.
- Continue to provide laboratories with access to sequencing services (*sub activity G1.E.4*):
 - Develop a system to manage requests by countries for sequencing services, working in close collaboration with the selected service provider;
 - Sign the LoA with CIRAD to assist countries in genotyping through sequencing of CBPP strains.
 - Finalization and dissemination of a handbook for beneficiary national laboratories to support sequencing protocols, workflow with selected service providers and sequence raw data analysis (*sub activity G1.E.5*).

- Establish with service providers a cost effective and sustainable procedure for sequencing services: (i) producing and evaluating tagged primers for Capripoxvirus, *peste des petits ruminants* (PPR) and ASF to allow polymerase chain reaction (PCR) products sequencing with universal primers (*sub activity G1.E.6.a*); (ii) evaluating the temperature stability of purified and non-purified PCR products in order to determine the maximum time that the PCR products can be stored at ambient temperature before being sent for sequencing. PPR, Capripox and ASF will serve as models. This will help to ensure cost effective and efficient shipment of PCR products to the sequencing company (*sub activity G1.E.6.b, at the FAO/IAEA joint division*).

G1.F Targeted support for strengthening diagnostic capacity and laboratory management.

Activities undertaken during the current reporting period (1 April - 30 September 2013)

- Supported PCR testing for multiple diseases as a follow-up to the IAEA consultation on “Good laboratory practices for conducting multiple disease diagnosis”; also supported standardization and validation of the major PCR testing procedures through the use of the same kits of reagents for various diseases (*activity G1.F2*).
- Provided technical support to laboratories with standard operating procedures (SOPs) and reagents to facilitate the transfer of techniques (PCR using the fluorescence resonance energy transfer (FRET) system) described in *activity G.3.H3*:
 - Transferred a Capripoxvirus genotyping assay based on classical PCR to Senegal through provision of primers and SOPs. Follow-up actions (gel pictures) show that the laboratory is performing well.
 - Follow-up actions were performed to help the National Animal Disease Diagnostics & Epidemiology Centre (NADDEC) in Uganda, including advising on instrument and reagent handling, and checking the raw data sent by the laboratory. However, some technical problems (i.e. the type of qPCR available in this laboratory) have prevented the successful implementation of the assay. Efforts to overcome these technical difficulties are ongoing.
 - Follow-up actions with the National Animal Health Diagnostic and Investigation Center (NAHDIC) Ethiopia (exchange of data files) show that the Capripoxvirus genotyping assays transferred in February 2013 have been successfully implemented for routine use.
- Supported the joint FAO/IAEA division to validate and transfer new techniques for multiple disease diagnosis (PCR using the FRET system):
 - Developed a cost effective method for capripoxvirus genotyping using snapback primers and dsDNA intercalating dye. The results of this work were published in PLoS ONE (PLoS ONE 8(10): e75971. doi:10.1371/journal.pone.0075971). This assay was transferred to NAHDIC Ethiopia in February 2013. Further efforts to transfer this assay to additional laboratories will take place during the next reporting period.
 - Most analytical parameters of the pan-pox detection system are now available and the assay transfer will start during the next reporting period.
 - As part of multiple pathogen detection development for respiratory diseases in small ruminants, a real time PCR multiplex assay was developed targeting priority diseases of IDENTIFY: capripox, parapox, PPR, pasteurella, contagious caprine pleuropneumonia. An analytical validation was performed, including linearity, sensitivity, specificity and repeatability parameters.
 - Designed and evaluated a multiple pathogen detection assay for respiratory diseases of small ruminants based on a fluid array system (Luminex). The initial phase (designing, coupling of the micro beads with the probes, single plex PCR, and detection) was standardized. Further assessment of the performance of the

multiplex assay is needed. The microbead based assay on Luminex allows further multiplexing of more than 50 targets with the following advantages over other conventional PCR and real time PCR assays: sample utility, cost, time and labour in screening a larger number of pathogens.

- Continued the joint FAO/IAEA division's work on molecular epidemiology of PPR:
 - The PPR virus was genotyped in clinical specimens collected from different regions of Nigeria between 2010 and 2013. In total, 73 samples have been characterized and phylogenetically analysed. Of particular interest is that the PPR viruses identified belong to both lineage II and IV, indicating that viruses from both lineages are presently circulating in Nigeria. The data also indicates transboundary movement of the virus between neighbouring countries.
 - Full genome sequencing of two PPR viruses isolated in Benin 42 years apart (1969–2011) is near completion. This data will provide significant information on the evolution of the virus over an extended period.
 - The full genome sequencing of two historical isolates from Senegal isolated in 1969 and 1970, respectively, are near completion.

Planned activities for the next reporting period (1 October 2013 - 31 March 2014)

- Provide assistance to the field support mission, including knowledge transfer on using the tagged primers for sequencing; processing post-PCR products for shipment; and establishing local capacity for sequencing raw data analysis (*activity G1.F.1, linked with regional sub activity C1.F9*).
- Produce teaching material on the introduction of new molecular assays in a diagnostic laboratory (*activity G1.F.2*).
- Write SOPs and guidelines for molecular epidemiological studies and diagnosis of PPR, ASF, animal pox diseases and ruminant respiratory diseases (*activity G1.F.3*):
 - A consultant was appointed at the Animal Production and Health Laboratory of the joint FAO/IAEA division to validate and develop guidelines and SOPs for newly developed PPR diagnostic tests, and to compare the sensitivity of newly developed cell lines for the *in vitro* isolation of PPR virus from pathological samples. This eight month consultancy started at the end of August 2013.
- Perform validation studies and transfer a multiple poxvirus detection assay to selected regional laboratories (*sub activity G1.F.4*): transfer the new techniques for multiple disease diagnosis (PCR using the FRET system):
 - Finalize the pan-pox detection system and initiate transfer: Identify potential countries with suitable qPCR platforms; prepare and distribute the SOPs; and distribute the primers.
 - Diagnostic validation of real time PCR-based method for multiple pathogen detection of respiratory diseases using clinical samples; compare the performance by testing in member state laboratories. The targeted country will be Ethiopia. Prepare SOPs to facilitate the transfer of the assay to member states.
 - Continue the development and testing of the fluid array system assay (Luminex) for multiple pathogen detection of respiratory diseases. Test the sequence tagging or ligation strategies in order to increase the efficiency of multiplex PCR, and hence sensitivity. The aim of these experiments is to allow the flexibility of including or excluding specific targets without affecting the sensitivity of the assay.
- Perform validation studies and transfer a multiple respiratory pathogen detection assay to selected regional laboratories (*activity G1.F.5*).
- Facilitate collaboration on laboratory testing based on PREDICT protocols (*activity G1.F.6, linked with regional sub activities C1.F7, C1.F8, S1.D1 and S1.D2*).

- Provide technical support to laboratories with SOPs and reagents to facilitate the transfer of techniques (PCR using the FRET system):
 - Transfer real time PCR-based Capripoxvirus genotyping assays to Senegal; Assist NADDEC in Uganda in the implementation of these assays. The Snapback primer assay will be offered to these laboratories.
 - Produce teaching material on the introduction of new molecular assays in a diagnostic laboratory to facilitate the transfer of molecular assays for multiple diseases, focusing on animal pox diseases, PPR and ASF.
- Continue the joint FAO/IAEA division's work on the molecular epidemiology of PPR:
 - Forty PCR amplicons of suspected PPR virus positive samples have been sent for characterization from Kenya.
 - The study of the Nigerian isolates will be finalized and published.
 - The full genome sequencing of isolates from Benin, Ghana, Ethiopia, Democratic Republic of the Congo, Uganda and Senegal will be finalized.
 - Continue to receive and characterize clinical samples suspected of PPR from Africa.

USAID | IDENTIFY OBJECTIVE 2: Enhance/Support Laboratories' timely reporting of IDENTIFY targeted diseases to national authorities, in support of their official notification to the appropriate regional and international organizations.

G2.G Support timely diagnosis and reporting for priority animal diseases, including support of laboratory policies to ensure flow of samples and information sharing.

Activities undertaken during the current reporting period (1 April - 30 September 2013)

- Reviewed existing animal health laboratory policies and developed laboratory policy guidelines for IDENTIFY targeted countries (*sub activity G2.G.5*):
 - Finalized working document defining laboratory policies;
 - Reviewed existing laboratory policies and gaps in selected pilot countries; noted strengths and weaknesses of existing policies at national and regional levels;
 - Based on the outcomes of the laboratory policy review, drafted guidelines on laboratory policy in selected fields of interest; this was done for senior management of the veterinary laboratories and the competent authorities in charge of laboratories, with further adaptation for regional context in Asia and Africa (still ongoing).
 - Presented the initiative in Africa, including the results of the review and discussions, during the fourth joint Eastern Africa epidemiology and laboratory annual coordination meeting (Bujumbura, Burundi, 16-19 July 2013); Presented recommendation number six in the final communiqué: "Considering that failures in delivery of quality laboratory services in the region are mostly attributed to an inadequate policy environment, and noting that FAO through the IDENTIFY project has embarked on developing guidelines for laboratory policy, the meeting recommended that FAO finalizes the draft guidelines for laboratory policy making and explores opportunities to pilot the guidelines in a few countries through the VET GOV programme".
- 

Final
Communiqué.EARLN2
- Submitted proposal (grant under the VET GOV project) for operationalizing the laboratory policy initiative at national level in three pilot countries.

Planned activities for the next reporting period (1 October 2013 - 31 March 2014)

- Support the development of sample referral guidelines for transboundary animal diseases (TADs) (*sub activity G2.G.10*).
- Publish document on laboratory policy definitions and review laboratory policies;
- Finalize laboratory policy guidelines for IDENTIFY targeted countries, and work with regional offices to adapt the policy guidelines to a regional setting (*sub activity G2.G.2, linked with Congo Basin sub activity C2.G3*).
- Present initiative on laboratory policy to SE Asia region (at the TAG meeting, 29-30 October 2013, Yogyakarta, Indonesia) and to West-Central Africa (annual West and Central Africa Veterinary Laboratory Network for Avian Influenza and Other Transboundary Diseases (RESOLAB) meeting, January 2014).
- Support the review of results for the public-private partnership and sustainability study of veterinary laboratories in sub-Saharan Africa, and the creation of linkages to develop laboratory policy (*sub activity G2.G.3, linked with Congo Basin sub activity C2.G.4*).

USAID | IDENTIFY OBJECTIVE 3: Laboratories have adopted or improved Quality Assurance practices, inclusive of biosafety and biosecurity measures, and a comprehensive quality management system.

G3.H External quality management (EQA) for diagnosis of targeted animal diseases.

Activities undertaken during the current reporting period (1 April - 30 September 2013)

- Provided assistance for the organization of proficiency tests (*linked with regional Congo Basin C3.H.1*):
 - Supported external quality assurance (EQA) provided for proficiency testing in avian influenza (AI)/Newcastle Disease (ND) (*linked with Congo Basin sub activity C3.H.1*).
 - Reported on proficiency test for serological diagnosis of Rift Valley fever (RVF) submitted by the Center for Emerging and Zoonotic Diseases (formerly Special Pathogens Unit), National Institute for Communicable Diseases of the National Health Laboratory Service (CEZD NICD/NHLS), Sandringham, South Africa (10 participating laboratories in Africa).

Planned activities for the next reporting period (1 October 2013 - 31 March 2014)

- Provide assistance for the organization of the proficiency testing (AI, ND, FMD, CBPP, RVF, PPR, ASF) (*sub activity G3.H1, linked with Congo Basin sub activities C3.H1 and C3.H2*).
- Support the organization of a backstopping mission at country level Tanzania, (South Sudan and Uganda) (*activity G3.H.2 linked with Congo Basin C3.H.2*).

C3.I Develop and conduct trainings or workshops to promote laboratory quality management, excluding biosafety/biosecurity (refer to activity group J).

Activities undertaken during the current reporting period (1 April - 30 September 2013)

- Signed an LoA with FVI in July 2013 and initiated the development of an e-learning module on quality assurance, through partnership with FVI and CIRAD.

Planned activities for the next reporting period (1 October 2013 - 31 March 2014)

- Finalize the e-learning module on quality assurance under the LoA with FVI.

G3.J Develop and conduct trainings or workshops to promote laboratory biosafety and biosecurity.

Activities undertaken during the current reporting period (1 April - 30 September 2013)

- N/A.

Planned activities for the next reporting period (1 October 2013 - 31 March 2014)

- N/A.

G3.K Targeted support laboratory quality management systems, including biosafety.

Activities undertaken during the current reporting period (1 April - 30 September 2013)

- LoA signed with FVI in July 2013 and discussions held with experts from FVI for the planning of the on-site audit/backstopping missions on QA to be performed by FVI in Africa (*sub activity G3.K1, linked with Congo Basin C3.K.J*).
- LoA signed in April 2013 with the Institute G. Caporale, Teramo, Italy to support the implementation of laboratory information systems (LIMS) in two targeted laboratories (Tanzania and Botswana) (*sub activity G3.K2, linked with regional activity Congo Basin activity C3.K.3*).
- Discussions held with experts from FVI for the development of a road map for biosafety/biosecurity by experts from FVI.

Planned activities for the next reporting period (1 October 2013 - 31 March 2014)

- Under the LoA with FVI: On-site audit, backstopping and/or training missions on QA performed by FVI in Africa (*sub activity G3.K1, linked with Congo Basin C3.K*).
- Meeting with FVI experts to draw conclusions on past missions in African laboratories, prepare upcoming missions and discuss services conducted under the LoA.
- Conduct activities under the LoA signed with the Institute G. Caporale, Teramo, Italy that will continue to support the implementation of LIMS in two targeted laboratories (Tanzania and Botswana) (*sub activity G3.K.1, linked with Congo Basin activity C3.K.3*).
- Apply FAO experience in supporting LIMS establishment to a World Health Organization (WHO) workshop to "define and discuss options for developing laboratory information management system for public health laboratories" (October 2013, Lyon, France).
- Define road map for biosafety/biosecurity strengthening in Africa with FVI experts (*sub activity G3.K1*).

Output 2. Linkages and communication pathways across national, regional and global laboratory and epidemiologic networks for the management of emerging zoonotic pathogens strengthened.

USAID | IDENTIFY OBJECTIVE 4: Laboratories are participating in relevant regional and international laboratory networks according to their respective abilities, disease priorities, and responsibilities.

G4.L Regional laboratory network support and coordination for animal health.

Activities undertaken during the current reporting period (1 April - 30 September 2013)

- Supported regional thematic sub-networking (i.e. rabies, ASF, CBPP, FMD, PPR):
 - OFFLU has been represented in SE Asia and West/Central Africa regional network meetings; all regional laboratories in Africa and SE Asia have participated to the second OFFLU ring trial; results submitted to individual laboratories.
- Supported regional networking meetings (*linked with regional sub activities C4.L*):

- Supported the organization of and participation in the year four work plan implementation meeting and year five planning of the IDENTIFY|FAO project; the meeting was held in Douala, Cameroun on 4-6 June 2013, and included laboratory directors and Chief Veterinary Officers (CVOs).
- Supported preparation of the Eastern Africa Veterinary and Epidemiology Laboratory Network (EARLN), and participation of the IDENTIFY |FAO management team (16-19 July 2013, Bujumbura, Burundi).
- Promoted/sponsored existing disease-based, regional, and global laboratory network meetings, including OFFLU:
 - OFFLU:
 - OFFLU Swine Influenza Virus (SIV) expert meeting in Rome, 16-17 April, 2013. This meeting gathered 25 participants to discuss achievements of the SIV group, provide updates on countries activities, review achievements and plan future activities (main funding source: NIH).
 - FAO's coordination effort under OFFLU for H7N9 laboratory data sharing and dissemination (three teleconferences organised for protocol validation data, animal experiments data sharing, inventory of information for posting on OFFLU website), table of H7N9 protocols;
 - Preparation of OFFLU technical meeting on lessons learned from HPAI vaccination (4-6 December 2013, Beijing, China; co-funding with OIE and FAO AI projects);
 - Participation in OFFLU strategic meeting (Paris, France, 6 September 2013).
 - WHO Vaccine Composition meeting:
 - OFFLU's contribution to the September WHO Vaccine Composition Meeting (H5N1, H9N2, H7N7 and H7N9 virus sequences shared, as well as antigenic and epidemiologic data);
 - Received extension of agreement for OFFLU's contribution to the WHO process of vaccine strain selection for animal influenza viruses of public health concern for the 1 January 2014 to 31 December 2018 period;
 - Continued harmonization of work with WHO on antigenic data with standard reagents produced by WHO Collaborating Centres and distributed to selected OFFLU laboratories.
- Identification of potential FAO Reference Centres (*activity G4.L4*): as of October 2013, 29 new FAO Reference Centres have officially been designated.

Planned activities for the next reporting period (1 October 2013 - 31 March 2014)

- Support regional thematic sub-networking (i.e. rabies, ASF, CBPP, FMD, PPR) (*sub activity G4.L1*).
- Support regional networking meetings (*sub activity G4.L2, linked with regional sub activities C4.L*):
 - Provide support to the preparation of the RESOLAB handover meeting (November 2013, Bamako, Mali).
 - Provide support to the preparation of the RESOLAB annual Regional Laboratory Network Meeting, tentatively planned for January 2014.
- Promote/sponsor existing disease-based regional and global laboratory network meetings, including OFFLU (*sub activity G4.L3*):
 - Disseminate outcomes of the OFFLU technical meeting on lessons learned from HPAI vaccination (4-6 December 2013, Beijing, China).
 - Update protocol tables for H5N1 and H7N9 PCR testing, and list H5 and H7 influenza virus cleavage sites for OFFLU website.

- Signature of formal agreement between WHO, OIE and FAO on OFFLU collaboration in the WHO process of vaccine strain selection for animal influenza viruses of public health concern.
- Participate in the launch of the ASF global platform and propose links between the global platform and regional AF sub-networks (Africa).
- Continued work on designation of FAO Reference Centres (*sub activity G4.L4*):
 - Continued process for final designation of FAO Reference Centres still in the pipeline.
 - Assessment panel of new applications.

G4.M Enhancing the role of Regional Leading/Support Laboratories.

Activities undertaken during the current reporting period (1 April - 30 September 2013)

- Supported and promoted the establishment or development of Regional Leading/Support Laboratories by:
 - Analyzing annual reports submitted by regional support laboratories (RSLs) for M&E purposes to identify strengths and gaps.
 - Providing visibility to RSLs, including writing articles, participating in the second OFFLU ring trial, and supporting the participation of RSL staff in international events and trainings.

Planned activities for the next reporting period (1 October 2013 - 31 March 2014)

- Support the establishment or development of Regional Leading/Support Laboratories (*sub activity G4.M1, linked with Congo Basin Activity C4.M.1*) by assisting preparations for the final meeting for validation/endorsement by beneficiary laboratories, CVOs, and commitment by key partners.

G4.N Supporting national laboratory networks for animal health.

Activities undertaken during the current reporting period (1 April - 30 September 2013)

- N/A.

Planned activities for the next reporting period (1 October 2013 - 31 March 2014)

- Continue support to national laboratory networks (*sub activity G4.N1, linked with Congo Basin C4.N1*).
- Develop a tool to evaluate national laboratory networks (*sub activity G4.N2, linked with Congo Basin C4.N2*).

G4.O One Health initiatives: strengthening linkages between veterinary and public health.

Activities undertaken during the current reporting period (1 April - 30 September 2013)

- Established a four-way linking framework to improve the linkage between laboratory and epidemiological data (for H5N1 zoonotic influenza) for assessing health risks at the human-animal interface (*activity G4.O.1*):
 - Tripartite finalization of the four-way linking web summary

4WL 2013
 - In Bangladesh: preparation of the four-way linking review mission, planned for November 2013.
- Coordinated OFFLU data contribution to the WHO Influenza Vaccine Composition Meeting (and other joint OFFLU-WHO initiatives).

Planned activities for the next reporting period (1 October 2013 - 31 March 2014)

- Four-way linking framework (*activity G4.O1*):
 - Bangladesh: conduct review mission in November 2013 and workshop (March 2014).
- Support One Health seminar on rabies in Africa (*activity G4.O.2, linked with Congo Basin C4.O.1*):
 - Develop with the *Istituto Zooprofilattico Sperimentale delle Venezie (IZSVE)* (FAO Reference Centre for rabies) a "rabies tool kit" to provide the methodology for a systematic approach to national trainings for rabies diagnosis and One Health seminars on rabies (*linked to regional activity 2.A.C*).

G4.P Support for participation in scientific conferences, trainings or workshops.**Activities undertaken during the current reporting period (1 April - 30 September 2013)**

- N/A.

Planned activities for the next reporting period (1 October 2013 - 31 March 2014)

- N/A.

2 ACTIVITIES UNDERTAKEN DURING THE REPORTING PERIOD (1 APRIL 2013 – 30 SEPTEMBER 2013) AND PLANNED ACTIVITIES FOR THE NEXT REPORTING PERIOD (1 OCTOBER 2013 - 31 MARCH 2014)

2.1 ACTIVITIES ASIA COMPONENT

Output 1. Capacity of national animal health laboratories to detect and diagnose diseases under a quality management system enhanced.

USAID | IDENTIFY OBJECTIVE 1: Enhance Laboratories' ability to detect - to the appropriate level of characterization for the laboratory's capability - IDENTIFY targeted diseases

S1.A Mapping national and regional laboratory resources for animal health.

Activities undertaken during the current reporting period (1 April – 30 September 2013)

- Conducted a biosafety risk assessment, as well as a laboratory assessment using the LMT, in the following locations: Regional Animal Health Office (RAHO) 6 in Ho Chi Minh City, Viet Nam from 26-27 May 2013; National Center of Veterinary Diagnosis (NCVD) in Hanoi, Viet Nam on 28 May 2013; FMD-Regional Reference Laboratory (FMD-RRL) in Nakorn Raschasima, Thailand from 5-6 July 2013; and the Center of Excellence for Emerging Infectious Diseases in Animals at Chulalongkorn University in Bangkok, Thailand from 19-21 July 2013 (*sub activity S1.A3.TH and S3.K1.r*).
- Data obtained from the laboratory mapping and assessment activities were compiled and updated for the laboratory network, and assessment results were shared with participating laboratories and relevant partners.

Planned activities for the next reporting period (1 October – 31 March 2013)

- Coordinate laboratory re-assessment activities in order to compile and update laboratory capacity data for project completion; refine laboratory mapping tool and biosafety risk assessment, working with participating laboratories in South and Southeast Asia (*sub activity S.1.A.1.reg*).

S1.B Provide laboratory equipment and supplies in a coordinated manner.

Activities undertaken during the current reporting period (1 April – 30 September 2013)

- Standardized veterinary diagnostic reagents, including proficiency testing panels, were procured from the Australian Animal Health Laboratory (AAHL) and provided to 13 participating laboratories in Southeast Asia. These materials will support the proficiency testing programme for diagnosing influenza, ND, Classical Swine Fever (CSF), porcine reproductive and respiratory syndrome (PRRS), ASF and rabies.
- The fire alarm system (consisting of four units of universal power supply [UPS] to be used with four biosafety cabinets) and other biosafety supplies were provided to the National Veterinary Research Institute (NaVRI) in Cambodia.
- Biosafety supplies were provided to the National Animal Health Laboratory in Lao PDR, based on the findings and recommendations from the biosafety risk assessment.
- Three units of Powered Air Purifying Respirator were provided to the PERHILITAN Laboratory in Malaysia.
- One unit of thermal cycler (PCR machine), one unit of digital gel imaging system, one unit of UV/visible spectrophotometer, and one unit of refrigerated microcentrifuge were procured

through tender and provided to the National Institute of Animal Health (NIAH), Thailand to increase the capabilities of NIAH in brucellosis services (*also linked to S1.E1.TH*).

- Based on recommendations from the biosafety risk assessment, one biosafety cabinet and a control box LCD Display were provided to the Regional and OIE Reference Laboratory for FMD in South East Asia in Nakorn Rashedima, Thailand.
- The procurement tender for four units of biosafety cabinets has been launched in Indonesia for provision to four laboratories, including (i) Disease Investigation Centre (DIC) Banjarbaru; (ii) DIC Wates; (iii) Public Animal Health Centre (Pusvetma) in Surabaya; and (iv) National Veterinary Drug Assay Laboratory in Serpong. The provision of these biosafety cabinets are based on recommendations from the biosafety risk assessment conducted in Indonesia from October to December 2012 .
- Three units of TACO RNA/DNA extraction machines were procured and provided to three laboratories in Viet Nam, including the National Center for Veterinary Diagnosis (NCVD), Regional Animal Health Office No. 2 (RAHO 2), and Regional Animal Health Office No. 7 (RAHO 7).
- The enzyme-linked immunosorbent assay (ELISA) kits for antibody detection for PRRS, CSF, Aujeszky's disease virus were purchased to support studies on pig diseases in Viet Nam.
- The software of DNASTAR licenses were renewed and provided to the Veterinary Research Institute in Malaysia, the National Animal Health Institute, Thailand, and three laboratories in Indonesia, including DIC Bukittingi, DIC Wates, and Balai Besar Penelitian Veteriner.
- Pre-screen and screening reagents for the Indonesia Influenza Virus Monitoring (IVM) network were procured from AAHL and provided to laboratories in Indonesia (*sub activity S1.B2.ID*).

Planned activities for the next reporting period (1 October 2013 – 31 March 2014)

- Provide standardized veterinary diagnostic reagents, including proficiency testing panels, supplies and equipment as requested by the network laboratories or recommended in support of the proficiency testing programme, and disease diagnostic and surveillance activities.
- Support and/or facilitate the provisions of necessary supplies and equipment, based on the findings and recommendations of the biosafety assessment and cabinet testing activities to ensure the proper biosafety containment and practices in the network laboratories.
- Procure antigenic screening reagents and minor laboratory equipment for DICs in Indonesia for the IVM network.
- NCVD Viet Nam: procurement of diagnostic kits to complement Emerging Pandemic Threats (EPT)+ testing.

S1.C Strengthening the linkage between the field and laboratory.

Activities undertaken during the current reporting period (1 April – 30 September 2013)

- Organized and delivered the Regional Laboratory Network Workshop on Laboratory-Field Epidemiology Linkage from 20 to 31 May 2013 in Bangkok, Thailand (*sub activity S1.C1.r*). The workshop was conducted by facilitators from AAHL, an implementing partner. There were 25 veterinary laboratory and field epidemiology staff from Cambodia, China, Indonesia, Lao PDR, Malaysia, Myanmar, Philippines, Thailand and Viet Nam attending the workshop. Outcomes included: (i) participants with knowledge and understanding of the key features related to the laboratory-field epidemiology interface; (ii) participants understood the importance of linkage between laboratory and epidemiology field staff for the effective planning and implementation of surveillance and outbreak investigation activities; and (iii)

enhanced communication and linkage between the laboratory and field epidemiology staff at the country level.

- Supported in-country lab-field pathology linkage training in Thailand: Pathology Workshop "From Field to Laboratory and Back to the Field" from 26 to 30 August 2013. The workshop was organized by the National Institute of Animal Health (NIAH), Thailand. The workshop was attended by thirty veterinary officers from national and regional livestock offices. The training was a follow-up activity of the previously offered training-of-trainer workshop, "Basics of Field and Laboratory Diagnosis", conducted in May 2012 (*sub activity S1.C2.a.TH*).

- Supported in-country lab-field pathology linkage training in Philippines: a Downstream Training on Enhancing the Field-Laboratory Connection was organized from 23-27 September 2013. Targeted participants included veterinarians assigned to the Regional Animal Disease Diagnostic Laboratories and Animal Health Coordinators of the Regional Field Units. The training was a follow-up activity of the previously offered training-of-trainer workshop in the Philippines (*sub activity S1.C2.d.PH*).
- A 'user acceptance' testing and feedback workshop of a beta version of the IVM online software was successfully completed from 27-29 August 2013 in Yogyakarta in conjunction with the annual IVM Meeting.
- A selection of approximately 30-40 H5N1 virus isolates from 2012-2013 were collected at DIC Wates to be sent to AAHL.

Planned activities for the next reporting period (1 October – 31 March 2014)

- Conduct technical backstopping and capacity building activities in Indonesia for: quality reagent production (Pusvetma/Balai Besar Pengujian Mutu dan Sertifikasi Obat Hewan); pre-screening and antigenic characterization (DIC laboratories, industry and university partners); sequencing and sequence analysis (DICs, industry and university partners); use of data management; and analysis tools developed for IVM activities.
- IVM meeting in December 2013 in Indonesia for IVM Online implementation launch and IVM online support for DICs (technical backstopping and AI data management).

S1.D Develop and conduct trainings or workshops to build diagnostic laboratory capacity.

Activities undertaken during the current reporting period (1 April – 30 September 2013)

- Organized and delivered a regional workshop on applied veterinary bioinformatics with the Center of Excellence in Influenza Research and Surveillance, St. Jude Children's Research Hospital, and the Center of Excellence for Emerging and Re-Emerging Infectious Diseases in Animals as implementing partners from 26 June to 1 July 2013 in Bangkok, Thailand (*sub activity S1.D2.r*). Fifteen veterinary laboratory staff from Bangladesh, Cambodia, China, Indonesia, Lao PDR, Malaysia, Myanmar, Nepal, Philippines, Thailand, and Viet Nam participated in the workshop. Outcomes included: (i) participants with laboratory skills in veterinary bioinformatics, including nucleotide database search, sequencing protocol, sequence validation, sequence assembly, sequence alignment, nucleotide sequence analysis, phylogenetic analysis algorithms (NJ, Bayesian), Reference Data Query, and data interpretation; (ii) participants with knowledge of applying bioinformatics for disease surveillance, monitoring, prevention and control, especially in HPAI and veterinary related

diseases; and (iii) enhanced networking and information sharing among participants and the bioinformatics experts.

- Organized and delivered a regional laboratory network workshop on diagnosis and characterisation of Influenza A (H7N9) and priority swine diseases, ASF, CSF, and PRRS at the Regional Animal Health Office Number 6 (RAHO 6), Ho Chi Minh city, Viet Nam, from 29 July to 9 August 2013 (*sub activity S1.D1.r*). Nineteen veterinary officers who are directly responsible for diagnosis of the above diseases attended the workshop from Cambodia, China, Indonesia, Lao PDR, the Philippines, Malaysia, Myanmar, Thailand and Viet Nam. The regional workshop will be followed by the proficiency testing activity to ensure the quality of diagnostic services for priority diseases at participating laboratories. The implementing partners were: AAHL; RAHO 6; and the Department of Animal Health, Viet Nam. Outcomes included: (i) increased quality diagnostic services for influenza (H7N9) and priority swine diseases in participating laboratories; (ii) enhanced diagnostic and research activities for influenza (H7N9) and priority swine diseases at participating laboratories; and (iii) enhanced communication among laboratory staff and the OIE/FAO reference centre (AAHL).

- Organized and delivered a regional laboratory network workshop on diagnosis of rabies and ND at the National Institute of Animal Health, Bangkok, Thailand from 26 August to 6 September 2013 (*sub activity S1.D1.r*). Sixteen laboratory and veterinary officers directly responsible for diagnosis of rabies and ND from the national veterinary laboratories in Cambodia, Indonesia, Lao PDR, Philippines, Malaysia, Myanmar, Thailand and Viet Nam attended the workshop. The regional workshop will be followed by the proficiency testing activity to ensure quality diagnostic service for priority diseases at the participating laboratories. The implementing partners were AAHL and NIAH, Thailand. Outcomes included: (i) increased diagnostic capability for rabies and ND at the participating laboratories; and (ii) enhanced communication among laboratory staff in the region and the world reference laboratory providing technical support to the region (AAHL).

Planned activities for the next reporting period (1 October 2013 – 1 March 2014)

- Backstopping missions to participating countries are scheduled to provide in-country training and follow-up on regional protocols to each laboratory, including diagnosis of three priority animal diseases, quality assurance, proficiency testing and general trouble shooting (linked to sub activity S3.H2).
- Provide training and applications of PREDICT tools for livestock samples in Indonesia and Viet Nam.

S1.E Strengthening regional resources for selected animal diseases.

Activities undertaken during the current reporting period (1 April – 30 September 2013)

- Supported and strengthened the roles and responsibilities of the Regional Leading/Reference Laboratories in the region (*sub activity S1.E1.TH, S1.E2.VN, S1.E3.BD*).
- In collaboration with NIAH, Thailand, conducted the regional workshop on diagnosis of ND and rabies (*sub activity S1.E1.TH linked to sub activity S4.M2.a.TH*).
- In collaboration with RAHO 6, Viet Nam, conducted the regional workshop and training on diagnosis of swine diseases (*sub activity S1.E2.VN linked to sub activity S4.M2.b.VN*).

Planned activities for the next reporting period (1 October 2013 – 1 March 2014)

- Continue to support and strengthen the roles and responsibilities of the Regional Leading/Reference Laboratories in the region (*sub activities S1.E1.TH, S1.E2.VN, S1.E3.BD*).

S1.F Targeted support for building diagnostic capacity.

Activities undertaken during the current reporting period (1 April – 30 September 2013)

- Supported the NaVRI-Institut Pasteur du Cambodge twinning programme through an LoA to strengthen capacities of the Government of Cambodia, using a joint animal-human-environment interface survey for HPAI in live bird markets (*sub activity S1.F2.CA*).
- Supported the Technical Assistance Programme for Enhancing Quality Laboratory Management and Services at the NAHL, Lao PDR with Mahidol-Oxford Tropical Medicine Research Unit (MORU), Bangkok, Thailand as an implementing partner (*linked to sub activity S3.K3.a.LA*).

Planned activities for the next reporting period (1 October 2013 - 31 March 2014)

- Continue to support the NaVRI-Institut Pasteur du Cambodge twinning programme to strengthen capacities of the Government of Cambodia (year two).
- Continue to support the NAHL-MORU technical assistance program (year two).

USAID | IDENTIFY OBJECTIVE 2: Enhance/Support Laboratories' timely reporting of IDENTIFY targeted diseases to national authorities, in support of their official notification to the appropriate regional and international organizations.

S2.G Support timely diagnosis and reporting for priority animal diseases, including support of laboratory policy to ensure flow of samples and sharing of information.

Activities undertaken during the current reporting period (1 April– 30 September 2013)

- Supported implementation and information update to the EMPRES-i and TADs Network Asia email list.
- Supported sharing of expertise and disease information across the network and among the international organizations and provided inputs when applicable.

Planned activities for the next reporting period (1 October 2013 – 31 March 2014)

- Continue to support the sharing of expertise and disease information across the network.
- Continue to support sample referral for disease confirmation upon request from the network laboratories (*sub activity S2.G1.r*).

USAID | IDENTIFY OBJECTIVE 3: Laboratories have adopted or improved QA practices, inclusive of biosafety and biosecurity measures, and a comprehensive quality management system.

S3.H External Quality Assessment (EQA) for diagnosis of targeted animal diseases.

Activities undertaken during the current reporting period (1 April – 30 September 2013)

- Conducted the Regional Proficiency Testing Programme, including procurement and distribution of the proficiency testing panels for diagnoses of influenza A, H5-influenza, PRRS, CSF, ASF, rabies and ND viruses, with AAHL as an implementing partner (*sub activity S3.H1.r*).

Planned activities for the next reporting period (1 October 2013 – 31 March 2014)

- Backstopping missions by AAHL experts have been planned to fourteen participating laboratories in Cambodia, Laos, Indonesia, Malaysia, Philippines, Thailand, and Viet Nam from October to December 2013. The purpose of these missions is to ensure the implementation of appropriate diagnostic protocols under a QA system. The activity is part of the 2013 Regional Proficiency Programme (*sub activity S3.H2.r*).

S3.I Develop and conduct trainings or workshops to promote laboratory quality management, excluding biosafety/biosecurity (refer to activity group J).

Activities undertaken during the current reporting period (1 April– 30 September 2013)

- Planned and coordinated a one-day International Air Transport Association (IATA) Certification Course for Shipper of Infectious Substances (IATA certification) to be held back-to-back with the Regional Laboratory Network Training of the Trainers (ToTs) Workshop on Biosafety Management (see below) (*sub activity S3.I1.r*).

Planned activities for the next reporting period (1 October 2013 – 31 March 2014)

- Provide an IATA certification training back-to-back with the Regional Laboratory Network Training of the Trainers (ToTs) Workshop on Biosafety Management with MORU as an implementing partner (*sub activity S3.I1.r*).

S3.J Develop and conduct trainings or workshops to promote laboratory biosafety and biosecurity.

Activities undertaken during the current reporting period (1 April – 30 September 2013)

- The 2013 Regional Biosafety Programme has been implemented. The programme included the development of regional resource materials on biosafety practices and trainings to be used at the Regional Laboratory Network Training of the Trainers Workshop on Biosafety Management (*sub activity S3.J1.r*).
- Planned and coordinated the organization of the Regional Laboratory Network Training of the Trainers Workshop on Biosafety Management, with MORU as an implementing partner.
- Delivered a follow-up biosafety training for the Sabah Wildlife Department, Kota Kinabaru, Malaysia from 25-28 July 2013 with the EcoHealth Alliance and Sabah Wildlife Department as implementing partners. The training course was attended by 23 participants from EcoHealth Alliance and Sabah Wildlife, as well as the Veterinary Research Institute, Ipoh and PERHILITAN, Kuala Lumpur (*sub activity S3.J2.MY*).
- A follow-up training on biosafety and good laboratory practices was conducted at the Regional Animal Health Office No. 6 (RAHO 6) from 20-22 June 2013 in collaboration with RAHO 6. The training course was attended by 36 staff from the national network laboratories under Department of Animal Health, Viet Nam (*Linked to sub activity S1.E2.VN*).

Planned activities for the next reporting period (1 October 2013 – 31 March 2014)

- Conduct the Regional Laboratory Network Training of the Trainers (ToTs) Workshop on Biosafety Management for participating laboratories with MORU as an implementing partner, from 9-20 December 2013 in Bangkok, Thailand (*sub activity S3.J1.r*).
- Distribute the regional resource materials for biosafety practices and trainings to the laboratory network (*sub activity S3.J1.r*).

S3.K Targeted support for laboratory quality management systems, including biosafety.

Activities undertaken during the current reporting period (1 April– 30 September 2013)

- Biosafety expert visits were provided to assess biosafety infrastructure, equipment and practices, and provide recommendations, including remedial activities, to four laboratories: National Centre for Veterinary Diagnosis in Hanoi, Viet Nam; Regional Animal Health Office No. 6 in Ho Chi Minh City, Viet Nam; FMD-Regional Reference Laboratory in Nakorn Raschasima, Thailand; and the Center of Excellence for Emerging Infectious Diseases in Animals, Chulalongkorn University in Bangkok, Thailand (*sub activity S3.K1.r*).
- The 2013 biosafety cabinet calibration and certification was scheduled from 14 August to 15 November 2013 for approximately 170 biosafety cabinets in 29 laboratory locations in 10 participating countries, including Cambodia, Lao PDR, Indonesia, Malaysia, Myanmar, Philippines, Thailand, Viet Nam, Bangladesh, and Nepal (*sub activity S3.K2.r*).
- Coordinated and supported activities under the Technical Assistance Programme for Enhancing Quality Laboratory Management, including quality laboratory services and biosafety management at the National Animal Health Centre, Lao PDR with MORU as an implementing partner (*sub activity S3.K3.a.LA*).
-

Planned activities for the next reporting period (1 October 2013 – 31 March 2014)

- Conduct the biosafety risk assessment in IDENTIFY-supported laboratories in South and Southeast Asia according to the 2014 regional biosafety programme (*linked to sub activity S1.A1.reg*).
- Coordinate and support activities related to providing technical assistance, equipment and supplies to the laboratory network based on the expert's recommendations from the laboratory assessment missions.

Output 2. Linkages and communication pathways across national, regional and global laboratory and epidemiologic networks for the management of emerging zoonotic pathogens strengthened.

USAID | IDENTIFY OBJECTIVE 4: Laboratories are participating in relevant regional and international laboratory networks according to their respective abilities, disease priorities, and responsibilities.

S4.L Regional laboratory network support and coordination for animal health.

Activities undertaken during the current reporting period (1 April – 30 September 2013)

- Planned and coordinated the Regional Laboratory Network Animal Health Laboratory-Technical Advisory Group back-to-back with the first Association of Southeast Asian Nations (ASEAN) Laboratory Directors' Forum meeting in collaboration with OIE and the Directorate General of Livestock Services, Indonesia (*activity S4.L1.r*).
- Provided support to activities in alignment with the ASEAN Regional Framework for Laboratory Capacity Building and Networking.
- The IDENTIFY|FAO Southeast Asia coordinator provided technical inputs at the Field Epidemiology Training Programme for Veterinarians, 14-16 August 2013, Bangkok, Thailand.
- The IDENTIFY|FAO Southeast Asia coordinator participated and provided technical inputs at the USAID EPT Program Asia Regional Meeting, 18-19 June 2013, Bangkok, Thailand.

- The IDENTIFY|FAO Southeast Asia coordinator participated and provided technical inputs at the tripartite meeting of IDENTIFY Project Headquarters, Regional and Country counterparts in South and Southeast Asia, 20 June 2013, Bangkok, Thailand.

Planned activities for the next reporting period (1 October 2013 – 31 March 2014)

- Organize the Laboratory-Technical Advisory Group meeting scheduled from 29 to 30 October 2013 to be held back-to-back with the first ASEAN Regional Laboratory Directors' Forum scheduled from 31 October to 1 November 2013 in Yogyakarta, Indonesia. The meetings were jointly organized by the Directorate General of Livestock Services, Indonesia, FAO and OIE. (*sub activities S4.L1.r and S4.L2.r*).
- Circulate the updated regional protocol for diagnosis of AI, including H7N9 in SE Asia.

S4.M Enhancing the role of Regional Leading Laboratories.

Activities undertaken during the current reporting period (1 April – 30 September 2013)

- Provided support on laboratory capacity building activities at the SEA Regional reference/leading animal health laboratories (*sub activities S4.M2.a.TH, S4.M2.b.VN*).
- Collaborated with NIAH, Thailand to organize a regional workshop on diagnosis of ND and rabies (*sub activities S4.M2.a.TH also linked to S1.E1.TH*).
- Collaborated with RAHO 6, Viet Nam to organize a regional workshop and training on the diagnosis of swine diseases (*sub activities S4.M2.b.VN also linked to S1.E2.VN*).
- Supported studies on pig diseases including PRRS and CSF for RAHO 6, Viet Nam through the provision of reagents for diagnosis of PRRS, CSF, and Aujeszky's disease viruses (pseudorabies) (*sub activity S4.M2b.VN*).

Planned activities for the next reporting period (1 October 2013 – 31 March 2014)

- Continue to support activities related to enhancing the role of Regional Leading Laboratories.
- Support the visibility of the regional reference/leading laboratories at the Regional Laboratory Network Animal Health Laboratory-Technical Advisory Group, and the first ASEAN Laboratory Directors' Forum.

S4.N Supporting national laboratory networks for animal health.

Activities undertaken during the current reporting period (1 April – 30 September 2013)

- A national laboratory coordinator was provided to support activities related to strengthening laboratory quality services at the national laboratory networks in Indonesia (*sub activity S4.N3.ID*).
- The IDENTIFY|FAO Southeast Asia coordinator participated and provided technical inputs at the Philippine Animal Health Centre Strategic Planning Workshop from 14-18 May 2013 in Quezon City, Philippines. The meeting was organized by OIE, in collaboration with the Philippine Animal Health Centre.
- The IDENTIFY|FAO Southeast Asia coordinator participated and provided technical inputs at a strategic planning workshop follow-up activity for NaVRI-Cambodia from 26-27 September 2013 in Preah Sihanouk province, Cambodia. The meeting was organized by OIE, in collaboration with NaVRI.

Planned activities for the next reporting period (1 October 2013 – 31 March 2014)

- Continue to support activities related to strengthening the national laboratory network in participating countries.
- Support the Vietnamese National Veterinary Conference in collaboration with Hanoi University of Agriculture (*sub activity S4.N5.VN*).

S4.O One Health initiatives: strengthening linkages between veterinary and public health.**Activities undertaken during the current reporting period (1 April – 30 September 2013)**

- Provided support for four-way linking activities planned in Bangladesh and Indonesia to improve the linkage between laboratory and epidemiological experts from animal and public health sectors (*sub activities S4.O3.BD, S4.O4.ID*).

Planned activities for the next reporting period (1 October 2013 – 31 March 2014)

- Continue to provide support for four-way linking activities planned in Viet Nam, Bangladesh, and Indonesia to improve the linkage between laboratory and epidemiological experts from animal and public health sectors (*sub activities S4.O2.VN, S4.O3.BD, S4.O4.ID*).
- Four-way linking review mission (November 2013) and workshop (March 2014) in Bangladesh.

S4.P Support for participation in scientific conferences, trainings, or workshops.**Activities undertaken during the current reporting period (1 April – 30 September 2013)**

- No activities during the reporting period.

Planned activities for the next reporting period (1 October 2013 – 31 March 2014)

- Coordinate and provide support for participation in scientific conferences, trainings, and workshops upon request.

3 ACTIVITIES UNDERTAKEN DURING THE REPORTING PERIOD (1 APRIL 2013 – 30 SEPTEMBER 2013) AND PLANNED ACTIVITIES FOR THE NEXT REPORTING PERIOD (1 OCTOBER 2013 - 31 MARCH 2014)

3.1 ACTIVITIES CONGO BASIN COMPONENT

Output 1. Capacity of national animal health laboratories to detect and diagnose diseases under a quality management system enhanced.

USAID | IDENTIFY OBJECTIVE 1: Enhance Laboratories' ability to detect - to the appropriate level of characterization for the laboratory's capability - IDENTIFY targeted diseases

C1.A Mapping national and regional laboratory resources for animal health.

Activities undertaken during the current reporting period (1 April – 30 September 2013)

- No mapping took place during the reporting period, as the data call was postponed at the end of the project. However, the overall mapping data were analysed and compared. As a follow-up of this analysis, the laboratory mapping tool is being revised for better results and consistency over time (*linked to global activity G1.A*).
- Compiled and analyzed the mapping exercise results in the RSLs:
 - Results of the mapping exercise were shared with the Eastern Africa Regional Support Laboratory (NAHDIC-Ethiopia) for compilation and analysis. Feedback from NAHDIC is expected. Regarding the two RSLs based in West Africa, results of the completed LMT are expected from Vom (Nigeria) and the Laboratoire National d'Elevage et de Recherches Vétérinaires (Senegal).

Planned activities for the next reporting period (1 October 2013 – 31 March 2014)

- Mapping national and regional laboratory resources for animal health (*sub activity C1.A.1*).
- Contribute to global compilation of updated regional data on laboratory capacity and networks (*sub activity C1.A.2*).
- Contribute to the revision and the dissemination of the FAO LMT (*sub activity C1.A.3*).
- Contribute to the laboratory interviews (*sub activity C1.A.4, linked to the global M&E effort G1.A*).

C1.B Provide laboratory equipment and supplies in a coordinated manner.

Activities undertaken during the current reporting period (1 April – 30 September 2013)

- Provided equipment, supplies, manuals and equipment maintenance services (*sub activity C1.B1*):
 - Continued follow-up of diagnostic kit delivery if not yet completed. Laboratory equipment and diagnostic kits were procured for all beneficiary laboratories with a close follow-up by the FAO|IDENTIFY project team in the Congo Basin region and FAO country offices. Although there were delays in the delivery of some parcels, all procured equipment and diagnostic kits have been delivered with satisfaction.
- Assisted laboratory equipment procurement (*sub activity C1.B2*): On-site missions carried out by external and/or internal experts monitored delivery and appropriate use of procured equipment and reagents provided to beneficiary laboratories. The experts listed the items still missing that could be procured in years four or five of the project. Three on-site missions

were carried out in Congo, Democratic Republic of the Congo and Uganda during the reporting period with the following findings:

- Congo: Two experts from IZSve took advantage of the hands-on training on rabies diagnostics held at Laboratoire de Diagnostic Vétérinaire de Brazzaville (LDVB) (Brazzaville, 3-7 June 2013) to begin using the new equipment provided by the IDENTIFY project (biological cabinet, bench autoclave, incubator, refrigerator-freezer and a UV-microscope). The experts trained laboratory staff on proper use and basic maintenance requirements. In order to optimize the use of the new equipment, a water distillatory and an auto-start power generator are urgently needed to overcome frequent power cuts and inconstant voltage issues.
- Democratic Republic of the Congo: The laboratory expert that assessed the laboratory in Goma also visited the laboratory at Kinshasa (3-6 May 2013) and checked proper reception, installation and use of laboratory equipments delivered under IDENTIFY (*also linked to sub activity C4.N*).
- Uganda: Two visits were made by FAO IDENTIFY project staff (13 July and 9 September 2013) to NADDEC (Uganda) to assess progress under the national LoA.

Planned activities for the next reporting period (1 October 2013 – 31 March 2014)

- Provision of equipment, supplies, manuals and equipment maintenance services (*sub activity C1.B1*): purchase of basic laboratory items for the Democratic Republic of the Congo planned as a follow-up of the assessment mission in the contry.
- Assist mission for installation of procured laboratory equipment (*sub activity C1.B2*): Assistance in the proper use of laboratory equipment received will be extended to other laboratories during expert on-site visits in the coming months.
- Explore possible schemes and procedures for coordinated procurement of key reagents in Africa (*sub activity C1.B3*).

C1.C Strengthening the linkage between the field and laboratory.

Activities undertaken during the current reporting period (1 April – 30 September 2013)

- National field pathology trainings were provided under LoAs with laboratories (*activity C1.C.1*) were conducted in Cameroon (April 2013) and Congo (August 2013):
 - Cameroon: A total of 61 persons from the *Laboratoire National Vétérinaire*, Cameroon (LANAVET) and field veterinary staff participated in two trainings organized in Garoua (from 9-11 April 2013 with 22 participants, and Yaoundé from 23-25 April 2013 with 41 participants) on necropsy techniques, sample collection and good shipping practices. Training reports have been made available to FAO by the LANAVET.
 - Congo: 20 participants from LDVB and field veterinary staff from six departments (Brazzaville, Cuvette Ouest, Likouala, Plateaux, Pool and Sangha) attended the training on necropsy techniques, sample collection and good shipping practices that was held from 20 to 23 August 2013. Trainings reports have been shared with FAO by the laboratory.
- Investigation and data collection on targeted diseases (*sub activity C1.C.2*):
 - Cameroon: 1 327 samples (110 percent of the 1 200 targeted samples planned in the LoA) were collected (PPCB: 265; FMD: 265; ND: 143; PPA: 189; PPR: 202) in the Far North and the North regions and tested at LANAVET in Garoua. Additional sampling activities are underway in the Adamoua Region. Laboratory analyses are *underway and the results will be compiled in the final report of the LoA*.
 - Congo: 2 224 samples were collected, out of which 1 676 were of good quality (167 percent of the 1 000 targeted samples planned in the LoA): 1 044 samples for

PPR; 476 samples for PPCB; 156 samples for ASF; 1 676 samples for FMD. The samples were submitted to LDVB as a result of a survey conducted in two departments (Cuvette and Cuvette-Ouest) from 30 June to 8 July 2013 to determine the prevalence of four priority diseases (PPR, ASF, CBPP and FMD).

- Gabon: 1 305 samples (843 for PPR and 462 for PPCB) of the 1 000 targeted samples in the LoA were collected by LNVL. Laboratory tests are underway and results will be made available in the final report of the LoA.
- Rwanda: 811 samples were collected, of which 150 were submitted to OVI for RVF confirmation.
- South Sudan: Of 500 samples targeted as per the LoA, 488 PPR and 273 RVF serum samples were submitted to CDVL, and tested using Competitive ELISA; the respective results were recorded.
- Tanzania: 616 samples (62 percent of the targeted samples as per the LoA) were collected and submitted to two zonal laboratories - Tanzania Veterinary Laboratory Agency (TVLA) centre in Iringa and TVLA centre in Tabora. 225 samples were tested for PPR; 97 for ASF; 158 for CBPP; 4 for FMD; and 132 for LSD. Sample collection activities are still ongoing and more samples are expected to be submitted to the laboratories.
- Uganda: Out of the targeted 5 000 samples, 1 931 samples (39 percent of the targeted samples as per the LoA) were submitted to NADDEC and testing is reported as ongoing.

Planned activities for the next reporting period (1 October 2013 – 31 March 2014)

- National Field Pathology trainings to reinforce the capacities of laboratory staff previously trained will be conducted to finalize activities under national LoAs (*sub activity C1.C.1*).
 - Central African Republic: Serious security issues following the unstable political situation prevented implementing this activity. Therefore, this activity is now planned for the next reporting period and the LoA will be extended accordingly.
 - Gabon: In the past months, many changes occurred in the management team of the LNVL, including the change of the Director. This situation has hampered the organization of the training as well as the implementation of other project activities in the country. A new scheduling of activities has been established through a no cost extension of the LoA.
- Investigation and data collection on targeted diseases will be conducted to finalize activities under national LoAs (*sub activity C1.C.2*).

C1.D Develop and conduct trainings or workshops to build diagnostic laboratory capacity and support laboratory management.

Activities undertaken during the current reporting period (1 April – 30 September 2013)

- N/A.

Planned activities for the next reporting period (1 October 2013 – 31 March 2014)

- Develop training kits on laboratory equipment and calibration, and follow-up on previous trainings on laboratory equipment and calibration (*sub activity C1.D1*).

C1.E Strengthening regional resources for selected animal diseases.

Activities undertaken during the current reporting period (1 April – 30 September 2013)

- N/A.

Planned activities for the next reporting period (1 October 2013 – 31 March 2014)

- Disseminate laboratory cards (available diagnostic assays and cross-cutting technologies for selected animal diseases, including zoonoses) for IDENTIFY priority diseases (*sub activity C1.E.1, linked with sub activity G1.E.1*).
- Produce and disseminate disease cards (case definition and recommended test repertoire for IDENTIFY listed priority diseases) (*sub activity C1.E.2*).
- Provide access to sequencing services to Cameroon, Ethiopia, Kenya, Democratic Republic of the Congo, Tanzania, Uganda, Nigeria, Senegal, Botswana (*sub activity C1.E.3*). The sequencing provider has been selected (*linked to sub activity G.1.E.5*). The handbook will be disseminated to users (*linked to sub activity G1.E.4*).
- Assist countries on genotyping through sequencing of CBPP strains, in accordance with the validated protocol (*sub activity C1.E.4*).

C1.F Targeted support for strengthening diagnostic capacity and laboratory management.

Activities undertaken during the current reporting period (1 April – 30 September 2013)

- Supported capacity development in bush meat microbiology in Congo, Central African Republic and Gabon (*sub activity C.1.F.1*): validated the terms of reference of the missions, and recruited an international consultant.
- Continued to support capacity development in antimicrobial resistance for food safety, including training, supplies and sampling (*Uganda, sub activity C.1.F.2*): initiated planning of the training and prepared a list of items for procurement together with the laboratory. Owing to budget constraints, this activity is no longer planned under IDENTIFY.
- Continued to strengthen advanced ASF capacities (*sub activity C1.F.3*): the tools developed by the staff from Cameroon are used routinely at the FAO/IAEA joint division for ASF genotyping. Samples from Ethiopia and Democratic Republic of the Congo were genotyped using the primers and SOPs developed.
- On site missions to develop diagnostic competence:
 - Specific assessment/on-site training on ASF in Tanzania, Uganda, Congo and Gabon (*sub activities C1.F.4 and C1.F.5*): the terms of reference of the consultant were prepared and approved.
 - On-site mission to develop diagnostic competence for CBPP in Bangui (Central African Republic), Brazzaville (Congo), Libreville (Gabon) and Uganda (*sub activities C1.F.5 and C1.F.7*): the terms of reference are completed and the international consultant has been recruited. Planning of the missions has been initiated.
 - On-site missions to develop diagnostic competence for rabies (*sub activity C1.F.6*): on-site technical assistance and hands-on training related to rabies diagnosis including rabies blind tests were organized in the national laboratory of Republic of the Congo, under the LoA with IZSvE; a hands-on rabies diagnostic training was performed in Congo (3-7 June 2013, LDVB in Brazzaville) by two experts from IZSvE, and was attended by seven trainees from LDVB and one from a public health laboratory (Laboratoire National de Santé Publique). The training addressed general information on rabies (aetiology, pathogenesis, symptoms in animals, epidemiology) and the available techniques to diagnose the disease in animals (both OIE/WHO recommended methods, as well as techniques under evaluation for rabies diagnosis or confirmation). Management of a diagnostic sample by a diagnostic laboratory, as well as recommended storage conditions and sample shipping procedures according to the international regulations (IATA) were also presented and discussed by the trainers. The trainers also stressed the importance of the biological risk assessment evaluation in the laboratory when working

with infectious agents. The improvement of the general knowledge was estimated at about 17 percent, based on a questionnaire submitted to trainees.

- On-site mission to design a strategy for the development of the national laboratory of Equatorial Guinea (*sub activity C1.F10*): the mission was postponed in order to obtain the full commitment of the officials to implement mission findings. However, this activity is not planned in year five because of budget constraints.
- Transfer of technology of protocols developed by the FAO/IAEA joint division (PCR using the FRET system) in Senegal, Uganda and Ethiopia (*linked to activity G1.F*).

Planned activities for the next reporting period (1 October 2013 – 31 March 2014)

- Support competence development in bush meat microbiology (*sub activity C1.F1*) in Congo and Gabon.
- Strengthen advanced ASF diagnostic capacities in Cameroon (*sub activity C1.F2*): the scientist from Cameroon will join the FAO/IAEA joint division in October 2013 for eight months under another project. However, he will contribute to the IDENTIFY project in evaluating tagged ASF primers to support the access to sequencing services by African Laboratories.
- On-site missions to develop diagnostic competence for ASF (*sub activity C1.F3*): the missions in Tanzania, Uganda, Congo and Gabon are tentatively scheduled in January/February 2014.
- On-site missions to develop diagnostic competence for CBPP (*sub activity C1.F4*): missions in Central African Republic, Congo, Gabon and Uganda are tentatively planned to start in January/February 2014.
- On-site assessment mission on local situation in central African Republic (*sub activity C1.F5*).
- On-site mission to develop diagnostic competence for rabies (*sub activity C1.F6*): trainings will be organized in Gabon and South Sudan (staff are being vaccinated).
- Develop competencies on new and advanced laboratory testing based in Cameroon (*sub activity C1.F7*): two laboratory experts will participate in a four week internship at the PREDICT laboratory in Yaoundé.
- Develop competencies on laboratory testing of samples by applying PREDICT protocols on samples from domestic animals in Cameroon (*sub activity C1.F8*).
- Field support mission held in Uganda by FAO/IAEA joint division to transfer knowledge on using tagged primers for sequencing, post-PCR product processing and shipment for sequencing, and established local capacity for post-sequencing raw data analysis (*sub activity C1.F9*).

USAID | IDENTIFY OBJECTIVE 2: Enhance/Support Laboratories' timely reporting of IDENTIFY targeted diseases to national authorities, in support of their official notification to the appropriate regional and international organizations.

C2.G Support timely diagnosis and reporting for priority animal diseases, including support of laboratory policy to ensure flow of samples and sharing of information.

Activities undertaken during the current reporting period (1 April – 30 September 2013)

- Provided continued support for sample referral from national laboratories to RSLs and international reference laboratories for disease confirmation for all supported laboratories (*sub activity C2.G.1*):
 - Cameroon: Samples of FMD were sent to Plum Island and the University of Ohio, USA. All FMD diagnostic laboratory results were shared with Plum Island, the

University of Ohio and Botswana Vaccine Institute with the aim of producing a FMD vaccine.

- Rwanda: 150 suspected RVF samples were sent to Onderspoort Veterinary Institute (the OIE reference laboratory for RVF) for confirmation by DVS-Rwanda Agriculture Board on 13 November 2012.
- Contributed to the Global Consultation on laboratory policy by providing information regarding procedures in Africa (*sub activity C2.G3, linked to global sub activity G2.G.2*):
 - Five laboratories in the Congo Basin (LANAVET/Cameroon, LNVL/Gabon, Laboratoire National d'Elevage et de Recherches Vétérinaires /Senegal, NVRI/Nigeria and OVI/South Africa) were targeted as pilot laboratories for the laboratory policy review in the Congo Basin. Thus far, accurate information from laboratory policy documents was collected from Cameroon, Senegal, Gabon and Tanzania. As a result of this review, the key guidelines for laboratory policy development were presented during the EARLN annual meeting held in Bujumbura in July 2013. Three concept notes to operationalize the guidelines and strengthen laboratory policy at national level were prepared for Cameroon, Congo and Tanzania, and one concept note was prepared for a non-IDENTIFY beneficiary country (Chad). Funding to implement these pilot activities is expected from alternative sources.
- Reviewed public-private partnerships and sustainability of veterinary laboratories in sub-Saharan Africa (*sub activity C2.G.3*):
 - The terms of reference of a national consultant for the public-private partnership (PPP) study in Tanzania were developed and submitted to the FAO Representation in Tanzania. The national expert is being selected.
 - An article on PPP was published in October 2013 (p.21-23: <http://www.fao.org/docrep/018/i3470e/i3470e.pdf>). A concept note and a leaflet on PPP were also finalized. (*see embedded document*) In Cameroon, the LANAVET annex in Yaoundé is now operational and started delivering priced services to the private sector in April 2013. The LANAVET annex has been very active, with a total of 1 229 samples submitted to investigate PPR, ASF, FMD and poultry diseases.

PPP leaflet.2013

Planned activities for the next reporting period (1 October 2013 – 31 March 2014)

- Support sample referral from national laboratories to RSLs and international reference laboratories for disease confirmation (*sub activity C2.G1*).
- Conduct sampling activities on wildlife at LDVB, Congo (*sub activity C2.G2*).
- Advocate for laboratory policy development in the Congo Basin region (*sub activity C2.G3*).
- Review public-private partnerships and sustainability of veterinary laboratories in sub-Saharan Africa (*sub activity C2.G4*): the preliminary mission of the national expert for the PPP study in Tanzania is planned on November 2013 to collect baseline information in Tanzania. This first round of the PPP study in Tanzania will be followed by another mission by international experts in Cameroon and the Democratic Republic of the Congo in 2012.

USAID | IDENTIFY OBJECTIVE 3: Laboratories have adopted or improved quality assurance (QA) practices, inclusive of biosafety and biosecurity measures, and a comprehensive quality management system.

C3.H External quality assessment (EQA) for diagnosis of targeted animal diseases.

Activities undertaken during the current reporting period (1 April – 30 September 2013)

- Conducted regional proficiency testing (AI and ND, RVF, PPR, ASF) (*sub activity C.3. H.1*):
 - AI and ND: Results of 2012 proficiency testing (organized by IZSve) were presented during the Eastern Africa fourth joint regional epidemiology and laboratory networks meeting held in July 2013 in Bujumbura, Burundi. For Cameroon, Congo, Gabon and Democratic Republic of the Congo, the test results will be presented at the first Central Africa RESOLAB meeting (tentatively planned in Chad, January 2014). Logistical issues hindered the completion of AI/ND proficiency testing in Rwanda; the reagents for testing were shipped from IZSve Padova in the first week of April 2013 for Rwanda to complete the AI/ND proficiency testing. All five RSLs in sub-Saharan Africa agreed to participate to the second OFFLU ring trial (organised by NVSL-USA and FLI-Germany) and submitted their results during the reporting period.
 - PPR: The third round of the EQA for molecular detection of PPR was conducted. Panels were prepared by the Joint FAO/IAEA division and shipped to Nigeria, Cameroon, Tanzania, Ethiopia, Uganda and Democratic Republic of the Congo.
 - RVF: The first round of proficiency testing for RVF serological diagnosis was completed. Ten participants have tested the panel and submitted their results to the organiser. Feedback was sent to participating laboratories in May 2013; corrective actions will be discussed during the next reporting period. Provided an assessment of the individual performance of each laboratory and the overall score and agreement between each laboratory and the Center for Emerging and Zoonotic Diseases (former special pathogen unit) of the national institute for communicable disease (South Africa), which served as the reference laboratory. The performance of two kits (the IDVET competitive ELISA and the BDSL Inhibition ELISA) were simultaneously assessed.
- Provided backstopping missions at country level to aid with EQA (*sub activity C3.H2*):
 - South Sudan: Training on EQM was conducted on 6-13 April 2013 at the Central Veterinary Diagnostic Laboratory in Juba by an international expert to provide assistance on developing Quality Laboratory Management, SOPs and laboratory bench work guidelines. A second visit for the EQA mission will be necessary, especially when the laboratory moves to a new site.

- Uganda: an internal audit was conducted to adjust non-conforming items and review quality system documents according to the recommendations formulated during the last on-site mission.

Planned activities for the next reporting period (1 October 2013 – 31 March 2014)

- Regional proficiency testing (AI and ND, FMD, RVF, PPR, ASF) (*sub activity C3.H.1*):
 - AI and ND organized by IZSve: Botswana, Cameroon, Ethiopia, Gabon, Kenya, Nigeria, Senegal, South Sudan, Tanzania and Uganda.

- RVF (with FAO/IAEA and the National Institute for Communicable Diseases/South Africa) organized for the Democratic Republic of the Congo, Ethiopia, Senegal, Tanzania and Uganda. Discussions to be held with the National Institute for Communicable Diseases/South Africa and a technical contract to be prepared by the FAO/IAEA joint division for the second EQA program for serological diagnostics of RVF virus.
- PPR organized by FAO/IAEA for Cameroon, Republic of Congo, Democratic Republic of the Congo, Ethiopia, Gabon, Senegal, Tanzania and Uganda.
- ASF (organized by an FAO reference centre) for Cameroon, Republic of Congo, Democratic Republic of the Congo, Ethiopia, Tanzania and Uganda.
- CBPP organized by CIRAD for CAF, Gabon, Republic of Congo and Uganda.
- FMD organized by IAH, Pirbright in collaboration with EU-FMD for the Democratic Republic of the Congo, Senegal, Nigeria and Botswana.
- Results of all proficiency testing (including rabies and other diseases, if any) from all partners will be integrated to shape regional testing programs (*sub activity C3.H.1*).
- Three backstopping missions will be organized at country level to aid with EQA 3 countries, according to results obtained during proficiency testing (*sub activity C3.H.3*).

C3.I Develop and conduct trainings or workshops to promote laboratory quality management, excluding biosafety/biosecurity (refer to activity group J).

Activities undertaken during the current reporting period (1 April – 30 September 2013)

- Conducted regional trainings on equipment maintenance and calibration (*sub activity C3.I.1*): five participants from Cameroon, Central African Republic, Congo, Democratic Republic of the Congo and Gabon attended the training organized from 3-7 June 2013 in Dakar, Senegal. Other participants from non-IDENTIFY beneficiary laboratories (Burkina Faso, Côte d'Ivoire, Mali, Niger, Chad and Senegal) sponsored by another funding source also attended the training. The training gathered maintenance officers who improved their skills on maintenance of key laboratory equipment, including biological safety cabinets, controlled/dust-free rooms, spectrophotometers, CO2 incubators, optical microscopy, analytical balance and an ultra deep freezer.

Planned activities for the next reporting period (1 October 2013 – 31 March 2014)

- N/A.

C3.J Develop and conduct trainings or workshops to promote laboratory biosafety and biosecurity.

Activities undertaken during the current reporting period (1 April – 30 September 2013)

- N/A.

Planned activities for the next reporting period (1 October 2013 – 31 March 2014)

- N/A.

C3.K Targeted support for laboratory quality management systems, including biosafety (at country level).

Activities undertaken during the current reporting period (1 April – 30 September 2013)

- Continued to support the laboratory biosecurity/biosafety implementation, including the completion of minor laboratory repairs (*implemented through national LoAs, sub activity C3.K1*):

- Cameroon: As a follow-up of the assessment mission conducted by an FVI expert in February 2011, a sample reception room was set up, eight staff were vaccinated against rabies and 80 percent of SOPs and other quality documents were developed and disseminated.
 - Congo: A water tank and a high water pressure pump were installed. The quality system documentation was updated.
 - Gabon: 80 percent of SOPs for diagnostic tests currently performed at the laboratory were developed. Eight staff were vaccinated against rabies.
 - Rwanda: Laboratory renovations were delayed because of lengthy local tender procedures. However, the major renovations have been carried out.
 - Tanzania: Electronic locks were installed on all three doors whilst 20 laboratory personnel involved in rabies necropsy and diagnosis (in pathology and virology sections) were vaccinated against rabies.
 - South Sudan: Renovations on the CVDL were carried out (air conditioners repaired, electricity and water system repaired, laboratory benches in place, laboratory partitioned into three units). Sustainable cold chain system put in place. As the laboratory will be moved to a new site, a visit to assess laboratory quality management needs will be required.
- Supported the implementation of LIMS in Tanzania and Botswana (*sub activity C3.K3, under LoA with IZS Teramo*). In Tanzania, LIMS- LABs Information and Management System (SILAB) has been installed on the local server at TVLA. Staff from the Sample Reception, Pathology, Bacteriology and Animal Science sections were trained and are now able to use the system autonomously. Final test reports generated by SILAB are currently sent to TVLA's customers. Interfacing the SILAB and TADinfo systems was discussed and will be explored by IZS Teramo.

Planned activities for the next reporting period (1 October 2013 – 31 March 2014)

- Support laboratory biosecurity/biosafety implementation, (minor renovations in the laboratories) (*sub activity C3.K1*) in all countries except CAF, Equatorial Guinea and Rwanda.
- Conduct on-site audit and training on quality assurance (*sub activity C3.K2, under LoA signed with FVI*): on-site audit/backstopping missions on QA will be performed by FVI for all countries except Equatorial Guinea and Central African Republic.
- Complete support for implementation of LIMS in Tanzania and Botswana (*sub activity C3.K.3, under LoA with IZS Teramo*): in Tanzania, staff from TVLA will autonomously extend SILAB use to other sections of the laboratory with IZS Teramo's remote support.

Output 2. Linkages and communication pathways across national, regional and global laboratory and epidemiologic networks for the management of emerging zoonotic pathogens strengthened.

USAID | IDENTIFY OBJECTIVE 4: Laboratories are participating in relevant regional and international laboratory networks according to their respective abilities, disease priorities, and responsibilities.

C4.L Regional laboratory network support and coordination for animal health.

Activities undertaken during the current reporting period (1 April – 30 September 2013)

- Provided support to regional networking:
 - Supported ASF regional network meeting (20-22 May 2013 Entebbe, Uganda) of the ASF Working Group for Eastern Africa (*sub activity C.4.L.1*). Launched the ASF Working Group

in Kampala during a meeting organised from 11-14 June 2013. Country focal points were appointed during the meeting. The meeting also adopted an action plan that includes consultations on national strategies for the control of ASF; modalities for the selection of regional diagnostic laboratories for ASF using the model from AI; a framework for sampling at the field level; harmonized surveillance of ASF; preparedness and contingency plans; mechanisms for information sharing between cross border districts; and cross-border collaboration in outbreak investigations. An *ad hoc* ASF sub-network working group was established to look into sylvatic cycles and bring on board other stakeholders, including the private sector, conservation agencies and farmers.

Provided support for rabies regional networking: Inputs and technical backstopping provided to the rabies RESOLAB sub-network, under the LoA with IZSve; collected and shared information on the rabies situation, including confirmed cases, by laboratories in CRA, Democratic Republic of the Congo and the two RSLs (Senegal and Nigeria); prepared the first RESOLAB rabies sub-network quarterly report. Assistance was also provided by IZSve, including the provision of sampling and laboratory diagnostic protocols, which were uploaded to the website of ECTAD Bamako. FAO and IZSve prepared an update on the laboratories' rabies diagnosis activities in Central and West Africa². Assistance has been provided for the celebration of World Rabies Day (28 September 2013) by making flyers and key messages available to rabies country focal points.

- Organized the year four work plan implementation meeting and year five planning of the IDENTIFY|FAO project, with help from laboratory directors and Chief Veterinary Officers. IDENTIFY target countries were given the opportunity to comment, make suggestions and agree to the implementation of all activities for years four and five. The meeting was held in Douala, Cameroun from 4- 6 June 2013, with 30 participants including CVOs and laboratory directors of IDENTIFY beneficiary countries in the Congo Basin Region (except Rwanda). The project's achievements in year four were discussed. Participants developed a draft of the year five workplan. The meeting provided a good forum to discuss opportunities for collaboration with PREDICT in Cameroon and Congo regarding applying PREDICT testing protocols to diagnose disease in domestic animals. A joint session of the FAO|IDENTIFY Project and PREDICT was organized to select key stakeholders in Cameroon and address sampling activities in wildlife (Congo). The final communiqué of the meeting is available on the ECTAD Bamako website³.
- Organized the fourth joint (EARLN/ Eastern African Region Epidemiology Network) annual coordination meeting, held from 16-19 July 2013 in Bujumbura, Burundi, with representatives from 10 countries and participants representing FAO, OIE, African Union Interafrican Bureau for Animal Resources, African Union Panafrikan Veterinary Vaccine Centre, IGAD and IZSve Padova. The meeting was organized within the framework of the implementation of the European Commission-funded programme entitled "Reinforcing Veterinary Governance in Africa". Two side meetings of the Eastern African Region Epidemiology Network and EARLN took place to discuss challenges faced by the national epidemiology networks and the central veterinary laboratories; also discussed was the needs assessment on epidemiology training and the report of the EA Regional Support Laboratory. The final communiqué of the meeting is available on the ECTAD Nairobi website⁴.

² <http://www.fao-ectad-bamako.org/fr/Update-on-animal-rabies-diagnostic?lang=en>

³ http://www.fao-ectad-bamako.org/fr/IMG/pdf/final_communique_IDENTIFY_Meeting_Douala2013_Eng.pdf

⁴ http://www.fao-ectad-nairobi.org/IMG/pdf/Final_communique_EAREN_EARLN_Bujumbura_meeting.pdf

- Provided funding for an officer from headquarters to attend the "Workshop on PPR Prevention and Control in the Southern African Development Community region- Preparing Southern African Development Community countries for the possible introduction of PPR into PPR-free areas (disease identification, control and management)", Dar es Salaam, Republic of Tanzania, from 10-13 June 2013.

Planned activities for the next reporting period (1 October 2013 – 31 March 2014)

- Support activities of regional thematic sub-networks (i.e. rabies, ASF, CBPP, FMD, PPR) (*sub activity C4.L1*).
- Present activities and results of rabies RESOLAB subnetwork, including support provided by IDENTIFY in two rabies conferences (Senegal and Canada): AfroREB (8-10 October 2013, Dakar, Senegal); Rabies in the Americas/Rita (27-31 October 2013, Toronto, Canada).
- Hold one regional support laboratory annual meeting in Senegal, Botswana, Ethiopia and Nigeria (*sub activity C4.L2*).
- Hold two regional animal health networks meetings (*sub activity C4.L3*).
- Hold conclusive meeting for IDENTIFY beneficiary countries (*sub activity C4.L4*).
- Hold hand-over meeting for RESOLAB coordinators (tentatively planned for November 2013) (*sub activity C4.L5*).
- Hold annual regional laboratory network meeting (RESOLAB) (tentatively planned in Chad for January 2014) (*sub activity C4.L6*).

C4.M Enhancing the role and status of Regional Support Laboratories.

Activities undertaken during the current reporting period (1 April – 30 September 2013)

N/A.

Planned activities for the next reporting period (1 October 2013 – 31 March 2014)

- Hold conclusive meeting for validation/endorsement by beneficiary laboratories, CVOs and commitment by key partners (*sub activity C4.M.1*). This activity has been postponed to year five, as a hard commitment from Regional Economic Communities (RECs) is required in order to implement findings of the meeting. Discussion on institutional arrangements with RECs are underway.
- Review annual reports submitted by RSLs for M&E purposes, and to identify strengths and gaps.

C4.N Supporting national laboratory networks for animal health.

Activities undertaken during the current reporting period (1 April – 30 September 2013)

- Continued support to national laboratory network meetings and related activities (*sub activity C4.N1*): In Cameroon, 3 000 brochures and flyers on the services and products of LANAVET were produced and disseminated. At least 100 copies of scientific papers from EMPRES and IDENTIFY projects were disseminated during the workshops organized by LANAVET. An open day was organized.
- Supported the animal health laboratory in Goma (DR Congo) to carry out basic serology analysis and good practices on sampling and shipment (PPR, FMD) (*sub activity C4.N3*): a mission was conducted at the laboratoire vétérinaire de Goma (Democratic Republic of the Congo) from 6-14 May 2013 in order to: (i) assess laboratory needs (equipment and reagents) and perform routine testing (serology) on targeted diseases; and (ii) train laboratory staff on biosecurity, biosafety, sampling and shipment of samples to regional or reference laboratories. The laboratory expert also visited the laboratory at Kinshasa (from 3-

6 May 2013) to assess the implementation of the activities under the LoA, and check proper reception, installation and use of laboratory equipment delivered under IDENTIFY. Contact was also made with PREDICT to envisage collaboration between PREDICT and the national laboratory.

Planned activities for the next reporting period (1 October 2013 – 31 March 2014)

- Support minimal laboratory diagnostic capacity in Goma (Democratic Republic of the Congo) (*sub activity C4.N1*).
- Support national laboratory network in Cameroon (*sub activity C4.N1*).

C4.O One Health initiatives: strengthening linkages between veterinary and public health.

Activities undertaken during the current reporting period (1 April – 30 September 2013)

- A One Health seminar on rabies was held in Brazzaville, Congo (12-13 June 2013) (*sub activity C4.O1*): a stakeholder consultation was held before the seminar with the objective to exchange and share information on rabies and identify best practices and opportunities to control rabies in Congo. The meeting gathered fifty participants from veterinary services (central and district veterinarians) and public health services.

RabiesOneHealth.Br
azza.June2013

- Held national seminars on One Health (*sub activity C4.O3*):
 - In Cameroon, 20 participants from public health, veterinary and environmental laboratories attended a national seminar on “Establishment of public health, veterinary and environmental laboratories network in Cameroon” held in Mfou on 23 August 2013. A draft of a decree to establish the network was adopted. Participants agreed to establish a list of resource personnel, and to develop information sharing mechanisms. A second One Health seminar was organized at LANAVET Garoua on 30 August 2013. Twenty participants from universities, professional schools and various ministries (livestock, public health, environment and wildlife) attended the seminar. Participants agreed to include One Health training modules in the curricula of academia and to organize a One Health seminar in each of the 10 regions of Cameroon. These meetings are part of the group dynamics for the implementation of the One Health concept in Cameroon, which resulted in another meeting on “Advocacy for intersectorial support to laboratories” (Yaoundé, 21 August 2013). This meeting was attended by LANAVET and 19 other participants from the Ministries of Livestock, Public Health, Environment and Wildlife. The meeting participants committed to develop an advocacy document to be submitted to the national authority and the regional economic communities for funding.
 - The Democratic Republic of the Congo held the One Health seminar on 27-29 May 2013. 40 participants from Universities, Ministries from public health, Agriculture, Rural development, environnement and wildlife attended the seminar. The participants recommended other “One health” meetings to be organized, for better networking between the different sectors, and better surveillance and control of zoonotic diseases.
 - Uganda held a One Health seminar on 12 April 2013 with 56 participants from the Ministry of Agriculture, Animal Industry and Fisheries, Ministry of Health, Uganda National Bureau of Standards, National Drug Authority, district health

officers, district veterinary officers, College of Veterinary Medicine, Animal Resources and Bio-Security, Uganda Wildlife Authority, Central Public Health Laboratories, FAO and USAID. The workshop objectives were: Understanding the One Health approach to disease control; developing network and communication strategies for improved disease control; and discussing strategies on sustaining laboratory networks in Uganda and beyond for long-term benefits.

Planned activities for the next reporting period (1 October 2013 - 31 March 2014)

- Hold national One Health seminars on rabies, in Gabon and South Sudan (*sub activity C4.O1*).
- Finalization and dissemination of rabies training kits (*sub activity C4.O2*).
- Linking laboratory activities with country One Health initiatives, including implementation of One Health roadmaps (*sub activity C4.O3*).

G4.P Support for participation in scientific conferences, trainings or workshops.

Activities undertaken during the current reporting period (1 April - 30 September 2013)

- N/A.

Planned activities for the next reporting period (1 October 2013 - 31 March 2014)

- Upon countries' request.

4 MAIN CHALLENGES ENCOUNTERED AND RESPONSE PROVIDED

- Owing to budget constraints in year five, FAO decreased the overall level of activities, ended some activities (especially those under LoAs with national laboratories), ended all support to one country previously supported under IDENTIFY (Equatorial Guinea, except for participation in regional networking meetings with RESOLAB), and decreased funding for proficiency testing and procurement of laboratory supplies. These changes will be communicated to the countries once the year five IDENTIFY workplan has been fully approved.
- Several constraints at the end of year four, including institutional arrangements with key stakeholders (beneficiary countries, RECs...) resulted in the postponement of several key activities in Africa, including: the handover meeting to designated coordinators for RESOLAB/ Regional Network of National Epidemiology Surveillance Systems for Transboundary Animal Diseases; the conclusive meeting on Regional Support Laboratories; on-site missions for rabies, ASF, CBPP and field pathology in four countries; a public-private partnership mission in Tanzania; and a follow-up QA mission in South-Sudan, for which countries expected FAO's support. The assessment mission for strategic development of a veterinary laboratory in Equatorial Guinea has been postponed in order to obtain the full commitment of the officials to implement mission findings. However, because of year five budget constraints this activity in Equatorial Guinea is cancelled. Countries and regions have been informed of these constraints.
- The low priority given to animal health in country policies and development strategies often leads to difficulties in mobilizing technical, financial and human resources at national level, thus compromising the sustainability of activities implemented under the project. Therefore, there is a need to intensify advocacy at country level and increase sustainable financial resources.
- Great efforts are being made to strengthen biosafety in SE Asia, for which the Southeast Asia Regional Biosafety Programme has been developed. Laboratory biosafety was made a priority topic at the Laboratory Directors' Forum meeting to advocate for more support from higher-level authorities. Emphasis has been made on awareness of biosafety practices among the laboratory staff in SE Asian laboratories. In Africa, only a few activities to strengthen biosafety have been conducted (training, assessment, minor repairs in the laboratory facilities) under IDENTIFY so far. However, this is a large undertaking and the development of a road map and a project with a dedicated budget is required.
- As most of the technical inputs have focused primarily on the key national veterinary laboratories in Southeast Asia, there remains a need to expand capacity building activities to other laboratories at the subnational level, and to improve the linkage of the laboratories and field staff to ensure the sustainable quality of laboratory services. It is believed that such objectives can be achieved by supporting the training/workshops at national level, and with assistance from the Regional Leading/Reference Laboratories, key national laboratories and other implementing partners. Several activities for enhancement of laboratory quality service among the national laboratory networks were planned during the next year to fulfil the above needs.
- The low level of resources allocated to veterinary laboratories by authorities in the Congo Basin continues to present a major challenge. The project is trying to address this issue through private-public partnership consultations conducted in Cameroon, Democratic Republic of the Congo and Rwanda. Outcomes of the ongoing work include: (i) targeted identification of products and services (e.g. poultry, pig and dairy sectors; post-vaccination control; and food safety analysis) that the laboratory could offer to the private sector, including an estimate of the additional resources which would be required; (ii) preparation of appropriate communications and promotion tools or activities (such as brochures summarizing recent laboratory analyses and related costs, open days, and participation in fairs) to initiate/improve client relationship and design complementary activities with other country veterinary laboratories (e.g. samples

submission, training); and (iii) review of legal status (e.g. opening of bank accounts, strengthening/training of commercial staff). By supporting the extension or improvement of laboratory diagnosis services to the private sector and addressing internal issues, the private-public partnership consultations are expected to improve the sustainability of some project activities, as well as provide contributory references to formulate a laboratory policy. Although the IDENTIFY project is improving communication between laboratories and other technical partners (including regional laboratories, FAO/OIE reference centres, national veterinary services, FAO, OIE, joint FAO/IAEA division), findings on PPP missions demonstrated the need for laboratories to engage in more transparency and communication with the private sector and other interested stakeholders on non-technical matters, such as priced services and products. This issue will be addressed during the next missions in Tanzania and Uganda, as well as follow-up missions in Cameroon, Democratic Republic of the Congo and Rwanda.

- Engagement of Regional Economic Communities and countries remains insufficient in Africa, while ASEAN countries have made great institutional progress engaging with laboratory and animal health centres in SE Asia. Discussions with RECs on the issue of Regional Support Laboratories are ongoing in Africa. FAO would like to ensure that meeting findings from the conclusive meeting on the institutionalization of RSLs are fully endorsed by RECs. ECOWAS has paved the way for such commitment by recognizing the two RSLs in West Africa, and discussions are underway with UA IBAR with the support of FAO decentralized offices.
- Most beneficiary laboratories in the Congo Basin and Southeast Asia still face the issue of low quality and quantity samples received from the field. The IDENTIFY project does not cover any surveillance activities. Building capacities in laboratories for diseases for which there is no surveillance, although they are considered priority diseases by the veterinary services, does not fulfil the project objectives. The proper development of laboratory strategy and sustainability of the skills and activities supported by IDENTIFY is hindered by weak laboratory policy and management (e.g. shortage of laboratory reagents that prevent participation in proficiency tests, no bank accounts or possibility to generate income, etc.). It is expected that these complex issues will be addressed by the guidelines on animal health laboratory policies for both the top management of the veterinary laboratories and the authorities in charge of laboratories, with further adaptation to the context of Asia and Africa regions.
- Although LoAs have been recognized as a major tool for implementation of the project, it should be emphasized that administrative complexity observed in laboratory operations has contributed to delays in project implementation. Implementation of the agreed activities as they appear in LoAs between beneficiary countries in Congo Basin and FAO was slower than expected. However, most of the issues related to the delayed completion of LoAs are justifiable. For instance, recent events in Mali (FAO ECTAD regional office) and Central African Republic, and continued challenges faced by beneficiary laboratories have slightly limited the project delivery for the past three months. As a result, the FAO-IDENTIFY project management team agreed to extend the duration of LoAs with beneficiary laboratories. The FAO project team continues close monitoring of the LoAs and provides necessary guidance through regular and effective communication. This experience should help to ensure greater autonomy to laboratories, which will enable them to contract with the private sector. This issue is being addressed by FAO through the work on laboratory policy.
- Issues on timely delivery of reagents in some countries have contributed to delayed trainings in diagnostic techniques for priority diseases (rabies in Gabon and ASF and CBPP in Central African Republic, Congo and Gabon).
- Implementation of One Health activities remains linked to the ability of countries to engage in this initiative after the One Health meeting held in Libreville in November 2012. However, FAO supports specific activities in countries such as Cameroon through the LoAs. A number of

challenges were identified during the One Health seminar on rabies held in Brazzaville, Congo (5-6 June 2013) with participants from animal and public health. The lack of overall collaboration between sectors and the absence of functional mechanisms for collaboration and coordination between human and veterinary sectors was noted. Thus far, the authorities have not formulated any realistic goals and it seems appropriate to define activities for the short- to medium-term to improve and promote rabies prevention and control. The stakeholders were very interested in the step-wise approach developed by the global alliance against rabies group of which FAO is a member. They were able to identify the activities to be implemented in the short- and medium-term to improve intersectoral collaboration and control of rabies. No incidences of rabies have been officially reported to the OIE, although the country is surrounded by rabies endemic countries. However, after the training performed by IZSve at LDVB from 3-7 June 2013 (*sub activity C1.B*), the country is now capable of detecting (animal) rabies and it is expected that a rabies case will be confirmed before the end of 2013. In addition, the outdated legislation from 1968 should be updated; clear protocols must be defined on how to address animal bites and follow-up outbreak investigations; various roles and responsibilities must be defined; and a coordination mechanism should be implemented.

5 MAIN PROGRESS MADE TOWARDS THE ACHIEVEMENT OF PROJECT OUTCOMES (FROM THE START OF THE PROJECT ACTIVITIES)

- The support provided by IDENTIFY has contributed to a greater understanding of regional animal health priorities, assessment of laboratory capacities and identification of regional and national gaps and resources.
- The direct support provided to laboratories in Africa has been greatly appreciated by the laboratories. Specifically, quality assurance, biosafety, and the maintenance and calibration of equipment has been improved, thus contributing to laboratories' capacity to conduct work with reference to internationally accredited standards (e.g. ISO 17025). Minor repairs have been made or orchestrated by the laboratories to improve biosecurity through national LoAs. National laboratories have improved their national visibility through open events, production of leaflets and radio messages. FAO has reviewed and provided feedback on national LoA progress and final reports; the template used was inspired by the FAO M&E framework (which includes performance indicators and means of verification). By working closely with the laboratories, this approach has also been a training exercise in project management for beneficiary laboratories.
- In Africa, laboratories have significantly improved their biosafety practices. In addition, good progress has been made in quality control through training provided on maintenance and calibration of equipment. However, much work remains in these areas. In Asia, during the past three years, the numbers of laboratories which participated in and received the benefit from the Southeast Asia Regional Biosafety Programme has expanded over 400 percent. Significantly improved awareness and biosafety management and practices are observed across the region. However, continued efforts are essential to reinforce trainings and promote the establishment biosafety management systems in the laboratories.
- The Southeast Asia Regional Quality Assurance Programme enabled the supported laboratories to improve the quality laboratory diagnostic service against six priority diseases, including Influenza A, ASF, CSF, PRRS, rabies and ND. The results from the proficiency testing activities carried out in past years indicated improvement in the laboratory performance in both accuracy and quality of the reported results. Problems identified in the previous years were, in most cases, solved in the following rounds of the proficiency testing programme. Through the regional proficiency testing activities, the supported laboratories in the regional network were able to harmonize and improve the test sensitivity to a satisfactory level. The improvement of the diagnostic quality has been observed across the region.
- As many priority diseases are TADs, a regional approach (where agreed) allows for rapid disease detection/identification. Response measures can be coordinated regionally for more effective control. The networks in the West/Central, Eastern Africa and Southeast Asia regions have set a good example regarding the formal and informal exchange of information, and collaborative efforts and responsibility to build laboratories in the regions. Other partners, such as the United States Department of Agriculture Animal and Plant Health Inspection Service, EuFMD Commission and CIRAD, have demonstrated an increased interest in and support for these laboratory networks. This growing confidence lends credence to the regional approach, and highlights FAO's comparative advantage in the coordination of such support and inputs. This project has supported regional laboratory networks, providing assistance with networking, strategy and policy development to regional service laboratories. In Southeast Asia, the establishment and endorsement by ASEAN of the regional laboratory capacity building and networking programme and the Regional Quality Assurance Programme represents a full engagement of the key regional stakeholder in supporting sustainable quality laboratory services across the region and has a significant impact on the regional preparedness against the newly emerging pathogen. Following the emergence of influenza A(H7N9) virus, updated diagnostic

protocols were rapidly distributed through the network and implemented at the member laboratories, with better confidence in quality services. In addition, through the established regional laboratory network, experienced laboratory staff could be quickly identified and recruited as regional resource to provide technical assistance and consultation to the supported laboratories in the region. This has enabled rapid risk assessment and emergency disease surveillance within a few months following the emergence of the virus.

- The FAO M&E framework was finalized based on the experience gained from both EPT data calls and the tripartite discussions held with the Donor regarding IDENTIFY deliverables. This M&E framework is being routinely implemented by the FAO|IDENTIFY team together with implementing partners (laboratories and technical partners through LoAs). In Asia, the FAO Laboratory Mapping Tool, along with the support for the assessment missions, has been a great asset for identifying gaps and needs at the laboratory level. Information obtained from the laboratory assessment tools was subsequently used to design and monitor the progress of the capacity building and technical assistance programmes at the laboratories. A harmonized approach was discussed during year four planning to assess the direct contribution of the IDENTIFY project to changes in supported laboratories; lab sheets have been developed for all IDENTIFY supported laboratories and are being completed on a regular basis (including mapping data, activities conducted, follow-up actions and success stories) in order to measure the project's impact on laboratory functionality. A decision was made to augment the lab sheets with a survey measuring the observed (and perceived) changes in laboratories against what was done under the IDENTIFY project. The IDENTIFY project's main outcomes (including information on trainings, proficiency testing, networking activities, success stories and lessons learned) will be presented in the report for the next "FAO Regional Conference for Africa" (March 2014) on the results of FAO's work in the region.
- This project has enabled or will shortly enable the launching of innovative initiatives, such as the genetic module in the EMPRES-i database; the four-way linking framework; the laboratory mapping tool; the development of private-public partnerships between laboratories and the animal production sector; the provision of laboratories' access to sequencing services and the FAO guidelines on laboratory policy. The genetic module represents an ideal example of a multidisciplinary success, linking virology, epidemiology and bioinformatics, and is receiving increased interest from the scientific community and policy makers. It was released to the public in March 2013. The support provided for sequencing services receives significant interest from beneficiary laboratories. Looking toward integration within a national policy, beneficiary countries and other FAO partners recognize the need to review the laboratories' organization and performance. Such measures include FAO guidelines on laboratory policy development, as well as activities to be implemented in pilot countries through alternative funding mechanisms (e.g. the VET GOV project).
- Building on the investments made with support under AI, this project sustains previously established mechanisms, such as collaborations and communication pathways between organizations, global OFFLU and regional networks. These investments are crucial to the continued development of technical laboratory capacities, especially molecular techniques, to respond to other transboundary and priority diseases.
- The project benefits from the public's increased awareness about its activities, such as understanding the importance of early detection and intervention, as well as the potential impact of pathogens with pandemic potential.
- The project has strengthened linkages between laboratory and epidemiology services by enabling veterinary services to collect samples on priority diseases through LoAs. This supports and justifies the provision of equipment and reagents to laboratories and trainings that the project has delivered since its launch.

- Discussions with PREDICT have resulted in a significant change regarding the identification of effective opportunities for collaboration with the year five FAO IDENTIFY projects in Cameroon, Congo, Viet Nam and Indonesia.

EXECUTIVE SUMMARY

This document is the final report for the Strategies Against Flu Emergence (SAFE) program, covering program start-up in March 2011 through to program closedown in June 2013.

SAFE was originally awarded as a three-year \$21,016,378 program with an end date of March 15, 2014. In May 2012, DAI was informed that due to budgetary constraints, there would be a reduction in budget and scope of work. In November 2012, a modification reduced the budget to \$7,258,200 which reduced the duration of the project to June 15, 2013. SAFE modified its strategy, eliminated inputs/activities, modified deliverables, and reduced the size of the project team to operate within the new scope of work.

The SAFE project was developed to support USAID/Indonesia's API Program to reduce the impact of AI on animals and humans and limit the emergence of a pandemic influenza virus. SAFE had four objectives:

- Objective 1 Strengthen and Expand Public Private Partnerships to Improve Good Farming Practices and Limit AI Transmission among Poultry

- Objective 2 Promote Behaviors that Lower the Risk of AI Transmission among Poultry and Increase Knowledge of Signs and Symptoms and Risk Factors for AI-Related Illnesses

- Objective 3 Increase Knowledge of Signs/Symptoms and Risk Factors for AI-Related Illness in People and Promote Behaviors that Improve Household-Level Care-Seeking in Response to AI-Related Illnesses

- Objective 4 Coordinate with and Facilitate Communication among Partners

SAFE operated in 12 high-risk districts in the provinces of West Java and Banten. This area contains a large human and poultry population as well as an active trading route for the poultry value chain with various point of H5N1 AI transmission. It also has contained the highest number of poultry AI outbreaks.

The project operated in collaboration and consultation with Government of Indonesia Ministries of Agriculture, Health, and Trade at national, provincial and district levels, poultry industry, academia, civil society and international partners.

The 2011 "Consensus Report: Priority Audiences and Behaviors for Reducing the Risk of AI Transmission in Indonesia" served to bring together the technical know-how and experience of local and international biosecurity experts in Indonesia, and served as the basis for SAFE's programming. Developed under the previous CBAIC program in 2009, SAFE led a review and

updated the document in 2011.

Under Objective 1, SAFE aimed to increase the number of Sector 3 farms adopting biosecurity and good farming practices. At the end of two years, 347 farms had self-financed changes at their farms. This outcome was achieved by: a) securing industry support, b) developing Teaching Farms as instructional areas, c) positioning the industry to expose Sector 3 farmers to new biosecurity practices at these Teaching Farms, d) having industry staff provide technical assistance to farmers to implement changes at their farms, and e) developing incentives and support mechanisms in the form of SMS communication, development of educational material aimed at farmers, "champion farmer" competition award, and field-level discussion groups.

In addition, SAFE introduced academic partners and their students to new biosecurity practices by establishing Teaching Farms at their institutions and providing new information and material to reinforce classroom curriculum.

By the end of the project, in addition to commitment from industry to continue with the 12 Teaching Farms opened under the SAFE program, four new Teaching Farms were opened completely financed by industry partners; GOPAN, the independent farmers' association, took on the communication responsibilities through the SMS system; the three academic partners have each taken responsibility for continuing with technical discussion groups; and educational materials such as the farmer-to-farmer video are being reproduced and disseminated widely by the industry.

Under Objective 2, SAFE aimed to increase the number of poultry vendors in demonstration markets adopting healthy market practices. At the end of two years, 2,721 vendors had made changes in 69 markets; 846 vendors at the demonstration markets and 1,875 vendors reached by the local government replicating the SAFE program. This outcome was achieved by: a) extensive consultation with local government; b) implementation of the Healthy Market and Consumer Empowerment Initiative; c) development of "model" live bird markets; d) physical changes at markets, and education of market managers and vendors; e) education and empowerment of women consumers surrounding the markets; and f) communication and community support mechanisms in the form of a radio serial drama, social media, community videos, linkages with sermons and religious activities, and vendor-of-the-month awards.

By the end of the project, local governments had begun replication of the program with their own resources; Aisyiyah, the largest women's religious organization in Indonesia, had officially adopted the consumer empowerment component of the program nation-wide and begun to replicate it; private sector companies had begun to partner with civil society to support the program; and communication materials had been replicated by inter-ministerial KOMNAS-Zoonosis and Aisyiyah. The MOH had plans to replicate the radio series and distribute nationally.

Under Objective 3, SAFE aimed to increase the knowledge of health care-seeking practices for AI/ILI related illnesses. At the end of two years, there is substantial evidence-based information

and data upon which to develop future programming. This outcome was achieved by: a) designing (in collaboration with CDC, WHO and USAID), conducting and analyzing a Healthcare Utilization Survey with 2,560 respondents, and a Clinician KAP that included interviews with 545 medical doctors; b) development of priority behavior change practices and messages in collaboration with the MOH and WHO; c) field-test of the messages with the community through programming with Aisyiyah; and d) analysis of the results of the field-testing.

By the end of the project Indonesian researchers, MOH, WHO and others had improved information on the care seeking behaviors of communities, and the knowledge and case management practices of physicians; and there was increased comprehension of community response to care seeking messages. SAFE has drafted findings of these activities and plans to publish peer-reviewed papers in international journals.

Under Objective 4, SAFE aimed to improve use of Avian and Pandemic information by local and international stakeholders. At the end of two years, 202 documents were accessible globally and over 2,052 visitors from 18 countries had accessed information; AI partners regularly met and shared programmatic and technical information; and SAFE partner successes and lessons learned had been shared. The program outcome had been achieved by: a) uploading documents to the newly created Indonesia API page on the Knowledge for Health website, b) financing study trips for local Indonesians, c) organizing and hosting monthly COP meetings, d) media coverage and articles, e) development of one page success stories, and f) a six-booklet project informational series.

The project ended with two well attended end-of-project forums which highlighted project outcomes, replication and sustainability; and a field visit by the MOH Vice Minister and USAID Mission Director to one of the project sites at the request of the Vice Minister who had heard of the healthy market and consumer empowerment program model.

There are numerous lessons learned and future considerations detailed in the document. The three observations applicable to the entire project are the following:

- 1) A value chain approach is required to decrease disease as it enables members of the chain to understand the impact of their practices on other member of the chain and the ultimate value of their final product.
- 2) A business model resonates with key members of the value chain; a public health perspective does not. It is possible to develop a business case that addresses both industry and public health priorities.
- 3) Priority risk reduction practices and message harmonization across donors and stakeholders reinforces change. Agreement by partners on a core set of priority biosecurity practices and technical messages for each member of the poultry value chain reduces conflicting messages and misinformation.

Additional lessons learned and considerations are included under each of the objectives.

I. INTRODUCTION

This document represents the final comprehensive report for the Strategies Against Flu Emergence (SAFE) program, covering program start-up in March 2011 through to program closedown in June 2013. The submission of this document is in accordance with the reporting requirements stated in Section F.5 Reports and Deliverables or Outputs of Contract No. AID-EDH-I-00-05-00004-00, AID-497-TO-00-00001.

This first section of this document provides the project background, objectives, geographic area and results and lessons learned from the program, including considerations and recommendations for future planning. Section two provides a detailed description of the results (by outcome and output) of the four components that are linked to the indicators in the Monitoring and Evaluation (M&E) plan. Section three concerns program management, including operations, grants and budget. Lastly, Section four reports on monitoring and evaluation, containing the reference sheets for each indicator in the M&E plan along with program assessments and evaluation studies.

I.1 Project Background

Indonesia continues to be the country with the most reported H5N1 Avian Influenza (AI) human cases in the world. At the time of this award, Indonesia had the highest AI human case fatality rate (84%), which was partly a result of delays in obtaining medical treatment. AI outbreaks in poultry have been reported in 31 of Indonesia's 33 provinces. Surveillance data confirm that AI is endemic in most provinces on the islands of Java and Sumatra. Clearly, AI is both a public health and a business concern. To address this concern, the United States Agency for International Development (USAID) designed and awarded the SAFE project, originally as a three-year program created to support USAID/Indonesia's Avian and Pandemic Influenza (API) Program and the Government of Indonesia's (GOI's) National Strategy for Avian Influenza Control and Preparedness for Human Pandemic Influenza. The SAFE project was implemented by Development Alternatives, Inc. (DAI) and Johns Hopkins University Center for Communication Programs (JHU-CCP).

I.2 Modification to Budget and Scope of Work

SAFE was originally awarded as a three-year \$21,016,378 program with an end date of March 15, 2014. In May 2012, DAI was informed that due to budgetary constraints, there would be a reduction in budget and scope of work. In November 2012, modification # 6 reduced the budget to \$7,258,200 and truncated the duration of the project to end June 15, 2013. SAFE modified its strategy and reduced the size of the project team. A second year (15-month) workplan was developed and approved by USAID.

1.3 Project Objectives

The SAFE project, awarded on March 15, 2011, was developed to support USAID/Indonesia's API Program to reduce the impact of AI on animals and humans and limit the emergence of a pandemic influenza virus. SAFE has four objectives:

- Objective 1 Strengthen and Expand Public Private Partnerships to Improve Good Farming Practices and Limit AI Transmission among Poultry

- Objective 2 Promote Behaviors that Lower the Risk of AI Transmission among Poultry and Increase Knowledge of Signs and Symptoms and Risk Factors for AI-Related Illnesses

- Objective 3 Increase Knowledge of Signs/Symptoms and Risk Factors for AI-Related Illness in People and Promote Behaviors that Improve Household-Level Care-Seeking in Response to AI-Related Illnesses

- Objective 4 Coordinate with and Facilitate Communication among Partners

1.4 Geographic Coverage

SAFE operated in 12 high-risk districts in western Java -- three districts in Banten province and nine in West Java province. These twelve districts were Ciamis, Tasikmalaya, Garut, Bandung, Bandung Barat, Cianjur, Sukabumi, Bogor, Lebak, and Serang (all Objectives), and Tangerang and Sumedang (Objective 1 only).

The large number of Sector 3 farms located in western Java and the movement of poultry through the value chain into the *Jabodetabek* (greater Jakarta area), coupled with the high density of human population, made this region a high-risk AI transmission area. Data from the government's Participatory Disease Surveillance and Response (PDSR) officers, who had been trained by the United Nations Food and Agricultural Organization (FAO), also indicated western Java to be a high-risk area, based on Sector 4 data (a proxy data point used by FAO). Concentrating on western Java optimized the effectiveness of program implementation, with a focus on Sector 3 biosecurity and good farming practices, healthy market initiatives, and consumer empowerment.

The map in Figure 1 shows the locations of the SAFE Teaching Farms (TFs) with red dots, and the locations of the program's Live Bird Markets (LBMs) with green dots.

professional relationships focused on addressing public health threats. Indonesian and international partners' work, research findings and program activities in API are now being captured in the newly created Indonesia API section of the Knowledge for Health (K4Health) website at Johns Hopkins University.

1.6 Lessons Learned and Drivers

This section summarizes the main lessons from the SAFE project and looks at the key drivers that led SAFE local partners and target audiences to assume leadership roles, implement changes, and adopt and continue the models developed under the program.

1.6.1 Lessons learned

Overall

- 1 A value chain approach enables members of the chain to see the impact of their practices on the value of the final product. In Indonesia, members of the poultry value chain tend to see themselves as isolated workers rather than part of a production team. The SAFE program introduced the value chain concept and worked with select members of the chain to help them recognize the interrelated and complex process of getting poultry to the consumer and their impact on the ultimate value of the product, which could include cost of production, food safety and ultimately consumer trust for their product. The program focused on recognizing and promoting best biosecurity practices at select points in the chain.
- 2 A business model resonates with key members of the value chain. It is not surprising that many public health professionals use a public health model when making a case for change – such as improved biosecurity practices. Businesses do not speak that language. Their operational model is based on profitability and responsibility to shareholders. Nevertheless, developing a business case that addresses both industry and public health needs is possible. The program and partners developed common goals such as reducing poultry morbidity and mortality, an overall reduction in disease transmission, and selling healthy products to consumers, even though partners developed a different roadmap and were driven by separate incentives to reach these goals. As long as the ultimate goal is the same, there is no need to become sidetracked over the reasons for reaching that goal.
- 3 Priority risk reduction practices and message harmonization across donors and stakeholders reinforces change. Agreement by partners on a core set of priority biosecurity practices and technical messages for each member of the poultry value chain reduces conflicting messages and misinformation. Subsequently, creating communication and educational materials that contain clear, concise messages that have been pre-tested with the target audience is most likely to support program goals. SAFE delivered the same priority messages through multiple channels including a teaching farm audio system, SMS messages, a disease prevention booklet, training, a farmer-to-farmer video, posters, pamphlets, games, commercial and community radio, social media and entertain-educate activities.

Private Sector Poultry Farm Intervention

- 1 Farmers will self-finance changes. When addressing biosecurity changes at the small farm (Sector 3) level, industry executives believed farmers would never change old ways. However, the SAFE program found that in a short time over 350 small farmers were able to implement biosecurity changes at their farms with technical support and guidance under a multi-pronged approach involving industry technical staff, competitions and rewards, a supportive communication (e.g. SMS) system, and the ability to visualize biosecurity through a teaching farm model.
- 2 Motivations for change are economic, social and regulatory. While research studies demonstrated that economics is still the strongest motivator for farmers and live bird market vendors to change, their standing in the community and with their families, and the threat of sanctions, are also important motivators.
- 3 Improved farmer biosecurity practices can be built into the industry incentive system. It is easy to return to old patterns if there are no disincentives to do so. Industry leadership through technical assistance, incentives and motivation, which are all part of the contractual relationship with farmers, will continue to be required.
- 4 There may be a regulatory role for government when there is a 'market failure'. When an industry which has the power to address a problem – in this case, improved biosecurity – lacks the financial incentive to solve that problem, in large part due to industry structure, impressive domestic sales growth and a non-reliance on exports, then government regulations may have a role. The challenge for the government is to identify low-cost interventions to correct the market failure, for instance, the government may consider setting and monitoring quality standards, enforcing existing regulations, improving coordination through poultry associations, and motivating industry self-regulation.
- 5 Farmer-to-farmer learning works. Farmers trust fellow farmers' experiences, particularly when they work under similar environmental and geographic circumstances. A farmer-to-farmer video in which program farmers described biosecurity changes they had implemented at their farms, and the results of those changes, incentivized farmers who were not part of the early adopter group. Personal stories carried relevance and credibility that motivated others to change.
- 6 Private/public/academic partnerships work. Where there is limited trust between the public and private sectors, academia can play a constructive, independent role in bringing all players to the table. In addition, strengthening academic curricula and providing pre-service education that provides students with hands-on practical experience produces stronger, smarter public health extension workers and industry technical staff.

Live Bird Market and Community Empowerment Intervention

- 1 Local government leadership and financing is indispensable. Local government was positioned as a lead agency through a participatory process that identified its role as a resource/technical expert for the program and as a decision-making partner together with civil society and the community. Resources available to the district were used to co-finance and complement work under the SAFE program.
- 2 Providing an operational model is essential for change and sustainability. The program guided partners in developing a model that served the interests and mission of local government institutions and civil society. This model “translated” government guidelines and standard operating procedures into day-to-day action and change supported by specific activities, outreach programs and development of materials that were then replicated by the government in non-SAFE districts.
- 3 The consumer has the power to produce change. Consumers have purchasing power. They decide where to purchase their poultry and which vendor to visit. Once consumers understood their right to clean markets and how to distinguish healthy poultry, they began to purchase from those vendors who had implemented changes such as having tiled surfaces and using soap and water to clean their stalls and equipment. This change motivated vendors who faced falling sales to make the same changes.
- 4 Private/public/civil society partnerships work. Civil society partners with extensive community networks exponentially grow the outreach efforts of local government. More established civil society organizations (CSOs) can also bring financial resources to a program. Private sector partners seem more willing to enter a relationship with the government when they can win the good will of the community by also engaging with CSOs such as Aisyiyah and the Indonesian Red Cross (PMI). The end result is leveraged resources and local ownership.

1.6.2 Drivers

Economics

Both commercial farmers and live bird vendor markets were motivated to make changes if they believed they could secure and improve their livelihood and increase revenues. Incentives included reduced poultry loss, perceived overall return on investment, and higher cash flow. For small farmers, better production performance during the rainy season was an added incentive. For some market vendors, cleaner stalls translated into increased sales. Even market managers were able to increase market revenues by creating new poultry zoning areas and renting the old space to new dry goods vendors.

Community Empowerment

CSOs such as Aisyiyah and PMI are driven by community-focused visions. Their organizational missions focus on empowering the community to become self-sufficient. Education and health are priorities for both organizations. They are willing and able to embrace donor projects that support, augment and

intensify their missions, and provide educational and informational materials that facilitate the transfer of information and knowledge and calls for action.

Public Health

Local governments, particularly the Ministry of Health (MOH), Ministry of Agriculture (MOA) and Ministry of Trade (responsible for the markets) embrace the “healthy markets” concept and seek to improve the healthcare-seeking practices of people suffering flu-like symptoms. Working together with these three ministries contributed to a ‘one health’ approach that eventually improved cooperation across the ministries, all of which had were able to reinforce their public health goals.

2 PROGRAM RESULTS

2.1 Objective 1: Strengthen and Expand Public Private Partnerships to Improve Good Farming Practices and Limit AI Transmission among Poultry

2.1.1 Increased Sector 3 biosecurity and good farming conditions and practices

2.1.1a Strategy

Objective 1 strengthened and coordinated a variety of industry-focused and industry-driven biosecurity interventions specifically designed to improve biosecurity prevention, control, policy, and response, and good farming practices (GFP) in small (Sector 3) broiler farms. The scale and design of Objective 1 interventions aimed to (a) achieve impact within the targeted geographic areas with minimal investment, (b) leverage strong industry investment and support at all times, and (c) build upon successful ongoing and past work by other AI partners, including FAO, USDA and the Indonesia Dutch Partnership, among others. Objective 1 interventions focused on selected Sector 3 farms in high-risk areas of western Java, and educational institutions; two university programs and a poultry farming vocational high school located in the ten districts identified and agreed upon with USAID. The objective was accomplished through strong partnerships with Sector 1 and 2 farms, poultry shops and academia. As was the case with all other SAFE program activities, all Objective 1 activities were conducted in coordination and collaboration with partners FAO, USDA, the MOA, and Provincial and District Livestock and Animal Health Services.

The components of the strategy, which are described in detail under section 2.1.1c (Inputs), included a leadership role for the private sector; converting existing farms into “see and do” TFs – an approach supported by the poultry industry and educational institutions; capacity building of industry technical staff; field-level technical discussion groups (TDGs); an SMS communication system; field-level farmer group discussions; educational tools, materials and methodologies to support the transfer of knowledge from Technical Service (TS) staff to farms managers and workers; and a “champion farmer” competition.

2.1.1b Partners

SAFE partnered with large Sector 1 integrated poultry companies, poultry shops and educational institutions, engaging with a total of 14 partners. Sector 1 firms included Charoen Pokphand Indonesia (CP), Japfa Comfeed Indonesia (Japfa), Sierad Produce (SP), and PT. Cheil Jedang Indonesia/Super Unggas Jaya (CJ). These partners control over 70% of broiler production in Indonesia. SAFE also worked with seven poultry shops (Tunas Mekar Farm, Rinjani Poultry Shop, Sukahati Poultry Shop, Tanjung Mulya Poultry Shop, Hikmah Mitra Bersinar Poultry Shop, Multi Sarana Pakanindo Poultry Shop, and Dramaga Unggas Farm) and three educational institute partners – Bogor Agricultural University (IPB), Padjadjaran University (UNPAD), and SMK Agro Nurul Huda vocational school (SMK).

These partners are described in more detail below.

PT Charoen Pokphand Indonesia Tbk (CP)

CP is Indonesia's largest producer of poultry feed, Day Old Chicks (DOCs) and processed chickens. CP was established in 1972 as the first high-volume feed mill in Jakarta that manufactured premium quality poultry feed. CP's 2012 Annual Report recorded net sales of 21,310,925 million Indonesian Rupiah. CP's core business is agro-business, especially the manufacturing of poultry feed, DOCs and processed chicken, which is carried out by the company and its subsidiaries.

PT Japfa Comfeed Indonesia Tbk (Japfa)

Japfa is one of the largest and most integrated agro-food companies in the country. Its core business activities include animal feed manufacturing, chicken breeding, poultry processing, and aquaculture farming.

PT Sierad Produce Tbk. (SP)

SP's core business includes the production of primary processed and poultry feed, breeding and hatchery, growing farm, slaughtering and production of further processed and value-added chicken products, poultry equipment, and fishmeal production.

PT. Super Unggas Jaya (CJ)

CJ is a South Korea-based company that produces approximately 20 million Day Old Chicks (DOCs) each year.

Tunas Mekar Farm (TMF)

TMF owner Mr. Mulikhin Irmat oversees the production of 50,000 chicks per week distributed to 50 farms in its group. Ten TS staff provide oversight and technical assistance to farmers.

Sukahati Poultry Shop

This poultry shop supplies 20,000 chicks per week to an associated firm, Gn. Jati, and 30,000 chicks per week to Sukahati Poultry Shop itself. From an office in Tasikmalaya, the shop supervises about 100 farms through eight TS staff.

Rinjani Poultry Shop

This 20-year-old firm from Ciamis provides 60,000 chicks per week to 300 small farms.

Tanjung Mulya Poultry Shop

This firm, which began life in 1990, was the primary founder of SMK Agro Nurul Huda vocational school. It has 300 small farms in its group, spanning several districts, and receives about 80,000 chicks per week from a parent stock farm in Panjalu, Ciamis.

Hikmah Mitra Bersinar Poultry Shop (HMB)

HMB Poultry Shop, which opened in 2002 with an office in Sukabumi, produces about 125,000 chicks per week for various farms under the care of HMB Poultry Shop and Selaras Inti Prima.

Multi Sarana Pakanindo Poultry Shop

Multi Sarana Pakanindo Poultry Shop, whose head office is in Jakarta, produces about 200,000 chicks per week for a few relatively large farms in the Sector 3 broiler industry.

Dramaga Unggas Farm

Dramaga Unggas Farm has its office in Bogor. It produces about 55,000 broilers per week from the 70 farms in its group.

Bogor Agricultural University (IPB)

IPB has undergraduate, graduate and diploma programs. The undergraduate program awards a four-year bachelor's degree. Since 2005, IPB has offered a major-minor curriculum that includes on-farm agricultural activities and off-farm agricultural activities, covering agribusiness and agro-industry. There are nine faculties at IPB. The Animal Science faculty has a Department of Animal Production and Technology and a Department of Nutrition and Feed Technology. An average of 211 animal husbandry students graduated annually between 2004 and 2011.

Padjadjaran University (UNPAD)

UNPAD has 16 faculties, one of which is Animal Husbandry. This department offers both an undergraduate program and a postgraduate program that awards master's and doctoral degrees.

SMK Agro Nurul Huda vocational school (SMK)

SMK was founded in 2008 and it offers a technical high school diploma. It teaches students poultry industry knowledge so they can be effective in the industry. The school also teaches computer technology and light vehicle maintenance. There are currently about 240 students. Subjects include hatchery management, nutrition and feeding, growing broilers, and processing broilers. Of the 34 graduates in 2010, 15 were immediately hired to work at corporate farms in Kalimantan. Other graduates have become self-employed or moved overseas to work. There were 39 graduates in 2011, 34 of whom went to work in Java and Kalimantan while five went on to college. In 2012, SMK had 66 graduates.

2.1.1c Inputs

SAFE developed two workplans during the life of the project. Below is a summary of the main program inputs, which became activities in the workplans.

1. Strategic Consultative Meetings with Industry and Academic Stakeholders

SAFE built on the industry partnerships created under the CBAIC program and developed new relationships with poultry shops and academia. Industry and academic partners were always expected to be full participants in the program, being responsible for the ultimate results and sustained changes by

the end of the project. Various consultative meetings (particularly at the outset, but also throughout the project) focused on several areas:

- a) an assessment of current disease prevalence at the farms;
- b) proposed solutions and incentives to improve Sector 3 biosecurity;
- c) review of recent research results;
- d) commitment of industry human resources;
- e) expansion of students' hands-on practical experience before they graduated; and
- f) how best to adapt to the project's reduced funding and life-of-project, including accelerating transfer of responsibilities to the industry.

Meetings with executives of Sector 1 and poultry shops revealed information gaps and the needs, concerns and priorities of this industry segment. Proposed solutions and incentives (such as bonuses for implementing biosecurity measures) to overcome problems identified during field visits were discussed, along with establishing field-level TDGs. Discussions and consultations with MOA, FAO, USDA, AusAID and US-APHIS, among others, provided information to help eliminate duplication, enhance collaboration and coordination, and ensure that SAFE supported value-added activities. Regular meetings with the MOA's Campaign Management Unit and the FAO provided guidance and ensured that SAFE activities were supporting the national program and its priorities.

2. *Industry Convention on Poultry Biosecurity*

SAFE planned to conduct three annual industry biosecurity conventions as a way of committing the industry to an official review and acceptance of biosecurity-related changes by the entire industry. Budget changes ultimately reduced the number of these conventions to one, which was held in the first year of the project.

In July 2011 SAFE organized an Industry Convention on Poultry Biosecurity to address incentives and models for promoting industry-wide improvements in biosecurity. Speakers included the Deputy Minister of Agriculture and representatives from the key poultry industry associations. The 80 participants included poultry farmers, companies and shops, representatives from the government and international organizations, academics and a consumer group.

The convention had four main objectives:

1. Define and develop mechanisms and platforms for coordinating private sector responses to improve adoption of strong biosecurity compliance;
2. Identify incentives and secure private sector investments to (i) implement industry-wide disease reduction activities; (ii) strengthen biosecurity information, learning and training access; and (iii) define concrete platforms for improving private sector communication and knowledge sharing;
3. Validate industry-agreed achievable, commercially feasible and cost-effective biosecurity conditions and behaviors to be jointly promoted throughout Sector 3 farms; and
4. Define a framework and common indicators for measuring improved biosecurity.

The overarching approach of the convention was to provide a clear platform for fostering broad discussion about different investments, incentives and models for promoting a greater industry-wide response to improving biosecurity. Discussions were framed through a private sector perspective focusing on evidence that biosecurity is good for business and suitable for wide-scale industry development, rather than through a public health perspective. SAFE felt this framework would be more comprehensible to key players in the poultry value chain.

Discussions focused on achievable biosecurity results for the poultry industry. The private sector was expected to take a lead role in both the discussions and the design of industry-acceptable programs and investments, with clear incentives and achievable outcomes grounded in private sector reality. Plenary sessions were used to organize the convention around specific working group sessions with defined outputs.

Key outcomes of the convention included:

1. Better understanding of the challenges faced by the various groups in the poultry supply chain;
2. Agreement to create TFs as models of biosecurity and good farming practices;
3. Contribution of industry human resources to bring farmers to the TFs and provide technical assistance;
4. Availability of TS staff to participate in technical and communication training;
5. Creation of field-level TDGs; and
6. Access to farm mortality data.

3. *Development of Teaching Farms*

From discussions with industry executives at the end of CBAIC and more recent discussions with industry TS staff and farmers during TDG meetings in the field, it became evident that farmers wanted to “see” the biosecurity conditions and behaviors that had been presented orally at seminars and group discussions. Senior members of the industry also indicated that their staff needed to visualize the changes, clarifying that Indonesia is a “see and do” society. Members of the industry were also very much in favor of TFs that would show the conditions summarized in the SAFE Disease Risk Index that had been presented for discussion. Indonesia’s experience with model dairy farms, which have been successful in encouraging adoption of good farming practices, also reinforced this approach.

The initial strategy had been to create 30-40 TFs, saturate the priority geographic area, ensure that farmers did not have to travel far to visit a TF, and create a social norm that made it attractive and desirable to implement biosecurity improvements. After discussions with USAID, the strategy was modified to accommodate only 12 new TFs. These were opened with the following objectives:

- ✓ Model good farming and biosecurity practices
- ✓ Serve as teaching centers for capacity building in good biosecurity and other good farming practices
- ✓ Strengthen the technical capacity of students graduating from vocational schools or with degrees from universities
- ✓ Provide a venue for educational institutions to provide continuing education credits

Table 2-1 lists the TFs that were opened during the life of the SAFE project.

Table 2-1. Teaching Farms and locations

Firm/Organization	Teaching Farm	Location (District)
Rinjani Poultry Shop	Darwin	Tasikmalaya
SMK Agro Nurul Huda Vocational School	Nurul Huda	Ciamis
Sukahati Poultry Shop	Cikaleker	Tasikmalaya
Super Unggas Jaya (CJ)	Encep Rusli	Garut
Super Unggas Jaya (CJ)	H. Ujang	Bandung
Universitas Padjadjaran (UNPAD)	UNPAD	Sumedang
Sierad Produce (SP)	Tursinameta	Bogor
Tunas Mekar Farm – poultry shop	Muslikhin	Bogor
Institut Pertanian Bogor (IPB) – university	Closed	Bogor
Institut Pertanian Bogor (IPB) – university	Open	Bogor
Charoen Pokphand Indonesia (CP)/Dharmaga Unggas Farm – poultry shop	Wahyu	Tasikmalaya
Japfa Comfeed Indonesia/Ciomas Adisatwa	Solihin	Tangerang

Selection of the TFs during the initial process depended on the institutions' readiness, interest in and commitment to making the required changes, maintaining the TF, and allowing regular visits by farmers and students. The TF also had to be easily accessible (i.e., not be located at the top of a hill) and have a minimum level of infrastructure.

Once a farm had been selected to become a TF, the following steps were followed:

- The premises were assessed to identify the changes needed.
- A budget was created for the selected farm.
- Cost sharing discussions were held.
- An MOU delineating responsibilities and expectations was signed.
- Modifications to the farm were completed.
- Teaching elements were installed (e.g., signs, tour items, handouts).

The behaviors practiced at the TF were based on the priority behaviors listed in the 2011 Consensus Report: Priority Audiences and Behaviors for Reducing the Risk of AI Transmission in Indonesia. The changes implemented at one TF, Solihin, are illustrated in the before-and-after pictures below.

Solihin Teaching Farm: before and after

4. *Train Sector 1 and Poultry Shop TS Staff*

To support the transfer of knowledge and behavior change aspects of the training for TS personnel, SAFE designed and implemented training modules that improved the interpersonal communication skills of 59 TS staff and taught them how to use different tools, approaches and methodologies to communicate the importance of GFP and biosecurity measures. The training modules guided the persuasion skills needed to improve TS professional duties as they related to the improvement of Sector 3 biosecurity practices. The staff were taught the fundamentals of interpersonal communication and were led through a series of training and 'role playing' situations for handling resistant Sector 3 farmers. By the end of the training, participants had practiced relevant skills for situations where a 'sales' perspective is needed to achieve structural and/or behavioral action to improve biosecurity within the Sector 3 farms. These trainings were conducted at or near the TFs, where the "see, hear and do" techniques were demonstrated.

5. *Farmer and Student Visits to Teaching Farms*

Industry TS staff brought farmers associated with their companies to their TF. Towards the end of the project many of the companies had agreed to open their TFs to farmers from competing firms, which helped to reduce travel time for many farmers. There were also occasions when companies brought in visitors from neighboring districts and sometimes from other islands and provinces. After the tours, there was an opportunity to engage the TF owner to discuss how he overcame obstacles, and the results of the changes.

SAFE worked with its educational institute partners to ensure their students visited the TFs. These visits helped students to understand the benefits of biosecurity. Reinforcing good biosecurity and farming practices during pre-service education is both cost-effective and efficient, while changing old habits later through in-service training is costly and challenging.

SAFE staff worked with industry leadership to monitor the number of farmers that visited each TF, address quality control and key maintenance issues, and offer continuous technical guidance.

Students at SMK Agro Nurul Huda vocational school practice biosecurity techniques

6. *Technical Support to Farmers*

SAFE encouraged all farmers visiting the TFs to implement biosecurity measures and GFP. All farmers who committed to making changes received technical assistance (TA), generally from industry TS staff and selectively from SAFE staff. The project gave particular attention to farmers who had entered and won the champion farmer competition because they had already demonstrated motivation and the ability to implement changes. They became model farmers for others. As part of the technical assistance, all farms interested in making biosecurity and GFP changes received how-to guidance on upgrading the farm with new techniques and biosecurity-related construction, along with a biosecurity booklet on "Effective Measures to Reduce the Spread of Disease". SAFE made over 100 visits to individual farms during the project, and the TS staff visited over 700 individual farms multiple times. Both SAFE and TS

staff provided TA during these visits. Data were collected on the number of farms self-financing changes and the kinds of changes being made.

7. *Educational and Communication Tools and Materials*

SAFE designed, produced and distributed a booklet titled "Effective Measures to Reduce the Spread of Disease", which described, in simple terms and with many illustrations and photos, the key biosecurity measures and GFPs that visitors could observe at the TF. An illustrated poster highlighted six behaviors a farmer should practice to keep his farm safe from disease. The TF display, which was produced on heavy cardboard, was used as a wall hanging and showed biosecurity conditions that should exist at a commercial broiler farm, and some conditions that should not be present. It was designed for presentations in small group and classroom settings.

A farmer-to-farmer video that was also titled "Effective Measures to Reduce the Spread of Disease" featured SAFE program farmers and educators at commercial broiler farms talking about their personal experiences in making biosecurity changes at their farms, and the results of those changes. The video had five specific purposes:

- 1) Demonstrate the biosecurity techniques and GFPs of farmers who used these practices;
- 2) Increase credibility and adoption of the techniques by having listeners relate to the farmers that were speaking (these were real Indonesian farmers, not actors);
- 3) Provide a visual tool for local MOA offices (*Dinas*) and other government bodies to use in the field;
- 4) Serve as a training tool for industry to use with new TS staff and contract farm owners; and
- 5) Provide educational institutions with a visual tool that could be incorporated into classroom curricula.

The video targeted small (Sector 3) contract and independent broiler farmers and was filmed at TFs, educational institutions and visiting farms. It had sections on the farm entrance, farmyard, overall cleanliness requirements, doorway to the chicken house, ventilation, and disposal of dead chickens. The techniques demonstrated were easy to follow and usually inexpensive. The video also included testimonials from fellow farmers.

Around 1,300 copies of the video were distributed to the poultry industry, educational institutions, and farmers. They are now being used to educate farmers and students on how to reduce the likelihood of disease outbreaks, improve the performance of chickens, and increase farmer revenues.

8. *SMS System*

Observation and a formal survey found that farmers use their mobile phones extensively as an inexpensive means of communication. Under the project's grants program and Biosecurity Improvement Innovation Fund, SAFE established an SMS system for information dissemination, to reinforce the biosecurity measures farmers had seen at the TF, and to remind them of GFPs. It was also used as a means to inform farmers of activities of interest, such as the radio drama series and the champion farmer competition dates and winners.

SAFE implemented two SMS systems. One began early in the project and was led by the Objective 1 Team Leader. Approximately two SMS messages were sent each week to farmers, TS and educators on a number of topics, each with a series of messages that built on one other. SAFE received input from the FAO on the content of the messages. Specific product recommendations and sensitive issues (e.g. the price of chicks) were avoided. In some cases, farmers were referred to their TS.

A second pilot was implemented through a grant awarded to Satu Dunia (One World), which targeted a separate group of farmers and their TS staff with supportive biosecurity and good farming technical information. Satu Dunia introduced a more creative aspect to the messages, including motivational themes, quizzes with prizes, and acknowledgements delivered through innovative uses of interactive SMS text.

These text messages commonly led to expressions of appreciation. Mr. Suwardi from CP requested a complete set of the messages to review and share. SMS recipients gave only positive feedback on the messages, whether in conversation or through other media. The impact of the messages was evident. For example, in response to the SMS series on hot weather, on September 12, 2012 one of the farmers wrote, "We have opened the curtains."

9. *Technical Discussion Group Meetings*

In addition to regular field visits to project sites, SAFE created TDGs in Tangerang, Tasikmalaya and Bogor to provide a platform for continuous communication and advocacy. Small group discussions have been found to have a positive effect on uptake of new biosecurity practices. Participants included Sector 1 and poultry shop TS staff, Sector 3 broiler farmers, educators, and SAFE staff. The objectives of the discussions were to (a) troubleshoot farm problems, (b) discuss local solutions to illnesses such as Chronic Respiratory Disease, (c) conduct peer-to-peer training and problem solving, (d) learn new technical information, and (e) motivate through the sharing of success stories.

*Technical Discussion Group meeting in Tasikmalaya
February 2013*

Each TDG meeting was attended by about 20 TS, farmers and managers. A discussion topic such as "Ventilation in the Chicken House," was reinforced by SMS messages on the same topic.

10. "Champion Farmer" Award

SAFE introduced a "Champion Farmer" Competition to recognize early adopters of biosecurity changes. The aim of this competition was twofold: to motivate farmers to make biosecurity changes after returning from their visits to the TF, and to motivate TS staff to provide guidance for those changes. SAFE staff rated the farms of the best-qualified candidates using a scoring system for biosecurity and GFP conditions and behaviors. Farmers who implemented the most important biosecurity and GFP measures received the most points.

Ms. Herlijati receiving a Champion Farmer Award in February 2013

Each team member of the winning farm was recognized during a ceremony and received a cash prize of US\$150.

SAFE slowly transitioned the process and operation to the industry. These awards were a key motivator for farmers and TS staff, encouraging friendly competition amongst participants.

2.1.1d Key outcome

Details of the results and impact are outlined in the monitoring and evaluation (M&E) section of this Final Report. SAFE highlights below the key outcome for Objective 1.

Farmers will self-finance changes. A total of 345 Sector 3 farms self-financed biosecurity and GFP changes to reduce the transmission of AI and other diseases at their farms. Based on conversations with TF staff and industry members, SAFE believes that many more farms implemented changes, but only data backed by detailed written records are reported. In addition, towards the end of the second program year, industry replicated the SAFE TF model and self-financed an additional four TFs. Table 2-2 lists the number of biosecurity changes implemented by Sector 3 farms.

Number of Biosecurity Changes	Number of farms
12 (maximum #)	5
11	12
10	33
9	41
8	27
7	30
6	6
5	4
4	33
3	110
2	42
1	2
Total	345

2.1.2 Improvements at Sector 1 and poultry shops

2.1.2a Increased industry technical capacity

A variety of activities and routes were used to increase the technical capacity of the industry. Each is presented below.

Technical and communication training

In February 2012, 39 TS personnel were trained in three areas: (i) skills related to the supervision, management and transfer of knowledge; (ii) assessment of changes needed at Sector 3 broiler farms; and (iii) how to budget for changes that are needed. These workshops included visits to TFs, providing TS with a strong visual perspective on how to assess the needs of a typical farmer when implementing biosecurity measures. This allowed the TS to be better prepared to support farmers visiting the TFs.

A pre- and post-test comparison conducted during the training showed that participants' knowledge of the 10 topics covered by the training had increased by 53 percent.

A further 20 TS personnel were trained in May 2012 in the areas of biosecurity adoption processes, persuasion, how to answer questions presented by the farmers as objections to implementing change, and which changes to prioritize at individual farms.

Technical training in Tasikmalaya February 2012

On-the-job training

TS always accompanied SAFE staff on their visits to farms, meaning that the TS heard their recommendations. Each encounter lasted between 30 minutes and three hours. Many topics were discussed, including biosecurity (restricting the entry of visitors); good farming practices (ventilation, weighing chickens, recording mortality); data collection (mortality rates); assessing the farms for the Champion Farmer Award; activities planned (such as TDG meetings) and various other topics (e.g., selling prices, IP of the flock, construction of new chicken houses). Table 2-3 summarizes the number of Sector 3 farms visiting TFs.

Table 2-3: Summary of Sector 3 Farms Visiting Teaching Farms

Teaching Farm	Number of Farms
Cikaleker	42
Darwin Farm	25
Encep Rusli	38
IPB Closed house	19
IPB Open houses	36
Muslikin	23
Nurul Huda	128
Solihin	40
Tursinameta	48
Ujang	48
UNPAD	34
Wahyu	58
Total	539

Learning through SMS

The TS received the same SMS messages that the farmers received. It was essential that the TS were always aware of SAFE's communications (both technical and non-technical) with the farmers. The goodwill of the TS was essential, but they also needed to give farmers the same information that was being provided by SAFE. The strategy of many sources of information giving the same information and guidance was strengthened through this process.

TDG meetings

The primary audience at the 21 TDG meetings was the TS. Information presented by SAFE was intended for them to use in their work with the farmers. SAFE and the TS discussed the topics (e.g., the need for ventilation) thoroughly so that the TS would be ready to talk effectively with the farmers. Farmers, supervisors, regional managers and other industry persons also attended the TDGs and participated in the discussions.

2.1.2b Increased understanding of and dissemination of biosecurity and good farming practices and techniques

Through the development and use of the TFs, farmers and TS staff increased their understanding of the key biosecurity and good farming practices and techniques. While visiting the TFs with farmers, the TS staff learned that the farmers could change. For instance, at the grand opening of Solihin TF, one TS staff noted a farmer stating, "These are simple things. We can follow the model, especially for footwear exchange." Other farmers agreed.

Increased technical assistance to farmers from TS staff

Historically, the TS have talked to farmers about a variety of subjects, including biosecurity and GFPs, but the intervention of SAFE emphasized these subjects and "lit a fire under the TS" to engage the farmer in a problem-solving discussion on these topics. For the Champion Farmer Award, the TS encouraged the farmers in their care to make improvements and become a winner, since this would also make the TS a winner. The fact that SAFE staff were in contact with TS on a weekly basis was a constant reminder to "push" the farmers in the desired direction. In one year, the TS made more than 38,000 visits to the 753 farms in the SAFE project area. With the booklet and information from the SMS messages, the TS had new subjects to discuss and different perspectives to convey.

There is evidence that demonstrates TS staff became more focused when they talked to the farmers in their charge. For example, Mr. Surpryanto (a Japfa field investigator (PPL) under

Mr. Rofik) has 24 farms in his charge. After visiting Solihin TF, Mr. Surpryanto spoke to each of his farmers about biosecurity

Mr. Dodang, TS of Sukahati Poultry, advising Mr. Eman Sulaeman

measures. Eight have since implemented the sandal exchange system at the chicken house doors. He now aims to convince other farmers to implement this basic biosecurity technique.

Increased technical assistance to farmers from SAFE staff

SAFE and TS combined their efforts to give farmers more information. Direct farm visits by SAFE staff occurred throughout the project, with more intensive visits in the later months. TS accompanied SAFE on all farm visits. The number of visits by SAFE staff to individual farms by quarter is presented in Table 2-4.

SAFE and TS also brought together small groups of five, 10 and 20 farmers. At these meetings SAFE gave a formal presentation and then opened the floor to comments and questions.

Table 2-4. Visits to farms by SAFE staff

Quarter	Year	Number
Jan - Mar	2012	4
Apr - Jun	2012	16
Jul - Sept	2012	35
Oct - Dec	2012	34
Jan - Mar	2013	28
Total:		117

Objective 1 staff spent many days in the field providing technical guidance on issues related to biosecurity and GFPs. These discussions took place either in one-on-one settings or in small groups. The direct assistance provided by SAFE and TS to the farmers and workers included:

- identification of basic needs;
- establishment of priorities (e.g., sandal exchanges at chicken house doors, and locked gates at entrances);
- selection of simple and least expensive options;
- training on how to use existing resources (such as bamboo) at the farm; and
- Information, Education, and Communication (IEC) materials as visual reminders (e.g., posters, pamphlets) to reinforce the biosecurity practices observed at the TF and emphasized by TS and SAFE staff.

A small group of farmers and educators meet at UNPAD in March 2013

Indirect contact with the farmers via the SMS campaign was effective in conveying the messages to them. The comments below confirm that this type of communication is positive.

"They [the SMS messages] are very helpful. They remind me to always pay attention to the condition of the chicken, litter, temperature, and ventilation. Very good and useful." (Mr. Ajat)

"I often receive text messages from SAFE. They are useful for managing the chickens. Thank you." (Mr. Laksono)

"Thank you for reminding me of the importance of farm management. The information is good and useful for me and my employees." (Mr. Dedi)

2.1.2c Increased access to educational materials and information on biosecurity and good farming practices and techniques

Farmers, TS staff, educators, students and management obtained access to a variety of educational materials. Each item is presented below.

- Over 5,500 copies of the booklet titled “Effective Measures to Reduce the Spread of Disease” were distributed by SAFE. A softcopy was requested and made available to all partners.

Teaching Farm Display at entrance to Agus Farm

The response to the booklet’s contents and presentation was exceptional. At a stakeholder meeting in Bogor on September 19, 2012, at which the booklet’s content and intended readership were discussed, Mr. Ruri Sarasono, Secretary General of

GOPAN (the Indonesian Association of Independent Sector 3 Poultry Producers, which is an independent farmers’ association), stood up waving the booklet and told the audience, “This is a very good publication. We will use it in East Periangan.” After the meeting, CP Vice President Mr. Moch Fill Yunus told Dr. Miller, “The booklet is very good.”

- More than 1,300 copies of the farmer-to-farmer video titled “Effective Measures to Reduce the Spread of Disease” were distributed by SAFE.

The recipients of the video have been told that it can be copied. The video uses real farmers with whom other farmers can relate. It has received very favorable comments from farmers, TS and managers.

- A poster titled “Six Key Actions that a Farmer Should Do at the Farm” was distributed by SAFE to over 250 farms.
- The TF display was distributed by SAFE to over 100 farms.
- Over 20,000 SMS messages were sent to around 400 farmers, TS, educators and managers. These messages covered various subjects, including ventilation, litter management, and biosecurity techniques.

2.1.3 Improvements at educational institutions

2.1.3a Expanded access to biosecurity lectures and information

The educational institutions received information and technical classroom presentations during regular field visits by SAFE staff to the academic institutions, TFs and offices of educators. In addition, SAFE distributed publications, the farmer-to-farmer video, and other educational materials for discussion and reflection.

Four classroom presentations were given to over 600 students at the educational institutions, on the following topics:

1. Biosecurity from Grandparents to Consumers
2. Modern Broiler Industry in the USA
3. Biosecurity at Sector 3 Broiler Farms
4. Maximizing Potential Profit at a Sector 3 Broiler Farm Using Basic Management

These presentations were also made available to the educators in softcopy form for use in other classes with other students. Each student attending the presentation received a copy of the booklet on "Effective Measures to Reduce the Spread of Disease". Each institution also received further copies of the booklet to distribute at the TF to farmers and other visitors, and to distribute to students at lectures on biosecurity. Copies of the farmer-to-farmer video on "Effective Measures to Reduce the Spread of Disease" were distributed to academia. Educators have indicated that they will integrate the video into their classroom curricula.

A presentation on Chronic Respiratory Disease (CRD), which is a major cause of mortality in broilers, was given at the TDG meetings and was also made available to the educational institutions. Educators attending the TDG meetings received additional insights into farm problems and solutions from discussions with the farmers, SAFE staff and TS.

On March 13, 2012, Dr. Luki Abdullah, Dean of Faculty of Animal Science, IPB told SAFE "The Animal Husbandry Department is changing its curriculum. We will include a two-hour segment on poultry farm biosecurity in the new curriculum."

2.1.3b Increased practical experience through Teaching Farm visits

At each of the three educational institution partners the students toured the TF as part of their semester classes. Students also spent more time caring for chickens and were reminded of the importance of biosecurity and GFPs through the signage found throughout the farm. At SMK, the students participated in the construction of the TF, so they acquired first-hand knowledge of how to construct some of the biosecurity measures, including the pass-over system. Whenever students visit a TF, they practice several actions, including washing their hands with soap and water (see photo), which they may not have done before. Applying biosecurity practices on a regular basis is far more likely to be

incorporated into the memory than just reading about them. SAFE also learned that many of the students come from families that own farms, and have passed on the newly acquired information and techniques to their parents and other family members.

2.1.4 Program replication/leveraging

2.1.4a Industry financing of new Teaching Farms/training farms

Students learning at the SMK TF

Four farms associated with SAFE industry partners expressed interest in becoming TFs in order to reach farmers who lived too far away from the SAFE program TFs. These new TFs were self-financed by the industry and received TA from SAFE staff to implement the changes. They are now open and being used to disseminate and teach the biosecurity and GFPs advocated by the SAFE project. All of these farms were modified and changed in the first quarter of 2013. Each farm is discussed below.

Cibuntu Farm – Tri Group

Cibuntu Farm has already been partially modified (farm yard cleaned, ponds drained, footwear exchange installed at chicken house doors). Modifications to the farm entrance are also being planned. In addition to providing a tour of the farm with biosecurity-related explanations at key points, Cibuntu Farm plans to hold meetings of small groups of farmers in a semi-classroom environment. This activity will replicate the technical and farmer group discussions conducted under the SAFE project.

The creation of this TF followed discussion and negotiation between CP and one of its key customers, Mr. Tri Hardiyanto, who is also the Chairman of GOPAN. Mr. Hardiyanto has been very supportive of the work performed by SAFE.

Yaya Farm – Dramaga Unggas Farm

To develop a suitable TF, Mr. Yaya made changes to the parking area and introduced barriers for vehicles and people, gates with locks, a pass-over system, footwear exchange at the farm entrance and chicken house doors, proper cleaning of buildings and equipment, and good drinking water. Nearby farmers have already begun visiting the farm. In the near future, TS will collect farmers living in Banjar district and bring them to Yaya Farm to learn about biosecurity and GFPs.

H. Darto – Rinjani Poultry Shop

To make his farm suitable for a TF, Mr. H. Darto invested in changes to the parking area, barriers for vehicles and people, gates with locks, a pass-over system, footwear exchange at the entrance to the farm and the chicken house doors, hand washing equipment, proper dead chicken disposal, proper cleaning of buildings and equipment, good drinking water, and rodent control. The first group of visitors will come from the University of Indonesia.

Hendra Pangkalan Farm – TMF

This farm is used to teach about the construction of new poultry farms. Various biosecurity techniques presented in the SAFE TFs are now being incorporated in the design of new farms and being taught to farmers and managers.

SAFE has also worked with Japfa and its Bina Farm. Bina Farm is not a teaching farm but a training farm that has begun to use SAFE materials (booklets, videos and posters) to teach farm management to new TS staff and contract farmers. Several biosecurity and good farming practices are now included in the training.

2.1.4b *Academia takes over Technical Discussion Groups*

IPB, UNPAD and SMK have agreed to continue the TDG meetings in Bogor, Bandung and Tasikmalaya, respectively. They each hosted the first such meetings in March 2013. The interaction between the staff of the educational institutions and industry has been very positive. When asked to take over the meetings, the educators responded, "Yes, of course. This is one of our duties as responsible educators."

2.1.4c *GOPAN takes over SMS system*

SAFE staff sent over 20,000 messages to farmers, TS, educators and upper management via the SMS system on biosecurity and GFP topics. GOPAN has now assumed responsibility for the SMS message system and will continue to broadcast to farmers. SAFE has provided the necessary hardware and software, and a database of farmers, educators, TS and upper management to whom GOPAN can send the messages. SAFE has also provided all past messages as well as messages that can be sent out over the next year. The IT person at GOPAN has been trained by Satu Dunia on the equipment and programs, and the IT person from SAFE has also assisted the GOPAN staff. SAFE provided financial assistance sufficient for two months of these communications. GOPAN has already sent out messages to a pilot group of farmers and TS.

2.1.4d *Key educational tools replicated by industry*

As mentioned earlier, SAFE has provided the poultry industry with over 1,300 copies of the farmer-to-farmer video on "Effective Measures to Reduce the Spread of Disease", as well as softcopies of the booklet of the same name. Industry people are aware that the booklet and video can be replicated and already have plans for their replication. Mr. Tony Unandar, a private poultry farm consultant, will replicate the booklet for distribution in several provinces where he works.

2.2 Objective 2: Promote Behaviors that Lower the Risk of AI Transmission among Poultry and Increase Knowledge of Signs and Symptoms and Risk Factors for AI-Related Illnesses

2.2.1 Increased risk reduction conditions and practices at live bird markets

2.2.1a Strategy

SAFE considered the impact of the supply chain on the risk of disease transmission. This understanding led SAFE to work upstream and downstream along the poultry value chain. While upstream interventions are reflected under Objective 1, Objective 2 developed a “Healthy Market and Community Empowerment Initiative” that focused on vendors, slaughterers, transporters and market managers, and poultry consumers. This initiative was targeted to promote behaviors that lower the risk of AI transmission among poultry and between poultry and humans, and to increase knowledge of signs and symptoms and risk factors for AI-related illnesses.

The interventions support behavior changes at three levels – policy and a supportive environment, poultry marketplace and the supply chain, and community/individual demand for quality products. The activities emphasize key conditions and behaviors for risk reduction, consistency in messages across poultry supply chain audiences and consumer demand for cleaner live bird markets and healthier products.

The main target audiences are selected members of the poultry supply chain, namely poultry vendors, slaughterers, transporters and market managers at live bird markets (LBMs), and consumers in areas with a high risk of AI transmission. Interventions for these target audiences are developed around the following issues:

Market vendors, slaughterers, transporters and managers

- *Biosecurity practices:* stalls, utensils and cages cleanliness and hygiene, hand washing, cleaning and disinfection, proper waste management
- *Market management:* carcass and live bird separation, zoning, drainage, waste facilities, slaughtering outside the market, loading/unloading activities, regulation

Consumers

- *Positive and correct behaviors:* food safety knowledge and practices, including proper poultry handling, hand washing and use of clean utensils
- *Consumer empowerment:* consumers as advocates for improvements in the market

2.2.1b Gender considerations

SAFE believed engaging women in active consultation, participation and decision-making from the very beginning of the program would build women’s self-confidence and sense of empowerment, and

generate sustainable change at the community level and within live bird markets.

A woman's role

Women play a pivotal role in making decisions for their families. They play important roles as homemakers, food handlers and health providers. In addition, they make decisions related to food purchases. Specifically, it is women who go to the market, decide which market they visit, what to buy and from whom. This purchasing power could be used to influence behaviors and practices of poultry vendors in the market.

In households that keep live poultry, two thirds of female spouses are responsible for rearing them, based on data collected by SAFE in a 2012 survey. This survey also found that women were the most knowledgeable individuals in the family about the health status of other family members. Embracing women was therefore a strategic decision for the program.

Empowerment objectives

Given women's role, SAFE included them from the beginning in the Healthy Market and Consumer Empowerment Initiative and partnered with Aisiyah, a women's organization described in the next section. The empowerment objectives were two-fold: first, to improve awareness and impart knowledge for women to buy healthy poultry products, and second, to build critical thinking and thus create demand for healthier poultry products and a healthier environment at the markets. With women as empowered consumers, changes in the industry could be accelerated. Consumer demand would compel the markets to change.

A provincial livestock officer shows Aisiyah facilitators how to identify a healthy chicken carcass.

When A Woman Talks to Another Woman

Ms. Tati Masliati, a facilitator from Serang district in Banten province, felt honored when the Serang Livestock office asked her to help draft the local government's workplan for alleviating Avian Influenza in Banten. Ms. Tati stated: "I am not a government officer or an authority figure, yet they valued my opinion. They asked me to review their workplan."

For the Serang local government, Tati's role in SAFE's Healthy Market and Consumer Empowerment Initiative was important. Tati was trusted; she had spoken to hundreds of women in the community and impacted many more household members in Serang.

Ms. Tati became aware of her rights as a consumer and her responsibility to ask market vendors for healthy poultry products under the SAFE program. When she visits the local market now, she asks for the source of the chicken carcasses, how the vendor handled the product, and what hygiene and sanitation measures the vendor practiced. She has passed on her newly acquired knowledge and confidence to other women in her community. She says: "We are doing something right in targeting women. They are the power of change itself. When talking in front of women, I always remind myself what I aim to accomplish. I want to bring value. I want our lives and the lives of these women to be better today than yesterday, and be better tomorrow than today."

Ms. Tati is one of over 20,000 women reached through partner Aisyiyah, a women's religious organization that focuses on women's empowerment. Ms. Tati is an Aisyiyah committee member in Serang.

Tati Masliati, a true champion

2.2.1c Partners

SAFE partnered with three local Indonesian organizations to implement the Live Bird Market and Consumer Empowerment Initiative: PMI, Aisyiyah and Combine. These organizations are described below.

Palang Merah Indonesia (PMI)

PMI is the Indonesian Red Cross. DAI partnered with PMI under CBAIC, during which PMI acquired extensive experience undertaking AI prevention programs in 101 districts and 11 provinces across Indonesia. PMI has a large network of trained volunteers, allowing it to quickly scale up field programs.

Aisyiyah

Aisyiyah is a faith-based women's organization under Muhammadiyah (one of the two largest and most prominent Islamic organizations in Indonesia). Aisyiyah works intensively on women's empowerment, health, education, and social development issues in the community. Aisyiyah's network includes more than 20 million members across Indonesia.

Combine

Combine is a not-for-profit organization that specializes in using social and community media for development and human empowerment.

2.2.1d Inputs

SAFE developed two workplans during the life of the project. Below is a summary of the main program inputs reflected as activities in the workplans.

1. *KAP 2009 Secondary Data Analysis*

The data collected on commercial practices under the 2009 Knowledge, Attitudes and Practices (KAP) Survey were further analyzed to gain additional insight into the common practices and adherence to recommended behaviors among traders and transporters, market vendors, and poultry slaughterers. This secondary analysis was supplemented by a 2010 qualitative data analysis to explain motivations, perceptions and norms about current practices and perceived AI severity among target audiences.

2. *Rapid Needs Assessment*

In preparation for updating the "2009 Consensus Report: Priority Audiences and Behaviors for Reducing the Risk of AI Transmission in Indonesia" in June 2011, the National Convention of Poultry Biosecurity in July 2011 and the Communication Strategy Workshop in August 2011, SAFE conducted a rapid informational needs assessment of key audiences and behaviors to gain insight into the current feasibility of behaviors, interest, and economic value of particular AI risk reduction behaviors from an audience perspective. This assessment involved a series of focus groups and qualitative interviews with a small number of key informants from each target audience. The assessment revealed which behaviors were commonly practiced, less practiced, and most difficult to implement, from the perspective of the target audiences.

3. *2011 "Consensus Report: Priority Audiences and Behaviors for Reducing the Risk of AI Transmission in Indonesia"*

SAFE convened a group of national and international professionals who had been working to reduce the transmission of AI across the poultry supply chain to update the original 2009 Consensus Report. The 2011 report contained a package of 41 risk reduction behaviors across eight targeted audiences. Participants in the process included representatives from USAID, GOI, FAO, WHO, USDA, the Dutch and Australian AI programs, and other technical partners.

4. *Communication Strategy*

Early in the project, SAFE led a two-day communication strategy workshop with USAID, MOA, MOH, WHO, FAO, GOI, private sector representatives, communications experts from universities, consumer groups, and others to provide input and help finalize a communication strategy that supported SAFE objectives 1, 2 and 4. In Year 2, a communication strategy for Objective 3 was developed and integrated into the overall strategy after healthcare-seeking and health provider research studies were conducted and findings analyzed. The communication strategy defined the Indonesian context and presented a three-pronged approach covering advocacy, social mobilization, and behavior change activities; a conceptual framework; audience segmentation, draft messages and communication channels; and a monitoring and evaluation process.

5. *Strategic Consultative Meetings with Local Government and Stakeholders*

One of the main reasons for project accomplishments was the use of a participatory approach involving extensive consultation with local stakeholders. SAFE organized meetings in each province with key

stakeholders from the relevant provincial and district government offices. At these meetings there was local action planning, activity locations (markets) were jointly decided, and local ownership was created.

SAFE also conducted consultative meetings with PMI at the district level. These meetings served as ongoing opportunities to seek stakeholder input on the operational management of SAFE-based strategies and provided a forum for key stakeholders to share information, report activities and results, and coordinate amongst themselves. Participants included:

- District Livestock and Animal Health Services
- District Health Office
- Local Government Development Planning Agency (Bappeda)
- Dinas Pasar/Diskoperindag
- District MUI in collaboration with Aisyiyah

6. *Healthy Market Initiative*

The "healthy market" model was applied to two demonstration live bird markets (LBMs) in each of the 10 districts for a total of 20 demonstration markets. (See Table 2-5 for a list of these markets.) The model consisted of implementing AI risk reduction changes and practices focused on targeted members of the value chain – transporters, collector yards, slaughter houses, vendors and, ultimately, consumers. Each demonstration market received technical assistance in the form of participatory planning, grants, vendor training, regulation review, and communication and social mobilization activities that reinforced key biosecurity messages. Revitalization of the markets included a water tower and piping for access to clean water distribution, the installation of hand washing stations, plastic shielding and tiled table tops for vendor stalls, cleaning and disinfection of the markets, improved drainage systems, waste management, new zoning areas and caging.

More than \$22,000 in contributions from stakeholders (including vendors, local government and the private sector) complemented small USAID grants disbursed to the markets and contributed to the revitalization of infrastructure and vendor stalls, and the success and ownership of the program. After the initial grant program ended, improvements continued through a combination of vendor out-of-pocket contributions and government funding.

At the end of Year 2, maintenance plans for each market were developed to empower each market team to ensure that changes were sustained after SAFE ended. These plans included facility upkeep procedures and new biosecurity practices to be put in place to ensure the changes could be maintained. SAFE also worked with market teams to identify how maintenance activities would be funded.

Table 2-5. SAFE demonstration markets

No.	District	Working Markets
1	Ciamis	1. Pasar Manis Ciamis 2. Pasar Pangandaran
2	Tasikmalaya	1. Pasar Ciawi 2. Pasar Rajapolah
3	Garut ¹	1. Pasar Malangbong 2. Pasar Sukamukti
4	Bandung	1. Pasar Soreang 2. Pasar Sayati
5	Bandung Barat	1. Pasar Batujajar 2. Pasar Lembang
6	Cianjur	1. Pasar Sukanagara 2. Pasar Cipanas
7	Sukabumi	1. Pasar Sukaraja 2. Pasar Parungkuda
8	Bogor ²	1. Pasar Citayam 2. Pasar Jonggol
9	Serang	1. Banjar Sari (Cinkande) 2. Anyer
10	Lebak	1. Rangkas Bitung 2. Maja

The process in the market involved collective identification of problems and solutions, cooperative implementation, and resource allocation by stakeholders. SAFE served as a catalyst. This approach ensured that stakeholders at the market had experience in each stage of the process and, as a result, acquired the capacity to replicate the process. This approach also gave rise to “market champions” who would later be able to replicate the process in other markets.

By the end of the project, SAFE had provided the local government with a framework and program for a healthy market and consumer demand program. While “healthy markets” were not a new concept for government, the operationalization and scaling up of such a concept had been challenging. Government partners embraced the SAFE model as a practical and inclusive model that resulted in sustained change.

7. Customer/Consumer Demand Creation Initiative

SAFE used a demand creation consumer outreach approach to take advantage of “touch points” between the commercial sector and consumers to establish vendor/consumer trust and, in particular, community demand for high-quality poultry products. Using a range of media and community-based communication channels, SAFE’s activities generated consumer demand for higher quality poultry products. This in turn generated social pressure and financial incentives for commercial markets and vendors to improve hygiene and biosecurity. This activity was applied throughout the communities and served to apply citizen generated pressure on the specific purchase points of the private sector’s poultry value chain, encouraging them to adhere to recommended practices for clean live bird markets and healthy products.

SAFE fast-tracked consumer demand by working through subcontractor PMI and grantees Aisiyah and Combine, which organized peer-to-peer education activities in the markets for consumers, and entertainment-education events. SAFE organized partner meetings to ensure that all activities were coordinated between the three partners. The partners also utilized their media networks (including social media) to reinforce messages and provide coverage and dissemination of healthy market initiative activities and results. Aisiyah targeted Muslim females and approached consumers with religious messages and channels, whereas Combine targeted the general public and maximized the use of community-based media and channels to educate consumers. Combine also used a media literacy approach that led to community members who were sensitive to the environment and to health issues

such as AI.

Community members became involved in activities that captured their personal experiences and surrounding environment when they produced and screened short films about the healthy market initiative using mobile phones or video cameras. These activities created communities with greater confidence and positive self-efficacy, providing a strong foundation for consumer empowerment. Empowered communities had the confidence to ask for cleaner markets and stalls, and healthy poultry products.

8. Radio Serial Drama

Another core initiative to link communities with their market place was to develop a live “reality” radio initiative with local and regional radio stations, which offered a flexible and interactive communication format. Focused on biosecurity and healthy products in targeted high-risk areas, the program content consisted of interviews and profiles of members of specific sub-audiences, on-the-spot reports, information about simple ways to introduce and maintain risk reduction and biosecurity practices, and modeling of specific protective behaviors across target audiences and regions of Indonesia. Using an entertaining format to broadcast key API issues engaged audiences and resulted in greater awareness, attitudinal change, and behavioral adoption.

SAFE aired a 12-episode radio drama through 10 commercial radio stations (one in each district) and 18 community radio broadcasting stations across the 10 districts. Talk shows reinforced the messages from the radio drama. The commercial stations chosen were the most popular in each of the 10 SAFE districts, and thus had the biggest audiences. The community radio stations were chosen for their proximity to the live bird markets. Two episodes aired per week. The entire series took six weeks to air. During this period, there were three talk shows with local government Dinas staff as guests (Livestock Services, Health Office, and Industry and Trade Office) to reinforce messages and participate in live question-and-answer sessions.

The 18 community radio stations also broadcast short audio recordings of Islamic “words of wisdom” related to healthy poultry, food safety and hygiene. These messages stemmed from *Khutbah* sermons developed in Year 1. Each station had an active listenership of approximately 1,000 persons living around the markets, for a total reach of 18,000 listeners.

SAFE provided Combine with copies of the radio series to disseminate throughout its network. All the materials were made available as downloadable files on the K4H website, as well as on the Aisyiah and Combine websites and Facebook pages. The materials were protected by the “Creative Commons” copyright scheme whereby anyone can use the materials as long as they are not altered.

9. Health Communication Strategy Training

The goal of this training was to strengthen the overall communication capacity of MOA, MOH and Komnas Zoonosis personnel and other district-level officials, and to improve the communication planning and response capacity of officials. SAFE coordinated with the government and FAO to identify participants for this training program. SAFE brought over a communication expert from Johns Hopkins University to cover the following areas: leadership, communication objectives, strategy design,

networking and advocacy, engagement of stakeholders, resource sharing and analysis, audience analysis and segmentation, and use of evidence-based tools. The following skill sets were developed:

- *How to develop a communication strategy*: involvement of stakeholders, analysis, and writing;
- *How to implement a communication strategy*: pre-testing, materials production, program launching, implementation of key program activities, monitoring activities, and making mid-course changes;
- *Use of evidence-based tools*: awareness of availability of and access to tools, creation, usage, and adaptation of local tools;
- *Networking and advocacy*: participation in networks, participation in health communication advocacy efforts, coordination and management of networks;
- *Providing technical assistance to others*: determining when TA is needed and how to provide TA to others;
- *Resources leveraged/funding diversified*: implementation of cost-sharing activities; and
- *How to manage and conduct research*: hiring a research firm, developing the capacity of internal research staff, conducting research, and publishing research findings.

10. Vendor of the Month Awards

To better link consumer perceptions of quality with the desired behaviors of the vendors, SAFE established a consumer-led 'voting' system that allowed officials and the community to select their preferred vendor of the month. Examples of rewards included acknowledgement by posting the award certificate at the stall and a small prize to contribute to upgrading their stall. The vendor-of-the-month award program was conducted in the 20 demonstration markets.

11. Educational and Communication Tools and Materials

SAFE designed communication materials and tools in Years 1 and 2. Table 2-6 lists the distribution of IEC materials and campaign merchandise that were produced. Technical content was reviewed by FAO, WHO and the MOA to ensure accuracy. The MOA provided content related to *Ayam ASUH (Aman, Sehat, Utuh dan Halal)*, which is a government program to produce healthy and quality poultry products (carcasses). The program features good practices in poultry product handling and use of a cold chain. SAFE provided copies of materials to the MOA for distribution through the Ministry's network both within and outside of SAFE program districts. Communication materials identified included:

- A *Khutbah* book containing a religious perspective on biosecurity, food safety, and good business practices (*Aisyiyah*); and
- Mobile phone videos produced by communities and then screened in markets and communities, capturing the progress under the Healthy LBM Initiative.

Table 2-6: Distribution List for IEC Materials and Campaign Merchandise

No	Items	Total Production	Provincial Livestock Office of West Java	Provincial Livestock Office of Banten	District Livestock Office in 10 Districts	Aisyyah	Combine	PMI	International and National Partners of SAFE*

* Distributed at various meetings. Partners included: FAO, WHO, Komnas Zoonosis, MOH, MOA, Kominfa, National PMI, National Aisyyah, National Combine, USAID, DAI, and JHU documentation

** and *** played in 10 community radio stations, 10 private radio stations, and provided to all local and national partners

2.2.1e Key outcome

Details of the results and impact are outlined in the M&E section of this report. SAFE highlights below for the reader the key outcome for Objective 2.

Poultry vendors will make changes. A total of 846 vendors in the program's 20 markets introduced more risk reduction practices. An additional 1,875 vendors in 49 non-program live bird markets were inspired by the SAFE program and led by the local government to make changes and increase healthy practices.

2.2.2 Improved consumer knowledge and expectations for cleaner markets and healthier poultry products

2.2.2a Reach

SAFE initially worked in 20 subdistricts surrounding the 20 demonstration markets. During program implementation, the number of subdistricts expanded to 33 following requests from community members in the neighboring subdistricts. The expansion was led by the local governments and Aisiyah, which replicated the program model into other markets.

SAFE continued to focus its efforts on (1) advocating for change by disseminating information and using media campaigns to focus on key risk reduction key behaviors; and (2) building critical thinking and creating consumer demand for healthier poultry products and healthier environmental settings by working through consumer groups.

In addition, the 12-episode radio drama reached over 200,000 members of the poultry value chain; 21,000 women poultry consumers were empowered to ask for change; and 5,000 students and teachers learned about healthy markets and how to transfer their newly acquired knowledge to their peers. Table 2-7 summarizes the target and reach of Aisiyah and Combine grant activities.

Table 2-7. Target and Expanded Reach of Aisiyah and Combine Grant Activities

Activities by Aisiyah			Activities by Combine		
Activity	Target	Actual Reach	Activity	Target	Actual Reach
Advocacy through group Quran readings	8,000 women	12,613 * (Figure excludes replication begun in West Java)	Production of community videos	10 videos	25 videos **
Market visits by consumer groups	200	278	Radio campaign (community and private radio)	10 community radio and 10 private radio stations	Met target
Meetings with informal religious and community leaders	300	Met target	SMS blast	Twice a week update	Met target; Total recipients: 1,197
Twitter and Facebook	Twice a week updates	Met target. Reached 453 Twitter followers and 5,023 Facebook friends	Citizen journalism through online and print (bulletin) articles	120 articles (20 articles per month for six months)	141 articles developed as of March 2013, reaching 11,666 readers

Notes:

* Under the leadership of the Aisiyah West Java Provincial Chapter, activities have begun to reach an additional 40,000 women through thematic "Majlis Taklim" messages on healthy behavior, healthy poultry, and AI. Aisiyah West Java Chapter has taken up the initiative to be a pioneer in replicating the consumer empowerment program under SAFE and has targeted the remaining 18 districts in West Java. Soon, all districts and municipalities (26 areas in total) will be reached with AI messages.

** Not only the local communities surrounding the demonstration markets were involved; the nationwide community was also encouraged to become involved. Combine announced a national competition for this video activity.

2.2.2b *Increased understanding/knowledge*

Implementation partners and members of the value chain demonstrated increased understanding and knowledge of biosecurity issues and how these relate to live bird markets. During the initial stage of implementation, SAFE trained field facilitators from Aisiyah and Combine on behaviors that increase AI risks and the changes to be implemented under the program. After the training, the facilitators returned to their respective areas and further developed strategies and messages based on the local wisdom found in each area. Aisiyah, for instance, developed issues around healthy poultry products from the perspective of *Al Quran* and the prophet's wisdom. These messages were then translated for various communication channels, including radio, television, bulletins, Facebook, websites, and Twitter. Aisiyah also recorded seven minutes of "words of wisdom" for off-air events and public service announcements (PSAs) on radio stations.

In Year 2, SAFE conducted a consumer survey to assess consumers' knowledge of healthy poultry products and to identify whether they understood the concepts of clean poultry stalls and healthy products. The survey sample was taken from consumers who had attended religious meetings where healthy poultry product and consumer rights topics were discussed. The total sample was 200 respondents, with 79% of respondents reporting they were confident of being able to recognize the characteristics of healthy chicken carcasses sold by poultry vendors. Table 2-8 shows respondents' knowledge of the characteristics of sick chicken carcasses.

Table 2-8: Knowledge of characteristics of unhealthy/sick chicken carcasses	Number of respondents mentioning characteristic	Percentage of total surveyed
Meat does not smell fresh	160	80%
Meat does not bounce back when pressed	115	58%
Color of meat is pale (not pinkish)	131	66%
Meat blood is not fresh (blood not red)	119	60%
Carcass has bluish marks	177	89%

N: 200 (Open ended response – multiple response)

Over 80% of respondents reported two characteristics of sick chicken carcasses, namely carcasses had with bluish marks, and the meat not smelling fresh, while over 60% identified the pale color of the meat and blood not being fresh as signs of unhealthy carcasses.

"Most of the things we do with regard to food handling and processing were passed down from our mothers, and our mothers had them passed down from their mothers. We were never critical before. We followed them without asking many questions. Information such as how to handle food properly and how to practice correct behaviors on sanitation and hygiene may seem trivial to others, but are new and important to us. This is invaluable information. We never received this sort of guidance from any other sources before."

Hj. Titin Suastini, Aisiyah Facilitator for Cianjur District

2.2.2c *Increased consumer action*

SAFE conducted an activity called “Consumers Visit the Market”. The consumers participating were organized into groups of ten, with each group containing consumers who had attended the earlier thematic Quran reading activities. They visited the demonstration markets and spoke with poultry vendors and market managers on the state of the markets, how best to improve cleanliness, and the importance of healthy poultry products. The objective of this activity was to build confidence among consumers in asking vendors and managers questions about cleanliness, sanitation, and safety, and to practice asking for change. Consumers learned how to exercise their rights as members of a consumers’ group. This prepared them to reach out to managers and vendors as individuals in the future.

This activity developed consumers’ critical thinking and provided a platform for vendors and consumers to talk freely about consumer demands for healthier products and a healthier environment for the purchase of poultry.

An Aisiyah facilitator explains how to ask for healthy poultry during a Quran reading activity.

During a live community radio show, Aisiyah facilitators talk about halal food, cleanliness, and sanitation at the market.

2.2.3 *Improved government, civil society and community collaboration*

SAFE positioned itself as a facilitator that invited, collaborated with and accompanied the actors, consumers and stakeholders surrounding the communities. SAFE implemented this principle through stakeholder meetings, which provided a forum to:

- inform provincial and district stakeholders outside the livestock services network about SAFE’s Healthy Market and Consumer Empowerment Initiative
- involve all concerned parties in district-level initiatives to select two demonstration markets
- jointly develop a district workplan to implement the initiative
- identify and mobilize human, technical and financial resources

The participants in the district consultative meetings in all 10 SAFE working districts came from diverse backgrounds, including:

- *Government:* Animal Husbandry and Agriculture Services, Health Office, Hygiene and Environmental Office, Trade and Industry Services, BUMD (District Government managing traditional markets), District Planning Bureau, Civil Order Officers, Public Works Office, Income

Office, and local parliamentarians

- *Market:* Market managers and vendor representatives
- *Community:* Informal leaders, Aisiyah facilitators as consumer representatives, and district-level Red Cross (PMI)

All of these participants shared one thing in common: they agreed that healthy poultry products should be made available, and that an effective way to achieve this is to improve the markets. This common goal served to bring them together, such that each party felt comfortable and considered the initiative as a productive effort to which they could all contribute resources according to their roles and comparative advantage.

2.2.4 Creation of strategic communication "community of interest" inter-ministerial group

As a result of the SAFE-sponsored Health Communication Strategy Workshop held in Bandung on 16-20 April 2012, 29 participants from five different ministries and agencies agreed to form an inter-ministerial "community of interest" on AI prevention and management.

The community shared a vision of working together towards an Indonesia that is a role model for AI prevention and response in Asia. At the end of the workshop, the group drafted an Avian Influenza Action Plan and agreed to meet regularly to implement the Action Plan.

The alumni of this workshop have since stayed in contact and worked closely with each other, resulting in better coordination in the area of zoonotic diseases, in particular AI. They have become a cross-sector government group striving for policy and behavioral change. SAFE sees this group as an invaluable resource that has the potential to lead and accelerate change in the government's approach to how AI is addressed, managed and controlled in Indonesia.

Two inter-ministerial meetings were held during the SAFE project. The First Inter-Ministerial Health Communication Group Meeting was held on May 30, 2012, and the second was held on February 25, 2013. At these meetings SAFE supported a new partnership between the GOI and strategic partners including Non-Governmental Organizations (NGOs) and local stakeholders, to serve as a model for disease prevention and management in Indonesia. These meetings also provided a platform for sharing information, particularly updates on the status of the Komnas Zoonosis workplan and the government's response to new strains of AI. The participants in this group agreed to continue to meet under the stewardship of Komnas Zoonosis.

Participants at Inter-Ministerial Health Communication Group Meeting, February 2013

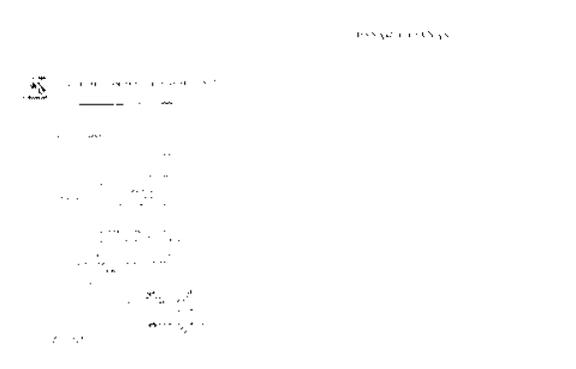

2.2.5 Program replication/leveraging

2.2.5a Local government financing of program

During the life of the program, district governments adopted components of the SAFE program design, including market manager training, market rehabilitation, healthy market competition, and use of the facilitation method. Several district heads (*Bupati*) promptly provided financial support for these efforts. The Cianjur District government supported the market with funds of Rp. 323,868,000, Bandung District provided Rp. 321,930,000 and Serang District provided Rp. 75,000,000. Several local regulations were passed or in the process of being formalized, covering market regulations and slaughtering outside markets. A total of 59 markets in five districts benefited from these activities and policies, being home to approximately 1,875 poultry vendors and 24,328 vendors of all types.

The Bupati welcomes the Healthy Markets and Consumer Empowerment Initiative and recognizes collaborative efforts.

2.2.5b Civil society replication of program

In light of the impressive results of the consumer empowerment activities, Aisyiyah officially adopted the consumer component of the SAFE program design into its national program. Aisyiyah West Java chapter took up the initiative to become a pioneer in replicating the program in the remaining 16 districts in West Java. Aisyiyah held a Training of Trainers (TOT) program for 36 facilitators in March 2013 and is now continuing the SAFE consumer empowerment program in all 16 districts.

During the opening speech of Aisyiyah Tanwir in October 2012, Aisyiyah chairperson Ibu Dra. Noardjannah Djohantini stated that activities under the USAID-SAFE program to educate and empower healthy poultry consumers would be adopted by Aisyiyah and implemented in other provinces.

2.2.5c Private sector financing of program

SAFE activities in the communities and markets also attracted interest from the private sector. Bank Danamon provided support in the form of a tent, entertainment, meals and snacks, medical doctors and medicine, cleaning equipment (brooms, hoes, and shovels) and waste bins for the SAFE market event. The total value of this support was around 25 million rupiah. Griya Supermarket allocated 25 million rupiah to support improvements in the Lembang market. PMI's West Java chapter is now collaborating with PT

UMRI, a mining company, to replicate market interventions in Garut Selatan (a non-SAFE working district).

2.2.5d National government replication

Three organizations have reproduced or are in the process of reproducing SAFE IEC materials with their own funding and resources – Komnas Zoonosis, MOH, and Aisiyah West Java Chapter.

- Komnas Zoonosis is producing 1,000 copies of each type of material for further distribution to local government officials.
- The MOH plans to reproduce the 12 episodes of the SAFE radio drama for further distribution to provincial health offices.
- Aisiyah West Java Chapter produced 500 copies of the SAFE poster on Avian Influenza in Humans for further distribution in the other 16 cities and districts that were not part of the SAFE program.

"I appreciate all the efforts of the healthy market. A healthy market is needed by business and in trade competition to ensure that healthy products are available to consumers. This initiative should take place in all traditional markets to reflect our seriousness about developing a healthy market to reduce disease transmission."

Drs. H. Hasnan Bey Fanani (Member of Parliament, DPR RI) during market event at Cipanas Market, Cianjur

"Traditional markets support the economy, especially the lower-income sector. Markets should be healthy and humane because they are the livelihood of many people. The West Java government supports the initiative and will make improvements to and rehabilitate traditional markets in West Java so that they become healthy markets."

West Java Governor Ahmad Heryawan at Giawi Market event

2.3 Objective 3: Increase Knowledge of Signs/Symptoms and Risk Factors for AI-Related Illness in People and Promote Behaviors that Improve Household-Level Care-Seeking in Response to AI-Related Illnesses

2.3.1 Increased knowledge of health care seeking practices for AI/ILI-related illnesses

2.3.1a Strategy

Under the umbrella of the SAFE project and in collaboration with the Atlanta and Jakarta offices of the CDC and WHO Indonesia, two surveys were conducted in East Jakarta municipality and in Bogor district, West Java related to ILI diagnosis and treatment – a Healthcare Utilization Survey (HUS) and a Clinicians' Knowledge, Attitude and Practices (C-KAP) survey. Prior to data collection activities, SAFE and the Center for Health Research at the University of Indonesia (Pusat Penelitian Kesehatan Universitas Indonesia, or PPK-UI) obtained ethical clearance for survey implementation from the Research Ethics Committee at PPK-UI and from the CDC Atlanta Institutional Review Board. The purpose, fieldwork conducted, and several key findings of these studies are summarized here.

2.3.1b Partners

PPK-UI was selected as the research agency to conduct the fieldwork for both studies. SAFE also collaborated and consulted closely with the CDC offices in Atlanta and Jakarta, WHO and USAID.

2.3.1c Inputs

1. HUS

The HUS was designed to generate estimates of the seasonal influenza disease burden and to determine the proportion of people with Influenza-Like Illness (ILI) that seek care, their understanding of the signs and symptoms that indicate the need for care, and decision-making about when and where to seek care for respiratory illness. The HUS survey also aimed to understand perceptions about exposure to birds and of the risk of H5N1 transmission.

Data collection was accomplished through face-to-face surveys of households in East Jakarta Municipality and in Bogor District, West Java from February 8 to March 1, 2012. In total, 2,520 respondents were interviewed (1,260 respondents in each region).

There were several key findings of the HUS study:

1. Individuals frequently do not seek care at a healthcare facility when they have a fever or cough, or suffer difficulty breathing, even if they are aware that they need immediate treatment for these symptoms.
2. Households express a preference for self-treatment for respiratory symptoms using over-the-counter medications from pharmacies or by giving medicines and fluids at home.

3. Routine contact with birds in the home can diminish perceptions of risk, leading to a lower likelihood of seeking care for potential symptoms of AI.
4. Households with the highest exposure (i.e., those allowing poultry to roam freely indoors) demonstrated:
 - Weaker beliefs in the need for immediate treatment for respiratory symptoms
 - Lower self-efficacy in seeking medical care when needed
 - Lower self-efficacy in protecting themselves and their families from AI
 - Less knowledge of the sources of exposure
 - Greater likelihood of using traditional remedies instead of healthcare facilities
5. High self-efficacy about seeking care when needed is influenced by:
 - Greater knowledge of the exposure routes of AI
 - Higher perception of the severity of AI
6. Shorter waiting time before seeking care is influenced by:
 - Greater knowledge of the exposure routes of AI
 - Higher self-efficacy about seeking care when needed.

2. C-KAP

To complement the HUS survey on household care-seeking and utilization behavior, a survey was conducted among outpatient and hospital-based physicians (providing medical care for in-patients) to determine their knowledge, attitudes and practices (KAP) regarding the identification, treatment and referral of patients with suspected infection from the highly pathogenic avian influenza A (H5N1) virus. Physicians were also asked about their knowledge of seasonal and pandemic (H1N1) influenza and the risk factors for H5N1 virus infection.

The study used a cross-sectional design and face-to-face interviews. The study population was licensed physicians who provide adult and/or pediatric medical care in government and private sector health facilities in East Jakarta Municipality and Bogor District. This list was constructed based on data from District Health Offices. A purposive sample of 300 physicians in each study area was proportionally allocated among general practitioners and specialist groups. A simple random sample of physicians was then drawn from the sampling frame in each group. Data collection was conducted from March 14, 2012 to June 6, 2012. In total, 554 respondents were interviewed.

Some of the key findings of the C-KAP study were as follows:

- 1) Most clinicians know the main clinical features of AI. Clinicians seem to be aware of some of the critical differences between H5N1 and other forms of flu.
- 2) Considering the many potential sources of exposure to the H5N1 virus, clinicians tend to ask relatively few diagnostic questions (three or four, on average) to determine if suspected cases involved exposure, including handling of dead chickens, exposure to wild birds, and exposure to

infected humans. A few doctors mentioned key questions regarding potential sources of poultry exposure at wet markets.

- 3) Just under two thirds of clinicians said that treatment for H5NI should begin within one day of the onset of symptoms.
- 4) Less than half of clinicians surveyed said they had received official AI case management guidance. This guidance was generally received by clinicians at local health clinics (*Puskesmas*) and public hospitals.
- 5) Receipt of *any* case management guidance information has significantly improved:
 - Clinicians' knowledge of signs and symptoms of seasonal influenza, pandemic influenza (H1N1) and H5NI
 - Perception of severity of pandemic influenza (H1N1)
 - Likelihood of asking questions about specific exposures to H5NI (contact with dead poultry, handling live birds at wet markets in East Jakarta, keeping poultry at home in Bogor)
 - Likelihood of testing after learning of exposure to H5NI.
- 6) Increased exposure to mass media or professional resources regarding H5NI has significantly improved:
 - Clinicians' knowledge of the signs and symptoms of H5NI
 - Perception of the severity of H5NI
 - Likelihood of asking questions about all sources of exposure
 - Likelihood of testing for H5NI after learning of exposure.
- 7) In *Puskesmas*, case management guidance information improved clinicians' knowledge of the signs and symptoms of H5NI, but did not improve their confidence in their own knowledge, equipment and resources available to diagnose and treat H5NI.

The HUS had indicated some knowledge gaps on the part of the public about different types of influenza, risk factors (in particular, the high levels of exposure to potential H5NI sources in the wet market), and the most critical signs to look for prior to immediate care seeking. The C-KAP survey found similar gaps in knowledge among physicians, particularly about the risk factors. Relatively few clinicians ask enough diagnostic questions about the varieties of potential exposure to the H5NI virus that are described in the Indonesian case definition for suspected H5NI. These gaps in knowledge and priorities can largely be remedied through communication and information dissemination.

3. *Priority messages for care-seeking behaviors*

Based on the HUS and C-KAP survey findings, SAFE built consensus and developed priority messages to improve healthcare seeking by the general public and to improve early detection of AI by healthcare providers. During this process, SAFE consulted with international technical agencies and donors and the following MOH directorates:

- Director of Vector Borne Disease Control, Dr. Rita Kusriastuti, MSc
- Director of Communicable Disease Control, Dr. H.M. Subuh, MPPM

- Director of Surveillance, Immunization, Quarantine and Matra Health, Dr. H. Andi Muhadir, MPH

Based on this series of consultation meetings, key healthcare-seeking messages were developed. These messages can be summarized as follows:

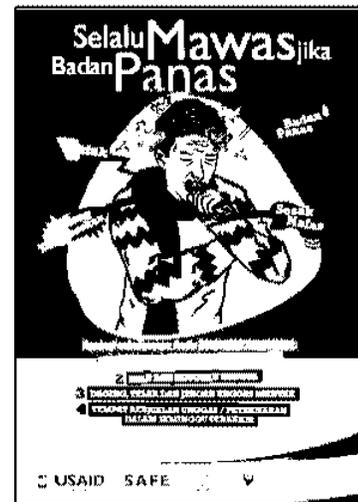

- Do not self-medicate.
- Immediately contact a health provider if you experience the following clinical symptoms: high fever (38°C or more), sore throat, cough, and difficulty breathing – especially following contact with dead or sick poultry, raw carcasses and the insides of poultry organs, poultry feathers or feces, farms or LBMs in the last seven days.
- Tell the health provider about your contact history.

4. Communication Poster with Key Messages

SAFE developed a communication poster with key messages, field-tested it with the target audience, consulted with the MOH and international partners, then finalized and produced the poster.

5. Pilot Test Communication Materials and Key Messages

Care-seeking messages were disseminated to Aisiyah and Combine facilitators at a coordination meeting with field facilitators on December 4-10, 2012. Twenty facilitators and four regional coordinators from 10 districts and two provinces attended the socialization.

Technical briefing on care-seeking key messages with Aisiyah facilitators in Cianjur on December 5, 2012

A total of 3,500 copies of a healthcare-seeking poster containing the key messages were distributed to the 10 districts as a communication tool for Aisiyah facilitators. These key messages were disseminated in the field during the last round of Quran recital events in the community as well as through radio talk shows. A further 1,500 posters were distributed to local governments and the central government.

2.3.2 Increased dissemination of research findings and analysis

2.3.2a Indonesian research community

SAFE made numerous presentations to disseminate the results of the HUS and C-KAP surveys to the MOH and other stakeholders, including:

- **Presentation of HUS results at 15th International Congress on Infectious Disease**
The HUS study abstract was accepted for display as a poster board at the 15th International Congress on Infectious Disease, held in Bangkok on June 13-16, 2012.
- **Presentation of findings of HUS and C-KAP surveys to MOH and other stakeholders**
The results of the HUS and C-KAP surveys and the key messages were presented to the MOH on September 21 and 24, 2012. The first presentation was made at an evaluation meeting on influenza surveillance in East Jakarta. This meeting aimed to evaluate the influenza surveillance program in terms of case management and identification of seasonal influenza and H5N1 cases. It was attended by around 35 people, including those responsible for program implementation at ten sites in East Jakarta (six Puskesmas and four hospitals). The second presentation was held on September 24 during an information dissemination meeting on the results of Surveillance Harmonization on Epidemiology and Virology of Influenza (H5N1 and other forms of flu). Around 70 people participated in this second meeting, including staff from several divisions of the MOH.
- **Presentation on C-KAP findings at 2nd National Scientific Conference on Epidemiology**
SAFE presented the C-KAP survey findings to the committee of the Second National Scientific Conference on Epidemiology held in Bandung on October 17, 2012. This conference was attended by approximately 90 people, including university lecturers, researchers and students, health officials from several districts, and representatives of international organizations.

2.3.2b Publications

Based on the HUS and C-KAP findings, SAFE and CDC plan to publish the findings in international peer journals for peer-reviewed papers. Six potential publications have been identified and five out of these six plan to include the HUS and/or C-KAP data. The publications will involve an analysis of findings and how they influence decision making at the household level and among clinicians relating to seasonal flu, pandemic and Avian Influenza symptoms.

The paper/publication titles for SAFE are (1) Characteristics of households with ongoing vs. intermittent exposure to H5N1 avian influenza: implications for targeted interventions; and (2) Healthcare provider capacity and individuals' self-treatment of potential symptoms of H5N1 avian influenza. These drafts were completed during the life-of-project. They will be circulated for review and submitted for publication after the SAFE project has ended.

2.3.3 Increased comprehension of community response to care seeking messages

SAFE and Aisiyah conducted a care-seeking evaluation from late February to mid-March 2013 in order to better understand targeted audience responses to the care-seeking messages developed by SAFE, and to program efforts aimed at improving healthcare-seeking practices. Two different approaches were applied in this study. SAFE employed a quantitative method using a questionnaire administered through face-to-face interviews, and a qualitative method using a Focus Group Discussion (FGD) to obtain more detailed data. A total of 200 respondents (mothers) were surveyed in the 10 program districts in West Java and Banten, and there were 36 participants in the FGDs held in three program districts (West Bandung, Tasikmalaya and Serang).

The highlights of the quantitative and qualitative findings were as follows:

- Regarding knowledge of AI symptoms, 84% of respondents (N=200) mentioned correctly the signs of AI in humans, namely high fever, coughing, sore throat and difficulty breathing. Aisiyah, Quran recitals (*pengajian*) and posters were usually cited by respondents as their information source.
- Most participants could easily comprehend the messages. Around 35% mentioned that the messages were very easy to understand, and around 64% said the messages were quite easy to understand. The FGD findings confirmed this data. Most FGD participants recalled the image of the poster, the signs of avian flu, "*mawas jika panas*" (the poster headline), and contact with poultry. Some added that one should not underestimate flu/fever/cough and should visit a doctor or health practitioner immediately. When participants were asked about the biggest take-away message from this poster, they referred to the tagline: "Do not underestimate flu. Stay alert for AI."
- Regarding the message in the poster, the words *Kontak/contact* (contact with poultry) and *segera/immediately* (as in "go see a healthcare provider immediately") led to multiple interpretations. The words were discussed and queried by several FGD participants, who were unclear about the type of contact with poultry, or how many days one should wait before going to a healthcare provider.
- After receiving the care-seeking messages, there was a strong intention from the respondents to go to a healthcare provider immediately if they have symptoms like fever, sore throat, coughing, and have contact with poultry in the near future (reported by 76%). They mostly preferred to go to a Puskesmas (mentioned by 70%) rather than another place.
- In terms of communication channels for disseminating AI messages, they preferred small groups or face-to-face socialization, since during group socialization they could freely ask questions and discuss the issues.
- Suggestions arising from the discussion included:

FGD for care-seeking assessment

- Add the prevention messages
- Use more than one poster, and other media like flipcharts, leaflets or pocketbooks to provide detailed explanation
- Use a picture/visual to clarify the meaning of "contact with poultry".

2.4 Objective 4: Coordinate with and Facilitate Communication among Partners

2.4.1 Improved dissemination and access to Indonesia A/PI information

2.4.1a Strategy

To facilitate coordination and communication among partners, SAFE built on platforms already developed by USAID, such as the Chief of Party (COP) meetings, and tapped into the potential of digital technology. SAFE supported regular face-to-face meetings and learning opportunities. At the beginning of Year 2, SAFE developed an online knowledge platform to share information globally. SAFE also developed articles, an informational series, and one-page program highlights, and contributed to articles in several publications to spread information on the work being conducted by the program.

2.4.1b Partners

SAFE partners included members of the COP meetings and local partners described previously under each of the objectives.

2.4.1c Inputs

1. Chief of Party Meetings

On a monthly basis SAFE hosted the API COP meetings with international donors. SAFE also held monthly meetings with FAO, MOA-CMU and USAID to share program activities and results. These two regular meetings were held to avoid duplication of effort between partners, and to share knowledge.

2. GOI Travel to Technical Workshops

GOI officials benefitted from study tours and technical conferences where they were able to see and hear firsthand models and approaches that addressed AI-related issues and could be replicated in Indonesia. SAFE supported the following individuals to attend the Emerging Pandemic Threats (EPT) meeting in Jakarta on July 2011: Prof. Sofia Mubarika; Dr. Joko Pamungkas; Prof Wayan T. Artama; and Dr. Drh. I Wayan Teguh Wibawa. In addition, SAFE also supported Dr. Tjandra Yoga Aditama and Mr. I Made Artika to travel to the United States.

3. Media Coverage and Articles

SAFE program media coverage and articles were produced in collaboration with Combine. Combine used its citizen journalist perspective and published 141 articles on www.suarakomunitas.net, which is an online platform for ordinary citizens to voice issues for mainstream media coverage. As of April 2013, 11,666 readers had read these online articles.

SAFE drafted two articles for the MOH, which then submitted them to *Tempo* magazine and *NOVA Tabloid*. These articles were intended to raise awareness of and emphasize the importance of healthy live

bird markets. SAFE also developed and disseminated two articles highlighting the Teaching Farms and the partnership with Aisyiyah.

4. *One-pager Success Stories*

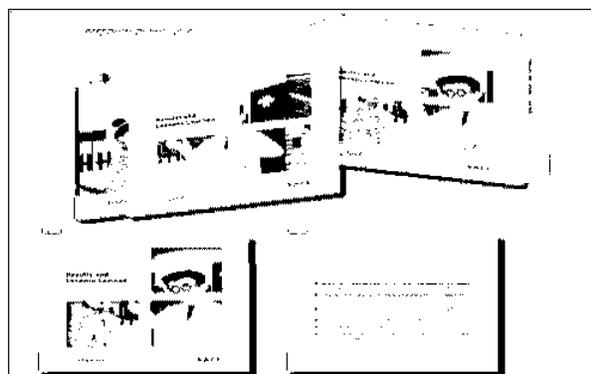

SAFE developed the following ten one-page success stories on the highlights of the SAFE program, which are reproduced in Annex 7:

1. Citizen Journalism Takes on a Consumer's Right to Healthy Poultry Products at Live Bird Markets
2. From Inspired to Inspirational
3. Market Poultry Vendors Increase Biosecurity Practices
4. Radio Drama Series Highlights Poultry Value Chain Risks and Romance
5. Koran Readings Highlight Importance of Healthy Poultry Markets and Products
6. Community Videos Spark Interest in Healthy Poultry Markets
7. Market Poultry Vendors Increase Biosecurity Practices
8. Poultry Farmers Self-Finance Biosecurity Changes
9. Vocational School Improves Student Knowledge of Good Biosecurity and Farming Practices
10. Market Manager Influences District Government Regulations.

5. *Project Informational Series*

SAFE developed six booklets to highlight results and lessons learned from the project. These booklets are listed below.

1. Healthcare Utilization Survey in East Jakarta and Bogor District, Indonesia: Healthcare Seeking for Avian Influenza and other Influenza-Like Illnesses
2. Clinicians' KAP Survey in East Jakarta and Bogor District, Indonesia: Healthcare Provider Practices for Avian Influenza and other Influenza-Like Illnesses
3. Commercial Farmer Perspectives: Biosecurity, Good Farming Practices, Motivation and Incentives

Project Informational Series package

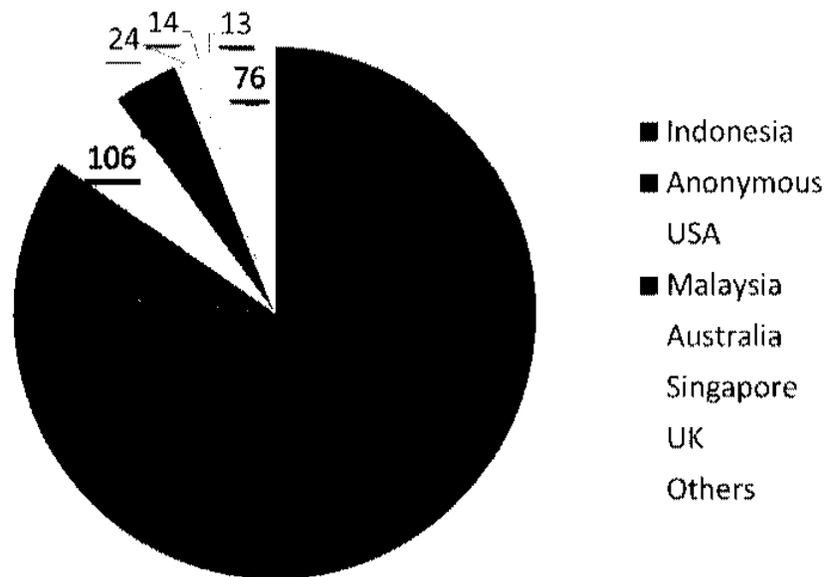

4. Teaching Farms: Improving Biosecurity and Good Farming Practices
5. Healthy Poultry Markets: Healthy Market and Community Empowerment Initiative
6. Social Media: Reinforcing Health Messages and Behavior Change Through Social, Mobile and Community Media

6. *Indonesia Avian Pandemic Information Website*

SAFE developed a site on an online platform – K4Health (Knowledge for Health) – as a tool to share knowledge and communicate experiences related to AI and Pandemic Influenza programs in Indonesia.

This website was launched in 2012 and is currently maintained by JHU-CCP, funded by USAID/Washington. K4Health is designed as a toolkit system that contains electronic collections of selected information resources on a particular topic for health policy makers, program managers, and service providers. K4Health toolkits are repositories of information on various health-related topics including family planning/reproductive health, HIV/AIDS, child health, and population and environment. Under SAFE, K4Health expanded its coverage to include AI and Pandemic Influenza Resources in Indonesia. The site is already one of the most visited on K4H.

Figure 2-1: Visitors Accessing Indonesia API Site on Knowledge for Health Website (May 1, 2012 - May 7, 2013)

The site contains 202 documents that SAFE has uploaded from API partner organizations in Indonesia. On April 2, 2013, training was conducted for representatives from the MOA, MOH, Komnas Zoonosis, FAO, WHO, and USAID in order to transfer to them responsibility for uploading documents. Representatives from these institutions were granted special access to upload their own resources as they become available so that the toolkit remains a living and dynamic platform through which all stakeholders can share the latest and most important information. The objective of the training was to ensure that the person appointed to maintain K4Health had the required understanding, skills and competency to handle the site. Through an online simulation, participants were able to learn by viewing, doing, and practicing how to upload a document and navigate the site.

Training on the use of the K4Health site was attended by seven participants representing six technical and donor organizations in Indonesia responsible for API control

7. End of Project Seminars

The Objective 1 end-of-project forum was held on April 9, 2013 in Bogor, with over 30 participants provided results and lessons learned from the program. Speakers included Maria I. Busquets, Chief of Party, Paul C. Miller, Senior Commercial Poultry Specialist, Yunita Wahyuningrum, Research/Monitoring and Evaluation Officer, industry leaders (i.e. Paulus Widanarko, Regional Manager, Cheild Jedang Indonesia (CJ)), farmers (i.e. Ms. Harlijeti, Herlijeti Farm), educators (i.e. Mr. Iwan Setiawan, SMK vocational school). Topics discussed included: findings of the program; impact on the farms (i.e. number of farms which made changes, number of conditions that were changed); impact on the educational institutions (i.e. number of students who visited the Teaching Farms); sustainability and replication (i.e. TriGroup is converting a commercial farm to a Teaching Farm, CJ has made commitment to build numerous Teaching Farms). Of note is that during his presentation Mr. Widanarko stated, "We now know that farmers will change." The industry expressed appreciation for the work conducted bySAFE and stated they would continue to use the educational material and advice provided.

The Objective 2 end-of-project forum was held at the 9th Technical Briefing Meeting on Biosecurity and Animal/Human Health Surveillance on 17 April 2013 at MOA. The meeting was held in collaboration with MOA, USAID and FAO.. Speakers included Maria I. Busquets, Chief of Party, Heri Haerudin, Team Leader, and Yunita Wahyuningrum, Research/Monitoring and Evaluation Officer. Topics included: program inputs, outcomes and results; impact on the markets and vendors (program and non program); and replication and leveraging. It was attended by approximately 35 participants from different units of MOA, FAO, WHO, and SAFE. Replication of the Objective 2 program by local government, civil society and private sector reinforced continuation of the program.

8. MOH Vice Minister/USAID Mission Director Visit SAFE Program Live Bird Market

On May 8, 2013, MOH Vice Minister Ali Ghufroon and USAID Mission Director Andrew Sisson, accompanied by other dignitaries including the head of the MOH for West Java province and head of Cianjur district, visited SAFE program Cipanas market. The Vice Minister requested the visit after hearing about the biosecurity changes at the SAFE program markets and the public/private/civil society partnerships forged to implement and finance the changes. The visit included approximately 100 representatives from government and SAFE civil society partners. Speakers included the market representative, the head of Cianjur, the SAFE COP and the Vice Minister.

Guests toured the market and observed some of the changes instituted by the program such as access to clean water supply, repairing of drainage and sewer systems, and tiled table tops at vendor stalls. They also took note of hand washing stations and separate areas for carcasses and live birds.

The visit ended with a tour of the market and discussions with vendors in the new zoning area for live birds. Mission Director Sisson congratulated SAFE and indicated the importance of such programs particularly with the appearance of the new H7N9 strain of Avian Influenza.

USAID Mission Director Andrew Sisson speaks with program poultry vendor at Cipanas market

3 PROGRAM MANAGEMENT

3.1 Introduction

SAFE's COP formed a senior management team that included the Senior Commercial Poultry Expert, the Social and Behavior Change Communication Expert, the Community and Government Liaison, the Senior Finance, Procurement and Grants Manager, and a Monitoring and Evaluation Specialist.

The SAFE subcontractors were JHU-CCP and PMI. The main grantees were Aisiyah and Combine.

DAI's headquarters in Bethesda, Maryland provided additional technical and administrative oversight, responded to USAID requests for contractual information, and issued invoices and other financial statements. DAI home office support, including Finance, Contracts, Procurement, Information and Management Technology, and Human Resources/Recruitment offices, ensured the COP had the management support, expertise and resources needed to manage SAFE and meet or exceed USAID expectations.

3.2 Operations

SAFE provided program operations, administrative and financial management support to achieve program results that complied with USAID regulations and DAI policies and procedures.

SAFE effectively utilized DAI's TAMIS (Technical and Administrative Management Information System) and FAS (Financial Accounting System). Both systems were tailored to meet technical and administrative needs to ensure compliance. TAMIS allowed project staff to perform administrative functions that were critical to effective project management, including grants management, procurement procedures, subcontractor management, and travel procedures. Time stamps of reviews and approvals provided an audit trail.

FAS reflected local labor laws, automating some of the most complex elements of field financial management including payroll, tax withholding and payment of remittances, cash advance tracking, and monitoring local subcontract and activity budgets. In addition, FAS imposed strict controls over financial data and assigned different levels of rights to various users. Time stamps of modified transactions also provided an audit trail report with information about transactions and modifications.

In addition to the systems mentioned above, SAFE developed and used a number of manuals and policies to aid staff, including a grants manual, personnel policy, procurement manual, operations manual, security policy, travel policy and vehicle use policy.

Since SAFE's activities affected more than one objective, SAFE held biweekly meetings for all staff and weekly senior management meetings to ensure integration and resolve any management, administrative

or programmatic issues. Other measures taken by the COP and the Senior Finance, Procurement and Grants Manager included holding biweekly meetings with the USAID Contracting Officer Representative (COR), Dr. Artha Camellia, and the Alternative COR, Mr. Bambang Heryanto, to review successes and challenges, bottlenecks and achievements.

3.3 Budget

In January 2012, SAFE was verbally informed by USAID there would be substantial budgetary cuts to the project and to refrain from starting new activities. On July 17, 2012, DAI received a notice from USAID explaining that SAFE's budget would be reduced by 65.5%. In light of the reduced funding available, SAFE reduced the period of performance for several major subcontractors and for the entire SAFE project.

Due to the substantial funding cuts, DAI also had to reduce staffing by eliminating six positions: Government & Community Liaison, Public Private Partnership Specialist, Monitoring and Evaluation Officer, one Grants and Contracts Specialist, and two Program Officers. SAFE combined the Behavioral Research Analyst and Monitoring and Evaluation Officer positions and responsibilities.

On November 5, 2012, DAI received a signed modification to the SAFE contract covering the reduction in the budget, a revised Scope of Work (SOW), and a reduced period of performance. On November 14, SAFE submitted a revised workplan covering the period March 15, 2012 to June 15, 2013 along with a revised two-year Monitoring and Evaluation Plan and Performance Monitoring Plan.

As a result of the budgetary cuts and reduced period of performance, SAFE had to eliminate key inputs, including the number of TFs and markets, the PVUK/private sector model, TF upgrades, BIIF grants, strategic communication training, an instructional video for use by GOI, a second series of the radio drama, and many other inputs, reducing the impact initially planned for the project.

3.4 Grants

The SAFE grants program represented a key tool for supporting activities in Western Java and Banten under Components 1 and 2. SAFE successfully completed 25 grants, 20 of which were allocated for making improvements at 20 demonstration markets at LBMs under Objective 2. SAFE issued two grants each to Combine and Aisyiyah, who were responsible for campaign activities to raise awareness and promote consumer demand for clean LBMs and healthy poultry products. SAFE also implemented an SMS pilot project aiming to maximize communication between TS staff and more than 50 farmers to reinforce the biosecurity messages and promote positive behavior change.

SAFE's initial grant budget of \$1 million was reduced to approximately \$358,000 under the revised SOW as a result of funding cuts. SAFE received grant proposals from the University of Indonesia and evaluated proposals for the social media RFA, but these were all cancelled as a result of funding cuts. SAFE informed several potential grantees that it was no longer able to fund grant applications under the BIIF.

All grants were administered based on guidelines and policies in the USAID-approved grants manual. All grants were reviewed and approved by USAID's COR. Comprehensive results of these grants are consolidated in Table 3-1.

Table 3-1: Summary of Grants Activities

Grant Number	Grantee	Goal(s)	Number of Beneficiaries	Grant Amount (USD)
G-001	Combine Resource Institution	Establish an information system on the community basis and through various media (audio, picture, text, internet, social media and SMS) as tools for campaigning the efforts of protecting consumers' health from the dangers of the Avian Influenza virus (AI H5N1)	Direct: 5,400 ¹ Indirect: 21,600	\$47,289.00
G-002	Aisyiyah	Create awareness to buy healthy poultry products among consumers to improve their understanding and critical thinking on healthy poultry products through a consumer empowerment program	Direct: 5,940 ² Indirect: 23,760	\$50,000.00
G-003	Koperasi Kowapi Cita Lestari	<ol style="list-style-type: none"> 1. Revitalization of drainage 2. Revitalization of market roof 3. Revitalization of foot path inside the market 4. Revitalization of market's gate 5. Revitalization of temporary trash dumper 6. Revitalization of vendor stalls 7. Provision of hand washing stand and clean water 8. Provision of apron for carcass vendor 9. Provision of cleaning equipment (trash cart, wearpack, boots, trash bin) 	Direct: 30 Indirect: 590	\$6,000.00
G-004	Koperasi Pedagang Pasar Mitra Usaha	<ol style="list-style-type: none"> 1. Revitalization of market roof 2. Revitalization of carcass vendor stalls 3. Revitalization of poultry slaughter area and its drainage 4. Provision of trash cart 5. Provision of cleaning equipment (sprayer, disinfectant, mask, gloves, boots) 6. Provision of apron for carcass vendor 7. Provision of freezer for carcass products 8. Provision of poultry cage from plastic material 	Direct: 35 Indirect: 682	\$6,000.00
G-005	Asosiasi Pedagang Paguyuban Karya Bakti	<ol style="list-style-type: none"> 1. Revitalization of market road 2. Revitalization of drainage 3. Provision of aprons, boots, sprayers, mica cutting board for carcass vendor 	Direct: 40 Indirect: 1167	\$6,000.00
G-006	Koperasi Cahaya Anugrah	<ol style="list-style-type: none"> 1. Revitalization of market road 2. Revitalization of drainage 3. Revitalization of temporary waste dumping 	Direct: 20 Indirect: 310	\$6,000.00
G-007	CV Islamedia	<ol style="list-style-type: none"> 1. Revitalization of drainage 2. Revitalization of market floor 	Direct: 61 Indirect: 2,148	\$6,000.00

Grant Number	Grantee	Goal(s)	Number of Beneficiaries	Grant Amount (USD)
G-008	Koperasi Pasar Mandiri Pangandaran	<ol style="list-style-type: none"> 1. Revitalization of drainage 2. Revitalization of floor 3. Revitalization of carcass vendor stalls 4. Provision of clean water (wells and piping) 	Direct: 28 Indirect: 320	\$6,000.00
G-009	Koperasi Hasanah	<ol style="list-style-type: none"> 1. Provision hand washing stand and clean water (piping and wells) 2. Revitalization of temporary waste dumper 3. Provision of carcass hanger, boots, trash bin for carcass sellers 4. Provision of PPE and biosecurity equipment at slaughter area (sprayer, boots, disinfectant, waste bin, wearpack, mask) 	Direct: 15 Indirect: 300	\$6,000.00
G-010	Koperasi Warga Pasar (Kowapas) Sentausa	<ol style="list-style-type: none"> 1. Provision hand wash stand and clean water (piping and well) 2. Revitalization of carcass vendor stalls 3. Revitalization of drainage 4. Provision of mica cutting board, trash bin for carcass sellers 5. Provision of PPE and biosecurity equipment at slaughter area (sprayer, boots, disinfectant, waste bin, wearpack, mask) 	Direct: 17 Indirect: 350	\$6,000.00
G-011	UD Saba Desa	<ol style="list-style-type: none"> 1. Revitalization of temporary waste dumper 2. Revitalization of drainage 3. Revitalization of market floor 4. Provision of trash bin, apron, gloves, boots, fiber cutting board for carcass vendor 5. Revitalization of vendor stalls 	Direct: 34 Indirect: 530	\$6,000.00
G-012	Koperasi Syariah Pedagang Pasar Malangbong	<ol style="list-style-type: none"> 1. Provision of clean water (piping) 2. Revitalization of vendor stalls into ceramic 3. Provision of boots, gloves, apron and mica cutting board for carcass vendor 4. Revitalization of poultry slaughter area and its drainage 5. Revitalization of temporary waste dumping 6. Provision of cleaning equipment (wearpack, power sprayer, floor wiper, shovel, trash bin) 	Direct: 27 Indirect: 564	\$6,000.00
G-013	Koperasi Pasar Surya Kencana Cipanas	<ol style="list-style-type: none"> 1. Revitalization of carcass vendor stalls and floor 2. Provision of livebird cage 3. Revitalization of drainage revitalization 4. Provision of hand-washing station 5. Provision of trash bin and trash cart 6. Provision of cleaning equipment (power sprayer, soap, broom, shovel, bucket) 	Direct: 44 Indirect: 1,967	\$6,000.00

Grant Number	Grantee	Goal(s)	Number of Beneficiaries	Grant Amount (USD)
G-014	Paguyuban K-5 Pasar Sukanagara	<ol style="list-style-type: none"> 1. Revitalization of carcass vendor stalls 2. Revitalization of drainage 3. Revitalization of market road 4. Provision of power sprayer 5. Provision of clean water (piping) 6. Provision of trash bin 	Direct: 72 Indirect: 512	\$6,000.00
G-015	PT Putra Bangsa Sakti	<ol style="list-style-type: none"> 1. Revitalization of drainage 2. Revitalization of temporary waste dumper 3. Provision of cleaning equipment (trash cart, shovel, masks, boots, gloves) 6. Provision of poultry cage 	Direct: 35 Indirect: 610	\$6,000.00
G-016	Koperasi Siliwangi Sejahtera	<ol style="list-style-type: none"> 1. Revitalization of temporary waste dumping 2. Provision of hand wash stand and clean water 3. Revitalization of vendor stalls into ceramic 4. Provision of boots, gloves, apron and mica cutting board for carcass vendor 5. Revitalization of poultry slaughter area 6. Provision of Power sprayer and cleaning equipment (coverall, floor wiper, shovel, trash bin) 	Direct: 30 Indirect: 261	\$6,000.00
G-017	CV Graphis	<ol style="list-style-type: none"> 1. Provision of power sprayer and cleaning equipment 2. Revitalization of sewage system 3. Provision of apron, mask, mica cutting board for carcass vendor 4. Provision of trash cart 5. Revitalization of carcass vendor stalls 6. Revitalization of temporary waste dumping 	Direct: 27 Indirect: 710	\$6,000.00
G-018	CV Gading Mas	<ol style="list-style-type: none"> 1. Provision of power sprayer and cleaning equipment 2. Revitalization of sewage system 3. Provision of apron, mask, mica cutting board for carcass vendor 4. Provision of trash cart 5. Revitalization of carcass vendor stalls 6. Revitalization of temporary waste dumping 	Direct: 27 Indirect: 1,327	\$6,000.00

Grant Number	Grantee	Goal(s)	Number of Beneficiaries	Grant Amount (USD)
G-019	Koperasi Wanita Srikandi Pabuaran	<ol style="list-style-type: none"> 1. Revitalization of drainage 2. Revitalization of market floor 3. Revitalization of vendor stalls 4. Provision of livebird cages 5. Provision of cleaning equipment (power sprayer, trash bin, trash cart, boots, gloves, disinfectant) 6. Provision of apron, mica cutting board, gloves, masks for carcass sellers 7. Provision of clean water (piping) 	Direct: 76 Indirect: 674	\$6,000.00
G-020	Yayasan Ponpes Al-Hikmah Kopo	<ol style="list-style-type: none"> 1. Revitalization of drainage 2. Revitalization of carcass vendor stalls 3. Provision of biosecurity equipment (power sprayer, disinfectant, masks, boots) 4. Provision of apron, trash bin, gloves for carcass vendor 5. Provision of cleaning equipment (trash cart, shovel, masks, boots, gloves) 6. Provision of poultry cage 	Direct: 70 Indirect: 650	\$6,000.00
G-021	PO Shandi Anugrah Mandiri	<ol style="list-style-type: none"> 1. Revitalization of slaughter area 2. Revitalization of vendor stalls 3. Provision of poultry cage 4. Revitalization of temporary waste dumper 5. Revitalization of drainage 6. Provision of power sprayer and Personal Protective Equipment (PPE) for biosecurity implementation 7. Provision of trash cart and trash bin 	Direct: 15 Indirect: 172	\$6,000.00
G-022	PO Shandi Anugrah Mandiri	<ol style="list-style-type: none"> 1. Revitalization of drainage 2. Revitalization of slaughter area 3. Provision of poultry cage 4. Provision of power sprayer and PPE for biosecurity implementation 5. Provision of clean water (well and water pump) 	Direct: 14 Indirect: 230	\$6,000.00
G-023	Satu Dunia/One World	Build an SMS system that will encourage breeders and traders to actively exchange information and knowledge, utilizing the breadth and speed of technology to more quickly and widely deliver information and knowledge about livestock health and the importance of contributing to better biosecurity.	Direct: 70 ³ Indirect: 650	\$41,367.00
G-024	Combine Resource Institution	<ol style="list-style-type: none"> 1. Educate consumers about healthy poultry products 2. Encourage key behaviors related to food safety and processing. 3. Empower consumers and communities to demand healthy poultry products 4. Create a platform through SMS, online media and radio networks within the chain of poultry business involving consumers and other related stakeholders 	Direct: 215,650 ⁴ Indirect: 862,600	\$50,000.00

Grant Number	Grantee	Goal(s)	Number of Beneficiaries	Grant Amount (USD)
G-025	Aisiyah	<ol style="list-style-type: none"> 1. Increase the capacity of local leader (motivator and facilitator) to become skilled advocates for AI related issues 2. Carry out the discussion of religious meeting in the market with traders, transporters of poultry and poultry cutters on Islamic business 3. Carry out a religious meeting in the community to conduct consumer education and consumer empowerment 4. Carry out market visits with customers to establish communications with poultry traders 5. Develop and distribute teaching materials (advertising and pocket book) about healthy consumer empowerment in Islamic perspective 6. Disseminate teaching materials and activities on healthy birds of consumer empowerment through online media 	Direct: 374,427 ⁵ Indirect: 1,570,508	\$50,000.00

Notes

¹ Direct beneficiaries are people who listened to the community radio broadcasts (18 radios X estimation 300 listener per area) and indirect beneficiaries are family members of the radio listeners (# of radio listener X 4 persons).

² Direct beneficiaries are participants at Aisiyah 'pengajian' and indirect beneficiaries are family member of pengajian participants (# of pengajian participants X 4 persons).

G-003 to G-022: Direct beneficiaries are the vendors who directly received the material/equipment/improvement generated by the grants. Indirect beneficiaries are the total number of vendors in the market who were also affected by the improvements.

³ Direct beneficiaries are farmers and Technical Service (TS) staff who registered in SMS gateway system and indirect beneficiaries are total number of farmers who were directly supervised by the TS (13 TS X approximately 50 farmers for each TS).

⁴ Direct beneficiaries are calculated from: SMS = 1,200; bulletin = 1,500; radio = 200,000; website = 12,000 and community video = 950 and indirect beneficiaries are direct beneficiaries x 4 family members.

⁵ Direct beneficiaries is calculated from: audio messages (Kuitum) = 12 edition x 300 CDs x 100 listeners; Khutbah book = 2,000; Facebook = 5,023; religious events = 6,673; consumer visit = 278; and Twitter = 453. Indirect beneficiaries are calculated from: (direct beneficiaries x 4 family members) + (Replication West Java in the remaining 16 districts/municipalities through 700 branches of Aisiyah group Quran reading x 4 family members). (374,427 x 4 = 1,497,708) + (700 x 6 facilitators and 700 x 20 participants = 18,200 x 4 family members = 72,800). The number for indirect beneficiaries has not taken into consideration that Aisiyah distributed SAFE IEC materials to their branches in 33 provinces during Aisiyah's National Meeting in Yogyakarta in October 2012.

4. MONITORING AND EVALUATION

4.1 Introduction

SAFE developed a performance monitoring system to collect data and present the results for program indicators in a timely and reliable manner. Performance monitoring focused on progress in achieving indicators defined for program activities/inputs, outputs and outcomes. The monitoring system combined quantitative and qualitative methods in order to collect and present data of good quality.

In reference to quantitative methods, units were either measured or counted, or questions were asked according to a defined questionnaire so that the answers could be coded and analyzed numerically. SAFE quantitative performance monitoring activities ranged from the simple counting of inputs/activities, such as the number of training participants and the number of communication materials produced, to the more complex processes, such as surveys based on the use of questionnaires and sampling respondents – especially at the outcome level. Quantitative performance monitoring was carried out at all levels of the program results (outcomes, outputs and inputs/activities).

SAFE used qualitative monitoring as a way of looking at why and how certain activities were conducted or achievements made. Activities conducted as part of the qualitative performance monitoring included site visits to capture SAFE success stories, FGDs, regular observation visits to farms and LBMs, and observations of behavior changes that related SAFE activities to changes in AI/ILI-related behaviors.

Quality assurance was applied to both quantitative and qualitative data. SAFE involved local partners and stakeholders in monitoring roles and data collection to ensure program ownership. Data collection forms were distributed and partners were trained in their use. Activities to support quality assurance included regular field visits, supervision and activity report reviews. In addition, SAFE program staff and the M&E officer conducted spot checks and carefully reviewed data originating from partners to ensure their accuracy.

The sections below include a report on the Performance Monitoring Plan outcomes and outputs and a summary of project activities and deliverables.

4.2 Performance Monitoring Plan

This section contains the Performance Monitoring Plan (PMP) Framework, Performance Indicator Reference Sheets and Workplan Activities and Deliverables which represent project inputs.

4.2.1 Performance Monitoring Plan (PMP) framework

The SAFE program PMP framework was developed to contribute to the USAID API Results Framework at the time of award. The relationship of the SAFE Outcomes is included below for reference. The SAFE PMP was used as a management tool to plan and manage the process of assessing and reporting progress towards achieving SAFE's program outputs, outcomes and overall results.

SAFE Program Link to USAID API Results Framework

Overall USAID Goal: Reduced impact of H5N1 in Indonesia on animals and human and limit emergence of pandemic threat

Animal

Human

Sub-goals:

1. Refined knowledge about how H5N1 virus is circulating in poultry
2. Improved control of H5N1 in poultry

Sub-goals:

1. Strengthen early detection and treatment of H5N1 (and H1N1) in high risk areas
2. Minimized risk of H5N1 and H1N1 re-assortment

IR 1

Biosecurity & vaccination program at commercial poultry farms are improved and established

IR 1

Improved early recognition of signs and symptoms of H5N1-related illness at household/community levels

IR 2

Promoted health seeking behavior in communities in H5N1-related illness

IR 3

Effective management of H5N1-related illness at health facility level

SAFE

OUTCOME 1
IMPROVED BIOSECURITY AND GOOD FARMING PRACTICES AT SECTOR 3 BROILER FARMS IN HIGH-RISK AREAS

OUTCOME 2
IMPROVED RISK REDUCTION PRACTICES WITHIN LIVE BIRD MARKETS (LBM)

OUTCOME 3
INCREASED KNOWLEDGE OF HEALTH CARE-SEEKING PRACTICES FOR A/ILI-RELATED ILLNESS

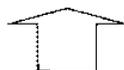

OUTCOME 4
USE OF A/PI INFORMATION BY LOCAL AND INTERNATIONAL STAKEHOLDERS

Table 4-1 below, summarizes SAFE's four "Outcomes", nine "Outputs" and accompanying indicators. There are a total of 13 indicators; four outcome level indicators and nine distinct output level indicators.

Table 4-1: Summary of SAFE Outcomes and Outputs

Objective I

	I. IMPROVED BIOSECURITY AND GOOD FARMING PRACTICES AT SECTOR 3 BROILER FARMS IN HIGH-RISK AREAS
	I.i. # of farms adopting biosecurity and good farming practices at sector 3 broiler farms

OUTPUT	I.1 Sector 1 poultry companies and poultry shops encourage and support implementation of changes in biosecurity and good farming conditions at sector 3 broiler farms	I.2. Increased knowledge and understanding of biosecurity and good farming conditions among farmers and students
	I.1.i # of poultry industry Technical Services (TS) staff working with and contributing to SAFE Program	I.2.i # of farmers who self-financed changes in biosecurity and good farming conditions at their farm
OUTPUT INDICATORS	I.1.ii # of technical visits by TS and SAFE staff to TFs to support and monitor changes in biosecurity & GFP conditions	

Objective 2

	2. IMPROVED RISK REDUCTION PRACTICES WITHIN LIVE BIRD MARKETS (LBM)
	2.i. # of poultry vendors in demonstration markets adopting healthy market practices

OUTPUT	2.1. Increased technical support, participation and coordination among key stakeholders	2.2. Empowered consumer who demands healthy poultry product	2.3. Cleaner physical facilities for poultry vendors in LBMs	2.4. Improved coordination among ministry program/communication staff (same as output 3,2)
	OUTPUT INDICATORS	2.1.i # of Dinas technical visits to LBMs	2.2.i. Percentage of consumers who know and exercise their consumer right	2.2.i. # of markets with revitalized facilities to support improved biosecurity practices.

Objective 3

	3. INCREASED KNOWLEDGE OF HEALTH CARE-SEEKING PRACTICES FOR AI/ILI-RELATED ILLNESS
	3.i. Percentage of survey respondents who can identify AI/ILI symptoms

OUTPUT	3.1. Community members reached with key AI-ILI health care seeking messages	3.2. Improved coordination among ministry program/communication staff (<i>same as output 2.4</i>)
	3.1.i. # of community members who receive care-seeking messages on AI/ILI-related messages	3.2.i. # of multi ministerial AI communication action plans
OUTPUT INDICATOR		

Objective 4

	3. USE OF A/PI INFORMATION BY LOCAL AND INTERNATIONAL STAKEHOLDERS
	4.i # of unique visitors on the A/PI Indonesia Knowledge for Health site of Johns Hopkins University

OUTPUT	4.1. Access to A/PI information by local and international stakeholders	4.2. Improved access to updated best practices knowledge by local MOA and MOH stakeholders
	4.1.i. # of documents uploaded to the site by Indonesian partners and SAFE staff	4.2.i. # and type of subject matter accessed by partners attending conferences, workshops and meetings
OUTPUT INDICATORS		

4.2.2 Performance indicator reference sheets

This section contains the reference sheet for each of the 13 Outcome and Output performance indicators. Each sheet describes the indicator, unit of measurement, target for the 27-month life of project, and final target achievement. The remarks section adds additional detailed information.

OBJECTIVE 1. STRENGTHEN AND EXPAND PUBLIC PRIVATE PARTNERSHIPS TO IMPROVE GOOD FARMING PRACTICES AND LIMIT AI TRANSMISSION AMONG POULTRY

<i>PMP Outcome</i>	<i>Indicator</i>	<i>Unit of Measurement</i>	<i>Target Over Life of Project</i>	<i>Final Achievement</i>	<i>Remarks</i>
Outcome 1: Improved biosecurity and good farming practices at sector 3 broiler farms in high risk areas	1.i Number of Sector 3 broiler farms that score at least 60 out of 100 points on a weighted survey	Number of farms	50	64 (128%)	

Final Achievement:

- The final achievement of this outcome was 64 Sector 3 broiler farms that scored at least 60 out of 100 points for biosecurity and good farming practices adoption. This achievement was 128% of the total program target.
- The 64 farms had visited the teaching farms and received technical assistance from TS and SAFE staff to adopt biosecurity and good farming practices through weekly visits to the farms, one-on-one discussions, informal group discussions, and educational materials. The average score for these farms was 79 for condition implementation and 75 for practices adoption.
- Most of the changes implemented on the farms consisted of constructing fences, parking areas outside the farms, footwear exchange at chicken house doors, hand washing facilities, good drinking water, and cleaning and disinfecting the chicken house and equipment. Simplicity, low cost and being easy to adopt were the main reasons reported by farmers for implementing these structural changes rather than others.
- Visiting a TF, support from SAFE and TS staff, and the farmer competition were the external factors that encouraged farmers to implement biosecurity and good farming practices on their farms.
- Detailed information on the achievement figures stated above can be found in Annex I.

<i>PMP Output</i>	<i>Indicator</i>	<i>Unit of Measurement</i>	<i>Target Over Life of Project</i>	<i>Final Achievement</i>	<i>Remarks</i>
OUTPUT 1.1: Sector 1 poultry companies and poultry shops encourage and support implementation of changes in biosecurity and good farming conditions at Sector 3 broiler farms	1.1.i Number of Sector 1 and poultry shop TS staff transferring their knowledge and supervising targeted farm, biosecurity and GFP changes at farms	Number of Sector 1 and poultry shop TS staff	25	39 (156%)	<ul style="list-style-type: none"> The final achievement of this output was 39 poultry industry TS staff working and contributing towards SAFE program goals. These TS came from Rinjani PS, Tanjung Mulya PS, Cheil jedang PT, Sierad Produce PT, Darmaga Unggas PS/CPI, Tunas Mekar Fram PS, Japfa PT. An additional 27 TS staff were trained in Year 1 and are serving the industry Detailed information on this output can be found in Annex 2.
	1.1.ii Number of technical visits by TS and SAFE staff to TFs to provide direction and support on biosecurity & GFP changes	Definition: Number of technical visits by TS and SAFE staff to TFs	600	800 (133.3%)	<ul style="list-style-type: none"> The final achievement of this output was 800 technical visits conducted by TS and SAFE staff to TFs. 246 technical visits were carried out by SAFE staff and 554 by TS staff. TS staff on average made three one-on-one visits per month to TFs.
OUTPUT 1.2: Increased knowledge and understanding of biosecurity and good farming conditions among farmers and students	1.2.i Number of Sector 3 farms that self-financed changes in biosecurity and good farming conditions	Number of Sector 3 farms	300	345 (115%)	<ul style="list-style-type: none"> The final achievement of this output was 345 Sector 3 broiler farms that self-financed changes in biosecurity and good farming conditions. Over 80% of farmers implemented footwear exchange at the chicken house doors, and almost 80% upgraded their hand washing facilities. Other conditions that were improved including proper disposal of dead chicken, record sheets, clean buildings and equipment, good drinking water, and parking area outside the farm (implemented by around 40% of farmers). Detailed information on this output can be found in Annex 3.

OBJECTIVE 2: PROMOTE BEHAVIORS THAT LOWER THE RISKS OF AI TRANSMISSION AMONG POULTRY AND INCREASE KNOWLEDGE OF SIGNS, SYMPTOMS AND RISK FACTORS FOR AI-RELATED ILLNESS

<i>PMP Outcome</i>	<i>Indicator</i>	<i>Unit of Measurement</i>	<i>Target Over Life of Project</i>	<i>Final Achievement</i>	<i>Remarks</i>
OUTCOME 2: Improved risk reduction practices within live bird markets (LBMs)	2.i Number of market vendors with improved stalls in 20 demonstration markets	Number of market vendors	800 in 20 demo markets	846 (105.7%) Additional 1,875 in non-program markets	<ul style="list-style-type: none"> • A total of 1,875 poultry vendors in 49 non-program markets adopted the SAFE program. These changes were financed by local government and market managers and vendors. • A total of 2721 vendors improved practices – a 340% increase over target.

Final Achievement:

- The final achievement of this outcome was 846 poultry vendors in 20 demonstration markets adopting healthy market practices. This achievement represented 105.7% of the total program target in the program area. A greater target was reached when an additional 49 markets implemented components of the SAFE program reaching an additional 1,875 poultry vendors.
- Changes in biosecurity practices could be shown through stall improvements such as revitalizing display tables, using appropriate poultry cages, and using mica cutting boards, and implementing biosecurity practices such as cleaning vendor stall areas, proper disposal of poultry waste, washing hands with soap, and using appropriate equipment. Improved practices in the market cannot be separated from the support provided by market management staff, the local government, the poultry vendor association and other related stakeholders.
- There was strong involvement by the local government in the adoption of the SAFE healthy market program in 49 non-program live bird markets. This was shown through replication in other markets, development of policies and regulations, budget allocations, and capacity building implementation. A total of 1,875 market poultry vendors in 49 non-program live bird markets were impacted by adoption of the SAFE healthy market program.
- Detailed information on the achievement figures stated above can be found in Annex 4.

PMP Output	Indicator	Unit of Measurement	Target Over Life of Project	Final Achievement	Remarks
OUTPUT 2.1: Increased technical and financial support, participation and coordination among key stakeholders	2.1.i Number of technical visits conducted by Dinas (Local Government) to assist with LBMs	Number of technical visits	80	741 (926.2%)	<ul style="list-style-type: none"> • The Dinas' related markets are Trade and Industry, Animal Husbandry, and Health. • The following technical visits were conducted by at least one of the local Dinas' referenced above : <ul style="list-style-type: none"> - 1 market manager training (Mar 2012) - 20 PRA in first year (Feb 2012) - 20 <i>gebyar pasar</i>/market events (Mar 2012) - 100 market implementation activities (first year) - 480 market implementation activities (second year) - 20 maintenance plan meetings (Sep-Dec 2012) - 20 peer-to-peer volunteer orientations (first year) - 80 peer-to-peer volunteer orientations (second year)
OUTPUT 2.2: Empowered consumer who demands healthy poultry product	2.2.i Percentage of survey respondents from target audience who have knowledge on healthy poultry products and ask for clean poultry stalls and healthy products	Percentage of survey respondents	60% of total sample	<p>74% of the total sample (N:200) had ever asked a poultry vendor to improve cleanliness (123.3%)</p> <p>84% of the total sample (N:200) had ever asked a poultry vendor to provide healthy poultry products (140%)</p>	<ul style="list-style-type: none"> • SAFE conducted a consumer survey to assess consumer knowledge about healthy poultry products and identify whether they had asked for clean poultry stalls and healthy products • Method: quantitative, using a questionnaire (face-to-face interviews) • The survey population was consumers who attended religious meetings where the topics were healthy poultry products and consumers' right to obtain healthy poultry products • Total sample: 200 respondents (20 respondents per district) <p>The following data concerns the number of consumers reached through Quran recitals and consumer visits to market activities conducted by Aisyiyah:</p> <ul style="list-style-type: none"> • 12,165 consumers received socialization on healthy chicken products. • 278 consumers met with vendors and practiced requesting healthier products and cleaner market as part of a group exercise.

<i>PMP Output</i>	<i>Indicator</i>	<i>Unit of Measurement</i>	<i>Target Over Life of Project</i>	<i>Final Achievement</i>	<i>Remarks</i>
OUTPUT 2.3: Cleaner physical facilities for poultry vendors in LBMs	2.3.i Number of markets with improved facilities	Number of markets	20	20 (100%)	Improvements in the 20 program markets included: <ul style="list-style-type: none"> • Drainage revitalization • Revitalization of temporary waste dumpsters • Revitalization of vendor stalls • Hand washing stands • Piping clean water channels.
OUTPUT 2.4: Improved coordination among ministry program/ communication staff	2.4.i Number of multi-ministerial AI communication action plans	Number of multi-ministerial AI communication action plans Unit: Number	1	1 action plan developed (100%)	<ul style="list-style-type: none"> • Five Ministries were part of the SAFE Inter-Ministerial Health Communication Group. • Two meetings were held for this group. The first meeting discussed the draft Avian Influenza Action Plan and gathered input for AI prevention and management efforts in Indonesia. • The second meeting was held to share lessons learned and best practices from SAFE implementation in the field, with the aim of handing over some of the SAFE program elements to the government, and encouraging exchange of information among government agencies in the areas of AI prevention, control and management, including the most recent Komnas Zoonosis workplan.

OBJECTIVE 3: INCREASE KNOWLEDGE OF SIGNS/SYMPTOMS AND RISK FACTORS FOR AI-RELATED ILLNESS IN PEOPLE AND PROMOTE BEHAVIORS THAT IMPROVE HOUSEHOLD-LEVEL CARE-SEEKING IN RESPONSE TO AI-RELATED ILLNESS

<i>PMP Outcome</i>	<i>Indicator</i>	<i>Unit of Measurement</i>	<i>Target Over Life of Project</i>	<i>Final Achievement</i>	<i>Remarks</i>
OUTCOME 3: Increased knowledge of healthcare-seeking practices for AI/ILI-related illness	3.i Percentage of survey respondents who can identify AI/ILI symptoms	Percentage of survey respondents	60% of total sample	84% of total sample (N=200) can identify the signs of AI in humans (140%)	

Final Achievement:

- The final achievement of this outcome was 84% of the total sample (N=200) correctly mentioning the signs of AI in humans, namely, high fever, coughing, sore throat and difficulty breathing. This achievement constituted 140% of the total program target.
- SAFE and Aisiyah conducted a care-seeking evaluation in order to better understand targeted audience responses to the care-seeking messages developed by SAFE and to program efforts aimed at improving healthcare-seeking practices. SAFE employed the quantitative method using a questionnaire administered through face-to-face interviews, and the qualitative method using an FGD to obtain more detailed data. A total of 200 respondents (mothers) were surveyed in the 10 program districts in West Java and Banten, and there were 36 participants in FGDs held in three program districts (West Bandung, Tasikmalaya and Serang).
- After receiving care-seeking messages, around 76% of respondents stated that in the future they would go to a healthcare provider immediately if they had symptoms like fever, sore throat, coughing, and had been in contact with poultry. They mostly preferred to go to a Puskesmas (mentioned by 70%) rather than other sites, due to its accessibility and low cost.
- Quran recitals (*pengajian*) and posters were the information sources most often reported by respondents.

<i>PMP Output</i>	<i>Indicator</i>	<i>Unit of Measurement</i>	<i>Target Over Life of Project</i>	<i>Final Achievement</i>	<i>Remarks</i>
OUTPUT 3.1: Community members reached with key healthcare-seeking messages	3.1.i Number of community members who receive care-seeking messages on AI/ILI-related messages	Number of community members	200	444 (222%)	<ul style="list-style-type: none"> • 444 participants attended socialization on AI in humans through Quran recitals in Dec 2012-Jan 2013. • Detailed information on the date and place of these Quran recitals can be found in Annex 5. • In some areas, Aisyyah facilitators continue to conduct Quran recitals on the topic of AI in humans.
OUTPUT 3.2: Improved coordination among ministry program/ communication staff	3.2.i Number of multi-ministerial AI communication action plans	Number of multi-ministerial AI communication action plans	1	1 action plan developed (100%)	<ul style="list-style-type: none"> • Same indicator as output 2.4 under Objective 2

OBJECTIVE 4: FACILITATE COORDINATION AMONG PARTNERS BY SHARING INFORMATION AND HOSTING MEETINGS

<i>PMP Outcome</i>	<i>Indicator</i>	<i>Unit of Measurement</i>	<i>Target Over Life of Project</i>	<i>Final Achievement</i>	<i>Remarks</i>
OUTCOME 4: Use of A/PI information by local and international stakeholders	4.i Number of unique local and international visitors to the A/PI Indonesia Knowledge for Health site	Number of unique visitors	2,000	2,052 (102.6%)	

Final Achievement:

- The final achievement of this outcome was 2,052 unique visitors to the A/PI Indonesia Knowledge for Health (K4Health) site. This achievement represented 102% of the total program target.
- The site is hosted by the JHU Knowledge for Health Project. K4Health is designed as a toolkit system that contains electronic collections of relevant information on a particular topic for health policy makers, program managers, and service providers.

<i>PMP Output</i>	<i>Indicator</i>	<i>Unit of Measurement</i>	<i>Target Over Life of Project</i>	<i>Final Achievement</i>	<i>Remarks</i>
OUTPUT 4.1: Access to A/PI information by local and international stakeholders	4.1.i Number of documents uploaded to the site by Indonesian partners and SAFE staff to share knowledge on health issues	Number of documents uploaded	75	202 (269.3%)	<ul style="list-style-type: none"> • 202 documents had been uploaded as of April 29, 2013 • Documents uploaded came from MOA, MOH, FAO, WHO, and other AI-related organizations.

<i>PMP Output</i>	<i>Indicator</i>	<i>Unit of Measurement</i>	<i>Target Over Life of Project</i>	<i>Final Achievement</i>	<i>Remarks</i>
OUTPUT 4.2: Improved access to updated best practices knowledge by local MOA and MOH stakeholders	4.2.i Number and type of subject matter accessed by partners attending conferences, workshops and meetings by SAFE-funded professionals	Number of subject matters accessed	5	6 (120%)	<p>This output was limited because attendance at conferences and workshops was discontinued early in Year 2 following funding cuts.</p> <p>SAFE supported the following individuals to attend the EPT meeting in Jakarta on July 2011: Prof. Sofia Mubarika; Dr. Joko Pamungkas; Prof Wayan T. Artama; and Dr. Drh. I Wayan Teguh Wibawa.</p> <p>SAFE also supported Dr. Tjandra Yoga Aditama and Mr. I Made Artika to travel to the United States</p>

Workplan Activities and Deliverables/Inputs

The project inputs, that is, the workplan project activities and deliverables, and the quarter in which they were each planned and completed are summarized below in Table 4-2.

Table 4-2: Summary of Workplan Activities and Deliverables/Inputs

No.	ACTIVITIES	DELIVERABLE	Schedule	Q1	Q2	Q3	Q4	Q5	Q6	Q7	Q8	Q9	REMARKS
OBJECTIVE 1: Strengthen and expand public private partnerships in high-risk districts to improve biosecurity and good farming practices in order to limit AI transmission													
Act. 1.1.	Build on existing relationships with the public and private poultry sectors and engage new partners to build commitment for	Listing of meetings with stakeholders and field visits	Planned Actual										
Act. 1.2.	Design, organize and convene an industry convention on poultry biosecurity	Convention Summary Report	Planned Actual										
Act. 1.3	Establish a Biosecurity Innovation Fund	Biosecurity Innovation Fund Concept	Planned Actual										
		Biosecurity Innovation Fund Literature	Planned Actual										
		Biosecurity Innovation Fund Roadshow presentation	Planned Actual										
Act. 1.4	Develop new or strengthen existing Teaching Farms that will model good farming and biosecurity practices	Teaching Farm concept write-up	Planned Actual										
		Eleven (11) Teaching Farms	Planned Actual										
Act. 1.5.	Develop educational and informational materials for use at Sector 3 teaching farms, and educational institutions	Training and education material	Planned Actual										
		Package of communication tools, best practices and methodologies to support biosecurity implementation	Planned Actual										
Act. 1.6	Train Sector 3 and poultry shop technical service staff and select Sector 3 farm managers and farmers to transfer their knowledge of GFP/biosecurity practices	Eleven (11) technical/ communication skills training sessions - 100 Technical Staff trained and 500 farms reached	Planned Actual										SAFE collapsed 11 training sessions, which companies had originally requested be held separately, into two sessions that mixed TS personnel from different companies. This decision improved the learning process and saved money. A total of 59 TS staff were trained. This number reflects the reduction in funding and life-of-project.
Act. 1.7.	Identify and test incentives for private industry to adopt biosecurity practices	SCW and action plan with at least one Sector 1 Firm to measure the effectiveness of biosecurity bonuses	Planned Actual										D/R SAFE took a different approach to testing incentives and instead used the Teaching Farms and the BIF grant program to test and study industry and farmer motivation and incentives
Act. 1.8.	Develop and implement a system to monitor implementation of activities	Program Monitoring Plan	Planned Actual										
		Data collection sheets	Planned Actual
