OBJECTIVE 2: Promote behaviors that lower the risks of AI transmission among poultry and increase knowledge of signs, symptoms and risk factors for AI-related illness													
Act. 2.1	Conduct analysis: KAP 2009 secondary data analysis.	KAP 2009 Secondary Data Analysis Summary Report.	Planned Actual										
Act. 2.2	Conduct rapid needs assessment	SAFE Rapid Need Assessment Summary Report	Planned Actual										
Act. 2.3	Update 2009 "Consensus Report: Priority Audiences and Behavior for Reducing the Risk of AI Transmission in Indonesia"	2011 Consensus Report: Priority Audiences and Behavior for Reducing the Risk of AI Transmission in Indonesia	Planned Actual										Review of the final document by all stakeholders took longer than planned in part because FAO technical staff had to leave country due to internal visa related issues. As FAO was technical lead partner SAFE believed the document could not be completed without their review.
Act. 2.4	Develop Communication Strategy	Communication Strategy Development Workshop Communication Strategy Document	Planned Actual Planned Actual										
Act. 2.5	Organize and conduct consultative meetings	Listing of stakeholder meetings List of Demonstration Live Bird Markets (LBMs)	Planned Actual Planned Actual										
Act. 2.6	Develop SOV and conduct training for PHM	Signed subcontracts with PHM One training session	Planned Actual Planned Actual										New changes in PHM management resulted in a slow and bureaucratic internal subcontract approval process. PHM's two-month delay in signing the subcontract also impacted the commencement of various activities under Objective 2
Act. 2.7	Implement healthy market initiative	20 grants awarded to 20 Demonstration LBMs in 10 districts	Planned Actual										SAFE submitted all 20 proposals to USAID in Q4. An unexpected request to compare unit prices of commodities in the proposals with Gal district unit prices slowed down the approval process.
Act. 2.8	Conduct capacity building program for marker managers and vendors	Training materials and curriculum 10 workshops conducted in 10 districts	Planned Actual Planned Actual										This activity was delayed by PHM's delay in signing its subcontract
Act. 2.9	Conduct consumer/consumer demand creation initiative	Award subcontract to one to two NGO/Community Groups to create demand for healthy markets and products	Planned Actual										
Act. 2.10	Create and air radio serial drama	Develop and air 12 radio serial drama episodes across community radio channels across 10 priority districts	Planned Actual										SAFE was not pleased with the initial development of characters and draft of the episodes. The subcontractor was required to re-design the scripts.
Act. 2.11	Investigate viable mobile phone applications	Report with recommendations	Planned Actual

4.3 Assessments and Evaluation Studies

4.3.1 Assessments

4.3.1a *Rapid informational needs assessment of key audiences and behaviors for reducing the risk of AI transmission*

The KAP study conducted by CBAIC in 2009 documented critical public perceptions and attitudes that framed the challenges that SAFE and its partners would face in developing a sustainable effort to reduce the risk of human H5N1 infections. Social, cultural, and economic factors play an important role in the extent to which individuals, businesses, and government organizations act to limit the impact and spread of these diseases.

During the CBAIC program, FAO, WHO and other technical partners had developed risk reduction behaviors for different audiences. There were 41 key behaviors for eight target audiences. These behaviors would certainly reduce the transmission risk if they were implemented well. Key data on audiences and adoption of key behaviors were needed before program implementation in order to provide basic data for SAFE program and activity development. Qualitative findings from a 2009 KAP Survey showed different levels of feasibility in implementing each risk reduction behavior for each audience. Some behaviors were commonly practiced, others were less practiced, and still others were perceived as difficult to implement for various reasons.

SAFE conducted a rapid informational need assessment of key audiences and behaviors for reducing the risk of AI transmission to obtain insight into current key behavior implementation in each target audience. The need assessment provided input on the adoption, interest, and value of particular behaviors and identified factors that facilitate or hinder the target audience in adopting risk-reduction behavior. The rapid assessment used the qualitative method, with a series of focus groups and interviews with a few key informants from each target audience.

The assessment found that behavior adoption is influenced by several factors:

- *Health* – Health and disease considerations of self, family, neighbors and community.
- *Social* – Social or cultural pressures, norms or practices.
- *Economic* – Determinants related to price, cost, profit or loss.
- *Regulatory* – Government (national to village) or corporate regulation, policy, ordinance and/or rules.

Some factors can be considered barriers for key audiences to practice the recommended key behaviors. These barriers include:

- Lack of knowledge on the importance and reasons that lead to the need to adopt key behaviors
- Economic reasons – Behaviors are performed or not practiced based on financial benefits or business purpose

- Social barriers – A mindset that believes the current behavior does not need to be changed because it is a common habit embraced by many people
- Limited access and supporting infrastructure
- Structural barriers – One reason that behavioral change is hard to achieve is that it is closely related to policy issues, whereas key audiences in the group do not have the authority to make policy decisions.

Incentives for behavior change in the poultry value chain tend to be dominated by financial incentives. Health incentives alone do not appear to be sufficient to encourage behavior change.

4.3.1b KAP 2009 secondary data analysis

In 2009, the USAID funded CBAIC conducted a KAP study to understand perceptions of H5NI A1 and analyze audience behavior regarding the poultry value chain. The KAP looked at each audience's perception of A1 risk, intended or actual A1 risk reduction behaviors practiced, and specific program outcomes under the CBAIC program. The survey employed both quantitative and qualitative instruments and was conducted in Banten, DKI Jakarta and West Java.

Under SAFE, as the follow-on project, a secondary analysis of the same KAP raw data was conducted, supplemented by qualitative data analysis to further explain motivations and barriers to change. This analysis focused on behaviors specific to four commercial sector audiences (traders, transporters, poultry vendors, and slaughterers). Areas analyzed included cleaning practices, poultry handling, waste disposal and overall perceptions about reporting, perceived threat, and levels of self-efficacy. The report summarized the findings of this secondary analysis, which were used to inform SAFE programmatic design and work. A summary of the analysis follows.

- Respondents in the commercial sector indicated a high level of perceived susceptibility to and severity of A1. Most members of each audience in the commercial sector group expressed high to moderate levels of confidence in preventing A1 transmission in villages and working places. This indicates that A1 is considered as a dangerous yet preventable disease. Thus, behavioral change communication is still needed to maintain people's awareness of the threats posed by A1 and other poultry diseases. This can be done by promoting the importance of performing the recommended key behaviors.
- Findings show that people practice the behaviors under different motivations, including economic, health, and social norms. The economic factor is the strongest determinant, and it may therefore be effective for any behavioral change campaign to consider giving economic incentives as well as emphasizing the health benefits.
- Of all the key behaviors recommended for reducing the risk of A1 transmission among target audience groups, behaviors related to personal and equipment hygiene were considered by most participants as crucial for avoiding taking work viruses home.
- However, hygiene behaviors are not fully implemented by people. Findings show that in terms of hand washing with soap behavior, in practice most people only used water, and no soap. Cleaning the equipment using detergents was only done when the vehicles looked dirty or smelled bad.

4.3.1c Technical needs assessment for Sector 3 broiler farmers

Prior to developing the TFs, the Objective 1 team aimed to be effective in demonstrating biosecurity aspects at the TFs. The team aimed to create demonstrations at the TFs that farmers would find useful, rather than recycle information they already knew. Accordingly, the TFs were developed based on responses from several farmers and observations at farms. Secondary information – including FAO, ACIAR and CBAIC reports – was also consulted, but farmers had not been systematically consulted. The team was concerned that other biosecurity techniques and GFPs were being overlooked. Comprehensive data gathering would help support future TFs, and modifications to existing farms.

The assessment was intended to identify (i) farmers' level of knowledge about biosecurity and the technical aspect of GFPs for reducing poultry disease transmission, (ii) to what extent the farmers had practiced biosecurity measures on the farm, and (iii) the factors that facilitate, incentivize or hinder farmers in adopting the recommended biosecurity practices. Three FGDs were held with Sector 3 broiler farmers, in Tangerang, Bogor and Tasikmalaya.

The assessment explored in detail the following technical aspects of biosecurity measures:

- Selection of appropriate fencing
- Orientation of building for ventilation
- Obstruction of flow of air through chicken house
- Use of fans inside chicken house
- Use of footwear exchange system at chicken house
- Use of pass-over system

Key findings of the assessment are summarized below.

- The farmers believed there were three key factors that directly influenced their productivity – weather, DOC, and feed. Biosecurity was only perceived as important when they were about to start a new cycle and when there was an outbreak.
- Footwear exchange was a familiar technique for all farmers. Most of the farmers claimed to already have a footwear exchange system in place, but for practical reasons had been unable to implement the system routinely.
- Fences were considered as an unnecessary burden where there were no issues with security or strong winds. The farmers had limited knowledge about the types and functions of fences, believing that fences were unrelated to improving productivity.
- The pass-over system was a new technique for the farmers. Some farmers who had no fences said this technique was impossible for them. For farmers who had installed a fence, the technique was seen as impractical and expensive.
- Incentives for farmers were cheap and easy-to-use technology which allowed them to practice biosecurity while improving productivity. They needed to be convinced by a success story from a successful farmer.

4.3.2 Evaluations

SAFE conducted three evaluation studies during the life of the project – a Commercial Farm Evaluation Study, a Live Bird Market Study: Surveillance of Live Bird Markets, and a Care-Seeking Assessment. The summaries below cover the purpose of each study, the methodology used, implementation in the field, and several key findings from these evaluations.

4.3.2a Commercial farm evaluation

SAFE conducted this study during Year 2 to measure changes at the farm level attributable to the TF program. This study was intended to measure changes in conditions and in good farming and biosecurity practices that reduce the risk of AI and other poultry disease transmission. SAFE used a mixed-method approach to gather both qualitative and quantitative data. The evaluation was also grouped by farm characteristics. These characteristics included TFs, specific intervention farms and a control group. For interventions made at the specific intervention farm group, SAFE focused on TA conducted by TS personnel and SAFE staff, and educational materials provided by SAFE. The control group of Sector 3 farms comprised of farms not receiving program services or interventions, but similar to those farms receiving the service or intervention. Baseline information was collected before the program was initiated.

Baseline data were obtained in May 2012, with an endline survey being conducted by the PPK-UI team on February 11-21, 2013. Table 4-3 shows the survey sample for the baseline and endline studies.

Table 4-3. Survey Sample

Farm Category	Baseline Sample (2012)	Endline Sample (2013)
Teaching Farms	12	12
Intervention Farms	94	20
Control Farms	20	10
Total	126	42

The baseline sample included 126 respondents while for the endline sample 42 respondents (Sector 3 broiler farms) were interviewed and their farms observed (including 12 TFs, 20 Sector 3 intervention farms and 10 Sector 3 control farms). Quantitative data collection focused on conditions and practices implemented in the farm, and poultry mortality data. Qualitative data collection used in-depth interviews with 13 informants, including TF farmers, farmers receiving interventions (among the 20 farms), control site farmers, TS staff, representatives of Sector 1 and poultry shop management, and academics. These in-depth interviews had three purposes: identify the incentives and barriers to change, uncover the reasons for their behavior change, and obtain lessons learned from SAFE program implementation. Key findings are summarized below.

SAFE FINAL REPORT

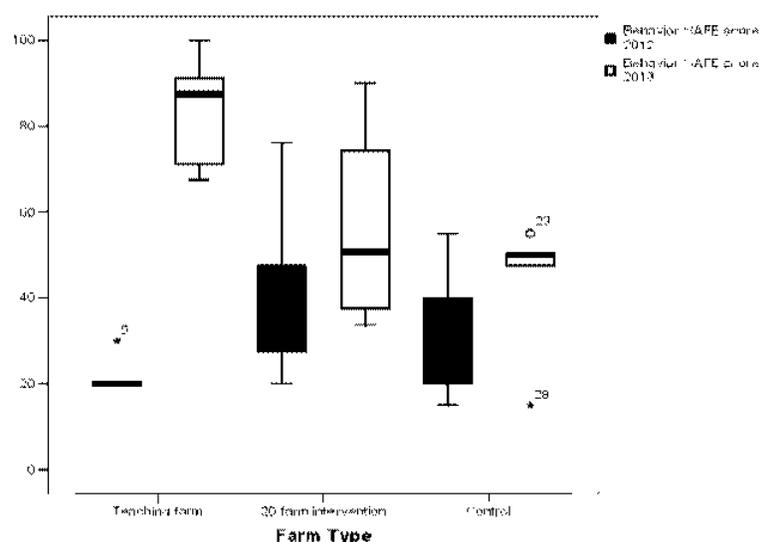

- 1) Biosecurity conditions in the intervention farms and TFs improved. The score on biosecurity conditions in Sector 3 intervention farms increased from an average of 32 to 44, while in TFs it jumped from 24 to 81. Both figures are statistically significant. In a control group, some small changes were detected (from 23 to 28), but these were not statistically significant. See Table 4.4 for details.

Table 4-4: Biosecurity Conditions in 2012 and 2013 at Teaching, Intervention and Control Farms

Biosecurity condition	All		Intervention		Control		Teaching Farm		Total	
	2012	2013	2012	2013	2012	2013	2012	2013	2012	2013
N	144	20	20	10	10	12	12	30	42	
Entrance Area	%	%	%	%	%	%	%	%	%	
Parking area outside the farm	18	35	90	20	80	50	100	30	90	
All gates have locks	15	25	35	0	0	0	92	17	43	
Pass-over area and/or pass through area	1	0	10	0	0	0	100	0	33	
Footwear for visitors at entrance area	7	5	30	0	0	0	75	3	36	
Boots or other footwear for employees at entrance area	13	10	35	10	0	0	67	10	36	
Equipment for hand washing and soap	23	15	75	10	20	0	100	13	69	
Chicken House Door Area	%	%	%	%	%	%	%	%	%	
Footwear in the chicken house near the step-over barrier	32	25	30	20	40	0	50	23	38	
Small fenced area for the footwear in the chicken house	20	20	20	0	0	0	58	13	26	
Dead bird/chicken	%	%	%	%	%	%	%	%	%	
All acceptable methods of disposal	38	45	60	20	20	91.7	75	37	55	
A record sheet is available to record the mortality	98	100	50	90	90	100	42	97	57	
General condition	%	%	%	%	%	%	%	%	%	
All parts of the building and equipment are free of old organic material	66	65	75	50	60	0	75	60	71	
Good drinking water	96	100	95	100	100	75	100	100	98	
Biosecurity score										
Mean	31	32	44	23	28	24	81	28	51	
Minimum/Maximum	10/68	15/63	10/74	10/55	15/38	15/30	68/93	10/63	10/93	
Significance (between years in each type)		0.005		0.307		0.002		0.000		
Significance (between farm types)				0.000						

- 2) Changes in biosecurity conditions in intervention farms were evident in the parking area outside the farm, equipment for hand washing and soap, acceptable method of dead chicken disposal, footwear for visitors and employees in the entrance area, and availability of good drinking water.
- 3) Biosecurity implementation behavior in the intervention group and TFs also changed towards better practices, as shown in Figure 4-1. The score in Sector 3 (intervention) farms rose from 40 to 54. TFs had a dramatic increase, from 21 to 83. Control farms also showed behavior change, with the score rising from 32 to 46. According to discussions with TS staff, some of the control farms may also have been influenced (halo effect or induction) by the TF program. However, the mean score in the control group in 2013 was still slightly lower than that of the intervention group.

Figure 4-1: Behavior scores in 2012 and 2013 by Farm Type

- 4) Positive change in behavior was noted primarily at the front gate, with cars parked outside the farm, the gate locked, pass-over and pass-through systems in place, and hand washing by staff and visitors. Some other improved behaviors were also revealed, such as dead chicken being disposed of properly, and chicken houses and equipment being clean. A few areas still require further changes, including regular staff/visitor footwear changes and dips, not selling any dead chickens, and immediate treatment of sick chickens.
- 5) Based on an analysis of the correlations between knowledge, condition and behavior variables, a correlation was found between behavior and biosecurity conditions. The better the conditions, the higher the behavior score, and vice versa. Therefore, interventions can commence at either side.

- 6) The complementary data derived from the qualitative study revealed further information. Assigning TFs as role models received a positive response from informants on SAFE interventions. They were generally satisfied with the SAFE design of TFs as role models. Most informants mentioned that with the existence of TF, they had the opportunity to learn from farmers who had already taken some of these steps. Lessons learned by farmers who visited a TF included important points on biosecurity, as well as management aspects. The issues studied by farmers visiting the TF included building fences, hand washing, changing clothes, changing footwear, and cage/chicken house management. The fuel used in heaters, and DOC, were also discussed.
- Selected quotes from farmers and TS staff regarding lessons learned from the TF**
- “...before the teaching farm existed... we didn't know that we must wash footwear, change sandals... but now after teaching farm, we learn step by step how to change footwear when entering chicken cage...” (Sector 3 Farmer in Tasik)*
- “After the grand opening of this TF, we invited farmers... they learned and are enthusiastic... we received 30 farmers from Subang, Cirebon, Indramayu... this coincided with training that we held...so we included the biosecurity topics in that training...we strengthened them not only in theory, but also in practice.” (TF Farmer in Bandung)*
- “...it helps Sector 3 farmers who did not know about biosecurity before, how to maintain healthy poultry, so now this TF exists, it helps... we are not just giving instruction to farmers to practice good biosecurity, farmers can see the teaching farms directly... they can see the benefits of having a fence, good biosecurity... to reduce depletion or mortality... health aspects are there as well.” (TS Staff)*
- 7) After learning from the TF, implementation still appears to be variable and partial. Some farmers said that some of the biosecurity elements could be applied, while other farmers still deemed them unfeasible. Their reasons for not implementing these measures included the state of the farm's contours, a lack of money, and their preference for existing materials. Many farmers followed the TF recommendations, but some faced difficulties and barriers in implementing the biosecurity measures. Constraints often cited were that the measures were too complicated or difficult, they had had a bad experience, they lacked funds, or were simply unwilling to change. One year of project implementation was insufficient to achieve maximum results. The third year initially programmed for the SAFE project could have reinforced the changes and addressed some of these lingering barriers to change.
- Selected quotes from farmers and TS staff on changes made to their farms**
- “...I instructed the worker to change the footwear, wash or dip first... this is mandatory...” (Sector 3 farmer in Tasik)*
- “...the influence on the farmer is substantial, firstly because of the education...we have received much knowledge about chicken, cleanliness of the cages, the quality of chicken... I have introduced many changes...fences, hand washing, sandal exchange...” (Sector 3 farmer in Bandung)*
- “...the constraint here is capital or funding from the farmer. They want to build fences... a good fence costs a lot... so perhaps they will build them from bamboo first... they prioritize small things to support biosecurity...” (TS staff in Ciamis)*
- 8) Economic, social and health issues were the main motivations and incentives for farmers to implement the biosecurity and good farming practices. Economic determinants such as profits at harvest time and reduced mortality were the perceived positive impacts.

4.3.2b Live bird market evaluation

The purpose of the LBM Study was to measure changes in the program-assisted LBMs as a result of SAFE's Healthy Market and Community Initiative Program. The changes being evaluated included changes in conditions and biosecurity practices that reduce the risk of AI and other poultry disease transmission, and changes in the presence of H5N1 AI at vendor stall areas.

SAFE conducted three cycles of swab data collection during the life of the program. PCR testing was used to monitor these changes, with the same five-swab protocol as that used in the FAO Jabodetabek program. In addition, an epidemiology survey was carried out to identify conditions and biosecurity practices among market poultry vendors. Information, data and sampling were collected from 20 LBMs where SAFE program interventions took place, while 10 non-intervention LBMs served as control sites in 10 districts in West Java and Banten.

The IPB team randomly selected 10 poultry vendors as respondents for the epidemiology survey and took five of them per market as swab test samples. The sampling frame was provided by a PMI facilitator. The swab test was conducted in the same five areas as before:

- Tables where carcasses are displayed
- Baskets holding cut chicken
- Waste bins (containing wet poultry waste)
- Processing tables (cutting boards)
- Wet cloths.

A total of 133 samples were collected in the first data collection period and 150 swab samples were collected from the environment around the stall area in the second and third data collection periods. Three hundred poultry vendors and 30 market managers were interviewed using a structured questionnaire for the epidemiology survey. PCR testing used the same five-swab protocol as in the FAO program. The PCR results (Table 4-5) show the results for the H5N1 AI virus.

Table 4-5: Presence of H5N1 Virus in swab samples collected from traditional markets in West Java and Banten Provinces

District	Market	Intervention/control	PCR Result 1 st Round (May 2012)	PCR Result 2nd Round (Nov 2012)	PCR Result 3rd Round (Feb 2013)
Sukabumi	Sukaraja	Intervention	Negative	Negative	Negative

Ciamis	Manis	Intervention	Negative	Positive	Negative
	Pananjung	Intervention	Negative	Negative	Negative
	Banjarsari	Control	Positive	Negative	Negative
Total Positive Results			1	6	0

The first survey indicated that AIV H5N1 was present in the LBM environment with low prevalence (n=1) and in the second survey more positive results were found (n=6). This finding was related to the season and climate situation. The first survey was conducted during the dry season (in May) when the viability of AI in the environment is lower. The second survey was conducted during the rainy season, when the risk factors for AI prevalence are higher. In the third survey there were no positive results in any market.

To complement the market surveillance above, a study was conducted to identify the biosecurity conditions and practices at the market level and at poultry vendors at two different times. The first survey was conducted on May 21-29, 2012 and the second survey on February 4-14, 2013, using a questionnaire and biosecurity checklists. The biosecurity checklist was used to assess the market location and buildings, facilities provided, control of poultry origin, poultry health management, and

SAFE FINAL REPORT

personal hygiene and sanitation. The biosecurity assessment checklist for poultry vendors was intended for live poultry vendors, poultry slaughtering vendors, and poultry carcass vendors, and was used to assess the vendor stalls, availability of facilities at the stalls, handling of chicken carcasses, equipment provided, personal hygiene, and the sanitation level of the equipment and environment. The market was then categorized as 'good', 'fair' or 'poor'. Table 4-6 shows the results for the biosecurity conditions and practices at the market level.

Table 4-6. Biosecurity conditions and practices at the market level pre and post program interventions

District	Market Name	Level of market biosecurity conditions					
		Survey 1			Survey 2		
		Good	Fair	Poor	Good	Fair	Poor
		n	n	n	n	n	n
BANDUNG	Soreang	0	0	1	0	1	0

Table 4-6 shows that after eight months of program implementation, two markets improved their biosecurity conditions to the 'good' category in the second survey (Malangbong Market in Garut and Rangkas Bitung Market in Lebak). Two additional markets moved from poor to fair (Soreang Market

and Sayati Market in Bandung) and the number of markets categorized as 'poor' fell from 10 to 6 in the second survey.

The level of biosecurity conditions and practices at the poultry vendor level in all intervention markets also showed improvement in the second survey. The percentage of live poultry vendors in the 'fair' category rose from 38% to 56%. Poultry slaughterers also showed an increase in this category, from 37% to 63%, while the proportion of carcass poultry vendors categorized as 'fair' rose from 46% to 72%. Details of the findings are shown in Table 4-7.

Table 4-7: Biosecurity conditions and practices at the poultry vendor level pre and post program interventions

Vendor	Survey 1						Survey 2					
	Good		Fair		Poor		Good		Fair		Poor	
	n	%	N	%	n	%	n	%	n	%	n	%
Live poultry vendor	0	0%	13	38%	21	62%	5	15%	19	56%	10	29%
Poultry slaughterer	0	0%	11	37%	19	63%	2	7%	19	63%	9	30%
Carcass poultry vendor	0	0%	82	46%	96	54%	6	3%	126	72%	42	24%

Improvements were noted in several biosecurity practices, including the frequency of cleaning poultry cages, using ceramic material for display tables, using plastic cutting boards, cleaning knives in running water with soap, cleaning display tables, and using boots while working in the market. However, some practices still need to improve, such as always washing hands with soap, wearing special clothes or aprons while working, and changing clothes after work.

4.3.2c Healthcare-seeking evaluation

SAFE and Aisiyah conducted a care-seeking evaluation from the end of February to mid-March 2013 in order to better understand targeted audience responses to the care-seeking messages developed by SAFE and to program efforts aimed at improving healthcare-seeking practices. The areas that were evaluated included:

- Recall of care-seeking messages;
- Response to/acceptance of care-seeking messages disseminated through materials and community activities;
- Appropriateness of channels of communication; and
- Intention to act after receiving the message.

Two different approaches were applied in this study. SAFE employed a quantitative method using a questionnaire administered through face-to-face interviews, and a qualitative method using FGDs to obtain more detailed data. A total of 200 respondents (consumers) were surveyed in the 10 program

districts in West Java and Banten, and there were 36 participants in FGDs held in the three program districts (West Bandung, Tasikmalaya and Serang).

The key finding from the assessment was strong recall of the care-seeking message on AI symptoms in humans. Around 84% of respondents mentioned the AI symptoms, including fever, coughing, sore throat and difficulty breathing. Other topics included the poster tagline, influenza symptoms, and contact with sudden-death chickens. However, messages about the other risk factors were still not mentioned by at least half of respondents. Table 4-8 summarizes recall of topics on care-seeking messages.

Table 4-8: Recall of Care-Seeking Message Topics

N: 200 (multiple response)

Topic	Percentage
AI symptoms in humans	84%
<i>Mawas jika badan panas</i> (poster tagline)	67%
Influenza symptoms	60%
Contact with sudden-death chicken	60%
Contact with sick poultry	50%
Do not treat yourself	47%
Go to healthcare provider	47%
Poultry contact	47%
Contact with raw meat, eggs and inner organs	34%
Contact with place where poultry sold in last seven days	26%
Tell healthcare provider about poultry contact history	21%
Contact with farm in last seven days	20%

The findings from the FGDs confirmed this quantitative data. In general, all participants claimed to be familiar with AI messages, having heard them during the thematic Quran recitals by Aisiyah about two or three months previously. Most FGD participants mentioned the AI symptoms in humans correctly, and some were able to differentiate between AI and common flu. In general, all participants could easily comprehend the messages. They said that people should not underestimate flu/fever/cough and should visit a doctor or health practitioner immediately. Some of their responses are repeated below.

"...The symptoms are high fever, coughing, difficulty breathing, actually it is similar to common flu...but there is contact with poultry before getting sick...maybe like touching poultry, handling the chicken..." (from FGD in West Bandung)

"The symptoms are like flu, the difference is having difficulty breathing...contact with poultry...with sudden-death poultry or going to the market and buying chicken..." (from FGD in Tasikmalaya)

Although most participants reported that the messages were easy to understand, some of the messages brought multiple interpretations. The terms "contact" (contact with poultry), "immediately" (go to see a healthcare provider immediately) and "do not treat yourself" were still perceived unclearly and queried

by several participants. They needed detailed information about contact with poultry and they wanted to know the reasons and how many days they should wait before going to a healthcare provider.

Participants preferred small group or face-to-face socialization to television, since during group socialization they were free to ask questions and discuss the issues. They had heard about AI from television, but only news or information about victims. They said they had heard this technical information from SAFE for the first time.

Some suggestions from the participants included:

- Adding AI prevention messages;
- Using more than one poster and other media such as flipcharts, leaflets or pocketbooks; and
- Using pictures/visuals or an additional explanation to clarify the meaning of abstract words like “contact” and “immediately”.

In general, there was good acceptance of the care-seeking messages. There were no strong objections to the message and poster developed by SAFE. Having received this information, there is now a strong intention to immediately go to a healthcare provider when they get influenza and have had contact with poultry the previous day. In the survey, 76% of respondents reported being very likely to immediately go to a healthcare provider. Most said that they would go to a Puskesmas (70%) due to its accessibility and the low cost.

SUCCESS STORY

Market Manager Influences District Government Regulations

Photo: SAFE

Mr. Asep Tresna, an advocate for good management practices in markets, believes vendor participation is the key to better market management.

“It used to be hard to collect the market fee from the vendors because they didn’t see any improvements. Now the situation had changed, not only do we have improved facilities, but the vendors also actively participate in maintenance activities.”

Asep Tresna, market manager in Baleendah market, District of Bandung

Just recently, Mr. Asep Tresna was invited by the Bandung district House representative to participate in the revision of the district’s market fee regulations for all live bird markets in the district, based on his experience with the SAFE program.

Asep, who has been managing Baleendah market for three years and is also a representative of the Market Managers’ Forum in the district of Bandung, received a grant from SAFE to improve biosecurity in his market. He knew that one of the greatest challenges he faced was convincing his market vendors to participate in the maintenance and expansion of these biosecurity changes

His work with SAFE taught him that improved interpersonal communication and regular meetings with his vendors were essential in solving market problems. During the meetings, vendors communicated their aspirations, listened to the management’s perspective and slowly built a more trusting relationship. This improved collaboration resulted in vendors agreeing to a new and higher fee structure assessment for the market. The fee is used for cleaning, security and market maintenance.

Asep’s personal story and success in convincing all of the vendors in his market to pay the market fee influenced decisions at the wider district level (Perda Retribusi No. 11/2012 on Public Service Fee Collection). The result was a new fee structure requiring all vendors in the district to pay between Rp. 2,000 - Rp. 6,000 per day, defined by type of commodity sold and size of stall.

His next goal is to have the local government develop a local regulation on poultry zoning. “It was part of the government’s campaign three years ago, but then everyone seemed to forget. The SAFE program has reminded all of us about the issue again.”

Strategies Against Flu Emergence (SAFE) project is a two-year United States Agency for International Development (USAID) program implemented by Development Alternatives, Inc. (DAI) and Johns Hopkins University Center for Communication Programs.

SUCCESS STORY

Market Poultry Vendors Increase Biosecurity Practices

Photo: Palang Merah Indonesia

Vendors use glass to keep the carcass clean

"I can serve the consumer better because my new display is made of glass now. It is much cleaner, healthier, no flies and the carcass does not dry easily. It looks pretty too."

Ms. Denok, carcass vendor at Ciawi market, Tasikmalaya

SAFE facilitates biosecurity improvements and practices in the poultry value chain. The traditional market, where live poultry are sold and slaughtered and sometimes taken home live, is one of Avian Influenza's disease transmission points.

Over 800 market vendors have made biosecurity related improvements and market managers have led important infrastructure modifications to promote lower-risk behaviors at the markets and offer healthier poultry products.

SAFE has teamed with the Indonesian Red Cross and other local civil society and government partners to work with twenty demonstration poultry markets in western Java. The goal was to create an integrated and locally "owned" program that would empower the community and market vendors to identify risky conditions and behaviors at the market and create strategies to decrease the risk of AI transmission.

Field facilitators assisted market managers and vendors, and the surrounding communities to assess market conditions, develop an improvement plan, identify human and financial resources, and implement the program with the assistance of the local government. Involving consumers who learned to request cleaner stalls and healthy poultry products served as a business incentive for vendors who wanted to attract more customers.

Strategies Against Flu Emergence (SAFE) project is a two-year United States Agency for International Development (USAID) program implemented by Development Alternatives, Inc. (DAI) and Johns Hopkins University Center for Communication Programs.

SUCCESS STORY

Vocational School Improves Student Knowledge of Good Biosecurity and Farming Practices

Teaching Farm at SMK Nurul Huda vocational school

Photo: SAFE

SMK Nurul Huda opened its doors in 2008 and graduated its first class in 2011. On average, 60 students graduate every year with a high school specialization in poultry farming and computer skills. Ninety percent of them are immediately hired by the poultry industry as technical service and support staff.

In 2012, SAFE opened a teaching farm at SMK Nurul Huda to support upgrading of the curricula and hands-on experience with biosecurity and good farming practices. The 230 students are able to see up close a series of changes such as a new fence that separates the farm from the community area, a sandal exchange system, improved ventilation at the chicken houses, a dead bird pit for safe disposal of sick or dead chickens, and other biosecurity practices that decrease the transmission of poultry diseases such as Avian Influenza.

Most of the students currently enrolled come from poultry rearing families which means their new knowledge extends beyond the classroom. A third year student explained how she is sharing what she learns about biosecurity with her father. While difficult at first, her father is beginning to change old ways, little by little. He now understands the importance of improving disease control to protect his livelihood.

Upgrading pre-service education curricula has proven to be more cost-effective and efficient than spending human and financial resources to provide in-service training to modify risky practices after years of service. SMK's new graduates will be better prepared to support and champion good biosecurity and farming practices across Indonesia.

“Now we have standards for biosecurity instruction and necropsy equipment, and our farm is much cleaner.”

Mr. Iwan Setiawan, Assistant Director

SUCCESS STORY

Poultry Farmers Self-Finance Biosecurity Changes

Teaching Farm with a pass over system

Photo: SAFE

Over 230 poultry farms in western Java have implemented biosecurity changes and good farming practices after visiting one of Indonesia's new teaching farms.

The teaching farms are private broiler farms associated with the largest industry poultry producers, poultry shops and academic institutions. They model biosecurity and good farming practices and were developed as a response to the need for farmers to "see" these practices in action.

Farmers in the area of the teaching farms, and university and vocational school students have made over 1000 visits to the teaching farms to see first-hand and learn about biosecurity. Another 200 visits have been made by industry technical and management staff, and international organizations. Visitors understand biosecurity procedures through multisensory education that employs visual, aural and interactive techniques. The visiting farmers then received technical support to implement changes in their farms by SAFE and industry staff.

Approximately 80% of the changes implemented include footwear exchange at two separate entrances, building a fence and upgrading the hand washing area. These changes were deemed to be the simplest and least expensive to make. About 25% of the farms also built a dead bird pit for safe disposal of sick or dead birds. All the farmers receive educational materials including access to a recently produced farmer-to-farmer video. A "Champion Farmer" award recognizes those farms that have implemented the most important changes as well as the technical industry staff that provided the technical support.

"I invested IDR 2 million to improve my farm with a new gate for vehicles and people. I also built fences and began the use of the sandal exchange system at the chicken house doors."

Mr. Sanusi, Sanusi Farm

Strategies Against Flu Emergence (SAFE) project is a two-year United States Agency for International Development (USAID) program implemented by Development Alternatives, Inc. (DAI) and Johns Hopkins University Center for Communication Programs.

Radio Drama Series Highlights Poultry Value Chain Risks and Romance

Live community radio – Aisyiyah facilitators highlight the importance of market sanitation, cleanliness, consumer rights and halal food.

"I laughed when listening to it. The show had funny moments, especially when it comes to romance in the market. At the same time, I wondered what disease was affecting Mr. Ajat. I think the drama has given me a lot of useful information on how poultry products are processed and sold in the market. One must be very selective on what products to buy these days,"

Nia Nurniati, one of the listeners of the radio drama

SAFE launched a twelve-episode radio drama on Avian Influenza risks found throughout the poultry value chain.

The plot begins with a vendor falling seriously ill and being absent from the market for some time. Later, it is discovered that he has caught AI. The main character then sets off to investigate how he caught the disease, accompanied by a female vendor, when a romance develops. They visit a local farmer and learn about good farming practices. They also visit a slaughterhouse and meet a transporter who does not perform regular cleaning and disinfecting.

Finally, they discover that a chicken collector has been paying a garbage collector to buy dead chickens from a farmer. The dead chicken carcasses are then resold in the market at low prices.

In the last episode, the vendor who had fallen ill in the first episode recovers and returns to the market. He had gone to the community health center promptly, received treatment, been referred to a public hospital, and then recovered.

The drama series has been broadcast to approximately 200,000 listeners across Banten and West Java.

Episodes are sometimes followed by talk shows where experts from the government's Livestock Services, and Industry, Cooperatives and Trade office answer listeners' questions on good farming practices, healthy markets and waste management, and Avian Influenza in humans.

Strategies Against Flu Emergence (SAFE) project is a two-year United States Agency for International Development (USAID) program implemented by Development Alternatives, Inc. (DAI) and Johns Hopkins University Center for Communication Programs.

SUCCESS STORY

Koran Verses Linked to Clean Markets and Healthy Poultry

Religious event in the community, integrating Koran teachings, healthy poultry products and food safety.

Koran recital events in the communities surrounding the 20 live bird markets reached over 5,500 people.

Indonesia's Ministry of Agriculture healthy poultry products program focuses on products that are safe, healthy, whole and prepared according to local religious custom. Locally it's known as ASUH (Aman, Sehat, Utuh and Halal).

The SAFE project partnered with Aisyiyah, Indonesia's largest moslem women's organization, to support their outreach to poultry markets and surrounding communities to ensure that ASUH, and *thayyib* (cleanliness), were being practiced at the twenty project markets that served the local communities in western Java.

Issues of safe poultry products, hygiene and sanitation were linked to verses from the Koran and delivered at religious events commonly held once a week at a mosque, *mushalla* or community gathering facility.

With market vendors, Aisyiyah facilitators approached the topic from the view of good business ethics and demonstrated how to conduct an appropriate halal transaction. At community religious gatherings topics were food safety, and consumers' power to influence the markets.

Government officials participated in events and encouraged other leaders to conduct similar events in their respective areas. In Cianjur, Aisyiyah promoted and endorsed Koran readings with 60 women's organizations to further disseminate the key messages to their members.

Aisyiyah also developed a series of Khutbah (public sermon) books for vendors and consumers containing religious perspectives on biosecurity, food safety, good business practices, hygiene in Islam, business ethics in Islam, healthy markets, and the rights and obligations of consumers.

Strategies Against Flu Emergence (SAFE) project is a two-year United States Agency for International Development (USAID) program implemented by Development Alternatives, Inc. (DAI) and Johns Hopkins University Center for Communication Programs.

SUCCESS STORY

Citizen Journalism Takes on Social Change

Citizen journalists write and produce bulletins to share news, information and experiences of market stakeholders

Written by the community with assistance from SAFE facilitators, 16 editions of market bulletins were published during the last quarter of 2012. Each edition was distributed to market managers, vendors, consumers, government stakeholders and civil society organizations.

SAFE believes in the power of a consumer to trigger social change. Experience also demonstrates that changes in social norms are best accepted when desired behaviors are modeled by those around us.

In citizen journalism, communities themselves capture their own personal experiences around an important issue and report back to the community. SAFE uses citizen journalism as an effective tool to support a consumer demand campaign aimed at changes in live bird markets to support safer poultry purchases and improved poultry products for the community.

Participating communities report better confidence and positive self-efficacy, providing a strong foundation for consumer empowerment.

Articles written appear in live bird market bulletins and partners' news portals and websites showcasing the story of a vendor or a slaughterer's experience with adoption of healthy practices. More than 100 articles on healthy poultry and healthy markets have been uploaded thus far to partner facebook pages and websites. These articles have received more than 6,000 page views in a short period of time.

Topics highlighted include product zoning in the market, how to identify healthy poultry products, results of consumer visits to the market, and community gatherings focused on healthy poultry products.

The citizen journalism activities attracted the interest of Bogor's district office of Information and Communication who asked for SAFE assistance in conducting a three-day training on citizen journalism for 15 volunteers who work with the government's Radio Teman Bogor.

Strategies Against Flu Emergence (SAFE) project is a two-year United States Agency for International Development (USAID) program implemented by Development Alternatives, Inc. (DAI) and Johns Hopkins University Center for Communication Programs.

FROM THE AMERICAN PEOPLE

SUCCESS STORY

From Inspired to Inspirational

Mr. Denny (left), receiving additional tools for cleaning and disinfecting from the local government while still Sukaraja market manager.

Photo: Palang Merah Indonesia

“The market manager training has inspired me. I learned practical steps and processes to handle complex problems in the market. These practical steps are small but effective.”

Mr. Denny, Sukaraja market manager

Together with 19 fellow market managers, Mr. Denny attended a market manager training organized by SAFE. During the training, he learned about the principles of a healthy market, product zoning, basic sanitation and hygiene. He also learned about the role of the market manager. At that time, no one really knew how the training had inspired Mr. Denny.

When he returned to Sukaraja, one of the demonstration markets supported by SAFE, he immediately began improving the cleanliness of his market but just a few months later he was reassigned. The move took him to Warung Kiara market which was much bigger than Sukaraja, and located on the side of the main road.

When he moved, he brought with him the inspiration, knowledge and skills he had acquired during the market manager training. Very soon he was able to form a vendor association and establish a system for fund raising.

He was able to encourage vendors to establish a vendor's group and contribute IDR 1,000 per day for petty cash. In total he collected IDR 21 million. A portion of the funds was used to improve vendor stalls including replacement of table tops from wood to ceramic.

His newest idea is to rent the space in front of the market for carnival activities, a popular attraction in Sukabumi. Rental fees collected will be used for additional physical improvements to the market and a portion will launch a social contribution fund for vendors and family to cover expenses in case of illness.

Champions like Mr. Denny exemplify how market managers can provide healthy and quality poultry products to their customers while serving the business needs of their vendors.

Strategies Against Flu Emergence (SAFE) project is a two-year United States Agency for International Development (USAID) program implemented by Development Alternatives, Inc. (DAI) and Johns Hopkins University Center for Communication Programs.

Community Videos Spark Interest in Healthy Poultry Markets

Video screening at Maja market

Photo: Corbis

Approximately 60 community members attended the inaugural screening of a community video at Maja market entitled “I’m afraid my chicken carries the AI virus”.

The story begins with a backyard poultry owner seen listening to a radio talk show about AI. He hears a government expert explain the signs and symptoms of AI in chickens and the dangers AI poses to humans. He becomes anxious when he thinks one of his chickens might be infected. Believing his wife has taken the chicken to the nearest market to sell, he heads to the market to stop the transaction. He wanted to cull the chicken and dispose of it properly, as explained during the radio talk show. In the end, he discovers his wife never brought the chicken to the market.

Along with citizen journalism activities, SAFE has utilized audio-visual media to support the project’s Healthy Market Initiative.

SAFE facilitated training of community members to develop and screen short videos depicting risky behaviors observed at traditional poultry markets to encourage reflection and discussion.

Twenty-seven videos have been produced using mobile phones and video cameras. In one video, a group of high school students share concerns about the conditions at their neighborhood traditional market and how it can no longer be regarded as a safe food market. Another video documents market conditions in Bogor by mixing testimonials from housewives and vendors.

This intervention found that people who saw themselves practicing risky behaviors such as slaughtering poultry without proper protection, tossing waste from slaughtering activities, or selling and buying unhealthy chicken carcasses, were more likely to recognize and acknowledge the dangers of such behaviors.

Based on the success of the video initiative, SAFE and partners launched a competition for short films with the theme “healthy traditional markets for healthy consumers”. In early 2013, three winners were selected by a panel composed of judges from the Jakarta Art Institute, filmpelajar.com and Blogger Nusantara.

SUCCESS STORY

Consumer Empowerment Across West Java Province

Group exercise involving healthy poultry products before Koran reading

“We regard the Consumer Empowerment Program as our organization’s mandate. It is at the very core of Islamic principles and values to work towards improvement and empowerment.”

Ms. Heni Nur’aeni, SH, Vice Chairperson of Aisyiyah West Java Chapter

Imagine thousands of women in 700 *Majlis Taklim* (Koran reading groups) across West Java reciting and studying the wisdom of the holy Koran and prophet Muhammad and applying the words to the role of women as home makers, food handlers and health providers, and discussing Avian Influenza prevention and control.

In West Java this is soon to be a reality. Under the leadership of Aisyiyah’s West Java provincial chapter, approximately 40,000 women will be reached through thematic Koran reading groups related to healthy poultry, healthy practices, and Avian Influenza. All 26 districts and municipalities will be reached under the initiative of Aisyiyah’s West Java Chapter to replicate the consumer empowerment program implemented under the SAFE program.

One of the women who attended a Koran reading in West Java said “Before I didn’t know that Bird Flu has symptoms similar to the common flu. It is a normal practice in my family to self-medicate first before going to see a doctor. Ever since I attended the Koran reading organized by Aisyiyah, I have a commitment with myself to not put my family members at risk. I clean up properly, choose only healthy carcass when shopping at the market, and cook properly. If someone in my family falls sick, I will definitely ensure they go to a doctor and I will tell the doctor about his/her contact history with poultry, if any.”

Aisyiyah’s network includes more than 20 million members across Indonesia. SAFE’s consumer empowerment program was officially embraced by the national board in October 2012. The organization has plans to replicate in other geographic areas.

Strategies Against Flu Emergence (SAFE) project is a two-year United States Agency for International Development (USAID) program implemented by Development Alternatives, Inc. (DAI) and Johns Hopkins University Center for Communication Programs.

SUCCESS STORY

Koran Verses Linked to Clean Markets and Healthy Poultry

Religious event in the community, integrating Koran teachings, healthy poultry products and food safety.

Koran recital events in the communities surrounding the 20 live bird markets reached over 5,500 people.

Indonesia's Ministry of Agriculture healthy poultry products program focuses on products that are safe, healthy, whole and prepared according to local religious custom. Locally it's known as ASUH (Aman, Sehat, Utuh and Halal).

The SAFE project partnered with Aisyiyah, Indonesia's largest moslem women's organization, to support their outreach to poultry markets and surrounding communities to ensure that ASUH, and *thayyib* (cleanliness), were being practiced at the twenty project markets that served the local communities in western Java.

Issues of safe poultry products, hygiene and sanitation were linked to verses from the Koran and delivered at religious events commonly held once a week at a mosque, *mushalla* or community gathering facility.

With market vendors, Aisyiyah facilitators approached the topic from the view of good business ethics and demonstrated how to conduct an appropriate halal transaction. At community religious gatherings topics were food safety, and consumers' power to influence the markets.

Government officials participated in events and encouraged other leaders to conduct similar events in their respective areas. In Cianjur, Aisyiyah promoted and endorsed Koran readings with 60 women's organizations to further disseminate the key messages to their members.

Aisyiyah also developed a series of Khutbah (public sermon) books for vendors and consumers containing religious perspectives on biosecurity, food safety, good business practices, hygiene in Islam, business ethics in Islam, healthy markets, and the rights and obligations of consumers.

SUCCESS STORY

Poultry Farmers Self-Finance Biosecurity Changes

Teaching Farm with a pass over system

Photo: SAFE

Over 230 poultry farms in western Java have implemented biosecurity changes and good farming practices after visiting one of Indonesia's new teaching farms.

The teaching farms are private broiler farms associated with the largest industry poultry producers, poultry shops and academic institutions. They model biosecurity and good farming practices and were developed as a response to the need for farmers to "see" these practices in action.

Farmers in the area of the teaching farms, and university and vocational school students have made over 1000 visits to the teaching farms to see first-hand and learn about biosecurity. Another 200 visits have been made by industry technical and management staff, and international organizations. Visitors understand biosecurity procedures through multisensory education that employs visual, aural and interactive techniques. The visiting farmers then received technical support to implement changes in their farms by SAFE and industry staff.

Approximately 80% of the changes implemented include footwear exchange at two separate entrances, building a fence and upgrading the hand washing area. These changes were deemed to be the simplest and least expensive to make. About 25% of the farms also built a dead bird pit for safe disposal of sick or dead birds. All the farmers receive educational materials including access to a recently produced farmer-to-farmer video. A "Champion Farmer" award recognizes those farms that have implemented the most important changes as well as the technical industry staff that provided the technical support.

"I invested IDR 2 million to improve my farm with a new gate for vehicles and people. I also built fences and began the use of the sandal exchange system at the chicken house doors."

Mr. Sanusi, Sanusi Farm

SUCCESS STORY

Vocational School Improves Student Knowledge of Good Biosecurity and Farming Practices

Teaching Farm at SMK Nurul Huda vocational school

Photo: SAFE

SMK Nurul Huda opened its doors in 2008 and graduated its first class in 2011. On average, 60 students graduate every year with a high school specialization in poultry farming and computer skills. Ninety percent of them are immediately hired by the poultry industry as technical service and support staff.

In 2012, SAFE opened a teaching farm at SMK Nurul Huda to support upgrading of the curricula and hands-on experience with biosecurity and good farming practices. The 230 students are able to see up close a series of changes such as a new fence that separates the farm from the community area, a sandal exchange system, improved ventilation at the chicken houses, a dead bird pit for safe disposal of sick or dead chickens, and other biosecurity practices that decrease the transmission of poultry diseases such as Avian Influenza.

Most of the students currently enrolled come from poultry rearing families which means their new knowledge extends beyond the classroom. A third year student explained how she is sharing what she learns about biosecurity with her father. While difficult at first, her father is beginning to change old ways, little by little. He now understands the importance of improving disease control to protect his livelihood.

Upgrading pre-service education curricula has proven to be more cost-effective and efficient than spending human and financial resources to provide in-service training to modify risky practices after years of service. SMK's new graduates will be better prepared to support and champion good biosecurity and farming practices across Indonesia.

“Now we have standards for biosecurity instruction and necropsy equipment, and our farm is much cleaner.”

Mr. Iwan Setiawan, Assistant Director

EXECUTIVE SUMMARY

This workplan is the second and final workplan for SAFE. It covers a period of 15 months, from March 15, 2012 to June 15, 2013. The original Year 2 workplan, submitted in April 2012 was placed on hold at the request of USAID because of a significant budget cut followed by a revised scope of work and changes to the contract that were completed on November 5, 2012 followed by the submission of this workplan.

The original SAFE objectives remain the same:

- Objective 1. Strengthen and Expand Public Private Partnerships to Improve Good Farming Practices and Limit AI Transmission among Poultry
- Objective 2. Promote Behaviors that Lower the Risk of AI Transmission Among Poultry and Increase Knowledge of Signs and Symptoms and Risk Factors for AI Related Illnesses
- Objective 3. Increase Knowledge of Signs/Symptoms and Risk Factors for AI-Related Illness in People and Promote Behaviors that Improve Household-Level Care-Seeking in Response to AI-Related Illnesses
- Objective 4. Coordinate with and Facilitate Communication among Partners

This final workplan has been modified to reflect the following changes:

- significant budget cuts;
- new scope of work due to the de-scoping process that needed to be undertaken as a result of the budget cut, resulting in a delay in Year 2 workplan approval and implementation;
- new activities on hold as the new SOW was being negotiated;
- reduction in staffing and reorganization of staff responsibilities; and
- elimination of multiple key inputs such as the number of teaching farms and markets, the PVUK/private sector model, upgrades to teaching farms, the grants Biosecurity Improvement Innovation Fund, strategic communication training, instructional video for use by GOI, radio drama series #2, and many others.

This workplan builds on the accomplishments of Year 1, which are highlighted below and described in more detail in the Program Overview section.

- Public and private sectors committed to making changes for improved biosecurity;
- Improved Indonesian technical, management and programmatic capacity;
- Indonesia's first poultry teaching farms operating in an effort to control disease;
- Demonstration live bird market (LBM) action plans in place;
- Information, education and communication materials and tools developed;
- Civic organizations engaged and committed to empowering poultry consumers;
- Demonstrated commitment to cost sharing;

YEAR TWO WORKPLAN

- Research completed for evidenced-based programming; and
- Baselines collected for quantitative and qualitative evaluation.

SAFE will continue to be incentive-based, entrepreneurial and collaborative. These approaches have proven to be essential in securing commitment, motivation and change.

In addition, given the severe decrease in budget and accompanying reduction in performance period, SAFE has adjusted its strategy to emphasize the following tenets during the last 15 months:

➤ *Concentrate efforts.*

SAFE will focus efforts on the same 12 western Java districts where it worked in Year 1, and work with key partners in the poultry industry, academic institutions, NGOs, local and national government, and international partners. Efforts will also focus on fortifying the key messages developed under the 2011 "Consensus Report: Priority Audiences and Behaviors for Reducing the Risk of AI Transmission in Indonesia."

➤ *Reinforce local ownership.*

SAFE will accelerate the transfer of responsibilities to local partners and continue to collectively implement the program, evaluate progress and conduct mid-term corrections.

➤ *Produce tools to sustain efforts.*

SAFE's approaches and models have been well received by local partners. A minimum of five documents will be produced to capture the methodology, interventions, models or results of work performed in the areas of research, biosecurity changes at commercial farms, consumer demand results at live bird markets, and use of social media as a catalyst for change.

As stated earlier, SAFE will continue to operate in the same high-risk districts in western Java, which include three districts in Banten province and nine districts in West Java province. These twelve districts are Ciamis, Tasikmalaya, Garut, Bandung, Bandung Barat, Cianjur, Sukabumi, Bogor, Lebak, and Serang and only under Objective 1, Tangerang and Sumedang.

SAFE will continue to target three critical points in the poultry value chain to decrease the transmission of H5N1: (a) the poultry industry, including contract and independent farmers that harvest the broiler chickens; (b) traditional live bird markets where chickens are sold; and (c) the poultry consumer, including customers at live bird markets. The activities to be implemented are described in more detail under each of the objectives below.

During the period covered by this workplan, Objective 1 will: 1) Continue to hold strategic consultative meetings with industry and academic stakeholders; 2) conduct farmer and student visits to the teaching farms; 3) provide technical support to farmers to adopt and implement new biosecurity and good farming practices; 4) produce and distribute educational and communication materials; and 5) develop and establish technical discussion groups meetings. SAFE will capture the changes and document the results under the monitoring and evaluation plan.

Objective 2 will: 1) organize and conduct consultative meetings to develop and establish local ownership; 2) establish local NGO involvement to create consumer demand activities; 3) support improvement of vendor stalls; 4) maintain market improvements; 5) establish vendor of the month award; 6) air radio serial drama; 7) develop targeted communication tools to support changes in LBMs; and 8) provide health communication strategy workshop to ministry program/communication staff (Same as Objective 3, activity 8). SAFE will capture the changes and document the results under the monitoring and evaluation plan.

Objective 3 will: 1) analyze data from the Healthcare Utilization Survey (HUS) and the Clinician's Knowledge, Attitudes and Practices (C-KAP) Survey; 2) create new report versions of the HUS and C-KAP; 3) present findings from HUS and C-KAP to MOH, partners and stakeholders; 4) build consensus and develop priority messages for care-seeking behaviors; 5) develop a communication strategy; 6) develop a communication poster with key messages; 7) disseminate care-seeking key messages; and 8) provide health communication strategy workshop to ministry program/communication staff (Same as Objective 2, activity 8). SAFE will conduct a qualitative evaluation, through partners, to measure acceptance of messages, materials and channels of communication as well as offer recommendations for future programming.

Objective 4 will: 1) document/highlight SAFE activities; 2) develop, produce and disseminate information series; 3) upload A/PI stakeholder information onto K4H website; 4) organize and host monthly COP meetings; 5) hold informal end-of-project forum (s); and 6) support project-related domestic and international travel for Indonesian government counterparts or other parties.

By the end of the project, SAFE expects to have achieved the following:

- ✓ Improved biosecurity and good farming conditions and practices at Sector 3 broiler farms;
- ✓ Embedded biosecurity technical assistance in poultry industry technical farm visits;
- ✓ Integrated SAFE biosecurity materials into poultry industry and academic training and classroom curricula;
- ✓ Improved risk reduction conditions and practices of live bird market vendors;
- ✓ Healthy market and community empowerment initiatives replicated by local government and civic organizations;
- ✓ Engaged and knowledgeable consumers that demand cleaner markets and healthy poultry products;
- ✓ Social media and civic society partners interacting with target audiences;
- ✓ A functional platform for sharing Indonesia-related avian and pandemic flu information and documentation;
- ✓ Healthcare Utilization Survey (HUS) and the Clinician's Knowledge, Attitudes and Practices (C-KAP) research completed and analyzed, and findings disseminated.
- ✓ An information series that captures and disseminates highlights of the SAFE experience.

I. OVERVIEW OF PROGRAM

Program Objectives

The Strategies Against Flu Emergence (SAFE) project, awarded March 15, 2011, was developed to support USAID/Indonesia's Avian and Pandemic Influenza (A/PI) Program to reduce the impact of AI on animals and humans and limit the emergence of a pandemic influenza virus. SAFE has four objectives:

- Objective 1. Strengthen and Expand Public Private Partnerships to Improve Good Farming Practices and Limit AI Transmission among Poultry
- Objective 2. Promote Behaviors that Lower the Risk of AI Transmission among Poultry and Increase Knowledge of Signs and Symptoms and Risk Factors for AI-Related Illnesses
- Objective 3. Increase Knowledge of Signs/Symptoms and Risk Factors for AI-Related Illness in People and Promote Behaviors that Improve Household-Level Care-Seeking in Response to AI-Related Illnesses
- Objective 4. Coordinate with and Facilitate Communication among Partners

Objective 1

Objective 1 will focus on private sector partnerships to improve good farming practices and limit AI transmission among poultry. The public sector continues to be very limited in its ability to provide value-added technical assistance to the private sector. These limitations, coupled with the inherent private and competitive nature of the poultry industry and a continued distrust of each other impedes the ability to form public/private sector partnerships that are open, transparent and productive. Other international partners have found the same challenges. Nevertheless, SAFE continues to invite and include the public sector in commercial sector activities whenever feasible and also keeps the national and local governments involved in SAFE activities with the private sector. Documents from the information series will be shared with both public and private sectors.

During the period covered by this workplan, Objective 1 will: 1) continue to hold strategic consultative meetings with industry and academic stakeholders; 2) conduct farmer and student visits to the teaching farms; 3) provide technical support to farmers to adopt and implement new biosecurity and good farming practices; 4) produce and distribute educational and communication materials; and 5) develop and establish technical discussion groups meetings. SAFE will capture the changes and document the results under the monitoring and evaluation plan.

Objective 2

Objective 2 will: 1) organize and conduct consultative meetings to develop and establish local ownership; 2) establish local NGO involvement to create consumer demand activities; 3) support improvement of vendor stalls; 4) maintain market improvements; 5) establish vendor of the month award; 6) air radio serial drama; 7) develop targeted communication tools to support changes in LBMs; and 8) provide health communication strategy workshop to ministry program/communication staff

(Same as Objective 3, activity 8). SAFE will capture the changes and document the results under the monitoring and evaluation plan.

Objective 3

The work under Objective 3 will be limited in scope. Funding, a new performance period, and the need to prioritize will not enable the project to increase knowledge of all relevant signs/symptoms and risk factors for AI-related illnesses. Priority behaviors that improve household-level care-seeking will be selected based on research findings and highlighted by existing partners through a limited communication campaign.

Objective 3 will: 1) analyze data from the HUS and C-KAP Survey; 2) create new report versions of the HUS and C-KAP; 3) present findings from HUS and C-KAP to MOH, partners and stakeholders; 4) build consensus and develop priority messages for care-seeking behaviors; 5) develop a communication strategy; 6) develop a communication poster with key messages; 7) disseminate care-seeking key messages; and 8) provide health communication strategy workshop to ministry program/communication staff (Same as Objective 2, activity 8). SAFE will conduct a qualitative evaluation, through partners, to measure acceptance of messages, materials and channels of communication as well as offer recommendations for future programming.

Objective 4

Objective 4 will: 1) document/highlight SAFE activities; 2) develop, produce and disseminate information series; 3) upload A/PI stakeholder information onto K4H website; 4) organize and host monthly COP meetings; 5) hold informal end-of-project forum(s); and 6) support project-related domestic and international travel for Indonesian government counterparts or other parties.

Building on Year I Foundation

The next 15 months will build on the partnerships, commitments, strategies, research and overall program work accomplished during Year I. These are highlighted below:

- **Public and private sectors committed to making changes for improved biosecurity.** Commitments were secured from poultry industry senior management, IPB and UNPAD universities, SMK Nurul Huda vocational school, owners of the Teaching Farms (TFs), LBM managers, and local governments in the high-risk provinces of West Java and Banten.
- **Improved Indonesian technical, management and programmatic capacity.** Technical Service (TS) industry staff, farm owners, managers and workers, local government animal husbandry professionals, LBM managers and field facilitators received group or one-on-one training in areas such as biosecurity and good farming practices; motivational, planning, finance and supervision skills; application of new approaches and techniques to reduce transmission of poultry disease and improving production; cleaning and disinfection techniques at LBMs, and effective approaches to managing LBMs and motivating and supporting changes by vendors. Indonesian Red Cross (PMI) facilitators were trained in participatory approaches, needs

YEAR TWO WORKPLAN

assessments, mapping techniques, problem identification, problem solving, proposal development, stakeholder analysis, and advocacy.

- **Indonesia's first poultry teaching farms operating in an effort to control disease.** The first 11 (and an additional one in the first month of Year 2) Indonesian TFs were created to respond to the need for Sector 3 farm workers and students to visualize biosecurity and good farm management practices, and to move beyond traditional classroom and hands-on field-level training. This learning approach is simple but powerful.
- **Demonstration live bird market action plans in place.** These plans were developed collectively by LBM managers, vendors and local government offices. Government and stakeholder consultative meetings in all program districts, joint assessments and decisions on the selection of 20 demonstration markets, and participatory mapping of these markets resulted in local ownership of SAFE program activities by District Livestock Services staff, District Industry and Trade Office staff, market managers, and members of the market's poultry supply chain including vendors, slaughterers and transporters. These action plans for change will contribute to a reduction in the risk of disease transmission both among poultry and from poultry to humans.
- **Information, education and communication materials and tools developed.** SAFE developed, field tested and vetted with partners a set of communication materials based on the "2011 Consensus Report: Priority Audiences and Behaviors for Reducing the Risk of AI Transmission in Indonesia", which SAFE updated through a collaborative effort this year.
- **Civic organizations engaged and committed to empowering poultry consumers.** SAFE awarded grants to two NGOs – Aisiyah and COMBINE – to implement a consumer empowerment campaign directed at influencing and motivating the consumer to demand clean LBMs and healthy poultry products. Aisiyah's area of expertise is conducting consumer demand generation activities through a faith-based approach and messaging. COMBINE's strength is maximizing the use of community-based media.
- **Demonstrated commitment to cost sharing.** Despite facing financial constraints, Sector 3 broiler farms contributed an average of 16% towards the total cost of upgrading their farms to become TFs. Inputs included labor, supplies and fencing materials, and sometimes cash. NGO grantees Aisiyah and COMBINE are contributing 10.5% in in-kind contributions. While the recipients of the 20 grants for LBM improvements are required to contribute a minimum of 10% of costs, in practice they are contributing an average of 16.3%, with the funds coming from both market vendors and stakeholders. Local government offices have committed to contribute disinfectant as well as labor and expertise to the demonstration market managers and vendors.
- **Research completed for evidenced-based programming.** Five research surveys, studies and analyses were conducted in Year 1: 1) Healthcare Utilization Survey (HUS); 2) Clinician's Knowledge, Attitudes and Practices (KAP) Survey; 3) KAP 2009 Secondary Data Analysis; 4) Rapid Needs Assessment; and 5) Sector 3 Broiler Farm Survey. The results of these studies will inform programming during the next 15 months.

YEAR TWO WORKPLAN

- **Baselines collected for quantitative and qualitative evaluation.** In close collaboration with its partners, SAFE designed two evaluation studies that will support monitoring and evaluation efforts. The Commercial Farm Evaluation Study and the Live Bird Market Evaluation Study are designed to provide evidence-based information on changes in biosecurity conditions and practices at Sector 3 broiler farms and LBMs in West Java and Banten provinces.

Program Approach

SAFE has refined its approach to working with government, private sector, civic organizations, community groups and other stakeholders to counteract the significant disruption caused by the reduction in budget and resulting shortened performance period. SAFE is leveraging program efforts from Year 1 and focusing on the activities that make the greatest difference in the ability to achieve and sustain results and have the greatest impact on those served by the project.

SAFE will continue to use approaches practiced since the launch of the project, which have proven to be essential in securing commitment, motivation and change. They are described below:

- *Incentive-based.* Motivations and behavioral drivers relevant to each targeted audience group will continue to be the focus – from the commercial sector to the community.
- *Entrepreneurial.* The entrepreneurial spirit of early adopters of biosecurity, good farming practices and clean markets will continue to be a driving force behind change.
- *Collaborative.* Extensive collaboration with Indonesian leaders, the public and private sectors, and international stakeholders will continue to be a cornerstone of the program.

In addition, SAFE will:

➤ **Concentrate efforts.**

SAFE will focus efforts on the 12 western Java districts where it has been working and will continue to engage the key partners in the poultry industry, academic institutions, NGOs, local and national government, and international partners. Efforts will also focus on fortifying the key messages developed under the “2011 Consensus Report: Priority Audiences and Behaviors for Reducing the Risk of AI Transmission in Indonesia”, ensuring appropriate practices remain in place at the 12 TFs, and supporting consumer demand initiatives for healthier markets and poultry products.

➤ **Reinforce local ownership.**

SAFE will accelerate the transfer of responsibilities to local partners and continue to collectively implement the program, evaluate progress and conduct mid-term corrections.

➤ **Produce tools to sustain efforts.**

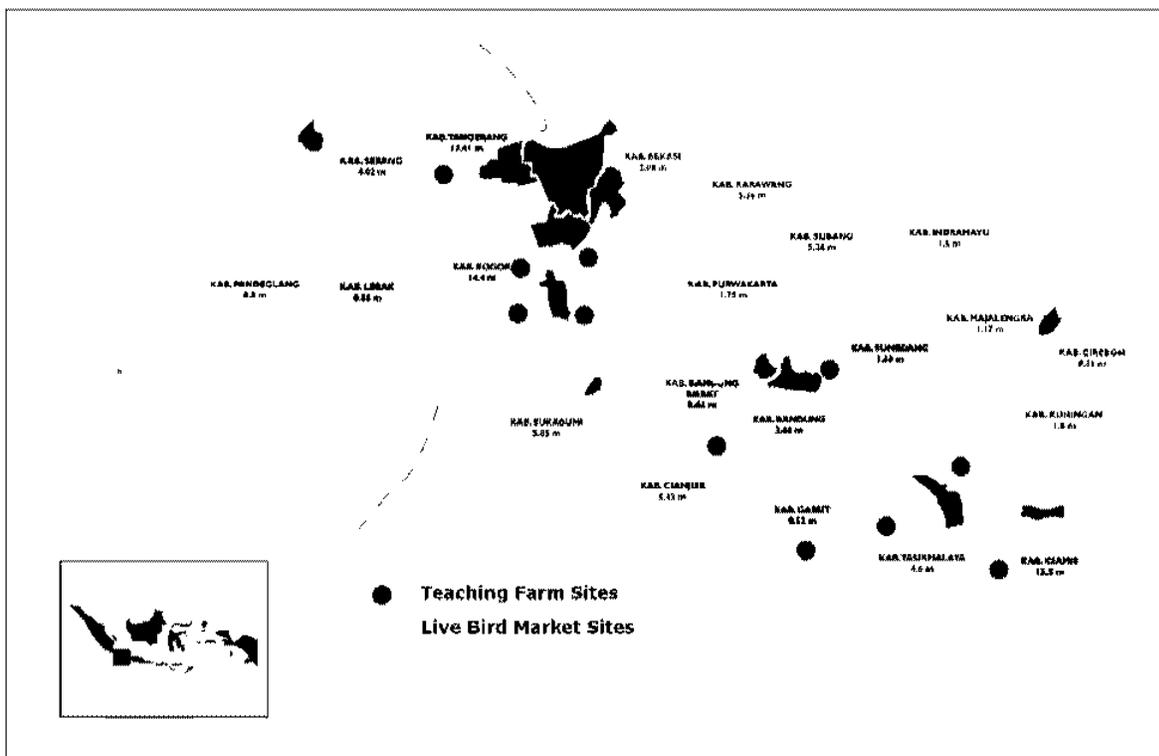

SAFE’s approaches and models have been well received by local partners. A minimum of five documents will be produced to capture the methodology, interventions, models and results of work

performed in the areas of research, biosecurity changes at commercial farms, consumer demand results at live bird markets, and use of social media as a catalyst for change.

Geographic Focus

During Year 1 SAFE operated in 12 high-risk districts in western Java; three districts in Banten province and nine districts in West Java province. These twelve districts are Ciamis, Tasikmalaya, Garut, Bandung, Bandung Barat, Cianjur, Sukabumi, Bogor, Lebak, and Serang and only under Objective 1, Tangerang and Sumedang. These districts are the busiest trading routes for poultry in Indonesia. The map in Figure 1 shows the locations of the TFs with red dots and the locations of the Healthy LBM Initiative with green dots.

Figure 1. SAFE Geographical Focus in Year 2

The large number of Sector 3 farms located in western Java and the movement of poultry through the value chain into the Jabodetabek (Greater Jakarta) area, coupled with the high density of the human population, make this region a high-risk AI transmission area. Data from the FAO-trained government Participatory Disease Surveillance and Response (PDSR) officers also indicate western Java to be a high-risk area. These data are derived from Sector 4, which is a proxy data point used by FAO.

Concentrating on western Java optimizes the effectiveness of program implementation, with a focus on Sector 3 biosecurity and good farming practices, healthy market initiatives, and consumer empowerment.

2. PROGRAM PLANNING, MANAGEMENT, REPORTING AND CLOSEDOWN

Program Planning

The 15-month workplan presented in this document was developed in close collaboration with partners. SAFE convened a workplan retreat that was attended by all key SAFE partners – Ministry of Agriculture (MOA)/CMU, MOH, FAO, PMI, and poultry industry representatives. Team leaders reviewed and led a discussion on each objective's outcomes and outputs. Inputs and recommendations from partners were accommodated in this workplan. This participatory approach helped establish links with existing programs, reduce duplicative efforts, clarify questions, and strengthen the overall workplan. After the reduction in budget, USAID and SAFE discussed priority activities and chose those that will make the greatest difference in achieving and sustaining results and that have the greatest impact on the objectives of the project within the new timeframe for performance.

Program Management

Adjustments

The scale of change in program budget, implementation period and workplan required significant changes in management.

First, the organizational structure required to support the activities was modified. Six positions were eliminated, 50% of those were professional staff. The positions eliminated included Government & Community Liaison, Public Private Partnership Specialist, Monitoring and Evaluation Officer, a Grant and Contracts Specialist, and two Program Officers. SAFE has combined the Behavioral Research Analyst with the Monitoring and Evaluation Officer responsibilities. Please see Annex I for the revised management structure of the SAFE team.

Second, senior managers are meeting more frequently to address program implementation issues and ensure all deliverables are completed on or before schedule. While SAFE reports to USAID on a quarterly basis, internally, deliverables are set on a monthly deadline schedule. In addition, one-on-one meetings with the COP focus on identifying and addressing any barriers that may cause a delay in implementation.

Third, SAFE informed all key partners of the changes in budget and life-of-project. Transfer of responsibilities is taking place earlier, which is causing some discomfort to partners that are not yet ready to assume these responsibilities. SAFE manages these issues on a case-by-case basis.

Fourth, the Project's Performance Monitoring Plan (PMP) was modified to reflect the budget cut and resulting decrease in performance period.

Fifth, cost containment and management, which are always a priority for DAI projects, have taken on even greater weight because of the 65.5% decrease in budget. The project budget will now be monitored on a bi-weekly basis as opposed to a monthly basis.

Finally, monitoring visits by the Research/M&E specialist have been increased in order to collect additional qualitative information, and evaluation plans have been modified with university partners to

YEAR TWO WORKPLAN

account for the reduced life-of-project and to ensure data collection and reports are completed and submitted based on the new timeline.

The COP continues to be responsible for ensuring that all staffs perform effectively to meet the deliverables outlined in the workplan, and for subcontract management of JHU-CCP and PMI.

Meeting Schedules

Teamwork is essential, as many of the project's activities affect more than one objective. In addition to the more frequent Senior Management Team and one-on-one meetings described above, all-staff meetings are held every two weeks. These meetings focus on programmatic integration as well as management, administrative and programmatic issues. Problem-solving, coordination and compliance with USAID and DAI regulations are agenda items at every meeting.

The biweekly meetings that began in Year I with the COR and assistant COR will continue, thus ensuring that USAID is apprised of successes and challenges, bottlenecks and achievements, which will become particularly important during the final 15 months.

Internal Systems

Internal controls, manuals and systems implemented during Year I continue to serve the project. In Year I, under the direction of the COP, the Senior Finance, Procurement and Grants Manager developed a personnel manual as well as procurement, travel and vehicle policies. Staff use these administrative policies and procedures to help reduce risk, control costs, and ensure compliance with USG and USAID regulations. SAFE's Technical and Administrative Management Information System (TAMIS) allows project staff to perform administrative functions critical to effective project management, including among other things grants management, procurement procedures, subcontractor management, and travel procedures. Time stamps of reviews and approvals provide an audit trail.

SAFE's Field Accounting System (FAS), which is a secure software accounting application, combines an accounting database back-end with a customized front-end, integrating the specific needs of the project and client. The FAS has been customized to reflect local labor laws, automating some of the most complex elements of field financial management including payroll, tax withholding and payment of remittances, cash advance tracking, and monitoring of local subcontract and activity budgets. In addition, the FAS imposes strict controls over financial data and assigns different levels of rights to the various users. Time stamps of modified transactions provide an audit trail report with information about transactions and modifications.

DAI/Bethesda

DAI's headquarters in Bethesda, Maryland will continue to provide additional oversight, respond to USAID requests for contractual information, and issue accurate invoices and other financial statements. DAI home office support offices, including Finance, Contracts, Procurement, Information and

YEAR TWO WORKPLAN

Management Technology, and Human Resources/Recruitment offices, will continue to ensure that the COP has the management support, expertise and resources needed to manage SAFE and meet or exceed USAID expectations.

DAI home office technical backstop has been reduced substantially. STTA from abroad or Indonesia has been eliminated. Anahit Gevorgyan will provide minimal management support to SAFE and serve as the point of contact in the DAI home office. She will also lead quarterly project reviews with the COP to discuss and resolve project management, technical, and/or information issues quickly and efficiently. DAI home office Project Coordinator Nicole Russo's Level of Effort (LOE) has also been reduced, but she will continue to provide administrative support to SAFE regarding all financial and administrative issues and will conduct a site visit during closedown.

Program Reporting

In accordance with our contract and modifications, SAFE will submit the following program and financial reports and assist with other reporting requirements as needed by USAID.

Program Reports

- Annual Monitoring and Evaluation Report within ten working days after the start of the fourth fiscal quarter
- Monthly Report within five days after the end of each month
- Quarterly Reports within ten working days after the start of each fiscal quarter

Financial Report

- Pipeline Analysis Report within 30 calendar days following the end of each fiscal quarter
- Accrual Report no later than the 20th of March, June, September and December covering the period through the end of the reporting Quarter

Program Closedown

SAFE will submit a closedown and disposition plan before the last six months of the project outlining the staff demobilization plan, disposition plan for SAFE inventory and the steps for the closedown of the project. SAFE field staff will work closely with staff in Bethesda to ensure a successful closedown of the project that is in compliance with USAID regulations and DAI procedures.

3. IMPLEMENTATION OF PROGRAM

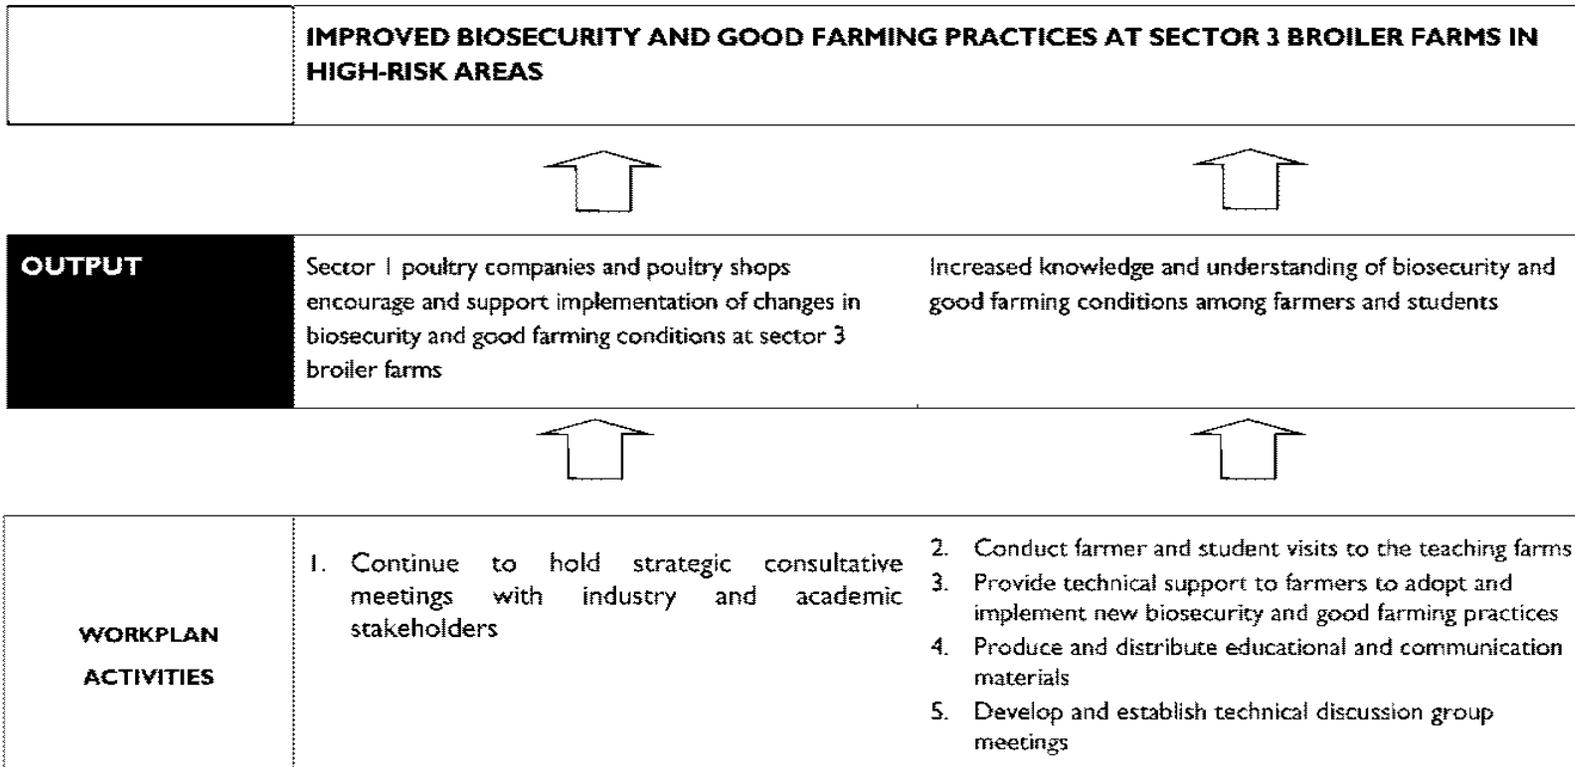

The program implementation plan embraces a modified and accelerated approach, as explained earlier. It builds on a strong foundation centered on creating local ownership, active partnerships with public and private sector leadership, incentives and motivation, and consultation and productive working relationships with FAO, WHO, Government of Indonesia (GOI) ministries and coordinating bodies. SAFE will no longer expand but instead concentrate efforts, reinforce local ownership by accelerating to the extent possible the transfer of responsibilities to local partners, and produce and disseminate communication, educational and practical tools to sustain efforts long after SAFE has ended.

SAFE has strived to use multiple interventions for a single outcome, including combining program and policy interventions. One example is combining consumer demand activities with in-market policy implementation. Combinations are often more effective than any one intervention alone. SAFE also works across objectives. For example, SAFE will bring together the MOA and MOH as well as the KOMNAS Zoonosis coordinating body to work together as one team at the Strategic Health Communication Workshop, thus combining Objective 1, 2 and 3 stakeholders. Several of the communication interventions will also reach across objectives. For example, the radio drama series has 12 episodes each directed at a different poultry value chain worker as well as healthcare decision makers at the household level.

Activities proposed are also often interdisciplinary in nature and may encompass more than one critical program area, especially when addressing public health issues. For instance, science, economics, sociology and technology may all be incorporated in an activity.

The section below details program implementation by objective. Each program activity is linked to the SAFE PMP framework outputs and outcomes. The framework below represents only the activities (inputs), outputs and outcomes for Year 2. The updated PMP document, which will be submitted separately, includes inputs, outputs and outcomes for the entire SAFE life-of-project.

OBJECTIVE 1: Strengthen and expand private, and public/private partnerships in high-risk districts to improve biosecurity and good farming practices in order to limit AI transmission among poultry

OBJECTIVE 1: Strengthen and expand private, and public/private partnerships in high-risk districts to improve biosecurity and good farming practices in order to limit AI transmission among poultry

Overview

During the final 15 months of the project, Objective 1 will build on industry-focused and industry-driven biosecurity interventions. SAFE and industry TS will continue to monitor and support the 12 TFs, facilitate Sector 3 Broiler Farm (S3BF) farmer visits to the TFs and technically support biosecurity and good farming practice (GFP) changes at those farms. Various techniques are being used to motivate and support these changes. They include SMS pilots, dissemination and use of a farmer-to-farmer video, and field-level technical discussion groups that identify practical solutions to biosecurity problems. As in Year 1, the scale and design of Objective 1 interventions will (a) achieve impact within the targeted geographic areas with moderate investments, (b) leverage committed poultry industry investment and support, and (c) build on the successes of past and ongoing work by other partners such as FAO, USDA and the GOI.

Objective 1 will have five core activities during the final 15 months:

- Activity 1. Continue to hold strategic consultative meetings with industry and academic stakeholders
- Activity 2. Conduct farmer and student visits to the teaching farms
- Activity 3. Provide technical support to farmers to adopt and implement new biosecurity and good farming practices
- Activity 4. Produce and distribute educational and communication materials
- Activity 5. Develop and establish technical discussion group meetings

Objective 1 Outcome and Activities

Activity Descriptions

ACTIVITY 1. CONTINUE TO HOLD STRATEGIC CONSULTATIVE MEETINGS WITH INDUSTRY AND ACADEMIC STAKEHOLDERS

Industry and academic partners are full participants responsible for the ultimate results and sustained changes at the end of the project. The consultative meetings will focus on how best to: a) adapt to the reduced funding and life-of-project, b) accelerate transfer of responsibility, and c) move Year 3 industry commitments to Year 2, whenever possible. SAFE will also continue to seek advice from the MOA/CMU and FAO.

ACTIVITY 2. CONDUCT FARMER AND STUDENT VISITS TO THE TEACHING FARMS

Activities 2 and 3 are greatly impacted by the reduced funding, and even more so by the reduction in SAFE's performance period. The original strategy needs to be compressed, requiring a careful balance of funding allocation, level of effort and prioritization. While SAFE wishes to bring as many farmers as possible to the TF, this intervention requires an extensive level of effort from industry TS staff, thereby reducing the time they dedicate to Activity 3 – technical support to farmers wishing to implement biosecurity and GFP. This balancing of efforts, which is unique to each industry partner, will be continually monitored and adjusted as SAFE implements these two tasks.

Teaching farms will be monitored on a regular basis by SAFE and industry TS staff to ensure that appropriate biosecurity practices are followed, equipment and grounds are maintained properly, and visitors have access to the TFs. TS also provide technical support to the TF staff and conduct field-level training sessions that aim to provide practical solutions to biosecurity and good farming practice challenges. TS staff will put into practice the training they received during Year 1 on inter-personal skills, persuasive arguments, and practical and inexpensive solutions based on TF techniques.

SAFE will use several strategies to accelerate farmer visits to the TF. SAFE will work with industry TS staff to promote the champion farmer competition to incentivize farmers and technical staff to establish and maintain new biosecurity and GFPs. Audits of "early adopter" farms demonstrate that farmers are beginning to implement changes one step at a time, starting with the easiest practices such as shoe exchanges at the poultry house entrance. SAFE and the industry will expand promotion of the competition, which has been received favorably.

In addition, SAFE will work with academia partners to ensure students also visit the TFs. These visits will help students understand the benefits of biosecurity. Reinforcing good biosecurity and farming practices during pre-service education is cost-effective and efficient. Changing old habits later through in-service training is costly and challenging.

SAFE will also target farmers who live within easy access of the teaching farm – up to one hour of travel time. SAFE staff will work with industry leadership to monitor the percentage of farmers living within one hour away that have visited each TF. This will be the priority group. SAFE and TS staff will also focus on those farms located over one hour away from a TF. To bring this second group to the TF, industry will consider covering the transportation costs of these farmers to the TF while SAFE will provide them with a learning experience that will include a review of what they have observed, discussion of solutions to the challenges they see in implementing the changes, presentation of the farmer-to-farmer video (which will contain testimonials of fellow farmers), and educational materials to take home.

ACTIVITY 3. PROVIDE TECHNICAL SUPPORT TO FARMERS TO ADOPT AND IMPLEMENT NEW BIOSECURITY AND GOOD FARMING PRACTICES

SAFE will encourage all farmers visiting the teaching farms to implement biosecurity and GFP. All farmers committed to making changes will receive technical assistance, mostly by industry TS staff and selectively by SAFE staff. The project will pay particular attention to farmers who have entered and won the champion farmer competition because they have already demonstrated motivation and the ability to implement changes. They can become model farmers for others. All farms interested in making biosecurity and GFP changes will receive as part of the technical assistance how-to guidance on upgrading the farm with new techniques and biosecurity-related construction, and the biosecurity booklet.

SAFE will also implement additional changes at the TF that include improved movement control of people, equipment and supplies into the farm; water analysis and water treatment; examples of good ventilation; and use of boiling pots for dead chickens.

ACTIVITY 4. PRODUCE AND DISTRIBUTE EDUCATIONAL AND COMMUNICATION MATERIALS

In addition to IEC materials produced in Year 1, SAFE will distribute information on biosecurity and good farming practices through SMS messages and a farmer-to-farmer video.

SMS pilots

SAFE will test two SMS pilots. One was started by the Objective 1 Team Leader and targets TF farmers, industry TS staff and S3BFs. It reinforces biosecurity measures farmers have seen at the TF and reminds them of good farming practices as well as informing them of activities of interest such as the radio drama series and the champion farmer competition. A second pilot will be implemented through a grant awarded to Satu Dunia, which will target a separate group of farmers and their TS with supportive biosecurity and good farming technical information. Satu Dunia will add a more creative side to the messages including motivational aspects, quizzes with prizes, and acknowledgements delivered through innovative uses of interactive SMS text.

Farmer-to-farmer video

Farmers learn from each other. SAFE will develop a locally produced video that shows real farmers talking about new biosecurity techniques and practices at their farms. The farmer-to-farmer video targets Sector 3 contract and independent broiler farmers and will be filmed at TFs and visiting farms. The video will include footage of the good biosecurity and farming practices and techniques taught at the TF, such as pass-overs and dead chicken disposal, and proper ventilation of poultry houses. The video will also include testimonials from fellow farmers.

The purpose of the video is five-fold: 1) demonstrate techniques of biosecurity and good farming practices by farmers who have used the practices; 2) increase credibility and adoption of the techniques by having the listener relate to the farmer that is speaking – these are real Indonesian farmers, not actors; 3) provide a visual tool for Service Offices (*Dinas*) and other government bodies to use in the field; 4) provide a training tool for industry to use with their TS staff; and 5) provide educational institutions with a visual tool that can be incorporated into classroom curricula. This video will be beneficial and critical to supporting and reinforcing the new techniques the TFs have introduced, particularly given the early departure of SAFE.

SAFE will also share the locally produced USDA video with appropriate local stakeholders.

ACTIVITY 5. DEVELOP AND ESTABLISH TECHNICAL DISCUSSION GROUP MEETINGS

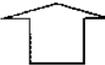

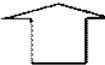

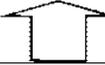

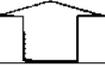

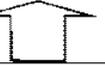

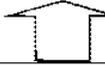

In addition to regular field visits to project sites, SAFE will continue the technical discussion groups in Tasikmalaya and Bogor to provide a platform for continuous communication and advocacy. Small group discussions have been found to have a positive effect on uptake of new biosecurity practices. Participants include Sector I and poultry shop TS staff, S3BF farmers, educators, and SAFE staff. The objectives of the discussions are to (a) troubleshoot farm problems, (b) discuss local disease solutions, (c) conduct peer-to-peer training and problem solving, (d) learn new technical information and (e) motivate through the sharing of success stories.

SAFE will continue to encourage the private sector – companies, farms and poultry shops – to engage local government, e.g., PVUK and other local animal health officers. SAFE will also continue to play a role in facilitating and encouraging TFs to share information and provide more access to farmers beyond their group members.

Deliverables and Timeline

OBJECTIVE IACTIVITIES	DELIVERABLE	QUARTERS					
		Q1 Apr - Jun 2012	Q2 July - Sept 2012	Q3 Oct - Dec 2012			
ACTIVITY 1. Continue to hold strategic consultative meetings with industry and academic stakeholders	Summary results in Quarterly Reports	X	X	X			
ACTIVITY 2. Conduct farmer and student visits to the teaching farms	Summary number of visits in Quarterly Reports	X	X	X			
	Report on Champion Farmer competition results		X	X			
ACTIVITY 3. Provide technical support to farmers to adopt and implement new biosecurity and good farming practices	Summary farm changes in Quarterly Reports		X	X			
ACTIVITY 4 Produce and distribute educational and communication materials	Report on SMS pilots						
	Farmer-farmer video production			X			
	Farmer-to-farmer video dissemination						
ACTIVITY 5. Develop and establish technical discussion group meetings	Summary findings in Quarterly Reports	X	X	X			

OBJECTIVE 2: Promote behaviors that lower the risks of AI transmission among poultry and increase knowledge of signs, symptoms and risk factors for AI-related illness

IMPROVED RISK REDUCTION PRACTICES WITHIN LIVE BIRD MARKETS (LBM)				
				
OUTPUT	Increased technical support, participation and coordination among key stakeholders	Empowered consumer who demands healthy poultry product	Cleaner physical facilities for poultry vendors in LBMs	Improved coordination among ministry program/communication staff
				
WORKPLAN ACTIVITIES	1. Organize and conduct consultative meetings to develop and establish local ownership	2. Establish local NGO involvement to create consumer demand activities	3. Support improvement of vendor stalls 4. Maintain market improvements 5. Establish "Vendor of the Month" award program	8. Provide health communication strategy workshop to ministry program/communication staff
		6. Air radio serial drama 7. Develop targeted communication tools to support changes in LBMs		

YEAR TWO WORKPLAN

Objective 2. Promote Behaviors that Lower the Risk of AI Transmission Among Poultry and Increase Knowledge of Signs, Symptoms and Risk Factors for AI-Related Illnesses**Overview**

During the final 15 months of the project SAFE will continue to work with members of the poultry supply chain, namely poultry vendors and market managers at traditional live bird markets (LBMs), and poultry consumers including market customers in the surrounding areas. The application of citizen-driven pressure on biosecurity and other market-based sanitation/hygiene measures to guide poultry purchasing decisions will be a key element of the program.

Utilizing the momentum created in Year 1, SAFE will continue work in close partnership with local government, support modification of vendor stalls and vendor practices, accelerate the BCC campaign for consumer demand generation, empower LBM stakeholders to maintain changes and biosecurity practices, establish a "vendor of the month" award program, reinforce key messages with the airing of a radio serial drama, develop targeted communication tools to support changes in LBMs, conduct a national/provincial Health Strategic Communication Workshop, and capture the changes and document the results under the M&E plan.

SAFE will continue to work in close consultation and coordination with MOA/CMU, MOH, WHO, FAO, Provincial and District Livestock Services, and other essential stakeholders to build a lasting program and to support government expansion of the program.

Objective 2 will have eight core tasks:

- Activity 1. Organize and conduct consultative meetings to develop and establish local ownership
- Activity 2. Establish local NGO involvement to create consumer demand activities
- Activity 3. Support improvement of vendor stalls
- Activity 4. Maintain market improvements
- Activity 5. Establish Vendor of the Month award
- Activity 6. Air radio serial drama
- Activity 7. Develop targeted communication tools to support changes in LBMs
- Activity 8. Provide health communication strategy workshop to ministry program/communication staff (*Same as Objective 3, activity 8*)

YEAR TWO WORKPLAN

Objective 2 Outcome and Activities

**Activity Descriptions****ACTIVITY 1. ORGANIZE AND CONDUCT CONSULTATIVE MEETINGS TO DEVELOP AND ESTABLISH LOCAL OWNERSHIP**

SAFE's most important legacy under this objective is to provide local government with a framework and program for a healthy market and consumer demand program. While "healthy markets" are not a new concept for government, the operationalization and scaling up of such a concept has been challenging. Government partners are embracing the SAFE model as a practical and inclusive model that results in sustained change. SAFE will continue to work with local government ministries at the provincial, district and sub district levels to support local adoption of the SAFE model. Consultative meetings will also serve as a platform for information sharing, consultation, coordination and decision-making that will facilitate communication, coordination, resource sharing and ultimate sustainability of the program. SAFE will also continue to seek advice from the MOA/CMU and FAO.

ACTIVITY 2. ESTABLISH LOCAL NGO INVOLVEMENT TO CREATE CONSUMER DEMAND ACTIVITIES

SAFE will fast track consumer demand activities for healthy markets and poultry products. SAFE, subcontractor PMI, and grantees Aisiyah and COMBINE, will organize peer-to-peer education activities in the markets for consumers, and entertainment-education events. SAFE will organize a partners' meeting to ensure that all activities are coordinated between the three partners. Partners will utilize their media networks (including social media) to reinforce messages and provide coverage and dissemination of healthy market initiative activities and results. Aisiyah will target Muslim

YEAR TWO WORKPLAN

females and will approach the consumer with religious messages and channels whereas COMBINE will target the general public and will maximize the use of community-based media and channels for consumer education. COMBINE will also use a media literacy approach that will lead to the creation of community members who are sensitive to the environment and to health issues such as AI.

Community members will be involved in activities that capture their personal experiences and surrounding environment, and they will continue to produce and screen short films about the healthy market initiative, created on mobile phones or video cameras. The result of these activities will be communities with greater confidence and positive self-efficacy, providing a strong foundation for consumer empowerment. Empowered communities will have the confidence to ask for cleaner markets and stalls, and healthy poultry products.

ACTIVITY 3. SUPPORT IMPROVEMENT OF VENDOR STALLS

In Year 1 market managers and local partners developed proposals detailing changes in the markets to improve sanitation in the market, and thus contribute to reducing the threat of animal-to-animal or animal-to-human transmission of Highly Pathogenic Avian Influenza (HPAI). SAFE will make improvements to the marketplace through the SAFE grants program. These changes will be made in collaboration with market managers and vendors as well as the Cooperatives, Industry and Trade Office.

Examples of changes that will be made include improved drainage systems, upgraded stalls, waste dumpsters, new zoning areas, caging, and a water tower and piping for access to clean water distribution. These changes in market conditions coupled with the training of market vendors and the BCC campaign for consumer demand generation (described below) constitute the core of this objective.

ACTIVITY 4. MAINTAIN MARKET IMPROVEMENTS

Sustaining changes at the LBMs has always been a priority objective. A team of market stakeholders at each market – including the market manager, field facilitator, vendors, beneficiaries, and grant committee – will finalize maintenance plans. The plan will empower each team to ensure that changes are sustained after SAFE ends. It will contain facility upkeep procedures and new biosecurity practices that need to be put in place to ensure changes can be maintained. SAFE will work with market teams to identify how maintenance activities will be funded. Options currently under consideration include monetary contributions to pay for waste collection and clean water, and a compulsory monthly vendor fee for the communal use of refrigeration. To strengthen support for these changes, SAFE, its facilitators and Dinas staff will build broader market capacity and skillsets in biosecurity, hygiene and sanitation through healthy market community activities.

ACTIVITY 5. ESTABLISH VENDOR OF THE MONTH AWARD

To better link consumer perceptions of quality with the desired behaviors of the vendors, SAFE will establish a consumer-led text 'voting' system that allows citizens to select their preferred vendor of the month, and will reward commercial sector players with social recognition for hygienic facilities and healthy poultry practices. For this to be successful, vendors will need to be motivated to

YEAR TWO WORKPLAN

become a 'vendor of choice'. Examples of rewards may include acknowledgement by posting the vendor's photograph in the center of the market, a gift to help them upgrade their stall, or a nominal financial incentive.

The vendor-of-the-month award program will be conducted in 20 demonstration markets. By the end of the project, 80 vendors will have been recognized.

ACTIVITY 6. AIR RADIO SERIAL DRAMA

SAFE will air the 12-episode radio drama through 10 commercial radio stations (one in each district) and 18 community radio broadcasting stations across the 10 districts. Talk shows will reinforce the messages from the radio drama. The commercial stations chosen are the most popular in each of the 10 SAFE districts, and thus have the biggest audiences. The community radio stations were chosen for their proximity to the live bird markets.

There will be two episodes aired per week. The entire series will take six weeks to air. During this period, there will be three talk shows with local government Dinas staff as guests (Livestock Services, Health Office, and Industry and Trade Office) to reinforce messages and participate in live question-and-answer sessions.

The 18 community radios will broadcast short audio recordings of Islamic "words of wisdom" related to healthy poultry, food safety and hygiene. These messages stem from the *Khutbah* sermons developed in Year 1. Each station has an active listenership of approximately 1,000 persons living around the markets, for a total reach of 18,000 listeners.

SAFE will also provide COMBINE with copies of the radio series for dissemination through their networks. All the materials will be made available as downloadable files on the K4H website, and on the Aisyiyah and COMBINE websites and Facebook pages. The materials will be protected by the "Creative Common" copyright scheme whereby anyone can use the materials as long as they are not altered.

ACTIVITY 7. DEVELOP TARGETED COMMUNICATION TOOLS TO SUPPORT CHANGES IN LBMs

SAFE will build on the communication materials and tools developed in Year 1 and identify gaps and needs based on field program implementation results. Technical content will be reviewed by FAO, WHO and the MOA to ensure its accuracy. The MOA has already agreed to provide content related to *Ayam ASUH*. *Ayam ASUH (Aman, Sehat, Utuh dan Halal)* is a government program to produce healthy and quality poultry products (carcasses). The program features good practices in poultry product handling and use of a cold chain. SAFE will provide copies of materials to the MOA to be distributed through the Ministry's network both within and outside of the SAFE program districts. Communication materials that have already been identified include:

- A Khutbah book containing a religious perspective on biosecurity, food safety, and good business practices (Aisyiyah).
- Mobile phone videos produced by communities and then screened in markets and communities, capturing the progress under the Healthy LBM Initiative.

YEAR TWO WORKPLAN**ACTIVITY 8. PROVIDE HEALTH COMMUNICATION STRATEGY WORKSHOP TO MINISTRY PROGRAM/COMMUNICATION STAFF (Same as Objective 3, activity 8)**

In implementing its Year 1 program, SAFE coordinated and worked with national and local MOA and MOH staff. In the spirit of "One Health" and the desire to address both poultry and human health diseases together, and with the need to improve skills in communication and strategy development, SAFE planned a health communication workshop during Year 1 for staff from the MOA, MOH and KOMNAS Zoonosis who are regularly involved in the planning and development of AI-based communication programs. Participants were identified based on the goals of the workshop and SAFE conducted a needs assessment with each person in preparation for the training. The workshop was moved to Year 2 as a result of discussions early in the project.

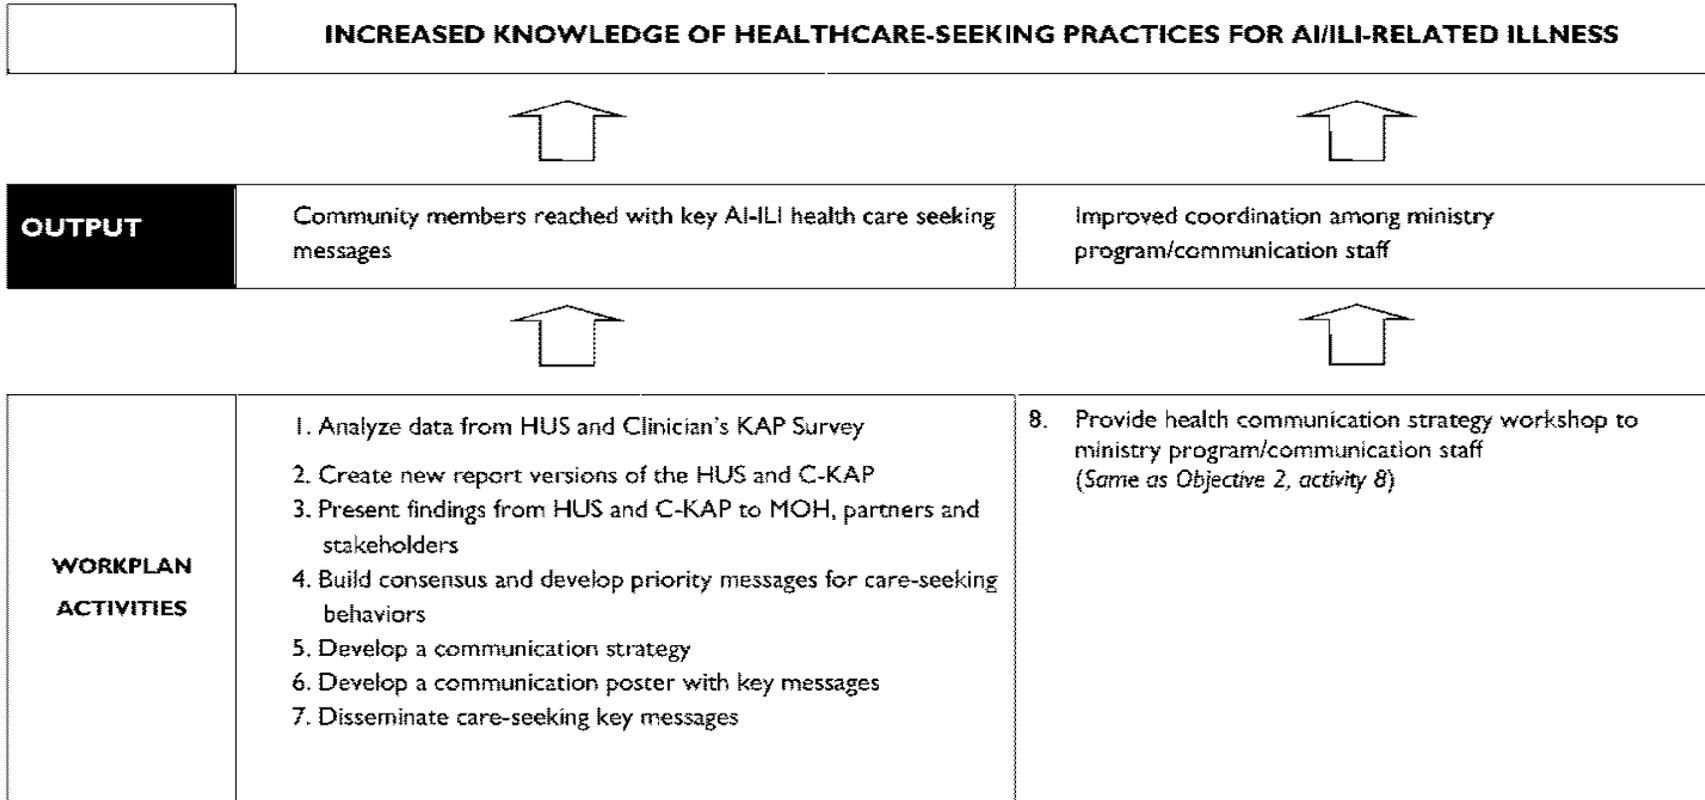

The goal of the workshop training is to improve communication planning and response, and strengthen the overall communication capacity of national and provincial-level officials between and among agencies. The training will take place in April 2012 and will be led by Ben Lozare, director of training and capacity building at JHU-CCP. Training topics will include leadership, communication objectives, strategy design, networking and advocacy, engagement of stakeholders, resource sharing and analysis, audience analysis and segmentation, and use of evidence-based tools.

YEAR TWO WORKPLAN

Deliverables and Timeline

OBJECTIVE 2 ACTIVITIES	DELIVERABLE	QUARTERS				
		Q1 Apr - Jun 2012	Q2 Jul - Sept 2012	Q3 Oct - Dec 2012

OBJECTIVE 3: Increase knowledge of signs/symptoms and risk factors for AI-related illness in people and promote behaviors that improve household-level care seeking in response to AI-related illness

YEAR TWO WORKPLAN

Objective 3: Increase Knowledge of Signs/Symptoms and Risk Factors for AI-Related Illness in People and Promote Behaviors that Improve Household-Level Care Seeking in Response to AI-Related Illness

Overview

Indonesia has the highest human case fatality rate from AI in the world. The fatality rate has remained above 80 percent for several years. Data from the MOH and WHO reveal that the median length of time between onset of illnesses and hospital admission is six days, which is often too late to prevent death, and much longer than in countries with lower fatality rates.

SAFE will use the key findings from a 2012 Healthcare Utilization Survey (HUS) and a 2012 Clinician's KAP (C-KAP) Survey to develop program activities. The HUS was conducted to understand how households make their healthcare-seeking decisions. One of the key findings was that about 65 percent of respondents seek care within 48 hours of onset of an acute illness episode. However, as mentioned above, it takes about six days to be admitted to a hospital. This suggests that SAFE will need to further analyze the data to understand what aspects of the healthcare system cause this considerable delay in hospitalization.

In consultation with WHO and MOH, the main efforts will be to jointly reach consensus on the key findings stemming from the HUS and C-KAP Survey; transform each of the PowerPoint presentation reports into additional reports; develop a communication strategy with target audiences; develop consensus on key messages; pre-test and finalize the messages; design, pre-test and finalize communication material(s); and use existing partners PMI, Aisyiyah and COMBINE to reach communities with key healthcare-seeking messages. SAFE will conduct a qualitative evaluation and document the results under the monitoring and evaluation plan.

Objective 3 will have eight core activities:

- Activity 1. Analyze data from HUS and C-KAP Survey
- Activity 2. Create new report versions of the HUS and C-KAP
- Activity 3. Present findings from HUS and C-KAP to MOH, partners and stakeholders
- Activity 4. Build consensus and develop priority messages for care-seeking behaviors
- Activity 5. Develop a communication strategy
- Activity 6. Develop a communication poster with key messages
- Activity 7. Disseminate care-seeking key messages
- Activity 8. Provide health communication strategy workshop to ministry program/communication staff (*Same as Objective 2, activity 8*)

Activity Descriptions

ACTIVITY 1. ANALYZE DATA FROM HUS AND CLINICIAN'S KAP SURVEY

The HUS was conducted to develop estimates of the seasonal influenza disease burden and to determine the proportion of persons with ILIs that seek care, their understanding of signs and

YEAR TWO WORKPLAN

symptoms that indicate the need for care, and decision-making about when and where to seek care for respiratory illnesses.

The Clinician's KAP (C-KAP) Survey was conducted among all primary care outpatients and hospital-based physicians providing medical care for in-patients in East Jakarta municipality and in the district of Bogor, West Java who provide medical care for children or adults. The aim was to determine their knowledge, attitudes and practices (KAP) with regard to the identification, treatment and referral of patients suspected to be infected with the H5N1 A1 virus. Physicians were also surveyed on their knowledge of seasonal influenza.

During Year 1, SAFE summarized and presented the HUS topline findings. During Year 2, SAFE will conduct a deeper analysis of the HUS findings and submit a report. SAFE will also summarize and present the topline findings for the C-KAP Survey and submit a report. CDC-Atlanta will conduct a deeper analysis of this study.

The HUS findings will be used to address barriers and inform preventive educational strategies at the community level to reduce avian-to-human transmission of H5N1 A1 and to reduce delays in care seeking that can result in higher-than-necessary mortality rates. The findings of the C-KAP Survey will be used to inform healthcare provider education efforts to improve H5N1 case management and support earlier detection and antiviral treatment. In addition, findings will be inputted into the SAFE communication strategy. SAFE will make all reports available to stakeholders.

ACTIVITY 2. CREATE NEW REPORT VERSIONS OF THE HUS AND C-KAP

SAFE will develop condensed versions of the HUS and C-KAP as part of SAFE's end-of-project information series. These versions will focus on research to practice audiences and will target those working in the area of health programming, such as professionals working in a ministry of health and holding managerial and decision-making positions, both locally and internationally.

ACTIVITY 3. PRESENT FINDINGS FROM HUS AND C-KAP TO MOH, PARTNERS AND STAKEHOLDERS

SAFE will convene a meeting for stakeholders to present the HUS and C-KAP Survey findings. Participants will be drawn from:

- WHO
- MOH
- Ikatan Dokter Indonesia (IDI, Association of Indonesian Medical Doctors)
- Ikatan Bidan Indonesia (IBI, Association of Indonesian Midwives)
- Universities (Faculties of Public Health)

ACTIVITY 4. BUILD CONSENSUS AND DEVELOP PRIORITY MESSAGES FOR CARE-SEEKING BEHAVIORS

YEAR TWO WORKPLAN

SAFE will schedule a meeting with USAID, WHO, and CDC to review and discuss the HUS and C-KAP findings and determine evidence-based behavior changes required to improve healthcare-seeking practices related to AI. A subsequent meeting will be held with the MOH to finalize the priority behavior change messages. SAFE will develop and pre-test messages with target audiences, share results with the extended team, and finalize messages.

ACTIVITY 5. DEVELOP A COMMUNICATION STRATEGY

In consultation with WHO and the MOH, SAFE will develop a strategy for targeted populations that will promote appropriate healthcare-seeking practices. The communication strategy will be a short SAFE project strategy to document the background, evidence-based approach and process. The strategy will highlight key HUS findings and the process of message development and selection of channels to conduct a limited campaign on care-seeking behaviors. This strategy will focus on a cost-effective, quick and efficient manner to reach high-risk audiences in the existing 10 SAFE high-risk districts. SAFE will use existing partner communication channels and networks to disseminate and reinforce improved healthcare-seeking messages.

ACTIVITY 6. DEVELOP A COMMUNICATION POSTER WITH KEY MESSAGES

SAFE will design, pre-test, finalize and produce a poster to encourage care-seeking practices. A dissemination plan, based on SAFE funding, will be developed in coordination with the extended team. The 12th and final episode of the radio drama series will be developed with a message that reinforces seeking healthcare at a nearby facility if someone in the family experiences AI/ILI symptoms and has had recent contact with poultry.

ACTIVITY 7. DISSEMINATE CARE-SEEKING KEY MESSAGES

The HUS topline findings show that interpersonal communication and social networks play an important role in providing information at the community level. SAFE will work with existing programs and partners in the field, including PMI, Aisyiyah and COMBINE, and their extensive grass-roots networks, to communicate messages that endorse positive and rapid healthcare-seeking behaviors. The messages will be part of the content that is distributed through all communication channels used by SAFE program interventions, such as *pengajian* (Quran readings), peer-to-peer education, social media, and the radio drama. SAFE will also disseminate these key messages to farmers and the poultry industry and LBM audiences under Objectives 1 and 2. The materials and radio series will be made available to the MOH and its *Desa Siaga* program, for further dissemination.

ACTIVITY 8. PROVIDE HEALTH COMMUNICATION STRATEGY WORKSHOP TO MINISTRY PROGRAM/COMMUNICATION STAFF (Same as Objective 2, Activity 8)

In Year 1 SAFE coordinated with KOMNAS Zoonosis, MOA and MOH officials to conduct a communication skills needs assessment and identify participants for SAFE training programs. Training participants in the Health Strategic Communication Workshop will be MOA and MOH personnel and members of KOMNAS Zoonosis who are regularly involved in the planning and

YEAR TWO WORKPLAN

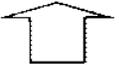

development of AI-based communication programs. The training goals will be to improve communication planning and response, and to strengthen the overall communication capacity of national and provincial-level officials between and among agencies. The training will be organized in April 2012 and will be led by Ben Lozare of JHU-CCP. Training topics will include engagement of stakeholders, resource sharing and analysis, audience analysis and segmentation, use of evidence-based tools, communication objectives, strategy design, and networking and advocacy.

YEAR TWO WORKPLAN

Deliverables and Timeline

OBJECTIVE 3 ACTIVITIES	DELIVERABLE	QUARTERS					
		Q1 Apr - Jun 2012	Q2 Jul - Sept 2012	Q3 Oct - Dec 2012			
ACTIVITY 1 Analyze data from HUS and Clinician's KAP Survey	HUS and C-KAP final report	X					
ACTIVITY 2 Create new report versions of the HUS and C-KAP	Condensed HUS Word report Condensed C-KAP Word report		X				
ACTIVITY 3 Present findings from HUS and C-KAP to MOH, partners and stakeholders	Presentation of HUS and C-KAP to international stakeholders	X					
ACTIVITY 4 Build consensus and develop priority messages for care-seeking behaviors	Priority messages on care-seeking behaviors drafted		X				
	Priority messages on care-seeking behaviors finalized		X				
ACTIVITY 5 Develop a communication strategy	Final communication strategy document			X			
ACTIVITY 6 Develop a communication poster with key messages	IEC material developed, pre-tested, finalized, and produced			X			
ACTIVITY 7 Disseminate care-seeking key messages	IEC material and messages disseminated			X			
ACTIVITY 8 Provide health communication strategy workshop to ministry program/communication staff (Same as Objective 2, activity 8)	Report on Health Strategic Communication Workshop	X					

OBJECTIVE 4: Facilitate coordination among partners by sharing information and hosting meetings

USE OF A/PI INFORMATION BY LOCAL AND INTERNATIONAL STAKEHOLDERS		
		
OUTPUT	Access to A/PI information by local and international stakeholders	Improved access to updated best practices knowledge by local MOA and MOH stakeholders
		
WORKPLAN ACTIVITIES	<ol style="list-style-type: none"> 1. Document/highlight SAFE activities 2. Develop, produce and disseminate information series 3. Upload A/PI stakeholder information onto K4H website 4. Organize and host monthly COP meetings 5. Hold informal end-of-project forum (s) 	<ol style="list-style-type: none"> 6. Support project-related domestic and international travel for Indonesian government counterparts or other parties

YEAR TWO WORKPLAN

Objective 4. Coordinate With and Facilitate Communication Among Partners

Overview

In Year 2 SAFE will continue to build on the established professional and collegial relationships with the leadership and technical staff of Indonesian and international partners including MOA/CMU, local government, MOH, FAO, WHO, JSI, AusAID, CDC and executives from the Indonesian poultry industry. SAFE will also continue to host regular coordination meetings and working groups that facilitate the sharing of information and consensus building. A new global information platform containing Indonesian A/PI resources will go live this year and SAFE will hold an informal end-of-project forum(s).

Objective 4 will have six core tasks:

- Activity 1. Document/highlight SAFE activities
- Activity 2. Develop, produce and disseminate information series
- Activity 3. Upload A/PI stakeholder information onto K4H website
- Activity 4. Organize and host monthly COP meetings
- Activity 5. Hold informal end-of-project forum (s)
- Activity 6. Support project-related domestic and international travel for Indonesian government counterparts or other parties

Activity Descriptions

ACTIVITY 1. DOCUMENT/HIGHLIGHT SAFE ACTIVITIES

SAFE will continue to document and highlight SAFE activities through articles, press clippings and success stories.

ACTIVITY 2. DEVELOP, PRODUCE AND DISSEMINATE INFORMATION SERIES

The purpose of this series is to capture and share SAFE findings, models and lessons learned. The audiences for this series are the GOI and industry, animal and human health partners and global practitioners; researchers and program professionals in the fields of pandemic and avian influenza, other zoonotic diseases, ILI and ARI; and other local partners. SAFE will develop a minimum of five documents on five themes, selected from those below.

1. Health Care Utilization Survey in East Jakarta and Bogor District Indonesia: Healthcare Seeking for Avian Influenza and other Influenza-Like Illnesses (referenced under Objective 3);
2. Clinicians' KAP Survey in East Jakarta and Bogor Districts Indonesia: Healthcare Provider Practices for Avian Influenza and other Influenza-Like Illnesses (referenced under Objective 3);

YEAR TWO WORKPLAN

3. Commercial Farmer Perspectives: Biosecurity, Good Farming Practices, Incentives and Benefits (referenced under Objective 1);
4. The Teaching Farm: An Innovative Approach to Improving Biosecurity;
5. Healthy Markets and Community Initiative: A Supply - Demand Interplay; and
6. Social Media as a Catalyst for Improved Health.

ACTIVITY 3. UPLOAD A/PI STAKEHOLDER INFORMATION ONTO K4H WEBSITE

The Indonesia A/Pandemic “Knowledge for Health” (K4H) (www.k4health.org) website was launched earlier in the year. The purpose of this Internet presence is to provide a platform to globally disseminate research findings, communication materials and educational tools, best practices, and lessons learned from A/PI programs in Indonesia. The page currently showcases documents from the GOI, FAO, WHO, JSI-Deliver, USAID and SAFE. During the remainder of the SAFE project, we will continue to upload key documents and grant access to USAID’s key local and international A/PI partners to upload their own resources as they become available so that the site is a living and dynamic platform through which all stakeholders can share the latest and most important information.

ACTIVITY 4. ORGANIZE AND HOST MONTHLY CHIEF OF PARTY MEETINGS

SAFE will continue to host COP meetings for USAID and USAID A/PI implementing partners to facilitate coordination, planning and data sharing.

ACTIVITY 5. HOLD INFORMAL END-OF-PROJECT FORUM (S)

SAFE will hold one or two informal forums or meetings to cost-effectively and efficiently transfer the core elements of the SAFE project to local stakeholders. The symbolism of this exchange marks the completion of the USAID/SAFE partnership with the industry and local government, and highlights the responsibility entrusted to these partners. The details of the forum(s) will be finalized in consultation with USAID.

ACTIVITY 6. SUPPORT PROJECT-RELATED DOMESTIC AND INTERNATIONAL TRAVEL FOR INDONESIAN GOVERNMENT COUNTERPARTS OR OTHER PARTIES

The SAFE program will continue to finance participation in key meetings, conferences or study tours by government officials and other relevant stakeholders. SAFE will continue to coordinate with USAID to identify study tours that can provide a learning environment that encourages participation from multiple sectors (public, private, nongovernmental) and the development of new problem-solving skills.

YEAR TWO WORKPLAN

Deliverables and Timeline

OBJECTIVE 4 ACTIVITIES	DELIVERABLE	QUARTERS				
		Q1 Apr - Jun 2012	Q2 Jul - Sept 2012	Q3 Oct - Dec 2012		
ACTIVITY 1 Document/highlight SAFE activities	Articles/press clippings/success stories	X	X	X		
ACTIVITY 2 Develop, produce and disseminate an information series	Five documents developed					
	Five documents produced and disseminated					
ACTIVITY 3 Upload A/PI stakeholder information onto K4H website	A/PI stakeholder information available on portal	X	X	X		
ACTIVITY 4 Organize and host monthly Chief of Party meetings	Monthly meetings	X	X	X		
ACTIVITY 5 Hold informal end-of-project forum (s)	One or two end-of-project forums held					
ACTIVITY 6 Support project-related domestic and international travel for Indonesian government counterparts or other parties	Travel to regional/international conferences and/or workshops	X				

YEAR TWO WORKPLAN**4. GRANTS ADMINISTRATION****Grants Program**

SAFE's initial grant budget of \$1 million was reduced to approximately \$358,000 under the revised SOW. SAFE had received proposals from the University of Indonesia and evaluated proposals for the social media RFA, but these were all cancelled as a result of funding cuts. SAFE had to inform several potential grantees that it was no longer able to fund grant applications under the Biosecurity Improvement Innovation Fund (BIIF).

However, SAFE will issue several grants that contribute towards SAFE program objectives. SAFE has allocated part of the grants program for making improvements at the LBMs. In Year 2, SAFE will award 20 small grants to 20 demonstration markets to make improvements in the marketplace.

SAFE will also issue grants to increase awareness and promote consumer demand for clean LBMs and healthy poultry products. The campaign activities will be coordinated with COMBINE and Aisyiyah, which began implementing Healthy LBM Initiative activities through grants issued in Year 1.

SAFE also will implement an SMS pilot project that aims to maximize communication between TS staff and more than 50 farmers to reinforce biosecurity messages and promote positive behavior change.

Management and Administration

The Grants and Contracts Specialist will work closely with the Chief of Party, the Senior Finance, Procurement and Grants Manager, and the Objective team members to successfully implement the grants program.

All grants will be executed in compliance with the USAID ADS (Automated Directive System) 302.3.4.8 and 302.3.5.6 and the grant awards will be administered in accordance with the requirements of 22 CFR 226, ADS 303, the provisions of the Contract, and applicable federal law, which are fully described in the Grants Manual. Before awarding a proposed grant, SAFE will obtain prior written approval from USAID, including approval as to (1) the identity of the proposed grantee, (2) the amount of the proposed grant, and (3) the nature of the grant activities.

The Grants and Contracts Specialist will be responsible for successful implementation of the grants program of the SAFE project. The Grants and Contracts Specialist will ensure that the daily operation and routine administrative functions of the SAFE grants are well administered and that the outcomes of the grants program activities support the targeted end results of the SAFE project. The Grants and Contracts Specialist is the primary liaison with grantees, both monitoring the program and providing training and technical assistance in areas such as proposal writing, management, and program operation. The Grants and Contracts Specialist will make sure that grant funds are available for the program and will provide assistance in financial management to the grantee if needed.

YEAR TWO WORKPLAN

The technical specialists and the Grants and Contracts Specialist will assure that work progress has been made according to the agreement, that invoices are made correctly, and that progress and financial reports and other administrative requirements have been made, met and submitted prior to disbursement. A comprehensive electronic grants management system is included in TAMIS to streamline and simplify grants management.

YEAR TWO WORKPLAN

5. MONITORING AND EVALUATION

Overview

A separate Monitoring and Evaluation and PMP document will be submitted under separate cover as a complement to this workplan. This section provides a brief summary of the M&E work that will be conducted during Year 2.

SAFE uses monitoring as an integral part of the project's daily program implementation to assess progress against objectives. SAFE uses monitoring for the early identification of problems and to ensure that the process and timeline will meet workplan requirements. During Year 2, SAFE staff will continue to conduct field level monitoring of activities, subcontractors and grantees. The evaluation records information about lessons learned during implementation or from work already done, and assesses overall outcomes and program impact.

Monitoring

SAFE will continue to conduct field-level monitoring of activities, subcontractors and grantees as part of project management. Overall program monitoring will be conducted by the SAFE Research and Monitoring & Evaluation officer, SAFE team leaders and their program staff, poultry industry staff and project implementation subcontractors. SAFE senior staff will also ensure that implementing and monitoring the strategy includes concentrating efforts, reinforcing local ownership, and producing tools to sustain efforts.

SAFE staff will monitor TFs to ensure that the new biosecurity and GFPs, and techniques such as the "pass over" and "pass through" systems, are being complied with correctly. The industry TS staff will also conduct monitoring visits to support the changes implemented at the TFs and other Sector 3 commercial farms. The findings from these visits will be captured through trip reports and qualitative data. SAFE and partners are collecting five main information sources from the field. These are:

- a. *Distribution of Communication and Educational Materials*
This information indicates the distribution of the booklet on "Effective Measures to Prevent the Spread of Disease", Sector 3 poster and leaflet, teaching farm display, and merchandise to target audiences including farmers, academia and the poultry industry.
- b. *Teaching Farm Visitors*
This information indicates the number of farms, farmers and students that visit the teaching farms. The data are monitored monthly and collected routinely by the SAFE Objective 1 team through the guest books available at each Teaching Farm. The data on the location of the farms help to identify the number of visitors from farms located at different distances from the TF (i.e., less than an hour, 1.5 hours, and more than 2 hours). This data will be used by SAFE to encourage the poultry industry to bring farmers to the TFs.
- c. *Biosecurity and Good Farming Practices Technical Assistance to Farms*
This information indicates the technical assistance provided by SAFE and the TS staff to farms.

YEAR TWO WORKPLANd. *Changes in Biosecurity and Good Farming Conditions*

This information is collected quarterly by TS staff, and Objective 1 team members also do spot checks to validate the data. Examples of changes include parking areas outside the farm, locks at the entrance gates, footwear exchange, hand washing facilities, sandal exchange, and dead chicken disposal.

e. *Mortality data*

This information is collected on a continuous basis during regular field visits. It indicates poultry mortality by farm cycle. This information will be coupled with additional information collected by PPK-UI and presented at the end of Year 2.

Activities at demonstration markets and within the community will be monitored by SAFE staff and facilitators.

The monitoring forms for PMI facilitators cover:

- Market conditions before and after the intervention;
- Advocacy/consultative meetings;
- Peer-to-peer consumer outreach;
- Stakeholder participation in the market; and
- Distribution of communication materials.

The monitoring forms for Aisiyah facilitators cover:

- Consumer group visits to markets;
- Quran recitals in markets and communities;
- Advocacy training for Aisiyah facilitators;
- Communication materials developed and distributed (Kultum, Kutbah book); and
- Posting of updates in social media.

The monitoring forms for Combine facilitators cover:

- SMS gateway;
- Communication materials developed and distributed (short movie, bulletin);
- Radio drama, talk show and Kultum broadcast; and
- Posting of updates in social media.

The field facilitators will conduct monitoring visits and report back using custom templates. SAFE will also monitor dissemination of care-seeking messages in coordination with our partners. Financial staff will monitor select activities, particularly grants, to ensure compliance with USAID requirements and federal law.

The TAMIS system will continue to be used to capture and create reports from data gathered or received from the field. Updates on progress and challenges faced will be provided to USAID through the quarterly reports.

Evaluation

SAFE will conduct two evaluation studies: a Commercial Farm Evaluation Study, and a Live Bird Market Evaluation Study. Given the reduction in funding and that one year of work has been eliminated, SAFE has made adjustments to the evaluation plan, as described below.

YEAR TWO WORKPLAN***Commercial Farm Evaluation Study***

SAFE will conduct an evaluation in March 2013, implemented by the University of Indonesia. The purpose of the evaluation will be to measure changes in commercial farms as a result of SAFE interventions. Specifically:

- (i) Changes in conditions (structural) that reduce the risk of AI and other poultry disease transmission. Examples include restricting access to farms through locks on gates, fenced areas, and putting in place a pass-over system.
- (ii) Changes in good farming and biosecurity practices that reduce the risk of poultry disease transmission. Examples include the use of a footwear exchange system and appropriate disposal of dead chickens.

The same checklist used to collect the baseline data will be used. Forty-two farms will be evaluated: 12 teaching farms, 20 farms that have visited the teaching farms and instituted changes, and 10 control farms in the same area with similar characteristics.

- (iii) In addition, for industry teaching farms, SAFE will gather changes in the incidence of poultry mortality.

Live Bird Market Evaluation Study

The LBM study will be conducted in three periods over the duration of the entire program. The baseline was taken on May 2011, the second round of swab tests will be conducted in November 2012, and the final evaluation study will be conducted in March 2013 by Bogor Agricultural Institute (IPB). The purpose of the LBM Study is to measure changes in the program-assisted LBMs as a result of SAFE interventions. The changes evaluated will include:

- (i) Changes in conditions that reduce the risk of AI and other poultry disease transmission. Examples include the creation of a zoning area, and access to waste bins and waste management.
- (ii) Changes in biosecurity practices that reduce the risk of poultry disease transmission. Examples include appropriate disposal of poultry waste, cleaning of vendor stall areas, and appropriate apron usage.

Twenty SAFE demonstration markets and 10 control markets in the same area with similar characteristics will be evaluated. Baseline data will be collected by IPB to measure presence of H5N1 AI at vendor stall areas. The IPB sample collectors and government Dinas staff will be trained in collection techniques by FAO staff. The same five-swab protocol used by FAO in its surveillance activities will be used by SAFE. PCR testing will be conducted on the market samples and the results will be analyzed. SAFE will develop a plan to crosscheck lab results to ensure comparability of laboratory analysis between samples taken from LBMs under the SAFE project and other LBMs under FAO/MOA projects. SAFE will also thoroughly review the results and elements of the various markets with FAO, USAID, and other relevant stakeholders to identify key factors that account for any differences in the results.

YEAR TWO WORKPLAN

SAFE will conduct the second and final rounds of data collection at the same time as surveillance is conducted by FAO.

Care-Seeking Assessment

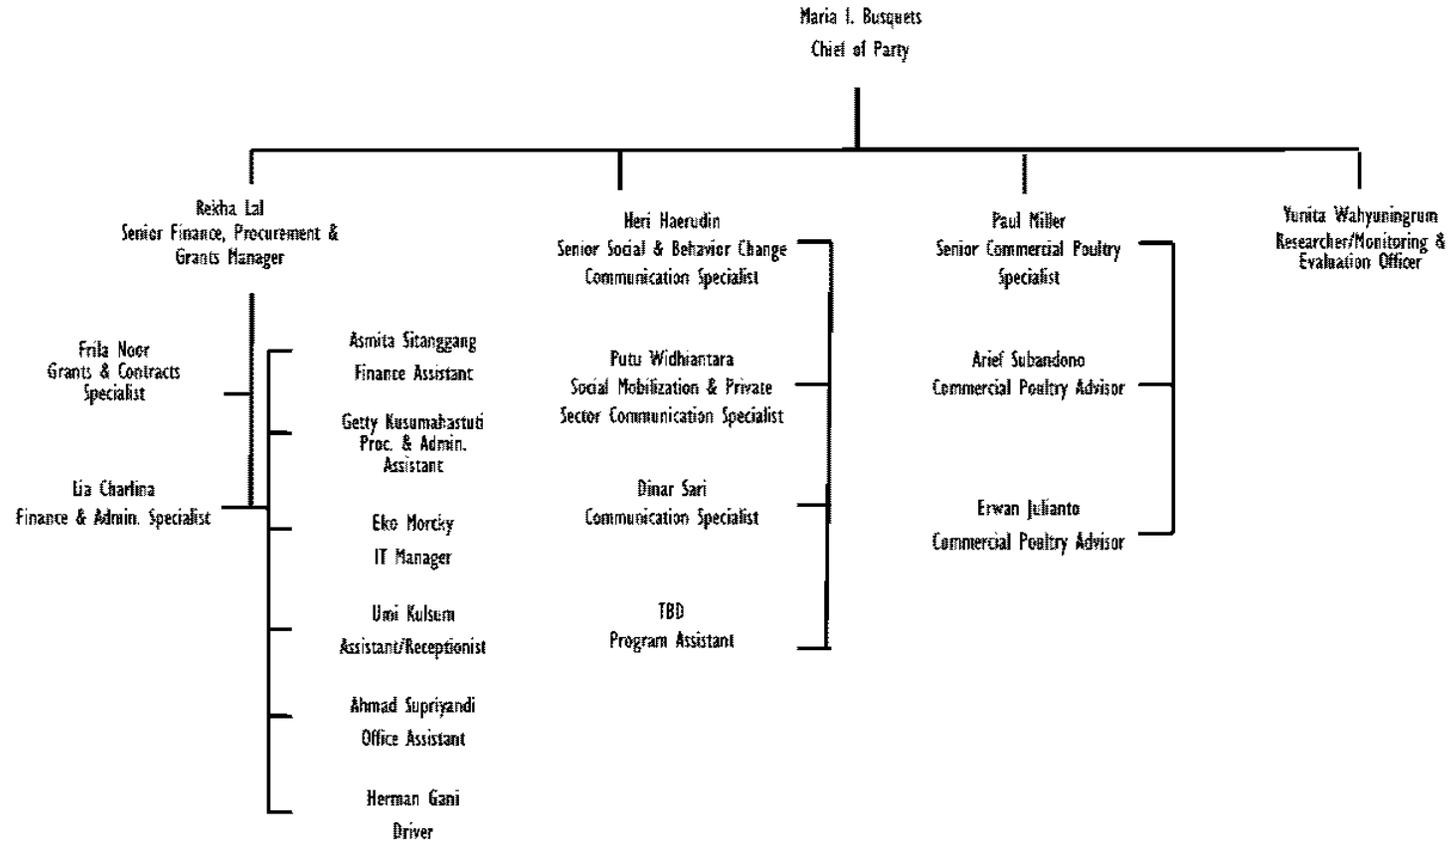

SAFE will conduct a qualitative assessment in March 2013 through partners PMI, Aisiyah and COMBINE in order to better understand targeted audience responses to program efforts aimed at improving healthcare-seeking practices.

The areas evaluated will include:

- (i) Response to/acceptance of care-seeking messages disseminated through materials and community activities
- (ii) Response to radio series
- (iii) Appropriateness of channels of communication
- (iv) Recommendations for future programming

The audiences and districts targeted will be the same as those under Objectives 1 and 2.

ANNEX I: SAFE ORGANIZATION CHART

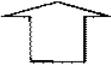

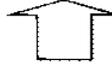

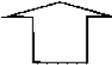

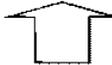

ANNEX II. BUDGET

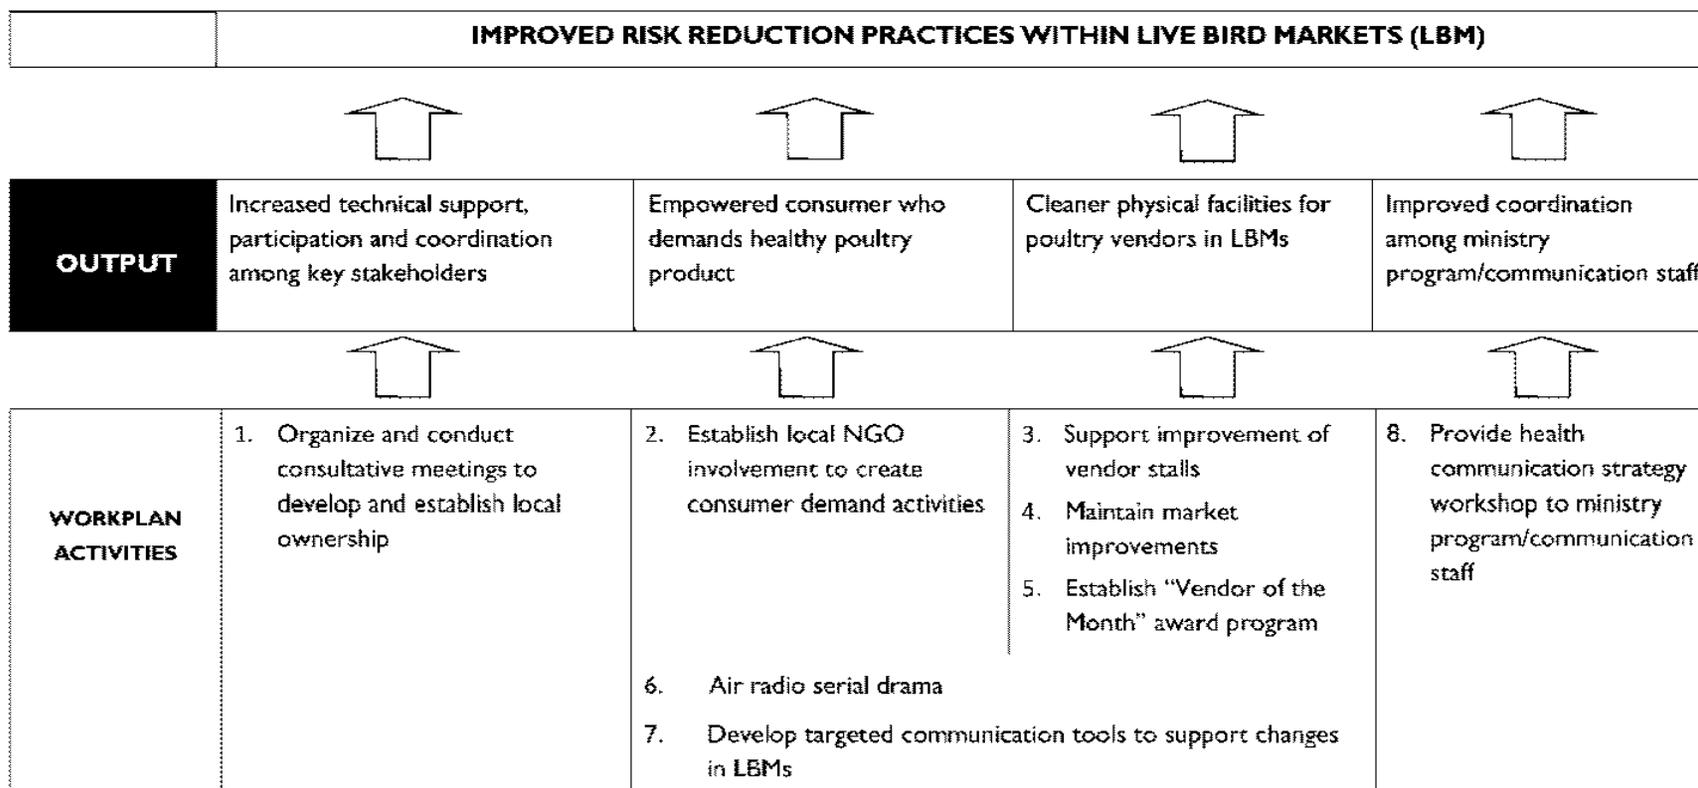

CLINS	New Contract Task Order Budget	Obligated Amount	Invoiced		Projections	
			Mar 2011 - Oct 2012	Accruals	Nov 1, 2012 - June 15, 2013	Total Year 1-3
OBJECTIVE 1	\$2,997,381	\$2,997,381	\$2,420,285	\$69,099	\$565,657	\$3,055,041
OBJECTIVE 2	\$2,896,170	\$2,896,170	\$2,046,411	\$184,264	\$674,310	\$2,904,985
OBJECTIVE 3	\$1,101,543	\$1,101,543	\$674,405	\$184,264	\$171,249	\$1,029,919
OBJECTIVE 4	\$263,106	\$263,106	\$153,015	\$23,033	\$92,208	\$268,256
TOTAL	\$7,258,200	\$7,258,200	\$5,294,115	\$460,661	\$1,503,424	\$7,258,200

ANNEX III. SUMMARY OF OUTCOMES, OUTPUTS AND ACTIVITIES

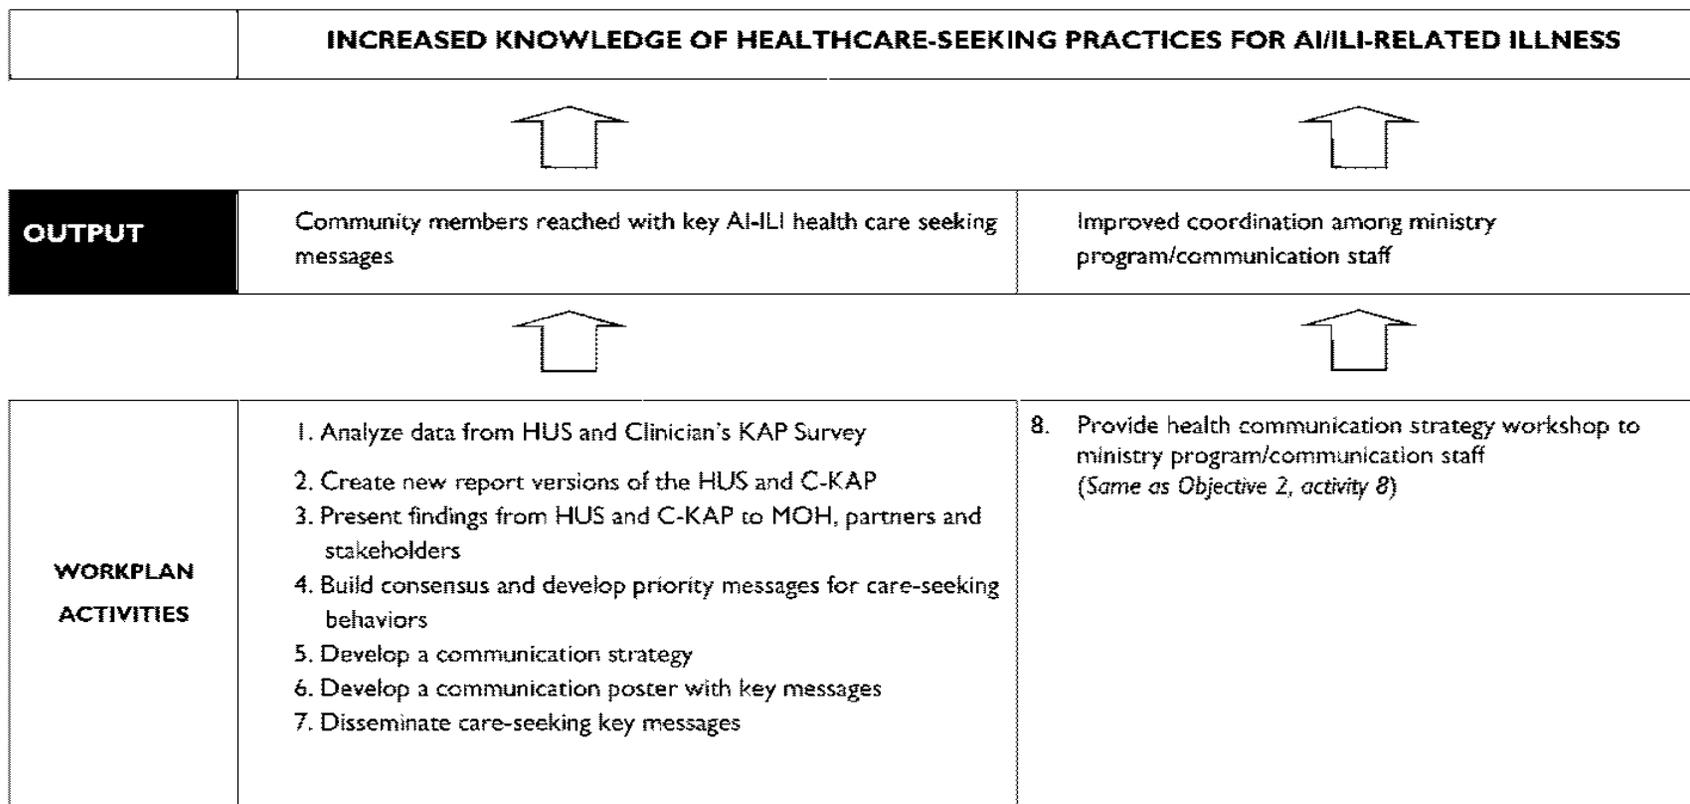

OBJECTIVE I: Strengthen and expand private, and public/private partnerships in high-risk districts to improve biosecurity and good farming practices in order to limit AI transmission among poultry

	IMPROVED BIOSECURITY AND GOOD FARMING PRACTICES AT SECTOR 3 BROILER FARMS IN HIGH-RISK AREAS	
		
OUTPUT	Sector 1 poultry companies and poultry shops encourage and support implementation of changes in biosecurity and good farming conditions at sector 3 broiler farms	Increased knowledge and understanding of biosecurity and good farming conditions among farmers and students
		
WORKPLAN ACTIVITIES	<ol style="list-style-type: none"> 1. Continue to hold strategic consultative meetings with industry and academic stakeholders 2. Conduct farmer and student visits to the teaching farms 3. Provide technical support to farmers to adopt and implement new biosecurity and good farming practices 4. Produce and distribute educational and communication materials 5. Develop and establish technical discussion groups meetings 	

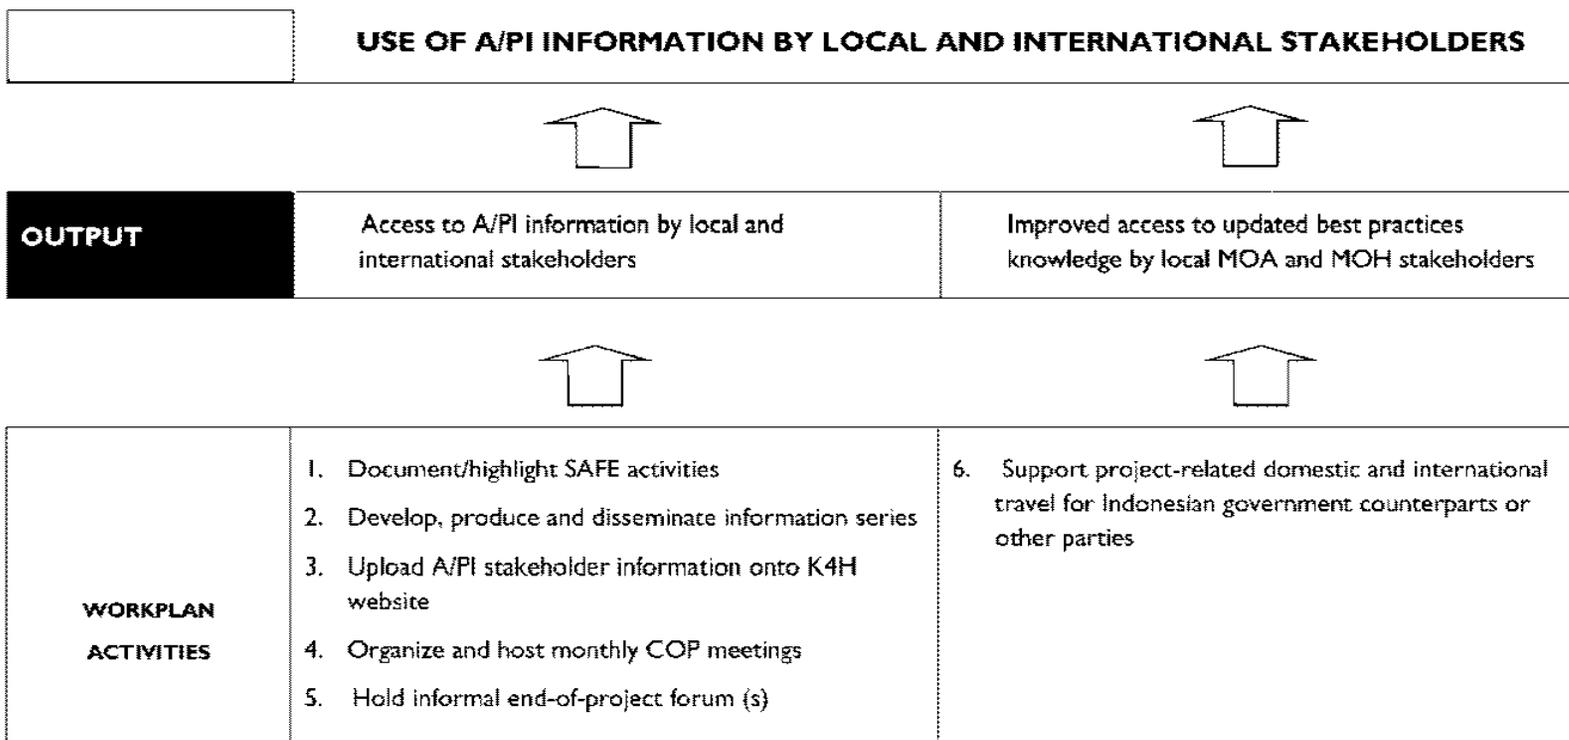

OBJECTIVE 2: Promote behaviors that lower the risks of AI transmission among poultry and increase knowledge of signs, symptoms and risk factors for AI-related illness

OBJECTIVE 3: Increase knowledge of signs/symptoms and risk factors for AI-related illness in people and promote behaviors that improve household-level care seeking in response to AI-related illness

OBJECTIVE 4: Facilitate coordination among partners by sharing information and hosting meetings

YEAR TWO WORKPLAN

ANNEX IV. SUMMARY OF DELIVERABLES AND TIMELINE

OBJECTIVE ACTIVITIES	DELIVERABLE	QUARTERS					
		Q1 Apr - Jun 2012	Q2 July - Sept 2012	Q3 Oct-- Dec 2012			
ACTIVITY 1. Hold strategic consultative meetings with industry and academic stakeholders	Summary results in Quarterly Reports	X	X	X			
ACTIVITY 2. Conduct farmer and student visits to the teaching farms	Summary number of visits in Quarterly Reports	X	X	X			
	Report on Champion Farmer competition results		X	X			
ACTIVITY 3. Provide technical support to farmers to adopt and implement new biosecurity and good farming practices	Summary farm changes in Quarterly Reports		X	X			
ACTIVITY 4 Produce and distribute educational and communication materials	Report on SMS pilots						
	Farmer-farmer video production			X			
	Farmer-to-farmer video dissemination						
ACTIVITY 5. Develop and establish technical discussion groups meetings	Summary findings in Quarterly Reports	X	X	X			

YEAR TWO WORKPLAN

OBJECTIVE 2 ACTIVITIES	DELIVERABLE	QUARTERS				
		Q1 Apr - Jun 2012	Q2 Jul - Sept 2012	Q3 Oct - Dec 2012		
ACTIVITY 1 Organize and conduct consultative meetings to develop and establish local ownership	Regular district operational meetings	X	X	X		
	Provincial advocacy/update meetings		X	X		
	District technical sustainability meetings		X	X		
ACTIVITY 2 Establish local NGO involvement to create consumer demand activities	Partner's planning workshop		X			
	Summary of community outreach activities (peer-to-peer, enter-educate, video screening, consumer group visits to market, religious events) in Quarterly Reports	X	X	X		
	Summary of healthy poultry and market electronic/social media activities (SMS blasts broadcast, Aisyiah and COMBINE websites, Facebook and Twitter) in Quarterly Reports		X	X		
	Advocacy training for facilitators		X			
	Capacity building workshop on SMS			X		
	Summary tools/job aids (short films on healthy market initiative, bulletin on healthy poultry and markets, audio recording for community radio, and <i>khutbah</i> books	X	X	X		
	Summary of modifications in Quarterly Reports	X				
ACTIVITY 4 Maintain market improvements	LBM maintenance plans		X			
	Healthy market community activities conducted	X	X	X		
ACTIVITY 5 Establish Vendor of the Month award	Summary of vendors award program in Quarterly Reports		X	X		
ACTIVITY 6 Air radio serial drama	Radio serial drama episodes aired		X	X		
ACTIVITY 7 Develop targeted communication tools to support changes in LBMs	IEC materials developed	X				
ACTIVITY 8 Provide health communication strategy workshop to ministry program/communication staff (Same as Objective 3, activity 8)	Report on Health Strategic Communication Workshop	X				

YEAR TWO WORKPLAN

OBJECTIVE 3 ACTIVITIES	DELIVERABLE	QUARTERS				
		Q1 Apr - Jun 2012	Q2 Jul - Sept 2012	Q3 Oct - Dec 2012		
ACTIVITY 1 Analyze data from HUS and Clinician's KAP Survey	HUS and C-KAP final report	X				
ACTIVITY 2 Create new report versions of the HUS and C-KAP	Condensed HUS Word report Condensed C-KAP Word report		X			
ACTIVITY 3 Present findings from HUS and C-KAP to MOH, partners and stakeholders	Presentation of HUS and C-KAP to international stakeholders	X				
ACTIVITY 4 Build consensus and develop priority messages for care-seeking behaviors	Priority messages on care-seeking behaviors drafted		X			
	Priority messages on care-seeking behaviors finalized		X			
ACTIVITY 5 Develop a communication strategy	Final communication strategy document			X		
ACTIVITY 6 Develop a communication poster with key messages	IEC material developed, pre-tested, finalized, and produced			X		
ACTIVITY 7 Disseminate care-seeking key messages	IEC material and messages disseminated			X		
ACTIVITY 8 Provide health communication strategy workshop to ministry program/communication staff (Same as Objective 2, activity 8)	Report on Health Strategic Communication Workshop	X				

YEAR TWO WORKPLAN

OBJECTIVE 4 ACTIVITIES	DELIVERABLE	QUARTERS					
		Q1 Apr - Jun 2012	Q2 Jul - Sept 2012	Q3 Oct - Dec 2012			
ACTIVITY 1 Document/highlight SAFE activities	Articles/press clippings/success stories	X	X	X			
ACTIVITY 2 Develop, produce and disseminate an information series	Five documents developed						
	Five documents produced and disseminated						
ACTIVITY 3 Upload A/PI stakeholder information onto K4H website	A/PI stakeholder information available on portal	X	X	X			
ACTIVITY 4 Organize and host monthly Chief of Party meetings	Monthly meetings	X	X	X			
ACTIVITY 5 Hold informal end-of-project forum (s)	One or two end-of-project forums held						
ACTIVITY 6 Support project-related domestic and international travel for Indonesian government counterparts or other parties	Travel to regional/international conferences and/or workshops	X					

**TECHNICAL AND POLICY DISCUSSION ON IMPROVING
THE PREVENTION AND CONTROL OF H5N1 HIGHLY PATHOGENIC AVIAN INFLUENZA
IN HIGHLY AFFECTED AND NEIGHBORING COUNTRIES**

23-25 April 2012, Ho Chi Minh City, Viet Nam

**REPORT OF THE MEETING
HO CHI MINH CITY, VIET NAM, 23-25 APRIL 2012**

Report prepared by: David Payne, Consultant, on behalf of FAO Viet Nam

Disclaimer:

This report does not necessarily represent the views of the organizations that supported the meeting or the views of the Government of Vietnam who hosted the meeting.

Executive Summary

At the beginning of 2012, the H5N1 HPAI virus continues to reside primarily in the poultry populations in about five to ten countries despite efforts by countries and the international community to decrease the burden of disease. Since 1996, the virus has undergone considerable genetic evolution and has expanded its geographic range. Some recent variants of the virus are not susceptible to existing poultry vaccines applied in some national control programs. The H5N1 HPAI virus is still considered a serious pandemic threat.

A previous *Technical Discussion on Best Practices for Prevention and Containment of H5N1 Highly Pathogenic Avian Influenza* organized by the Government of Indonesia and the United States Agency for International Development (USAID) in Bali in March 2010 brought together five highly-affected countries (Bangladesh, China, Egypt, Indonesia, and Viet Nam) to share lessons learned and identify best practices in responding to HPAI H5N1.

A second technical- and policy-level discussion for prevention and control of H5N1 HPAI was organized from April 23 to 25, 2012 in Ho Chi Minh City, Viet Nam. In addition to the five highly-affected countries that participated in the Bali meeting, the April 2012 discussions also included four neighboring countries (Cambodia, Lao PDR, Myanmar, and Thailand) which have reported periodic poultry outbreaks and some human H5N1 cases. The meeting was hosted by the Government of Viet Nam, with financial and technical assistance from USAID.

The technical discussions focused on (i) sharing key programmatic lessons learned and best practices, and identifying opportunities to replicate these successes in other countries; and (ii) on discussing and identifying possible solutions to key unresolved issues related to preventing and controlling H5N1 HPAI infections in poultry and humans and monitoring H5N1 HPAI viral evolution.

Participants in the meeting included high-level technical representatives from Ministries of Health and Ministries of Agriculture in the participating countries, as well as international technical partners from the headquarters and field offices of FAO, WHO, UNSIC, USAID, US CDC, USDA and Collaborating and Reference Centers.

Mr. Diep Kinh Tan, Vice-Minister of the Ministry of Agriculture and Rural Development (MARD), Viet Nam opened the meeting, affirming the value of regional and global cooperation and the importance of learning from past experiences and identifying the next steps to build strong national responses and effective regional and inter-country cooperation to address H5N1 and other potentially-serious zoonotic diseases.

Mr. Robert W. Ogburn, U.S. Deputy Consul General in Ho Chi Minh City, noted that the meeting was an important opportunity to take stock of and carry forward important and timely policy discussions around a persistent health concern of our time -- avian influenza.

Dr. Emil Agustiono, Deputy Coordinating Minister of the Coordinating Ministry for People's Welfare, Indonesia provided a summary of the previous technical discussion in Bali in March 2010. Mr. Andrew Clements from USAID/Washington provided a summary of the current HPAI H5N1 situation in the world.

Four sessions were organized to provide an opportunity for participating countries to share poster presentations on **best practices and lessons learned**, addressing the following topics:

1. Improving surveillance for reservoirs of H5N1 HPAI virus and monitoring of "silent" infections in animals (including in vaccinated poultry) and people;
2. Improving surveillance for molecular changes in H5N1 HPAI viruses residing in poultry, wild birds, humans, and other animals e.g. swine;
3. Improving the efficacy of outbreak surveillance and control in poultry; and
4. Improving detection and treatment of H5N1 infections in humans using existing systems such as influenza-like illness (ILI) surveillance and early warning/alert systems.

Individual country teams discussed the poster presentations and then reported back to the plenary on what they had learned and which best practices they might be interested to know more about or potentially apply in their own countries. A number of common themes emerged, focusing on:

- Field Epidemiology Training Programs (FETP) and Applied Veterinary Epidemiology (AVET/FETP-V) programs
- Surveillance and early detection of animal disease outbreaks
- Outbreak detection and community-based surveillance (CBS)
- Collaboration between the animal health and human health sectors
- Monitoring virus evolution and poultry vaccine matching
- Live Bird Market (LBM) biosecurity
- Enhancing various other aspects of disease control
- Improving detection and treatment of H5N1 infections in humans
- Cooperation between neighboring countries

Four sessions were organized to explore **key unresolved issues**, focused on the following questions:

1. How can countries and the global community most effectively identify key reservoirs of H5N1 HPAI (and their interconnectivity) and what interventions can be applied to reduce disease burden?
2. What current practices are likely driving evolution of the H5N1 virus and how can countries and the global community most effectively monitor for

- the presence and movement of new viral variants (and other influenzas) in key species to ensure efficacy of interventions and assess pandemic risk?
3. How can countries improve H5N1 HPAI cross-border cooperation and coordination to diminish the likelihood of the virus spreading from country to country?
 4. How can countries sustain essential components of H5N1 HPAI prevention, monitoring, and control programs when faced with declining funding?

Each session was led by a moderator, with comments from expert panel members followed by plenary discussions. For each question, key issues and possible areas for action were identified.

In the final session of the conference, Dr. Dennis Carroll, USAID/Washington noted that USAID and other partners would identify opportunities to follow up and build on the country exchanges during the meeting in order to strengthen country responses and international cooperation. Dr. Carroll also emphasized the need to respond to changing funding levels and to intensify regional and global coordination in responding to HPAI H5N1. Dr. Carroll expressed his strong appreciation to all participants for their contribution, and in particular to the Government of Viet Nam as host of the meeting.

Dr. Subhash Morzaria, FAO particularly noted the value of the innovative format of poster presentations developed by USAID as an effective way to promote sharing of experiences in a highly interactive way with a diverse group of participants. Dr. Morzaria noted the good results also of the panel discussion sessions, providing expert feedback and raising important issues and challenges as well as ways to address key unresolved issues. Dr. Morzaria expressed his appreciation for meeting participants, the national organizing committee and the support team. He also thanked USAID for their leadership and support to the meeting itself and the wider area of HPAI H5N1.

Dr. Hoang Van Nam, Director-General of the Department of Animal Health of the MARC thanked participants on behalf of the Government of Viet Nam, noting that the meeting had provided an important opportunity for learning, discussion of key unresolved issues, and identification of next steps for national responses and regional and inter-country cooperation. Dr. Hoang Van Nam also thanked USAID for their support for the meeting and their wider ongoing support on HPAI H5N1.

In line with the objectives of the meeting to promote technical and policy exchanges between participating countries and agree on actions to enhance coordination on key issues, a number of bilateral meetings were held, providing an opportunity for individual country delegations to exchange specific information and experiences on areas of common interest. Brief summaries of the topics discussed in the bilateral meetings are available.

PRRS	Porcine Reproductive & Respiratory Syndrome
PSD-R	Participatory Disease Surveillance and Response (Indonesia)
RDMA	Regional Development Mission for Asia (USAID)
SAARC	South Asian Association for Regional Cooperation
SARI	Severe acute respiratory infection
SIV	Swine Influenza Virus
SMS	Short message service (via mobile phone)
SPS	Sanitary and Phytosanitary
SOP	Standard operating procedure
UN	United Nations
UNSC	United Nations System Influenza Coordinator
US CDC	United States Centers for Disease Control and Prevention
USAID	United States Agency for International Development
USDA	United States Department of Agriculture
WHO	UN World Health Organization

1. Background to the meeting

In 1996, a new variant of H5N1 HPAI virus first emerged in East Asia and since that time, more than 17,000 poultry outbreaks and 600 human infections have been reported from 62 countries in Africa, Asia, Europe, and the Middle East.

Between 30 and 31 March 2010, USAID and the Government of Indonesia hosted a *Technical Discussion on Best Practices for Prevention and Containment of H5N1 Highly Pathogenic Avian Influenza* in Bali to strengthen existing interventions against H5N1 HPAI by promoting dialogue among five countries (Bangladesh, China, Egypt, Indonesia, and Viet Nam) that accounted for >90% of H5N1 HPAI infections in poultry and humans. The technical discussion focused on: a) identifying key programmatic successes or "best practices"; b) identifying how these successes were achieved; and c) identifying opportunities to replicate these successes in other countries. Best practices highlighted during the meeting included: active surveillance for poultry outbreaks; mass poultry vaccination; cleaning and disinfection of live bird markets; matching poultry vaccines with currently circulating strains of H5N1 HPAI virus; market chain analysis; improved referral, clinical management, and infection control for human cases; and communications and awareness-raising. As a follow-up to the Bali meeting, a number of inter-country technical exchanges were planned. The first such exchange took place in March 2011 between China and Viet Nam to discuss the role of vaccination in H5N1 HPAI control in endemic situations with a focus on: the current situation and future prospects; epidemiological tools to support risk-based surveillance, targeted vaccination and risk reduction interventions; and a roadmap for HPAI H5N1 control in China and Viet Nam.

At the beginning of 2012, the H5N1 HPAI virus continues to reside primarily in the poultry populations in about five to ten countries despite efforts by countries and the international community to decrease the burden of disease. Since 1996, the H5N1 HPAI virus has undergone considerable genetic evolution, including recombination and, in just the past few years, a newer variant (clade 2.3.2.1) has expanded its geographic range from Southeast Asia to Eastern Europe, East Asia, and South Asia. Some variants of clade 2.3.2.1 are antigenically different enough from other H5N1 HPAI clades so that, in some countries where poultry vaccination is used, the efficacy of programs to control the virus in poultry is compromised.

Despite the fact that all H5N1 human infections to date appear to have been the result of transmission of the virus from poultry (and/or poultry products) to people, H5N1 HPAI virus is still considered a serious pandemic threat because of (1) its continued presence in poultry in numerous countries and (2) its ability to infect humans and cause severe disease with an apparent average fatality rate of about 60%.

Two years after the meeting in Bali, it had become clear that in some countries simply monitoring for and controlling outbreaks in poultry has not produced additional gains. Instead, the continuing entrenchment of the H5N1 virus in poultry populations along with on-going evolution and geographic spread of new viral clades with different epidemiological and antigenic profiles highlights the importance of reassessing and refining existing prevention, monitoring, and control strategies, particularly those targeting poultry populations that serve as reservoirs for the virus. The recent decreases in national and international funding for H5N1 HPAI prevention and control put a premium on making existing interventions and programs more effective. To assist in this process, a second technical and policy level discussion for prevention and control of H5N1 HPAI was planned for April 2012 in Ho Chi Minh City, Viet Nam. In addition to the five highly-affected countries that participated in the Bali meeting, the April 2012 discussions also included four neighboring countries (Cambodia, Lao PDR, Myanmar, and Thailand) which have reported periodic poultry outbreaks and some human H5N1 cases.

The meeting took place from April 23 to 25, 2012 at the New World Saigon Hotel in Ho Chi Minh City, Viet Nam. The purpose of the meeting was to provide an opportunity for a mix of technically oriented senior professionals and policy makers plus international technical partners from nine countries affected by the H5N1 virus to share their successes and discuss unresolved issues.

The technical discussions focused on sharing key programmatic successes or "best practices" that have led to important outcomes or impacts, sharing how these successes were achieved, and identifying opportunities to replicate these successes in other countries; and on identifying possible solutions to unresolved issues related to H5N1 HPAI prevention and control.

The objectives of the meeting were to provide country representatives with an opportunity to:

- Participate in an exchange among representatives from countries principally affected by the H5N1 virus of lessons learned and best practices that are related to preventing and controlling H5N1 HPAI infections in poultry and humans as well as monitoring H5N1 HPAI viral evolution;
- Discuss the current State-of-the-Art in addressing HPAI
- Identify opportunities for replication of lessons learned and best practices;
- Discuss specific unresolved issues related to preventing and controlling H5N1 HPAI infections in poultry and humans and monitoring H5N1 HPAI viral evolution; and
- Identify steps for addressing these unresolved issues.

The expected deliverables of the meeting were:

- Sharing of specific best practices in Bangladesh, Cambodia, China, Egypt, Indonesia, Lao PDR, Myanmar, Thailand, and Viet Nam that have resulted in important outcomes or impacts;
- Identification of opportunities to replicate specific best practices in other countries and next steps needed to adopt these best practices; and
- Identification of possible solutions to unresolved issues related to H5N1 HPAI prevention and control.

Participants in the meeting included high-level technical representatives—below Vice Minister level—from Ministries of Health and Ministries of Agriculture from Bangladesh, Cambodia, China, Egypt, Indonesia, Lao PDR, Myanmar, Thailand and Viet Nam, including some senior policy makers who are empowered to make decisions related to disease prevention and control. In addition to the country representatives, international technical partners from the headquarters and field offices of the UN Food and Agriculture Organization (FAO), the UN World Health Organization (WHO), the UN System Influenza Coordinator (UNSIC), the US Agency for International Development (USAID), the US Centers for Disease Control and Prevention (US CDC), the US Department of Agriculture (USDA), and Collaborating and Reference Centers also participated in the meeting.

2. Summary of proceedings

2.1 Opening session

Mr. Diep Kinh Tan, Vice-Minister of the Ministry of Agriculture and Rural Development (MARD) of the Socialist Republic of Viet Nam welcomed the members of country delegations, representatives and technical experts from the international agencies and other participants to the meeting. He briefly noted the experience of Viet Nam as a highly-affected country responding to HPAI H5N1 since late 2003, and emphasized the importance that the Government of Viet Nam has placed on sharing experiences with other countries within the region as well as with other highly affected countries throughout the world, in order to ensure a well-coordinated and effective overall global response.

The Vice-Minister affirmed the value of previous exchanges, including the *Technical Discussion on Best Practices for Prevention and Containment of H5N1 Highly Pathogenic Avian Influenza* organized in Bali in March 2010 by the Government of Indonesia, the US Agency for International Development (USAID) and the *International Ministerial Conference on Animal and Pandemic Influenza (IMCAPI)* hosted by the Government of Viet Nam together with the United States Government, the European Union and the United Nations system in Hanoi in April 2010, which identified important achievements, lessons and remaining challenges for the global response to H5N1. He noted that the conclusions of these meetings had been applied in Viet Nam's national response through the development of the Viet Nam Integrated National Program on Avian Influenza, Pandemic Preparedness and Emerging Infectious Diseases for the period 2011 through 2015.

The Vice-Minister welcomed the opportunity to host a follow-up discussion to the Bali meeting, thanking the US Government for their support and welcoming the inclusion of some neighboring countries of highly-affected countries that participated in the Bali meeting, including Cambodia, Lao PDR, Myanmar and Thailand. He described the meeting as an opportunity to learn from the best practices and lessons of each country, to identify and discuss key challenges and unresolved issues related to preventing and controlling H5N1 in poultry and humans as well as monitoring H5N1 viral evolution, and to formulate joint next steps and practical, effective options to build strong national responses and effective regional and inter-country cooperation to address H5N1 and other potentially-serious zoonotic diseases.

Speaking on behalf of the US Government as sponsor and co-organizer of the meeting, Mr. Robert W. Ogburn, U.S. Deputy Consul General in Ho Chi Minh City, noted that the meeting was an important opportunity for representatives from nine countries and key international agencies to take stock of and carry forward important and timely policy discussions around a persistent health

concern of our time -- avian influenza. He referred to the similar exchange two years previously in Bali hosted by the Government of Indonesia, which was followed by many fruitful exchanges among participating countries, and described the meeting in Ho Chi Minh City as the next step in promoting an effective dialogue among five partner countries from the Indonesia meeting as well as neighboring countries still affected by avian influenza.

The Deputy Consul General noted that the meeting was occurring at a critical time, when governments and donors have increasingly limited resources, which will require some difficult decisions. He emphasized the need for future planning to be based on an awareness of the many technical and financial challenges and further thinking about long-term strategies for assessing the risk posed by the avian influenza virus. He thanked the Government of Viet Nam for agreeing to host the conference.

Dr. Emil Agustiono, Deputy Coordinating Minister of the Coordinating Ministry for People's Welfare, Indonesia provided a summary of the previous *Technical Discussion on Best Practices for Prevention and Containment of H5N1 Highly Pathogenic Avian Influenza* organized in Bali in March 2010.

Mr. Andrew Clements, Deputy Director of the Pandemic Influenza & Other Emerging Threats Unit, USAID/Washington provided a summary of the current HPAI H5N1 situation in the world.

2.2 Sharing Best Practices and Lessons Learned

2.2.1 Overview of the section on sharing best practices and lessons learned

This section of the meeting provided an opportunity for meeting participants to participate in an exchange among representatives from countries principally affected by the H5N1 virus of lessons learned and best practices related to preventing and controlling H5N1 HPAI infections in poultry and humans as well as monitoring H5N1 HPAI viral evolution.

The best practices/lessons learned presentations prepared by country team participants consisted of “posters” highlighting best practices, successes and potential applications, and continuing challenges. These presentations were used to interactively share information among all participants and foster a rich technical dialogue among the affected countries. The guidelines for the preparation of poster presentations are available at Annex IV.

The poster sessions on best practices and lessons learned focused on the following topics:

1. Improving surveillance for reservoirs of H5N1 HPAI virus and monitoring of “silent” infections in animals (including in vaccinated poultry) and people (12 poster presentations from 7 countries)
2. Improving surveillance for molecular changes in H5N1 HPAI viruses residing in poultry, wild birds, humans, and other animals e.g. swine (11 poster presentations from 6 countries)
3. Improving the efficacy of outbreak surveillance and control in poultry (12 poster presentations from 6 countries)
4. Improving detection and treatment of H5N1 infections in humans using existing systems such as influenza-like illness (ILI) surveillance and early warning/alert systems (4 poster presentations from 4 countries)

The full list of poster presentations is available at Annex IV. Poster presentations from the previous technical discussion in Bali in March 2010 were also displayed.

Soft copies of each poster presentation were distributed on a flash memory drive at the conclusion of the meeting. Soft copies of all presentations are available from PAHI Secretariat, Viet Nam and are expected to be made available online in PDF format by PAHI Secretariat in future.

2.2.2 Country Team Discussions and Reporting Back

Following the poster walk sessions, each individual country team met together to discuss the poster presentations and identify what had been learned from the best practices and lessons learned from the other countries, to review the comments made by other teams on their own country team posters, and to review which lessons learned and best practices from other countries could be adopted by the country team in their own national response. Each country team

also identified any questions or comments they would like to raise to the other country teams.

During the first session on the morning of day three, each country team reported back to the plenary on the contents of their internal team discussions, focusing on what they had learned and which best practices they might be interested to know more about or potentially apply in their own countries.

Generally, country delegations noted the value of this session as a way to learn from the experiences of other countries and to identify best practices and lessons learned that might be applied in their own country programs and also form the basis for future cooperation and exchange between the participating countries.

A number of common themes emerged from the feedback from individual countries on the poster sessions, focusing on the following topics:

- Field Epidemiology Training Programs (FETP) and Applied Veterinary Epidemiology (AVET/FETP-V) programs
- Surveillance and early detection of animal disease outbreaks
- Outbreak detection and community-based surveillance (CBS)
- Collaboration between the animal health and human health sectors
- Monitoring virus evolution and poultry vaccine matching
- Live Bird Market (LBM) biosecurity
- Enhancing various other aspects of disease control
- Improving detection and treatment of H5N1 infections in humans
- Cooperation between neighboring countries

A summary issues discussed in relation to these topics is outlined below.

Field Epidemiology Training Programs (FETP) and Applied Veterinary Epidemiology (AVET/FETP-V) programs

- Many countries expressed interest in the FETP and FETP-V programs being applied in a number of participating countries, and requested these countries to share their experience and curricula.
- Countries including Bangladesh, Myanmar and Lao PDR expressed interest in developing an FETP program for human health.
- Countries including Bangladesh, Cambodia, Indonesia and Lao PDR expressed interest in developing an FETP-V program. In Indonesia, for example, it was suggested this could potentially be developed in alongside and complementary to the existing FETP program.
- Viet Nam noted that they have already established FETP and AVET programs, however they are currently concerned about financial sustainability of these programs and would like more information from countries such as China and Thailand about how they have managed to ensure ongoing national funding for their equivalent programs for more than a decade.

Surveillance and early detection of animal disease outbreaks

- Several countries noted the need to strengthen surveillance for early detection and response to animal disease outbreaks. There was particular interest in country experiences with LBM surveillance and duck surveillance.
- Cambodia asked about whether there was any experience in applying a trace-back system in LBM surveillance. Indonesia also noted the interest in LBM surveillance, and suggested the need for further discussion on this, including potentially better standardization of sample selection and methodologies (cloacal versus fecal samples), as well as ways to reduce the cost of sampling and testing. Thailand noted the lessons from studies and surveillance in LBM, including the active environmental surveillance in Indonesia and Viet Nam's oro-pharyngeal sampling. They noted their interest in applying these approaches in Thailand to learn more about virus sources.
- In relation to their poster on duck surveillance, Lao PDR noted the comments from other countries that their sero-prevalence was quite low compared to the virus isolation in Lao PDR. Lao PDR requested more information on the methodologies applied for surveillance in ducks in different countries, noting some comments from some countries on the approach and results of the surveillance in Lao PDR to date, and also raising the question of whether duck surveillance should be standardized across different countries.
- Indonesia expressed interest in the Bangladesh experience of compensation to farmers for culling, as something that could also possibly be applied in Indonesia. Egypt also requested further information on experiences with culling and compensation.

Outbreak detection and community-based surveillance (CBS)

- Countries including Egypt and Lao PDR expressed interest in local surveillance experiences shared at the meeting, including the PDS-R system from Indonesia and the CBS model applied in Viet Nam. There were requests to share further information about the impact of these systems for early disease detection.
- Viet Nam noted that other countries had expressed interest in the CBS model presented at the meeting, including about the ongoing costs and how it could be made sustainable for the long term and replicated nationwide.
- Cambodia, Lao PDR and Egypt also expressed interest in Bangladesh's experience of applying SMS-based outbreak reporting as a good practice for early detection and reporting of outbreaks.
- Egypt noted that they have also been applying SMS-based reporting since 2008.

- Cambodia and Lao PDR identified SMS-based reporting as a possible aspect for application in their countries, however requested more information on how it could be applied and the potential impact.

Collaboration between the animal health and human health sectors

- Countries including Indonesia and Lao PDR noted the similar activities across several countries related to joint field investigations between animal health and human health sectors.
- More information on country experiences in developing sustainable models for joint human and animal outbreak investigation teams was requested by Lao PDR.
- China noted their intention to continue strengthening communication and collaboration between human health and animal health sectors for joint training and improved surveillance. China also expressed interest in the experience of Viet Nam in implementing integrated CBS including surveillance for both human and animal diseases.

Monitoring virus evolution and poultry vaccine matching

- There was significant interest in the experience of different countries in tracing the evolution of the HPAI H5N1 virus over time, including the importance of monitoring virus circulation for poultry vaccine matching. Viet Nam's poster on virus characterization was noted by several countries.
- Bangladesh noted that effective poultry vaccination requires a good molecular surveillance system, which requires high-level laboratory capacity. They noted that it may also require in-country vaccination capacity. They expressed interest in having more information on the RE-6 vaccine.
- Egypt requested further information on the impact of vaccination in terms of reducing the virus load in the environment as seen in poultry outbreaks and the incidence of human infections. They also raised questions about the prospects for an effective vaccine for use in day-old chicks.
- Vietnam requested to have more information from other countries on their vaccination experience. They referred to the vaccination challenges in the face of changes in the virus strain and their current reliance on procuring vaccines from other countries.

Live Bird Market (LBM) Biosecurity

- Countries including Cambodia, China, Egypt, Lao PDR, Myanmar and Viet Nam noted their interest in further sharing of experiences related to improving LBM biosecurity and noted various aspects for possible application in their own countries.

- There was interest in the application of market cleaning and rest days. Noting the experience of Bangladesh on applying a weekly rest day in LBM markets, other countries raised the question of how all birds could be moved out for cleaning. It was suggested that a monthly rest-day might be more feasible. Further information was also requested on ways to measure improvements in LBM cleanliness.
- China mentioned the aspect of SOPs for LBM biosecurity.
- Egypt noted their interest in the involvement of the private sector in renovation of LBM in Bangladesh, including with some government incentives, as something that could potentially be applied in Egypt.
- Viet Nam expressed interest in experiences related to rolling out enhanced biosafety activities in LBM nationwide at different levels, however also noted the challenge of attracting vendors and consumers to the new markets after they have been upgraded.

Enhancing various other aspects of disease control

- Countries including China, Egypt and Myanmar expressed interest in applying experiences in hatchery biosecurity improvements.
- Egypt noted their interest in poultry hatchery quality improvement, mapping, legislation and auditing systems. They requested further information on the results of hatchery quality improvement in terms of impact on controlling disease. They also requested more information on the application of vaccination in poultry hatcheries in Viet Nam.
- Bangladesh noted their interest in possibly applying GPS mapping of commercial farms to support planning, surveillance and rapid response.
- Egypt expressed interest in having more information on the Gathering Evidence for a Transitional Strategy (GETS) program in Viet Nam.
- The good practices shared by Thailand in relation to breeding farms and certification linked to compartments and zones were noted by Indonesia as something that they could possibly apply. Viet Nam particularly noted that they would like to enhance the role of the private sector in disease control activities, drawing on the experiences of countries like Indonesia and Thailand in public-private partnerships.
- Several countries expressed their interest in enhancing farm biosecurity, including ways to assist poultry farmers to improve decision-making related to biosecurity, management and vaccination. Thailand's experience in improving poultry farm biosecurity was noted.

Improving detection and treatment of H5N1 infections in humans

- Several of the participating countries shared their experiences on ILI, SARI, pneumonia and similar surveillance activities in the human health sector. Topics of interest for further information sharing included selection of sentinel sites and provision of feedback to doctors.

- Lao PDR noted their interest in the experience of hospital-based surveillance for ILI/SARI/pneumonia in detected H5N1 human cases in some countries. Lao PDR noted that other countries had been interested in whether their hospital-based ILI/SARI surveillance has detected any human H5N1 cases, and how they detect community cases. They advised that no human H5N1 cases have been detected through hospital-based ILI/SARI surveillance, and that community surveillance is carried out through health care workers, event-based surveillance and a toll-free hotline.
- Thailand noted the lessons from China's hospital-based extensive network for AI surveillance. Indonesia also noted the One Health approach applied by MOH and MOA in China on ILI surveillance as something that could potentially be applied in Indonesia. They requested more information on some specific aspects of China's ILI surveillance.
- Viet Nam noted that their current ILI surveillance activities are mostly funded from international assistance, particularly from US CDC. They expressed interest in having more information from countries like China that are funding their own ILI surveillance from national sources on how they were able to mobilize government funding and how long it took to achieve sustainability.
- Thailand noted the lessons from Bangladesh about active surveillance of farm workers as a high-risk population. Thailand expressed interest in applying the lessons and experiences from other countries on active surveillance in high-risk poultry farms. Thailand expressed interest in conducting additional studies on surveillance in ducks, including surveillance of duck farmers, looking at the animal-human interface.

Cooperation between neighboring countries

- Several countries expressed interest in cross-border studies, cooperation and information sharing in relation to HPAI H5N1.
- Cambodia requested further information on any experience of joint surveillance between different countries. Myanmar also expressed interest in cross-border studies.
- Viet Nam commented on the challenges of border markets and cross-border trade, for example in spent hens, and raised the question of whether source countries for such cross-border trade could have any plans for enhancing ILI surveillance amongst these poultry populations.

2.3 Addressing Unresolved Issues

2.3.1 Overview of the section of the meeting on addressing unresolved issues

Four sessions were organized during day two and day three of the conference to explore key unresolved issues related to H5N1 HPAI. Each of these sessions consisted of an 85-minute plenary discussions related to H5N1 HPAI prevention, monitoring, and control for issues that do not yet have a clear way forward. The expected output for each session was a set of specific policy and/or technical recommendations related to the topic of the session.

Each session focused on a particular question, as follows:

1. How can countries and the global community most effectively identify key reservoirs of H5N1 HPAI (and their interconnectivity) and what interventions can be applied to reduce disease burden?
2. What current practices are likely driving evolution of the H5N1 virus and how can countries and the global community most effectively monitor for the presence and movement of new viral variants (and other influenzas) in key species to ensure efficacy of interventions and assess pandemic risk?
3. How can countries improve H5N1 HPAI cross-border cooperation and coordination to diminish the likelihood of the virus spreading from country to country?
4. How can countries sustain essential components of H5N1 HPAI prevention, monitoring, and control programs when faced with declining funding?

A moderator led and facilitated the discussion for each session, together with 4-5 panel members with specific expertise and experience throughout the region related to the specific question being discussed.

Breakdown of the Unresolved Issues discussion session

Time allotment	Format	Comments
10 minutes	Challenge statement (see above)	Moderator
20 minutes	Comments/perspectives from an expert panel	5 minutes for each of the 4-5 panelists
65 minutes	Commentary and discussion	Open to entire group
10 minutes	Final summary of key policy issues and recommendations	Moderator

A rapporteur was also assigned for each session to take notes, focusing on the key issues identified in relation to the question, as well as possible areas where action might be taken (“actionables”).

2.3.2 Main contents of the sessions on addressing unresolved issues

Dr. Dennis Carroll, Director of the Pandemic Influenza & Other Emerging Threats Unit, USAID/Washington introduced this section of the meeting, recalling the context over the past 6-7 years of responding to a situation of explosive growth and movement of the HPAI H5N1 virus throughout the world, and the achievements in bringing the virus under control, with the result that the situation in 2012 is now very different to the situation faced in 2006. Dr. Carroll noted that HPAI H5N1 does not now represent the same level of threat as it previously did in terms of the number of affected countries, the geographic distribution of the virus within affected countries and the amount of time between the onset and control of outbreaks.

In this context, Dr. Carroll also emphasized the ongoing challenges posed by the virus, and the need for the meeting participants to collectively question whether the questions that have been focused on during the previous 6 years continue to be the most relevant questions looking ahead 1, 2, 5 and 10 years into the future. He noted the expectation of reduced resources for HPAI H5N1 in future, requiring considerations about how to use available resources in the most effective way.

Dr. Carroll emphasized that these sessions were meant to be considered as open and frank opportunities for brainstorming and raising provocative issues, with the purpose of identifying both areas to adjust or tweak existing activities, as well as areas where more substantial changes to existing approach could be considered.

Unresolved Issue #1: Identifying Key Reservoirs

Challenge question:

How can countries and the global community most effectively identify key reservoirs of H5N1 HPAI (and their interconnectivity) and what interventions can be applied to reduce disease burden?

Moderator: Dr. Subhash Morzaria, Regional Manager, FAO ECTAD RAP

Panel members:

- Dr. Hossain Mosharraf, Additional Secretary, Ministry of Fisheries and Livestock, Bangladesh
- Dr. Xinyan Zhai, Research fellow, China Animal Disease Prevention Control Center, China
- Eric Joseph Brum, Chief Technical Advisor, FAO Indonesia
- Dr. Phan Quang Minh, Deputy Director of Epidemiology Division, DAH Viet Nam
- Dr. Les Sims, Veterinarian

Rapporteur: Mr. Andrew Clements, Deputy Director of the Pandemic Influenza & Other Emerging Threats Unit, USAID/Washington

Summary of the discussion

Dr. Morzaria introduced the session, recalling the significant achievements in moving from a situation where a total of 63 countries had been affected by the virus in previous years to the currently situation with only 5 countries endemic and a further 4-5 sporadically infected.

Dr. Morzaria noted that the international response had reached something of a crossroads, with a perception that the disease will stay in the endemic countries over the coming 10-15 years due to the lack of biosecurity in production systems and the difficulty in making further progress in controlling the virus unless significant changes can be made in the poultry sector in a context of various economic drivers.

Dr. Morzaria noted some specific challenges raised in the poster sessions, including biosecurity in duck populations in some countries, the identification of the virus through LBM surveillance despite the lack of widespread outbreaks, and situations where wild birds have been responsible for introducing H5N1 viruses.

Dr. Morzaria requested the panel members to provide perspectives on the question of whether the current approach to surveillance should continue or required significant changes. Following the initial comments of the panel members, discussion was opened up to the whole meeting.

A range of key issues were identified by panel members and other meeting participants during the discussion session, including:

- Defining infection reservoirs: sources of virus that can further infect susceptible populations; elimination of reservoir removes disease threat
- Suspected reservoirs: poultry (including domestic ducks) in live bird markets and farms for HPAs; wild birds might be reservoirs, but likely more for LPAs.

- Poultry sector seen as the major reservoir for H5N1 HPAI virus; limited biosecurity present and economic disincentives exist which limit ability to improve biosecurity.
- Viral surveillance in poultry on farms and live bird markets as well as in wild birds.
- Passive surveillance focusing on poultry outbreaks which does not necessarily identify reservoirs; some active surveillance being used, but enough to identify key reservoirs?
- Despite decreases in reported poultry outbreaks and human cases in some countries, virus continues to persist and cause sporadic infections.
- Monitoring virus in domestic ducks and LBMs; often find more infections than those reported in outbreaks; what control measures are used when sub-clinical infections or "exposed" birds (seropositive) are found? Is culling of birds without clinical infections allowable?
- Outbreak monitoring used to control disease where there are clinical infections; does not address sub-clinical/silent infections.
- Intensive H5N1 surveillance is heavily donor supported.
- H5N1 viral replication can be year-round (e.g. backyard settings in Indonesia), but seasonal peaks exist in most/all countries suggesting transmission is lower at some times of year than others.
- May be multiple (nested) reservoirs of virus.
- Transport of live birds spreading the virus.
- Many countries use large-scale poultry vaccination to control the disease which makes monitoring for virus more challenging; endemicity possible in absence of poultry surveillance.
- Limited potential for improving biosecurity in some settings (e.g. free ranging ducks, sector 3 and backyard farms).

Related to these key issues, a range of possible areas for action ("actionables") were identified, including:

- Identifying—through various types of surveillance—where the virus is "hiding" during the low transmission time of the year (e.g. May-October) so that control measures can be temporally targeted.
- Improving surveillance (animal and human) to be more active, comprehensive, and longitudinal and include other flu viruses of public health concern. One important question will be how to do with decreasing donor funding.
- Identifying flock sizes, composition and other factors associated with flocks that are required to maintain the virus year-round.

- Better identifying how the virus might persist in the environment.

Unresolved Issue #2: Evolution of the H5N1 HPAI Virus

Challenge question:

How can countries and the global community most effectively identify key reservoirs of H5N1 HPAI (and their interconnectivity) and what interventions can be applied to reduce disease burden?

Moderator: Ron Waldman, Pandemic Influenza Consultant, USAID Washington

Panel members:

- Dr. Tim Uyeki, Influenza Division, CDC Atlanta
- Dr. Malik Peiris, Chair of Virology, School of Public Health and Scientific Director, HKU-Pasteur Research Centre, University of Hong Kong
- Dr. Sujira Pachariyanon, Head of Virology Section, NIAH, Department of Livestock Development, Ministry of Agriculture and Cooperatives, Thailand
- Dr. Ken Inui, International Laboratory Expert, FAO Viet Nam
- Dr. Jeremy Farrar, Oxford University Clinical Research Unit, HCM City, Viet Nam

Rapporteur: Dan Schar, Emerging Infectious Disease Advisor, USAID RDMA

Summary of the discussion

Dr. Waldman opened the session, emphasizing the need to look forward and to consider whether our current actions will lead us to the future we want to reach.

Dr. Waldman requested the panel members to provide perspectives on the question of whether the current approach to surveillance should continue or if it required significant changes. Following the initial comments of the panel members, discussion was opened up to the whole meeting.

A range of key issues were identified by panel members and other meeting participants during the discussion session, including:

- What are the right things to be doing, and are we doing them correctly?

- What does the human health sector require from animal health sector? Identification of influenza A subtypes with pandemic risk, including but not limited to H5N1.
- Requires real time info on circulating viruses, both genetic and antigenic variation.
- Sequence sharing is increasing dramatically, but it currently may take several years to get this information into databases which hinders human vaccine strain selection
- Will H5N1 ever move toward effective human-human transmissibility? Over 16 years it has not yet done so.
 - However, ferret studies indicate improved transmissibility with around 5-6 mutations.
 - This indicates some key factors we should be looking at; at least 2 of the mutations are already present in circulating viruses.
- In Hong Kong, dead wild bird surveillance has been useful. There is also a need to look in other species, especially swine where there may be shift to human receptor binding specificity.
- In Vietnam, HPAI H5N1 started with clade 1, then moved to clade 2.3.4. Now Vietnam is at clade 2.3.2.1 (2009-10) in the north; in south, the clade 1 virus introduced in 2003-04 has persisted to the present with ongoing evolution.
- Factors in the north affecting which clades are present include incursions of new strains; ~ 20% of viruses have evidence of reassortment, which helps track genetic movement and monitor specific sequences.
- Thailand's experience with stamping out without vaccination; public-private partnerships; active surveillance in domestic poultry, wild birds. swine.
- SIV mostly occurs in young weaner swine, rather than sows, which may help target novel influenza A surveillance.
- Initial focus on poultry and ducks; however, 2009 pdm H1N1 demonstrates the need to be forward thinking.
- Must better understand benefits/risks of vaccinating large number of poultry.
- Need to both improve sample sharing, and the sharing in benefits of research to countries sharing samples
- Need to understand risk of avian and swine influenza virus transmission to humans; in US, have had pdm H1N1 in swine and reassortment generating new strains transmissible to humans (H3N2v); some pig-to-human transmission, but also possibly limited human-to-human transmission

- Serosurveillance: population studies have not been standardized; must standardize methods (e.g. what populations—i.e. poultry workers—what sero assays, definition of sero +, when to sample); need to sample serially around the poultry outbreak and need more data to understand the trends and relevance; need a control population of non-exposed people to limit false +s from cross reactivity (major limitation of current sero surveillance studies)
- Issue of longitudinal surveillance in asymptomatic populations of swine and other spp., and what is required to accomplish this?
 - Receptor binding affinity and how the virus adapts; a2,6 human type receptor in avian gut as well, which we don't fully understand
 - Abattoir surveillance one possible solution
 - Deep sequencing capabilities may help elucidate viral mutations of significance
- What's the objective of surveillance? Can we pick up increases in secondary cases that indicate the virus is changing? What about picking up milder cases via sentinel surveillance?
- Can we be predictive about viral evolution? Should we be looking for BOTH random mutations and "viral chatter"?
- Vaccination: should we producing human vaccines against animal and avian influenza targets to avoid a "too late" scenario?
 - Vaccination likely our best tool, and yet production capabilities still limited
 - Treatment protocols need standardization
 - Improved seasonal influenza vaccination will also yield benefits for a potential pandemic event
 - Raise with the public a "pre-pandemic" use of vaccines
- Must avoid food security threats from misguided or misunderstood surveillance; how can we improve compensation schemes
- Looking at drivers of viral evolution will be locally context dependent
- Is poultry vaccination a major driver of H5N1? No, not the major driver but a contributor if used imperfectly (poor vaccine, mismatched, inappropriate timing); it may, but some poultry acquire immunity by LPAI or natural infection and so vaccination itself may not be of primary significance
- Do we need a regulatory body to enforce standards of matching avian influenza vaccine with circulating strains
 - Monitoring programs for ensuring matches are already in place; China has changed antigen 3x since mass vaccination in 2004-05;

- however, other countries have a void in regulation that enables use of poorly matched vaccines
 - Requires stronger veterinary services over a longer time frame to ensure any regulations are enforceable
 - Farmer driven programs (e.g. Indonesia) to help select a well matched vaccine by incentivizing use of well matched vaccine for better productivity/fewer losses
- Transgenic poultry—are there some poultry that are more naturally resistant to infection?
- Need to develop more logical way to assess pandemic risk
 - US CDC has a risk framework in development; once risks are assessed, antigen candidates can be appropriately selected for pre-pandemic vaccine candidate and production

Related to these key issues, a range of possible areas for action (“actionables”) were identified, including:

- Can we predict the combination of gene sequences that will predispose influenza A to pandemic potential?
- Need improvement in speed of sequence availability; must be shift to sequencing capability in developing world for more real time capability
- We must have a better understanding of spp barrier; what is preventing circulating viruses from crossing the spp barrier and infecting humans? Will help target surveillance
- Surveillance in primary health care units; must ensure clinicians are readily able to pick up cluster events and flag samples for further study
- We need longitudinal surveillance in animals (swine and poultry) in combination with human influenza surveillance; need population-based sentinel surveillance for milder disease, not just hospitalized case surveillance (as has been done in Bangladesh); cluster surveillance needed, with every H5N1 case investigated, particular involving non-blood relatives as a flag for transmissibility
- Need to look at H7 and low-path H9N2 viruses, which we already know affect humans
- Need improved and coordinated sharing of animal/human data, both geographically and temporally to track viral evolution and assess pandemic risk
- Can we better characterize the animal/human interface to help better assess risk?

- Agro-ecological variables, population density, and other factors that will predispose an introduction event to ongoing transmission and endemicity
- Need more extensive swine surveillance looking for highest risk production systems to identify new influenza A threats
- Do we need to screen for milder cases with earlier viral clearance as an indicator of improved adaptation to humans?
- Delivery of poultry vaccination still a challenge: can we develop a vaccine that provokes a sterile immunity without virus shedding?
 - Unlikely to get sterile immunity
 - Major problem is timing to get two doses in ducks to provoke adequate immunity
- Need to make a list of potential drivers of viral evolution; will likely be a combination of drivers that have most significance

Unresolved Issue #3: Cross-Border Cooperation

Challenge question:

How can countries improve H5N1 HPAI cross-border cooperation and coordination to diminish the likelihood of the virus spreading from country to country?

Moderator: Dr. Santanu Bandyopadhyay, ECTAD Viet Nam Team Leader, FAO

Panel members:

- Dr. Teng Srey, Deputy Director, Communicable Disease Control Department, Ministry of Health, Cambodia
- Dr. Khamphouth Vongxay, Deputy Chief of Animal Disease Diagnostic Laboratory, National Animal Health Center, Lao PDR
- Dr. Than Htun, National Project Manager, FAO Myanmar
- Dr. Pasakorn Akkarasewi, Director, Bureau of Epidemiology, Department of Disease Control, Ministry of Public Health Thailand
- Dr. Mohinder Oberoi, FAO ECTAD Sub-Regional Office, Nepal

Rapporteur: David Payne

Summary of the discussion

Opening the discussion, Dr. Santanu Bandyopadhyay noted that cross-border trade (CBT) is not a new phenomenon. However, as volume has increased, disease transmission risks from formal and informal trade have also increased. Dr. Bandyopadhyay noted that drivers of CBT include price differentials, demand-supply gap (surplus production in one country and demand in a neighboring country) and limited livelihood options in border areas, which are often underdeveloped and not a priority for government investments in industry.

Dr. Bandyopadhyay noted systems in place to reduce risk, including formal trade requirements, SPS certification and bilateral trading agreements. However, when disease occurs, the first response is often to ban trade, often under considerable pressure from the media and the public. However, an unintended result of banning trade may be that CBT becomes more lucrative. Additionally, monitoring and SPS certification will not be taking place and there may be limited capacity of veterinary authorities to enforce a ban.

Dr. Bandyopadhyay requested the panel members to provide perspectives on issues of CBT and cross-border cooperation. Following the initial comments of the panel members, discussion was opened up to the whole meeting.

A range of key issues were identified by panel members and other meeting participants during the discussion session, including:

- Dimensions of CBT demand and risk include seasonal factors, e.g. related to socio-cultural practices such as festivals, trading of live rather than processed poultry due to cultural and other reasons, different consumption patterns (e.g. for spent hens), demand for day-old chicks and young poultry as food for raptors (Middle East, North Africa), and wildlife farming and trade for consumption, ornamental purposes.
- Limited investment by central governments in border areas also may mean that producers and traders in these areas have low awareness of biosecurity and disease and are not reached by risk communication efforts, increasing the likelihood of risky practices for disease transmission.
- Challenges in cross-border cooperation at different levels:
 - Plans on each side of the border may not be harmonious (e.g. different approaches to culling). Actions taken in one country may not be feasible in the other country due to various factors, which may become an issue of contention between technical people.

- The number and capacity of local veterinary authorities and other related sectors may not be matched across borders.
- Formal agreements may be in place, however may not be actively pursued in practice. There may be a tendency to assign blame to other countries for disease events.
- While local governments and veterinary authorities raise the need for direct information-sharing from local cross-border counterparts, normally disease reporting goes up to provincial and central authorities before being shared by central level with cross-border counterparts.
- When suspected infected cases are identified, the local border checkpoints etc. may need to wait for official instructions from central ministry or provincial government. Responses may therefore not be timely.
- Customs, immigration and other authorities may not understand the importance and risks posed by CBT in poultry and poultry products.
- Full enforcement on bans of movement of people, poultry or poultry products may be effectively impossible:
 - Many borders are highly porous, existing only on maps. In some countries there is no or a limited visa regime at the local level, with free and frequent movement of people.
 - In some cases cross-border populations share the same background, socio-cultural traditions, kinship and language.
 - CBT is the core livelihood particularly for traders using established networks.
 - Unregulated movement of people and products is entrenched on some borders, particularly in the context of civil unrest or conflict.
- By banning CBT, we are not effectively stopping trade, but we are effectively stopping ourselves from collaborating with traders to reduce risks.

Related to these key issues, a range of possible areas for action ("actionables") were identified, including:

- Studies to identify and analyze specific dynamics of CBT, including volume of trade, main actors and drivers, as well as key risk points along the chain. Where possible, these would be coordinated cross-border efforts.
- Cross-border cooperation at different levels, including bilateral MOUs between neighboring countries, bilateral trade agreements and related legislation. Trust and commitment of neighboring countries is a key

determinant of effectiveness in cross-border collaboration. Effectiveness of implementation depends on political commitment from central down to local level. Leadership, ownership and support are required from each level, including technical, financial and logistical support.

- Using multilateral forums including ASEAN, SAARC which can give a multilateral and potentially more equal platform for discussions between different countries.
- Implementation of IHR (2005) reporting requirements to WHO.
- Meetings between overall authorities at central and local levels, through established mechanisms for periodic or specific exchange between overall government authorities. The onus is on veterinary authorities to raise issue to relevant government authorities at each level and to raise awareness of key risks.
- Regular cross-border technical working meetings between veterinary authorities at different levels.
- Cross-border telephone contact for sharing information and immediate alerting on suspected disease outbreaks. (Is this feasible/ legal in different countries?).
- Harmonized/joint strategies or plans for disease control and management of CBT at central level and for localities along border areas.
- Review training and support to veterinary authorities, quarantine, customs and other related sectors for enforcement and management in border areas. Where possible, joint training, joint planning, joint risk communications, joint investigation and ongoing cooperation and information sharing in localities along each side of a common border.
- SOPs for cross-border collaboration e.g. sharing information, raising alerts, joint surveillance, joint investigation, dealing with quarantine and customs issues, etc.
- Established formats for sharing information on identified diseases including HPAI as well as emerging diseases.
- Support from international agencies. Joint training and opportunities for networking and exchanges. Regional projects e.g. Mekong Basin Disease Surveillance (MBDS) project.
- Focusing surveillance, communication and other activities on border areas to strengthen early detection and response. Joint surveillance in border areas where possible.
- Focusing poultry vaccination on border areas.
- Harmonizing systems for import/export of livestock and livestock products, including systems for certification and physical checking.

- Strengthening international collaboration with OIE, FAO, WHO, US CDC and sharing information and results with neighboring countries, international and regional organizations
- In relation to banning or regulation of CBT in response to animal disease risks, two main options emerged in the discussion:
 - The first option is to intensify efforts to control and prevent illegal trade. While complete control and prevention may not be possible, further efforts could still be made. This requires additional human resources as well as training, logistical support and other aspects. Improved certification and applying certification directly at border areas could be important.
 - The second option focused on moving our efforts from prevention to regulation and risk-reduction. Regulating and monitoring trade including SPS certification, rather than maintaining an outright ban and trying to prevent illegal trade, may be a more effective approach.
- For regulation, we could apply the same value chain approach we do elsewhere, identifying risks and critical control points where these could be managed and reduced, working with traders. Investments in effective management and regulation may be offset through subsequent returns e.g. from exports.
- Normally, countries are not legally able to allow import of infected animals. Vietnam's recent experience of establishing animal lots and testing for disease, then allowing the animals to be imported if no disease found (rather than confiscating and destroying the animals as illegal imports) was noted as a possible approach.
- Compartmentalization was suggested as one approach to managing risks. It may be possible to apply a clean compartment approach in line with OIE. An alternate option could be a 'dirty compartment' approach, where identified risky products from the compartment are either processed within the compartment prior to CBT, or if this is not possible establishing a designated checkpoint where live poultry could be transported across a border to a processing facility in the second country.

Unresolved Issue #4: Sustaining Essential Components of the H5N1 HPAI Response

Challenge question:

How can countries sustain essential components of H5N1 HPAI prevention, monitoring, and control programs when faced with declining funding?

Moderator: Andrew Clements, Deputy Director of the Pandemic Influenza & Other Emerging Threats Unit, USAID/Washington

Panel members:

- Dr. Hossain Mosharraf, Additional Secretary, Ministry of Fisheries and Livestock, Bangladesh
- Dr. Moussa Soliman, Manager of Avian Viral Diseases, General Organization for Veterinary Services, Egypt
- Dr. Muhammad Azhar, Coordinator of Campaign Management Unit (CMU) for HPAI, Directorate General of Livestock and Animal Health Services, Ministry of Agriculture, Indonesia
- Dr. Orapan Pasavorakul, Senior Veterinary Expert, Department of Livestock Development, Ministry of Agriculture and Cooperatives, Thailand
- Mr. Do Huu Dung, Director of International Cooperation Division, DAH, Ministry of Agriculture and Rural Development, Viet Nam

Rapporteur: Dr. Kendra Chittenden, Infectious Disease & Science and Technology Advisor, USAID Indonesia

Summary of the discussion

Dr. Andrew Clements opened the discussion, noting that HPAI H5N1 program efforts started as emergency efforts to contain and manage HPAI outbreaks. Now, as the threat is diminished, countries that have an ongoing burden struggle to keep funding and focus on H5N1. Mostly these issues have dropped out of the media. Contagion and recent ferret research has raised a bit of attention, however overall donor support is decreasing.

Dr. Clements noted the need to keep a focus on HPAI H5N1 and influenza in general due to the ongoing risk of a human pandemic. He requested the panel members to provide perspectives on three key questions. Firstly, what activities can be supported with existing funds? Secondly, what are the core elements of the AI programs? And thirdly, how can we share costs with other infectious disease programs? Dr. Clements noted that initially it made sense to have a

standalone HPAI H5N1 program focus but now this needs to be incorporated into other programs for sustainability.

The five countries represented in the panel shared perspectives on these questions.

The panel member from Indonesia identified seven essential components of their HPAI H5N1 response, including:

- Participatory Disease Surveillance and Response (PDS-R) is key – implementing in 30/33 provinces & costs initially all donor BUT now 50-50% cost share with local government. Important to assist advocacy to local government.
- PDS-R is an effective tool not just for AI but other diseases- we have proved this with rabies. PDS-R is now a part of a National Veterinary Services (NVS) program to focus on a range of zoonotic and animal health issues.
- Surveillance and strain characterization is very important and strategic to help develop effective vaccines and to improve local laboratory capacity. Local governments will fund lab but the Government of Indonesia still wants partnership and technical assistance with the international community.
- Public-Private partnerships strengthen. Private industry investment is useful for vaccine development and production, biosecurity, and value chain.
- Decrease costs for ILI & SARI systems because PCR testing is very expensive. Need to better define magnitude and frequency of testing.
- Integrate AI case management into a broader Acute Respiratory Infections to strengthen the health care system to better control ARI and AI case management.
- Strengthen early warning systems which can provide rapid information about unusual events in a cost-effective way.

The following aspects were identified in relation to Bangladesh's HPAI H5N1 program:

- Pandemic planning is important and mainly supported by donors. Governments needs to advocate at the grassroots level to raise awareness about AI risks—such as markets—and the need for control activities.
- The importance of biosecurity at markets.
- Public-Private partnerships to find new funding.
- Establishing sustainable field level activities.

The panel member from Viet Nam noted that the national program has already been impacted by declining donor and government funding. Key points for the Viet Nam program included:

- Revising the strategy now and making smarter decisions about what activities to sustain. It is necessary to sustain routine control measures. It is also necessary to focus on other emerging infectious diseases without distracting from H5N1.
- The current strategy focuses on surveillance, which is a key component in an endemic country. It is important to clarify the objective of the surveillance—i.e. HPAI H5N1 or influenza more broadly—and this is still under discussion. Another key aspect is targeting live-bird market rather than farms, which can allow for cost-savings.
- Modify the control program to withdraw vaccination but now a more focused targeted, risk-based, and affordable strategy is in place.
- Improve veterinary services.
- Struggle between focus on pandemic and/or H5N1: what is most important, what is affordable?
- Public Private Partnerships: slow, not easy but important and an opportunity to share costs.
- Could do better with proper funding but must make do.

The panel member from Thailand noted some differences from other countries because they export poultry products (\$3m/year until exports stopped). They resumed export of cooked products one year after the last reported outbreak in November 2008, and exports are now back to normal. Key aspects of their ongoing program include:

- AI Emergency Operations Center under MOA which help to improve surveillance monitoring, and response to control for H5 & H7.
- Used compensation policies.
- Still continue to monitor sero-surveillance for export.
- In 2004 the disease spread across the country – spent \$100M – now control costs are \$10M/year (sub-division for poultry health—avian influenza and New Castle)
- AI prevention and monitoring is still robust and will continue for 5 years.

The panel member from Egypt noted that the national response had been occurring in the context of specific recent overall events in the country. Key aspects of the national response identified here include:

- A revised National Strategy, shifting from an emergency basis to a long term approach.
- Good and strong surveillance systems (human and animal)- (passive, active, syndromic, etc.) with samples collected daily. 34 teams (108 well trained doctors) for community for outbreak investigation, BCC, and work under difficult conditions.
- Sustain lab capacity for sustained isolation and sequencing. Discovered variant strain. Use information to guide vaccine.

- Each district has team for outbreak response (3 vets and a doctor)—sampling, culling, disinfecting, and communication & information.
- Enhance 4-way linkage (MOH, MOA, virology and surveillance)
- Public-Private Partnerships are important; there is a real lack of trust now.
- Good vaccines: test for efficacy.
- Monitor environmental contamination: this is important because the virus is wide-spread.
- 8 million back-yard farms (1/2 billion chickens)- Cannot widely vaccination back-yard farms.
- Poor hygienic practices in live-bird markets (12,000 LBMs) & movement is a critical issue.
- Recent social and political changes undermined investment in AI. All 167 cases infected by the same strain except one.
- What we need: surveillance and control to prevent a pandemic.

Following the initial comments of the panel members, discussion was opened up to the whole meeting. Key issues and areas for possible further action identified in the discussion included:

Public-Private partnerships:

- These can be a good source of funding and investments might be large.
- Government needs to facilitate these partnerships:
 - It may make sense for the public sector to provide a small amount of support to get the private sector to invest in the right things and to use resources more widely. An example of this is evidence-based vaccination.
 - The public sector can provide services to the private sector but public veterinarians must have strong skills to offer and assist.
- Poultry Associations play an important role to facilitate public and private partnerships.
- Market restructuring: moving birds outside of communities and away from people's homes into private pens.
- Sector 3 is a high risk and must be engaged
- Compensation is important for back-yard and small commercial farms in particular.
- Publically and globally share vaccine and sequencing information to achieve appropriate and useful vaccines.

Improved biosecurity—need to show that good biosecurity has an economic benefit from improving animal health. This has a much broader impact (beyond AI) whereas vaccination just focused on AI. Work with private sector to support costs of biosecurity – such as physical security.

Contact Investigations: A good investigation should be conducted following human cases and poultry outbreaks for close contacts, including syndromic and lab testing.

Market Monitoring: Not enough funds for routine monitoring—particularly in the markets. To reduce costs, focus on highly populated urban areas AI high risk areas.

Human resource issue—reduced budget for support. An appropriate response system is needed.

Need a **core epidemiology capacity**-- donor assistance has really helped to create this and now we must figure out how to sustain.

Use **modern technology** to expand and update training.

Laboratory costs are expensive and difficult to sustain, so it is important to select the right systems in terms of scale and collection and use non-PCR bases surveillance and early warning syndrome surveillance system to catch unusual events.

Many national budgets have also been reduced (double hit with reduced donor funds).

Broader Zoonosis Efforts:

- Risk of losing focus and with declining funds—now asked to do more things
- It is very important to look at the animal/human health interface
- Important to broaden influenza surveillance – in other species and to look for other types of influenza.
- Some countries—such as Egypt—H5 ranks first and other zoonotic diseases take a back-seat now. H5 is still wide spread and a real threat with human fatality and large loss of livestock.
- University and Government linkages are crucial and very useful (i.e. RESPOND with FETP programs implemented by Government)
- Select focus & decide what you are trying achieve – control, zoonotic; newly emerging diseases, etc.

Strengthen Animal Health Systems: Correlation because weak animal health system and human cases.

Dr. Robert Tanaka, Senior Attaché with the Animal and Plant Health Inspection Service of USDA in Bangkok also shared a donor perspective on these questions, noting that focusing on preventing transboundary animal diseases & emerging and zoonotic diseases continue to be priorities. Sustainability is important. Projects build laboratory capacity, improve regulatory services, and

strengthen animal health systems and epidemiology capacity. Not interested to just support surveillance and outbreak response—the focus is on capacity building and sustainability.

2.4 Closing session

Dr. Dennis Carroll, Director of the Pandemic Influenza & Other Emerging Threats Unit, USAID/Washington summarized the main sections of the meeting. He noted that the first part of the meeting on lessons learned and success stories had focused on elements of the response to HPAI H5N1 which are known from proven experience. He affirmed that USAID and other partners would identify opportunities for exchanges and visits to follow up and build on the country exchanges during the meeting in order to strengthen country responses and international cooperation.

With regard to the second part of the meeting on addressing unresolved issues, Dr. Carroll noted that this had addressed an area where participating countries and international agencies do not necessarily have the same level of experience or certainty. He emphasized the need to deal with the changing dynamics of economics and support on HPAI H5N1 at the international and national levels, and to be smarter and more effective in using the resources that are available. Dr. Carroll noted the challenge of genetically evolving virus, and the need to move the discussion forward to get better insight at an earlier stage into the evolution of threat and how to apply that insight in practical actions. He noted that a core take home lesson for him was that these issues are not ones that are going to be resolved within individual countries, by individual countries, and that they will require a more intensified and coordinated regional and global partnership.

Dr. Carroll expressed his strong appreciation to all participants for their contribution, and in particular to the Government of Viet Nam as host of the meeting. Dr. Carroll provided an opportunity for meeting participants to make any final comments. He then invited Dr. Subhash Morzaria to make final comments on behalf of FAO.

In his final remarks, Dr. Morzaria particularly noted the value of the innovative format of poster presentations developed by USAID and previously used at the Bali meeting in April 2010, as an effective way to promote sharing of experiences in a highly interactive way with a diverse group of participants. He noted that FAO has subsequently applied this approach with good results. Dr. Morzaria noted the good results also of the panel discussion sessions, providing expert feedback and raising important issues and challenges as well as ways to address key unresolved issues. He noted the need for further distillation of these ideas and cooperation between countries, international agencies and donors to move forward.

Dr. Morzaria expressed his appreciation for the pre-meeting preparations of each delegation in preparing their poster presentations. He also thanked international partners for their support. He also thanked the local organizing committee as well as the support team for the meeting including colleagues from PAHI Secretariat and FAO Viet Nam. Finally, Dr. Morzaria thanked USAID for their leadership and

support to the meeting itself and the wider area of HPAI H5N1. He then invited Dr. Hoang Van Nam, Director-General of the Department of Animal Health of the Viet Nam Ministry of Agriculture and Rural Development to provide final remarks and to close the meeting on behalf of the Government of Viet Nam.

Dr. Hoang Van Nam thanked participants for their engagement and active contributions to the meeting, noting that the meeting had provided an important opportunity to learn from the best practices and lessons of each country, to identify and discuss key challenges and unresolved issues related to preventing and controlling H5N1 in poultry and humans as well as monitoring H5N1 viral evolution, and had identified joint next steps and practical, effective options to build strong national responses and effective regional and inter-country cooperation to address H5N1 and other potentially-serious zoonotic diseases.

Dr. Hoang Van Nam also thanked USAID for their support to the meeting, as a part of their highly appreciated wider ongoing technical and financial support on HPAI H5N1.

3. Bilateral Meetings

3.1 Overview

In line with the objectives of the meeting to promote technical and policy exchanges between participating countries and agree on actions to enhance coordination on key issues, a number of bilateral meetings took place on the morning of the first day of the meeting, prior to the official opening session of the meeting. These bilateral meetings provided an opportunity for individual country delegations to exchange specific information and experiences on areas of common interest.

The following meetings were held:

Ministries of Agriculture (MOA) or equivalent:

- Cambodia and Lao PDR
- Cambodia and Viet Nam
- China and Viet Nam
- Lao PDR and Myanmar
- Myanmar and Viet Nam

Ministries of Health (MOH) or equivalent:

- Bangladesh and Myanmar
- Cambodia and Viet Nam
- China and Myanmar

3.2 Bilateral discussions between Ministries of Agriculture (MOA)

3.2.1 Bilateral meeting between the MOA of Cambodia and Lao PDR

The meeting noted that cross-border movements and trade in animals is not very significant. Traditional trade was noted between the bordering provinces of Champassak in Lao PDR and Stung Treng and Rattanakiri in Cambodia. Checkpoints have been established at the two main border points, reporting to provincial offices in Lao PDR and to the central level in Cambodia.

The MOA of both countries plan to establish bilateral meetings, to be followed by the development of an MOU and regular meetings. The value of strengthening collaboration between the MOA of the two countries was agreed.

3.2.2 Bilateral meeting between the MOA of Cambodia Viet Nam

Topics discussed include the movement of livestock between the two countries (focusing on the risk of PRRS posed by pigs from Viet Nam and the risk of FMD

posed cattle from Cambodia); support from Viet Nam for capacity building of Cambodian veterinary services; Viet Nam's passport system for recording the origin and movement of poultry flocks; the organization of joint cross-border trader meetings; and sharing HPAI epidemiological and surveillance information as well as the development of coordinated surveillance between the two countries.

MARD Viet Nam and MOA Cambodia agreed to follow up on a number of actions after the meeting, within the context of the existing MoU and technical working groups, as well as some specific meetings and exchanges that have been identified. FAO ECTAD noted their willingness to provide support through existing ECTAD projects.

3.2.3 Bilateral meeting between the MOA of China and Viet Nam

Topics discussed at the meeting including the epidemiology of HPAI H5N1; the efficacy of available vaccines types with currently circulating clades of HPAI H5N1 and the status of vaccine development, testing and approval; and the possibility of sharing epidemiological information (gene sequence information).

3.2.4 Bilateral meeting between the MOA of Lao PDR and Myanmar

Topics discussed at the meeting included the level of livestock trade across the common border between the two countries; identification of animal diseases of concern including HPAI in poultry, PRRS in pigs and FMD in cattle; and the possibility of initiating bilateral collaboration on animal disease control, which could be extended to zoonotic disease control, including information sharing of disease outbreaks and characteristics of the viruses responsible for HPAI, PRRS and FMD outbreaks, sharing of experience in disease control, and animal movement and trade. It was noted that this area is expected to be a strategic economic corridor within the region in the future, and that bilateral cooperation could later be expanded to multilateral cooperation including China and Thailand.

The two countries will follow up with informal discussions, which could be formalized later through official bilateral and multilateral meetings as well as a formal agreement between the two countries. FAO is requested to facilitate the multilateral discussion.

3.2.5 Bilateral meeting between the MOA of Myanmar and Viet Nam

Topics discussed at the meeting included Viet Nam's experience in applying poultry vaccination; Myanmar's application of culling as a control measure; and the possibility of establishing trade in poultry between the two countries.

3.3 Bilateral discussions between Ministries of Health (MOH)

3.3.1 Bilateral meeting between the MOH of Bangladesh and Myanmar

Topics discussed in the meeting included contact between communities in border areas along their common border; the history of coordination between the two countries on disease issues along the border (e.g. on polio) and ways to improve coordination between local-level actors on both sides (e.g. for outbreak investigation and reporting, and surveillance activities); and applying the IHR (2005) as a structure for focal-points for cross-border agreements on communication, coordination and collaboration.

The two ministries agreed to follow up within the next month to request WHO support to facilitate an initial meeting to discuss arrangements for improved cross-border communication on health issues.

3.3.2 Bilateral meeting between the MOH of Cambodia and Viet Nam

Topics discussed in the meeting included Viet Nam's update on the disease situation during 2011 and 2012, including HFMD, dengue and meningococcal meningitis; Cambodia's update on the current disease situation, including cholera, dengue, chikungunya and influenza A(H5N1); the established bilateral agreement at national and provincial levels; weekly disease data reporting via national level MOHs and the Mekong Basin Disease Surveillance (MBDS) project; the status of HPAI H5N1 outbreaks in the two countries; and the emerging threats posed by chikungunya and artemisinin-resistant malaria.

3.3.3 Bilateral meeting between the MOH of China and Myanmar

Topics discussed at the meeting included the agreement between the two ministries under the Mekong Basin Disease Surveillance (MBDS) project; the status of cross-border cooperation at different levels and under different conditions (ongoing cooperation, outbreak response); and ways to enhance cooperation at the provincial level in provinces along the common border, for example through regular annual meetings, disease information sharing and joint outbreak investigation and management for both communicable and zoonotic diseases.

Annex I Meeting Agenda

Technical and Policy Discussion on Improving the Prevention and Control of H5N1 Highly-Pathogenic Avian Influenza in Highly-Affected and Neighboring Countries

**April 23-25, 2012
Ho Chi Minh City, Viet Nam**

Meeting Outline

Venue: New World Saigon Hotel

Audience:

- Representatives from nine countries (Bangladesh, Cambodia, China, Egypt, Indonesia, Laos, Myanmar, Thailand, and Viet Nam) that have had the most experience with H5N1 HPAI in terms of defining high-risk populations and geographic areas and continually fine-tuning prevention and control strategies to achieve results. Participants will include:
 - Senior technical representatives from Ministries of Health and Ministries of Agriculture;
 - Senior policy makers who are empowered to make decisions related to surveillance and containment of H5N1 outbreaks; and
 - International technical partners from the UN Food And Agriculture Organization (FAO), the UN World Health Organization (WHO), the UN System Influenza Coordinator (UNSIC), the US Agency for International Development (USAID), the US Centers for Disease Control and Prevention (US CDC), the US Department of Agriculture (USDA), and Collaborating and Reference Centers.

Purpose:

- To provide an opportunity for a mix of technically oriented senior professionals and policy makers plus international technical partners from nine countries affected by the H5N1 virus to share their successes and discuss unresolved issues.
- The technical discussions will focus on:
 - Sharing key programmatic successes or "best practices" that have led to important outcomes or impacts, sharing how these successes were achieved, and identifying opportunities to replicate these successes in other countries
 - Identifying possible solutions to unresolved issues related to H5N1 HPAI prevention and control.

10:30 – 11:00	Opening Remarks Introductions	Mr. Diep Kinh Tan, Vice-Minister, Ministry of Agriculture and Rural Development, S.R. Viet Nam Mr. Robert W. Ogburn, U.S. Deputy Consul General Master of Ceremonies Dr. Do Huu Dung to ask introductions from country representatives
11:00 – 11:30	Group Photo	Master of Ceremonies to organize everyone
11:30 – 11:45	Summary of Technical Discussion in Bali, March 2010	Pak Emil, Indonesia Zoonotics KOMNAS
11:45 – 12:15	Summary of current H5N1 situation	Andrew Clements
12:15 – 13:15	Lunch (on site)	
13:15 – 13:30	Meeting purpose and objectives Instructions for poster sessions	Meeting Organizers Andrew Clements
13:30 – 14:15	Best Practices/Lessons Learned (1a): <i>Improving surveillance for reservoirs of H5N1 HPAI virus and monitoring of “silent” infections in animals (including in vaccinated poultry) and people</i> poster walk 1 <ul style="list-style-type: none"> • at least one member of the country team stays with each of their posters while others on the team visit posters of other countries • visitors to posters can ask questions in person or write questions on note cards (provided by organizers) 	See Annex 1 for guidance on poster presentations [A list of all poster titles will be provided to all participant at the beginning of day 1]
14:15 – 15:00	Best Practices/Lessons Learned (1b): <i>Improving surveillance for reservoirs of H5N1 HPAI virus and monitoring of “silent” infections in animals (including in vaccinated poultry) and people</i> poster walk 2 <ul style="list-style-type: none"> • people who stayed with posters in 	

	<p>session 1a now visit other country posters while other people on the country team stay with each of their posters</p> <ul style="list-style-type: none"> visitors can ask questions in person or write questions on notes cards (provided by organizers) 	
15:00 – 15:30	Break	
15:30 – 16:15	<p>Best Practices/Lessons Learned (2a):</p> <p><i>Improving surveillance for molecular changes in H5N1 HPAI viruses residing in poultry, wild birds, humans, and other animals (e.g. swine)</i></p> <p>poster walk 1</p> <ul style="list-style-type: none"> at least one member of the country team stays with each of their posters while others on the team visit posters of other countries visitors to posters can ask questions in person or write questions on note cards (provided by organizers) 	
16:15 – 17:00	<p>Best Practices/Lessons Learned (2b):</p> <p><i>Improving surveillance for molecular changes in H5N1 HPAI viruses residing in poultry, wild birds, humans, and other animals (e.g. swine)</i></p> <p>poster walk 2</p> <ul style="list-style-type: none"> people who stayed with posters in session 2a now visit other country posters while other people on the country team stay with each of their posters visitors can ask questions in person or write questions on notes cards (provided by organizers) 	
17:00 – 17:15	Country Team Discussions	Country Teams amongst themselves
18:00 – 20:00	Group banquet dinner	Vice Minister to welcome guests, Dennis Carroll to speak as well.

Tuesday, April 24

Time	Session	Comments
8:30 – 8:45	Introduction to day's activities, unresolved issues and instructions	Dennis Carroll to introduce day's activities and discuss unresolved issues section.
8:45 – 10:10	<p>Unresolved Issues: Challenge question #1</p> <p><i>How can countries and the global community most effectively identify key reservoirs of H5N1 HPAI (and their interconnectivity) and what interventions can be applied to reduce disease burden?</i></p>	<p>Moderator: Subhash Morzaria</p> <p>Bangladesh: Hossain Mosharraf China: Xinyan Zhai Indonesia: Eric Joseph Brum Viet Nam: Phan Quang Minh Other: Les Sims</p> <p>Rapporteur: Andrew Clements</p>
10:10-10:40	Break	
10:40 – 12:05	<p>Unresolved Issues: Challenge question #2</p> <p><i>What current practices are likely driving evolution of the H5N1 virus and how can countries and the global community most effectively monitor for the presence and movement of new viral variants (and other influenzas) in key species to ensure efficacy of interventions and assess pandemic risk?</i></p>	<p>Moderator: Ron Waldman</p> <p>China: Malik Peiris Thailand: Sujira Pachariyanon Viet Nam: Ken Inui Viet Nam: Jeremy Farrar Other: Tim Uyeki</p> <p>Rapporteur: Dan Schar</p>
12:05 – 13:05	Lunch (on site)	
13:05-13:50	<p>Best Practices/Lessons Learned (3a):</p> <p><i>Improving the efficacy of outbreak surveillance and control in poultry</i></p> <p>poster walk 1</p> <ul style="list-style-type: none"> at least one member of the country team stays with each of their posters while others on the team visit posters of other countries visitors to posters can ask questions in person or write questions on note cards (provided by organizers) 	

13:50-14:35	<p>Best Practices/Lessons Learned (3b):</p> <p><i>Improving the efficacy of outbreak surveillance and control in poultry</i></p> <p>poster walk 2</p> <ul style="list-style-type: none"> • people who stayed with posters in session 3a now visit other country posters while other people on the country team stay with each of their posters • visitors can ask questions in person or write questions on notes cards (provided by organizers) 	
14:35-15:05	<p>Break</p>	
15:05-15:50	<p>Best Practices/Lessons Learned (4a):</p> <p><i>Improving detection and treatment of H5N1 infections in humans using existing systems such as influenza-like illness (ILI) surveillance and early warning/alert systems</i></p> <p>poster walk 1</p> <ul style="list-style-type: none"> • at least one member of the country team stays with each of their posters while others on the team visit posters of other countries • visitors to posters can ask questions in person or write questions on note cards (provided by organizers) 	
15:50-16:35	<p>Best Practices/Lessons Learned (4b):</p> <p><i>Improving detection and treatment of H5N1 infections in humans using existing systems such as influenza-like illness (ILI) surveillance and early warning/alert systems</i></p> <p>poster walk 2</p>	

	<ul style="list-style-type: none"> • people who stayed with posters in session 4a now visit other country posters while other people on the country team stay with each of their posters • visitors can ask questions in person or write questions on notes cards (provided by organizers) 	
16:35-17:05	<p>Country team discussions to:</p> <ul style="list-style-type: none"> • Discuss what was learned • review comments from others on the country team's posters • review which lessons learned/best practices from other countries could be adopted by the country team • identify any questions/comments for other country teams 	Internal discussions within the country teams.
17:05 – 17:35	<p>Report out by countries on best practices they may be interested in adopting</p> <p>Discussion of common themes</p>	Individuals from country teams will provide read-outs on behalf of their country teams.

Wednesday, April 25

Time	Session	Comments
8:30 – 8:35	Announcements and instructions for day 3	MC to announce instructions for day
8:35 – 10:00	<p>Unresolved Issues: Challenge question #3</p> <p><i>How can countries improve H5N1 HPAI cross-border cooperation and coordination to diminish the likelihood of the virus spreading from country to country?</i></p>	<p>Moderator: Santanu Bandyopadhyay</p> <p>Cambodia: Teng Srey</p> <p>Lao PDR: Khamphouth Vongxay</p> <p>Myanmar: Than Htun</p> <p>Thailand: Pasakorn Akkarasewi</p> <p>FAO ECTAD: Mohinder Oberoi</p> <p>Rapporteur: David Payne</p>
10:00 – 10:30	Break	
10:30-11:55	<p>Unresolved Issues: Challenge question #4</p> <p><i>How can countries sustain essential components of H5N1 HPAI prevention, monitoring, and control programs when</i></p>	<p>Moderator: Andrew Clements</p> <p>Bangladesh: Mosharaf Hossain</p> <p>Egypt: Moussa Soliman</p> <p>Indonesia: Muhammad Azhar</p> <p>Thailand: Orapan Pasavorakul</p> <p>Vietnam: Do Huu Dung</p>

	<i>faced with declining funding?</i>	Rapporteur: Kendra Chittenden
11:55 – 12:55	Lunch (on site) Discussion of possible changes to USG programming based on April 23-25 meeting	US Government agencies only
12:55 – 13:55	Developing a “pathway to action” based on key recommendations from each of the previous sessions	Dennis Carroll will lead the discussion of the pathway to action.
13:55 – 14:55	Instructions for completing meeting evaluation form Closing comments	MC to close events and give closing comments
15:30- 17:00	Discussion of possible changes to FAO and WHO programming based on April 23-25 meeting	US Government agencies plus implementing partners (FAO, WHO)

Thursday, April 26

Time	Session	Comments
8:30 – 10:00	Planning meeting for EPT regional meeting in Bangkok (July 2012)	USAID only

Dr. Les Sims
Veterinarian
vetpath00@yahoo.com.au

Annex III Guidelines for Poster Presentations

Best Practices/Lessons Learned presentations by country team participants will consist of "posters" that highlight best practices, successes and potential applications, and continuing challenges. These presentations will be used to interactively share information among all participants and foster a rich technical dialogue among the affected countries.

Instructions for poster presentations:

- By April 11, country teams should use provided template to submit an abstract to the local USAID mission and FAO or WHO office for each Best Practice or Lesson Learned. USAID, FAO, WHO, and CDC technical staff in-country are available to help country teams with identifying and describing Best Practice or Lesson Learned.
- By April 20, country teams should develop 15 slides (using Word or Powerpoint) for each Best Practice or Lesson Learned to include the following information:

Slide 1: Provide country, title, author(s), and institutional affiliation(s)

Slide 2: Short description of activity

Slide 3-4: Describe what was accomplished (outcome or impact)

Slide 5: Describe why the result was significant

Slides 6-10: Describe the strategy used, how the work was organized, etc.

Slide 11: Describe what partners were involved

Slide 12: Describe any challenges or obstacles that had to be overcome

Slide 13: Describe any key steps that were essential for achieving the result

Slides 14-15: Describe any next steps or continuing challenges (e.g. further validation, scale-up, etc.)

In addition to the 15 slides, maps or diagrams can be included to help the audience understand the activity. A page number should be included on each page. When possible, please use a font between 20-24.

USAID, FAO, WHO, and CDC technical staff are available to help country teams with reviewing posters for Best Practice or Lesson Learned posters.

- By April 23, country teams should print their slides on 8.5" X 11" (or A4) sheets of regular, white paper (1 slide per page) and bring them to the meeting. *(Please do not spend time/money using glossy paper or making a formal poster that includes all of the slides on one big sheet of paper.)*
- At the meeting venue, country teams should assemble their posters during the morning of April 23 (8:00 – 10:00) in the areas designated by the organizers. Tape and thumbtacks will be provided.

Country teams should also bring an electronic copy of each poster presentation to the meeting so that they can be collected by the meeting organizers and distributed with all of the other presentations on a flash drive at the end of the meeting.

Annex IV Full List of Poster Presentations

Poster session 1: Improving the efficacy of outbreak surveillance and control in poultry

No.	Country	Agency	Poster Title
1	Cambodia	DAHP	Strong commitment of Cambodian Government to control H5N1 HPAI and to limit the economic cost of the disease
2	Cambodia	MoA/ MoH	Successful management of H5N1 outbreak success story
3	China	MoA	A sustainable national capacity building program on field epidemiology to deal effectively and efficiently with HPAI - China Field Epidemiology Training Program for Veterinarians (China FETPV)
4	Egypt	MOA/ GOVS	HPAI H5N1 control , challenges and way forward

Summary
Technical Discussion on
Best Practices for Prevention and Containment of
H5N1 Highly Pathogenic Avian Influenza
Bali Indonesia
March 30-31, 2010

Prepared by:

Kathy Alison & Kira Gnesdiloff
Stop AI
April 2010

**Technical Discussion on
Best Practices for Prevention and Containment of
H5N1 Highly Pathogenic Avian Influenza
Bali Indonesia
March 30-31, 2010**

Introduction

Representatives from five countries (Bangladesh, China, Egypt, Indonesia, and Vietnam) participated in a two-day technical discussion on Best Practices for Prevention and Containment of H5N1 Highly Pathogenic Avian Influenza at the Nicco Bali Hotel in Bali, Indonesia March 30-31, 2010. The five countries were highlighted because of their extensive experience with H5N1 Highly Pathogenic Avian Influenza (HPAI) in terms of defining high-risk populations and geographic areas where H5N1 occurs, and their efforts to continually fine-tune their prevention and containment strategies to manage the virus in both human and avian populations. USAID sponsored the meeting with support from the other international donors who participated.

Seventy-two participants participated in the innovative technical discussions. Delegates included:

- Technical representatives from Ministries of Health and Ministries of Agriculture from all 5 countries
- Senior policy makers who are empowered to make decisions related to surveillance and containment of H5N1 outbreaks from all five countries
- International technical partners from country offices and headquarters of WHO, FAO, UNSIC, US CDC, USDA and USAID

*See **Attachment 1** for a complete list of attendees*

The purpose of the meeting was to provide an opportunity for this mix of technically-oriented professionals and policy makers plus international technical partners to share their successes and discuss their constraints when faced with H5N1 HPAI infections in poultry and/or human populations. The technical discussion focused on:

- Identifying key programmatic successes or “best practices” that have led to important outcomes or impacts
- Identifying how these successes were achieved
- Identifying opportunities to replicate these successes in other countries

*See **Attachment 2** for the complete description of the meeting and the agenda.*

*A short summary of the various sessions that were held during the 2 day technical discussions can be found in **Attachment 3**.*

By the end of the 2 day discussions, attendees had been able to participate in an exchange of best practices that are contributing to reduction in H5N1 HPAI viral circulation in poultry & human populations; discuss and plan how some of these best practices could be applied in their country, and identify key points to share with other countries at the Inter-Ministerial Conference on Animal and Pandemic Influenza (IMCAPI) in Vietnam on April 19 - 21, 2010.

Best Practices – Telling the Stories

Prior to the Bali technical discussions, country delegations identified three to five best practices (focusing on both human and avian health) that they wanted to share and discuss during the two-day

session. Rather than present a series of PowerPoint presentations on each of the 22 best practices that were identified, participants prepared poster sessions that allowed all delegates to tell the story of their work and to discuss their learnings in detail with their counterparts from other countries. The result was an interactive, highly participatory conversation about what countries were doing to contain H5N1 in both the human and avian populations in their countries, to discuss the challenges they are facing in implementing these strategies, and to share ideas for overcoming those challenges and possible applications to their own situation.

A list of **best practices highlighted by each country during the technical discussions** is below:

Country		Poultry Best Practices		Human Health Best Practices
Bangladesh	A	Containment of HPAI through Active Surveillance	A	Antiviral prophylaxis / follow-up of high risk people
	B	Containment of HPAI through live bird market cleaning/decontamination program		
China	A	Integrated prevention & control measures combining surveillance, massive vaccination & stamping out policy	B	Early detection / rapid response to human infection w/ avian influenza A (H5N1) virus
			A	Improvement of Lab capability for influenza virus
			B	Clinical Management with H5N1 infection
Egypt	B	Faster time to produce confirmatory A/H5N1 diagnosis & outbreak reporting / effective	A	Nationwide comprehensive surveillance and response
	A	Achievements & successes in strengthening AI detection & response	B	Communication and Social Mobilization
	A		Improved referral, clinical care management and infection control	
Indonesia	A	Participatory Disease Surveillance and Response (PDSR)/Livestock Disease Coordinating Centers	B	Epicentre containment

		(LDCC)		
	B	OFFLU	A	Improving case management (includes Riau pilot project)
	A	Market Chain Analysis		
Vietnam	B	Government Committee and Approach	B	Addressing the prevention & control of flu A (H5N1) in humans through strengthening of health systems
	A	Disease surveillance and outbreak response	A	Communications and Awareness-raising
	B	Vaccination as an additional control measure		

Copies of the poster presentations were provided to each participant on a CD at the end of the technical discussion on March 31, and the posters were displayed again during the IMCAPI meeting in Hanoi on April 19-21, 2010.

See Attachment 4 for the technical content contained in country posters

Country Plans for Follow-up

During the two-day event, country and donor representatives had time to discuss the best practices described by each country by rotating through all of the poster presentations. On the final afternoon of the technical discussion, country teams reconvened to discuss what they had learned from other country best practices and identified how they will follow up, using the following three questions:

- Identify 1-2 Priority Best Practices that seem to have potential relevance for your country (Which challenge might this address?)
- Identify Specific Steps needed to explore how this best practice can be applied to meet your specific challenges
- What are the 2-3 most critical challenges related to H5N1 HPAI for which there don't appear to be any lessons learned but that are of concern in your country?

Each country plus the international donor community prepared and presented a brief summary of their discussions on these questions.

Highlights from each presentation can be found on the following pages.

Bangladesh Country Plan

Priority Best Practices that seem to have potential relevance for your country (Which challenge might this address?)	Specific Steps needed to explore how this best practice can be applied to meet your specific challenges
1. Enforcement of compliance of biosecurity through farm registration	<ul style="list-style-type: none"> • Prepare operational plan based on the national plan taking into account the experience of <i>Thailand</i> • Submit the operational plan for approval and endorsement from the authority • Mobilize resources for implementation of the approved plan • Pursue collaboration with Thailand to strengthen farm registration program • Implementation of animal disease control act • Build awareness among farmers through training
2. Market chain analysis to trace back poultry sources	<ul style="list-style-type: none"> • Prepare operational plan based on the national plan taking into account the experience of <i>Indonesia</i> • Submit the operational plan for approval and endorsement from the authority • Establishment of collection yard for live birds • Random sampling from ducks in the market • Keeping records of sources of birds from where they arrive in the market
3. Expansion of lab services with networking for enhanced surveillance (<i>Human health</i>)	<ul style="list-style-type: none"> • Prepare operational plan based on the national plan taking into account the experience of <i>China</i> • Submit the operational plan for approval and endorsement from the authority • Liaise with WHO and other development partners for mobilizing resources for implementation of the approved plan • Pursue collaboration with Ministry of Health, China for strengthening lab service including building capacity of lab personnel • Develop SOP and guidelines for establishing lab network in the country among labs within health and between the health and livestock sector • Identification of the sites, orientation of the personnel involved and develop operational plans for each of the sites • Implementation as per the plan such as procurement of lab equipment and consumables, renovation, training of lab personnel etc. • Set up web page for sharing of information between lab personnel, public health specialist and general public • Wide public relation to make aware of the network

China Country Plan

Presenters: Yu Kangzhen, CVO, Ministry of Agriculture & Li Zhengmao, Ministry of Health

Priority Best Practices that seem to have potential relevance for your country (Which challenge might this address?)	Specific Steps needed to explore how this best practice can be applied to meet your specific challenges
<p>1. Animal health <u>Challenge:</u> P.R. China - Management of LBM & Live birds movement</p> <p><u>Best practice:</u> <i>Indonesia</i> - Market Chain Analysis</p> <p>2. Human Health <u>Challenge:</u> Difficulty in early detection of suspected H5N1 human cases</p> <p><u>Priority Best Practices (Egypt)</u></p> <ol style="list-style-type: none"> 1. National comprehensive surveillance and response 2. Improved referral clinical care management and infection control 	<p>1. Animal health</p> <ul style="list-style-type: none"> • Intensify LBMs surveillance and improve the traceability system of positive birds • Enhance animal health supervision in LBMs • Intensify responsibilities of different agencies and stakeholders <p>2. Human Health</p> <ul style="list-style-type: none"> • Strengthening the surveillance system of pneumonia of unknown origin <ul style="list-style-type: none"> ○ Modifying case definition to improve sensitivity ○ Improving awareness of both the primary HCWs and the public ○ Strengthening surveillance for high risk populations and suspected H5N1 cases ○ Further sharing experience with Egypt colleagues and on-site visit if possible
<p>What are the most critical challenges related to H5N1 HPAI for which there don't appear to be any lessons learned but that are of concern in your country?</p>	
<p>1. Animal health</p> <ul style="list-style-type: none"> ➤ H5N1 HPAI prevention & control in waterfowl <ul style="list-style-type: none"> ○ Reservoir ○ Silence infection ○ Environments disinfection (water body) ○ Weakness of immuno-response 	

Egypt Country Plan

Priority Best Practices that seem to have potential relevance for your country (Which challenge might this address?)	Specific Steps needed to explore how this best practice can be applied to meet your specific challenges
<p><i>Animal Health</i></p> <p>A. Market Chain Management (Indonesia BP)</p> <p><u>Challenges:</u></p> <ul style="list-style-type: none"> • Conducting risk mapping • Live bird market restructuring • Policy dialogue and policy instrument(s) • Advocacy • Financial resources 	<ol style="list-style-type: none"> 1. Study tour to <i>Indonesia</i> 2. Market chain analysis 3. Policy dialogue that will lead to decisions and advocacy 4. Mobilize required resources 5. Develop implementation plan and M&E system
<p>B. Epidemiological surveillance (system for data collection, analysis and use) (Bangladesh BP)</p> <p><u>Challenges:</u></p> <ul style="list-style-type: none"> • Developing a system for data collection, analysis and use • Identifying use of appropriate communication technology: e.g. SMS gateway, digital pen technique 	<ol style="list-style-type: none"> 1. Study tour to <i>Vietnam</i> 2. Design appropriate system (SMS gateway, digital pen, etc) 3. Mobilize required resources 4. Sustainable diagnostic and research capabilities as well as an effective outbreak management system
<p><i>Human Health</i></p> <p>C. Sustain human diagnostic capacity</p>	<ol style="list-style-type: none"> 1. Strategic review and identify needs 2. Mobilize resources (human and financial) 3. M&E and sharing of information
<p>D. <i>Maintain</i> early detection for human H5N1 cases and decrease virus circulation</p>	<ol style="list-style-type: none"> 1. Expand surveillance network 2. Introduction of PDA technology 3. Strengthen infection control program
<p>What are the most critical challenges related to H5N1 HPAI for which there don't appear to be any lessons learned but that are of concern in your country?</p>	
<ul style="list-style-type: none"> ➤ Improve biosecurity in all poultry production sectors ➤ Working within a decentralized governmental system ➤ Dealing with government and community AI fatigue, in particular, maintaining awareness and financial commitment 	

Indonesia Country Plan

Country Team Members:

1. MOA -- Ade Siachrena Lubis, Mohammad Azhar, Soedarmono, Agus Wiyono.
2. MOHealth – Rita, Wilfred Purba, Ari, Rosliany

Priority Best Practices that seem to have potential relevance for your country (which challenge might this address?)	Specific Steps needed to explore how this best practice can be applied to meet your specific challenges
1. Strengthening sustainable integrated and community-based surveillance among health and agriculture.	<p><i>Integrated Surveillance</i></p> <ol style="list-style-type: none"> 1. Revision of DG decree into Ministerial decree 2. Revise surveillance guidelines 3. Training of MOH and MOA staff together 4. Strengthening reporting and evaluation 5. Data/information sharing between animal and human health labs 6. Look at <i>Egypt</i> for H1N1 vaccination and H5N1 detection and case management <p><i>Community-based surveillance</i></p> <ol style="list-style-type: none"> 1. Advocacy with local officials to village/neighborhood head 2. Socialization of guidelines to community/religious/health volunteers 3. Improved laboratory testing/improved access to testing for early case detection
2. Reduce viral spread along the poultry production and market chain.	<ol style="list-style-type: none"> 1. Meeting with local government and quarantine services to discuss options to see if feasible. 2. New regulations resulting from workshops 3. Maintaining Sector 4 quick response and encourage Sector 3 reporting. 4. Develop a plan for farm certification 5. Study other countries with farm certification 6. Visit <i>China</i> to learn about risk mgmt in LBM
3. Increase Public Awareness	<ol style="list-style-type: none"> 1. Work with media – for community 2. Health care workers and agriculture staff – training 3. Hold community campaign activities
What are the most critical challenges related to H5N1 HPAI for which there don't appear to be any lessons learned but that are of concern in your country?	
<ol style="list-style-type: none"> 1. Integrating viral dynamics knowledge derived from animal and human sources in order to understand 	

H5N1 epidemiology

2. Poultry movement control
3. Encouraging commercial poultry involvement in implementing biosecurity and case reporting.

Viet Nam Country Plan

Priority Best Practices that seem to have potential relevance for your country (Which challenge might this address?)	Specific Steps needed to explore how this best practice can be applied to meet your specific challenges
<p>Challenge: Decreasing the case fatality ratio (Human health)</p> <p>1. <u>Priority Best Practices</u></p> <ul style="list-style-type: none"> • Early case detection • Strengthening awareness of primary health care workers to improve screening for, identification of, and referral of suspect cases • Improve quality of case management and infection control 	<ol style="list-style-type: none"> 1. Develop advocacy document highlighting importance of early detection and improved quality of care; establish budget proposal 2. Study tour to <i>Egypt</i> to more fully understand success in identifying cases early 3. Revise surveillance, diagnosis, and treatment guidelines to include standardized case definition for suspect case 4. Improve communication and outreach to the public (request copies of communication materials used in <i>Egypt</i> and assess applicability to <i>Viet Nam</i>) 5. Train primary health care workers (and pharmacists?) to identify and refer suspect cases for testing (request copies of training modules in <i>Egypt</i> and <i>Indonesia</i>; assess applicability to Viet Nam) 6. Train hospital staff on new case definition and importance of testing suspect cases 7. Train ICU staff on case management and infection control (request copies of training programme from <i>Egypt</i> and assess applicability to Viet Nam)
<p>What are the most critical challenges related to H5N1 HPAI for which there don't appear to be any lessons learned but that are of concern in your country?</p>	
<p><u>Viet Nam – Animal health</u></p> <ul style="list-style-type: none"> - 'Fatigue' of stakeholders (donors, producers,...) - Poultry restructuring: free-range ducks - Sustain public awareness - No good vaccine available for ducks - Better understanding of risk factors (exposure, etc.) 	

Partners

On the afternoon of Day 2, while country teams developed their specific country plans, international donor representatives who are not located in a specific country also met to identify the critical / global challenges that have not been addresses and to suggest specific actions that donors could take to address these issues.

What are the most critical regional / global challenges related to H5N1 HPAI for which there don't appear to be any lessons learned?	Specific Actions that can be done to address these gaps / challenges
<ol style="list-style-type: none"> 1. Vaccination: no best practices for exit strategies and/or for application of vaccination. 2. Capacity building: especially technical level education in the animal health sector. Farm/fields schools and other participatory approaches. 3. Restructuring: Rethinking the way we produce food animals; increase biosecurity in small scale commercial sector; 4. Reducing unnecessary human and animal exposure in markets- some examples exists. 5. Ducks, domestic, free range. Improved raising systems? Targeted efficient vaccination schemes? 	<p>For all: mix of research, R&D, thinking, Pilot projects.</p> <p>NB: application of HACCP concepts to design of process solutions</p> <p><i>NOTE: HACCP is a management system in which food safety is addressed through the analysis and control of biological, chemical, and physical hazards from raw material production, procurement and handling, to manufacturing, distribution and consumption of the finished product.</i></p>

IMCAPI - Ideas to take to Hanoi meeting

One of the objectives of the Bali Technical Discussion was to identify key points to share with other countries at the Inter-Ministerial Conference on Animal and Pandemic Influenza (IMCAPI) in Vietnam on April 19 - 21, 2010.

Julie Hall, United Nations System Influenza Coordination (UNSIC) representative, presented a brief summary of *Messages for IMCAPI 2010 Hanoi / Sharing lessons from countries with most experience in controlling HPAI H5N1*

Ms. Hall summarized five key messages she hopes would be shared in Hanoi as a result of the Bali technical discussions

1. We must maintain the momentum
 - a. H5N1 is still a threat – to animal, to human and to livelihoods
 - b. The virus still has pandemic potential
 - c. There have been some great successes in a relatively short period of time
 - More geographically clustered than before
 - Many fewer 'exports'
 - d. But challenges remain and the virus is still not eliminated from domestic poultry
 - e. Other priorities are now competing for attention and funding
 - There is a concern that if we allow the 'lid to lift off again' H5N1 is likely to spread again (both domestically and internationally)

- f. Focused attention on the highly impacted countries provides an opportunity to eliminate the virus from domestic poultry – significantly reducing risk of export and ‘global viral load’
2. There are many good practices to share
 - a. Many good practices should be documented and transferred e.g. health care in Egypt, market chain critical intervention point analysis etc
 - b. Equally important to document and share experiences of things that do **not** work
 - c. Number of areas where best practice still to be developed
 - Fully understanding epidemiology
 - Finding better tools to support behaviour change
 - How best to engage with private sector and ensure biosecurity enhanced “farm to fork”
 - Vaccination – most effective strategy(ies), effective vaccine for ducks
 - d. Sharing of experiences is very valuable and should be supported
3. Systems still need to be strengthened
 - a. Capacity issues remain:
 - Poultry sector capacity to implement biosecurity especially in sector 3 (many small scale farms)
 - Grassroots level capacity – need for quality vet services
 - Health care system – reducing access barriers and strengthening clinical capacities and skills
 - b. Supportive systems also need to be strengthened
 - Multi-sector interface – very important but requires ‘nurturing’ and supporting
 - Poultry movement controls – further work to support trade but reduce risks
 - Licensing and registration
4. There is a need to mainstream practices and apply learnings from H5N1 to other diseases
 - a. Mainstreaming H5 activities
 - Healthy poultry production
 - Acute respiratory disease management
 - b. Lessons learnt through H5 experience are immense and applicable to other diseases
 - Multi-sector, trans-disciplinary approach is extremely useful in dealing with other diseases – need to build on this and show how to use the approaches to address other diseases
 - Also a means of strengthening food safety
5. Political Commitment and Funding is **Critical**
 - a. Need to showcase results – ‘see what can be achieved’
 - b. Need to document and showcase co-lateral benefits – ‘see what money can buy’
 - c. Need sustained funding – for programmes
 - d. Need further development of incentives and best practices for compensation

Ms. Hall then identified the following 6 ideas that could be addressed at the IMCAPI meeting in Hanoi based on the Bali technical discussions

1. Mass vaccination for poultry
2. Incorporate food safety and food security (including poverty reduction) and other global issues impacted by zoonotic diseases
1. Discuss H1N1

2. Making zoonotic diseases a priority and set up national committee
3. Strengthening regional coordinating bodies
4. Implementing One World One Health (OWOH) concepts – healthy farmer, healthy livestock – PSTS
5. Sharing genetic material
6. Sharing information, communications and technology

USAID wrap-up and next steps

Dennis Carroll, Director, Avian and Pandemic Influenza Unit (USAID/W) wrapped up the 2 day discussions with a quick summary of what will happen next, based on the results of the poster sessions and country plans. Including:

1. USAID will support site visits to other countries mentioned in each country report
2. USAID will use new resources to begin translating steps discussed in Bali into tangible lines of work
3. Information sharing begun in Bali will continue with support from USAID/W. Andrew Clements AI technical advisor, Avian and Pandemic Influenza Unit, will begin developing a process to move the discussion to the next level, identify what priorities to begin work on and set a timeline. (A draft will be presented in Hanoi)
4. USAID will organize a side meeting in Hanoi with participants from the Bali sessions to discuss next step scenarios.

Attachment 2

**Technical Discussion on Best Practices for Prevention and Containment of
H5N1 Highly Pathogenic Avian Influenza (HPAI)
March 30-31, 2010
Bali, Indonesia
Meeting Outline**

Audience:

- Representatives from five countries (Egypt, Vietnam, Indonesia, China and Bangladesh) that have had the most experience with H5N1 HPAI in terms of defining high-risk populations and geographic areas and continually fine-tuning prevention and containment strategies to achieve results. Participants will include:
 - Technical representatives from Ministries of Health and Ministries of Agriculture
 - Senior policy makers who are empowered to make decisions related to surveillance and containment of H5N1 outbreaks
 - International technical partners from WHO, FAO, UNSIC, US CDC, USAID

Purpose:

- To provide an opportunity for a mix of technically oriented professionals and policy makers plus international technical partners from five countries (Egypt, Vietnam, Indonesia, China and Bangladesh) to share their successes and discuss their constraints when faced with H5N1 HPAI infections in poultry and / or human populations.
- The technical discussion will focus on:
 - identifying key programmatic successes or “best practices” that have led to important outcomes or impacts
 - identifying how these successes were achieved
 - identifying opportunities to replicate these successes in other countries

Objectives: By the end of the 2-day session, representatives will have the opportunity to:

- Participate in a South-South exchange of lessons learned and best practices that are contributing to a reduction in H5N1 HPAI viral circulation in poultry and human populations
- Identify how these best practices could be applied in other countries
- Identify key points from this inter-country discussion of best practices that can be shared with other countries at the Inter-Ministerial Conference on Animal and Pandemic Influenza (IMCAPI) in Vietnam from April 19 to April 21, 2010

Expected deliverables:

- Identification of specific best practices in Bangladesh, China, Egypt, Indonesia, and Vietnam that have resulted in important outcomes or impacts
- Identification of opportunities to replicate specific best practices in other countries and next steps needed to adopt these best practices
- Identification of key points/actions from this meeting that will form the basis for a presentation to other countries during IMCAPI

Agenda

March 29 afternoon/evening

- 4:00 – 6:00 Meeting Preparations**
- Planning Meeting of Organizing Committee and International Advisors (Sawangan Room 6)
 - Country Teams Prepare Posters (Sawangan Rooms 1-2)
- 6:00 – 7:30 Informal Reception (in front of Sawangan Room 6)**

March 30 morning (Plenary)

- 8:30 – 9:00 Registration**

9:00 – 10:15 Opening (Plenary)

- Welcome: **Dr. Kendra Chittenden**, USAID/Indonesia
- Introduction to the meeting: **Dr. Dennis Carroll**, USAID/Washington
- Remarks by UN representatives:
 - FAO/Rome: **Dr. Juan Lubroth**
 - WHO/Geneva: **Dr. Cathy Ellen Roth**
 - UNSIC: **Dr. David Nabarro**
- Official Opening of the Meeting: **Dr. Ir. Bayu Krisnamurthi**, Vice Minister of Agriculture of the Republic of Indonesia
- Introduction of the participants (all)

10:15 – 10:45 Break (group photo)

10:45 – 1:00 (Plenary)

- Discuss Meeting Objectives and Format: **Dr. Dennis Carroll**

Story Telling

- Description and management of the process for discussing best practices: **Kathy Alison** and **Kira Gnesdiloff**, Training Resources Group
- Summary handout of best practices from the 5 countries
- PROCESS
 - Step 1: Gallery Walk
 - Everyone looks at posters and selects 2 best practices that he or she would like more information about. Put your name and country on a post-it note and leave next to each of the 2 posters.
 - Step 2: Country Team Meeting
 - Review list of individuals who want more information on your best practice(s). Agree who will present your best practice(s) – those people will stay with the posters to present and answer questions. If there are more

than 10 people who want to discuss this success story, you will repeat the presentation a second time –select a second presenter for round 2.

- Remaining country team members will divide up and each person will attend the discussion of one of the best practices they selected
- Individuals will be able to participate in discussions on the 2 best practices that are most relevant for them.
- Make sure there is a least 1 representative from your country in each of the best practices discussions.

Step 3: Round 1: Discuss Best Practices

- Move to Round 1 – country presenter will have 15 minutes to present a quick overview of the success story with 20 minutes for discussion – what questions do people have, what do people want to know more about

Step 4: Round 2

- Country presenter will have 15 minutes to present a quick overview of the success story with 20 minutes for discussion

1:00 – 2:00 **Buffet Lunch**

2:00 – 3:30 **Country Team Discussions**

- Briefly meet in Plenary – Explain task for afternoon discussion: **Kathy Alison** and **Kira Gnesdiloff**
- Reconvene in country groups and share key relevant lessons from success stories heard. Specifically share
 - a. What was most relevant to your risk factors (animal /human)?
 - b. What might be adapted to help you with your situation?
 - What would have the most immediate or significant impact?
 - c. What policies might be needed to implement the intervention?
 - d. What questions do you now have for any of the other groups about a specific intervention
- By 3:15, write each question for success stories on a 3x5 card and deliver questions to country teams before the break.
- Country teams review the questions about their best practices and try to match someone with each question - identify who will go to the different country teams to respond to the questions after the break.

3:30 – 4:00 **Coffee Break**

4:00 – 4:45 **Responding to Questions about Best Practices (Country Groups)**

- Resource people from other country teams will share more information with the groups requesting assistance.

4:45 – 5:10 **Concluding Country Discussions**

- Within country groups, discuss the following:
 - What was most useful / interesting about today's discussions?
 - What is one idea you want to follow-up on tomorrow?

- Based on what you heard today, what do you think might be relevant to what you are doing in your country?
- What are the next steps?

5:10 – 5:15 Wrap-up of Day

- Announce plans for organizational meeting and dinner; announce starting time for Day 2: **Kathy Alison** and **Kira Gnesdiloff**

5:30 – 6:00 Planning Meeting of Organizing Committee and International Advisors (main meeting room)

7:00 – 9:00 Group Dinner at Poolside Restaurant

March 31

8:30 – 8:45 Opening of Day 2 (Plenary)

- Summary of Day 1 discussions / Overview of day 2 plan: **Dr. Andrew Clements**, USAID/Washington

8:45 – 10:00 Challenges Facing Countries

- Briefly meet in Plenary – Explain tasks for the morning discussions: **Kathy Alison** and **Kira Gnesdiloff**
- In country groups:
 - Identify and write on notecards (5x8 cards) your 2-3 most significant / current technical, programmatic, policy or other challenges that are keeping you from reducing H5N1 HPAI viral circulation in your country. *Put only 1 challenge on each card*
 - Post your cards on the wall before the break

10:00 – 10:30 Break

10:30 – 12:00 Challenge Discussions (2 rounds)

- Groups will form around the challenges identified above. In these groups, participants will share what they have tried as an intervention to address this set of challenge and what they learned in doing so. What are they trying now?
- After 45 minutes, participants will select a second set of challenges to discuss. Again, those participating will share what they have tried and how it worked and what they have learned.

12:00 – 12:30 Challenge Discussions (Plenary)

- Discussion of specific challenges countries are facing: what is similar in other countries and what they have done to overcome those challenges? **Andrew Clements**

12:30 – 1:30 Buffet Lunch

- 1:30 – 3:00 Country Plans**
- Briefly meet in Plenary – Explain task for afternoon discussion: **Kathy Alison** and **Kira Gnesdiloff**
 - In country teams, develop a plan for implementing best practices in reducing H5N1 HPAI viral circulation in your country. Specifically:
 - Identify 2-3 best practices that could be adopted in your country
 - What specific actions (policy, strategy, technical intervention, other) need to be taken in order to adopt each best practice
 - Who will be the lead in supporting the effort (policy / strategy / technical intervention / other)?
 - What resources will be required to support your plan? Are resources already available?
 - What other kinds of support will you need to implement your ideas (study tours, exchanges, resource people you would like to contact, etc)
 - Who will serve as points of contact for any future interactions with the other countries around this issue?
 - What are 2-3 challenges related to H5N1 HPAI for which there don't appear to be any best practices yet – that may need to be discussed in the future (write these on notecards)
 - Put your plan on flipchart (using provided format) and be prepared to present a 10 minute overview in plenary
- 3:00 – 3:30 Coffee Break**
- 3:30 – 4:30 Country Reports (Plenary)**
- Each country reports which best practices it is interested in adopting and asks any follow-up questions it has related to implementing these best practices
 - Were there any important issues that still need to be addressed (that could be addressed in the future)?
- 4:30 – 5:00 Inter-Ministerial Conference on Avian and Pandemic Influenza (IMCAPI) that will take place in Hanoi, Vietnam April 19-21, 2010**
- Identification of key points / issues that could be presented at IMCAPI: **Julie Hall**, **UNSIC** and **Tim Meinke**, **USAID/Vietnam**
 - Which best practices can be adopted by these 5 countries?
 - Which best practices might be useful to other countries?
 - What are shared challenges related to H5N1 HPAI for which there don't appear to be any best practices yet?
- 5:00 – 5:30 Meeting Conclusion**
- Next Steps: **Dennis Carroll**
 - Evaluation of meeting: **Kathy Alison** and **Kira Gnesdiloff**
 - Closing comments: **Dr. Rita Kusriastuti** and **Kendra Chittenden**
 - Adjourn
- 5:30 – 6:00 Wrap-Up Meeting of Organizing Committee (main meeting room)**

Attachment 3**Summary of Technical Discussion Sessions****Pre-Sessions: Monday, March 29**

International Partners were invited to join the organizing committee in Bali on Monday, March 28 to review the technical agenda's discussion. In addition to introductions, the session included a review of the technical discussion's objectives, review of role assignments (for instance, note-takers and speakers), and participants' expectations for the two days.

An informal reception welcoming participants was held in the evening.

Day 1: Tuesday, March 30***Opening Session***

Dr. Kendra Chittenden of USAID/Indonesia welcomed the assembled plenary on Tuesday, March 29. Dr. Dennis Carroll, USAID/Washington, followed Dr. Chittenden by introducing the agenda for the technical discussions. Dr. Juan Lubroth, FAO/Rome, Dr. Cathy Roth, WHO/Geneva, and Dr. David Nabarro UNSIC gave opening remarks. The meeting was officially opened by Dr. Ir. Bayu Krisnamurthi, Vice Minister of Agriculture of the Republic of Indonesia.

Review of Objectives

After a break and group photograph, Dr. Carroll summarized the agenda and objectives for the two-day discussion as outlined in the objectives section of this summary report.

Gallery Walk and Poster Presentations

Participants were invited to scan the best practices posters that had been assembled by country teams throughout the meeting space. Participants used this "gallery walk" to select lessons and practices they wanted to explore in-depth during two subsequent discussion rounds with country representatives. The purpose of these discussions was to share information on best practices relevant to each attending country.

Country Team Discussions and Further Lesson Sharing

After lunch, country teams reconvened to share lessons learned from the morning's discussions. Teams were invited to discuss:

- What was most relevant to your risk factors (animal /human)?
- What might be adapted to your country situation?
 - o What would have the most immediate / significant impact?
- What policies might be needed to implement intervention?
- What additional questions do you have about specific intervention?

Teams also determined what questions they had for other countries. Those questions formed the basis for further discussion, as each country team identified resource representatives to share more information with the groups requesting assistance.

Country teams again reconvened to discuss the following questions:

- What was most useful / interesting about today's discussions?
- What is one idea you want to follow-up on tomorrow?
- Based on what you heard today, what do you think might be relevant to what you are doing in your country?
- What are the next steps?

Dinner

A group dinner was held by the resort's poolside and in its restaurant.

Day II: Wednesday, March 29

Opening

Dr. Andrew Clements, USAID/Washington, opened the second day of discussion with an overview of the previous day. He also identified areas for potential further discussion, including vaccinations, collaboration between ministries of health and agriculture, bio-security, private sector involvement, and compensation.

Challenges

Country teams were asked to identify their most significant challenges (technical, programmatic, policy or other) keeping them from reducing H5N1 HPAI viral circulation in their countries. Teams were asked to post their challenges on a wall and organizers clustered these challenges into themes.

Country Plan Discussions

Country teams met to develop a follow-up plan on what they would do with the information they gained when they returned home to implement best practices in reducing H5N1 HPAI viral circulation in their respective countries. Teams were given the following task and asked to prepare a brief summary of their discussion.

- Identify 1-2 Priority Best Practices that seem to have potential relevance for your country (Which challenge might this address?)
- Identify Specific Steps needed to explore how this best practice can be applied to meet your specific challenges
- What are the 2-3 most critical challenges related to H5N1 HPAI for which there don't appear to be any lessons learned but that are of concern in your country?

Country Plan Reports

Country teams made short presentations of their top priority best practices they plan to work on when they get back to their countries

International Advisors' Presentation

The international advisors presented a list of the most critical regional/global challenges related to H5N1 HPAI for which there did not appear to be any lessons learned. These challenges were:

- Vaccinations, including best practices for exit strategies and/or the application of the vaccination
- Capacity building, especially technical level education in the animal health sector; farm/field schools and other participatory approaches.
- Restructuring: Rethinking the way we produce food animals; increase biosecurity in small scale commercial sector
- Reducing unnecessary human and animal exposure in markets - some examples exists.
- Ducks, domestic, free range. Improved raising systems? Targeted efficient vaccination schemes

The international advisors identified a mix of research, R&D, and pilot projects as specific actions to address these challenges.

IMCAPI Presentation

Dr. Julie Hall, United Nations System Influenza Coordination (UNSIC) representative, presented key points and issues that were identified during the Bali technical discussions that will be shared at the Inter-Ministerial Conference on Avian and Pandemic Influenza (IMCAPI) discussion in Hanoi, Vietnam between April 19-21, 2010.

Dr. Hall asserted the importance of sustaining momentum, noting that the virus is still a threat with pandemic potential. Although there have been great successes in a relatively short period of time, she also said that other priorities were competing for attention and funding, while the focus on highly impacted countries provided an opportunity to eliminate the virus from domestic poultry. She commented that sharing best practices should be supported and that although there were plenty of lessons that had been shared, gaps remain. Challenges include a better understanding of epidemiology, better tools to support behavior change, understanding how to best engage with the private sector and ensure bio-security is enhanced from "farm to fork", and developing effective strategies for vaccination. Dr. Hall commented on the continuing need to support systems for capacity building and the need to mainstream practices and apply what had been learned to other diseases. Concluding that the political commitment was critical to success, she proposed a draft statement for the Hanoi meeting that would include topics such as:

- Mass vaccination for poultry
- Incorporate food safety and food security (including poverty reduction) and other global issues impacted by zoonotic diseases
- Discuss H1N1
- Making zoonotic diseases a priority and set up national committee
- Strengthening regional coordinating bodies
- Implementing OWOH concepts – healthy farmer, healthy livestock – PSTS
- Sharing genetic material
- Sharing information, communications and technology

Dr. Hall answered questions along with Mr. Tim Meinke, USAID/Vietnam after her presentation.

Closing Comments

After follow-up remarks from Dr. Carroll, Dr. Chittenden and Dr. Rita Kusriastuti, Director of Vector Borne Disease Control for the Indonesia Ministry of Health made closing remarks, and the meeting was officially adjourned.

Attachment 4: Summary of Best Practices presented by each country**Bangladesh Best Practices****Country Summary:**

1. Total human population = 150.4 million
2. Total poultry population = 262.62 million - by bird type: 84.30 % Chickens, 15.70 % ducks, % other (Not Available)

H5N1 HPAI Description:

	2003	2004	2005	2006	2007	2008	2009	2010
Confirmed H5N1 HPAI poultry outbreaks	0	0	0	0	69	226	32	22
Confirmed H5N1 HPAI human cases	0	0	0	0	0	1	0	0

Total suspect H5N1 human cases (2003-2010)	Total suspect H5N1 human cases referred (2003-2010)	Total suspect H5N1 human cases tested (2003-2010)	Total confirmed H5N1 human cases (2003-2010)
17	17	17	1* not referred as a suspect

Bangladesh Best Practice # 1

CONTAINMENT OF HPAI THROUGH LIVE BIRD MARKET (LBM) CLEANING/DECONTAMINATION PROGRAM

Presenters:

- Md. Sharful Alam; Secretary; MoFL; GoB
- Dr. Md. Abdul Baqi; Director; DLS; GoB

Sector: Animal Health

Description of the Best Practice

1. *Problem addressed:*
 - Live Bird Market (LBM) a potential harbor of HPAI virus
2. *Population impacted by this problem*
 - Total poultry population and concerned humans
3. *Specific results achieved*
 - Improved sanitation of selected major Live Bird Markets
4. *Contribution to reducing H5N1 HPAI viral circulation*
 - Potential reduction of viral load in selected major Live bird markets
5. *Specific strategies used*
 - Infrastructure improvement with routine cleaning and disinfection of 18 large live bird markets
6. *Specific tools used*
 - Installed tiles, improved drainage, metal cages, water supply, High power pressure sprayers, detergent, cleaning equipment, and disinfectant
7. *Specific policies needed*
 - MOUs with market committee, Market policy of cleaning during closed hours
8. *Specific information needed*
 - High risk markets chosen based on number of vehicles and birds moved per day.
9. *Specific groups of people involved*
 - Transporters, vendors, cleaners, engineers, veterinarians, public health personnel, market managers
10. *Specific organizations/institutions/sectors involved*
 - Market committees, Municipalities, Department of Livestock Services (DLS), FAO, USAID
11. *Specific intersectoral linkages needed*
 - Local Government, DLS, industry

12. *Lessons learned on efforts that did not end up contributing to this best practice (i.e. what not to do):*
 - Continuous outside sources of financing for cleaning and disinfection practice is discouraged; markets should be self-sufficient
13. *Other information related to the best practice:*
 - Markets cost-shared with FAO for infrastructure improvements
14. *Challenges faced*
 - Coordination between municipalities and market committees
15. *Challenges overcome*
 - Shifting cleaning schedule to closed hours

FIVE Remaining Challenges to Decreasing H5N1 HPAI Infections in Poultry and Humans

1. Cleaning and disinfection program for all the LMB
2. Infrastructure development
3. Scheduled closed day for LBM for comprehensive cleaning and disinfection
4. Suitable vehicle washing area
5. Waste management

Bangladesh Best Practice # 2

CONTAINMENT OF HPAI THROUGH ACTIVE SURVEILLANCE NETWORK PROGRAM

Presenters:

- Md. Sharful Alam; Secretary; MoFL; GoB
- Dr. Md. Abdul Baqi; Director; DLS; GoB

Sector: Animal Health

Description of the Best Practice

1. *Problem addressed*
 - Case identification and Early detection were the constraints in responding to HPAI outbreak
2. *Population impacted by this problem*
 - Total poultry population and pertinent humans
3. *Specific results achieved*
 - Average time to detect HPAI outbreaks reduced from 5 days in 2007 to 12 hours in 2010;
Average time between suspicion to response minimized from 6 days in 2007 to 24 hours in 2010
4. *Contribution to reducing H5N1 HPAI viral circulation*
 - Early reporting and detection followed by early response based on rapid laboratory detection resulting in better containment of HPAI
5. *Specific strategies used*
 - Employment of Community Animal Health Worker (CAHW) and additional Vet Surgeons to strengthen DLS activities; Biosecurity improvement in commercial farms
6. *Specific tools used*
 - Reporting of suspected cases through SMS gateway system; Use of Rapid Antigen Detection Technique for quick identification of A virus; Prescribed surveillance form
7. *Specific policies needed*
 - Expansion of Rapid Antigen Detection Technique to district level that facilitate quick identification; Single farm culling in commercial farms based on detection of Influenza type A and 500 meter area culling in case of backyard poultry
8. *Specific information needed*
 - Report of sickness and mortality in poultry; Population, types of farming, geographic data along with housing
9. *Specific groups of people involved*
 - LS Officials, FAO recruited Additional Vet. Surgeons (AVS) and Community Animal Health Workers (CAHW)

10. *Specific organizations/institutions/sectors involved*
 - USAID, Department of Livestock Services (DLS) and FAO
11. *Specific intersectoral linkages needed*
 - Active Surveillance is a collaborative program between DLS and FAO through LoA.
12. *Lessons learned on efforts that did not end up contributing to this best practice (i.e. what not to do)*
 - Not to be solely dependent on CAHW
13. *Other information related to the best practice*
 - The response might have been more prompt if local veterinary authorities were provided incentives with increased culling expenditure for rapid response
14. *Challenges faced*
 - Almost half (52%) of the country is outside the active surveillance command area results in ineffective virus containment
15. *Challenges overcome*
 - Successful introduction of SMS gateway system

FIVE Remaining Challenges to Decreasing H5N1 HPAI Infections in Poultry and Humans

1. Making farmers more responsive through increased rate of compensation
2. Need for improved Biosecurity practices and more awareness building
3. Improvement of Live bird market
4. Farming system (backyard poultry and duck rearing)
5. Improve Rapid response from DLS field officials

Bangladesh Best Practice # 3

ANTIVIRAL PROPHYLAXIS AND FOLLOW UP OF HIGH-RISK PEOPLE

Presenters:

- Dr. Syed Umar Khyyam, Joint Secretary (PH &WHO), Ministry of Health and Family Welfare, Bangladesh
- Dr. Be-Nazir Ahmed, Principal Scientific Officer, Institute of Epidemiology, Disease Control and Research (IEDCR)

Sector: Human Health

Description of the Best Practice

1. *Problem addressed*
 - Risk of transmission of HPAI H5N1 from poultry to human
2. *Population impacted by this problem*
 - High-risk people including cullers, poultry farmers and workers.
3. *Specific results achieved*
 - Mitigation of transmission of HPAI H5N1 to high-risk people
4. *Contribution to reducing H5N1 HPAI viral circulation*
 - No human case among the high-risk group in Bangladesh
5. *Specific strategies used*
 - Antiviral prophylaxis for people exposed to H5N1 virus and follow up for 14 days to facilitate detection of suspected cases
6. *Specific tools used*
 - Antiviral (Oseltamivir) in prophylactic doses, checklist for reporting, fax, mobile telephone, kits for specimen collection and diagnostics
7. *Specific policies needed*
 - Establishment of surveillance among high-risk groups, coordination among health and livestock departments (DLS) and poultry industry.
8. *Specific information needed*
 - Notification to health services of outbreaks in poultry with H5N1 by DLS , list of people exposed, antivirals taken, follow up performed, reporting of ILI among exposed, collection of specimens, diagnostic tests performed, reporting results.
9. *Specific groups of people involved*
 - District and sub-district level health managers, field health workers, National Rapid Response Team (NRRT) members of IEDCR, Personnel of DLS at the national, district and sub-district level, poultry industry

10. *Specific organizations/institutions/sectors involved*

- IEDCR, DGHS, DLS, ICDDR, CDC-USA, BLRI, WHO, FAO.

11. *Specific intersectoral linkages needed*

- Coordination among health and livestock departments by MoU.

12. *Lessons learned on efforts that did not end up contributing to this best practice (i.e. what not to do):*

- Difficulty in ensuring antiviral compliance by some high-risk people due to lack of perception of risk and side effects of medication

13. *Other information related to the best practice:*

- Close contacts are given anti-viral tablets once daily for 7 days and followed up for 14 days.
- Other contacts are followed up for 14 days without anti-viral tablets.
- Daily follow up is performed by a health care worker to detect 'Influenza Like Illness'
- From January through December 2008, 4107 people contacts were reported, of whom 3788 were followed up

14. *Challenges faced*

- Timely reporting of outbreaks in poultry
- Unwillingness by some to take antivirals
- Reporting of follow up to the centre (IEDCR)

15. *Challenges overcome*

- Initial lack of coordination between the health and livestock departments was remedied and communication improved.

5 Remaining Challenges to Decreasing H5N1 HPAI Infections in Poultry and Humans

1. Weakness in biosecurity practices in the poultry industry
2. Outbreaks of HPAI H5N1 among backyard poultry
3. Delay in reporting of outbreaks in poultry
4. Inadequate culling due to under-reporting of die-offs by poultry farmers (financial and social disincentives)
5. Lack of awareness about transmission among the general population

China Best Practices

Country Summary: Total human population =1,321,290,000

Standing poultry population = 5.6 Billion

- by bird type: **82%** chickens, **13%** ducks, **5%** other
- by farm type: **layer 23.1%** (1~499); **76.91%** (≥ 500); **broiler 18.4%** (1~1999); **81.64%** (≥ 2000)
- by function: **2%** breeder, **39%** broiler, **26.5%** layer

H5N1 HPAI Description

	2003	2004	2005	2006	2007	2008	2009	2010
Confirmed H5N1 HPAI poultry outbreaks	0	50	31	10	4	8	2	--
Confirmed H5N1 HPAI human cases	(1)	0	8	13	5	4	7	--

38 confirmed Human cases, 25 dead

China Best Practice # 1

EARLY DETECTION AND RAPID RESPONSE TO HUMAN INFECTION WITH AVIAN INFLUENZA A (H5N1) VIRUS IN CHINA

Presenters:

- Zhengmao Li, HERO, MOH
- Qiaohong Liao, China CDC
- Zhancheng Gao, People's Hospital, Peking University
- Tian Bai, China CDC

Sector: Human Health

Description of the Best Practice

1. *Problem addressed*
 - How to early detect H5N1 patients and limit the potential spread
 - How to early diagnose and treat H5N1 patients to lower the case fatality rate
2. *Specific strategies used:*
 - a. Surveillance for suspected H5N1 cases -- National surveillance system of hospitalized; cases with pneumonia of unknown origin; Enhanced one-month surveillance for ILI cases at all health care facilities within a 3km radius, following avian influenza outbreaks in poultry
 - b. Develop technical guidelines -- Guideline for National Surveillance of Hospitalized Cases with Pneumonia of Unknown Origin; The Emergency Preparedness and Response Guideline for Human Infection with Avian Influenza A (H5N1) Virus; Epidemiological Investigation; Specimen Collection and Laboratory Testing;
 - c. Emergency Surveillance Program; Definitions and Medical Observation of Close Contacts; Clinical management; Infection Control
 - d. Training -- Annual routine training workshop since 2005; Rapid Response Team (RRT) training workshop (Sep, 2007); The workshop to strengthen detecting and reporting awareness of cases with pneumonia of unknown origin or suspected H5N1 cases among primary health care workers (from Feb to May in 2008)
 - e. Field investigation -- Joint trained team designated by MOH including epidemiologists, clinicians, virologists for each H5N1 patient; Responsibilities - Interviewing case-patients and their proxies; Visiting patients household and place visited by them; Providing guidance on treatments; Collecting specimens from H5N1 patients and environment; Conducting case-control study and sero-prevalence study
 - f. Enhancing surveillance capacity -- Expansion of influenza surveillance network from year 2005 to 2009--No. of laboratories: from 63 to 44; No. of sentinel hospitals: 197 to 556: Hand in hand training of lab techniques for network laboratories in NIC: H5N1 nucleic acid PCR testing assessment -- CNIC: by WHO twice every year; Network laboratories: by CNIC once every year
 - g. Laboratory investigation -- Specimens from most H5N1 patients were shipped to NIC for diagnosis and virological monitoring; Rapid virus isolation and sequencing was performed for each patient with available specimens; Virological characteristics were studied

- h. Close contacts -- Under daily surveillance by telephone or in person for fever and respiratory symptoms for 7 days after last exposure; sometimes given chemoprophylaxis
 - i. Clinical management -- Clinical management guidelines were developed; Two experts were designated by MOH to give guidance on treatment for most H5N1 patients; A book entitled "Human infection with avian influenza A (H5N1) virus" with 18 case reports
 - j. Risk communication -- Disseminating information to senior government officers and people's representatives in national congress
 - k. Public Communications
 - l. Health Education Campaigns -- For general population, provide basic knowledge on AI, advice on food safety and risk avoidance. For risk groups, emphasizes on personal protection and safety handling of poultry
3. *Specific groups of people involved*
 - Public health officials, Health care workers, Epidemiologists, Laboratory workers, Veterinarians, Media workers
 4. *Specific organizations/institutions/sectors involved*
 - MOH; MOA; CDCs of all levels; Hospitals; Media
 5. *Specific results achieved*
 - 34(89.5%) H5N1 patients were detected through National Surveillance System of Unknown Origin Pneumonia; One H5N1 patient was detected through medical observation of close contacts; H5N1 virus isolated from 30 cases; Drug susceptibility test (Susceptible to neuraminidase inhibitor antiviral drugs; Some viruses were resistant to adamantine); No reassortment with seasonal influenza virus
 6. *Challenges faced:*
 - Awareness of detecting and reporting cases with PUO in the primary health care workers needs to be improved
 - Capacity of laboratory network needs to be enhanced

Remaining Challenges to Decreasing H5N1 HPAI Infections in Poultry and Humans

1. Difficult to change handling practice of poultry among poultry workers
2. H5N1 virus circulating in the environment is a continuous threat

China Best Practice # 2

CLINICAL MANAGEMENT WITH H5 INFECTION IN CHINA

Presenters:

- Dr. Zhancheng Gao, Peking Univ People's Hospital
- Mr. Zhengmao Li, MOH in China
- Dr. Qiaohong Liao, China CDC
- Dr. Tian Bai, China CDC

Sector: Human Health

Description of the Best Practice

1. *Problem addressed:*
 - All patients query clinical consultant in severe stage
 - No standardized clinical management approach exists for H5 infected patients
2. *Population impacted by this problem*
 - People fear to be infected by H5 since the poor prognosis
3. *Specific results achieved*
 - H5 virus can infect multi-system in severe patients
 - H5 vertical transmission route was found
4. *Contribution to reducing H5N1 HPAI viral circulation*
 - H5 patients should be treated in negative pressure or well-ventilated room for hospital infection control
5. *Specific strategies used:*
 - Patients should be treated in tertiary/capable hospitals.
 - Gestation should be terminated for pregnant pts w/ H5 infection.
 - Severe H5 infected pts within 2wks can be treated w/ specific high titering convalescent plasma or vaccinated plasma.
6. *Specific tools used*
 - Guidelines on clinical management & infection control
 - Clinical management training level by level
7. *Specific policies needed*
 - ICU infrastructure needs to be further invested in tertiary & non-tertiary hospitals.
8. *Specific information needed*
 - Effective clinical info-sharing platform needs to be built up at country-level
9. *Specific groups of people involved:*
 - Doctors in Respiratory Medicine, ICU, infectious disease
 - Epidemiologists in CDC

- Coordinators in Administration of Health Care
 - Specialists from WHO or other international groups
10. *Specific organizations/institutions/sectors involved:* Department of Respiratory Medicine; Intensive Care Unit; Administration of Health Care at different levels; International organizations, such as WHO
11. Lessons learned on efforts that did not end up contributing to this best practice (i.e. what not to do):
- Treating pts in the hospital is not warranted to the demand of monitor clinical status, including oxygenation.
 - 'lung recruitment' strategy should not be used in pts with bronchiectasis or bullae.
12. *Challenges faced:*
- Sensitive triage clinical parameters for early detection
 - Rapid, high sensitive and specific diagnostic assay for H5 infection unavailable.
 - Early effective therapeutic intervention
 - H5 infected pts need to be transferred to warranted hospital
 - Team work needs to be strengthened for caring the critical illness pts.
13. *Challenges overcome*
- H5 pts are to be managed in warranted hospital. Teamwork had be built up at different levels.
 - Early effective therapeutic intervention.

Remaining Challenges to Decreasing H5N1 HPAI Infections in Poultry and Humans

1. Sensitive triage clinical parameters for early detection in primary level hospitals
2. Rapid, high sensitive and specific diagnostic assay for H5 infection unavailable.

China Best Practice # 3

IMPROVEMENT OF THE LABORATORY CAPABILITY FOR INFLUENZA VIRUS IN CHINA

Presenter

- Ms. Bai tian, China CDC

Sector: Human Health

Description of the Best Practice

1. *Problem addressed*
 - The coverage and capability of existed network laboratories cannot meet the early detection and rapid response to pandemic influenza.
 - The laboratory capability varies between different levels of network laboratories in China
2. *Population impacted by this problem*
 - Population who may infected with seasonal influenza, human H5N1 avian influenza and pandemic influenza
3. *Specific results achieved*
 - Network laboratories expanded from 84 to 411, which almost cover a majority of counties of each province
 - Significant improving in the ability of virus isolation and nucleic acid detection of the network laboratories of Provincial CDCs
4. *Contribution to reducing H5N1 HPAI viral circulation*
 - The ability for early detection and prevention had been improved
5. *Specific strategies used:*
 - Expanding the coverage of network laboratories
 - Improving the laboratory capability of network lab in different levels.
 - Making the network labs at different levels more functional
6. *Specific tools used*
 - Quality Assessment
 - Reference reagent supply support
 - Training
 - Field Investigation
 - Information Platform
 - Financial Support
7. *Specific policies needed*
 - With approvals from the MoH of China , NIC launched the Five-year program of the Development of Influenza Surveillance Network with U.S. CDC.
 - In 2009, in order to improve the response to pandemic H1N1, MoH of China

decided to expand the network laboratories

8. *Specific information needed*
 - Provincial CDCs made the application for the name and number of new network laboratory
9. *Specific groups of people involved:*
 - Public health officials
 - Laboratory personnel
 - International experts
10. *Specific organizations/institutions/sectors involved:*
 - MoH of China
 - China CDC
 - NIC
 - CDCs of all levels
 - USCDC
 - WHO
11. *Specific intersectoral linkages needed*
 - MoH is in charge of organizing the national or local influenza surveillance, formulating the development plan of NISN.
 - NIC from IVDC, China CDC is in charge of the management of NISN and providing the technical support for local CDCs.
12. *Other information related to the best practice*
 - Most new joint network laboratories have already carried out sample testing for influenza viruses during the first wave of pandemic H1N1 influenza in China.
 - The number of seasonal influenza strains reported to the NIC by the network laboratories showed a significant increase in 2009
 - China NIC was accepted as the fifth influenza reference and collaborating center of WHO
13. *Challenges faced:*
 - Human resource
 - Imbalanced development of economy in different provinces
14. *Challenges overcome*
 - Laboratory capability had improved in most Provincial CDCs
 - Number of network lab had expanded

Remaining Challenges to Decreasing H5N1 HPAI Infections in Poultry and Humans

- Poor laboratory capability for rapid detection and sample collection in Prefecture and County CDCs.

China Best Practice # 4

INTEGRATED PREVENTION & CONTROL MEASURES COMBINING SURVEILLANCE, MASSIVE VACCINATION & STAMPING OUT POLICY

Presenter

- Yu Kangzhen, CVO, Ministry of Agriculture

Sector: Animal Health

Description of the Best Practice

1. *Problem addressed*
 - Improve the level of antibody protecting poultry
 - Reduce HPAIV circulation in environment to decrease poultry and human infection
2. *Population impacted by this problem*
 - All poultry flocks include domestic poultry, wild bird
 - Human
3. *Specific results achieved*
 - The government has required 100% vaccine coverage in domestic poultry
 - Billions of doses of the vaccines have been used in the field, and the vaccines are antigenically well matched to the circulating strains
 - The number and frequency of HPAI outbreaks have been significantly reduced. Especially no outbreak has occurred since May of 2009
4. *Contribution to reducing H5N1 HPAI viral circulation*
 - Experimental results show that the qualified immunized poultry doesn't carry and shed the virus and reduce the virus load in the environment
 - Significantly reduce the risk of viral replicating
5. *Specific strategies used:*
 - Integrated prevention and control policy combining compulsive vaccination, surveillance and culling.
 - Active surveillance, especially surveillance for evaluation of vaccination efficacy
6. *Specific tools used*
 - National vaccinating plans and optimization of vaccination procedures
 - Vaccines: 6 kinds of HPAI vaccines
 - Certificate: 9 companies that have Good Manufacture Practices (GMP) & enhanced vaccine quality
 - Vaccination identification system
7. *Specific policies needed*
 - Vaccination subsidy
 - Financial support relevant polices
8. *Specific information needed*
 - Information from the surveillance and report system

- Updating HPAI information and techniques by OIE, WTO, EU etc

9. *Specific groups of people involved:*

- Grassroots veterinary service system

10. *Specific organizations/institutions/sectors involved:*

- Animal disease prevention & control central, Animal health supervisory service from central to local level
- Relevant university and research institutes
- Sub-veterinary at the village level
- National Avian Influenza Reference Laboratory

11. *Specific intersectoral linkages needed*

- The multi-ministries cooperation mechanism, including Ministry of Health, China Inspection & Quarantine Service etc.

12. *Lessons learned on efforts that did not end up contributing to this best practice (i.e. what not to do):*

- Long distance movement of large quantities of live birds across regions and provinces

13. *Other information related to the best practice*

- Waterfowl vaccination
- Silence infection detection

14. *Challenges faced:*

- Large poultry population, especially large population of waterfowl
- Large proportion of small scale, and backyard farms with low bio-security
- Long distance movement of live birds
- Live bird markets
- Migratory birds

15. *Challenges overcome*

- Establishing Vet. system from central to local level
- Vaccine development for mutated virus strains

5 Remaining Challenges to Decreasing H5N1 HPAI Infections in Poultry and Humans

1. Aspects that affect vaccination efficacy in field e.g. Poultry health status, Application, store and transport of vaccines; Operation of vaccination (SOP); Feeding and bio-security management
2. Recessive carriers of the virus in waterfowl
3. High proportion of backyard poultry
4. Live bird market
5. Migratory bird

Egypt Best Practices

Total human population = 77,801,987

Total estimated poultry population = 985 million

- 96.5 % chickens, 1.8 % ducks, 1.5% turkey and 0.2% others
- 0.1 % Sector I, 1.7% Sector II, 47.7% Sector III, 50.7 % Sector IV.
- 0.03 % Grandparent stock, 8.6% parent stocks, 88.56% commercial broiler, 2.82% commercial layers

H5N1 HPAI Description

	2006	2007	2008	2009	2010 (24 Mar)
Confirmed H5N1 HPAI poultry outbreaks	1076	282	127	287	232
Confirmed H5N1 HPAI human cases	18	25	8	39	17

Total suspect H5N1 human cases (2003-2010)	Total suspect H5N1 human cases referred (2003-2010)	Total suspect H5N1 human cases tested (2003-2010)	Total confirmed H5N1 human cases (2003-2010)
11549	11549	11549+4899 contacts*	107
*at the start of the outbreak in early 2006 up to September 2007, MOH recommended to test suspected cases, their contacts plus workers in infected poultry farms.			

Egypt Best Practice # 1 (2 parts)**AVIAN INFLUENZA SITUATION IN EGYPT****Presenter:**

- Prof. Dr. Mona Mehrez Aly, DVM, Ph.D., Director of Animal Health Research Institute (AHRI) and Supervisor of National Laboratory for Veterinary Quality Control on Poultry Production (NLQP)

Sector: Animal Health**Description of the Best Practice – Part 1.**

1. *Problem addressed:*
 - Faster time to produce confirmatory A/H5N1 diagnosis and outbreak reporting
2. *Population impacted by this problem:*
 - Poultry producers in both household and commercial farms
3. *Specific results achieved*
 - Skilled manpower for HPAI diagnosis made available both centrally and at governorate satellite laboratories.
 - Time of confirmatory diagnosis reduced from several days to less than six hours.
 - Infrastructure for BSL2+ and BSL3 is being (in the process) built.
 - Six satellite laboratories in different governorates established and accredited according to international ISO 17025 following international protocols.
 - NLQP successfully passed series of international proficiency tests
4. *Contribution to reducing H5N1 HPAI viral circulation*
 - Rapid diagnosis and information sharing to enhance response
5. *Specific strategies used:*
 - Rigorous institutional capacity (manpower, facilities and work culture) efforts exerted
 - Internationally accepted standard diagnostic protocols adopted;
 - Improvement of BSL+2 and progress in the establishment of BLS3 laboratories
6. *Specific tools used:*
 - Tailor-made skill enhancement training provided to technical staff ranging from quality sample collection to advanced molecular diagnostic techniques
 - Six fully functioning and accredited governorate satellite laboratories established in strategic locations in the country,
 - Rapid response sampling teams from NLQP and satellite laboratories were established and deployed.
 - Sample collections and disease reporting were done in close collaboration with GOVS.
7. *Specific policies needed*
 - Development, approval and adoption of laboratory accreditation procedures
 - An elaborated protocol and procedures to handle per-slaughter and pre-movement certification services for licensed poultry farms

8. *Specific information needed*
 - Continuous update to the standard international protocol of diagnosis
9. *Specific groups of people involved*
 - NLQP and Satellite laboratory staff,
 - OFFLU backstopping officers,
 - SEPRL scientists, and
 - Other personnel from partner institutions
10. *Specific organizations/institutions/sectors involved*
 - NLQP, CLEVB, GOVS, OFFLU, ECTAD-FAO, USAID, SEPRL, Erasmus, NAMRU – 3, IZSVe, FLI
11. *Specific inter-sectoral linkages needed*
 - Coordination with both central and local Veterinary services, as well as continuous interaction with CLEVB and satellite laboratories to harmonize field operations and standardize procedures
12. *What other local conditions were necessary for success?*
 - Collaboration with SAIDR Team, Central and local Veterinary services, Coordination of outbreak investigation, sample collection, shipment and reporting.
13. *What challenges were faced, overcome, and still remain?*
 - Processing LoAs, MTA and shipment of samples abroad took more time than originally anticipated
 - To identify and receive expertise input in the preparation of the design, specifications, contractual arrangements and follow up processes for the establishment of BSL3 laboratory.
14. *Other comments :*
 - USAID-funded project and jointly implemented by NLQP and FAO aiming to evaluate the commercial vaccines against HPAI is progressing as planned and has considerable contribution to the existing capacity at NLQP

Description of the Best Practice - Part 2

1. *Problem addressed:*
 - Effective laboratory networking established
2. *Population impacted by this problem:*
 - NLQP, Satellite Laboratories, GoE, Partner International laboratories
3. *Specific results achieved:*
 - Laboratory data and genetic material shared on time with all relevant national and international partners, published on GENE BANK
4. *Contribution to reducing H5N1 HPAI viral circulation:*
 - Through standardization and adoption of acceptable protocols

5. *Specific strategies used*

- Adoption of information and knowledge sharing platform
- Perform international quality control and assurance tests
- International cooperation with reference laboratories;
- Twinning with FLI , OIE to be OIE reference laboratories;
- Establishment of local networks with satellite laboratories

6. *Specific tools used:*

- Material transfer agreement (MTA) and letter of agreements (LoAs) as well as laboratory information management system (LIMS)
- Twinning program with reference international laboratories were used.
- International projects funded by different development partners (USAID, EU, WB) allows adequate interactions between local and international laboratories, and
- Modalities of operations with UN and other agencies (FAO, WHO, OIE)

7. *Specific policies needed*

- Adoption of internationally accepted diagnosis protocols in both central and satellite laboratories.

8. *Specific information needed*

- Information on establishing a system for twinning with international laboratories
- Systems and detailed accounts for international shipment/transferring of hazard materials.

9. *Specific groups of people involved:*

- Staff of NLQP, Satellite and other provincial laboratories, and ministry of communication; OFFLU backstopping officers, experts from international laboratories

10. *Specific organizations/institutions/sectors involved:*

- NLQP, ECTAD, USAID, USDA, ECTAD-FAO, OFFLUE, SEPRL, Erasmus , NAMRU-3, IZSve , FLI

11. *Specific intersectoral linkages needed:*

- Local networking with satellite and other provincial laboratories, CLEVB

12. *What other local conditions were necessary for success?*

- Cooperation with Ministry of Communication, GOVS and other relevant departments in MoALR

13. *What challenges were faced, overcome, and still remain?*

- Initially lack of experience with LIMS and absence of expertise in local computer companies that would address NLQP's needs

14. *Other comments :*

- GoE provided funds to support local networking between central and satellite laboratories.
- Ministry of Communication played pivotal role in the establishment of the physical

network structures.

Egypt Best Practice # 2 (4 Parts)

ACHIEVEMENTS AND SUCCESSES IN STRENGTHENING AI DETECTION AND RESPONSE

Presenter:

- Prof Dr. Mohamed Elgarhy, Chairman General Organization for Veterinary Services

Sector: Animal Health

Description of Best Practices – Part 1

1. *Problem addressed:*
 - Better detection and response of HPAI outbreaks in poultry
2. *Population impacted by this problem:*
 - Household poultry sector
3. *Specific results achieved:*
 - HPAI detection progressively improved: 6% in 2009 to 18% in 2010. and Passive Surveillance positive detection increase from 25% in 2009 to 43% in 2010.
 - CAHO contributed 49.1% of confirmed HPAI positives (2009-10).
 - Decrease in time lap between notification and action and final containment from 5 days in 2007 to 1 day in household and 3 days in farms in 2010 (more efficient containment interventions)
4. *Contribution to reducing H5N1 HPAI viral circulation:*
 - Detected cases with good containment and tracing will lead to decrease number of outbreak after a period of time.
5. *Specific strategies used:*
 - Strengthened Surveillance activities and Improved outbreak response capacity at central and governorate levels
6. *Specific tools used:*
 - Rapid Ag field test.
 - Community Animal Health Outreach (CAHO)
 - SOPs for use of rapid field test and action responses.
 - Provision of training on good practices and provision of inputs and logistics support for quick and effective response interventions.
 - Regular consultative meetings between technical and political authorities as well as coordination meetings between central and local veterinary services.
7. *Specific policies needed:*
 - Positive RFT has become the trigger to begin containment operations in household sector.
 - Change in policy from zonal mass culling to only infected premises.

8. *Specific information needed:*

- Previous experience on RFT implementation.
- Information on changes of HPAI clinical signs for accurate case definition.
- Identification of locally suitable culling and disposal procedures.
- The perception of poultry producers to containment measures.

9. *Specific groups of people involved:*

- Central and local veterinary services personnel,
- Laboratory personnel,
- key community informants at the local level

10. *Specific organizations/institutions/sectors involved:*

- Central and local veterinary services, laboratories; FAO, ILRI, USAID

11. *Specific intersectoral linkages needed:*

- Coordination between central and local Veterinary services.
- Coordination with the political authority (Governors).
- Strengthening the links between the veterinary services and all relevant stakeholders.
- Local communities.

12. *Lessons learned on efforts that did not end up contributing to this best practice (i.e. what not to do):*

- Random active surveillance (high cost without effectiveness)
- Mass culling impacted negatively on case detection.
- Lack of comprehensive compensation scheme
- Ring vaccination during outbreak

13. *Other information related to the best practice:*

- Passive surveillance is a key tool in detection.
- Enhancing trust between public and private partners
- Communication activities should be an integral parts of all detection and response activities

14. *Challenges faced:*

- Lack of trust between public and private sectors.
- Absence of comprehensive compensation scheme.
- Inadequate logistics necessary to implement effective containment interventions
- Absence of clearly defined roles and responsibilities of the players involved in response interventions

15. *Challenges overcome:*

- Increased community involvement
- Logistics chain enhanced
- Veterinary Services enabled to guide and coordinate responses to outbreaks.
- Regular Coordination meeting are held to discuss field level issues as well as roles and responsibilities

Description of Best Practices – Part 2

1. *Problem addressed:*
 - Improved farm biosecurity
2. *Population impacted by this problem:*
 - Commercial Poultry producers in sector II and III
3. *Specific results achieved:*
 - of the 802 farms randomly chosen in seven high risk governorates that received biosecurity training, about 65% showed moderate improvement in biosecurity measures
4. *Contribution to reducing H5N1 HPAI viral circulation:*
 - Increased socio- economically acceptable biosecurity measures will decrease environmental viral load
5. *Specific strategies used:*
 - Implement cost-effective and sustainable biosecurity measures in commercial farms with focus on sectors II and III
6. *Specific tools used:*
 - Training of farm workers and managers on biosecurity measures including cleaning and disinfection.
 - Regular monitoring of the implementation of suggested biosecurity measures.
 - Provide inputs and technical assistance for the farms.
 - LOAs to financially support local veterinary services in training on, monitoring of biosecurity measures.
7. *Specific policies needed:*
 - Farm registration decrees acceptable to most poultry producers.
8. *Specific information needed:*
 - Location, number, capacity, and biosecurity status of farms,
 - Capturing the views of producers on policy instruments affecting them.
9. *Specific groups of people involved:*
 - Veterinary services personnel,
 - Farm owners,
 - Representatives of poultry producers associations,
 - Private service providers
 - FAO staff
10. *Specific organizations/institutions/sectors involved:*
 - Central and local veterinary services, FAO, USAID
11. *Specific intersectoral linkages needed:*
 - Coordination between producers, local veterinary services and private service - input providers

12. *Lessons learned on efforts that did not end up contributing to this best practice (i.e. what not to do):*

- Lack of uniformity in implementation of policies between various governorates

13. *Other information related to the best practice:*

- Consolidate achievements obtained through USAID-funded projects in piloted areas and expand to all high risk governorates.

14. *Challenges faced:*

- The new registration/licensing policy exclude majority of poultry farms.

15. *Challenges overcome:*

- Revise strategy and policies.
- Increased involvement of private sector in farm biosecurity improvement

Description of Best Practices – Part 3

1. *Problem addressed:*

- Establish an Epidemio-Surveillance System

2. *Population impacted by this problem:*

- Decision makers, veterinary services

3. *Specific results achieved:*

- Network established in full capacity in all districts in 5 governorates, partial capacity in 10 governorates with projected full coverage in 18 governorates by September 2010

4. *Contribution to reducing H5N1 HPAI viral circulation:*

- Decisions made based on scientific analysis of epidemiological data.

5. *Specific strategies used:*

- Establish an epidemio-surveillance system

6. *Specific tools used:*

- Provision of various level of skills enhancement training provided to both central and governorate Epi-Unit staff (Epidemiology, data analysis, TADinfo, risk analysis, GIS and spatial analysis, Risk based surveillance, statistics).
- Establish networks to district levels and provide required hard and software

7. *Specific policies needed:*

- Epidemiology Unit became an integral part of the organizational structure of GOVS.

8. *Specific information needed:*

- PVS evaluation report by OIE.
- Data justifying that epidemio-surveillance output are needed for planning and decision making for veterinary services

9. *Specific groups of people involved:*
 - Epidemiology Unit personnel,
 - FAO backstopping officers and international consultants
10. *Specific organizations/institutions/sectors involved:*
 - GOVS, CIRAD, RVC, FAO and USAID
11. *Specific intersectoral linkages needed:*
 - Collaboration between central and local veterinary authorities
12. *Lessons learned on efforts that did not end up contributing to this best practice (i.e. what not to do):*
 - Lack of basic computer training within the plan.
 - Lack of hard and software regular technical support.
13. *Other information related to the best practice:*
 - Increase awareness on epidemiology at all level of veterinary services.
14. *Challenges faced:*
 - Lack of understanding the concept and value of epidemio-surveillance
15. *Challenges overcome:*
 - Consultative and brain storming sessions with partners and coordination meetings between central and local veterinary services

Description of Best Practices – Part 4

1. *Problem addressed*
 - Policy dialogue and information/knowledge sharing
2. *Population impacted by this problem:*
 - Policy decision makers
 - Various level of veterinary authority
 - Other partners
3. *Specific results achieved:*
 - A comprehensive HPAI compensation scheme designed,
 - Mass AI vaccination policy in the household poultry sector reconsidered,
 - Animal health component of the integrated national AHI plan revised to reflect the endemic HPAI situation in Egypt.
4. *Contribution to reducing H5N1 HPAI viral circulation:*
 - Longer term risk reduction strategy to address the endemic HPAI situation in Egypt.
5. *Specific strategies used:*
 - Engaging higher level political authorities to influence evidence-based decision-making

6. *Specific tools used:*

- Assessment study reports,
- Consultative workshops,
- Coordination meetings,
- Publications,
- Consultancy reports,
- Guidelines and SOPs.

7. *Specific policies needed:*

- AI vaccination policy with an operational plan and exit strategy,
- Equitable and all inclusive compensation policy
- A revised animal health strategy for control of HPAI.

8. *Specific information needed:*

- Data on AI vaccination coverage and flock immunity levels.
- Effectiveness of the strategy adopted in 2007

9. *Specific groups of people involved:*

- GOVS personnel
- FAO ECTAD staff and consultants

10. *Specific organizations/institutions/sectors involved:*

- GOVS, USAID and FAO

11. *Specific intersectoral linkages needed:*

- Collaboration between technical and political authorities, UN agencies, relevant international organizations, development partners, NGOs and private sector.

12. *Lessons learned on efforts that did not end up contributing to this best practice (i.e. what not to do):*

- Biases in decision-making due to conflict of interests

13. *Other information related to the best practice:*

- Developing elaborated SOPs, protocols and operational plans consistent with the revised HPAI control strategy.

14. *Challenges faced:*

- Inadequate policy enforcement capacity

15. *Challenges overcome:*

- Coordination between technical and political persons
- Coordination between central and local VS

5 Remaining Challenges to Decreasing H5N1 HPAI Infections in Poultry and Humans:

1. Multiple high risk factors favouring sustained circulation of A/H5N1 virus in both the commercial and household poultry production sectors
2. Most poultry farms operate in rental premises, hence reluctant to invest in biosecurity

improvement measures

3. Insufficient logistical capacity in the local VS remains a challenge for field veterinary operations.
4. The HPAI risks perception is weak among producers
5. Human settlement pattern in Egypt makes geographic distinction between administrative unit difficult

Egypt Best Practice # 3**NATIONWIDE COMPREHENSIVE
SURVEILLANCE AND RESPONSE****Sector: Human Health****Description of Best Practice:**

1. *Problem addressed:*
 - Avian influenza and the fear of the future human-human transmission
2. *Population impacted by this problem*
 - Every one deal with poultry
3. *Specific results achieved:*
 - In 2006, the proportion of detected cases in the first two days was from disease onset = 33.3% which increased in 2010 to 43.8%.
 - Suspected cases (11528), confirmed/suspected ~ 1/100
 - Decreased time elapsed to start field investigation, upon suspicion (within 24 hours)
 - Capacity to conduct many important field investigations at the same time.
 - Discovery of cases during field investigations.
4. *Contribution to reducing H5N1 HPAI viral circulation:*
 - early suspicion and isolation of exposed cases and receiving Tami flu on time -- decrease the virus shedding
 - prompt decontamination of households of confirmed human cases decrease the spread of the virus in environment
5. *Specific strategies used:*
 - Improving quality and surveillance capacity up to village level by: training local staff to conduct surveillance activities.
 - Expansion of surveillance network
 - Increase level of case suspicion by physicians and other health team.
 - Establishing of multilevel RRTs including all recommended qualifications: (TOT for central RRT, TOT for governmental RRT and training of district RRT)
6. *Specific tools used:*
 - Case definition (clinical symptoms and exposure) to suspect H5N1 HPAI;
 - Standard and Comprehensive investigation form to fulfill epidemiologic and clinical data;
 - Used targeted communication to raise awareness of signs and symptoms of H5N1 HPAI in humans for those who are in contact with poultry.
 - Prompt reporting within 24 hours. (Fax- telephone - etc.)
 - Regular update meetings, distributed guidelines, SOPs and instructions from central to peripheral levels (governmental, district, health care facilities).
 - Training materials on RRT roles and responsibilities
 - Clear guidelines, SOPs and instructions for implementing field activities
 - Assigning 29 RRTs on governmental level and 260 RRTs on district level including 1337

member staff

7. *Specific policies needed:*

- Increase sensitivity of case definition, the item of exposure to poultry -changed from exposure to dead poultry to the exposure to poultry.
- Increase sensitivity of the laboratory detection, re-testing of negative results.

8. *Specific information needed*

- Capacity and staffing of preventive departments at governorate and district levels
- Capacity and staffing of Hospitals PHCs involved in management of AI cases

9. *Specific groups of people involved:*

- Central preventive affairs staff,
- Epidemiologic surveillance team,
- Communicable disease department,
- Infection control department
- Central rapid response team (RRT),
- Central laboratories,
- Governorate and district level RRT
- Health services provider (Chest and fever hospital specialists, PHC staff, nurses) Sanitarians

10. *Specific organizations/institutions/sectors involved:*

- NGOs partnership, private sector involvement, veterinarians, police, Environment staff
- Community leaders and local authorities were essential.

11. *Specific intersectoral linkages needed:*

- Well established surveillance system within the preventive sector contributed to build linkages with other concerned sectors as curative sector, Lab and primary health care and environmental health

12. *Lessons learned on efforts that did not end up contributing to this best practice (i.e. what not to do):*

- During 2006 , 2007 testing was done for cases and contacts of human cases and poultry farms personnel, the policy changed in September 2007

13. Other information related to the best practice:

- Egypt was the highest reporting country for AI cases during 2009
- Egypt represent about 22 % from world human AI cases
- Egyptian profile of AI cases had a specific epidemiologic characteristics (increasing numbers of children and females and types of exposures like slaughtering and de-feathering)
- Active surveys targeted HH, markets, farms, check points as a joint integrated surveillance activity.

5 Remaining Challenges to Decreasing H5N1 HPAI Infections in Poultry and Humans:

1. No geographical borders between the Egyptian governorates that affect movement control

2. Egyptian culture regarding the consumption of fresh poultry meat and the practice of slaughtering the birds at home.
3. Over added pandemic H1N1 2009 increasing the burden on surveillance
4. Endemicity of the virus lead to system fatigue
5. Completing the planned – (readiness for pandemic)- equipments for referral hospitals

Egypt Best Practices # 4**IMPROVED REFERRAL, CLINICAL CARE MANAGEMENT AND
INFECTION CONTROL (IC)****Sector: Human Health****Description of the Best Practice:**

1. *Problem addressed:*
 - The high case fatality of the new emerged virus and minimal information about the clinical characteristics of the disease
2. *Population impacted by this problem:*
 - All suspected, probable, confirmed cases and their contacts
3. *Specific results achieved:*
 - Lowest Case Fatality Rate of human cases (30%) which is about half of Global H5N1 HPAI CFR (60%)
 - Establishing 57 ICUs during 2006.
 - From 31 mechanically ventilated AI cases, two cases recovered and one case under treatment.
 - From 45 cases admitted to ICU 17 cases recovered.
 - All hospitals were equipped with trained IC team, PPEs and disinfectants
4. *Contribution to reducing H5N1 HPAI viral circulation:*
 - Early suspicion and isolation of exposed cases and receiving Tami flu on time decrease the virus shedding
 - Infection control practices
5. *Specific strategies used:*
 - Develop cases management guidelines
 - Assigning hospitals for isolation per each governorate
 - Availability, stockpiling and distribution of antiviral medications which given on suspicion
 - Cases discharged after negative result.
 - Increasing capacity of ICU staff and infrastructures (eg ventilators , monitors , ABGs equipments .. etc)
 - Develop and distribute IC guidelines for isolation wards
 - Availability, stockpiling and distribution of PPEs, disinfects and Posters
 - Infection control guidelines and SOPs
 - Training, supervision and monitoring for hospitals
 - Assigning full time IC staff
 - Develop database for health care facilities (human resources and infrastructures)
6. *Specific tools used:*
 - Distribution of management guidelines to all hospitals deal with AI cases.
 - Algorithm for dealing with suspected cases.
 - Sample collection and testing of each suspected case.

7. *Specific policies needed:*

- Following well defined SOPs, instructions, case management guidelines (which is consistent with WHO guidelines)
- Strengthen supervision for health care providers.
- Stockpiling 5 million doses of Tami Flue from GOE budget to cover 6% of population.

8. *Specific information needed*

- Capacity and staffing of ICUs beds, Ventilators
- Capacity and staffing of IC teams

9. *Specific groups of people involved:*

- Physicians of Fever and Chest Hospitals
- Physicians of general hospitals which serve as referral centre for confirmed or severe clinical AI cases.
- Physicians of primary health care.
- Infection Control teams (physician , nurses , Laboratories and emergency staff)
- administrative management team

10. *Specific organizations/institutions/sectors involved:*

- Involvement of university hospital professors in consultations for protocol management of critical cases.
- Involvement of advisors and consultant from WHO, NAMRU 3
- political commitment at governorate level
- comprehensive communication campaign lead to Increase level of awareness for physician and patients

11. *Specific intersectoral linkages needed:*

- The preventive sector took the lead to integrate all activities related to cases inside the curative establishments in full coordination with central and sub national laboratories

12. *Lessons learned on efforts that did not end up contributing to this best practice (i.e. what not to do):*

- MOH use to give Tami flu for the confirmed cases until the throat swabs became –ve results, after consultation with WHO and CDC the management scheme changed to administer Tami flu for ten days

13. *Other information related to the best practice:*

- Average period of hospitalization 9 days

14. *Challenges faced:*

- Establishment and equipping (ICU) of referral hospital in each governorate
- Build up the capacity of high numbers of ICU care providers

15. *Challenges overcome:*

- The previous challenges were resolved

Egypt Best Practice # 5**COMMUNICATION AND SOCIAL MOBILIZATION****Sector: Human Health**Description of Best Practice

1. *Problem addressed:*
 - Lack of awareness of signs and symptoms (animal and human) and where/when to seek care
2. *Population impacted by this problem*
 - Primary: Sector 4, household breeders
 - Secondary: Sector 3, small farms
3. *Specific results achieved:*
 - 30 million home visits in 18 high-risk governorates by 13,000 female community educators thru 2009
 - Up to 6,700 seminars in villages yearly
 - More than 10 million posters/leaflets disseminated
 - 17 TV and radio spots broadcast, high frequency
4. *Contribution to reducing H5N1 HPAI viral circulation:*
 - Early identification of symptoms and seeking of medical and veterinary services
 - Enforcing and promoting proper breeding practices
5. *Specific strategies and tools used:* Multi-channel approach with audience segmentation
 - Mass media campaigns to general population:
 - TV and radio spots
 - Indoor & outdoor advertising (posters, leaflets, banners)
 - Hotline with standard answers to general public inquiries
 - Community village outreach:
 - Home visits by female community educators
 - Orientation of households to proper poultry handling
 - Seminars, contests at schools, universities, youth centers
 - Theatrical plays; road shows
6. *Specific Policies Needed*
 - To build up trust of community and domestic backyard owners toward government measures:
 - Release all information about poultry outbreaks and human cases to the public
 - Implement activities focused on household through comprehensive outreach program
7. *Specific information needed:*
 - Backyard breeders: Cultural/socioeconomic status/educational level
 - Farms: Number, distribution and bio-security levels
 - Live bird market data

- Monitoring of behavioral change re: AI prevention
8. *Specific groups of people involved:*
- Poultry backyard breeders
 - Small and large farm operators
 - Live bird market vendors
9. *Specific organizations/institutions/sectors involved:*
- Local authorities; community leaders
 - Red Crescent, other NGOs
 - International agencies
 - Ministries of Agriculture, Environment
10. *Specific intersectoral linkages needed:*
- Partnerships with NGOs
 - Private sector/poultry industry and farm owners
 - Community members and local government officials
11. *Lessons learned on efforts that did not end up contributing to this best practice (i.e., what not to do):*
- Focusing on backyard breeders when farms are the real source of the virus
12. *Other information related to the best practice:*
- Data needed:
 - Number of suspected cases
 - Time between onset of disease and diagnosis
 - Link between poultry death and appearance of symptoms
13. *Challenges faced:*
- Difficulty in staging Rapid Response Communication after avian cases to prevent human cases
 - Under-reporting and/or detection in the commercial sector
 - Clear evidence of H5N1 circulating in the commercial sector; but backyards are blamed
 - Bio-security measures needed in commercial sector
 - Poultry farm owners reluctant to report HPAI outbreaks due to imposed penalties and lack of compensation
 - Mass media campaigns need consistency in airing
 - Children & women vulnerable: need greater awareness
14. *Challenges overcome:*
- Raised awareness of symptoms.
 - Increased public willingness to seek medical help early.

Indonesia Best Practices

Country Summary

1. Total poultry population = 1.35 billion (est)¹

	2009 Production ¹	Percentage
Broiler	930,318,000	68.79%
Native	261,398,000	19.33%
Layer	110,106,000	8.14%
Duck	42,090,000	3.11%
Quail	6,945,900	0.51%
Pigeon	1,511,200	0.11%
Total	1,352,369,100	100.00%

2. Total human population = 231,830,000 (est)

H5N1 HPAI Description

	2003	2004	2005	2006	2007	2008	2009	2010
Confirmed H5N1 HPAI poultry outbreaks	60	166	159	611	2751	1802	2202	551
Confirmed H5N1 HPAI human cases	0	0	20	55	42	24	21	1

Total suspect H5N1 human cases (2003-	Total suspect H5N1 human cases referred	Total suspect H5N1 human cases tested	Total confirmed H5N1 human cases (2003-
---	---	---	--

2010)	(2003-2010)	(2003-2010)	2010)
2190	?	2190	163

Indonesia Best Practice # 1

HPAI INDONESIA, PART 1 – MARKET CHAIN TARGETED ENGAGEMENT TO REDUCE RISK ALONG THE POULTRY MARKET CHAIN SINCE 2008

Presenters:

- Dr Muhammad Azhar (CMU-DAH)
- Dr Eric Brum (FAO)

Sector: Animal Health

Description of the Best Practice:

1. *Problem addressed:*
 - Spread of HPAI virus to both poultry and humans via a vast, complex, and poorly regulated post-production poultry market chain
 - Limited understanding of H5N1 epidemiology within market systems
2. *Population impacted by this problem:*
 - Human: All, but primarily urban populations
 - Animal: All marketed poultry, especially those sent to urban markets
3. *Specific results achieved:*
 - Movement patterns and value chains elucidated
 - Market chain surveillance system established in greater Jakarta1 (Jabodetabek2)
 - Market restructuring in greater Jakarta accelerated
 - C&D activities increased in collector yards in greater Jakarta
 - C&D infrastructure improvement integrated with market restructuring in greater Jakarta
 - Greater Jakarta is the largest and highest risk urban market system in Indonesia
 - Jabodetabek = Jakarta province, BOgor district, DEpok city, and TAngerang and BEKasi district and city
4. *Contribution to reducing H5N1 HPAI viral circulation:*
 - Less HPAI virus spread between farms and less virus contamination in collector yards and markets
 - Improved knowledge of virus origin (geographic location of farms and bird type) to target disease control at source
 - Less HPAI virus entering urban home environment (decreased human cases in urban areas)
5. *Specific strategies used:*
 - Strengthening of local government livestock services to conduct surveillance and monitor C&D activities
 - C&D training and technical support to market traders and vendors
 - Strategic infrastructure improvements to facilitate C&D and reduce risk of virus spread from collection points
 - Technical and facilitation assistance to key government agencies responsible for market

restructuring

- Awareness-raising on value of 'safe, healthy, wholesome and halal poultry meat' (*daging ayam ASUH*) targeting vendors, traders, and consumers

6. *Specific tools used:*

- Environmental surveillance to detect virus by PCR in markets + collector yards
- Sentinel bird surveillance to detect HPAI in collector yards
- High-pressure washers
- Permanent C&D stations based in poultry collector yards
- USAID's leftover Virkon
- Lots of soap and water

7. *Specific policies needed:*

- PERDA no 4/2007: Jakarta provincial government order to eliminate sale of live poultry in markets by 2010
- 'Policy' to proactively engage with private sector (poultry market chain and producers)

8. *Specific information needed*

- Value chain analysis of poultry market chains
- Understanding of poultry movements and associated risks in the greater Jakarta market system

9. *Specific groups of people involved:*

- Poultry traders, slaughterers, market vendors, and brokers
- Civil servants from district and provincial livestock services
- Poultry meat consumers

10. *Specific organizations/institutions/sectors involved:*

- Poultry-related associations
- Market, livestock/veterinary, and public health services in district and provincial government

11. *Specific intersectoral linkages needed:*

- Coordination amongst public sector agencies for effective market restructuring (e.g. public health, police, livestock, internal affairs, etc)
- Coordination and cooperation between public and private sector stakeholders in market restructuring and C&D

12. *Lessons learned on efforts that did not end up contributing to this best practice (i.e. what not to do):*

- Hesitation to engage private sector in planning led to difficulties in implementing market restructuring
- Cost of market restructuring underestimated by both public and private sector
- Stakeholder awareness and public sector understanding of the need for market restructuring was (and still is) weak

13. *Other information related to the best practice:*

- Because poultry travels such long distances within a complex market chain, the location

where risk is produced (e.g. farm origin) and point where risk is observed (e.g. human case) are often not geographically related. Understanding poultry movements and origins are critical to identify high risk production areas and target control measures.

14. *Challenges faced:*

- Lack of cooperation amongst private sector stakeholders (e.g. small-scale vs industrial stakeholders)
- Private sector stakeholders skeptical of risks of HPAI and need for market restructuring
- Difficulty in making sense of Indonesia's poultry market 'chain'
- Low level of understanding of how H5N1 virus moves through market chain
- Limited C&D of poultry transport at poultry collection points

15. *Challenges overcome:*

- Limited success in all of the above, most success in #3-5

5 Remaining Challenges to Decreasing H5N1 HPAI Infections in Poultry and Humans:

1. Successfully completing Jakarta's poultry market restructuring program
2. Sustaining effective C&D activities at poultry collection points
3. Ensuring quality poultry products are consistently provided to urban markets
4. Uniting private sector stakeholders to improve the quality of Indonesia's poultry
5. Developing a sustainable market chain surveillance system

Indonesia Best Practice # 2

HPAI INDONESIA, PART 2 – OFFLU UNDERSTANDING THE VIRUS TO INFORM CONTROL STRATEGY AND MAKE A BETTER VACCINE SINCE 2007

Presenter:

- Dr Agus Wiyono (DAH)
- Dr James McGrane (FAO)

Sector: Animal Health

Description of the Best Practice:

1. *Problem addressed:*
 - Epidemiology of HPAI in Indonesia poorly understood
 - Lack of knowledge of genetic and antigenic characteristics of circulating field strains
 - Widespread use of older vaccines ineffective against circulating field strains
2. *Population impacted by this problem:*
 - All poultry production systems, including commercial poultry producers and small-holder farmers
 - Both human and animal populations are at risk; especially because use of ineffective vaccines and/or inappropriate delivery of vaccine can lead to higher levels of shedding from apparently healthy birds
3. *Specific results achieved:*
 - Cooperation among national and international laboratories for sequencing and antigenic cartography of virus samples
 - Increased sharing of biologic material and information between public and private sectors
 - Strengthened in-country capacity to conduct and validate results from antigenic cartography
 - Improved understanding of virus strains circulating in Indonesia, predominantly in village-based poultry
 - Development of a newly engineered low pathogenicity reverse genetics vaccine strain for Indonesia selected using antigenic cartography to select efficacious seed strains
4. *Contribution to reducing H5N1 HPAI viral circulation:*
 - Indonesian vaccine producers generating vaccines from more up-to-date and representative field strains, thereby leading to more effective vaccination (theoretically)
 - Farmers choosing vaccines produced with vaccine seed strains recommended by updated government policy
5. *Specific strategies used*
 - International avian influenza laboratory partnership (OFFLU) used to receive virus samples for sequencing and antigenic cartography as a service to the Ministry of Agriculture; *virus material ownership and intellectual property rights maintained by*

MOA

- OFFLU stakeholder forums to share information and plan next steps
 - Focus on capacity building in order to expedite transfer of technology and laboratory techniques to Indonesian laboratories
6. *Specific tools used:*
- Real-time RT-PCR
 - Gene sequencing
 - Novel virus typing techniques using high resolution hemagglutination inhibition (HI) tests
 - Characterization of antigenicity using antigenic cartography
7. *Specific policies needed:*
- Approved vaccine seed strains to be based on antigenic and genetic characteristics of field isolates
 - Cooperation with international laboratories for antigenic characterization of field isolates for the short term and transfer of this technology for sustainability and ongoing monitoring of HPAI field viruses and vaccine efficacy
 - Development of a reverse genetics vaccine for use in Indonesia
8. *Specific information needed*
- Current capacity of MOA animal health laboratories (Disease Investigation Centers), laboratories responsible for vaccine and reference reagent production, and national reference laboratories
 - Contributions from other projects involved with strengthening laboratory capacity
9. *Specific groups of people involved*
- Personnel from MOA animal health laboratories
 - Indonesian vaccine producers
 - International laboratory personnel specializing in antigenic cartography and vaccine development (e.g. Erasmus Medical Centre, Southeast Poultry Research Laboratory, and Indonesia Dutch Partnership)
10. *Specific organizations/institutions/sectors involved:*
- MOA Disease Investigation Centers (DIC), Indonesia
 - Australian Animal Health Laboratory (AAHL), Australia
 - Southeast Poultry Research Laboratory (SEPRL), USA
 - Erasmus Medical Centre, Netherlands
 - Pusvetma, BBPMSOH, and Bbalitvet
 - Private sector partners: Vaksindo, Medion, SanBio, Caprifarmindo
11. *Specific intersectoral linkages needed:*
- Development of effective public-private partnerships
 - Communication between DICs and among all national laboratories and central government
12. *Lessons learned on efforts that did not end up contributing to this best practice (i.e. what not to do):*
- Assistance should be provided based on specific requests from host laboratories, not

based solely on decisions from external agencies

- Too much reliance on international laboratory input and getting samples shipped outside Indonesia

13. *Challenges faced:*

- Lack of vaccine efficacious against some virus strains circulating in the field
- Lack of coordinated system of collecting field isolates, analyzing genetic and antigenic characteristics, and managing information
- Use of wide range of vaccine strains by poultry producers
- Difficult to update vaccination policies

14. *Challenges overcome:*

- Genetic and antigenic characterization of field isolates achieved
- New vaccines produced
- Improved cooperation and transparency

Remaining Challenges to Decreasing H5N1 HPAI Infections in Poultry and Humans:

1. Transfer of technology for antigenic cartographic capacity to Indonesian laboratories including reagent production
2. Production and distribution of novel reverse genetics vaccines by Indonesian vaccine producers
3. Reduction in the number of registered vaccines to represent only those that are effective against currently circulating field strains
4. Consensus for national strategy on vaccination including transition and exit strategies

Indonesia Best Practice # 3

CONTAINMENT AND RESPONSE OF INFLUENZA PANDEMIC EPICENTER

Presenter:

- Dr. Arie Bratasena (Head of ARI Sub-directorate Directorate of DTDC, DG of DC&EH, MoH of Indonesia)

Sector: Human Health

Description of the Best Practice

1. *Problem addressed:*
 - Preparedness for the emergence of an influenza pandemic cluster in some area in Indonesia through a field simulation
2. *Population impacted by this problem:*
 - Direct impact to the patients and family and all the community around the cluster area
 - Potentially all the Indonesian and global population as an Influenza Pandemic Epicenter is a global Public Health Emergency International Concern that could wide spread globally
3. *Specific results achieved:*
 - National Epicentre Containment Guidelines published
 - Tested in two major field simulations (Bali 2008, Makassar 2008)
 - Over 1000 participants in each simulation
 - Training module for provinces produced
4. *Contribution to reducing H5N1 HPAI viral circulation:*
 - Potential to stop the virus circulation through increasing the action plan of rapid response and surveillance teams, medical response, risk communication, public health action.
5. *Specific strategies used: Indonesian policy strategy are:*
 - prevention and containment in port of entry
 - procurement and mobilization of medicine and PPE
 - Strengthening and empowerment of hospital and PHC
 - Strengthening and implementation of epidemiologic surveillance
 - Strengthening and implementation of Laboratory
 - Risk Communication
 - Command and Coordination
 - Public Health measure
 - Business Continuity Plan
6. *Specific tools used:*
 - Containment of an Influenza Pandemic Epicenter" Guidelines, which cover the following: Surveillance, Logistics including medicine and PPE, Hospital, PHC and

laboratory equipment, communication tools for the officer and for mass communication

7. *Specific policies needed:*

- National Strategic Plan for AI control and Preparedness for Influenza Pandemic, 2006-2008
- PP No. 7 Year 2006 about National Committee on AI Control and Pandemic Influenza Preparedness
- Presidential Instruction No. 1 Year 2007 about handling and control of Avian Influenza
- August 2007, by National Committee on AI control and Pandemic Influenza: Government of Indonesia National Plan of Pandemic Influenza
- Other policy from MoH and other related government sector etc.

8. *Specific information needed*

- Update information: result from rapid response team, surveillance, laboratory, logistic, medical response, risk communication, command and coordination (IHR), etc

9. *Specific groups of people involved:*

- Involving all existing community group (example: Tagana, cadre, etc) and cooperation from all people, especially community in the containment area and around

10. *Specific organizations/institutions/sectors involved:*

- All organizations/institutions/sectors will be involved to help the containment such as: NGO, religion organization, KOMDA FBPI, APINDO, etc., because it would need huge amount of human resources and cooperation from all sectors

11. *Specific intersectoral linkages needed:*

- Need cooperation from health sector, animal health, security (police, army, etc), transportation, logistic, communication, commerce, industrial and labor

12. *Lessons learned on efforts that did not end up contributing to this best practice (i.e. what not to do):*

- Expensive to run full field simulation
- Motivation of participants can vary and need to be involved early

13. *Other information related to the best practice:*

- The best practice implementation in Indonesia is not only for H5N1 but also could be implemented for H1N1 and other type of influenza pandemic.

14. *Challenges faced:*

- Intersectoral coordination and communication
- Unskilled human resource
- Insufficiency of logistics, equipment support, vaccine, medicine, etc
- Inadequate health budget and health infrastructure
- low awareness of influenza pandemic in community and local government

15. *Challenges overcome:*

- training for the officer (surveillance, laboratory, health officer) in all level (PHC, district, province)

- procurement of the equipment needed are still on-going process (there are still some gaps)
- inter sectoral coordination meetings

Remaining Challenges to Decreasing H5N1 HPAI Infections in Poultry and Humans:

1. Critical gaps among area due to geography, demography, socioeconomic, cultural, and environmental
2. Inadequacy of health budget
3. Indonesia does have H5N1 cases and H1N1 cases, and therefore the possibility of emergence of a new subtype of influenza virus
4. Insufficiency of logistic, equipment support, vaccine, medicine
5. Inadequate of public health infrastructure

Indonesia Best Practice # 4

SOCIALIZATION OF AI AMONG PRIMARY HEALTH CARE WORKERS

Presenter:

- Dr. Rita Kusriastuti, MSc, Director of Vector Borne Disease Control

Sector: HUMAN HEALTH

Description of the Best Practice:

1. *Problem addressed:*
 - Lack of knowledge of AI diagnosis and case management
 - Lack of early detection & prompt treatment of AI among Primary Health Care (PHC) workers
2. *Population impacted by this problem:*
 - Population of Java, Sumatra, Bali and South Sulawesi (181 million)
3. *Specific results achieved:*
 - To provide primer healthcare (PHC) workers with technical and practical information to enable (a) Identification of suspected cases (b) Management of cases (c) Referral to AI hospitals (d) Response (e) Report to District Health Offices
The number of PHC workers trained by this program :
 - Riau provinces : 750 persons
 - West Java : 2800 persons
 - Central Java : 3180 persons
 - In Riau, proportion of suspect cases detected within two days of onset of fever increased from 50 % to 70 % after the intervention
4. *Contribution to reducing H5N1 HPAI viral circulation:*
 - Greater PHC Workers aware of prevention of the spread of AI and how to detect early and treat promptly
5. *Specific strategies used:* The step of Socialization:
 - Planning meeting
 - TOT for provincial facilitators
 - Roll out in districts (each provinces) by provinces facilitators
 - Monitoring and evaluation
6. *Specific tools used:*
 - Training module
 - Method of socialization: participative lectures, group discussion, case study
7. *Specific policies needed:*

- Provide resources (man, money, local policy, etc) in the central, province and district to replicate the program in another provinces
8. *Specific information needed*
- The number of Puskesmas (PHC) in district
 - The number of Private clinics in district.
 - The number of Hospitals (government and private)
 - The number of private clinician (doctors, midwives)
9. *Specific groups of people involved:*
- PHC workers : Puskesmas (PHC), private clinics,
 - private practitioners, private midwives, nurses, etc
10. *Specific organizations/institutions/sectors involved: Many institutions involved :*
- provincial health offices and district health offices
 - Avian influenza referral hospitals
 - University/Academy
 - District Hospitals
11. *Specific intersectoral linkages needed:*
- Ministry of Agriculture
12. *Lessons learned on efforts that did not end up contributing to this best practice (i.e. what not to do):*
- Need more references and resource person with different competency
 - Need more time for discussion especially for case studies
 - Need more time to do the reporting of the activity
13. *Other information related to the best practice:*
- On evaluation : case detection and case management of AI among PHC workers (government and private) were improved
14. *Challenges faced:*
- It was not easy to involve private clinics and practitioners for a long one day socialization
 - Expensive, and replication of this model to other provinces will need to be supported by WHO, National Budget, or another donor agencies
15. *Challenges overcome:*
- Large number of PHC Workers trained
 - Many PHC workers from private hospitals/clinics/clinicians were involved
 - The method of socialization was good (participants were satisfied)

5 Remaining Challenges to Decreasing H5N1 HPAI Infections in Poultry and Humans:

1. Better Coordination
2. Better Data sharing
3. Integrated laboratory surveillance (human and animal sectors)
4. Enzootic HPAI, and poultry industry restructuring
5. Geographical factors (large country, many islands)

Indonesia Best Practice # 5

HPAI INDONESIA, PART 1 – PDSR AND LDCC

STRENGTHENING LOCAL GOVERNMENT VETERINARY SERVICES, EMPOWERING COMMUNITIES, AND COORDINATING NATIONALLY SINCE 2006

Presenters:

- Dr Ade Lubis Sjachrena (CMU-DAH)
- Dr Eric Brum (FAO)

Sector: Animal Health

Description of the Best Practice:

1. *Problem addressed:*
 - Weakened veterinary services throughout the country following decentralization
 - a) Human and financial resources¹
 - b) Technical authority and capability¹
 - c) Interaction with stakeholders¹
 - d) Access to markets¹
 - Budgeting for HPAI field activities left to autonomous district governments
 - Lack of early reporting, detection, and response to outbreaks
2. *Population impacted by this problem:*
 - Nationwide
3. *Specific results achieved:*
 - 2,253 government personnel trained in PDSR competencies
 - 33 Local Disease Control Centers (LDCC) established across 29 provinces, over 220,000 surveillance and investigation reports received
 - 8,620 detections of HPAI poultry outbreaks since 2006
 - Over 5.6 million community members directly engaged in PDSR activities
 - Major improvement in passive surveillance across all HPAI-endemic areas
 - Rapid outbreak control followed HPAI detection (< 1 day from detection to response)
 - Human health services/District Surveillance Officer (DSO) routinely notified of HPAI poultry outbreaks by PDSR
 - SMS gateway established for immediate reporting of HPAI poultry outbreaks
4. *Problem addressed:*
 - Weakened veterinary services throughout the country following decentralization
 - a) Human and financial resources¹
 - b) Technical authority and capability¹
 - c) Interaction with stakeholders¹
 - d) Access to markets¹
 - Budgeting for HPAI field activities left to autonomous district governments

- Lack of early reporting, detection, and response to outbreaks
5. *Population impacted by this problem:*
- Nationwide
6. *Specific results achieved:*
- 2,253 government personnel trained in PDSR competencies
 - 33 Local Disease Control Centers (LDCC) established across 29 provinces, over 220,000 surveillance and investigation reports received
 - 8,620 detections of HPAI poultry outbreaks since 2006
 - Over 5.6 million community members directly engaged in PDSR activities
 - Major improvement in passive surveillance across all HPAI-endemic areas
 - Rapid outbreak control followed HPAI detection (< 1 day from detection to response)
 - Human health services/District Surveillance Officer (DSO) routinely notified of HPAI poultry outbreaks by PDSR
 - SMS gateway established for immediate reporting of HPAI poultry outbreaks
7. *Contribution to reducing H5N1 HPAI viral circulation:*
- With increases in outbreaks as an immediate positive impact of PDSR (due to weak reporting previously), apparent reductions in HPAI incidence have been observed in provinces with less commercial production (e.g. Bali, East Java, Kalimantan, South Sulawesi), although reduction is difficult to sustain likely due to ongoing live poultry movements from other provinces.
8. *Specific strategies used:*
- Use participatory methods to train local government veterinary and livestock services in essential detection, outbreak response, and prevention competencies for HPAI in backyard poultry – Participatory Disease Surveillance and Response (PDSR)
 - Support use of participatory techniques to build confidence of local government services to engage and respond to the needs of constituent communities, and thereby building trust with communities for better reporting of suspected cases (passive surveillance)
 - Coordinate activities, manage data entry, and provide financial assistance for subsequent field activities via province-based Local Disease Control Centers (LDCCs)
 - Utilize PDSR investigations to assign “village HPAI infection status” in order to better track disease and monitor progress
9. *Specific tools used:*
- Influenza A rapid tests to enable immediate field diagnosis and outbreak control
 - Participatory engagement tools adapted for HPAI in villages in Indonesia
 - Integrated database developed to include PDSR disease surveillance, M&E of activities, and essential administrative functions
10. *Specific policies needed*
- Field diagnosis of HPAI on basis of compatible clinical signs (case definition) and positive influenza A rapid test, without laboratory confirmation

- Ending the policy of 1km culling following HPAI detection in backyard poultry with transition to focal culling of infected flocks only
 - Decreased use of “reactionary” vaccination, including ring vaccination following outbreaks
 - Presidential Instruction No.1 of 2007 on control of HPAI to all Governors and Ministers involved in HPAI control
 - Law No.18/2009 on Animal Health and associated animal health regulations
Amendment to law of local autonomy (Law no. 38/2007)
DGLS Decree on Task Force for National Veterinary Service and integration of PDSR in national animal health system
11. *Specific information needed*
- provincial human population, number of districts and villages
 - poultry population, especially backyard vs commercial poultry
 - relative HPAI risk of backyard vs commercial poultry
 - structure of veterinary services and number of veterinarians in local government
 - movement patterns of poultry in province
 - previous stakeholder experience with HPAI compatible events (especially ND)
12. *Specific groups of people involved:*
- Veterinarians and other civil servants in district and provincial governments
 - Community members rearing backyard poultry and community volunteers
 - Poultry farmers and traders
 - Village leaders
 - Human health officers in district and provincial government
13. *Specific organizations/institutions/sectors involved:*
- District and provincial animal health and livestock services
 - Dedicated HPAI team (Campaign Management Unit) in the Directorate of Animal Health in the MOA
 - District and provincial government human health services
 - Disaster management and prevention section of the Ministry of Internal Affairs
 - Multilateral technical organizations (e.g. UN) and donor organizations
 - NGOs: e.g. Muhammadiyah and Indonesian Red Cross
 - Academic institutions
14. *Specific intersectoral linkages needed:*
- Link with local government human health services to follow-up on detection of HPAI poultry outbreaks and suspect human cases
 - Support from Ministry of Internal Affairs to help mobilize local government financial and political resources
15. *Lessons learned on efforts that did not end up contributing to this best practice (i.e. what not to do):*
- Mistake to focus only on backyard poultry; engagement with all sectors, commercial producers and marketing system is essential

- Initial use of ring and mass vaccination of backyard poultry inappropriate and not feasible- early focus on H5N1 limited veterinary services ability to be responsive to other needs of constituent communities; broad strengthening veterinary services is fundamental to sustainable HPAI control!
- Limited involvement of district and provincial government heads of livestock services with PDSR and LDCC activities management has slowed integration of HPAI control activities
- The village, not the household, is the more appropriate epidemiological unit for control of HPAI in backyard poultry
- Controlling HPAI is very difficult without an effective compensation system for affected farmers
- Backyard poultry production should not be seen as a 'problem' that needs to be fixed, but rather as an opportunity to improve community nutrition and health
- Large-scale operational research programme did not meet intended goal

16. *Other information related to the best practice:*

- Very useful to enable field diagnosis via rapid test when laboratory diagnosis is unreliable
- Operational support for using trained skills in the field is essential for trainees to build competencies

17. Challenges faced:

1. Weakened and decentralized veterinary service.
2. Coordinating hundreds of autonomous district governments
3. Affected communities with previous poor experiences related to animal disease control (e.g. ND)
4. Centralized technical decision-making by major donor and technical disagreements between donor and multilateral technical agency
5. Limited government funding for HPAI control activities in the field
6. HPAI circulating through all poultry production and marketing systems across a large and fragmented geographic area

18. *Challenges overcome:*

- #1-4 have been largely overcome.
- #5 has improved, but is still a major challenge.
- #6 remains a fundamental challenge.

5 Remaining Challenges to Decreasing H5N1 HPAI Infections in Poultry and Humans:

1. Adequate technical support not yet provided to ALL stakeholders (e.g. farmers, traders, government) affected by HPAI in Indonesia
2. Lack of trust between government veterinary services and commercial poultry producers
3. Major integrated poultry companies directly and indirectly supporting poultry production practices that are profitable in the short-term, but reduce poultry production quality in the long-term
4. Weak control of poultry movements, especially inter-island and inter-provincial
5. Short funding cycles inhibiting long-term planning for sustainability and timely delivery of activities

Vietnam Best Practices

Country Summary:

1. Total poultry population = 280 million heads (2009)
 - by bird type: 71.4 % chickens, 25.9% ducks, 2.7% other
 - by farm type: in chicken production 30.2% sector 1 and % sector 2; 69.8% sector 3 and % sector 4, whilst in ducks production 92.9% is small scale and industrial rearing system accounts for 7.1%.
 - by function (2006): 12.4 % broiler, 940 million industrial-produced eggs (38.8 %)

2. Total human population = 86 million

H5N1 HPAI Description

	2003	2004	2005	2006	2007	2008	2009	2010
Confirmed H5N1 HPAI poultry outbreaks	----	2587 (Estimate)	1970 (Estimate)	52	269	79	53	----
Confirmed H5N1 HPAI human cases	3 (3)	29(20)	61(19)	0 (0)	8 (5)	6 (5)	5 (5)	5 (2)

Total suspect H5N1 human cases (2003-2010)	Total suspect H5N1 human cases referred (2003-2010)	Total suspect H5N1 human cases tested (2003-2010)	Total confirmed H5N1 human cases (2003-2010)

Vietnam Best Practice #1

ADDRESSING THE PREVENTION AND CONTROL OF INFLUENZA A (H5N1) IN HUMANS THROUGH STRENGTHENING THE HEALTH SYSTEM

Presenter:

- Prof. Dr. Nguyen Huy Nga, Director, General Department of Preventive Medicine and Environmental Health (GDPMEH), Vietnam Ministry of Health

Sector: Human Health

Description of the Best Practice:

1. *Problem addressed:*
 - Need to strengthen the health system
2. *Population impacted by this problem:*
 - Directly: Health care workers in preventive medicine and curative sectors
 - Indirectly: General public
3. *Specific results achieved:*
 - Capacity to detect, refer, receive, isolate and treat persons with H5N1 improved.
 - Regular information sharing among key sectors.
 - High level of political commitment to prevent and control H5N1.
4. *Contribution to reducing H5N1 HPAI viral circulation:*
 - The likelihood of human-to-human infection of H5N1 is decreased because of proper case management.
5. *Specific strategies used:*
 - Promoted leadership and coordination at all levels of government and in different sectors.
 - Established and supported for rapid response teams at the central, regional and provincial levels.
 - Promoting infection control and Strengthening of communicable disease reporting.
 - Conduct trainings based upon newly developed / revised guidelines.
 - Procured/obtained pharmaceuticals, supplies and equipment, including antivirals, essential materials, disinfectants, ventilators, ambulances, and laboratory equipment.
 - Provided free hospital care for confirmed H5N1 cases.
 - Launched of environmental sanitation and hygiene campaign.
 - Promoted of food safety-related efforts.
6. *Specific tools used:*
 - Distributed IEC to the public on a large scale by using mass media channels, including television, radio, newspaper, and posters

7. *Specific policies needed:*
 - An overarching framework to establish national strategy and coordination mechanisms.
 - Politburo directives on implementing emergency measures, to mobilize resources from whole society, to contain H5N1 virus in poultry and human populations.
 - Guidelines for provincial health departments.

8. *Specific information needed*
 - Recommended actions to prevent outbreaks and to respond to outbreaks, including how to test preparedness through exercises.

9. *Specific groups of people involved:*
 - Leaders from all levels of the political system.
 - Health care staff.
 - Other related sectors, mass media organizations...

10. *Specific organizations/institutions/sectors involved:*
 - Ministry of Health (GDPMEH, Department of Medical Services Admin).
 - Regional Institutes and provincial preventive medicine centers.
 - Health care facilities from central to grassroots levels.
 - Ministry of Agriculture & Rural Development (MARD).
 - Other related sectors (Ministry of Education & Training, Ministry of Foreign Affairs...).
 - Mass organizations to promote prompt outbreak reporting and early case detection

11. *Specific intersectoral linkages needed:*
 - Central and field level collaboration and coordination between MARD, MOH, other ministries and mass organizations in reporting and responding to outbreaks.

12. *Lessons learned on efforts that did not end up contributing to this best practice (i.e. what not to do):*
 - The same communication channels do not work equally effectively for all target groups.
 - Awareness-raising does not always translate into sustained changes in behaviour.
 - Community-based surveillance systems have to be practical and feasible.

13. *Other information related to the best practice:*
 - Efforts built upon prior experiences preventing and controlling infectious diseases of pandemic potential, for example, SARS.
 - Success was facilitated by sharing information with and mobilizing support from international partners.
 - Efforts also expanded capacity for dealing with future outbreaks of other emerging diseases.

14. *Challenges faced:*
 - Lack of full knowledge about influenza transmission and host susceptibility, prevention, and treatment
 - Limited capacity and resources for surveillance, investigation, and response.

- Gaps in surveillance and delays in laboratory testing led to inadequate and/or inaccurate information for decision making.
- Public fatigue in applying recommendations to protect poultry and to prevent human infections.

15. *Challenges overcome:*

- Poor knowledge of health staff on disease spectrum, treatment, and prevention.
- Limited awareness of the public
- Improved capacity for prevention, detection and control.

5 Remaining Challenges to Decreasing H5N1 HPAI Infections in Poultry and Humans:

1. Controlling and/or eliminating H5N1 given the large number of backyard flocks and inability to limit poultry movement, especially across borders.
2. Continuing to enhance linkages between the animal health and human health sectors to implement prevention and control strategies.
3. Strengthening behaviour change communication, particularly when the overall risk of infection is low and poultry can be infected with few or no symptoms
4. Obtaining more detailed information about specific high-risk behaviours associated with human infection
5. Encouraging ill people who may have avian influenza to seek earlier medical attention.

Vietnam Best Practice # 2

IMPROVING AHI AWARENESS AND PRACTICES THROUGH COMMUNICATION EFFORTS

Sector: Human and Animal Health

Description of the Best Practice:

1. *Problem addressed:*
 - Need to improve awareness and practices on AHI prevention and control
2. *Population impacted by this problem:*
 - General public including poultry farmers, supply chain actors and animal and human health workers, political and government officials and children, ethnic minorities and migrants
3. *Specific results achieved:*
 - Increased awareness of AHI and transmission through contact with infected poultry
 - Increase in selected prevention measures:
 - a) Increase in vaccination of poultry (chickens and ducks)
 - b) increased compliance to government prevention and control policies
 - movement control during outbreaks
 - reporting sick and dead poultry to authorities
 - regular farm cleaning and disinfection during outbreaks
 - c) Improved preventive practices
 - washing hands before and after contact with poultry
 - restricting entry to farm
 - d) Improved communication skills among animal and human health workers
 - e) Integration of AHI in school curriculum
4. *Contribution to reducing H5N1 HPAI viral circulation:*
 - Reduction of virus entry into farm and transmission to humans
5. *Specific strategies used:*
 - Training of animal and human health workers on AHI communication

- Mass media campaigns
 - Social mobilization through multi-sectoral campaigns
 - Interpersonal communication at village level
 - Distribution of IEC materials to various audiences
 - Entertainment education
6. *Specific tools used:*
- Training modules using participatory approaches
 - TV, radio, commune loudspeakers
 - Trained volunteers, community networks, mass organizations (Women's Union, Farmers Union, Youth Union)
 - Group discussions, community meetings, household visits
 - Posters, leaflets, flyers, booklets, billboards, promotional materials
 - AI plays, skits, songs, poetry competitions, market events, roadshows
7. *Specific policies needed:*
- Mass vaccination policy
 - Culling and compensation policy
 - Poultry movement control during outbreaks
 - National Strategic Framework for AHJ Communication
 - Coordination mechanisms from National, Provincial, District and Commune levels (e.g. AI Committees)
8. *Specific information needed*
- KAP of various audiences
 - Effective channels of information
 - Evidence to support recommended behaviors
9. *Specific groups of people involved:*
- Animal and human health workers, poultry farmers, teachers, women, school children, government officials at all levels, supply chain actors
10. *Specific organizations/institutions/sectors involved:*
- National : National AHJ Steering Committees, MARD, MOH, MOET, mass organizations, poultry associations, local NGOs, local research and communication agencies, private sector
 - International Organizations : UN agencies (FAO, UNDP, Unicef, WHO), INGOs, and others
 - Donors : Multi-lateral and bi-lateral donors (eg. development banks and foreign governments)
11. *Specific intersectoral linkages needed:*
- Coordination mechanisms at all levels

12. *Lessons learned on efforts that did not end up contributing to this best practice (i.e. what not to do):*

- Coordination mechanisms at all levels
- Promoted behaviors can only succeed if policy is enforced (e.g. reporting and compensation policy)
- Not all communication channels equally effective (mass media effective for raising awareness but not sustained behavior change- need for multi-channel approach)

13. Other information related to the best practice:

- Interpersonal communication is effective in producing behavior change but resource-intensive especially when scaled up
- There is a need to focus on a few key consistent messages
- It is important to monitor progress to gather feedback for further improvements

14. *Challenges faced:*

- Implementing national campaigns with diverse population groups in a large country
- Existence of multiple partners, multiple target groups, and multiple messages for promoting behaviors
- Low risk perception (i.e., people know that AHI are very serious diseases but feel that AHI are unlikely to affect them or their poultry)

15. *Challenges overcome:*

- Established IEC Working Group; tailored messages and channels to various target group
- Developed National Strategic Framework for AHI Communications that prescribed priority behaviors to promote
- Use other "entry points" e.g. personal and economic benefits to encourage practicing recommended behaviors

5 Remaining Challenges to Decreasing H5N1 HPAI Infections in Poultry and Humans:

1. Low risk perception (people know AHI very serious but feel AHI will not likely affect them or their poultry)
2. Competing priorities (e.g. FMD, fowl cholera, dengue)
3. Limited appreciation of benefits of communication leading to limited allocation of resources
4. Misperception that vaccination provides complete immunity against influenza; therefore, people tend to not practice other preventive behaviors
5. Increased awareness does not lead to (sustained) behavior change

Vietnam Best Practice #3

STRONG GOVERNMENT COMMITMENT

Sector: Animal Health

Description of the Best Practice:

1. *Problem addressed*
 - The wide spread nature of the HPAI H5N1 epidemic required a concerted effort
 - Effective disease control needed good coordination
2. *Population impacted by this problem:*
 - General public
 - Poultry farmers.
3. *Specific results achieved:*
 - Transparency in disease reporting, virus sharing
 - Efficient mobilisation of resources both from national and international sources (technical expertise: FAO, OIE; financial: USAID, WB, donors, etc.)
 - Integration of animal and human health in a joint strategy: Green Book.
4. *Contribution to reducing H5N1 HPAI viral circulation:*
 - Enhanced disease reporting
 - Supported local level rapid outbreak containment
 - Implemented vaccination policy (beginning late 2005).
5. *Specific strategies used:*
 - Legal framework for HPAI control: Regulations on HPAI control and prevention
 - Participation of political systems from Central to grass-root level
 - Enforcement of disease control measures: culling, LBM closure, ban of waterfowl hatching, etc.
 - Vietnam Integrated National Operational Program for Avian and Human Influenza (2006-2010) (OPI, aka Green Book)
 - Vaccination program
6. *Specific tools used:*
 - Chain of command through NSCAI and central level and its mirrors at local levels
 - National Preparedness Plan (Sept 05)
 - Media, website
 - Working groups.
7. *Specific policies needed:*
 - Disease reporting policy
 - Provision of free diagnosis services

- Compensation policy
 - Mechanism on utilisation of social/public organisations in HPAI outbreak response
8. *Specific information needed*
- Emergency funding mechanism
 - Availability of human resources
 - Engagement by community.
9. *Specific groups of people involved:*
- Central and local authorities
 - Other stakeholders: farmers, veterinary practitioners, etc.
 - International organizations
 - Donors
10. *Specific organizations/institutions/sectors involved:*
- National: Politburo, Government Office, MARD, MoH, and Other relevant ministries
 - International organisations: UN agencies (FAO, UNDP, UNICEF, WHO), INGOs etc.
 - Donors: WB, EU, USAID, etc.
11. *Specific intersectoral linkages needed:*
- MARD - MoH – MoF
12. *Lessons learned on efforts that did not end up contributing to this best practice (i.e. what not to do):*
- Low rate of actual donors' financial contribution vs. commitment needed
 - 'Response' vs. 'Preparedness'.
13. Other information related to the best practice:
- NSCAI is moving toward a steering committee for emerging infectious diseases (mostly zoonosis), thus, putting the concept of OWOH into reality
14. *Challenges faced:*
- Growing demand for meat → more dense poultry production
 - Small household poultry production (poor biosecurity) system dominant
 - Veterinary services capacity not ready for dealing with such a big problem
 - Big load of HPAI H5N1 virus circulation
15. *Challenges overcome:*
- Veterinary services strengthened: laboratory system, surveillance, outbreak response
 - Reduction of viral load via vaccination.

5 Remaining Challenges to Decreasing H5N1 HPAI Infections in Poultry and Humans:

1. Slow progress of poultry restructuring.
2. Hard to sustain high level of commitment over time, especially once the disease has been reduced to a certain level of prevalence.

3. Donor 'fatigue'; no funds secured for HPAI after 2010.
4. Compensation policy not up-to-date.
5. Decreasing awareness [or Complacency] of poultry farmers.

Vietnam Best Practice #4

VACCINATION AS AN ADDITIONAL CONTROL MEASURE FOR HPAI H5N1 IN POULTRY

Sector: Animal Health

Description of the Best Practice:

1. *Problem addressed*
 - In 2005, Vietnam faced a public health crisis. The number of human cases of influenza A (H5N1) was increasing, such that Vietnam became the country with the most reported human cases
 - Existing control measures had not prevented an increase in human cases... and a decision had to be made whether vaccination of poultry had a role to play.
2. *Population impacted by this problem:*
 - Humans
 - Poultry
3. *Specific results achieved:*
 - The ultimate goal of the Vietnamese program against H5N1 HPAI remains the sustained country-wide elimination of the virus
 - Decreased human cases
4. *Contribution to reducing H5N1 HPAI viral circulation*
 - Number of outbreaks reduced significantly
 - Active surveillance activities informed interventions to decrease circulation of virus.
5. *Specific strategies used*
 - Studies of vaccine usage in other parts of the world
 - Selection of vaccines to be used in Viet Nam; Government control of vaccines import and delivery
 - Vaccination subsidized by Central and local governments
 - Mass vaccination for the first phase, then moved to risk-based vaccination
 - Since 2009, a targeted vaccination strategy has been trialed as the GETS project in five provinces.
6. *Specific tools used:*
 - Campaign approach: two rounds per year; Cold-chain system set-up
 - Procurement, distribution and vaccination is totally within the control of the Government and it is using only one particular vaccine throughout the country
 - Vaccine trials and effectiveness monitoring; Tested vaccines regularly against circulating strains to ensure that the vaccines remain effective
 - Post-vaccination monitoring and virus circulation surveillance

7. *Specific policies needed:*

- National vaccination program against HPAI (Phase 1: 2005-06; Phase 2: 2007-08; Phase 3: 2009-10)
- Mechanism on utilisation of social/public organisations in HPAI vaccination.

8. *Specific information needed*

- Chain of command; Availability of human resources
- Accurate poultry population figures were required to determine coverage success and to estimate vaccine inventory requirements
- Knowledge of the antigenic and genetic make-up of the circulating HPAI virus to ensure adequate matching of the vaccine virus.

9. *Specific groups of people involved*

- Poultry industry, veterinary authorities including animal health workers, research and laboratory institutions and public health authorities
- Central and local authorities
- Other stakeholders: farmers, veterinary practitioners, etc.
- International organizations
- Donors

10. *Specific organizations/institutions/sectors involved:*

- National: Politburo, Government Office, MARD, MoH, and other relevant ministries
- International organisations: UN agencies (FAO, UNDP, UNICEF, WHO), INGOs etc.
- Donors: WB, EU, USAID, etc.

11. *Specific intersectoral linkages needed:*

- MARD – MoH – MoF

12. *Lessons learned on efforts that did not end up contributing to this best practice (i.e. what not to do):*

- Vaccinating migratory or grazing ducks was a challenge, which still remains
- Government-sponsored routine vaccination requires long-term financial and other resource planning; an exit or transition strategy is needed

13. Other information related to the best practice:

- Vaccination will remain an important part of the control and preventive program
- Modify vaccination programs: The USAID-supported 'GETS' program is looking at ways to move away from the current vaccination strategy

14. *Challenges faced:*

- The need for better vaccines: Current vaccines require the injection of two doses to every bird in a flock and, although effective in reducing the risk of infection and disease, administration is very labour intensive
- Data management for vaccination
- The problems of surveillance and disease reporting
- Deaths and production loss in vaccinated poultry

- Lack of Private Sector involvement

15. *Challenges overcome:*

- Getting the information to change the system.

5 Remaining Challenges to Decreasing H5N1 HPAI Infections in Poultry and Humans:

1. Slow progress of poultry restructuring
2. Hard to sustain high level of commitment over time, especially once the disease has decreased to a certain level of prevalence.
3. Donor 'fatigue'; no funds secured for HPAI after 2010.
4. Compensation policy not up-to-date.
5. Decreasing awareness [or Complacency?] of poultry farmers.

Vietnam Best Practice #5

DISEASE SURVEILLANCE AND OUTBREAK RESPONSE FOR HPAI H5N1 IN POULTRY

Sector: Animal Health

Description of the Best Practice:

1. *Problem addressed*
 - Wide spread nature of the disease.
 - Weak veterinary services, e.g. surveillance systems, especially community-based surveillance (CBS).
2. *Population impacted by this problem:*
 - Poultry farmers
3. *Specific results achieved*
 - Early detection system established; time lag for disease reporting reduced from 4 to 2.5 days
 - Diagnosis capacity and capability improved: now have 9 labs capable of diagnosing AI; lab confirmation available within 24h from the receipt of samples
 - Effective outbreak response
 - CBS models piloted
4. *Contribution to reducing H5N1 HPAI viral circulation:*
 - Number of outbreaks reduced significantly
 - Active surveillance activities informed interventions to decrease circulation of virus.
5. *Specific strategies used:*
 - Considerable investment in public education and in training of commune-based animal health workers to increase the likelihood of reporting of disease in poultry
 - Passive surveillance to complement active surveillance
 - Implementation of active surveillance programs (actively searching for cases of clinical disease, testing of apparently healthy animals in high risk places (large live poultry markets)
 - Enhance the Lab capacity
 - Support for the national telephone hotline and television spots for reporting suspicion of disease.
6. *Specific tools used:*
 - Rapid diagnostic tests for detection of virus, using real time RT-PCR
 - Reporting system: TADinfo, LabNet;
 - CBS models
 - SMS pilot.

7. *Specific policies needed:*

- Culling of poultry: Poultry culled in an area of approximately 3 km around affected farms. From late 2004, only the infected premises or poultry in the same village are culled. Culled animals are usually burned and buried following international guidelines.
- Movement controls: Movement restrictions imposed for 21 days. Also imposed on poultry flocks routinely going to market.
- Suspension of trading: Trade at live poultry markets within 5 km of the site of an outbreak is suspended
- Compensation: Used to support campaigns on culling and reporting
- Cleaning and disinfection: All infected premises after disposal of Infected poultry.

8. *Specific information needed*

- Chain of command
- Availability of human resources

9. *Specific groups of people involved:*

- Central and local authorities
- Other stakeholders: farmers, veterinary practitioners, traders, etc.
- International organizations
- Donors

10. *Specific organizations/institutions/sectors involved:*

- National: Politburo, Government Office, MARD, MoH, and other relevant ministries
- International organisations: UN agencies (FAO, UNDP, UNICEF, WHO), INGOs etc.
- Donors: World Bank, European Union, USAID, etc.

11. *Specific intersectoral linkages needed:*

- MARD - MoH – MoF

12. *Lessons learned on efforts that did not end up contributing to this best practice (i.e. what not to do):*

- Over-reliance on passive surveillance invariably led to delayed reporting. Active risk-based surveillance in target areas is more appropriate
- All negative cases of poultry mortality were not thoroughly investigated. Testing using RRT-PCR does not distinguish between natural infection and vaccine immune response.

13. Other information related to the best practice:

- n/a

14. *Challenges faced:*

- Weak veterinary system, especially field veterinary services
- Passive surveillance alone does not result in detection of all cases of infection with H5N1 viruses or other infectious agents

- Testing is difficult to do with thousands of mobile duck flocks and the cost of testing all flocks on a regular basis for infection is prohibitively expensive. Testing is also complicated by vaccination.

15. *Challenges overcome:*

- Training for animal health workers
- AVET (Applied Veterinary Epidemiology Training) program
- Training for field staffs on outbreak investigations and response.

5 Remaining Challenges to Decreasing H5N1 HPAI Infections in Poultry and Humans:

1. Slow progress of poultry restructuring.
2. Hard to sustain high level of commitment over time, especially once the disease has decreased to a certain level of prevalence.
3. Donor 'fatigue'; no funds secured for HPAI after 2010.
4. Compensation policy not up-to-date.
5. Decreasing awareness [or Complacency?] of poultry farmers.

H5N1 HPAI Summary

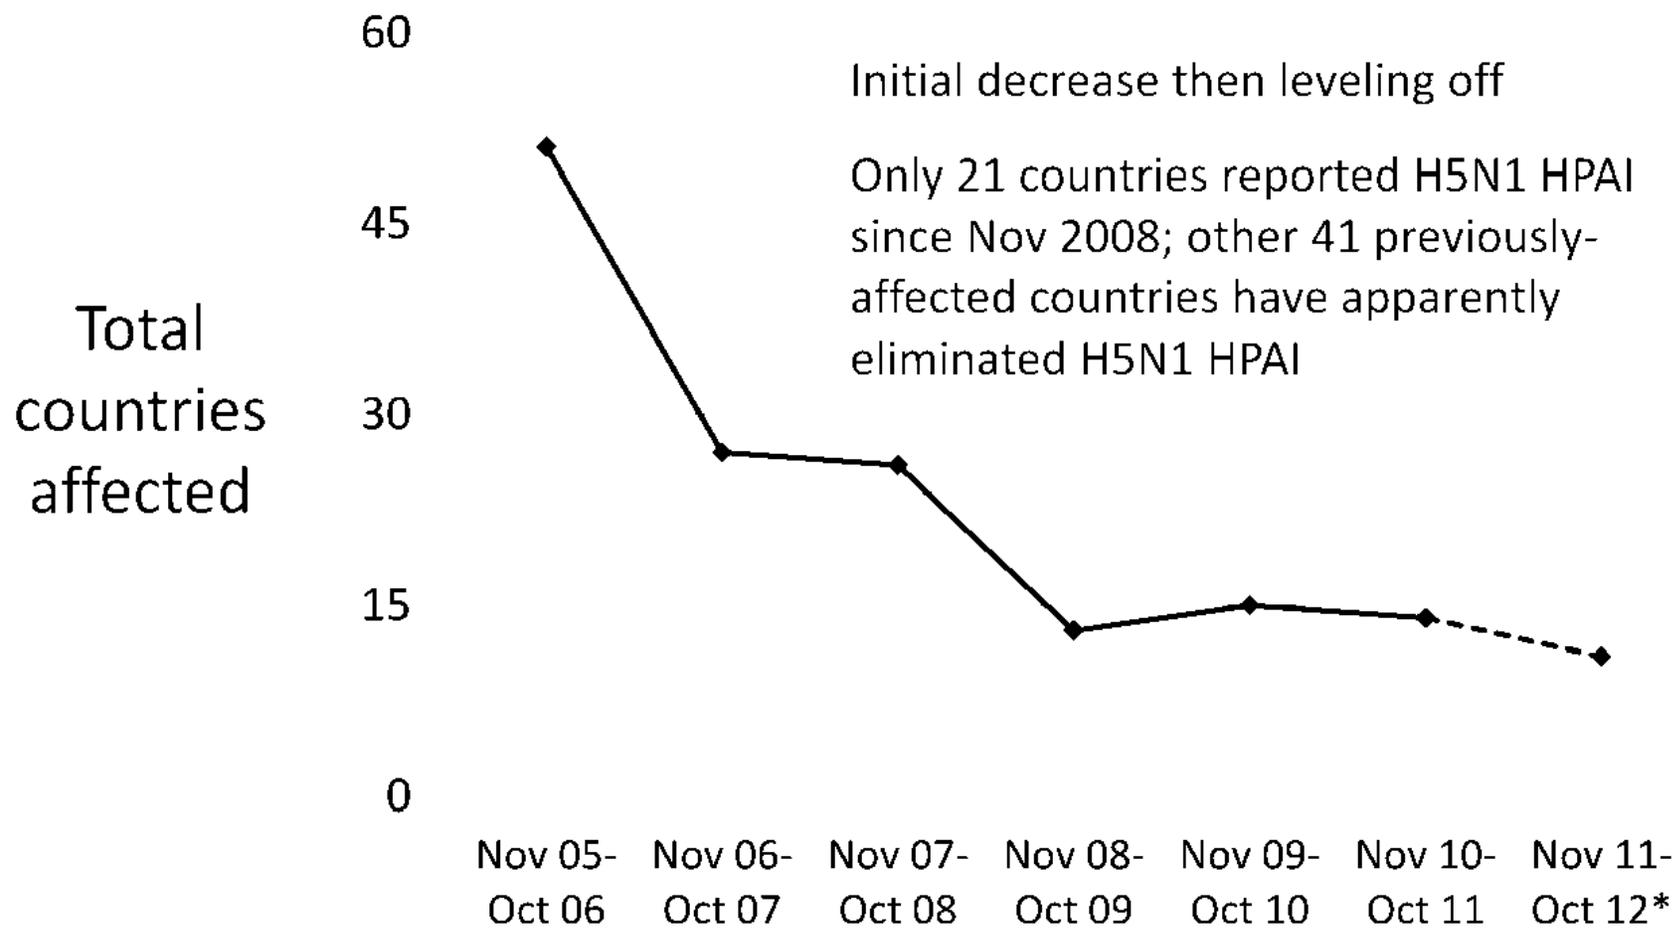

Andrew Clements, Ph. D.
USAID/Washington

23 April 2012

Ho Chi Minh City, Vietnam

H5N1 HPAI-Affected[^] Countries – Worldwide

1st Interim

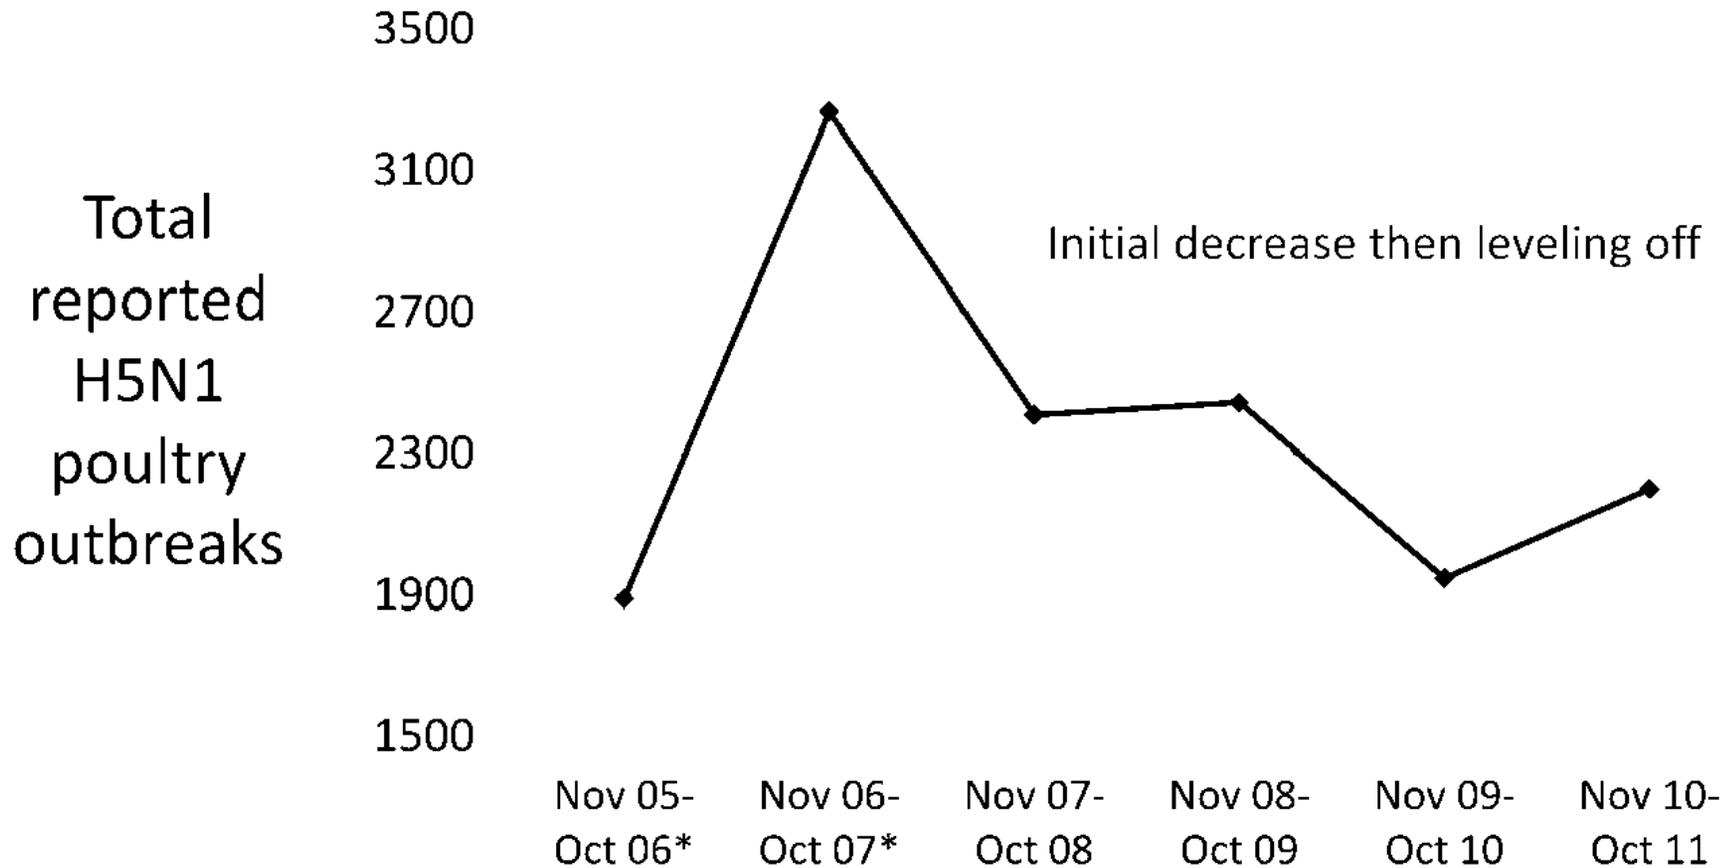

USAID FOIA No. F-00151-16

Sources: FAO, OIE, WHO reports, GenBank; [^] Virus detected at least once in poultry, wild birds, or humans since November 2003.

* Only includes Nov 2011-Mar 2012.

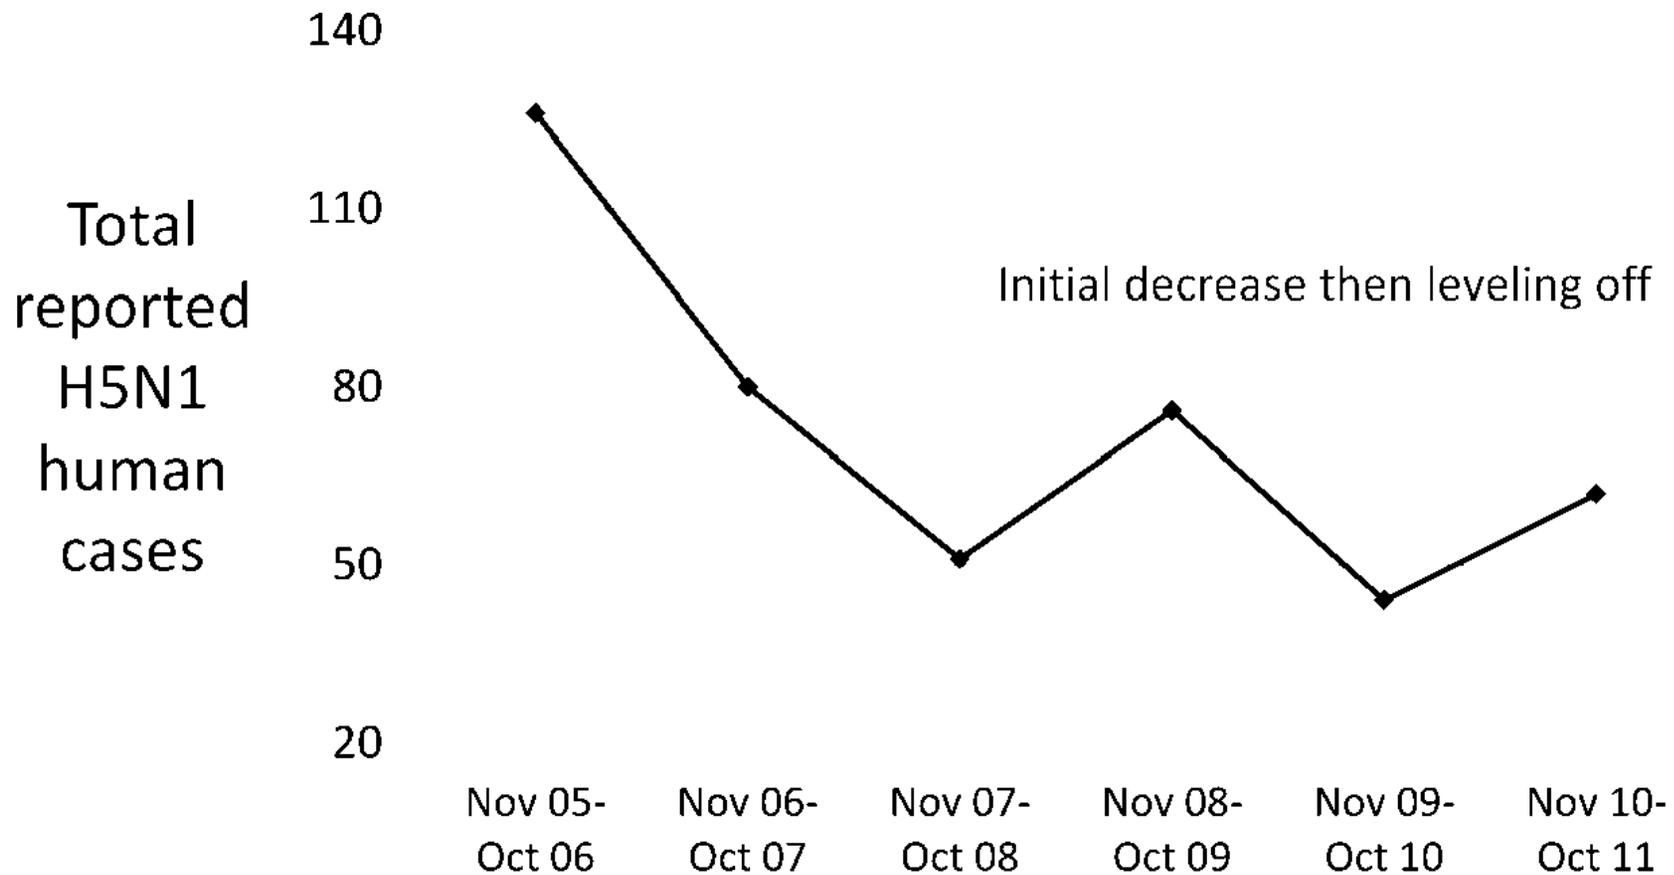

1680

Reported H5N1 HPAI Outbreaks in Poultry – All Countries

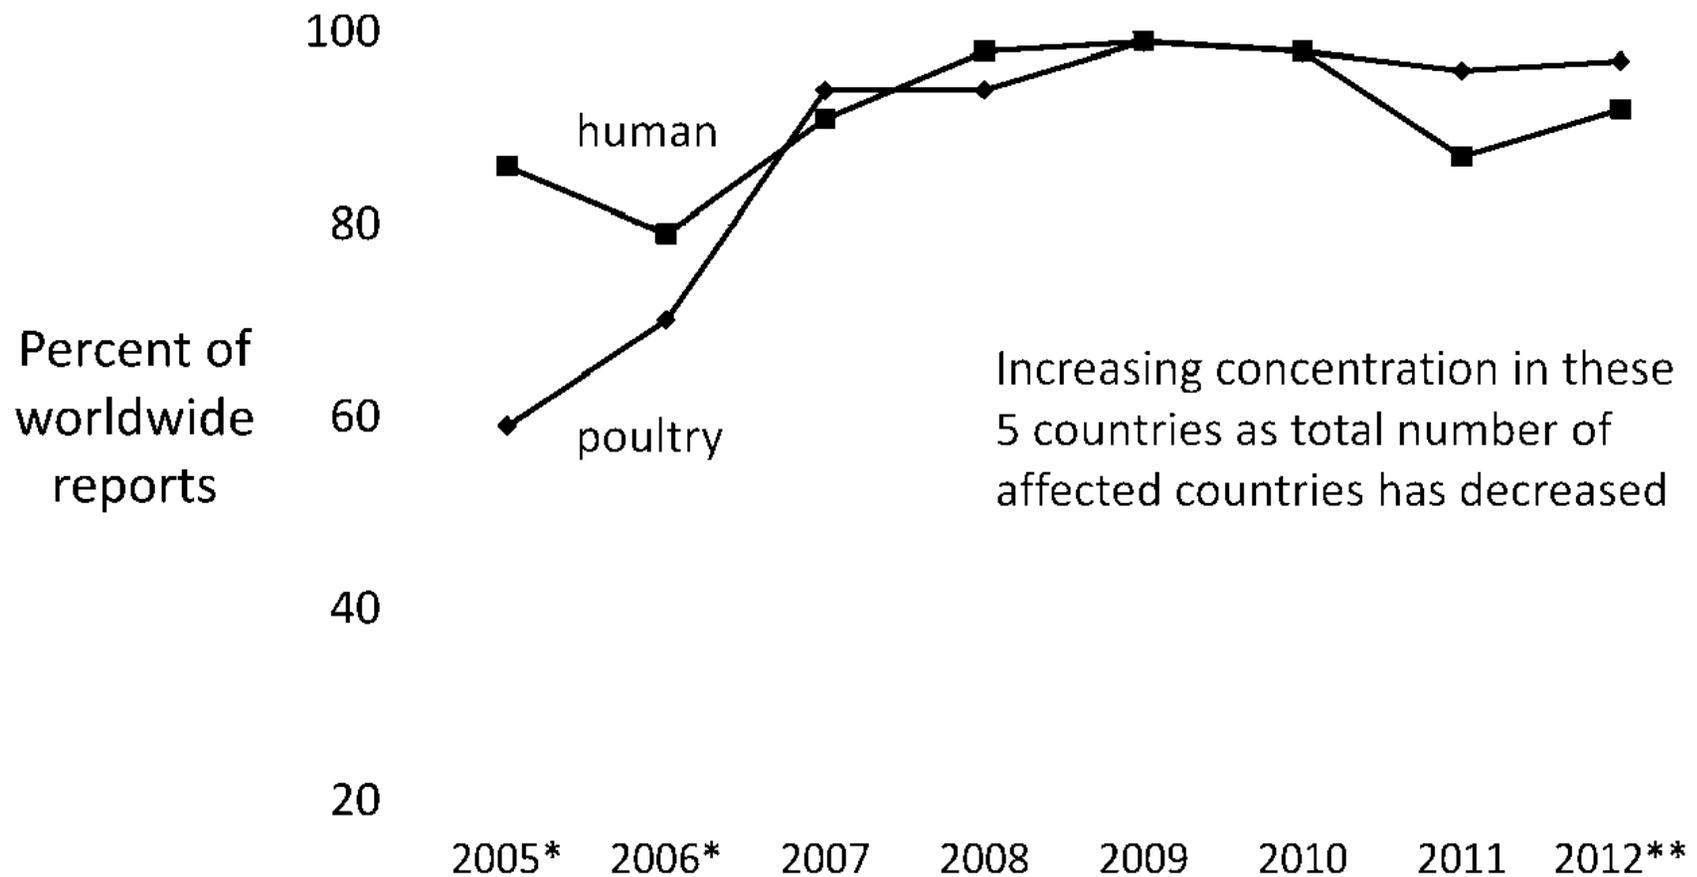

Source: OIE reports and non-OIE reporting (only Egypt and Indonesia). * Surveillance in Indonesia not fully operational

Reported H5N1 HPAI Human Cases – All Countries

Source: WHO reports

Percent of Reported H5N1 HPAI Poultry Outbreaks Worldwide in Bangladesh, China, Egypt, Indonesia, Vietnam

Source: WHO, OIE reports, and non-OIE reporting (Egypt and Indonesia only). * Poultry surveillance in Indonesia not fully operational. ** Jan-Apr 2012 only.

Geographic Concentration of H5N1 HPAI Poultry Outbreaks and Human Cases – Highly-Affected Countries (Nov 2003-Dec 2011)

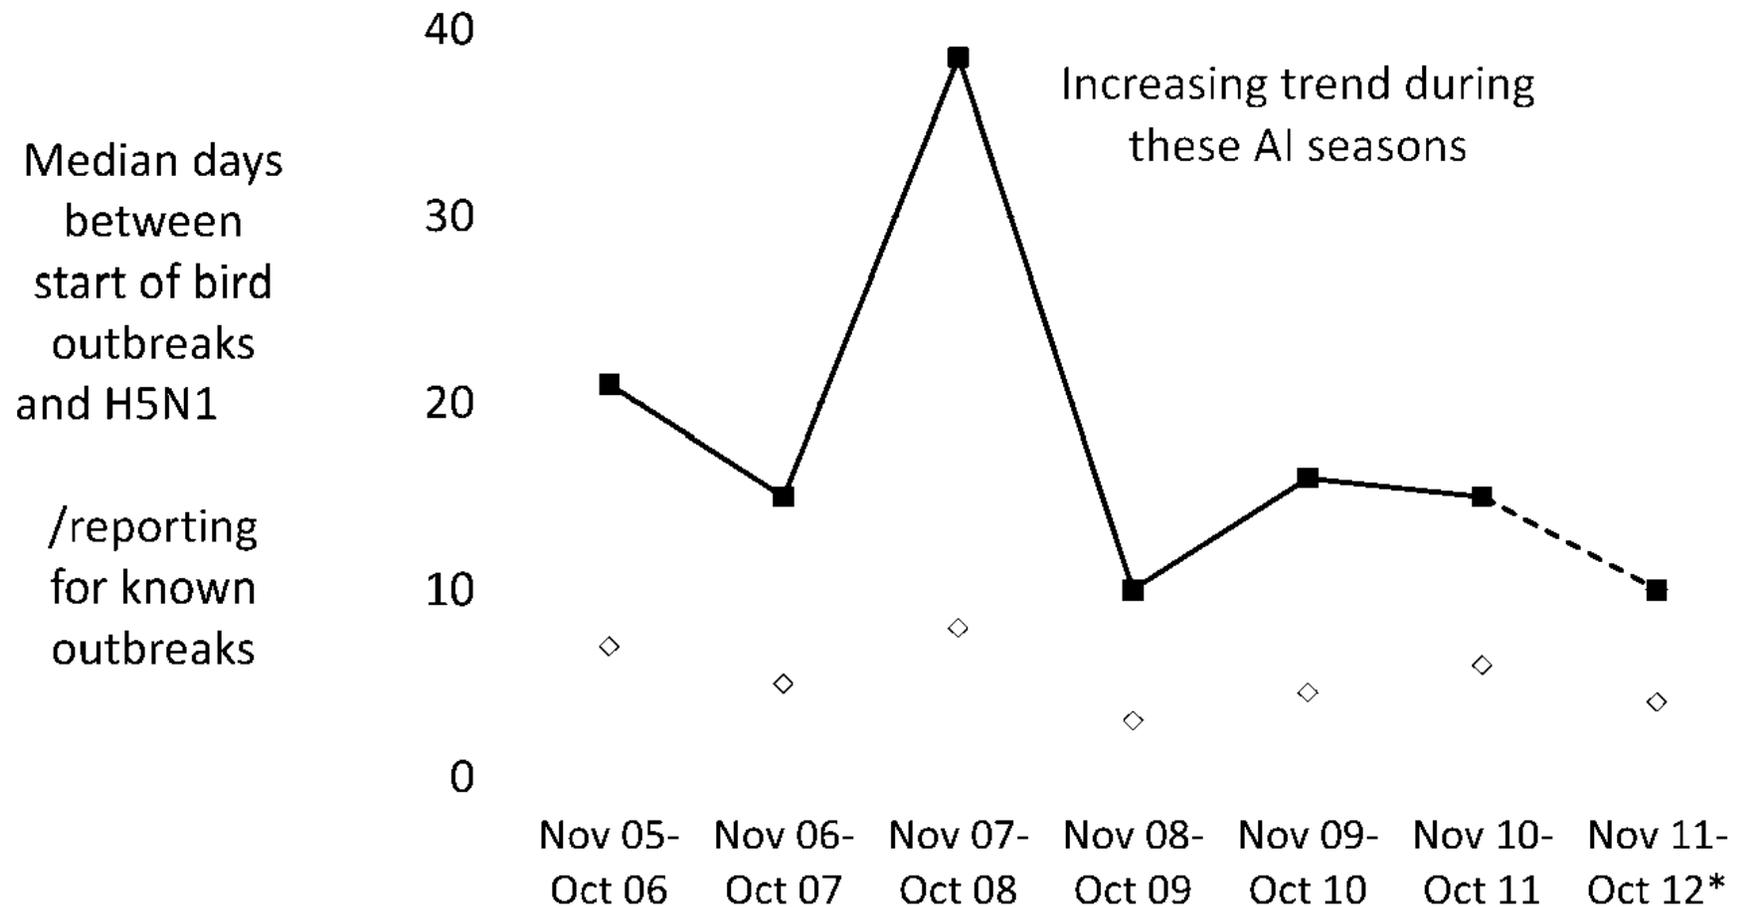

Country	Location	Percent of country's total reported poultry outbreaks	Percent of country's total reported human cases
Bangladesh	5 districts near Dhaka*	35%	100%
China	12 provinces/territories in South/Southeast**	57%	73%
Egypt	8 governorates in Nile Delta***	64%	61%
Indonesia	7 provinces on Java + 1 province on Sumatra ****	80%	73%
Vietnam	11 provinces near Red River + 10 provinces near Mekong River*****	57%	61%

Subsets of these 5 countries account for most of their reported poultry outbreaks and human cases

Source: FAO, OIE, WHO reports; includes non-OIE reporting for Egypt and Indonesia. * Dhaka, Gazipur, Manikganj, Narsingdi, Narayanganj; ** Tibet, Sichuan, Yunnan, Guizhou, Guangxi, Hunan, Hubei, Guangdong, Jiangxi, Fujian, Anhui, Hong Kong; *** Buhayrah, Daqahliyah, Dumyat, Gharbiyah, Kafr Ash Shaykh, Minufiyah, Qalyubiyah, Sharqiyah; **** Banten, Jakarta, W. Java, C. Java, Yogyakarta, E. Java, Lampung; ***** Thai Nguyen, Nam Dinh, Quang Ninh, Ninh Binh, Ha Nam, Thai Binh, Hanoi, Phu Tho, Ha Tay, Hai Phong, Thanh Hoa, (Long An, Tieng Giang, Ben Tre, Dong Thap, Tra Vinh, Soc Trang, Hau Giang, Ca Mau, Bac Lieu, Ho Chi Minh City

Detection and Reporting Times for H5N1 HPAI Bird Outbreaks – All Developing Countries

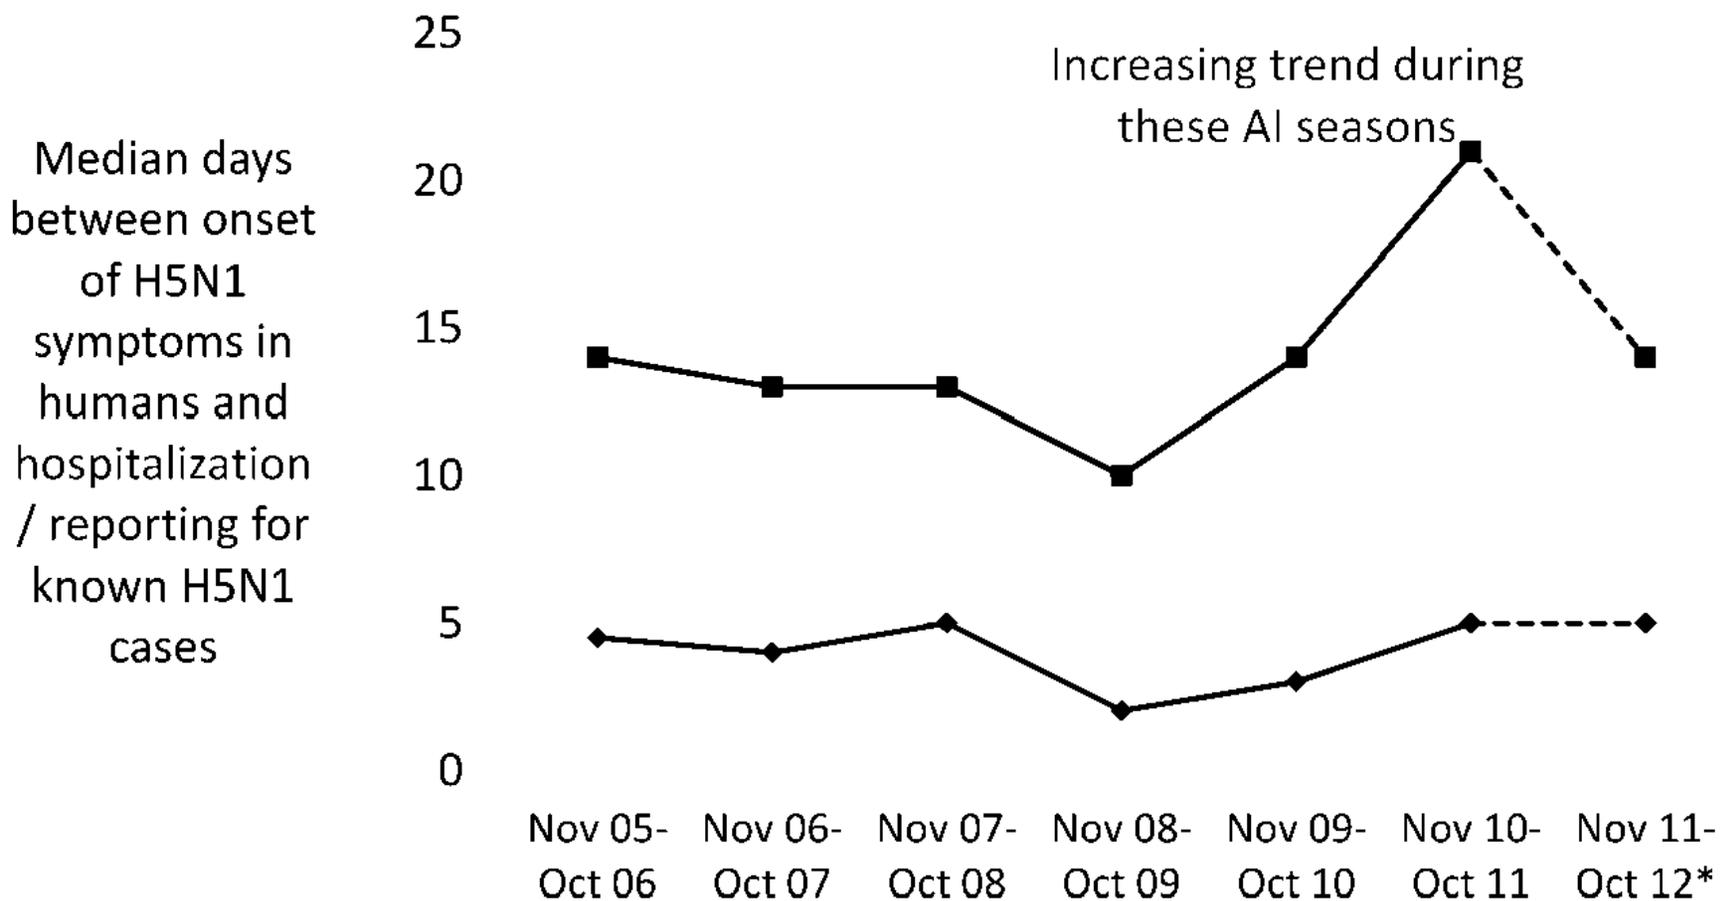

1st Interim

USAID FOIA No. F-00151-16

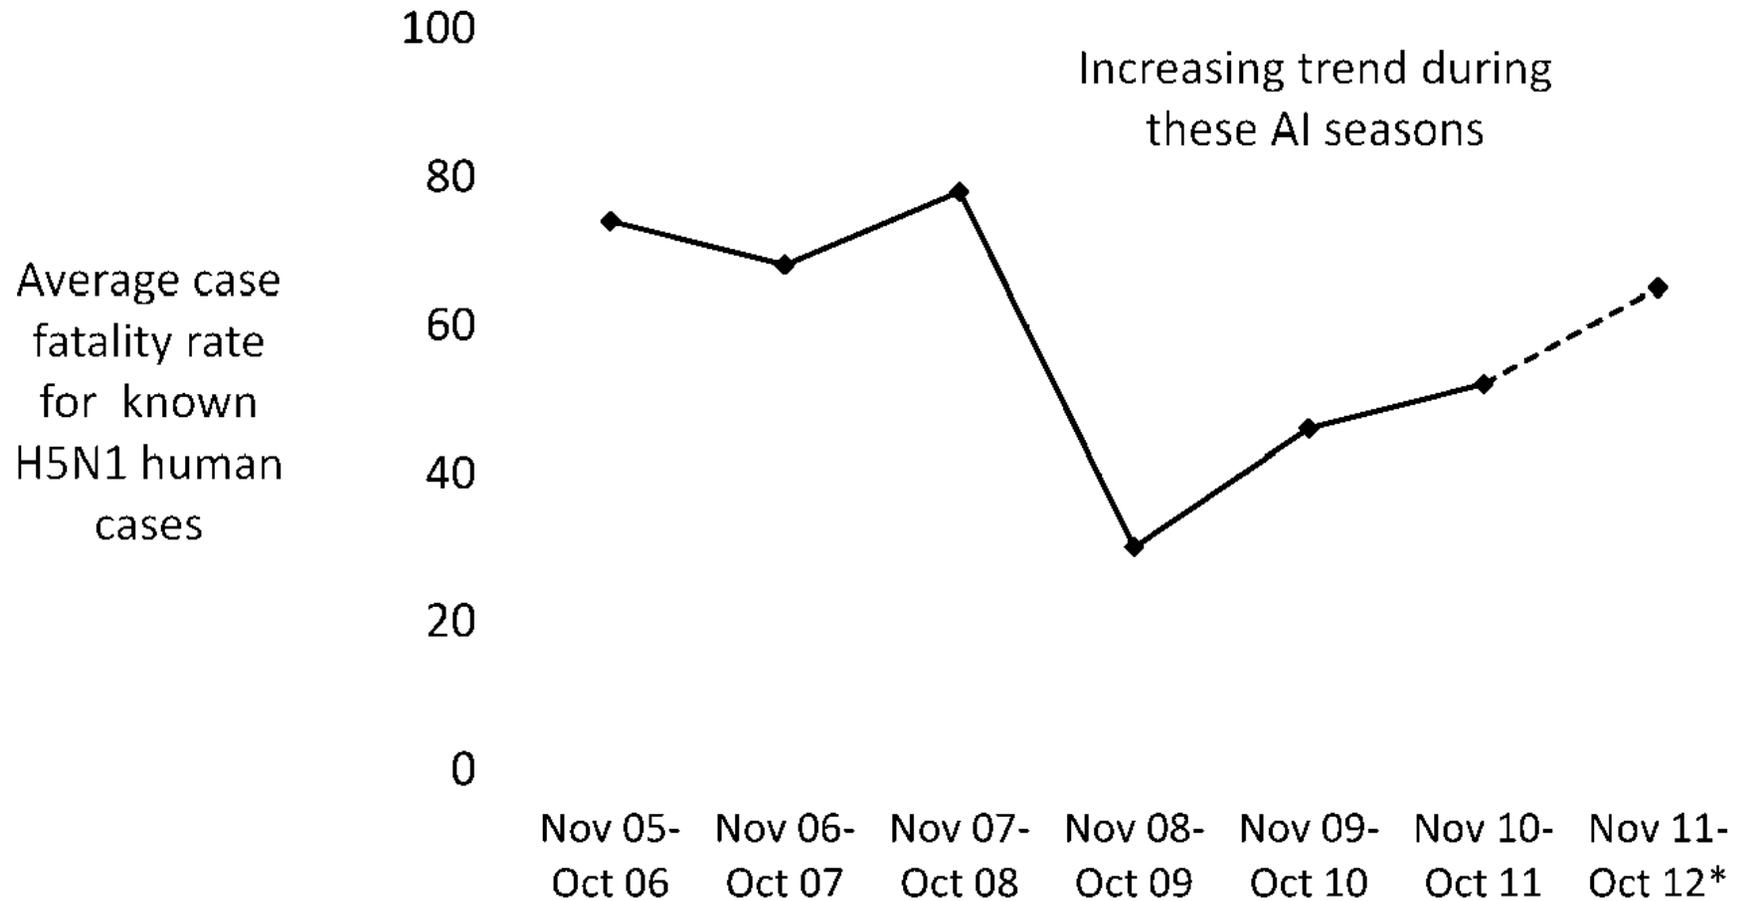

Source: OIE reports (only includes a few outbreaks from Egypt and Indonesia). * Only includes Nov 2011-Apr 2012.

Detection and Reporting Times for H5N1 HPAI Human Cases – All Developing Countries

Source: WHO reports. * Only includes Nov 2011-Apr 2012.

H5N1 HPAI Human Case Fatality Rate – All Developing Countries

Source: WHO reports. * Only includes Nov 2011-Apr 2012.

Since Bali Meeting in March 2010

- No major changes in:
 - number of affected countries
 - number of reported poultry outbreaks
 - number of reported human cases
- Virus continues to mutate and spread, e.g. clade 2.3.2
 - No apparent attenuation of morbidity and mortality in birds or humans
 - Human infections continue to be very rare since virus not well adapted to mammals (yet)
 - Limited surveillance data for other key species (i.e. pigs)
- “AI fatigue” and decreasing donor funding

Challenges for the Future

- Need to make additional gains to reduce H5N1 infections in poultry and humans
 - Identifying and targeting key reservoirs
 - Increasing cross-border coordination and cooperation
 - Sustaining essential surveillance and control elements in the face of decreasing interest and resources
- Need to improve monitoring of H5N1 virus
 - Improve understanding of factors driving viral evolution
 - Improve detection and tracking the spread of new variants
 - Routinely monitor the virus in swine populations

Introduction

This report presents the main achievements, challenges and solutions/lessons learned for USAID's Avian and Pandemic Influenza Initiative (APII) during Year 3, October 2011 – September 2012.

Year 3 saw the project reach full level of implementation in all 5-targeted provinces, to include animal health, human health and behavior change and communication. Activities are implemented via subcontracts, as Abt's current license does not accommodate for direct implementation. This carries its own unique challenges as it often is difficult to find subcontractors capable of delivering quality work on time, and strengthening the capacity of subcontractors has therefore become a vital part of APII's work.

The project progressed well in most of the eight main focus areas:

1. Animal Health Worker (AHW) Capacity Building;
2. Agricultural Extension Worker (AEW) Capacity Building;
3. Poultry Supply Chain Strengthening;
4. Community-Based Surveillance (CBS);
5. Infection Control / Case Management (IC/CM);
6. Pandemic Preparedness Planning (PPP);
7. Cross Cutting Issues
8. National Coordination & Policy Dialogue

Year 3 was also the year where the project started orienting itself towards advocating for the wider adoption and sustained implementation of models, beyond the life of the project. Adoption, adaptation, replication and up scaling of APII innovations by public and private partners is considered the real measure of success for the project. This will require a sustained advocacy and promotional effort for which the project has started preparing itself in close consultation with USAID and API partners.

Below follows a description and discussion of the main achievements, challenges of Year 3.

1. Animal Health Worker (AHW) Capacity Building

The goals are to develop an AHW educational program and an AHW networking model that will be adopted by relevant public-private agencies at national and/or local levels, and to develop a standard Terms of Reference for AHWs for adoption by Provincial Peoples Committees (PPCs) and the Ministry of Agriculture and Rural Development (MARD).

1.1 Achievements

The third-year focused on finalization of the AHW training manual including an E-Book, and continued support for wider adoption of AHW

capacity building packages using cost sharing mechanisms. Subcontractors included AFAP, VIPA, and Vietnam Veterinary Association (VVA).

- 1.1.1 *Animal Health Worker Training packages*¹ were developed, tested and published after approved by DAH/MARD. Eighty thousand hardcopies were printed with a letter from DAH Director officially introducing and endorsing the training materials. These books are being distributed to 700 districts veterinary stations throughout Vietnam. The training manual was first introduced during the Dissemination Workshop for AHWs network that was hosted by DAH/VVA/APII on August 30th. This was the first effort to advocate for the educational packages. Leaders of DAH, National Agriculture Extension Center (NAEC) and representatives from 18 provincial sub-departments of animal health (SDAH) from the North attended the workshop. Son La, Vinh Phuc, Quang Ninh and some other provinces shared their plan to strengthen the commune and village network and express their interesting in the Training of Trainers (TOT) diffusion training using the training manual (Son La, Thai Binh), replication of AHW logbook and illustration (Vinh Phuc). APII will continue to look for opportunities to work with these provinces for model replication in Year 4. The first version of an E-book for local trainers with lecture examples, detailed guidance for topic preparation, and more than 400 pictures were completed to facilitate the defusing training and planned to distribute early Year 4.
- 1.1.2 *AHW Terms of Reference (TOR)*: There were two lessons learned from the advocacy workshop on training and TORs for AHWs conducted in November 2011 and August 2012 in Quang Tri and Hanoi respectively. The first workshop included participation of Quang Tri-based AHW agencies, Agricultural Colleges and Vocational Training Centers, SDAHs of Quang Tri's neighboring provinces. Thanh Hoa, Nghe An, Ha Tinh, Quang Binh, Thua Thien Hue, Quang Nam provinces participated as well as representatives of DAH and Regional Animal Health Office 3 (RAHO3). The second workshop in Hanoi was hosted by DAH/VVA/APII with participants from 18 provinces in the North. Both workshops focused on sharing provincially developed AHW's TORs, the responsibilities assigned to AHWs and the formalization of AHW training and certification. While most of SDAH participants stressed the need to enhance the AHW network at commune and village level, the following remaining issues were discussed: a lack of government policy to support network development; and address unsustainable funding resources for recruitment and training of AHWs.
- 1.1.3 *AHW Networks*: The Australian Foundation for the Peoples of Asia and the Pacific (AFAP) continue to promote development of provincial strategies to maintain and expand monthly AHW

¹ AHW training package including an AHW training manual, AH log book and veterinary illustration and model of information desk and mailbox for AHW at district veterinary station is aim for increase knowledge and skills of AHW as well as their ability to assess information at grassroots level.

meetings and refresher trainings. Ninety-two training sections have monthly AHW meetings taking place in 19 districts of Quang Tri, Ha Nam, Can Tho and Kien Giang. A total of 1,955 AHWs have attended various district level events, covering nearly 40 topics. Ninety-five percent of these events were facilitated by local trainers between October 2011 and June 2012. New cost sharing mechanisms were tested as part of AHW network improvement plan: AHWs paid for lunch and travel themselves, while SDAH trainers delivered the courses with or without funding support from APII. This phase out process is preparing SDAHs to be ready and familiar with refresher training and monthly meetings with limited or no project funding support. (till June 2012, reduced more than 80% of cost funded to those provinces to < 20%).

- 1.1.4 *AHW Training:* A second 30-day course for new AHWs was successfully tested in Quang Tri with cost-sharing between APII and local authorities. The Quang Tri PPC has allocated 1 billion VND (~USD 50,000) in the provincial budget for 2012 AHW training as a result of APII project collaboration efforts and advocacy. The Excellent Animal Health Worker Competition also took place in May 2012 in Quang Tri. This was initiated by SDAH and was the first event of its type in both the province and the country. The competition sought to increase service quality, enhance recognition and promote the reputation of AHWs within the community. Quang Tri's SDAH, Department of Labor – Invalids and Social Affairs, and Agriculture College worked closely with the AHW network to implement training activities. As a result of this activity SDAH plays the leading role in this improvements, the Agriculture College has been appointed as the resource agency to adopt, adapt and replicate AHW training models with local funds. Those results provide solid evidence of the adaptation and replication by locality within project focus provinces.
- 1.1.5 *Adoption of AHW training package in non-pilot provinces:* Cost shared AHW TOT courses for local trainers were held in May and June respectively in Moc Chau and Ninh Binh. These TOTs, which reached 50 local trainers (20% are female), took place in provinces in collaboration with Moc Chau Dairy Cattle Joint Stock Company and Ninh Binh SDAH. In both cases, APII covered the cost of the training materials and national trainers; other costs were covered by the respective counterparts. Trained trainers implemented a training plan for AHWs in their local area. This successful form of replication will be explored further for Year 4.
- 1.1.6 *Vietnam Veterinary Association Development Strategy:* VVA finalized and disseminated their 2011-2015 Strategy in October 2011 as part of the national network. The strategy highlights a new direction in supporting AHWs from grassroots levels to civil society organizations and provincial networks. The Bac Giang Veterinary and Animal Husbandry Association hosted a replication event with 422 members and more than 100 public and private guests. The event highlighted the success of APII's support to VVA and Mr.

Dang Huu Hung, a representative from Vietnam Union of Science and Technology Association (VUSTA) noted in his speech that *"This is considered as a shining pearl in the development of various associations and it is very practical. Your lessons learned should be documented and shared with other associations to help strengthening our capacity."* The VVA has begun the process of extending the networks into the Mekong region using learning experiences from Quang Tri and Bac Giang through study tours to Quang Tri for representatives from Long An, Quang Binh and Son La. This resulted in establishment of VVA networks in Quang Binh in June and Long An in September. In addition, with support from APII, a new website has been developed and managed by VVA, providing a new channel for information sharing.² VVA also provided support to AHW at the field level by testing and delivering a training courses on *Skills to access internet information and farmer consultancy and service providing* for 90 AHWs in Bac Giang (24th May), Quang Binh (8th June) and Long An (19th June).

1.2 Challenges and Solutions

- 1.2.1 Allocation of local funds for training of AHWs remains an issue. While Quang Tri DARD has allocated provincial funds for AHW training in 2012 and is developing an implementation plan, other provinces have not yet done so. Can Tho, Hung Yen and Ha Nam's SDAHs have expressed commitment to maintaining refresher trainings and monthly meetings, but more funding for AHW training in the 2013 financial plan is needed. A policy from Department of Animal Health (DAH) supported TOT training courses and suggested a long - term strategy to introducing the training package nationally.

2. Agricultural Extension Worker (AEW) Capacity Building

The goal is to develop an AEW bio-security training program for small commercial poultry producers, which will be adopted by the national-provincial extension system, as well as by the private sector.

2.1 Achievements

The first six months of Year 3 focused on package completion and dissemination to introduce the AEW Biosecurity training package as widely as possible. The remainder of the year focused on coordinating with the BCC team, Vietnam Poultry Association (VIPA) and others to roll out the training courses to provinces as well as advocacy and replication the training in new provinces.

² The website address is www.hoithuyvietnam.org.vn.

2.1.1 *AEW Biosecurity Training packages* were developed, tested, and published in early 2012. Forty-five high-risk provinces³ received training materials.

2.1.2 *TOMT and TOFT training courses*: Following on a training of Master Trainers (TOMT) course conducted in Hanoi in 2010, two more TOMTs were organized in collaboration with the NAEC in Ho Chi Minh City (HCMC) for Mekong region provinces in early October 2011 and Da Nang regional provinces in April 2012.

The HCMC TOMT included 13 Provincial Agricultural and Fishery Extension Center (PAFEC) representatives from the Mekong region and the HCMC NAEC representative office. Immediately following this, APII received official requests for further support and training from PAFECs in Soc Trang, An Giang, Bac Lieu, Vinh Long, and Dong Thap.

The Da Nang TOMT included 29 participants from 13 central provinces, World Vision Da Nang, Quang Tri and Hue, IED/Da Nang and AFAP's Hoa Binh office. The goal of this training was to continue building the training capacity of agriculture extension workers and NGO staff expected to roll out biosecurity training for poultry farmers in their own provinces. Following this training, an advocacy event was held on April 6 for the MARD representatives, provincial leaders and agricultural extension experts from Vietnam's central region as well as representatives of international development partners and other local and international organizations. A joint workshop was hosted by USAID/APII and NAEC. In collaboration with the PAFECs, four Training of Farmer Trainer (TOFTs) on biosecurity for small commercial farmers were organized in the five focus provinces in the first quarter with a total of 100 participants from district and provincial extension centers, preparing the provinces for further roll out/replication.

2.1.3 *Replication of TOFTs in non-project focus provinces*. Responding to provincial requests, one TOFT for 25 local farmer trainers in An Giang was held in October 2011, one in Hoa Binh was held in July, and one was held in Son La in August. As a result of the An Giang TOFT, 35 replication biosecurity courses took place in 2011 reaching more than 1,000 small and medium commercial poultry farmers from 11 districts of An Giang and 11 courses for 329 poultry cooperative members. In 2012, An Giang PAFEC planned another 44 biosecurity training courses for 1,320 households under the "Developing biosecurity poultry production in An Giang period 2011-2013." The PAFEC also plans to set up 66 poultry raising cooperative groups by the end of 2012, and has requested additional assistance from USAID/APII, including additional training packages for both trainers and farmers. The 2012 results will be provided at a later date. Data indicates that for poultry farmers trained, there has been a 5-10% decrease in the number of morbid poultry. Similarly,

³ Following Department of Animal Health's List of Provinces for vaccination end of 2010.

poultry production productivity increased by 19% thanks to applying biosecurity measurements⁴

A TOT course was cost shared 20:30:50 between APII, AFAP (separate funding) and the Hoa Binh PAFEC and is serving as a model for possible wider replication. A local NGO called “Trung tam giao duc thuong xuyen Hoa Binh” has contacted APII and consequently implemented two more TOFTs in Hoa Binh and Moc Chau in July and Sep 2012 respectively. These trainings increased the total number of local trained trainers to 306 (96 female and 210 males.)

2.1.4 *Farmer training on biosecurity practices:*

Following the TOFTs, farmers’ small group discussions were conducted to measure knowledge and costs associated with implementation. More than 500 farmers attended 52 courses in the five focus provinces for these first training seminars. Following the discussions, APII encouraged PAFECs to replicate these trainings in other provinces. Through replication trainings between May and September, Can Tho has reached 1,213 farmers through 134 courses conducted completely by trainers trained in APII TOFTs.

APII promoted integrating biosecurity training for farmers into provincial communication plans during Year 3 for in all pilot provinces as a part of the hand over strategy. Biosecurity training packages have been used for small commercial farmer training in Hung Yen, Ha Nam and Quang Tri since late March 2012 with local “in kind” contributions of meeting space and banners. In total, 450 farmers in selected communes in Hung Yen and 600 farmers in selected communes in Ha Nam and 240 farmers in Quang Tri had opportunities to exchange knowledge and learn more about good farming practices in poultry production as well as how to improve their biosecurity measures. The provinces are expected to expand this training to the remaining sector three farmers through their annual training plans.

VIPA entered a new contract with APII for livestock sector workshops and strengthening of the association in order to promote biosecurity practices within their farmer club networks. This resulted in biosecurity trainings for 600 farmers (142 females - 23%) from 20 farmer clubs established by USAID’s AIBCC in Thai Binh province. In July 2012, VIPA strengthened its associations network and helped Thai Binh province develop a model of four-level-networks including farmer clubs at commune levels to district, province and national level poultry associations. At the same time, farmer’s clubs activities have been reviewed and enriched for lessons learned sharing among VIPA’s members as well as introducing into *the new Vietnam Poultry Association Strategy for Development period 2012 – 2020* which was developed taking in to consideration APII findings.

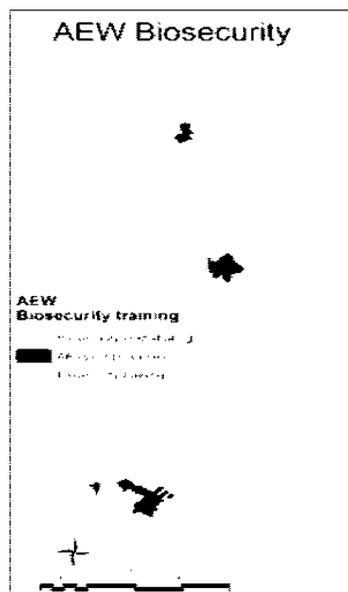

2.2 Challenges and Solutions

⁴ AEW/Biosecurity Cost Study Report

2.2.1 It is important to the sustainability and institutionalization of training/extension packages to work closely with NAEC and the PAFECs. This is a time-consuming process, which requires diplomacy, patience and perseverance in order to forge and sustain close relationships. Continuing to obtain official approval from government was a suggestion from deputy Director of NAEC and introducing the AEW/ Biosecurity training through NAEC/PAFEC system and national/provincial project remains a good option for replication of this training package widely and efficiently.

2.2.2 VIPA has demonstrated their ability to coordinate with MARD institutions such as DLP, DAH and NAEC. However, the association is still in need of substantial and sustained capacity strengthening. APII will continue to support this process through the next subcontract, if any.

Mapping to describe the replication to new provinces

3. Poultry Supply Chain Strengthening

The goals are to develop biosecurity/biosafety demonstration models in key (high risk) nodes along poultry supply chain, together with related documents (protocols, guidelines, training materials) which are adopted, adapted and replicated by public agencies, private partners and/or other development projects and programs elsewhere.

Achievements

The key activities and achievements of Year 3 supply chain work focused on the following activities and nodes:

- 3.1.1 *Risk reduction models established for slaughterhouse, slaughter points and LBM:* upgrades were made to Dong Ha live bird and poultry meat market in Quang Tri and two home-based slaughter points around the Dong Ha market; Upgrades to Ngoc Xuan centralized poultry slaughterhouse, Can Tho City and Phu Nong in Kien Giang; Upgrades to a district market and small slaughter point in Ha Nam.
- 3.1.2 *Technical Protocols and training documents were developed and shared with local authorities, SDAHs and DAH/RAHOs; Conducted*

a Technical Dissemination workshop for RAHO 3 to share experiences and lesson learned;

- 3.1.3 *Shared lessons learned and experiences for national level proposal and helped draft VIPA Official Letter to Prime Minister, Ministries and Provincial People Committees;*
- 3.1.4 *Assisted in developing legislation and local strategy development: Ha Nam province developed the provincial proposal for slaughter and inspection improvement 2012 – 2020; tested in one district of Duy Tien and has starting to implement it in another district;*
- 3.1.5 *Risk reduction models developed in Dong Ha City. Quang Tri: The local construction company completed upgrades to the poultry sections in Dong Ha Market co-funded by APII, the Market Management Board (MMB) and other vendors in November 2011. The project held a launch event in September 2011 with representatives of Quang Tri province, neighboring provinces, DAH, VIPA, DLP, LIFSAP, FAO, and USAID. A success story was published on USAID's website. Before the re-opening of the market, the project trained vendors and MMB representatives in risk reduction and good practices. Follow-up trainings on biosecurity, biosafety and business development was provided at monthly meetings through June 2012. Continued 'hand-holding' is absolutely necessary (and a positive thing) in order to see sustained behavior changes materialize. A follow up meeting is needed with MMB, Dong Ha Veterinary Station and SDAH to maintain this valid following up in Dong Ha and open the opportunity to certify the Dong Ha slaughter and market products as well as replicate the model in province in coming time.*

Two slaughter points in Dong Ha, both supplying the live bird market, were selected for upgrades and demonstration model development. Technical proposals and stakeholder agreements were prepared. Renovations, which were co-financed by slaughter point owners, started in late May 2012. Owners were responsible for site clearance and auxiliary structure construction costs (including kitchen and toilets), while APII covered the remaining upgrade costs to improve veterinary hygiene conditions and provide essential equipment for good slaughtering. Renovations were completed in July 2012, and a hand over ceremony was organized in August. Lessons learned in both infrastructure and operations improvement while developing these physical models have been shared to promote a new and good home-based slaughtering process for customers in Dong Ha and encourage replication to other slaughter points in Quang Tri province. More than 40 participants from Quang Tri Provincial People's Committee, local authorities and province function agencies including Sub-department of Food Safety and Hygiene and Sub-department of Agricultural, Forestry and Fishery Products Quality participated the event. Restaurants, Hotels, market vendors and slaughter point owners were also invited. Video of the event has been uploaded to websites for your information:

<http://danviet.vn/102302p1c34/chong-dich-cumgia-cam-tu-lo-mo.htm>

<http://nhandan.com.vn/cmmlink/nhandandientu/thoisu/doi-song/i-s-ng-tin-chung/l-v-ng-b-ng-song-c-u-long-s-m-1.364876>

- 3.1.6 *Risk reduction models developed in Can Tho City:* After signing the Stakeholders Agreement with the Ngoc Xuan? Can Tho upgrades began in April 2012 as scheduled and were completed in July 2012. Operational testing, reviewing of good practices and technical coaching was conducted between July and August, when the re-opening ceremony was held. In collaboration with the Can Tho SDAH APII organized a number of training courses on risk reduction measures and good slaughtering practices. About one-third of the slaughterers have only completed primary school so their capacity to absorb technical knowledge is limited and will require more follow-up and pictorial illustrations to promote behavior changes.
- 3.1.7 *Risk reduction models developed in Kien Giang City:* The slaughterhouse project in Kien Giang looks less promising, partly due to lack of buy-in and commitment from provincial counterparts, there will not be any more effort to make the renovation for this facility. However, Phu Nong will be the subject for a study tour and training on risk reduction as planned later.
- 3.1.8 *Risk reduction models for district market and small slaughter point in Ha Nam:* A similar approach to that applied at Dong Ha was applied in Ha Nam with plans for upgrading a district market and one home based slaughter point. All technical documents and proposals were completed in July 2012. Renovations and upgraded took place in September. Training for vendors, MMBs and slaughterers, operations testing and technical coaching is planned for October 2012 in Year 4.
- 3.1.9 *Technical Protocols:* APII developed technical protocols related to each risk reduction model, training documents for vendors, slaughterers, inspectors, and pamphlets and posters, etc. and shared them with local authorities, SDAHs and DAH/ RAHOs. APII also actively shared these materials, risk assessment reports, supply chain node prototype designs, small group discussion flipcharts etc. with other international projects including LIFSAP and VAHIP and invited their representatives to relevant events for closer collaboration and experience sharing.
- 3.1.10 *Technical Dissemination Workshop for Region 3:* In collaboration with Quang Tri Provincial Coordination Unit, and RAHO3 and RAHO6 the project organized a technical dissemination workshop in September on HPAI and EID risk reduction at Dong Ha live bird market and slaughter points. About 50 representatives from DAH, DLP, DARD, VAHIP, VIPA and six other neighboring provinces met and shared experiences and discussed risk reduction interventions. Participants also discussed how these interventions could be applied widely with regional approach to disease control and food safety. News on the workshop posted on websites:

<http://www.vietnamplus.vn/Home/Chia-se-kinh-nghiem-giam-lay-nhiem-cum-gia-cam/20129/160850.vnplus;>
<http://www.baoquangtri.vn/default.aspx?TabID=56&modid=377&ItemID=60703>
<http://nhandan.org.vn/cmlink/nhandandientu/hoisu/doi-song/i-s-ng-tin-chung/cac-t-nh-ng-b-ng-song-c-u-long-ch-ng-i-pho-v-i-l-u-ngu-n-1.369485>

- 3.1.11 *Inspector training:* In December 2011, in collaboration with the HCM Veterinary Hygiene Center No. 1, APII implemented a Risk Reduction for HPAI and EID in Slaughterhouse training for Mekong region provincial inspectors. The course covered inspection policies and legislation for animal and human health hazards in slaughtered poultry. Additionally, participants were given an opportunity to visit and conduct observation exercises in a number of slaughterhouses in Tien Giang, Long An and HCM, including USAID's STOP AI model at Go Cong.

This inspector's training was replicated through a request from Ba Ria Vung Tau province, in September, when APII supported a local inspectors training course conducted by SDAH with local trainers and materials. The veterinary inspectors were trained in necessary knowledge and are expected to become 'change agents' who share their knowledge with relevant stakeholders. This training brought the total number of inspectors that have been trained by APII to 117 (19% female).

- 3.1.12 *Other national workshops:* Under the technical and financial support of APII and in collaboration with DLP, VIPA successfully conducted a national workshop on Sustainable Development of Garden Chickens with 57 officials from various national level ministries, provinces, local and international agencies and the private sector (research firms, feed and equipment companies) and media in June. The workshop reviewed successful models, shared experiences in garden chicken production and included a field visit. Participants agreed on a list of proposed options to create an enabling policy environment on safe and sustainable development of garden chicken production. News on this workshop was aired through national television channel VTV2 and Workshop Proceedings were distributed widely through the DLP network.

Additionally, APII supported a National Workshop to review the current situation of poultry slaughter and marketing and to propose solutions to improve veterinary hygiene and food safety hosted by DAH and DLP. There were 80 participants from national and provincial levels of animal health and livestock sectors, international agencies and institutions including research firms and media agencies. During the last quarter of Y-3 FAO was brought up to date on all of these events as well as presenting their results of their LBM surveillance. Eighteen individual reports from management and production sites were presented. Participants also discussed appropriate models, policies and guidelines to be developed and

adapted by local provinces. News on this workshop was aired through national television channel VTV2.

Based on the findings from above two national workshops, VIPA has sent a letter to the Prime Minister, related Ministers, and all Provincial People's Committee Chairpersons with recommendations to improve the poultry slaughtering management and garden chicken development. The letter is bringing to bear attention from high ranking government officers and a response by Government office arrived recently for a further following up cross ministries' meeting in near future.

- 3.1.13 *National Legislation*: Under the VIPA contract, APII supported DAH and their local consultants to develop the 1st draft of *National Proposal on Ensuring Food Safety* in livestock slaughter and transportation. APII will continue to work with FAO and other international projects such as VAHIP and LIFSAP to provide further comments to enrich this version before finalization and submission to MARD for approval:

3.2 Challenges and Solutions

- 3.2.1 At the moment, the central government has requested that provinces develop proposals for livestock slaughter improvement. However, DAH and MARD do not have a national strategy for addressing poultry supply chain risk management. Some of provinces have developed their own 'master plan for slaughter' and some are on the way to implementing in this coming year. The developing National Proposal on Ensuring Food Safety for 2012 – 2020 and Vision 2030 are essential food safety strategic documents that can provide overall direction for the whole the country. The drafts have been developed by local consultants appointed by DAH, thus far. APII will work closely with FAO to provide comments and consolidate the regional disease control strategy initiated by FAO and DAH especially for RAHO 3 and 6 into the National Proposal as feasible.
- 3.2.2 While provincial counterparts clearly are very interested in the demonstration models, many provinces don't have a 'master plan' that demarcates future locations e.g. for centralized poultry slaughterhouses and markets, which makes it difficult for them to commit resources in this area. In addition, the processes for local authorities to approve construction are very complex, involving multiple stakeholders and complex regulatory framework, which are not always well understood by all or straightforward to implement.
- 3.2.3 Profit margins from poultry slaughtering are especially small, and even more so in small scale slaughtering operations. It is understandably hard to persuade the small private entrepreneurs to invest in facility upgrades without some form of 'subsidy' (financial support). Micro-finance options in the commercial financial sector

(banks, MFIs) are rare. Many small entrepreneurs appear to be comfortable where they are without plans to expand. Cost-cutting measures seem a more appealing way forward to improve business and increase profits. This also implies cutting private costs on environmental safeguarding and food safety related measures. Sustained awareness is necessary, combining sticks and carrots for more attention to public goods issues. APII continues to reach out to and invite partners such as LIFSAP and VAHIP. Partners rarely reciprocate however. USAID may need to step in and help promote the dialogue at donor level.

4. Community-based Surveillance (CBS)

The goal is to develop an events-based grassroots surveillance package, including training materials/tools and job descriptions for grassroots 'collaborators', which is adopted, adapted and scaled-up in the provincial-regional-national surveillance system with local resources.

The first six months of Year 3 focused on phasing out CBS implementation at the field level, preparing and initiating the CBS evaluation, and advocacy activities through out Vietnam.

4.1 Achievements

- 4.1.1 From October to December 2011, the local sub-contractor Quang Tri Livestock Production and Veterinary Association (QTLVA) continued to monitor, supervise, maintain and support the CBS collaborator networks in Quang Tri. When APII halted financial support in January 2012, animal health collaborators started receiving monthly allowances from the provincial budget, in accordance with Quang Tri PPC's Decision 25. In Ha Nam, Hung Yen, Can Tho and Kien Giang APII has also ceased providing financial support to CBS networks. The CBS collaborators continue to do surveillance despite a lack of provincial support.
- 4.1.2 In December 2011, QTLVA organized a CBS workshop in Quang Tri to share experiences with non-pilot districts and communes within Quang Tri. Fifty-two participants from communes, districts and provinces exchanged experiences and lessons learned and witnessed the CBS model in action via field visits. The participants discussed plans and feasibility of expanding the model to all communes and districts in Quang Tri with the hopes of local support.
- 4.1.3 In January 2012, an economist from Abt's Home Office updated the previous costing of the CBS model costing, including a cost-benefit analysis. This study will complement the final evaluation of the CBS model program.
- 4.1.4 A final CBS evaluation was conducted with technical lead by an international consultant and field implementation by a local sub-

contractor (AMDI) in three provinces (Hung Yen, Quang Tri and Can Tho). The evaluation team reviewed epidemiological data, KAP survey on CBS collaborators, and in-depth interviews to AHWs, HHWs at commune, district and provincial levels and also with households having had an outbreak. In July 2012, debrief was held at USAID Vietnam Office, followed by completion of the final report. The evaluation identifies that CBS is effective in enabling early detection and response of HPAI outbreaks in the province where there is a supportive policy environment, a high prevalence of outbreaks, willingness to reveal epidemiological data; furthermore CBS is linked with network development of AHWs at grass root level. This finding has a reference for developing a relevant plan for CBS replication in Year 4.

- 4.1.5 In April, USAID/APII hosted an official workshop to share experiences and lessons learned from Community-Based Surveillance work in Hue, Vietnam. News clips on the CBS workshop from Hue is posted on the website <http://danviet.vn/83138p34c109/du-an-sang-kien-gia-cam-phat-hien-hon-30000-gia-cam-mac-benh.htm>. The video clip on the event aired by VTC16 was available with English subtitles.
- 4.1.6 APII developed two posters on the CBS work and presented at the American Public Health Association (APHA) conference in Washington DC Oct 29 – Nov 2, 2011:

<http://apha.confex.com/apha/139am/webprogram/Paper242716.html>

<http://apha.confex.com/apha/139am/webprogram/Paper242729.html>

- 4.1.7 The CBS model was introduced to visiting undergraduate students from the University of North Carolina at Chapel Hill, USA. The students visited Ha Nam to see the CBS model at work.

4.2 Challenges and Solutions

- 4.2.1 The firm initially identified to implement the subcontract for the CBS evaluation withdrew and another company (AMDI) was identified as a suitable replacement. The change in subcontractor caused a delay in implementation but the evaluation is progressing well. APII staff spent considerable amount of time reviewing the subcontractor's work to insure quality.

5. Infection Control/Case Management (IC/CM)

The goal is to develop an IC training model for implementation of guidance outlined in Circular 18. This is targeted at the grassroots level, meaning at the commune and village level. The IC training model will be scaled up and advocated to the national and provincial levels. This has been approved by MOH for implementation throughout Vietnamese healthcare facilities.

5.1 Achievements

- 5.1.1 APII conducted training visits and technical assistance to Gio Linh district hospital in October 2011 in collaboration with Hue Infection Control Society (ICS) experts. The results of this work are posted on Hue ICS' website: http://www.husic.org.vn/vn_tin-tuc/thoi-su/hoat-dong-ksnk-tai-bv-gio-linh-tinh-quang-tri-91-husic.aspx
- 5.1.2 Can Tho provincial Department of Health (DOH) adapted APII's model to conduct IC assessments for all other hospitals in Can Tho. The results of the assessment will not only help them understand the current challenges of IC practices but also develop individualized action plans for IC improvement.
- 5.1.3 Eight-focus district hospitals were ranked above other similar hospitals in the annual DOH evaluations at the end of 2011.
- 5.1.4 USAID delegation visited Gio Linh district hospital on December 5, 2011. During the visit, the delegation had opportunities to observe IC activities and interact with the hospital board of directors and IC specialists.
- 5.1.5 APII invited WHO and MOH IC experts to Kien Giang province to visit Thot Not district hospital supported under USAID's AIMekong Initiative and Go Quao district hospital supported by APII. The team also had chance to visit a non-intervention district hospital in Hon Dat district. During the visit, the experts were able to observe and discuss with the hospital board of directors and IC specialist's achievements and lessons learned, success stories from IC interventions supported by APII and to compare intervention with non-intervention hospitals.
- 5.1.6 APII conducted a training needs assessment and situation review for IC situation in the eight focus hospitals. Findings were shared in three regional workshops and contributed to the IC training model developing.
- 5.1.7 A IC program cost-benefit analysis was conducted by an international consultant from Abt Associates, in concert with a Vietnamese consultant. The findings indicate an increase in hand washing quality and frequency in persons attending the three regional workshops. The evaluation was completed in April and its' results contributed to convincing MOH to adopt the APII IC model.
- 5.1.8 Between March and April the Vietnam Ministry of Health, Vietnam Nurses Association, regional Infection Control Societies, leaders from provincial Health Departments and district hospitals in seventeen provinces organized a series of workshops in Hanoi, Hue and Ho Chi Minh City. Participants described the significant infection control challenges that they face: low appreciation among hospital and staff of the importance of IC, shortage of human resources including dedicated IC staff, shortage of suitable equipment and facilities for adequate IC. News on this workshop

was aired on O2TV and uploaded to website of T5G at <http://www.t5g.org.vn/Default.aspx?u=dt&id=3706>.

- 5.1.9 The MOH chaired a meeting to review the IC training materials in April with participants from the Department of Science and Training, the Administration on Medical Service (AMS), VNA and IC experts from the IC Societies. The target of IC training model was expanded and will be applied to the district hospitals but also for all health facilities at grassroots level, including commune health centers and public/private clinics.
- 5.1.10 In May, APII staff attended the Launching Ceremony for Hand Hygiene organized by Ha Noi DOH and chaired by MOH with participants from district and provincial hospitals. In the meeting, MOH emphasized the importance of strengthening IC in hospitals. The MOH National Plan on IC for the period 2012-2015 which was approved by MOH on March 30, 2012 was officially introduced.
- 5.1.11 In June, APII, through a subcontract with VNA, hosted a review meeting chaired by Mr. Muc, the Deputy Director of AMS and Prof. Quy, chairman of HANSIC. This meeting allowed national IC experts to review the IC practical handbook that contains recommendations and guidelines on IC practices for all health workers at grassroots levels (commune and district levels).
- 5.1.12 In June, MOH's Scientific Review Board met and reviewed the IC training materials. As a result the seven board members recognized the training materials as the first official IC training material, noting that it is comprehensive and very useful tool. The approved training material will be applied to all health facilities at grassroots level throughout the country, in order to comply with the "National action plan on IC strengthening in health facilities in the period 2012-2015" and decision number 014/QĐ-BYT, which specifies that by 2015 at least 80% health care workers at health facilities will be trained on IC.
- 5.1.13 In collaboration with VNA, APII hosted three TOT courses on IC in June and July. These courses were based on the final version of IC training materials (as mentioned above). These six-day training courses were for 83 participants from 5 focus provinces as well as an additional seven other provinces. Lessons learned and final comments from these training were incorporated into the final version of the training materials.
- 5.1.14 In August, representatives from USAID and APII staff made a visit to Thot Not district hospital, Can Tho to see IC improvements. With initial support from APII in 2009, the IC situation in hospital has changed significantly including having one full time staff to be in charge of IC, having more basins in exam rooms to promote hand-washing, having more hand soap and IC supplies. Thot Not hospital is good example of sustaining IC changes without project support since 2010.

- 5.1.15 In August, the MOH officially approved the APII supported IC training materials for in-service training courses for all health staff at 645 district hospitals, 10,748 commune health centers and several public/private clinics with the release of official letter No 5771/BYT-K2ĐT dated August 30, 2012. The Deputy Director of AMS agreed to issue a letter to accompany this training material to send to all 63 provinces. APII will explore opportunities to apply these training materials to other relevant sectors and pre-service training institutions.
- 5.1.16 In September, MOH's Scientific Review Board met and reviewed the IC practical handbook. As a result the seven board members recognized the IC practical handbook as an update and useful material for practice at grassroots levels. The approved material will be applied for all health facilities at grassroots level throughout the country.
- 5.1.17 In September, APII representatives attended MOH's review workshop on the new IC guidelines. Final comments from this workshop will be incorporated into a finalized version.

5.2 Challenges and Solutions

- 5.2.1 All hospitals and DOHs were busy at the end of the year with little time for IC activities. To support the hospitals and DOHs, the APII team undertook field evaluation visits to help integrate IC activities into DOH annual evaluations.
- 5.2.2 Convincing key MOH personnel to participate was very time consuming and required a lot of staff effort (VNA and APII), but the end result justified this strategy, as finally participation by MOH was beneficial in the regional IC workshops.
- 5.2.3 The process of approval by MOH takes a long time with the involvement of some departments and policy makers in MOH. It's out of the control of APII and our subcontract. With the extra effort of APII and VNA, IC training material approved by MOH's Scientific Review Board and we expect the decision from MOH's Science and Training Department in near future.
- 5.2.4 There are still very few qualified trainers available at the provincial level. In the near future we will need to implement more training of master trainers (TOMT) on IC to train grassroots level staff once the MOH approves the IC training materials.

1. Pandemic Preparedness Planning (PPP)

The goal is to develop PPPs policies and programs into the selected pilot province(s) in Year 3 and then introduce the policies and programs into other provinces, and advocate for its wider adoption through out Vietnam.

1.1 Achievements

- 1.1.1 In November 2011, a PPP workshop was held with participants from Kien Giang. Authorities had opportunity to discuss the new concepts of “whole-of-society” approach and develop a multi-sector framework for the design and implementation of their PPP.
- 1.1.2 In January 2012, the framework of Kien Giang PPP was completed with inputs and comments from technical experts, national consultants and API partners.
- 1.1.3 In February and March, VNRC organized two provincial review workshops on PPP for participants from government management offices, provincial Military Agency, provincial Police Department, mass organizations, local staff and experts from national level to review the draft of provincial PPP. The draft had also get more in-depth comments and inputs from national experts and API partners such as FAO, WHO.
- 1.1.4 In April, the revision of training materials for community leaders with WHO inputs was finalized. The training materials focus on three main topics: concepts of influenza and pandemic response; community planning for pandemic preparedness; and business continuity planning and livelihood maintenance plans during the difference phases of a pandemic.
- 1.1.5 Ten PPP training courses with approximately 250 community leaders were organized by VNRC in Ha Nam, Hung Yen, Quang Tri, Kien Giang and Can Tho provinces. The training provided basic knowledge for community leaders on pandemic influenza and community preparedness for pandemics (such as preparedness for health, livelihood, essential services provision, business continuity planning, etc.).
- 1.1.6 In March and April, three preparation meetings were held in Kien Giang province. The VNRC and provincial counterparts met and provided more in-dcpth comments, getting inputs from participants to the draft a “table top exercise” plan. Participants from different agencies also discussed the roles and responsibilities within and between sectors involved. The “table top exercise” plan will be approved by Kien Giang People Committee for execution on a wider basis in early May.
- 1.1.7 In May the Kien Giang PPC chaired a tabletop exercise with participation of more than 60 representatives from MOH, VNRC, USAID, other provinces and agencies including provincial departments, military agencies, police, media agencies and mass organizations from Kien Giang. Comments from table exercise will be incorporated into the PPP before submitting for Provincial People’s Committee’s approval. News of this event was aired by Kien Giang TV channel on May 17 and on VTC16 in May 18, and uploaded onto YouTube, <http://youtu.be/vYQkDkMrWMA>.

- 1.1.8 VNRC organized a review meeting in Hanoi to finalize PPP training materials based on comments gathered from the training course for community leaders, with participants from GDPM (MOH), National Center for Health Communication and Education (TSG), APII experts, and local master trainers of VNRC on PPP.
- 1.1.9 A PPP dissemination workshop was organized by People's Committee in Kien Giang province for 35 staff members from provincial agencies, mass organizations and local authorities. The participants learned about the pandemic preparedness programs and practiced making a mock plan for their organization. They also discussed on multi-sector cooperation and shared their experiences dealing with outbreaks.
- 1.1.10 Kien Giang PPC approved the PPP in late June. This PPP compiles the lessons learned from previous PPPs, inputs and comments from almost government sectors, mass organizations in Kien Giang, MOH, FAO, WHO and follows a One Health and "whole society" approach. It is the first time that a Business Continuity Plan has been included. This PPP is also in line with the Vietnam Integrated National Operational Program on Avian Influenza, Pandemic Preparedness and Emerging Infectious Diseases 2011-2015 (AIPED).
- 1.1.11 In September, APII representatives attended a training workshop conducted by MOH on Business Continuity Plan (BCP) in Ha Noi. The workshop concluded that knowledge and skill on BCP should be applied to the pandemic preparedness plans of ministries, branches, and provinces.

1.2 Challenges and Solutions

- 1.2.1 It took a time to obtain feedback and comments on the PPP outline from API partners and local experts. This, and other delays (including flooding in Kien Giang), led to the late of submission of VNRC deliverables and were followed by a subcontract modification (time-wise extension).
- 1.2.2 The "whole-of-society" approach and the business continuity planning concepts adopted in Kien Giang's PPP are new to the province and to VNRC. APII technical staff, with inputs from WHO, worked very closely with VNRC and provincial counterparts to provide technical support in the development of the PPP
- 1.2.3 Final approval was delayed because Mr. Huan – the Vice Chairman of Kien Giang PPC assigned to sign PPP, was away on business until the end of June. This in turn required a modification to our PSA with VNRC. It caused the late of deliverable submissions, especially for last deliverable so the PSA have modified the timeline with the approval from USAID.

6. Cross-Cutting Issues

6.1 Behavior Change Communication (BCC)

The BCC program identifies appropriate behaviors changing messages, integrates these into the work of the animal and human health programs,

strengthening the BCC capacity of national and provincial stakeholders, enabling them to carry on BCC activities beyond the life-time of the project.

6.2 Achievements

- 6.2.1 Continue subcontracts with Women's Union of Ha Nam, Kien Giang, Quang Tri, Hung Yen Provincial Humanity Center under Provincial Red Cross and CEFACOM (Research Center for Family Health and Community Development) to implement Y3 BCC activities in five provinces. These subcontractors closely collaborated with their related PCU and BCC trainer teams in dealing with administrative and technical tasks respectively while conducting BCC activities.
- 6.2.2 Completed BCC campaigns in five provinces. Based on experiences, knowledge and skills gained, provinces like Quang Tri designed innovative activities such as Excellent Farmers Competition based on experiences of successful conducting Community Events. Three Clean Movement Launching Ceremonies, a part of a National Program on Building New Rural Areas, which utilized BCC trainer team's efforts, applied BC interactive approaches and integrated desired behaviors for AI/EIDs prevention in the WU network. These successful and innovative campaigns were conducted thanks to prior preparative works such as:
 - Organized a Consultation Workshop on the Year 3 BCC Strategy in Da Nang with participation of key leaders and officers from Ha Nam, Kien Giang and Quang Tri. The outcomes of workshop helped call for new and innovative BCC activities (e.g. excellent poultry farmer competitions) and local contributions. This workshop was a first step in the BCC transition strategy to position provincial partners to carry out their own BCC work post-APII.
 - Conducted Year 3 implementation planning workshops in December in the five focus provinces. The workshops helped provinces to think through the Year 3 transition strategy and prepare their BCC plans including campaigns, follow-up at farm level on biosecurity practices in poultry production, new activities such as farmer competition, and to identify provincial funding contribution in implementing Year 3 BCC activities.
 - Provided technical guidance and support on provincial proposals for Year 3 BCC activities in all five-focus provinces. These proposals served as the basis for developing Year 3 BCC SOWs for each province that subsequently were turned into subcontracts for local BCC subcontractors of Ha Nam, Hung Yen, Kien Giang and Quang Tri.
- 6.2.3 Conducted Year 3 BCC Review Workshops in all five provinces. These workshops were to review activities implemented, lessons learned withdrawn and what to report to the PPC to receive further provincial support. Below are key BCC achievements which were recognized by local authorities during these workshops:

- Developed five sets of BCC materials including discussion guides with small and medium poultry producers, community event drama scripts on three selected behaviors defined by provincial BCC trainer teams. These materials have been documented and will be disseminated in the final BCC Transition Strategy Review Workshop in Q1 Year 4. This is the result of the multi sector BCC trainer teams, which showed our effort on provincial BCC trainers' improved capacity.
 - Established, trained and built capacity for a team of about 25 strong BCC trainers in all five provinces. Provinces of Can Tho, Ha Nam, Kien Giang and Quang Tri highly appreciated this capacity building effort. In particular, Ha Nam PPC, Can Tho, Kien Giang, and Quang Tri's DARD gave official appreciation/compliment to their BCC trainers' team for their contribution to design and implement provincial BCC campaigns. These provincial BCC trainers also trained and mentored 110 facilitators and organizers of Community Events, 115 communicators of small group discussion from commune Animal Health, Health, Women's Union and Culture Sectors to lead 32 community events and more than 200 small group discussions which reach about 8,000 and 2,500 poultry producers respectively in this Year 3.
 - Unlike other years, in this Year 3, before participating in small group discussion, around 1,800 poultry producers (except those in Kien Giang) benefited from two-day training courses led and organized by provincial and district trained agriculture extension trainers in collaboration between Provincial Agricultural Extension Center and Women Union to improve their knowledge on risk reduction and biosecurity measures in poultry production.
 - Eighty (80) people from four provinces of Can Tho, Ha Nam, Hung Yen and Kien Giang including village head, the head of commune Women Union Association, a leader of commune people's committee were trained on general monitoring, how and what to do in a household visit: communication skills, steps of household visit and how to use the observational checklists.
 - Local partners conducted household visits to about 10% of poultry producers who participated in small group discussions to observe/discuss motivators and barriers for change of these audiences. More detailed results can be shared in a separate report, upon request.
 - Seven USAID's APII TV spots on hand-washing and proper cleaning and hygiene practices at market, slaughterhouse and at home when contacting with poultry, were aired on all five provincial television channels. These spots were also used in other events such as trainings courses, small group discussions, community events.
- 6.2.4 Finalized and produced the seven-step discussion guides for live bird and plucked poultry vendors in Dong Ha market and for collectors

and slaughterers with technical inputs from MOH, MARD, WHO and FAO. These guides are being used by provincial BCC trainer teams in Quang Tri, Ha Nam in-group discussions to promote desired behaviors among poultry vendors and slaughterers. The guide also serve as reference for all focus provinces to develop their own discussion guides on new bio-security behaviors and will be used by trained communicators to facilitate small group discussions with farmers in this Year 3.

- 6.2.5 Continued to build capacity for provinces through training courses on proposal development and writing skills for 20 key staff and BCC trainers from Animal, Human Health Sectors, Health Communication, Education, Agriculture Extension and Women Union from five focus provinces. Up to now, two provinces of Ha Nam and Quang Tri submitted their proposals for their future BCC activities. More technical assistance will be provided to provinces upon request in Year 4.
- 6.2.6 A qualitative Knowledge, Attitudes and Practice (KAP) study of poultry customers in 4 provinces of Can Tho, Ha Nam, Kien Giang and Quang Tri was completed. USAID/APII extracted results from this qualitative study to design Y3 activities targeting consumers. Three forums conducted in Quang Tri and Can Tho educated consumers on how to select safer food products, especially poultry products and to inform other stakeholders of poultry supply chain on consumer's expectations. The Can Tho forum was filmed and will be broadcasted through Can Tho's television to reach a wider number of the local population.
- 6.2.7 Small group discussions (SGD) were conducted with all poultry vendors and slaughterers of Dong Ha and Hoa Mac markets. These discussions were facilitated by their own BCC trainer teams, promoting good hygiene practices in these targeted audiences. In collaboration with Animal Health team, we conducted monthly meetings with poultry vendors and slaughterers to provide technical update and review their practices and behaviors changed compared with what was discussed during small group discussions, what were difficulties faced and what were solutions to fix these difficulties/problems.
- 6.2.8 Designed and produced BCC promotional materials for stakeholders of poultry supply chain including plastic aprons for slaughterers, hair bandeau, and aprons for vendors and posters of all these audiences. BCC messages, logo and slogan on "*Food safety, we all care*" was used on these materials as well as used for different events of poultry supply chain stakeholders to promote the application of good selling, slaughtering and consumption practices.
- 6.2.9 Different than two previous years, 4 provinces having local subcontractors (Women's Union for Ha Nam, Kien Giang and Quang Tri, Humanity Center for Hung Yen) contributed from 10-15% mainly in kind (locations, prizes for events) to BCC activities implemented in their provinces.

- 6.2.10 Published and/or broadcasted information on all key events conducted in provinces like trainings, workshops, small group discussions, and community events, farmers' competitions...through local newspapers or provincial TV by their journalists. Increasing media dissemination of information/ messages on our project to reach a larger number of audiences than the number of direct participants in the event.
- 6.2.11 KAP quantitative and qualitative reports -- More work has been done with support from Abt home office into data analysis. Final report will be submitted to USAID in the next quarter.
- 6.2.12 Shared APII's BCC approach and its materials with MOH/VAHIP project for reference and replication. APII's materials, tools kits, briefs will be shared and disseminate widely through other channel including the One Health Communications Network.
- 6.2.13 Ongoing development of Communication Strategy Development Guide and Training Manual for BCC trainers. Outlines in English will be shared with API partners before the full document are written in Vietnamese
- 6.2.14 Supported Center Committee for Popularization and Education (CCPE) to provide training on AI and EIDs prevention for more than 500 participants from 63 provinces. The diffusion training courses in CCPE network in 63 provinces/cities were included in provincial monthly plans submitted to CCPE. The monitoring visits made by CCPE to 13 provinces found that nearly 100 articles and 60,300 internal news on AI/EIDs prevention were disseminated and 59 times aired on provincial TVs and 48 times broadcasted through local radio systems.
- 6.2.15 With Ha Nam people's Committee organized a dissemination workshop disseminate their provincial Integrated Communication Plan. The plan was approved with a decision from the vice chairman of PPC that request related agencies to development their communication plan under the leadership of the Provincial Steering Committee for Disease Prevention
- 6.2.16 Attended and had a booth exhibition highlighting Food safety and HIV prevention at the US Embassy to feature information about the two projects' interventions as well as interactive quizzes about hand hygiene and HIV and materials promoting APII's food safety/ avian influenza risk reduction which were all very popular. The quizzes, while entertaining, served as a great opportunity to remind visitors about the importance of hand washing, and to provide education on some general misconceptions about HIV infection.

6.3 Challenges and Solutions

- 6.3.1 Officially certify and utilize BCC trainer teams by related provinces are really an issue as they are from different agencies. There is no clear responsibility for any provincial agency/organization member

of PCU to recognize/ provide a certificate to a BCC trainer. Thus, provincial authorities can just recognize their great contributions to design BCC activities, materials, and implement and monitor BCC activities in their provinces.

- 6.3.2 Knowledge and skills of BCC trainers cannot be gradually improved without opportunities for practicing their job as a BCC trainer. USAID/ APII is trying to connect these BCC trainers to events they can value their BCC knowledge and skill.
- 6.3.3 Local contributions to implement Year 3 BCC activities represented about 10-15% of the total budget. The required discussions and negotiations delayed provincial implementation of activities. Intensive technical assistance from APII staff and strict schedule management helped manage the delays.
- 6.3.4 The development of Strategy Communication Guide and Trainers' Training Manual could not finish at the end of Year 3 the approval process of consultant took more time than planned. It takes more time to review and comments when these were moved to the second half of the year when people are busy with other things.
- 6.3.5 CEFACOM was nominated again by Can Tho PCU as the quality of their previous work is appreciated. The disadvantage is that CEFACOM was not a local subcontractor who is likely to take the ownership and leadership for subsequent communication program on BCC works in Can Tho and they may not have strong connections with other agencies in the province than a local subcontractor. This shortfall did not facilitate several works such as getting the Provincial Integrated Communication Guide developed by Can Tho's BCC trainers to be approved by People's Committee. However, for BCC campaigns, CEFACOM successfully completed their activities and completed them on time even Year 3 BCC campaign in Can Tho started later than in others provinces.
- 6.3.6 Limitations in writing skills and analytical thinking among provincial subcontractors were reconfirmed through their participation as members of the writing team developing Can Tho's Multi-sector Communications Guide and also through their progress reports and activity proposals. This partly explains the delay in some activities.
- 6.3.7 In this Year 3, it was the first time for all provincial BCC trainers developed behavior change materials based on what they had been taught. This includes identifying determinants for changes. They really had opportunities to learn through doing and develop a mutual understanding from their multi-sectoral teams. Their team working manner also requires a lot of coordination that relied on the project's former PC/ PCUs Technical assistance from USAID's APII and their ownership of having their own BCC materials are key motivators for these local BCC trainers to overcome these obstacles.
- 6.3.8 The process of supporting provinces to maintain and sustain their communication activities to prevent AI and EIDs, more technical

support and partial financial one (including other financial mechanism) should be considered. In provinces where they develop their own communication proposals/plans they are seeking local resources.

- 6.3.9 Planned small group discussion and monthly meetings with poultry vendors and slaughterers of Hoa Mac market, Ha Nam province were delayed because of delay in infrastructure and special characteristics of target audience – vendors and slaughterers. Working with the poultry audiences is harder, say compared to farmers, as they always work during the day. Their concerns are driven by cost benefit and daily income compared. This requires a variety of approaches to encourage them to begin making changes for risk reduction and biosecurity. Lessons learned from implementing BCC activities in Dong Ha market, Quang Tri province would also be taken into account when designing the BCC activities with stakeholders of Hoa Mac market, in Ha Nam.
- 6.3.10 With the delay of approval for the consultant to work on the Development of Communication Strategy Development Guide and Training Manual for BCC trainers, there will a delay in the final training workshop for provinces on these materials and the final BCC transitional strategy review workshop.

6.4 Provincial Coordination and Implementation

APII's provincial implementation (PI) team works closely with the animal health, human health and BCC technical teams to coordinate field activities implemented by subcontractors, develop/test successful models at provincial and grassroots level, and advocate for their wider adoption with local public and private partners. The PI team operates out of the main office in Hanoi covering activities in northern Vietnam and through two satellite offices, one in Quang Tri for activities in central Vietnam and one in Can Tho for activities in southern Vietnam.

Provincial Coordination Units (PCUs), representing the body of key provincial counterparts and civil society, were established in Year 1 in the five focus provinces. Each province has a Provincial Coordinator (PC) appointed jointly with FAO and funded by APII. The PCs are typically seconded from a provincial agricultural/livestock agency. The PCs work closely with the PI team, coordinate their efforts with FAO's focal points, and report to the PCUs.

As scheduled in Y3 work plan, the implementation of API models should complete by June 2012 in the focus provinces, so from April 2012 PI team worked closely with PCU and PC to help site down and complete the implementation of models.

6.4.1 Achievements

- 6.4.1.1 Signed MOU addendums for the implementation of Y3 plan with all five-focus provinces.
- 6.4.1.2 In closed cooperation with provincial subcontractors, have prepared work plans in 5 focus provinces with emphasis on dissemination and advocacy activities.
- 6.4.1.3 Cooperated with FAO and provinces to conduct provincial planning workshops in five focus provinces in December, January and February.
- 6.4.1.4 Worked with PCUs to enhance their commitment to strategy of Y3 that shift focus from implementation to advocacy and replication with local resources and get provincial buy-in.
- 6.4.1.5 Organized stakeholder consultation workshops in five provinces to get inputs from provincial stakeholders to CBS review workshop in Hue in April and involved participation from other provinces in regions that to leverage the impact of the workshop.
- 6.4.1.6 Work closely with provincial partners in five focus provinces to organize review meeting /workshops to highlight the success and lessons learned from the models implemented. Beside reviewing the accomplishments, highlighted successes and lessons learned from three years of APII implementation in the province, participants also discussed and recommended suggestions to maintain and replicate the successful models within their province for the time to come.

- 6.4.1.7 The Provincial Implementation Team meets in Hanoi every quarter to review progress on the implementation in five provinces. The meeting went through three main themes with all APII teams: (1) Feedback from five provinces and outline for provincial implementation in the next quarter; (2) Programmatic update and directions/changes for Year 3 and for every period; and (3) cross-sector discussion between PI/BCC/AH/HH staff to define plans and multi-sector cooperation in target provinces.
- 6.4.1.8 In early May the PI Team met in Hanoi to prepare plan for provincial implementation slowdown and complete by the end of June 2012. Meantime, PI staff work proactively with PCU and provincial partners to get them agreed to close contracts with PCs in 5 focus provinces by the end of June.
- 6.4.1.9 Worked closely with PCU and PC in each focus province to identify transition moves to maintain provincial coordination for the phasing out period from July to September 2012.
- 6.4.1.10 Worked closely with PCU and provincial partners to organize “Year 3 final review workshops” in five focus provinces by the end of the project (September 2012). The workshops reviewed accomplishment and highlighted success and lessons learned from three years implementation of APII in the provinces, participants also discussed and recommended to maintain and replicate the successful models within their province for the time to come, also to inform policy makers at national level.
- 6.4.1.11 Gathered inputs from PCUs in five focus provinces for draft agenda of a “provincial coordination – lessons learned workshop” that will be organized by the project in October 2012 aiming to share experience from PCU and recommendation for effective coordination at province to ensure participation and uptake with local resources.

6.4.2 Challenges and Solutions

- 6.4.2.1 Shift from implementation to advocacy led to significant reduced implementation/investment to province and might reduce support and commitment from provinces. To prevent this potential thread, the PI staff worked closely with PCUs to explain on strategic changes and maintain provincial interest and constructive.
- 6.4.2.2 Maintaining provincial interest and commitment when APII has no more implementation and support to province activities.
- 6.4.2.3 Keep provincial coordination in the last three months from July to September 2012 when APII stopped payment for PC but there are huge need to review three years’ cumulated results and lessons learned, advocacy for adoption and uptake by local partners.

7. National Coordination & Policy Dialogue

The goal in Year 3 is to increase the focus on ways and mechanisms to transfer packages/models/approaches to public and private partners for adoption, adaptation, and replication and up scaling. The project consults and coordinates closely with API partners in this effort.

7.1 Achievements

- 7.1.1 With PAHI supported NAEC to chair series of quarterly meetings of the form BCC Working Group, current One Health Communication Network. A draft Plan of Action to revitalize the network was developed to maintain the routine meeting and to identify common interests in AI and EIDs prevention. More support will be provided to NAEC so that they can take the full leadership of this network by the end of 2012.
- 7.1.2 Communicated about project's results more to the wider audience through media advisories and press releases. Tracked aired clips and news and shared with partners and USAID.
- 7.1.3 Developed APII living advocacy matrix and communication strategy for Year 3 and will be updated with Year 4 to share with USAID.
- 7.1.4 Engaged an international expert as Advocacy/Policy Dialogue Advisor. This input is already bearing fruits and boosting APII's communications work

7.2 Challenges and Solutions

- 7.2.1 Compared to other priorities, local resources allocated for prevention work is always limited including for BCC to prevent AI and EIDs. In order to get more budgets from local government, good work should be turned in good proposals. More advocacy opportunities should be fleshed out to advocate replication of established models supported by the USAID's APII. Provinces should need to know how to advocate for themselves.

8. Monitoring & Evaluation

APII's M&E work aims to strengthen existing systems in the provinces, and help close existing gaps between grassroots level M&E and provincial-national levels M&E and reporting. In addition, APII acts as the repository for PMP indicators collected under USAID's API initiatives, providing analysis and reporting on this data.

8.1 Achievements

- 8.1.1 Collected PMP data of Year 2 and first six months Year 3 from API partners. Contributed to revising indicators and reporting template with MEASURE's lead. Collaborated continuously with API partners to review and supplement PMP data to prepare for future

data analysis. Compiled USAID PMP data in Year 1 and 2 and presented it at the API Partners' Meeting as an input for Year 4 planning process; Together with M&E specialists from MEASURE and FAO, reviewed the proposed activities in Year 4 of all partners and suggested necessary revisions of the USAID VN API's result framework and PMP.

- 8.1.2 Continued to update and fine-tune the project Log-frame. Revised Log-frame to fit with Year 4 work-plan.
- 8.1.3 Continued to provide oversight of ongoing monitoring, evaluation and quality assurance of activities on the APII project. Monitoring checklists were analyzed in Excel for a systematic review of quality of activities. Immediate sharing and feedbacks on activity monitoring results have become a regular practice. M&E Manager routinely review and provide feedbacks on deliverables, particularly when issues are detected.
- 8.1.4 Worked closely with AMDI (subcontractor) conducting the post-training assessment in November 2011. The assessment applied self-administered questionnaires on knowledge, attitudes and practices combined with focus group discussions and in-depth interviews to 1316 trainees, 220 trainers, and 59 local animal and human health officers. Overall, it identified a high level of knowledge, positive attitudes in all groups eight months to a year after the training courses. Higher percentages of trainees self-reported applying almost all gained skills with a high level of confidence. The assessment also acknowledged the working mechanism for AI prevention through hand-in-hand cooperation between AH, HH and communication sectors as a promising way to create long-term impact in HPAI and EIDs prevention and control.
- 8.1.5 Obtained acceptance from American Public Health Association (APHA) for an abstract on post-training assessment for 140th Annual APHA Meeting to be held in October 27-31, 2012 in San Francisco, USA.

The abstract can be found at here:
<https://apha.confex.com/apha/140am/webprogram/Paper264584.html>
- 8.1.6 Provided inputs to SOW and deliverables on the KAP survey and other assessments in order to help ensure technical soundness in APII's work.
- 8.1.7 Met with local partners in Ha Nam, Quang Tri and Can Tho to explore local plans for inspection of slaughter house/points and live bird market; then to identify possibility for involvement of local partners in the project's monitoring activities to the demonstration sites in these provinces. In September 2012, the project team worked with BCC trainers, AH officers and inspectors of Sub-DAH, and the owner of Ngoc Xuan slaughter-house in Can Tho to update monitoring checklist and develop a work-plan for multi-sector supportive monitoring activities for behavior change at this

Slaughterhouse in Year 4. The plan synergizes efforts and resources from both project and Can Tho Sub-DAH as it includes continuous monitoring and inspection activities and an official assessment in November 2012 to grade the SH by Can Tho Sub-DAH. A similar plan was developed for demonstration sites in Quang Tri and Ha Nam provinces.

- 8.1.8 Conducted a final CBS evaluation with technical lead by an international consultant and field implementation by a local sub-contractor (AMDI) in three provinces (Hung Yen, Quang Tri and Can Tho). The evaluation team carried out epidemiological data review, KAP survey on CBS collaborators, and in-depth interviews to AHWs, HHWs at commune, district and provincial levels and households having outbreaks. In July 2012, a debrief meeting was held at USAID Vietnam Office, followed by finalization of the final report. The evaluation identifies that CBS is effective in enabling early detection and response of HPAI outbreaks in the province where there is a supportive policy environment, a high prevalence of outbreaks, willingness to reveal epidemiological data; plus CBS is linked with network development of AHWs at grass root level. This finding has oriented for developing a relevant plan for CBS replication in Year 4.
- 8.1.9 In March 2012, the M&E Manager attended a training course on participatory planning and M&E and Management for Impact (PPME and M4I) in Netherlands.

8.2 Challenges and Solutions

- 8.2.1 We work in the context of “One PMP indicator set fits all” while interventions by each API partner are diversified and coordination mechanisms among partners are not always clear. It is a complicated process to harmonize/standardize indicator definitions and reporting requirements. To improve the situation, it is necessary to develop a clear timeline and define clear roles of each partner. To speed up the process, APII took initiative to meet with FAO and WHO to review the past data and identify the needs in supplementing “missed to report” data in Year 1 and Year 2 and updating reporting templates.
- 8.2.2 To manage and ensure quality of deliverables from subcontractors is often a ‘painstaking’ process with much time and effort spent by APII staff from the beginning to the end and final deliverables. It requires frequent communication, close monitoring, careful checking, guidance and mentoring to help ensure that we receive products of acceptable quality throughout. Very often we end up spending far more time than expected on assuring quality of work by subcontractors. An important lesson learned is the need to have clear elaborated deliverables from the outset. APII needs to document this effort and highlight any related ‘capacity building success stories’.
- 8.2.3 Challenges are faced for both of measuring and sustaining changes in trainees’ competencies and performance as identified through the

post-training assessment. The challenges for measurement include lack of baseline/need assessment at the beginning of training programs; unavailability of lifetime records of every trainee for tracking changes and requirement of significant resources. Key barriers for sustainability at institutional and individual levels include a lack of regular incentives (e.g. salary or allowances) or formalization of surveillance roles for AHWs; shortage of resources, standardized tools and frameworks for follow-up, continued on-site training and learning. The assessment recommends involving local partners in all stages of project's interventions as well as advocating for policy development to create an enabling environment for a higher sustainability.

- 8.2.4 To measure social, economic, environmental and biological impacts at the demonstration sites also face challenges in resources (time, money and human resources). The project has explored opportunities for collaboration with API partners to make the best use of the available efforts where possible. To remedy this shortage, the project is documenting carefully monitoring data to keep track the behavioral and operational improvements as much as possible.

9. Administration & Finance

9.1 Achievements

9.2 Managed all aspects of the finance and administration and all subcontracts and consultant agreements effectively. The procedures were streamlined during the course of the year.

9.3 Shorter turnaround time with the Regional Contracting Officer also helped improve the Consultant recruitment process during the course of the year.

9.4 APII continues to submit routine deliverables to USAID, including quarterly progress reports, quarterly financial reports, semi-annual and annual reports etc. The F&A team support the technical teams in managing all subcontracts and consultants.

9.5 Managed multiple Subcontracts and Consultant Agreements for all components. All subcontracts and consultants are now tracked better by the F&A team helping to prepare contract modifications in advance (and reduce need for retroactive approvals). Technical teams are regularly updated and reminded of due dates for upcoming deliverables.

9.6 Smooth coordination and communication with USAID and quicker approvals/turnaround times help reduce delays.

9.7 Internal communications in APII on recruitment of consultants and preparations of subcontracts have improved.

9.8 Challenges and Solutions:

9.9 Retroactive approval for AFAP Year 4 pending with USAID. Will follow-up.

9.10 Application for registration with Paccom (to open up for direct implementation) has been pursued for a long time but cannot succeed because our status does not meet their requirement. We have officially requested them to refund to the project the advance amount that we paid them in order to process the application

9.11 The available sub-contracting mechanisms remain a challenge to partners particularly those with little working capital or capital reserves and little experience in contracting with international development partners/donors. No immediate alternatives or solutions have been identified other than to continue to work closely with the subcontractors to prepare contracts and fulfill their obligations under contract.

10. Success Stories

11. USAID/APII programs strive to improve veterinary hygiene at poultry slaughtering points in Hoa Mac town, Duy Tien district, Ha Nam

In July of 2011, the USAID's Avian and Pandemic Influenza Initiative Project (USAID/APII) supported Ha Nam's Department of Agricultural and Rural Development provincial proposal to provide additional education and training for veterinarians working in cattle and poultry slaughtering. This effort is in alignment with recently published national Circular 14 promulgated by Department of Animal Health and the Ministry of Agricultural and Rural Development. This project provides a training platform for other small-scale poultry slaughterer's to emulate. Additionally this project was done in concert with local businessmen and USAID/APII both providing portions of the financial support.

The USAID's Avian and Pandemic Influenza Initiative Project (USAID/APII), in close collaboration with Hoa Mac town People's Committee upgraded a small-scale slaughter point in the town of Hoa Mac, Duy Tien district, Ha Nam. Realizing the benefits gained from the upgrades and improvements to the slaughtering hygiene, the owner of the slaughtering point contributed 30% of the total cost. He agreed to separate the slaughtering area from his family living area, create a one-way slaughtering line, install new and higher roofs and tile the floors and walls. These upgrades allowed for better cleaning and sanitizing; improved hygiene facilities and provided standard equipment for the processing line.

The project also renovated the animal meat section of Hoa Mac Market where now plucked poultry, beef, and pork are all sold in separate areas from the fruits, readymade rolls and other non-meat products. In the past tables and floors were constantly wet, dirty and difficult to clean and disinfect. Upgrading the tables and floors and improving the waste water

systems and electricity have significantly improved hygiene practices at this market.

In addition to the facility renovation projects, USAID/APII has provided a series of training courses for slaughterers, vendors and veterinary inspectors on proper veterinary inspection processes, HPAI risk reduction, food safety and sanitation. Follow-up discussions on key behaviors to include hand washing; and proper disinfection techniques continue. Monthly meetings were also provided for provincial food preparers on behavior change and the need for continued education and promotion of safe food practices. Special educational posters are hung at slaughter points and animal meat areas throughout the market to remind consumers of the need for these behaviors. These same posters remind meat handlers on the importance to reduce risk and ensure that food safety practices continue in this small-scaled slaughter point and animal meat market model.

In late October there was a handover and market reopening ceremony. It was noted that this small-scaled poultry slaughter point renovation has helped the province realize the proposal of local authorities. Replication of this demonstration model has been started with local resources and community contributions. In an annual project review workshop, Mr. Nguyen Manh Hung, Deputy Director of the Department of Agricultural and Rural Development shared that to expand the efforts to improve veterinary hygiene and food safety, the provinces will need to map out their plan to replicate this upgraded slaughter point and market model to other districts. Reference was made to ongoing replication in Ly Nhan market with upgrades to the fresh fish area with vendor's contribution and pathways in Hoa Mac market.

Quang Tri province adopts Community-Based Surveillance (CBS)

In April 2012 the final CBS evaluation was conducted by USAID/APII, and proved that the CBS model in Quang Tri province was being used. It helped to identify multiple events of H5N1, Blue Ear and Foot and Mouth Disease (FMD) resulting in timely disease control actions. Review of epidemiological data showed that among the twenty H5N1 events CBS collaborators detected eleven events (55%) and commune animal health workers (CAHWs) detected the remaining nine (45%). The mean time

calculated from disease onset to system's detection for the collaborator events was 1.8 days and 2.9 days for the CAHW level events ($p=0.16$). The CBS data also identified ninety-four confirmed blue ear events and twenty-eight confirmed foot and mouth events.

The collaborator surveys and in-depth interviews with stakeholders revealed that the CBS system was simple in structure and operation and enabled collaborators

to sustain its implementation. Collaborators from all sites performed well in terms of knowing their roles and responsibilities within the system, finding sources of disease information in their community and the disease reporting structure. In general, the system was acceptable to the local key stakeholders. Households initiated contact with the CBS system in the context of seeking treatment for sick animals from village animal health workers (VAHWs). Collaborators demonstrated high willingness to implement their roles under CBS during project implementation. Provincial, district and commune stakeholders confirmed that CBS system operating procedures were generally compatible with those of the National Disease Surveillance System.

In January 2012, the CBS system was officially adopted with the Decision 25 of Quang Tri People's Committee. All village AHWs have been provided a monthly allowance to participate in AH activities, to include disease surveillance.

The evaluation has identified that contextual factors may impact the effectiveness of the system. It is effective in Quang Tri where poultry farming is predominantly small-scale and managed at a household level. Stakeholders described a high level of political intervention will be needed to detect and control outbreaks and to minimize the adverse effects on the livelihood of households. CBS is linked with the formal establishment of a VAHW network at a grass roots level. Based on these findings, the last year of the project will focus on replicating CBS in those central provinces who share similar conditions of those in Quang Tri.

Introduction

This report presents the main achievements, challenges and solutions/lessons learned for USAID's Avian and Pandemic Influenza Initiative (APII) during Quarter 1 of Year 4, October 2012 – December 2013.

Quarter 1 of Year 4 saw the project reach the full level of implementation not only in the five-targeted provinces but also across Vietnam. We continued with the three major focus areas: animal health, human health and behavior change and communication. Activities are implemented via subcontracts, as Abt's current license does not accommodate for direct implementation. This carries its own unique challenges as it often is difficult to find subcontractors capable of delivering quality work on time, and strengthening the capacity of subcontractors has therefore become a vital part of APII's work. This is especially true in Year 4, as we have very limited time to complete our projects and close out the programs. We are working with our partners to provide them with our models and training programs for future use.

The project progressed well in most of the eight main focus areas:

1. Coordination & Policy Dialogue
2. Human Health Surveillance
3. Case Management and Infection Control (IC) Capacity Building
4. Pandemic Preparedness
5. Animal Health Surveillance
6. Animal Health Worker (AHW) Capacity Building and Agricultural Extension Worker (AEW) Capacity Building
7. Supply Chain (Poultry Supply Network) Strengthening;
8. Behavior Change Communication (BCC)

Year 4 is also the year where the project is in full swing to orient itself towards advocating for the wider adoption and sustained implementation of models beyond the life of the project. Adoption, adaptation, replication and scaling up of APII innovations by public and private partners are considered the real measure of success for the project. This will require a sustained advocacy and promotional effort for which the project is carrying out in Year 4 in close consultation with USAID and API partners.

Below follows a description and discussion of the main achievements, challenges during Quarter 1 of Year 4.

1. National Coordination & Policy Dialogue

Under coordination and policy dialogue we have three goals to achieve by the end of Year 4:

- Improved HPAI prevention and control based on improved coordination
- Sustained dialogue, coordination and lessons sharing on communications in Vietnam at a national level

- National communication framework revised in line with AIPED and officially approved by National Steering Committee for Avian Influenza (NSCAI) and applied by all members in planning and implementation.

1.1 Achievements

- 1.1.1 With PAHI, APII supported NAEC to chair the quarterly meetings of the One Health Communication Network (formerly known as the Avian Influenza BCC Working Group). A draft Plan of Action to revitalize the network was developed to maintain the routine meetings and to identify common interests in prevention and preparedness for AI and EIDs. APII is continuing to support NAEC to take the full leadership of this network during 2013.
- 1.1.2 Communicated about project's results more to the wider audience through media advisories and press releases. Tracked aired clips and news and shared with partners and USAID.
- 1.1.3 Developed the APII living advocacy plan and matrix as well as the communication strategy for Year 4.
- 1.1.4 Engaged an international expert, David Payne, as Advocacy/Policy Dialogue Advisor. This input is already bearing fruits and boosting APII's advocacy and communications work.

1.2 Challenges and Solutions

- 1.2.1 Compared to other priorities, local resources allocated for prevention work is always limited including for BCC to prevent AI and EIDs. In order to get more budget resources from local government, good work should be turned in good proposals. More advocacy opportunities should be fleshed out to advocate replication of established models supported by the USAID's APII. Provinces require ongoing technical assistance in advocating for themselves.

2. Human Health Surveillance

The human health surveillance model was developed over the first three years of the project as part of an integrated approach to community-based surveillance (CBS) in the five APII focus provinces: Can Tho, Ha Nam, Hung Yen, Kien Giang and Quang Tri. Based on the results of the external evaluation of the CBS activity conducted during FY12, the human health surveillance model has been separated from the animal health surveillance model to promote its adoption, adaptation, replication and scale up during the final year of the project. The goal of APII activities in Year 4 is to support national/provincial policies that facilitate community level surveillance and to replicate the relevant model in exiting provinces and in new provinces.

2.1 Achievements

- 2.1.1 The SOW of the subcontractor for human health surveillance activities in Year 4 was developed, submitted and approved by USAID.

- 2.1.2 The National Institute of Hygiene and Epidemiology (NIHE) was identified as subcontractor through a competitive bidding process. NIHE will work closely with APII technical staff, WHO, MOH and VAHIP to: a) conduct a regional workshop during Q2 to review the implementation of MOH's Circular 48 as it relates to local surveillance at the commune and village levels, in order to share APII's models, the experiences from the APII pilot provinces and the results of the CBS evaluation; b) organize a regional Training of Trainers (TOT) course for new provinces; and c) provide technical assistance to provincial Preventive Medicine Centers on developing/revising provincial plans on implementation of Circular 48 and replication of the relevant model on human health surveillance with a focus on EIDs and zoonotic diseases in their respective locations.

2.2 Challenges and Solutions

- 2.2.1 The process of selecting an appropriated subcontractor took longer than anticipated. We typically expect delays for required paper work, budget negotiations, preparations of CVs, Bio data, and leave without pay letters but we have also had a decrease in F/A staff during this time... The firm initially identified to implement the subcontract for the CBS evaluation withdrew and another company (AMDI) was identified as a suitable replacement. The change in subcontractor caused a delay in implementation but the evaluation is progressing well. APII staff spent considerable amount of time reviewing the subcontractor's work to insure quality.

3. Case Management and Infection Control (IC) Capacity Building

The Year 4 goal is to assist the GVN in rolling out a training model developed to assist health facilities in operationalizing Circular 18."

3.1 Achievements

- 3.1.1 The SOW for the Viet Nam Nursing Association (VNA) on APII infection control activities in Year 4 was developed, submitted and approved by USAID. VNA will work closely with APII technical staff, national IC experts and WHO in collaboration with MOH and three IC Societies (Hanoi, Hue, and Ho Chi Minh) to replicate the IC training model for in-service and pre-service systems. During Q2 and Q3 VNA will: a) conduct three regional TOT courses for IC specialists from health facilities in 15 new provinces and for teachers from 15 institutions, b) coordinate with MOH to support Departments of Health to implement the national action plan on strengthening IC at health facilities including dissemination training on IC, and c) support some medical/ nursing schools to revise, test and finalize their IC lesson plans and introduce and review them in a one-day workshop for medical institutions.

- 3.1.2 October 2, 2012: Senior APII staff participated in the *Workshop on the National Action Plan on IC Strengthening at Health Facilities: now to 2015* chaired by the MOH Vice Minister in Hanoi. USAID/APII's IC training model was introduced and the training document was distributed to all participants in the workshop. Further discussion on realizing IC training through the local training program is still in progress.
- 3.1.3 October 3, 2012: Senior APII staff participated in the *IC Scientific Conference* hosted by MOH's Administration on Medical Service in Hanoi. The participants had the opportunity to share research and new IC guidelines. After the meeting, these guidelines were distributed and implemented in all health facilities.
- 3.1.4 October 25 and 26, 2012: Senior APII Staff participated in the *National Workshop on Nursing Science and National Review Workshop of Vietnam Nursing Association* led by the MOH and VNA. During the meeting the hosts discussed cooperation for implementing the nationwide IC training program in the future.
- 3.1.5 Resulting from a meeting in September 2012 (Q4, Year 3) between the USAID/APII and the Board of Directors, Au Lac Private Nursing School in Hue announced that they are moving forward with adopting the APII/MOH IC training materials for their 2012/2013 school years. A full credit IC course of 60 sessions will be used to train 220 nurses and 150 physicians this year.

3.2 Challenges and Solutions

- 3.2.1 The process for finalizing the VNA contract took longer than anticipated because of year-end time commitments and the large number of meetings and workshops during the early fall on IC and nursing that required the attention of both APII and VNA staff. While these meetings caused delayed they also presented USAID/APII staff with opportunities to share the IC training model with in-service and pre-service systems, resulting in several conversations with provincial Departments of Health and training institutions who have indicated their interest in the IC curriculum and IC materials.

4. Pandemic Preparedness Planning (PPP)

The Year 4 goal is to introduce PPP packages in other provinces, and advocate for its wider adoption in Vietnam.

4.1 Achievements

- 4.1.1 On October 31, 2012, APII organized a national workshop for sharing experiences preparing pandemic preparedness and response plans in Hanoi. The workshop aimed to: a) introduce northern and central region provinces and central level stakeholders to a new approach for developing and revising PPPs according to the current situation, b) share experiences from the process of developing and

improving Kien Giang's provincial plan, and c) identify recommendations for improving provincial plans, applying the new approach to whole-of-society planning and maintaining the continuity of essential services. Participants in the workshop included the VNRC, DAHs, GDPM, the Central Propaganda Department/Committee, the HCM Institute of Hygiene and Public Health, VAHIP, FAO, WHO, PAHI, APII and USAID; as well as representatives from 13 provinces including Hung Yen, Ninh Binh, Bac Ninh, Bac Giang, Hai Phong, Hoa Binh, Ha Tinh, Nam Dinh, Bac Kan, Thanh Hoa, Ha Nam, Quang Tri and Kien Giang.

- 4.1.2 The SOW for Humanitarian Center, Hung Yen Red Cross Association for Pandemic Preparedness Plan (PPP) activities in Year 4 was developed, submitted and approved by USAID. During Q2 and Q3, the Humanitarian Center will: a) Organize a PPP workshop for Hung Yen authorities, multi-sectors and mass organizations to introduce the new concepts of "whole society" approach, business continuity plan (BCP) and present the multi-sector framework of PPP, b) revise the PPPs in Hung Yen province to include the whole society approaches, BCP, and c) conduct one two-day dissemination training workshop for about 35 designated staffs on PPP at provincial and district levels in Hung Yen.

4.2 Challenges and Solutions

- 4.2.1 The process of selecting an appropriated subcontractor took longer than anticipated due to requirements as well as a decrease in FnA staff during this time.

5. Animal Health Surveillance

The animal health surveillance model was developed over the first three years of the project as part of an integrated approach to community-based surveillance (CBS) in the five APII focus provinces/cities: Can Tho, Ha Nam, Hung Yen, Kien Giang and Quang Tri. Based on the results of the external evaluation of the CBS activity, which was conducted during FY12, the animal health surveillance model has been separated from the human health surveillance model for promotion of adoption, adaptation, replication and scaling up during the final year of the project. The goal of APII activities in Year 4 is to support national/provincial policies that would facilitate community level surveillance and to replicate the relevant model in exiting provinces and in new provinces.

5.1 Achievements

- 5.1.1 In year 4, Animal Health surveillance activities intend to concentrate in Central region in collaboration with RAHO3 and a local counterpart in Quang Tri. The SOW was developed for integrating AH surveillance with Animal Health Worker Capacity Building and Supply Chain Model Replication and will be send to USAID for approve in the beginning of Q2 (Mike, it has been sent to USAID?). With the APII's technical assistance. The potential subcontractor will review the USAID/APII animal health surveillance model and

animal health worker (AHW) network model in Quang Tri province and conduct regional courses for replication.

5.2 Challenges and Solutions

5.2.1 Nothing to report at this time.

6. AHW Capacity Building and AEW Biosecurity Training

The goals of the AHW Capacity Building and AEW Biosecurity Training activities are:

- Introduce the AHW training package to new provinces and seek other educational training opportunities
- Introduce the AHW networking model that will be adopted by relevant public-private agencies at national and local levels.
- Introduce the AEW training materials to NAEC, new PAFEC and private sector to applying them throughout AEW system

6.1 Achievements

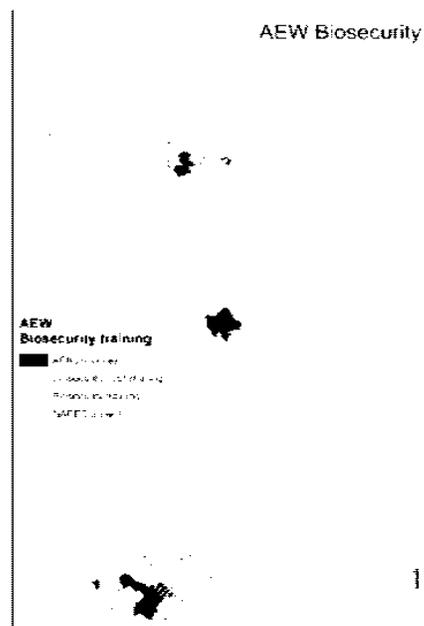

AHW Capacity Building

The AEW capacity building activities in the first quarter of year 4 focused on identifying the local counterparts and provinces and dissemination activities to introduce the AEW Biosecurity training package to other provinces.

6.1.1 Supported the National Agricultural Extension Center (NAEC) to officially adopt AEW training manual and training materials and to promote their use within the national agricultural system. APII has met with NAEC to determine the best method for official review and approval. We have introduced the training system to NAEC and outlined the current projects and agreed on the activities for the coming months. These activities were incorporated into a draft SOW for the Vietnam Poultry Association (VIPA) will be submitted for USAID approval in Q2.

6.1.2 Continue replication of AEW/ Biosecurity training programs for poultry farmers in additional provinces.

During Q1, the biosecurity training package was successfully transferred to

NAEC's *National Waterfowl Development Project* (2011-2013). This project, chaired by Mr. Nguyen Van Bac, covers 14 provinces: five provinces in the Hong River Delta including Bac Ninh, Ha Noi, Hai Duong, Hung Yen and Hai Phong and nine provinces in the Mekong Delta including Kien Giang, An Giang, Bac Lieu, Ca Mau, Dong Thap, Long An, Soc Trang, Tra Vinh and Tien Giang. We identified 452 farmer-developed demonstration farms with 1,320 duck farmers who were all trained by NAEC with materials adapted from the training package. At this time, 4,680 trainees who are raising ducks for meat and eggs have visited demonstration sites and received training materials. In addition, using local funds and integrating activities into the local vocational training centers program, there were 95 training courses conducted in Bac Lieu (10 courses), Vinh Long (five courses), Tra Vinh (20 courses) and An Giang (60 courses) with total of more than 1,000 people attending (Source: NAEC, *National Waterfowl Development Project 1*, 2012).

- 6.1.3 Following a TOFT for 25 local farmer trainers in October 2011, An Giang officially adopted the training package into their provincial project "*Developing biosecurity poultry production in An Giang during the period 2011-2013.*" This project is being implemented in 11 districts and towns of An Giang from July 2011 to December 2013. Since December 2011, these farmer trainers have organized 79 courses on biosecurity for poultry production with 2,319 trainees who are raising chicken and ducks for meat and eggs. They also offered 22 courses for 649 members of 66 poultry cooperative groups, providing training on upgrading biosecurity for poultry production. The training materials were also used by trainers for another 55 training courses on animal husbandry organized by the Provincial Agriculture Extension Center in 2011 and 2012 under the national *New Countryside (Nong Thon moi)* development program. (Source: *An Giang PAFEC 1*, 2012)

AEW Biosecurity Training:

The AHW Training Package consists of a hardcopy training manual, which provides a reference for AHWs (an enhanced manual based on the existing DAH Manual) as well as an E-Book version on CD with additional content for trainers and a sample toolkit with standard equipment for AHW service provision.

- 6.1.4 Negotiations with AFAP on a work plan, schedule and budget for Year 4 were completed in Q1 and submitted to USAID for approval of the contract modification. A final revised contract was signed with AFAP in January 2013
- 6.1.5 After the AHW Training package was approved by DAH/MARD, eight thousand hardcopies were printed with a letter from the DAH Director officially introducing and endorsing these training materials. These books have been distributed to 700 district veterinary stations throughout Vietnam during September – October

2012. This was followed up with an offer of limited support to Sub-DAHs to co-finance AHW training during Year 4.

- 6.1.6 Preparations for an AHW and Biosecurity Training Dissemination Workshop, *which* took place in January 2013 in An Giang during Q1.
- 6.1.7 As a result of cost-shared AHW TOT courses in Moc Chau and Ninh Binh, the Moc Chau Dairy Cattle Company has decided to use the Diffusion Training Program for new AH technicians in the Moc Chau area using their own funds. APII and AFAP are working with Moc Chau Dairy to develop the training curriculum and suggestions for a follow-up coaching. This public-private partnership model was initiated with an MOU (Memorandum of Understanding), which indicates that Moc Chau Dairy Cattle Company will contribute to training on animal surveillance, biosecurity and veterinary skills.

6.2 Challenges and Solutions

AHW Capacity Building

- 6.2.1 The lengthy AFAP approval process has had a bit of an effect to the time schedule of AHW and AEW/Biosecurity Training activities in overall but hopefully AFAP and the local counterparts can speed up right after TET.

AEW Biosecurity Training:

- 6.2.2 It is important for the sustainability and institutionalization of training/extension packages to work closely with NAEC and the PAFECs. This is a time-consuming process, which may not always be the top priority for these organizations and thus requires diplomacy, patience and perseverance in order to forge and maintain close relationships. Obtaining official approval from government authorities was a suggestion from the Deputy Director of NAEC and introducing the AEW/ Biosecurity training through NAEC/PAFEC system and national/provincial projects remains a good option for replication of this training package widely and efficiently.
- 6.2.3 Figures on replication training conducted in additional provinces may not be available in a timely manner where these activities are being funded from local, national or other resources not sourced by APII. APII will continue to build relationships with these counterparts and will seek appropriate ways to obtain useful information and data on the replication of APII models.

7. Supply Chain (Poultry Supply Network) Strengthening

The goals are to develop biosecurity/biosafety demonstration models in key (high risk) nodes along poultry supply chain, together with related documents (protocols, guidelines, training materials) which are adopted, adapted and replicated by public agencies, private partners and/or other development projects and programs elsewhere.

7.1 Achievements

The key activities and achievements of the supply chain work during the first quarter of Year 4 focused on the following activities and nodes:

- 7.1.1 On October 26, 2012, representatives from the People's Committees of Ha Nam province, Duy Tien district and Hoa Mac town, the Department of Agricultural and Rural Development, the DAH, mass organizations, the PAFEC, the Provincial Center for Health Communication and Education, the Sub-DAH, the provincial Preventive Medicine Center, the People's Committees of neighboring districts and communes and USAID/APII as well as market vendors and other slaughter point owners attended the *Completion and Handover Ceremony of the Upgraded Meat Section in Hoa Mac Market and Poultry Slaughter Point in Hoa Mac town, Duy Tien district, Ha Nam province*. In the coming months we will use these project activities as training platforms for other provinces.

During Year 3, the USAID/APII team collaborated with FAO, WHO, local partners and other USAID personnel to identify market and slaughter points in Ha Nam province that are key supply chain nodes for risk reduction interventions and the development of demonstration models that can be replicated in other provinces. Upgrading the meat Section in Hoa Mac Market reduces disease transmission by ensuring appropriate meat-handling procedures are performed in compliance with government regulations. Mr. Hue's small-scale slaughter point is providing the majority of plucked birds for Hoa Mac and surrounding communities. This market was selected for an upgrade and now serves as a model for the province and is being used as a training model. It is also a key stepping stone in the long-term restructuring of the livestock slaughtering network including transition to centralized slaughtering, providing a smaller-scale option that adheres to standard risk reduction measures.

The small-scale slaughter points near the Hoa Mac Market are typical to other small-scale slaughter points throughout Vietnam. The particular small-scale slaughter point chosen by the project for upgrading and process improvement was selected based on location and the willingness of the owner to share the cost. Before renovation the slaughtering area was a shared space in the living area of the family. Slaughtering was performed on the floor with inadequate tools, water and electricity systems. There was little evidence of hygiene and food safety practices. The renovation of this small-scale slaughter point has produced a one-way slaughtering system with products moving from "dirty to clean areas" and has eliminated the habit of slaughtering on the floor. Standardized support equipment also helped to improve the hygiene/sanitation operation and to ensure food safety. There are 45 stalls scattered throughout Hoa Mac market that sell meat products. Poultry occupies 8 stalls that sell approximately 400 birds per day. The stalls selling meat and poultry are now centrally located and divided according to product, i.e. pork, poultry, beef, etc. Water, electricity and hygiene supplies

have been provided separately to facilitate adherence to good veterinary hygiene practices.

Key Activities and Milestones for the Hoa Mac Market and Poultry Slaughter Point:

- Mapping and risk assessment of poultry supply chains;
- Provincial Strategic Planning for HPAI Risk Reduction, Prevention and Control along the Poultry Supply Network;
- Assessment, design and upgrading/renovation of infrastructure;
- Training of slaughterers and meat vendors;
- Communications activities.

This upgraded model has included training on good slaughtering practices and veterinary hygiene assurance for slaughterers, vendors and veterinarians. It has also helped to reduce the potential spread of disease during the slaughtering, selling and transportation processes. A training was conducted by local Sub-DAH, District Veterinary Station and APII on market cleaning, the requirements for infrastructure improvements and market rules for 54 participants including market vendors as well as the market management board, commune animal health workers and personnel from the People's Committee of Hoa Mac Township. The purpose of the training was to brief the vendors before they moved into to the newly upgraded facility.

7.1.2 *Further technical coaching and monitoring of risk reduction demonstration models of the slaughterhouse, slaughter points and live bird markets (LBM) to make those demonstration sites become a better training platform for further training, study tours and consideration for replication:*

**Hoa Mac market and slaughter point:* After the opening ceremony, a multi-sectorial team including the Hoa Mac Market Management Board (MMB), the provincial Sub-DAH, the District Veterinary Station and APII staff from the animal health and behavior change teams has undertaken regular bi-monthly technical coaching and monitoring trips. Action plans were developed for continuous monitoring by inspectors and the slaughterhouse owner right after each trip and shared among the stakeholders. In the market dramatic improvements regarding safer food handling practices have been observed and personnel hygiene has improved, for example, cleaning of tables and floors after closing and cleaning hands after using the toilet. Observation showed that not only in the meat section, but also in the whole vegetable and fishery areas there was upgrading with the contribution of other vendors and the market management board.

In addition, the observation showed that the Hue-Thanh slaughter point in Hoa Mac had secured a new contract to supply poultry meat

to three kindergartens, totaling 26-27 kilograms per day two days per week. This doubled the volume of poultry he was processing. However, while many slaughtering practices have been improved (good one-way slaughtering, cleaning and safer poultry handling practices) some behaviors remained unchanged between monitoring visits. Brand development has been identified as an additional project activity to increase the motivation for the owner in the long run and to help him to reach potential customers in the area, contributing to the long-term sustainability of the improvements.

**Dong Ha live bird and poultry meat market in Quang Tri and two home-based slaughter points:* On November 26, 2012, APII together with the Dong Ha Market Management Board, the Sub-DAH and the provincial Women's Union (WU) met with about 25 live and plucked poultry vendors to review issues related to cleaning, the live bird section arrangement and promotion of good slaughtering practices. Meeting minutes were shared with the Sub-DAH for enforcement of good, consistent slaughtering practices. The technical team provided operational coaching and mentoring for slaughterers and slaughterhouse owners, focused on behaviors during slaughtering, processing and sanitation and developing detailed action plans for meeting their responsibilities for biosecurity and biosafety.

**Monitoring Ngoc Xuan Centralized Poultry Slaughterhouse, Can Tho City:* APII staff conducted regular follow-up/monitoring visits and held a specific meeting to examine slaughtering processes and problem solving at Ngoc Xuan. To date most of the infrastructure is in place and operational procedures are established and being followed. During these visits observations identified most difficult-to-change practices as: a) poultry separation, b) off-floor slaughtering, and c) sanitation during the slaughtering process. APII organized a feedback meeting to discuss barriers preventing slaughterers from adopting improved practices and an action plan was developed with commitment from the slaughterers, slaughtering line managers and the Ngoc Xuan Slaughterhouse owner, and the inspectors and Sub-DAH were asked to assist in the monitoring and enforcement efforts. More than 60% of slaughter lines have applied the one-way slaughtering practices and off-floor slaughtering as a result of these monitoring and follow up efforts.

- 7.1.3 Sharing lessons learned and experiences for national and regional levels. In order to approach RAHO 3 and RAHO 7, field trips and meetings were held between the APII project directors and key staff of the new regional counterparts on November 7, 2012 in Vinh and November 27, 2012 in Can Tho.

In the meeting with RAHO 3 in Vinh, the Quang Tri Sub-DAH presented their results from the last three years with regard to disease surveillance, AHW capacity strengthening and network development, supply chain improvements and the integrated BCC program to the RAHO 3 directors and garnered interest in

identifying opportunities to replicate USAID/APII developed models in central Vietnam. The team also met with Sub-DAHs in Ha Tinh and Quang Binh to explore the potential for replication of project models.

The meeting in Can Tho with RAHO 7 also confirmed their interest to support replication of the AHW training and improvements to slaughtering facilities models.

On November 27, 2012 in Can Tho, in cooperation with DLP and FAO, 43 participants from RAHO 7, RAHO 6, DLP, FAO and USAID/APII attended *The 21st Biosecurity Working Group meeting*, funded by APII and FAO. The meeting focused on a) the current situation of poultry slaughtering in regions 6&7; b) dissemination of USAID/APII's risk reduction, veterinary hygiene and sanitation model at Ngoc Xuan Slaughter House; and c) recommendations and suggestions to reduce risks in slaughtering facilities by improving bio-security measures. USAID/APII recommended that training for selected slaughterhouse and slaughter point owners in these regions on risk reduction and food safety improvements in slaughtering environments should be considered as a follow-up activity of this meeting.

Mekong Regional training courses for slaughterhouse owners: On December 19-21 and 24-26, 2012, in collaboration with RAHO 7, APII organized two training courses on Veterinary Sanitation and Food Safety for 58 slaughterhouse owners and selected staff of Sub-DAHs from 13 provinces in RAHOs 6 and 7. These participants had the opportunity to join study tours to slaughtering facilities in Can Tho, Long An and Tien Giang including the USAID/APII supported Ngoc Xuan slaughterhouse model, and the USAID STOP AI supported Go Cong slaughterhouse model. Slaughterhouse owners in Ba Ria-Vung Tau and Dong Nai provinces showed their interest in replicating the USAID models through official letters calling for support that have been reviewed and incorporated in the plan for provision of technical assistance in the coming months.

In Quang Tri on December 20 and 21, 2012 in collaboration with Quang Tri WU, APII organized a two-day *dissemination workshop* in the Northern Central region to promote the use of a multi-sectorial approach to improving food safety of poultry and poultry products through BCC. More than 60 participants from the central Vietnam WU, FAO and the Ha Tinh, Hai Phong, Thanh Hoa, Quang Binh, Quang Ninh and Thua Thien-Hue province WUs participated in this workshop and visited the upgraded Dong Ha market and slaughter points.

- 7.1.4 On November 15, 2012, USAID/APII and Sub-DAH and other local counterparts of Ha Nam province hosted a *Supply Chain Models Technical Review Meeting*. This is a good chance for all sites to review the road map of the past two-years of collaboration and to identify achievements. The meeting agreed that most of the

identified and agreed indicators have been achieved, such as: successfully upgrading a district model market and a slaughter point that can be used for replication in the other districts and possible deploy to new province; increasing the effectiveness of state management on slaughtering and veterinary hygiene inspection activities for slaughter points and the sale of meat products. Following this, positive news has been received regarding a new provincial decision number 32/2012/QĐ-UBND on the management of animal and animal product slaughtering, transportation and inspection in Ha Nam province had been issued on December 13, 2012. After the provincial proposal for 2012-2020 to improve the animal slaughter inspection and the Duy Tien district proposal of slaughter inspection 2011-2012, this was a very positive outcome of the past three years of collaboration between APII and Ha Nam local authorities.

7.1.5. November 20-23, 2012: In collaboration with and with co-facilitation from the Ha Nam Sub-DAH, an advanced training course for Inspection for Food Safety and Sanitation for Poultry and Poultry Products was conducted for 40 inspectors from the veterinary stations of Thanh Liem and Duy Tien districts and Phu Ly City. The training provided updated knowledge on avian influenza, emerging infectious diseases and food borne diseases; the supply chain and how disease transmission occurs at key nodes; and the design and operation of poultry slaughtering facilities to enhance sanitation and food safety. Evaluation results from the training showed that most of the trainees achieved knowledge on inspection of good practices on food processing, safe slaughtering and waste management as well as being capable in providing effective supervision to slaughter points for better food hygiene and safety.

In addition, in collaboration with the Quang Binh Sub-DAH and RAHO 3 Veterinary Hygiene Division, APII provided technical support and co-financed a training course for Veterinary Inspectors on slaughtering practices, sanitation and food safety in Quang Binh on December 10-17, 2011. The training also included a visit to the Dong Ha Slaughter Point model to expose the trainees to risk reduction measures and to build their understanding on basic design and operation requirements for good slaughtering practices.

7.2 Challenges and Solutions

- 7.2.1 Profit margins from poultry slaughtering are especially small, and even more so in small-scale slaughtering operations. It is understandably hard to persuade these small private entrepreneurs to invest in facility upgrades without some form of 'subsidy' (financial support). Micro-finance options in the commercial financial sector (banks, MFIs) are rare. Many small entrepreneurs appear to be comfortable with their status quo business (size). Cost-cutting measures seem a more appealing way forward to improve business and increase profits. This also implies cutting private costs on environmental safeguarding and food safety-related measures. APII

continues to reach out to and invite partners such as LIFSAP and VAHIP to participate in project activities. Partners rarely reciprocate however.

8. Behavior Change Communication (BCC)

During the reporting period, we continued to work with Can Tho, Ha Nam and Quang Tri provinces, where the project has been providing support on the establish of poultry supply chain demonstration models at markets and slaughtering facilities (both centralized and small scale), to improve the behaviors of vendors and slaughterers working in plucked meat markets and the centralized slaughterhouse. We refined a set of BCC materials ready to share widely and during the two dissemination workshops. We have organized national and regional dissemination workshops in Ha Noi and Quang Tri respectively to roll out the BCC training model and advocate for multi-sectorial use and funding of communication programs with the participation of central-level agencies and 19 provinces throughout the country. We are working with Quang Tri WU and Farmer's Union to replicate BCC training model into the WU network and vocational training schools belonging to the Farmer's Union.

8.1 Achievements

- 8.1.1 Refined and produced BCC materials including five sets of discussion guides with small and medium poultry producers, vendors and slaughterers, community event drama scripts and other BCC documents developed over these three last years. This package of electronic and printed BCC materials was shared to participants from 24 provinces and the national level attending the National and Regional BCC Dissemination Workshops on BCC training model in December 2012.
- 8.1.2 Developed the second draft of the Communication Strategy Development Guide and BCC Training Manual. These documents are being translated into English for sharing with API partners for comments before finalization and dissemination to all provinces.
- 8.1.3 Designed and produced posters on BCC Training Model and BCC 3-year pathway. The two posters aim to visualize the BCC Training model and the BCC three-year transitional pathway of USAID/APII. These two posters were shared in the Ha Noi and Quang Tri BCC training model Dissemination Meetings in December 2012, and were highly appreciated by meeting participants for their thoughtful visualization and easy understanding.
- 8.1.4 APII hosted two Dissemination Workshops in Ha Noi and in Quang Tri in December 2012 gathering more than 130 participants coming from 19 provinces across Vietnam. This was an opportunity for the USAID/APII and its local partners to share lessons learned on its BCC Training Model to interested institutions and individuals for further adoption and replication. It was also an opportunity for provincial trainer/specialist teams to illustrate what they have gained

and are capable of doing as a result of their participation in the Model. Participants discussed and prepared plans on partial or full adoption of the model with essential support from the USAID/APII and its five focus provinces. The first replication of this model will be done by the Vietnam Farmer's Union through the development and official introduction of a BCC module for teachers through their Vocational Training School system.

- 8.1.5 Based on their interest in the USAID/APII BCC Training Model, the Vietnam Farmer's Union asked USAID/APII BCC for support to develop and officially introduce the BCC module for their trainers at their Vocational Training Schools. This scope of work was approved and other preparation tasks for signing the subcontract are ongoing.
- 8.1.6 Explored different opportunities to replicate BCC Training Model including a meeting with the Hai Phong WU and with the president of Women Consumer Club of Ha Noi under the Vietnam Association of Retailers.
- 8.1.7 Developed BCC materials for Hoa Mac market, Hue-Thanh slaughtering point and Ngoc Xuan Centralized Slaughterhouse. In combination with other inter-personal communication activities, posters promoting the application of good slaughtering and selling practices were developed, produced and hung. Posters promoting good consumption practices targeting consumers frequenting these places are under consideration for development.
- 8.1.8 **Continue behavior change activities at nodes** (Hoa Mac market, Hue-Thanh slaughtering point in Ha Nam; Ngoc Xuan Centralized Slaughterhouse in Can Tho):
 - In collaboration with AH and PI teams, APII conducted a meeting with relevant stakeholders including Ha Nam and Can Tho Sub-DAH, leaders of Hoa Mac People's Committee and MMB and target audiences to plan behavior change monitoring and follow up activities.
 - At each node, conducted small group discussions (SGD) with poultry vendors and slaughterers. These small group discussions were organized and facilitated by a multi-sectorial team of provincial BCC trainers. Action planning on solutions for change were collated and shared with related stakeholders for follows up.
 - Conducted monitoring trips including observation of actual practices from target audiences, identification of areas to be improved and discussion with audiences to help them find out optimal solutions for their own problems.
- 8.1.9 Broadcasted a 20-minute video of the Stakeholder's Forum on Safer Poultry Production and Food Safety in Can Tho on Can Tho City Television in December 2012. Key issues addressed in the forum including current regulations related to the responsibility of

stakeholders to contribute to the safety of poultry products, consumer's experiences while choosing and preparing poultry and practices and efforts of poultry slaughterers, vendors and Ngoc Xuan slaughterhouse owner to contribute to safer poultry products were broadcasted to reach a larger public audience.

- 8.1.10 Followed-up with individual provincial BCC trainers on their utilization of BCC knowledge and skills in their daily work. The follow-up results were used as inputs to design the agenda of the BCC Model Dissemination Workshop and to provide suggestions for trainers to prepare presentations for this Workshop. Continuous follow-up will be recorded to enhance sustainability of the impact of the BCC training model in provinces.
- 8.1.11 Met and discussed with VAHIP project to map out potential collaboration and experience sharing on USAID/APII's BCC model.
- 8.1.12 Published and/ or broadcasted information on USAID/ APII's results and key events through media advisories and press releases on local newspapers and television. Written articles and posted news were tracked and shared as follows:

http://tintuc.vnn.vn/video/xa_hoi/637041/thay-doi-hanh-vi-nham-cai-thien-an-toan-thuc-pham.htm

<http://www.baoquangtri.vn/default.aspx?TabID=56&modid=377&ItemID=63696>

8.2 Challenges and Solutions

- 8.2.1 Follow-up on the utilization of provincial multi-sectorial BCC trainers' teams may face difficulties on an individual basis because there is no formal reporting line of responsibility from the provinces to the project. There is no coordination mechanism in these provinces during Year 4. Concrete/strategic follow-up activities should be planned with the overall APII team as whole.
- 8.2.2 Slow development of the Communication Strategy Development Guide and BCC Training Manual, which document in detail the transitional pathway of the APII's BCC approach. The BCC team needs time to provide input and to review different drafts. Then it takes time to get good translation and editing in English. By the time the materials are ready to update, it will be the TET period when it is difficult to have full attendance from provinces. However, these

materials will be completed within February and all the dissemination work will be done by the end of March. These materials will be used as a reference for subsequent work with the Farmers' Union.

9. Monitoring & Evaluation

USAID/APII's M&E work aims to strengthen existing systems in the provinces, and help close existing gaps between grassroots level M&E and provincial-national levels M&E and reporting. It also aims to facilitate and guide project implementation towards achievement of impacts to contribute to achieving the stated objectives articulated in the USAID's API Performance Management Plan. In addition, APII acts as the repository for PMP indicators collected under USAID's API initiatives, taking the lead in providing analysis and reporting on this data.

9.1 Achievements

- 9.1.1 Prepared and shared a brief on progress of the USAID PMP, challenges and next steps with USAID and API partners following the API partnership meeting in November 2012.
- 9.1.2 Continued working with MEASURE and API partners on the data analysis plan and necessary preparation for a "good shape" PMP database for upcoming evaluation. Based on PMP data knowledge and discussions with FAO and WHO, USAID/APII provided comments on the draft MEASURE-developed data analysis template and discussed with MEASURE about program's data analysis needs and data reporting requirements in this year, making a connection with the scope of upcoming USAID's final evaluation. MEASURE is now working on necessary improvements of the analysis plan, based on USAID/APII's comments and the evaluation plan.
- 9.1.3 Finalized the project's Logframe through refining indicators to reflect selected approaches and interventions in realization of the annual work plans and defining targets for every indicator.
- 9.1.4 Prepared and submitted to USAID data quality assurance (DQA) documents for a number of the project's indicators in the Logframe of the first three project years upon USAID's request, using USAID's templates.
- 9.1.5 Reviewed and provided comments on project's advocacy plan as well as assigned indicators for monitoring realization of the advocacy plan, linking with the project's performance management plan/logframe.
- 9.1.6 Reviewed and provided comments and inputs to the SOWs of subcontractors to ensure the planned approaches, interventions and deliverables are aligned with the set targets and pathways articulated in the Work plan and the Logframe.

- 9.1.7 Continued providing quality assurance inputs to assessment and survey reports.
- 9.1.8 Worked with technical teams to implement supportive monitoring plans from September to December 2012 at biosecurity demonstration sites in Can Tho and Ha Nam. Developed, tested and implemented a monitoring checklist on biosecurity practices at local meat market in Ha Nam, which will be used for advocacy to DAH for adoption at national level.
- 9.1.9 Compiled monitoring results at Ngoc Xuan from September to December 2012 that were used in the review meeting on monitoring activities between the project and Can Tho Sub-DAH to define next steps. The summary of the assessment checklists from the four monitoring sessions shows that there has been an improvement of this Slaughterhouse. The percentage of the checklist items meeting biosecurity standards has increased from 48% in September to 65% in November. The design related issues have been resolved.
- 9.1.10 Joined with animal health team to train inspectors in Ha Nam in November 2012. Concepts and principles on supportive supervision activities were introduced to the trainees. After this, trainees practiced role-plays to acquire necessary skills such as two-way communication, active listening and providing constructive feedback to slaughterers.
- 9.1.11 Collaborated with technical teams, conducted a mini-survey on the situation of access to finance of the owners or investors of slaughter points/houses who were attending two training courses on biosecurity. The survey identified that 84.6% of 26 participants who filled in questionnaires faced difficulty in getting finance at the start-up of their business. 65.4% have used their own fund (with or without other sources); 38.5% of all never sought for bank' loans and other 50% sought and granted with loan at least once with annual rate of 12-18%. A number of them mentioned that they would not be able to upgrade the slaughtering facility and improve the working environment without easier access to finance. The findings of this survey are useful as an input for upcoming project support to this target group through providing education and information on the ways to access possible financial sources. The project is going to repeat the survey with the participants of the next similar training course.
- 9.1.12 The M&E Manager shared the major concepts and framework of participatory planning, monitoring and evaluation and management for impact (PPME/M4I) to USAID/APII's staffs. The audience found the session interesting and helpful. Details of the approach will be provided in the following technical update sessions.

9.2 Challenges and Solutions

- 9.2.1 To engage all relevant sides in the process of USAID PMP review and development of analysis template is time consuming since each

side has multiple tasks to coordinate and harmonize. The lack of a macro program data analysis plan for assessing program performance according to USAID's expectations has hindered the API partners in determining necessary supplementary data to fill the gaps in the current PMP data. It also has postponed decisions on necessary adaptations in the PMP reporting requirements to reflect the change from a provincial focus to a regional/zonal approach and expansion of the focus of intervention from five focus provinces to nationwide. Based on USAID's latest evaluation plan, it is possible that revisions to the MEASURE-drafted analysis template and current reporting templates will be necessary, which will take more time. Data collection in the second semi-annual period of the last fiscal year has been delayed in this context (USAID agreed with this delay so as to wait until the analysis template is finalized in order to be more efficient). Going through the whole process requires a lot of patience. Meanwhile, USAID/APII took initiative to consult with USAID and discuss and work actively with MEASURE and other partners to make progress in order to align with the program's timeframe.

- 9.2.2 In contrast to the hardware items, it is painstaking and challenging to improve 'software' related items at the biosecurity demonstration sites. For examples, in Ngoc Xuan Centralized Slaughterhouse, there is room for further improvement in many areas such as disinfection of poultry transportation vehicles, off-floor evisceration, regular water testing, use of toilets and shower room, regular health check-ups for workers, wearing of PPEs, personal hygiene practices, waste water processing and activities on management of by-products in the slaughterhouse according to Standard Regulation QCVN 01-25:2009/BNNPTNT. To address these issues requires multiple approaches including continuous education, technical coaching, supportive monitoring and enforcement. The project continues working with local partners to address these issues while gradually reinforcing their ownership in managing the sites.

10. Administration & Finance

10.1 Achievements

- 10.1.1 Managed all aspects of the finance and administration and all subcontracts and consultant agreements effectively. The procedures were streamlined during the course of the year.
- 10.1.2 Shorter turnaround time with the Regional Contracting Officer also helped improve the Consultant recruitment process during the course of the year.
- 10.1.3 APII continues to submit routine deliverables to USAID, including quarterly progress reports, quarterly financial reports, semi-annual and annual reports etc. The F&A team support the technical teams in managing all subcontracts and consultants.

10.1.4 Managed multiple Subcontracts and Consultant Agreements for all components. All subcontracts and consultants are now tracked better by the F&A team helping to prepare contract modifications in advance (and reduce need for retroactive approvals). Technical teams are regularly updated and reminded of due dates for upcoming deliverables.

10.1.5 .

10.2 Challenges and Solutions:

10.2.1 High staff turnover for the F&A team in the final months of the project increases the workload for remaining staff. It takes time to recruit and train new staff (who will only join the project for seven months).

10.2.2 The available sub-contracting mechanisms remain a challenge to partners particularly those with little working capital or capital reserves and little experience in contracting with international development partners/donors. No immediate alternatives or solutions have been identified other than to continue to work closely with the subcontractors to prepare contracts and fulfill their obligations under contract.

10.2.3 Delayed submission of Animal Health team for Consultants and Subcontracts SOWs may experience a delay in July 2013 close out for Consultants and Subcontracts.

10.2.4 Overlapping scheduling of large events this fall has particularly burdened the smaller F&A team. Likewise, lengthy approval processes cause pressure for F&A when technical staff made last minute logistic arrangement requests. Smooth coordination and communication with USAID and quicker approvals/turnaround times are helping reduce delays, and internal communications in APII on recruitment of consultants and preparations of subcontracts has improved.

11. Success Stories

Improving food safety and reducing disease risks in Ha Nam

In late October 2012, a handover and market reopening ceremony was organized in Hoa Mac township of Ha Nam province to formally mark the improvements in poultry slaughtering and marketing in the Hoa Mac market and a nearby small-scale poultry slaughtering facility.

The USAID's Avian and Pandemic Influenza Initiative Project (USAID/APII), in close collaboration with Hoa Mac Township People's Committee renovated

the animal meat section of Hoa Mac Market in Duy Tien district, Ha Nam. In the newly reopened market, poultry meat, beef, and pork are all sold in separate areas away from fruit, vegetables, prepared foods and other non-meat products. In the past, tables and floors in the sections where meat was sold were constantly wet, dirty and difficult to clean and disinfect. Upgrading the tables and floors and improving the waste water systems and electricity have significantly improved hygiene practices at this market.

The project also supported the upgrading of a nearby small-scale poultry slaughtering facility. Realizing the benefits to be gained from the upgraded facility and improvements in slaughtering hygiene, the owner of the facility contributed 30% of the total cost. He agreed to separate the slaughtering area from his family's living area, to create a one-way slaughtering line to move poultry from dirty and clean areas through the slaughtering process, and to install new and higher roofs and tile the floors and walls. These upgrades allowed for better cleaning and sanitizing, improving the hygiene of the facility. Standard equipment for the processing line has also been installed. Replication of the slaughtering demonstration model by other slaughterers in Ha Nam has commenced, relying on local resources and community contributions.

In addition to the facility renovation projects, USAID/APII has provided a series of training courses for slaughterers, vendors and veterinary inspectors on proper veterinary inspection processes, HPAI risk reduction, food safety and sanitation. Follow-up discussions on key behaviors to include hand washing; and proper disinfection techniques continue. Monthly meetings were also provided for provincial food preparers on behavior change and the need for continued education and promotion of safe food practices. Special educational posters are hung at slaughter points and animal meat areas throughout the market to remind consumers of the need for these behaviors. These same posters remind meat handlers on the importance to reduce risk and ensure that food safety practices continue in this small-scaled slaughter point and animal meat market model.

In July of 2011, the USAID's Avian and Pandemic Influenza Initiative Project (USAID/APII) supported Ha Nam's Department of Agricultural and Rural Development provincial proposal to provide additional education and training for veterinarians working in cattle and poultry slaughtering. This effort is in alignment with recently published national Circular 14 promulgated by Department of Animal Health and the Ministry of Agricultural and Rural Development. This project provides a training platform for other small-scale poultry slaughterer's to emulate. Additionally this project was done in concert with local businessmen and USAID/APII both providing portions of the financial support.

In the annual project review workshop in the province, Mr. Nguyen Manh Hung, Deputy-Director of the provincial Department of Agricultural and Rural Development emphasized that to expand the efforts to improve veterinary hygiene and food safety, the province needs to map out their plan to replicate the upgraded slaughtering facility and market model in other districts. Reference was made to ongoing replication in Ly Nhan market through upgrading of the fresh fish area with the vendors' contribution, and to upgrading of pathways in Hoa Mac market.

Quang Tri province adopts Community-Based Surveillance (CBS)

In April 2012 the final CBS evaluation was conducted by USAID/APII, and proved that the CBS model in Quang Tri province was being used. It helped to identify multiple events of H5N1, Blue Ear and Foot and Mouth Disease (FMD) resulting in timely disease control actions. Review of epidemiological data showed that among the twenty H5N1 events recorded in the province during the reporting period, CBS collaborators detected eleven events (55%) and commune animal health workers (CAHWs) detected the remaining nine (45%). The mean time calculated from disease onset to system's detection was 1.8 days for the CBS collaborator events and 2.9 days for the CAHW level events ($p=0.16$). The CBS data also identified ninety-four confirmed blue ear events and twenty-eight confirmed foot and mouth events.

The collaborator surveys and in-depth interviews with stakeholders revealed that the CBS system was simple in structure and operation and enabled collaborators to sustain its implementation. Collaborators from all sites performed well in terms of knowing their roles and responsibilities within the system, finding sources of disease information in their community and the disease reporting structure. In general, the system was acceptable to the local key stakeholders. Households initiated contact with the CBS system in the context of seeking treatment for sick animals from village animal health workers (VAHWs). Collaborators demonstrated high willingness to implement their roles under CBS during project implementation. Provincial, district

and commune stakeholders confirmed that CBS system operating procedures were generally compatible with those of the National Disease Surveillance System.

In January 2012, the animal health surveillance system developed through USAID/APII's CBS activities was officially adopted with the Decision 25 of Quang Tri People's Committee. All village AHWs have been provided a monthly allowance to participate in AH activities, to include disease surveillance.

The evaluation has identified that contextual factors may impact the effectiveness of the system. It is effective in Quang Tri where poultry farming is predominantly small-scale and managed at a household level. Stakeholders noted that a high level of political intervention is needed to detect and control outbreaks and to minimize the adverse effects on the livelihood of households. Improving animal health surveillance at the community level is linked with the formal establishment of a VAHW network at a grass roots level. Based on these findings, the last year of the project will focus on replicating human health and animal health surveillance activities in those central provinces that share similar conditions of those in Quang Tri.

Introduction

This report presents the main achievements, challenges and solutions/lessons learned for USAID's Avian and Pandemic Influenza Initiative (APII) during Year 3, Quarter 3 (October - December 2011).

The report is divided into the following thematic sections:

1. Animal Health Worker (AHW) Capacity Building
2. Agricultural Extension Worker (AEW) Capacity Building
3. Poultry Supply Chain Strengthening
4. Community-Based Surveillance (CBS)
5. Infection Control / Case Management (IC/CM)
6. Pandemic Preparedness Planning (PPP)
7. Cross-Cutting Issues
8. Success Stories.

1. Animal Health Worker (AHW) Capacity Building

The goals are to develop an AHW capacity building package and an AHW network model that is adopted by relevant public-private agencies at national and/or local levels, and to develop a standard Terms of Reference for AHWs for adoption by Provincial Peoples Committees (PPCs) and the Ministry of Agriculture and Rural Development (MARD).

The third quarter of Year-Three focused on finalization of the AHW training manual to include training manual in an E-Book format, we continue to support a wider adoption of AHW capacity building package by cost sharing with subcontractors to include AFAP and Vietnam Veterinary Association (VVA).

1.1 Achievements

- 1.1.1 Australian foundation for Peoples of Asia and the Pacific continue to promote development of provincial strategies to maintain and expand monthly AHW meetings and refresher trainings. Fifty-six training and monthly meetings for AHWs took place in Quang Tri, Ha Nam, Can Tho and Kien Giang in nineteen of the districts. Costs were shared with the AHW networks: AHWs paid for lunch and travel themselves and local trainers from SDAH delivered topic specific presentations.
- 1.1.2 Quang Tri PPC has allocated 1 billion VND (~USD 50,000) in the provincial budget for a training of AHWs program in 2012. The facilitators from AFAP/APII, Quang Tri's SDAH, Department of Labor – Invalids and Social Affairs, and Agriculture College met in May 2012 to plan for implementing an AHW training to cover 500 additional AHWs throughout the province. The Agriculture College has been appointed as the resource agency to help SDAH adopt and replicate the AHW training model with local funds.
- 1.1.3 The Quang Tri DARD and SDAH organized three excellent Animal Health Worker Competitions at district level culminating in a final

competition at provincial level. This competition recognized and promoted the reputation of AHWs. A first for both the province and the country, and co-founded by the province, seventy-percent of the presentations were informative, including community events, monthly technical seminars and training courses, while the remaining were entertaining. The first prize was granted to the Trieu Tai team, who incidentally also conducted a great community event in May 2012.

- 1.1.6. A local consultant was recruited to assist AFAP national trainers to complete the AHW training manual.
- 1.1.7. To introduce and promote the adoption of AHW training package in non-pilot provinces, TOT courses for local trainers were held. From May 21-25 and June 5-9, two cost-shared AHW TOT courses were offered for more than 50 local trainers. This training took place in Moc Chau and Ninh Binh in collaboration with Moc Chau Dairy Cattle Joint Stock Company and Ninh Binh SDAH respectively. In both cases, APII covered the cost of the training materials and national trainers, while the rest were covered by their counterparts. Those local trainers will be used to implement training plan for AHWs in the local area. This form of replication will be explored for year-four.

1.2. Challenges and Solutions

- 1.2.1 Allocation of local funds for training of AHWs remains an issue. While Quang Tri DARD has allocated 1 billion VND to fund for the provincial budget for AHW training in 2012 (for implementation of the provincial decision no. 25 of 2009 to implement and strengthen AHW networks) many other provinces have not developed or funded a clear plan. Sub Department of Animal Health DAHs, SDAHs in Can Tho, Hung Yen and Ha Nam have expressed commitment to maintaining the refresher training and monthly meetings, but more commitment was expected to including allocation of funds for AHW training in the year 2013 financial plan. This has yet to be allocated in the provincial budget to APII's knowledge. Currently, as in the previous quarter, most of the local contributions have been provision from the free meeting venues by District Veterinary Stations (DVS) and the voluntary participation of AHW without any compensation. Train of Trainer courses have been conducted in Ninh Binh province and Moc Chau as part of plan to reaching out to other new provinces but APII will need to follow-up and advocate in this area. We will also consider reaching out to other new provinces and consider cost-sharing TOTs (subject to USAID approval).
- 1.2.2 APII and SDAHs will need to continue to work with DARDs and PPCs and advocate for inclusion of AHW support within the 2013 annual budget cycle. Technical assistance and support from APII may well be needed (not to lose momentum) in the coming months to help position the AHW model for wider adoption with provincial resource allocations.

2. Agricultural Extension Worker (AEW) Capacity Building

The goal is to develop an AEW bio-security training package for small commercial poultry producers, which is adopted by the national-provincial extension system, and by other partners.

The activities in the third quarter focused on integration with BCC rolling out the training in some pilot provinces.

- 2.1.1. Training for Master Trainers (TOMT) was conducted in Da Nang during April 3-5 for 29 participants from 13 central provinces, World Vision Da Nang, Quang Tri and Hue, IED/Da Nang and AFAP's Hoa Binh participated in the project. The course's major goal was to continue building training capacity on biosecurity measures in poultry production for agriculture extension workers and NGO staff that are expected to roll out biosecurity training for poultry farmers in their own provinces. Following this training, an advocacy event was held on April 6. The new biosecurity training package targeting Vietnam's more than seven-million small holder poultry farmers was unveiled in Da Nang at a workshop for the MARD representatives, provincial leaders and agricultural extension experts from Vietnam's central region as well as representatives of international development partners and other local and international organizations. The workshop was jointly hosted by USAID/APII and the National Agriculture Extension Center (NAEC) in MARD.
- 2.1.2. Cost-sharing for a TOT course for Hoa Binh PAFEC was accepted and conducted in Hoa Binh with a contribution of 20:30:50 by APII, AFAP and local fund respectively. This method of replication will be continued in hopes of identifying novel ways for replication with funding resources that may identified from other NGOs and private sector.
- 2.1.3. Farmer training on Biosecurity good practices:

Integration of biosecurity training for farmers in provincial communication plans was promoted by the AH and BCC teams for adoption in Year-Three for BCC PSAs in all pilot provinces, as a part of hand over, the BCC strategy is to development these skills within the local populace. Biosecurity training packages have been used for small commercial farmer training in Hung Yen, Ha Nam and Quang Tri starting in late March 2012 with local "in kind" contribution of meeting venue and banner. In total, 450 farmers in selected communes in Hung Yen and 600 farmers in selected communes in Ha Nam and 240 farmers in Quang Tri had the opportunity for knowledge exchange and learn more about good farming practices in poultry production as well as how to improve their biosecurity measures. The provinces are expected to expand this training to the remaining sector three farmers through their annual training plans.

Vietnam Poultry Association (VIPA) entered a new contract with APII for livestock sector workshops and strengthening of the association in order to promote biosecurity practices within their farmer club networks. Similar approaches under this contract, provided training for 600 farmers from 20

farmer clubs established by USAID's AI BCC in Thai Binh provinces. The workshops train poultry produces in poultry farming biosecurity practices. In early July, VIPA planned to review farmer's Club activities and the development of poultry association Networks through a recognition workshop held in Hanoi.

- 2.1.4. Experiences of Thai Binh activities will be shared among other VIPA members and lesson learned will be introduced into the Vietnam Poultry Association Strategy for Development planning documents for 2012 – 2020. Together with guidance for network development draft, the first draft of this strategy has been written and we are gathering comments from partners to include DLP. Final draft is expected to completed and printed in July 2012.
- 2.1.5. Under the technical and financial support of APII of USAID, and in collaboration with DLP, Vietnam Poultry Association (VIPA) has worked with DLP to successfully conducted a national workshop on Sustainable Development of Garden chicken with 57 officials from various national level Ministries, provinces, local and international agencies and institutions including research firms and companies on feed equipment and breeding, and media agencies in 28-29th June 2012. The workshop was to review successful models plus field visit and experience sharing on garden chicken production. Participants got consensus on a list of proposed options including enabling policy environment on safe and sustainable development of garden chicken production. News on this workshop was aired through national television channel VTV2 on the following day and June 8, 2012 and Workshop Proceeding distributed widely through DLP network.

2.1 Challenges and Solutions

- 2.1.1 Working closely with NAEC/PAFECs is necessary to help institutionalize the training/extension package. This is a time-consuming process which requires diplomacy, patience and perseverance in order to forge and sustain close relationships. Meetings have been conducted to discuss these issues with NAEC and PAHI and we continue to look for more opportunities. MARD's recent strategy of opening up to competitive bidding the allocation/awarding of extension funds to not only to NAEC and PAFECs but also private enterprises will have implications for our work and will influence our strategy to promote replication of our AEW package. We have been willing to include NGOs, Civil Society Organizations and private entities as well in our advocacy strategy and partnership efforts. This may provide opportunities for some novel and unconventional public-private-partnerships.
- 2.1.2 VIPA has demonstrated their ability to coordinate with MARD institutions such as DLP, DAH and NAEC. However, the association is still in need of substantial and sustained capacity strengthening. APII will continue to support this process through the subcontracts.

3. Poultry Supply Chain Strengthening

The goal is to develop biosecurity/biosafety demonstration models in key (high risk) nodes along supply chains, together with related documents (protocols, guidelines, training materials) which are adopted, adapted and replicated by public agencies, private partners and/or other development projects and programs elsewhere.

The key activities in Year-Three focused on the following nodes:

- Supporting upgrades to Dong Ha live bird and poultry meat market in Quang Tri;
- Beginning processes for upgrades to District market in Ha Nam, and Ngoc Xuan centralized poultry slaughterhouse, Can Tho City;
- District market in Ha Nam;
- Ngoc Xuan centralized poultry slaughterhouse, Can Tho City;
- Home-based slaughter points around Dong Ha market, Quang Tri;
- Small slaughter points around Duy Tien district market, Ha Nam

3.1.1 The upgrade of the poultry sections in Dong Ha Market by a local construction company were completed in November of 2011, co-funded by APII, the Market Management Board (MMB) and other vendors. A launch event was conducted on December the 5th as reported in semiannual report. A training session on risk reduction and good practices was conducted before and after the re-opening market for vendors, MMB representatives, district veterinary staff and cleaning staff. Follow-up trainings on bio-security, bio-safety and business development are provided at regular (usually monthly) intervals. Continued 'hand-holding' was absolutely necessary (and a positive thing) in order to see sustained behavior changes materialize. A hand over plan will be made to introduce for MMB and Dong Ha Veterinary Station of SDAH to maintain this valid following up in Dong Ha in coming time.

3.1.2 Technical drawings, protocols, and needed quantities of supplies were completed/identified for the upgrades of Phu Nong centralized slaughterhouses in Kien Giang, Can Tho, and Ngoc Xuan. After the Stakeholders Agreement was signed the Ngoc Xuan (Can Tho) upgrade was started in April as scheduled and renovation will be completed in July 2012. Operational testing, reviewing good practices and the re-opening is planned to launch around the middle of August, 2012.

3.1.3 In collaboration with the Can Tho Sub DAH, and APII organized two training courses on risk reduction measures and good slaughtering practices for 30 slaughterers in Ngoc Xuan. About one-third of these slaughterers had only completed primary school so their capacity to absorb technical knowledge was limited and will require more follow up and pictorial illustrations to insure behavior changes.

3.1 The slaughterhouse project in Kien Giang looks less promising, partly due to lack of buy-in and commitment from provincial counterparts, there will not be anymore effort to make the renovation for this facility. However,

Phu Nong will be the subject for a study tour and training on risk reduction as planned.

3.2 Two slaughter points in Dong Ha, both supplying the live bird market, were selected for upgrades and demonstration model development. Technical proposals and stakeholder agreement were prepared. Renovation started in late May of 2012 at both of these home-based slaughter points. This renovation work is co-financed by the slaughter point owner and USAID/APII. The owner is in charge of site clearance and auxiliary structure including kitchen and toilets. The USAID/APII up-grade the remaining part to improve veterinary hygiene conditions and essential equipment for good slaughtering practices. Renovation in Dong Ha will be completed by the middle of July.

3.2.1 A similar approach is underway in Ha Nam with plans for upgrading a district market and one home based slaughter point.

APII actively shared materials including risk assessment reports, supply chain node prototype designs, small group discussion flipcharts etc. with LIFSAP and continued throughout the reporting period to invite LIFSAP and VAHIP representatives along to relevant events for closer collaboration and experience/lessons learned sharing. In addition to review current situation of Poultry Slaughter and Marketing and to propose solutions to improve veterinary hygiene and food safety, a National WS have been hold in 7-8th June 2012 at Vietnam Center for Commercial and Industry hosted by Department of Animal Health and Department of Livestock Production. There were 80 participants from national and provincial levels of animal health and livestock sectors, international agencies and institutions including research firms and media agencies. FAO has been brought up to date on all of these events as well as present the results of their LBM surveillance at the WS. Total of 18 reports from management and production sites have been presented at the WS. Participants also discussed appropriate models, policies and guidelines to be developed and adapted by local provinces. News on this workshop was aired through national television channel VTV2 on June 9-10, 2012. A summary of recommendation will be submitted to MARD on workshop results. A local consultant's team will work more details with DAH public health division and VIPA to develop and submit a proposal on Slaughter and transportation Management to MARD and related agencies in coming quarter. APII will work closely with FAO to introduce the market and slaughterhouse model approaches into the regional disease control strategy what initiate by FAO and DAH especially for RAHO 3 and 6.

3.3 Challenges and Solutions

3.3.1 While provincial counterparts clearly are very interested in the demonstration models, DAH does not have a national strategy for poultry supply chain risk reduction and most provinces do not have a 'master plan' that demarcate future locations, e.g. for centralized poultry slaughterhouses and markets, which makes it difficult for them to commit resources to this area.

- 3.3.2 Profit margins from poultry slaughtering are small, especially in small scale slaughtering operations. It is understandably hard to persuade the small private entrepreneurs to invest in facility upgrades without some form of 'subsidy' (financial support). Micro-finance options in the commercial financial sector (banks, MFIs) are rare. Many small entrepreneurs appear to be comfortable without plans to expand. Cost-cutting measures seem a more appealing way forward to improve business and increase profits. This also implies cutting private costs on environmental safeguarding and food safety related measures. Sustained awareness is necessary with possibly combining stick-and-carrot for more attention to public health issues.
- 3.3.3 APII continues to reach out to and invite partners such as LIFSAP and VAHIP. Partners rarely reciprocate however. USAID may need to step in and help promote the dialogue at the donor level.

4. Community-based Surveillance (CBS)

The goal is to develop an events-based grassroots surveillance package, including training materials/tools and job descriptions for grassroots 'collaborators', which is adopted, adapted and scaled-up in the provincial-regional-national surveillance system with local resources.

4.1 Achievements

- 4.1.1 USAID/APII hosted an official workshop to share experiences and lessons learned from Community-Based Surveillance work in Vietnam on Apr. 5 in Hue. Media Advisory and Press release were available and shared. The news on the CBS workshop in Hue posted on the website <http://danviet.vn/83138p34c109/du-an-sang-kien-gia-cam-phat-hien-hon-30000-gia-cam-mac-benh.htm> on April 6. The video clip, on the event aired by VTC16 are available with English subtitles.
- 4.1.2 Conducted data collection in three provinces (Hung Yen, Quang Tri and Can Tho), data entry and analysis on CBS evaluation by AMDI with technical guidance by the international consultant and oversight by the project's M&E Manager. APII staff has commented on draft technical report that is expected to be released in Year-Four.

5. Infection Control/Case Management (IC/CM)

The goal is to develop a model (with training tools, guidelines etc.) for implementation of Circular 18 at the local level, which we hope will be adopted more widely throughout Vietnam.

5.1 Achievements

- 5.1.1 From March 27 to April 7, a series of workshops in Hanoi, Hue and Ho Chi Minh City, organized by the Vietnam Ministry of Health (MOH), together with Vietnam Nurses Association, regional Infection Control Societies and health officials and leaders from provincial Health

Departments and district hospitals in seventeen provinces to describe the significant infection control challenges that they face. The major obstacle identified by these agencies were poor appreciation among hospital staff for the importance of infection control. It was noted that there is a shortage of human resources including dedicated infection control staff and a shortage of suitable equipment and facilities for adequate infection control. News on this workshop was aired on O2TV and uploaded to website of T5G at <http://www.t5g.org.vn/Default.aspx?u=dt&id=3706>. Media advisory and Press release were made available and shared.

- 5.1.2 The desk review on cost effectiveness of IC interventions in district hospitals was completed in April. Preliminary findings were presented in the IC workshops in Ha Noi Hue and HCM City. The final reports are available.
- 5.1.3 Based on the previous documents developed by APII in year 2 and MOH/WHO recommendation, VNA revised the IC training curriculum and IC training material for grassroots level, combined the results and discussions in 3 IC regional workshops conducted on March and April.
- 5.1.4 A meeting to review the IC training material was chaired by MOH with participants from the Dept. of Science, Training and Education, the Dept. of Treatment, VNA and IC experts from 3 IC Societies on 26 April.
- 5.1.5 The IC training material were submitted to MoH for approval on May 11 to become an approved document for all health facilities at grassroots level, include district hospitals, commune health centers and public/private clinics to use in their diffusion training for their own staff.
- 5.1.6 In June a review meeting hosted by VNA and chaired by Mr. Muc – Deputy Director of Administration on Health Service and Prof. Quy, chairman of HANSIC. This meeting allowed national IC experts to review the IC practical handbook which contains recommendations and guidelines on IC practices for all health workers at grassroots levels (commune and district levels).
- 5.1.7 The next day, MOH's Scientific Review Board met and reviewed the IC training material. As a result the seven board members recognized the training materials as the first official IC training material, noting that it is comprehensive and useful. The approved training material will be applied for training of all health facilities at grassroots level throughout the country, in order to comply with the "National action plan on IC strengthening in health facilities in the period 2012- 2015" and decision number 014/QĐ-BYT, which specifies that by 2015 at least 80% health care workers at health facilities will be trained on IC.
- 5.1.8 In collaboration with VNA, APII hosted the first TOT course on IC in June at the grassroots level. This was based on the final version of IC training material (as mentioned above). This six-day training course was for 25 participants from Quang Tri, Huc and Lam Dong. Lessons learned and final comments from this training will be incorporated into the final version of the training materials to be approved by MOH for national-wide use including 645 district hospitals, 10,748 commune health centers and

several public/private clinics. After attending this course, Lam Dong – a new province had plans to rollout this training in their provinces.

- 5.1.9 In May APII Staff attended the Launching Ceremony for Hand Hygiene organized by Ha Noi DOH and chaired by MOH with participants from district and provincial hospitals. In the meeting, MOH emphasized the importance of strengthening IC in hospitals. The MOH National Plan on IC for the period 2012-2015 which was approved by MOH on March 30, 2012 was officially introduced.

5.2 Challenges and Solutions

- 5.2.1 Convincing key MOH personnel to participate was very time consuming and required a lot of staff effort (VNA and APII), but the end result justified this strategy, as finally participation by MOH was beneficial in the regional IC workshops.
- 5.2.2 The process of approval by MOH takes a long time with the involvement of some Departments and policy makers in MOH. It's out of the control of APII and our subcontract. With the extra effort of APII and VNA, IC training material approved by MOH's Scientific Review Board and we expect the decision from MOH's Science and Training Department in near future.
- 5.2.3 There are still very few qualified trainers available at the provincial level. In the near future we will need to implement more training of master trainers (TOMT) on IC to train grassroots level staff once the MOH approves the IC training materials. While waiting for MOH approval the local authorities have requested a group of master trainers in the provinces to rollout IC training courses to all health care workers at the grassroots level with local funding. APII will provide technical assistance, material replication, and TOTs according to the MOHs IC training dissemination plan as it is developed

6. Pandemic Preparedness Planning (PPP)

The goal is to develop PPPs in selected pilot province(s), introduce the package in other provinces, and advocate for its wider adoption throughout Vietnam.

6.1 Achievements

- 6.1.1 In April, VNRC began discussions and drafting the Kien Giang tabletop exercise. Once the draft was completed and a second round of comments incorporated meetings commenced to plan for the event in May.
- 6.1.2 In May the Kien Giang People's Committee chaired a table top exercise with participation of more than 60 representatives from MOH, VNRC, USAID, other provinces and agencies including provincial departments, military agencies, police, media agencies and mass organizations from Kien Giang. Comments from table exercise will be incorporated into the PPP before submitting for Provincial People's Committee's approval. News of this event was aired by Kien Giang TV channel on May 17 and on VTC16 in May 18, and uploaded onto youtube. <http://youtu.be/vYQkDkMrWMA>.

- 6.1.3 VNRC organized a review meeting in Hanoi to finalize PPP training materials based on comments gathered from the training course for community leaders, with participants from GDPM (MOH), National Center for Health Communication and Education (T5G), APII expert, and local master trainers of VNRC on PPP.
- 6.1.4 A PPP dissemination workshop was organized by People's Committee in Kien Giang for 35 designated staff from provincial agencies, mass organizations and local authorities. The participants had opportunities to learn about the pandemic preparedness and practice to make the plan for their organization. They also discussed on multi-sector cooperation and shared their experiences dealing with outbreaks.
- 6.1.5 The Pandemic Preparedness Plan (PPP) in Kien Giang was approved by Kien Giang Provincial People's Committee, in late June. This PPP compiles the lessons learned from previous PPPs, inputs and comments from almost government sectors, mass organizations in Kien Giang, MOH, FAO, WHO and follows a One Health and "whole society" approach. It is the first time that a Business Continuity Plan has been included. This PPP is also in line with the Vietnam Integrated National Operational Program on Avian Influenza, Pandemic Preparedness and Emerging Infectious Diseases 2011-2015 (AIPED).

6.2 Challenges and Solutions

- 6.2.1 Final approval was delayed because Mr. Huan – the Vice Chairman of Kien Giang Provincial People's Committee assigned to sign PPP, was away on business until the end of June. This in turn required a modification to our PSA with VNRC. It caused the late of deliverable submissions, especially for last deliverable so the PSA have modified the timeline with the approval from USAID.

7. BCC and Cross-Cutting Issues

Behavior Change Communication (BCC)

The BCC work aims to identify appropriate behaviors and messages, integrate these into the work of the animal and human health components, and strengthen the BCC capacity of national and provincial stakeholders, enabling them to carry on BCC activities beyond the life-time of the project.

7.1 Achievements

- 7.1.1 Provided technical assistance to provincial BCC trainer teams to develop BCC materials including discussion guides, drama scripts for community events. In this year three, provincial BCC trainers were responsible to select three biosecurity behaviors based on priorities of Ministries of Health and of Agriculture and Rural Development and their own provinces. Then they were to develop discussion guides for small group discussion with small and medium commercial poultry farmers and drama scripts to be acted in community events in their province.
- 7.1.2 Continued to build capacity for provinces through a training course on proposal development and writing skills for 20 key staff and BCC trainers from Animal, Human Health Sectors, Health Communication and

Education, Agriculture Extension and Women Union from five focus provinces. These trained participants are responsible for proposal development in their related provincial agencies/organizations. During and after the training course, all these trainees were followed up and coached to develop proposals on BCC activities to seek for local resources. Follow-up results of these proposals will be updated in the next quarter.

7.1.3 Nearly completed BCC campaigns in all five provinces of Can Tho, Ha Nam, Hung Yen, Kien Giang and Quang Tri with the following achievements:

- 110 facilitators and organizers of Community Events (CE) were trained and mentored by provincial BCC trainers on facilitation and organization skills to lead and organize community events in their provinces. These CE's facilitators and organizers mobilized their community to play in the drama scripts and organized CEs to promote the application of biosecurity and food safety practices.
- 32 community events (CE) were organized and led by above-mentioned trained facilitators and organizers. Each CE reaches around 200-300 participants who are community people and key stakeholders of the poultry supply chain such as poultry producers, traders and local authorities. In Can Tho, all CEs were recorded and aired through local commune loudspeakers three times after the CEs.
- 115 communicators of small group discussions coming from Commune Animal Health, Human Health Sectors and from Commune Women Union were trained by their related provincial BCC trainers on refresh communication skills, use of small group discussion guides and on how to organize small group discussions with small and medium commercial poultry producers.
- These trained communicators were then mentored by their provincial BCC trainers to lead small group discussions with about 2500 small and medium poultry commercial producers to promote the application of priority biosecurity behaviors.
- Before participating in these small group discussions, around 1,800 poultry producers (except the ones from Kien Giang province) benefited of two-day training courses on led and organized by provincial and district trained agriculture extension trainers in collaboration between Provincial Agricultural Extension Center and Women Union to improve their knowledge on risk reduction and biosecurity measures in poultry production.
- Household visits were made to about 10% of small and medium commercial poultry producers who participated in small group discussions. These home visits were done by provincial trainers, trained communicators and local authority such as head of village to observe changes, and discussed motivators and barriers for change. Results of these observations will be shared in their review workshop and updated in the next quarter.
- Eighty people from four provinces of Can Tho, Ha Nam, Hung Yen and Kien Giang including village head, the head of commune Women

Union Association, a leader of commune people's committee were trained on how and what to do in a household visit: communication skills, steps of household visit and how to use the observational checklists.

- Seven USAID's APII TV spots were aired on all five provincial television channels. These spots were also used in other events such as trainings courses, small group discussions, community events.
- 7.1.4 Designed integrated BCC activities (video, poster, observation, group discussion, stakeholder forum) for Ngoc Xuan slaughterhouse in Can Tho that will be implemented during the next quarter of Y3 BCC activities.
- 7.1.5 KAP reports -- More work has been done with support from Abt home office into data analysis. Final report will be submitted to USAID in the next quarter.
- 7.1.6 Attended MOH/VAHIP project planning workshop in Da Nang and shared APII's BCC approach and its materials for reference and replication. Discussion guides and CBS handbook for human health providers are especially interested. Further collaboration on BCC training for their three new provinces and risk communication will be explored in coordination with One Health Communications Network.
- 7.1.7 Under the ongoing development of Communication Strategy Development Guide and Training Manual for BCC trainers. Outlines in English will be shared with API partners before the full document are written in Vietnamese

7.2 Challenges and Solutions

- 7.2.1 This is the first time for all provincial BCC trainers developed behavior change materials based on what they had been taught. This includes determinants for change of the target audiences. They are using programs outlined in the training guilds "Learning by Doing," and to develop a mutual understanding from multi-sectoral BCC trainers. Technical assistance from USAID's APII and their ownership of having their own BCC materials are key motivators for these local BCC trainers to overcome training obstacles.
- 7.2.2 Gathering the whole multi-sector team of BCC trainers to develop BCC materials or to prepare for a training course requires a lot of coordination that relied on the project's former PC/ PCUs. Official recognition represents a key challenge for the sustainability of this team of provincial BCC trainers.
- 7.2.3 The process of supporting provinces to maintain and sustain their communication activities to prevent AI and EIDs, more technical support and partial financial one (including other financial mechanism) should be considered. In provinces where they develop their own communication proposals/plans they are seeking local resources.
- 7.2.4 Planned small group discussion and monthly meetings with poultry vendors and slaughterers of Hoa Mac market, Ha Nam province were

delayed because of delay in infrastructure and special characteristics of target audience – vendors and slaughterers. Working with the poultry audiences is harder, say compared to farmers, as they always work during the day. Their concerns are driven by cost benefit and daily income compared. This requires a variety of approaches to encourage them to begin making changes for risk reduction and biosecurity. Lessons learned from implementing BCC activities in Dong Ha market, Quang Tri province will also be taken into account when designing the BCC activities with stakeholders of Hoa Mac market, in Ha Nam.

- 7.2.5 With the delay of approval for the consultant to work on the Development of Communication Strategy Development Guide and Training Manual for BCC trainers, there will a delay in the final training workshop for provinces on these materials.
- 7.2.6 Once we received the final several hundred page final KAP document from Nielsen, we began work on condensing it into a more reader friendly document. This has taken more HQ researcher support on analysis, and time from staff to complete than hoped. We will complete this revision by the end of Year 3.

Provincial Coordination and Implementation

APII's provincial implementation (PI) team works closely with the animal health, human health and BCC technical teams to coordinate field activities implemented by subcontractors, develop/test successful models at provincial and grassroots level, and advocate for their wider adoption with local public and private partners. The PI team operates out of the main office in Hanoi covering activities in northern Vietnam and through two satellite offices, one in Quang Tri for activities in central Vietnam and one in Can Tho for activities in southern Vietnam.

Provincial Coordination Units (PCUs), representing the body of key provincial counterparts and civil society, were established in Year 1 in the five focus provinces. Each province has a Provincial Coordinator (PC) appointed jointly with FAO and funded by APII. The PCs are typically seconded from a provincial agricultural/livestock agency. The PCs work closely with the PI team, coordinate their efforts with FAO's focal points, and report to the PCUs.

As scheduled in Y3 work plan, the implementation of API models should complete by June 2012 in the focus provinces, so the PI team worked closely with the PCUs and PCs to address this change.

7.3 Achievements

- 7.3.1 The PI team met in Hanoi in early May to prepare plan for provincial implementation slowdown and complete in this quarter.
- 7.3.2 Proactive preparation with PCU and provincial partners to get agreed and closed contracts with PCs in five focuses provinces by the end of June.
- 7.3.3 Worked closely with PCU and PC in each focus province to identify transition moves to maintain provincial coordination for the phasing out period from July to Sept. 2012.

- 7.3.4 Worked closely with PCU and provincial partners in five focus provinces to prepare for “Three year final review workshops” which will be organized in each province by the end of the project (September 2012). Overall objective is to identify the successes and withdraw lessons learned from the models that can inform policy makers at national level.
- 7.3.5 Gathered inputs from PCUs in five focus provinces for draft agenda of a “provincial coordination – lessons learned workshop” that will be organized by the project in August 2012 aiming to share experience from PCU and recommendation for effective coordination at province to ensure participation and uptake with local resources.

7.4 Challenges and Solutions

- 7.4.1 Maintaining provincial interest and commitment when APII has no more implementation and support to province activities.
- 7.4.2 Keep provincial coordination in the last three months from Jul to Sep 2012 when APII stopped payment for PC but there is a need for review three year cumulated results and lessons learned, advocacy for adoption and uptake by local partners.

National Coordination & Policy Dialogue

The goal in year-three is to increase the focus on ways and mechanisms to transfer packages/models/approaches to public and private partners for adoption, adaptation, replication and up-scaling. The project consults and coordinates closely with API partners in this effort.

7.5 Achievements

- 7.5.1 Facilitated the BCC working group meeting in June 2012 where BCC working group members got updated on BCC theory and application in changing behaviors of supply chain actors and potential collaboration and mapping for risk reduction, especially on Behavior Change Promotion through Education Action. The orientation of communication for foreseeable future will be the linkage between AI BCC WG and Biosecurity WG: Strengthening Hatchery Biosecurity Standard and Piloting Certification approach. The meeting concluded with new name: One health communication network.
- 7.5.2 Prepared media advisories and press releases for advocacy events on APII’s IC, CBS, PPP and AEW work. All news of those on websites were translated into English and sent to AI partners through weekly updates. The PPP and CBS workshop were aired on VTC 16. The TV clips are being subtitled in English and will be shared with USAID for wider dissemination.
- 7.5.3 Prepared APII Advocacy strategy from June-September 2012 and Y4 and shared with USAID for feedback.

7.6 Challenges and Solutions

- 7.6.1 Although APII BCC had organized training on proposal writing for provincial partners to encourage them to call for funding on their own, so they could implement their BCC activities in Y4, technical support from

APII would be maintained at least in fully developed proposal for provincial approval.

Monitoring and Evaluation

APII's M&E work as a critical component linked with all other program's components in the project's strategic plan and framework to strengthen existing systems for AI/EIDs detection, prevention and management in the focus provinces. In addition, APII acts as the repository for PMP indicators collected under USAID's API initiatives, providing analysis and reporting on this data.

In Year 3, M&E focuses on gathering data and evidence for showing the results of project implementation, especially the project's outcomes and effectiveness of the models. Documentation on monitoring results is paid attention to keep track on the improvements made after project's interventions.

The Project will continue to work closely with USAID's API partners to revise/update the result framework and PMP as well as to compile and analyze PMP data.

7.7 Achievements

- 7.7.1 Compiled USAID PMP data in Year 1 and 2; reviewed the compiled data, worked with MEASURE and FAO and provided feedbacks on the issues and suggestions for revision of the PMP indicators and reporting templates to MEASURE Evaluation.
- 7.7.2 Continued to provide oversight of ongoing monitoring, evaluation and quality assurance of activities on the APII project. Immediate sharing and feedbacks on activity monitoring results by project area managers are regularly practiced nowadays. M&E Manager reviewed deliverables of every component and provided feedbacks as necessary.
- 7.7.3 Continued to update and fine-tune the project Log-frame.
- 7.7.4 Met with local partners in Ha Nam, Quang Tri and Can Tho to explore local plans for inspection of slaughter house/points and live bird market; then to identify possibility for involvement of local partners in the project's monitoring activities to the demonstration sites in these provinces or integration of the project's monitoring activities with the local plan. The Can Tho Sub-DAH had conducted an assessment of all centralized slaughterhouses in May 2012 using the national checklist 1k-2. Ngoc Xuan was graded at B level (eligible to continuous operation as having only minor/major problems and not having any serious problem). A follow-up assessment of this slaughterhouse will be conducted in November 2012. In Ha Nam, a province-wide assessment of all slaughter points will be conducted in August or September 2012, under the provincial program for improving slaughtering activities according to the Circular 14. While the project can use local assessment results as an official data, it will co-implement more frequent monitoring visits to the demonstration sites with local partners to facilitate continuous improvement in operation at these sites.

7.8 Challenges and Solutions

- 7.8.1 We work in the context of “One PMP indicator set fits all” while interventions by each API partner are diversified and coordination mechanisms among partners are not always clear. It is a complicated process to harmonize/standardize indicator definitions and reporting requirements. To improve the situation and speed up the process, APII and MEASURE met to discuss the issues and defined a clear timeline with role of each partner clarified.
- 7.8.2 In order to measure the changes at outcome and impact level, particularly the competencies and behaviors of individuals, the capacity of a system and institutions, and social, economic, environmental and biological impacts, we will require significant resources (time, money and HR). The project is exploring opportunity for collaboration with other partners to make the best use of the available efforts. For example, we are discussing with FAO option for covering Dong Ha LBM through their active market surveillance activities. At the same time, the project is using monitoring data to keep track the behavioral and operational improvements as much as possible.

Administration & Finance

APII continues to submit routine deliverables to USAID, including quarterly progress reports, quarterly financial reports, semi-annual and annual reports etc. The F&A team support the technical teams in managing all subcontracts and consultants.

7.9 Achievements

- 7.9.1 Smooth coordination and communication with USAID Hanoi and quick approval turnaround time from USAID that helps to facilitate the process better
- 7.9.2 Senior team acknowledges they have seen no communication issue in the office so the coordination among the team is quite productive.
- 7.9.3 The office is still fully staffed and they show their strong commitment when there are only 02 months before Year 3 is finished and there is no clear picture for Year 4 and all the activities are in progress, including program and finance and administrative staff.

7.10 Challenges and Solutions:

- 7.10.1 Heavy workload and high pressure when it comes to close to the end of Year-Three of the Project including filling, reporting, workshops, printing, procurements of subcontracts and consultants, and closing out of consultants and subcontracts before the fiscal year is finish.

8. Success Stories

District Competitions in Quang Tri recognize the Skills and Knowledge of Local Animal Health Workers

A new initiative introduced in Quang Tri province during the summer increased awareness of the important role played by local Animal Health Workers (AHWs), and gave them an opportunity to display their abilities. During June, three district-level Excellent Animal Health Worker competitions were held, followed by a provincial-level competition to identify outstanding AHW teams.

AHW Competition in Quang Tri, June 2012

In each of the competitions, competing AHW teams had to introduce themselves, answer a number of questions within a set period of time to prove their knowledge on animal health, and then show their drama and communication talents by designing an innovative way to communicate an animal health message.

The provincial competition was organized on June 22, 2012, with 30 AHWs in six teams from communes in Gio Linh, Hai Lang and Trieu Phong districts competing. Representatives from the provincial Department of Animal Health (DARD), the provincial Sub-Department of Animal Health (SDAH) and other provincial departments and mass organizations attended the competition, along with leaders from district animal health stations, the media and 200 local supporters of the AHW teams.

In his opening speech, Mr. Tran Duc Nhu, Deputy Director of Quang Tri DARD said: "This is the first time that Quang Tri has organized a competition for the animal health workers at the local level. This is not only for those excellent veterinarians from the commune level to get official recognition for their contribution to the animal health sector but it also promotes the knowledge and skills needed for the effective performance of the overall animal health system. The event has received significant attention from provincial leaders and other sectors and it highlights the importance of the animal health system in our society."

The event, which aimed to promote competitiveness and passion for their work, as well as to strengthen capacity of animal health workers, raised the image of local veterinarians. After the event, Ms. Nguyen Thi Thanh, a member of the winning team from Trieu Tai commune in Trieu Phong district said: "We are very happy! The competition helped us to love our work more and we will try our best to provide better services. We hope that these kind of competitions will become popular so that we and our colleagues will have more opportunities to participate in the future."

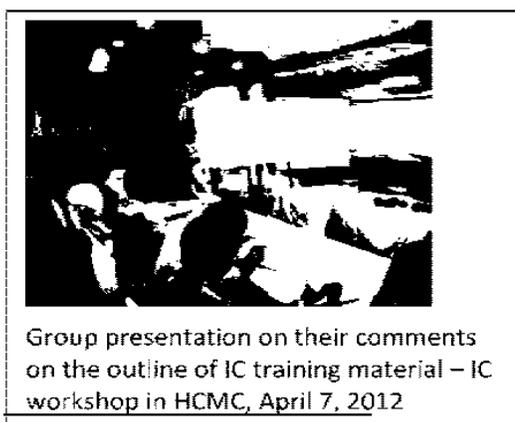

The competition also piqued the interest of community members and social organizations working on animal production, environmental protection and community health, and increased their understanding of the knowledge and talent of local AHWs. Mrs. Quang Son, the event's MC, said: "I learned a lot from the organization of this event, especially about the competing teams and their technical knowledge and their talent. The event was more successful than I could imagine." Local Government officials were also impressed: "The success of the competition is very encouraging to the provincial animal health system and will echo throughout the province," said Mrs. Lê Thị Nga, Head of the provincial SDAH.

Quang Tri province's Department of Agriculture and Rural Development (DARD) and the Quang Tri Sub-Department of Animal Health (SDAH) cooperated to organize the competitions. The province contributed 70% of the total cost, with the remaining 30% coming from the USAID/APII. This is the first time that such competitions have been organized in Quang Tri or—as far as we know—in the whole country.

USAID/APII training materials for strengthening infection control at district and community levels near formal adoption by Vietnam's Ministry of Health

Poor infection control in hospitals, medical centers and clinics creates risks for patients and their families as well as healthcare workers. Studies conducted outside Vietnam indicate that as many as 1 in 20 hospital patients may acquire an infection whilst admitted to hospital¹, which may result in medical complications, prolonged recovery time and increased cost of treatment. Recent studies suggest that hospital infection rates in Vietnam may be even higher². Vietnam's 645 district hospitals face particular challenges due to a lack of basic facilities and equipment combined with low awareness and poor practices by healthcare staff.

Since 2010, USAID's Avian and Pandemic Influenza Initiative (USAID/APII) has piloted a model approach to infection control in eight district hospitals in Can Tho, Ha Nam, Hung Yen, Kien Giang and Quang Tri provinces, and has worked with the Vietnam Nurses Association to develop a training curriculum adapted to the particular situation at the district level. The pilot activities and the training curriculum have been designed to offer practical support for enhancing the implementation of the Ministry's national circular on infection control³. The Vietnam Ministry of Health is now reviewing the USAID/APII training curriculum as a precursor to national adoption for training doctors and nurses from district hospitals as well as medical centers and clinics at district and commune levels.

A series of three workshops⁴ organized in Hanoi, Hue and Ho Chi Minh City in late March and early April by the Ministry of Health and the Vietnam Nurses Association (VNA) brought together health officials and leaders from provincial Health Departments and district hospitals in seventeen provinces as

² E.g. Truong Anh Thu et al. "A Point-Prevalence Study on Healthcare-Associated Infections in Vietnam: Public Health Implications". *Infection Control and Hospital Epidemiology*, Vol. 32, No. 10 (October 2011), pp. 1039-1041

³ Ministry of Health Circular No. 18/2009/TT-BYT dated October 14, 2009: *Guidelines on the Implementation of Infection Control in Health Care Facilities*

⁴ News on the Hanoi workshop was aired on O2TV and uploaded to website of T5G at: <http://www.t5g.org.vn/Default.aspx?u=dt&id=3706>

well as representatives of regional infection control societies to review the results of the USAID/APII pilot activities, including the draft national training curriculum which has been trialed with approximately 560 doctors and nurses working in these hospitals.

“Between May and December 2011, with support in improving knowledge, methods and facilities from USAID/APII and with the hospital strengthening monitoring and hand washing communications, the figures on hand washing practices increased from 40% to 80%,” Mr. Le Minh Tam, Head of the Infection Control Department of Hai Lang district hospital, Quang Tri, shared at the workshop in Hue.

Assessments carried out before and after the interventions in the pilot hospitals indicate that the training and other activities supported by the USAID/APII project have improved infection control systems and procedures, enhanced knowledge and practices of district health staff, improved medical instrument and linen processing and hospital waste management, increased the use of personal protective equipment, and contributed to establishing standardized facility disinfection and cleaning practices to prevent the spread of infectious diseases within these hospitals.

MOH Review Board worked on IC training material, Ha Noi, May 2012

Following the three workshops, comments on the USAID/APII training materials were incorporated. On 26 April the Ministry of Health convened a meeting of a scientific committee to review the training materials, with the participation of representatives from the Ministry’s Department of Science, Department of Training and Education and Department of Treatment, together with representatives of the VNA and infection control experts from the Hanoi, Ho Chi Minh

City and Hue infection control societies. This scientific committee has now endorsed the training materials, and formal Ministry approval is expected to follow shortly

Once the training materials are approved, they will be applied for training staff in 645 district hospitals and 10,748 commune health centers throughout the country in line with the Ministry of Health’s “National action plan on infection control strengthening in health facilities in the period 2012- 2015”. This will assist the Ministry to meet their national target that by 2015 at least 80% of health care workers at health facilities will have been trained on infection control. Trainees

will receive professional certificates and the training will also count towards their professional development requirements established by the Ministry⁵.

⁵ Ministry of Health Circular 07/2008/BYT dated May 28, 2008: *Guidance on In-service Training for Health Care Workers*

Kien Giang becomes the first province in Vietnam to include both Business Continuity Planning and a Whole-of-Society approach in their Pandemic Preparedness Plan

As part of the national response to highly pathogenic avian influenza (HPAI) and other potential pandemic threats, Vietnam's 63 provinces and major cities have been required by the central government to develop provincial pandemic preparedness plans (PPP). In general, however, these plans have mainly focused on planning for the human health system to a pandemic. They have not yet applied a whole-of-society approach that involves civil society, the business sector and local communities in responding to and mitigating the effects of a pandemic. They have also not yet included plans for operational continuity of essential services like food, water and power supplies during and after a pandemic, taking into account the likelihood of high levels of absenteeism.

Developed with support from the USAID/APII working through the Vietnam Red Cross (VNRC), the recently approved Kien Giang PPP is the first provincial PPP in the country to include business continuity planning for maintaining essential services in the province during a pandemic, including power, water, food supplies, telecommunications, banking, public transport and sanitation. It also applies a whole-of-society approach, including measures to mobilize civil society organizations and local communities to support the health response and maintain essential services and livelihoods during and after a pandemic. This draws on the experience of USAID's previous Humanitarian Pandemic Preparedness (H2P) project in Vietnam with the VNRC.

The planning process for the PPP brought together a wide range of relevant departments, agencies and organizations within the province. On May 17, 2012, the Kien Giang People's Committee tested the draft plan through a table top exercise in the province with the participation of more than 60 representatives from provincial departments, military agencies, the police, the media and civil society organizations. The Ministry of Health, VNRC, USAID and representatives of other provinces also attended. During the table top exercise, a pandemic scenario was presented, with different related agencies identifying how they would apply the plan in response. Participants gave comments and suggestions, which were then incorporated into the final version of the plan. The draft plan also received inputs from key national and international agencies including Vietnamese ministries, FAO and WHO.

Following the table top exercise, a PPP dissemination workshop was organized by Kien Giang

Training course for community leaders on community's preparedness in each of 4 stages of PPP, Kien Giang, June 2012.

authorities on June 11-12, 2012 for 35 designated staff from provincial agencies, mass organizations and local authorities to discuss multi-sector cooperation and shared experiences dealing with outbreaks.

The development of the PPP also served as an opportunity to train key people responsible for planning and implementing the plan and to strengthen inter-departmental, interagency and inter-sectoral links between the organizations that would need to respond in the event of a pandemic. From late May 2012, diffusion training courses have been organized for community leaders. Initial training courses included the participation of experts from the Ministry of Health's Department of Preventive Medicine and the National Center for Health Communication and Education (T5G), from the USAID /APII project team and from VNRC's group of master trainers. Comments gathered from the training courses helped to finalize PPP training materials for rolling out diffusion training on the PPP within the province.

"We believe that with diffusion training to all communities, if a pandemic occurs in Kien Giang, with our available network we will be able to respond," said Mr. Le Hoang Nam, Vice Chairman of Kien Giang Provincial Steering Committee for Infectious Diseases Prevention and Control, in an interview with VTC 16.

The Kien Giang Provincial People's Committee approved the new provincial PPP on June 26. The plan now serves as a model for other provinces that is in line with the *Vietnam Integrated National Operational Program on Avian Influenza, Pandemic Preparedness and Emerging Infectious Diseases (AIPED), 2011-2015*.

The Quang Tri Provincial Multi-Sector BCC Training Team demonstrates its capacity and ownership through specific provincial activities

Building on the experiences and lessons from two previous USAID-funded projects—AI Mekong and AI BCC (2006-2009), the USAID/APII has been continuing to build the capacity of Vietnam’s public and private sectors to prevent, control and enhance surveillance of avian influenza and emerging infectious diseases, particularly at the local level. The USAID/APII behavior change communications work aims to identify appropriate behaviors and messages, integrate these into the work of the animal and human health components, and strengthen the BCC capacity of national and provincial stakeholders, enabling them to carry on BCC activities beyond the lifetime of the project.

In Can Tho, Ha Nam, Hung Yen, Kien Giang and Quang Tri provinces, a team of key BCC trainers (5-8 people) drawn from animal health, human health and communications agencies as well as mass organizations, have been established, trained and provided intensive coaching. The ultimate goal by the end of the project is to leave behind a team of BCC trainers/specialists in each province who are able to design, implement and evaluate their own communication programs.

Excellent Farmer Competition in Quang Tri, June 2012

During this reporting period, the Quang Tri BCC trainer team has made great efforts in applying their BCC capacity to conduct specific activities that demonstrate their increasing ownership, mobilizing cost sharing from local resources with technical coaching from the USAID/APII BCC team. Innovative activities in Quang Tri during this period include the “Three Clean” Movement Launching ceremony, the Excellent Farmer Competition and the Poultry Stakeholder Forum.

Through these activities, the multi-sectoral trainer team has not only been able to adopt and apply modify its own behavior change approach to new activities but has also sharpen its team work spirit, promoting collaboration and coordination between animal health, human health and communication bodies, and more importantly receiving the support and buy-in from provincial, district and commune authorities for the application of good poultry production and food safety practices by all actors within local poultry supply chains.

In addition, in common with the other provincial BCC trainer teams, the Quang Tri team has identified, trained and mentored 30 facilitators and 30 communicators from commune animal health, human health, culture and information and women’s sectors to lead community events and conduct group discussions on desired behaviors with small and medium commercial farmers

(sector 3 farmers). The provincial team has supervised communicators and involved local authorities including commune people's committees in monitoring changes at household level. The team has also ensured technical soundness through attending rehearsals for community events. Through these events, local communities can enjoy an edu-entertainment approach to behavior change. The events also strengthen multi-sectoral participation at the grass-root level.

Communicator/AHW during home visits with coaching from a BCC trainer, Quang Tri, June 2012.

With USAID/APII support, the five pilot provinces now have multi-sectoral BCC trainer teams. During the final year of the project, further support and routine updating on behavior change communications and risk communications are planned, focusing on both avian influenza and other emerging infectious diseases in humans and animals. At the same time, the project will follow up to promote the utilization of these teams in developing and executing activities on avian influenza and emerging infectious diseases in line with provincial priorities, with a particular focus on activities utilizing local resources.

Introduction

This report presents the main achievements, challenges and solutions/lessons learned for USAID's Avian and Pandemic Influenza Initiative (USAID/APII) during Quarter two of Year four, covering the period from January to March 2013.

Quarter two of Year four saw the project reach the full level of implementation, not only in the five-targeted provinces but also across Vietnam. We continued with the three major focus areas: animal health (AH), human health, and behavior change communication (BCC). Activities are implemented via subcontracts, as Abi's current license does not accommodate direct implementation. This carries its own unique challenges as often it is difficult to find subcontractors capable of delivering quality work on time, and strengthening the capacity of subcontractors has therefore become a vital part of USAID/APII's work. This is especially true in Year four, as we have very limited time to complete our projects and close out the programs. In addition, are working to handover our models and training programs to our partners for long-term sustainability and future use.

The project progressed well in most of the eight main focus activities:

1. Coordination and Policy Dialogue
2. Human Health Surveillance
3. Case Management and Infection Control (IC) Capacity Building
4. Pandemic Preparedness
5. Animal Health Surveillance
6. Animal Health Worker (AHW) Capacity Building and Agricultural Extension Worker (AEW) Capacity Building
7. Supply Chain (Poultry Supply Network) Strengthening
8. Behavior Change Communication (BCC).

In Year four the project is also making a final push for the wider adoption and sustained implementation of models beyond the life of the project. Adoption, adaptation, replication and scaling up of USAID/APII innovations by public and private partners are considered the real measure of success for the project. This will require a sustained advocacy and promotional campaign, which the project is carrying out in Year four in close consultation with USAID and API partners.

What follows is a description and discussion of the main achievements and challenges of Quarter two of Year four.

1. National Coordination and Policy Dialogue

Under Coordination and Policy Dialogue we have three goals to achieve by the end of Year four:

- Improved coordination in order to improve highly pathogenic Avian Influenza HPAI prevention and control

- Sustained dialogue, coordination and lesson sharing on communications in Vietnam at a national level
- National communication framework revised in line with Avian Influenza, Pandemic Preparedness and other Emerging Infectious Diseases (2011-2015) (AIPED), officially approved by National Steering Committee for Avian Influenza (NSCAI), and applied by all members in planning and implementation.

1.1 Achievements

- 1.1.1 With other members of One Health Communications Network (OHCN), we attended and provided technical inputs to the National Communications Strategic Framework on Emerging Infectious Diseases (2013-2015) which was hosted by the Partnership on Avian and Human Influenza (PAHI) on February 28, 2013.
- 1.1.2 Four video clips on the upgrade of the poultry sections in Dong Ha Central Market, Quang Tri, were cleared by USAID to share with journalists in the training of government departments in Ha Noi. These clips will be widely disseminated not only through advocacy workshops but also with other Avian and Pandemic Influenza (API) projects and local provincial partners who plan to replicate market and slaughter point models.
- 1.1.3 The advocacy plan and matrix are being updated quarterly with close support from an Advocacy/Policy Dialogue Consultant. This quarter, the USAID/APII also developed and sent to USAID one-page briefs on Infection Control and BCC training, which specify approaches and desired achievements for replication.

1.2 Challenges and Solutions

- 1.2.1 There are some recent and pending changes in a few of the key personnel within technical agencies of the Government and other key stakeholders for our advocacy activities, for example due to people reaching retirement age. This requires us to engage with new personnel, who depending on their previous position and responsibilities may not in all cases be strongly aware of our activities. We are monitoring these changes and actively reaching out to the new personnel, with introductions and briefings from the outgoing personnel where possible. We also have the advantage in some cases from promotions of our former counterparts at different levels, meaning that officials who are very familiar with our work are now in more senior positions and can leverage the experience and capacity they gained in working with USAID/APII and support the wider application and replication of our models.
- 1.2.2 As we have moved from direct implementation in the original target provinces and reduced support to Provincial Coordination Units (PCU), we have had to consider effective ways to continue engaging with key counterparts in these target provinces in order to track the replication and scaling up of our models within these provinces, to have their cooperation in hosting visiting delegations to view the

model and sharing their experiences, and also to mobilize them to share the models with other parties. We have done this by building on the relationships and results of our work over the past three years and, in a few cases, providing limited support for follow up activities. So far, this approach has proved very successful, and counterparts in the original target provinces are strongly involved in replication and sharing our models across the different components as outlined below.

2. Human Health Surveillance

The human health surveillance model was developed over the first three years of the project as part of an integrated approach to community-based surveillance (CBS) in the five USAID/APII focus provinces: Can Tho, Ha Nam, Hung Yen, Kien Giang and Quang Tri. Following the findings of the external evaluation of CBS activity conducted during Year three of the project, the human health surveillance model has been separated from the AH surveillance model to promote its adoption, adaptation, replication and scale up during the final year of the project.

The goal of USAID/APII activities in Year four is to support national/provincial policies that facilitate community level surveillance and to replicate the relevant model in both current focus provinces and new provinces.

2.1 Achievements

- 2.1.1 The Statement of Work (SOW) of the National Institute of Hygiene and Epidemiology (NIHE) to implement human health surveillance activities in Year four was developed, submitted and approved by USAID, following a competitive bidding process. The SOW included 1) conducting an assessment and a regional workshop to review the implementation of the Ministry of Health's (MOH) Circular 48; 2) implementing a regional Training of Trainers (TOT) course for new provinces; 3) providing technical assistance to provincial Preventive Medicine Centers on developing/revising provincial plans on implementation of Circular 48 and replicating the relevant model on human health surveillance with a focus on emerging infectious diseases (EIDs) and zoonotic diseases in their respective locations. However, after finalizing the contract, we were informed that General Department of Preventive Medicine and MOH had planned assess Circular 48 themselves and asked that USAID/APII not conduct activities related to Circular 48 for the time being because of certain sensitive internal issues. In March USAID/APII cancelled the intended activities with NIHE and shifted those designated monies elsewhere.

2.2 Challenges and Solutions

- 2.2.1 The predictability and reliability of information from MOH is out of USAID/APII's and NIHE's control. We therefore decided to end the contract with NIHE, but we will continue discussions with NIHE in

order to explore other opportunities to cooperate in human health surveillance.

3. Case Management and Infection Control (IC) Capacity Building

The Year four goal is to assist the Government of Vietnam (GVN) in rolling out a training model developed to assist health facilities in implementing Circular 18.

3.1 Achievements

- 3.1.1 The SOW for the Vietnam Nursing Association (VNA) on USAID/APII infection control activities in Year four was developed, submitted and approved by USAID. VNA will work closely with USAID/APII technical staff, national IC experts and WHO in collaboration with MOH and three IC Societies (Ha Noi, Hue, and Ho Chi Minh City (HCMC)) to replicate the IC training model for in-service and pre-service systems. During Quarter two and Quarter three VNA will: a) conduct three regional training of trainer (TOT) courses for IC specialists from health facilities in 15 new provinces and for teachers from 15 institutions; b) coordinate with MOH to support Departments of Health (DOH) to implement the national action plan on strengthening IC at health facilities including dissemination training on IC; and, c) support selected medical/nursing schools to revise, test and finalize their IC lesson plans and introduce and review them in a one-day workshop for medical institutions.
- 3.1.2 As follow up to meetings held in September 2012 between USAID/APII and the Board of Directors of Au Lac Private Nursing School in Hue, on October 22, 2012 the school issued a decision adapting the USAID/APII-MOH IC training materials to their program beginning in the 2012/2013 school year. Two full credits for IC theory and practice with 60 sessions were used to train 220 nurses and 150 physicians.
- 3.1.3 Following a meeting in September 2012 between USAID/APII and directors of Phu Yen Nursing School on adapting the USAID/APII-MOH IC training materials, the Phu Yen Nursing School decided to integrate the training materials into their program in the second semester of the 2012/2013 school year. Phu Yen Nursing School will be the second medical/nursing school to apply the training model.
- 3.1.4 Based on the report from Can Tho DOH received by USAID/APII in Quarter two of Year four, during the period October through November 2012, Can Tho DOH conducted four training courses on infection control for 140 participants from all 21 hospitals in Can Tho including two private hospitals in Can Tho and one private hospital in Bac Lieu, a neighboring province. These hospitals contributed to the costs from their local budgets. The trainers of these four training courses were those trained by the USAID/APII in July 2012 in collaboration with VNA.

- 3.1.5 In late February, the MOH's Medical Services Administration issued an official requirement to all 63 DOHs and 34 national hospitals under the management of MOH to develop and implement provincial/hospital action plans on strengthening IC activities in healthcare facilities, including IC training for health care workers.
- 3.1.6 On March 1, the MOH's Medical Services Administration issued a plan for supportive monitoring trips to 13 hospitals in eight provinces where key staff were trained with support from USAID/APII in 2012 to assess post-training achievements and support provincial DOHs and hospitals to strengthen their IC practices.
- 3.1.7 In March two IC regional TOTs were held for participants from 10 provinces and 11 medical/nursing schools. The first, for health care workers from northern Viet Nam took place in Ha Noi and included 30 participants from Thai Binh, Thanh Hoa, Hai Duong, Ha Noi, and Dien Bien provinces and Thanh Hoa Medical College, Hai Duong Medical Technical University, Nam Dinh University of Nursing, Thanh Tay University, and Ha Noi Medical College. The second for Central and Highland Region healthcare workers was held in Hue with 30 participants from Binh Dinh, Quang Nam, Khanh Hoa, Nghe An, and Dak Lak provinces and Hue Medical College, Binh Dinh Medical College, Vinh Medical University, Duy Tan University, Quang Nam Nursing School, and Au Lac Private Nursing School. In both trainings the participants were received training adult learning methods, and IC skills and practices. A 1-day field study at the National Pediatric Hospital and Hue National General Hospital helped participants observe the actual IC and respectively demonstrated how to conduct Hospital-Acquired Infection (HAI) surveillance and how to monitor compliance with IC practices in health facilities. They also had opportunities to practice teaching with their own lesson plans, and they will apply these in IC diffusion training courses in their provinces and medical and nursing schools.
- 3.1.8 In March, USAID/APII staff met and worked with Thua Thien-Hue DOH to plan their IC diffusion training. Thua Thien-Hue DOH plans to provide IC training for three provincial hospitals, nine district hospitals and five specialty hospitals, covering about 510 medical workers in Quarter three. Thua Thien-Hue DOH is financing all of the 17 training courses (approximately 172 million VND) and USAID/APII will support printing costs of the required training materials.
- 3.1.9 In March USAID/APII supported the Vietnam Ministry of Defense's Military Medical Sub-Department's 5-day training course on "IC in hospital settings" in Ha Noi with IC training materials for participants from military hospitals. This training updated participants on international, US and National Hospital-focused IC practices and hospital pandemic preparedness.
- 3.1.10 In March USAID/APII staff attended the "Infection Control Training Program for Vietnam's Healthcare Workforce" workshop conducted

by MOH and VNA in Ha Noi for 17 military hospitals and eight medical/nursing schools. In this workshop, the MOH introduced existing IC training materials and introduced the draft IC training curriculum for the schools. Participants, who included directors of medical and nursing schools, were very interested in USAID/APII's IC training materials and are planning to adapt this material for use in their schools. The IC materials were distributed for integration into their schools' curriculums.

- 3.1.11 Between February and March, about 5,800 copies of IC training materials and 2,400 IC training curricula were distributed to 63 provincial DOHs and about 40 medical and nursing schools to support and encourage them in self-replication of the USAID/APII-supported IC training model within the healthcare system and in institutions.

3.2 Challenges and Solutions

- 3.2.1 The process of finalizing the VNA contract took longer than anticipated because of year-end time commitments and the large number of meetings and workshops on IC and nursing that took place during the early fall requiring the attention of both USAID/APII and VNA staff. While these meetings caused delays, they also presented USAID/APII staff with opportunities to share the IC training model with in-service and pre-service systems, leading to several fruitful conversations with provincial DOHs and training institutions, some of whom have expressed great interest in the IC curriculum and materials.
- 3.2.2 A number of projects are currently working on IC training materials to support implementation of the MOH's Circular 18, aimed at different levels of the national healthcare system. Japan International Cooperation Agency (JICA) developed a model for national and provincial level hospitals, based on and complementing the USAID/APII developed package, as well as a World Bank and Asian Development Bank model focused on strengthening healthcare worker capacity in healthcare facilities in specific focus provinces. To avoid overlap, USAID/APII has held discussions with these other projects on how best to use the materials approved by MOH in IC training and opportunities for collaboration.
- 3.2.3 The Ministry of Training and Education has issued an outline of IC training curriculums for nurses, but as yet there is still no IC training curriculum for medical students. To help fill this gap, USAID/APII's human health team worked closely with MOH, VNA, IC Societies and other partners to introduce and integrate the IC training model into nursing training programs. For medical students, we advised medical schools to develop an optional IC course and to use the training materials for reference in IC lessons in other subjects.

4. Pandemic Preparedness Planning (PPP)

The Year four goals were to introduce PPP packages to other provinces, and to advocate for wider adoption of PPP throughout Vietnam.

4.1 Achievements

- 4.1.1 The SOW for Pandemic Preparedness Plan (PPP) activities of the Humanitarian Center, Hung Yen Red Cross Association was developed, submitted and approved by USAID. The SOW includes: a) organization of a PPP workshop for Hung Yen authorities as well as representatives of related sectors and civic organizations to introduce the new concepts of “whole society” approach and business continuity plan (BCP), and present the multi-sector framework of PPP; b) revision of the PPP in Hung Yen province to incorporate the whole society approach and BCP concepts; and, c) conducting a two-day PPP dissemination training workshop for about 35 staff at provincial and district levels in Hung Yen.
- 4.1.2 In March, the Hung Yen Provincial People’s Committee (PPC) issued a letter assigning Hung Yen Red Cross to take the lead in coordination with other relevant departments in the province to revise the provincial PPP with support from USAID/APII. This document facilitates the activities of Hung Yen Red Cross in implementing the SOW.
- 4.1.3 In March the Hung Yen PPC hosted a PPP introduction workshop for participants from Hung Yen PPC, the Provincial Steering Committee on AI Control, Hung Yen DOH, and AH, Red Cross, and local media agencies. The workshop developed a plan for revising the Hung Yen PPP with the new “whole society” approach and multi-sectoral participation. The revised PPP is expected to be approved by Hung Yen PPC in mid-2013.
- 4.1.4 The Hung Yen PPC approved an editorial team in March design and write the PPP. The team consists of representatives from DOH, Department of Agriculture and Rural Development (DARD), Department of Communication and Information, and Hung Yen Red Cross. This editorial team developed an outline for the provincial PPP. Various department members will develop their specific plans with the intention of contributing to the first PPP draft. The first draft will be available in mid-April for comments.

4.2 Challenges and Solutions

- 4.2.1 The process of selecting an appropriate subcontractor took longer than anticipated but things are moving forward now.

5. Animal Health (AH) Surveillance

The AH surveillance model was developed over the first three years of the project as part of an integrated approach to community-based surveillance (CBS) in the five USAID/APII focus provinces/cities: Can Tho, Ha Nam, Hung Yen, Kien Giang and Quang Tri. Based on the results of the external evaluation of the

CBS activity, which was conducted during Year three of the project, the AH surveillance model has been separated from the human health surveillance model for promotion of adoption, adaptation, replication and scaling up during the final year of the project. The goal of USAID/APII activities in Year four is to support national/provincial policies that would facilitate community-level surveillance and to replicate the relevant models in both current focus provinces and new provinces.

5.1 Achievements

- 5.1.1 In Year four, animal health surveillance activities intend to concentrate in Vietnam's Central Region in collaboration with Regional Animal Health Office (RAHO) 3 and a local counterpart in Quang Tri. Quang Tri Livestock and Veterinary Association was identified to review the USAID/APII AH surveillance model and AHW network model in Quang Tri province beginning in March, based on a SOW approved in Quarter one. A local consultant, with a strong background in national AH surveillance systems, was also recruited in late March to provide technical assistance to the subcontractor in this area and develop a curriculum for AH surveillance for a regional course planned for April 2013.

5.2 Challenges and Solutions

- 5.2.1 Early desk review of national regulations showed that while a standard operating procedure (SOP) for HPAI has been developed there are a number of variations of surveillance guides available, for example guidance on specific diseases such as porcine reproductive and respiratory syndrome (PRRS), foot and mouth disease (FMD) and separate guidance for TAD-info (Trans-border animal disease information). However, except for the SOP for HPAI, these guides have gaps especially at community level where CBS can play a vital role in improving detection and reporting of new cases.

Similarly, despite the regulations issued in 2005 specifying 15 animal diseases to be included in the mandatory reporting list, only some are regularly reported. The varying SOPs and lack of consistent reporting practices complicates our ability to develop harmonized official guidance or a manual for AH surveillance, which does not conflict with current regulations and guidance but does cover all the reportable diseases. The local consultant is expected to make recommendations to address these issues.

6. AHW Capacity Building and AEW Biosecurity Training

The goals of the Animal Health Worker (AHW) Capacity Building and Agricultural Extension Worker (AEW) Biosecurity Training activities are:

- Introduce the AHW training package to new provinces and seek other educational training opportunities

- Introduce the AHW networking model that will be adopted by relevant public-private agencies at national and local levels.
- Introduce the AEW training materials to the National Agriculture Extension Center (NAEC), new Provincial Agriculture and Fishery Extension Centers (PAFEC) and private sector to applying them throughout AEW system.

6.1 Achievements

AHW Capacity Building

The AHW Training Package consists of a hardcopy training manual, which provides a reference for AHWs (an enhanced manual based on the existing DAH Manual) as well as an E-Book version on CD with additional content for trainers and a sample toolkit with standard equipment for provision of animal health services in the field.

- 6.1.1 The first AHW Training Package and AEW Biosecurity Training Dissemination Workshop for Year four took place on January 11, 2013 in An Giang with the participation of 51 from 13 Mekong provincial SDAH and PAFECs as well as representatives of RAHO 6, RAHO 7 and NAEC.
- 6.1.2 Following the An Giang dissemination workshop, USAID/APII received requests from 12 provinces in RAHO 6 and RAHO 7 for further assistance on TOT for AHWs, as outlined in Table 1.

Table 1. List of requests from SDAHs and PAFECs in RAHO6 and RAHO7 for support during Quarter one and Quarter two

	SDAH	Slaughterhouse technical supports (Unit)	Training requested (No. of participants)		
			Inspectors	TOT on AHWs	TOFT for AEWs
	<i>RAHO6</i>				
1	Ba Ria-Vung Tau	20 +1 market	-	7	-
2	Long An	-	-	5	2
3	Tien Giang	3	-	28	5
4	Ben Tre	2	15	10	11
5	Dong Thap	1	30	14	28
	<i>RAHO7</i>				
1	Can Tho	2	-	5	5
2	Vinh Long	6	-	14	-
3	An Giang	3	30	4	66
4	Soc Trang	1	30	5	5
5	Hau Giang	4+1 market	40	5	5
6	Ca Mau	4		5	30

7	Bac Lieu	3	30	5	5
8	Kien Giang	1	-	-	2
	Total	50 SHs +2 markets	175	107	164

- 6.1.3 Responding to these requests, USAID/APII has followed up with our subcontractor AFAP to organize two TOT courses on AHW capacity building for those provinces with some coaching and technical support. These courses will be organized in Ba Ria-Vung Tau and Tien Giang during April 2013.
- 6.1.4 On March 5, a second AHW dissemination Workshop was conducted in Ha Noi in collaboration with the VFU targeting VFU vocational training centers as well as the private sector. More than 50 participants joined the training, coming from regional and provincial vocational training centers under VFU as well as NGOs and the private sector. One more TOT course is planned in order to follow up this target group in May.
- 6.1.5 In an effort to replicate the AHW training package more widely, USAID/APII and AFAP worked with RAHO1 and RAHO2 and also directly with Phu Tho and Bac Giang provinces to conduct two regional TOT courses in Phu Tho and Bac Giang in March with total of 53 participants from 12 provinces. This brought the total number of provinces with local trainers trained by USAID/APII to 16 provinces as of the end of March 2013.
- 6.1.6 Following the cost-shared AHW TOT course in Moc Chau in Year three, the Moc Chau Dairy Cattle Joint Stock Company has decided to use the Diffusion Training Program for new AH technicians in the Moc Chau area using their own funds. In late January and early February, USAID/APII worked with the company through our subcontractor AFAP to develop the training curriculum as well as to provide technical coaching for this course. USAID/APII suggested a Memorandum of Understanding (MOU) to formalize a public-private partnership with the company, indicating that Moc Chau Dairy Cattle Company would contribute to training on animal surveillance, biosecurity and veterinary skills. However, to simplify the paperwork and align more closely with the interests of Moc Chau Dairy Cattle Joint Stock Company, in February it was agreed to just implement the training on veterinary skills and knowledge rather than to sign a formal MOU.

AEW Biosecurity Training

The AEW biosecurity training activities in the first two quarters of Year four focused on identifying the local counterparts and provinces and dissemination activities to introduce the AEW Biosecurity training package to other provinces. At the same time, a SOW was developed for official introduction and integration of the Biosecurity Training package into the programs of NAEC.

- 6.1.7 The project is supporting NAEC to officially adopt the AEW training manual and training materials and to promote their use within the national agricultural system. USAID/APII has met with NAEC to determine the best method for official review and approval. We have introduced the training system to NAEC and outlined the current projects and agreed on the activities for the coming months. These activities were incorporated into a SOW for the Vietnam Poultry Association (VIPA), which was approved by USAID in March.
- 6.1.8 As noted above, a combined dissemination workshop for the AHW Training Package and AEW Biosecurity Training Dissemination Workshop for Year four took place on January 11, 2013 in An Giang. Responding to requests following this workshop as outlined in Table 1, USAID/APII has worked with our subcontractor AFAP to prepare two more regional TOT courses in Soc Trang and Tien Giang that will be held in April 2013 to train local trainers who then will conduct diffusion training for their own provinces. Reproduction of the Biosecurity Training Package is planned utilizing a limited amount of funding from USAID/APII to ensure there are enough packages available to meet the training demand within this fiscal year.
- 6.1.9 In addition to this, the Project Management Unit within MARD of the World Bank-supported Vietnam Avian and Human Influenza Prevention and Control Project (VAHIP) has officially requested to reproduce 50,000 copies of the “Bac Mau nuoi ga” (Mr. Mau Raises Chickens) comic book developed as part of USAID/APII’s biosecurity training package for poultry farmers to use in their HPAI awareness raising program in schools during 2013.

6.2 Challenges and Solutions

- 6.2.1 Some delays in the subcontract approval process with AFAP initially slowed the time schedule of AHW Training Package and AEW Biosecurity Training activities. However, following Tet, AFAP and our local counterparts have quickly implemented activities, and all activities are currently on track to be completed before July as originally planned.
- 6.2.2 It is important for the sustainability and institutionalization of training/extension packages to work closely with NAEC and the PAFECs. This is a time-consuming process, which may not always be the top priority for these organizations and thus requires diplomacy, patience and perseverance in order to forge and maintain close relationships. Obtaining official approval from government authorities was a suggestion from the Deputy Director of NAEC and introducing the AEW/Biosecurity training through NAEC/PAFEC system and national/provincial projects remains a good option for replication of this training package widely and efficiently.
- 6.2.3 Figures on replication training conducted in additional provinces may not be available in a timely manner where these activities are

being funded from local, national or other resources not sourced by USAID/APII. USAID/APII will continue to build relationships with these counterparts and will seek appropriate ways to obtain useful information and data on the replication of USAID/APII models.

7. Supply Chain (Poultry Supply Network) Strengthening

The goals in Year four are to advocate and encourage adoption, adaption and replication by public agencies, private partners and/or other development projects and programs elsewhere of USAID/APII developed biosecurity/biosafety demonstration models in key (high risk) nodes along the poultry supply chain, together with related documents (such as protocols, guidelines and training materials).

7.1 Achievements

The key activities and achievements of the supply chain work during the second quarter of Year four focused on the following activities and nodes:

- 7.1.1. Further technical coaching and monitoring sessions of risk reduction demonstration models of the slaughterhouse, slaughter points and live bird markets (LBM) have been organized to make those demonstration sites become a better training platform for further training, study tours and consideration for replication:

**Dong Ha live bird and poultry meat market in Quang Tri and Hoa Mac, Duy Tien:* During routine monitoring visits in the quarter, USAID/APII together with the Market Management Board, SDAH and the provincial Women's Union (WU) as well as market vendors to review issues related to cleaning, the section arrangement and promotion of good trading practices. Meeting minutes were shared with the SDAH for enforcement of good, consistent practices.

In January, USAID/APII conducted monitoring visits and held an action-planning meeting with Hoa Mac meat vendors. Achievements and limitations of both the Hoa Mac market and the slaughter point were presented and discussed as a basis for reaching agreement between the stakeholders on follow up activities. The outcome of the three monitoring and supporting behavior change sessions in Hoa Mac was documented and shared with Ha Nam provincial partners including market management board.

Achievements and limitations of the Hoa Mac model were presented and discussed again with Ha Nam local partners including the DARD, SDAH, Hoa Mac People's Committee and Hoa Mac Market Management Board on March 15, 2013. The participants in this meeting gave a very positive assessment of the model, and outlined two areas where there is now a plan to carry out further related activities using local resources. Firstly, the USAID/APII-supported upgrade to the poultry and pork meat section of Hoa Mac market has also now been replicated for the vegetable and fish sections utilizing contributions from local authorities as well as the market vendors

themselves. Secondly, there is a proposal to replicate the Hoa Mac market model in Ly Nhan district market. This proposal is currently waiting on the next cycle of annual funding.

**Three upgraded small-scale slaughterhouses in Quang Tri and Ha Nam:* during routine visits, the technical team together with local inspectors, a BCC trainer and USAID/APII staff provided operational coaching and mentoring for slaughterers and slaughterhouse owners, focused on behaviors during slaughtering, processing and sanitation and developing detailed action plans for meeting their responsibilities for biosecurity and biosafety.

**Ngoc Xuan Centralized Poultry Slaughterhouse, Can Tho City:* USAID/APII staff conducted regular follow-up/monitoring visits and held a specific meeting to examine slaughtering processes and to identify solutions. To date most of the infrastructure is in place and operational procedures are established and being followed. During these visits, observation identified the most difficult-to-change practices, such as: a) poultry separation, b) off-floor slaughtering, and c) sanitation during the slaughtering process. USAID/APII organized a feedback meeting to discuss barriers preventing slaughterers from adopting improved practices and an action plan was developed with commitment from the slaughterers, slaughtering line managers and the Ngoc Xuan Slaughterhouse owner, and the inspectors and SDAH were asked to assist in the monitoring and enforcement efforts. More than 60% of slaughtering lines have applied the one-way slaughtering practices and off-floor slaughtering as a result of these monitoring and follow up efforts.

- 7.1.2. Sharing lessons learned and experiences for national and regional levels: in order to approach RAHO 3 and RAHO 6 and RAHO 7, field trips and meetings were held between the USAID/APII project directors and key staff of the new regional counterparts. Overall, the meetings confirmed their interest to support replication of the AHW training and improvements to slaughtering facilities models. Specially, the RAHOs expressed their interest to train inspectors in HPAI risk reduction at slaughterhouses and how to help the slaughterhouse owners to be more compliant with the Government's new regulations under Decree 61 and 14.
- 7.1.3. Following the Mekong Regional training courses for slaughterhouse owners on December 19-21 and December 24-26, 2012 on Veterinary Sanitation and Food Safety for 58 slaughterhouse owners and selected staff of SDAHs from 13 provinces in RAHO 6 and RAHO 7, slaughterhouse owners in Ba Ria-Vung Tau and Dong Nai provinces showed their interest in replicating the USAID models through official letters calling for support that have been reviewed and incorporated in the plan for provision of technical assistance in the coming months.

- 7.1.4. Responding to these requests, USAID/APII developed a small follow up plan for late March and early April for joint trips by RAHO, SDAHs and USAID/APII technical staff to visit selected slaughterhouses and provide direct technical advice for risk reduction and upgrades.

7.1.5. *Inspector training courses:*

Through the process of implementing three training courses on poultry inspection, USAID/APII has developed a curriculum for Advanced Training on Inspection of Poultry and Poultry Products for Food Safety and Sanitation. This training complements the existing RAHO inspector certification trainings. The USAID/APII advanced training include the following additional topics: updated information on AI, EIDs and food borne diseases; the supply chain and how disease transmission occurs at key nodes; and the design and operation of poultry slaughtering facilities to enhance sanitation and food safety. The RAHO and USAID/APII training courses have been combined, and costs were shared to replicate the USAID/APII model.

Each province SDAH contributed approximately 50 percent of the total training costs for administration and participants while USAID/APII covered the remaining 50%, mostly related to the costs of the trainers and the training materials.

Evaluation results from the training showed that most of the trainees achieved sufficient knowledge on good practices for food processing, safe slaughtering and waste management in order to carry out inspection, as well as being capable of providing effective supervision to slaughter points for better food hygiene and safety. After 3 more courses in Ha Nam and Quang Binh in the first quarter of Year four, USAID/APII continued to work with RAHO 3, 6 and 7 during the second quarter to prepare a plan for five more replication courses in quarter three 2013.

7.2 Challenges and Solutions

- 7.1.6. Profit margins from poultry slaughtering are especially small, and even more so in small-scale slaughtering operations. It is understandably hard to persuade these small private entrepreneurs to invest in facility upgrades without some form of 'subsidy' (financial support). Micro-finance options in the commercial financial sector (banks, MFIs) are rare. Many small entrepreneurs appear to be comfortable with their status quo business (size). The relevant cost savings, which in turn improve business and increase profits through environmental safeguarding and food safety measures, seem to be a more persuasive argument for small-scale slaughterers to make changes to their businesses.
- 7.1.7. USAID/APII continues to reach out to and invite partners such as LIFSAP and VAHIP to participate in project activities. Partners rarely reciprocate however.

8. Behavior Change Communication (BCC)

In line with Year four goal, in this reporting quarter we utilized BCC trainer teams established in Can Tho, Ha Nam, Hung Yen, Kien Giang and Quang Tri, to not only continue communication programs in their provinces including strengthening their supply chain models but also to roll out the BCC trainers' capacity building model to new provinces of Ha Tinh, Quang Binh and Thua Thien Hue for promotion of new desired behaviors. We also worked with selected BCC trainers from Ha Nam and Quang Tri and from the national level on the development of a BCC module for Viet Nam Farmer's Union to integrate BCC theory and methodology into the training curricula for their vocational training system.

8.1 Achievements

- 8.1.1 In late January, USAID/APII initiated a subcontract with the Vietnam Farmer's Union (VFU) to develop a BCC module for teachers at their Vocational Training Schools and then to introduce this BCC module to their training system in 63 provinces and cities of Vietnam with official approval and guidance from leaders of the VFU.
- 8.1.2 In early February, the VFU established a team of writers to develop the BCC module for teachers of Vocational Training School. The team included VFU trainers with experience in BCC, BCC specialists of the Ministry of Health (MOH) and selected BCC trainers from Ha Nam and Quang Tri. This writing team will benefit from technical support from other BCC specialists (MARD as well as professors from the fields of journalism and communications) who are part of the Advisory Team.
- 8.1.3 The VFU with technical inputs from the BCC team of USAID/APII developed the outline of the BCC module for teachers of Vocational Training School of Farmer's Union. The Scientific Committee of the VFU has approved this outline. Prior to submission to the Scientific Committee of the VFU, this BCC module was vetted by behavior change specialists from MOH, MARD, Professors from the Journalism and Communication Academy, teachers from Vocational Training Schools as well as selected BCC trainers from USAID/APII's focus provinces in March.
- 8.1.4 An APII consultant developed the first draft of BCC module. This first draft will be pre-tested with future users before getting final feedback from BCC specialists and finalization in early April.
- 8.1.5 The second draft of the BCC Training Manual and the Communication Strategy Development Guide were translated into English in order to seek comments not only from Vietnamese readers but also from Abt home office and API partners. These two materials will be field tested with provincial BCC trainers and communication experts from MOH and MARD in April before finalization.
- 8.1.6 On February 21, the Can Tho Communication Framework was officially endorsed by Can Tho DARD (as assigned by Can Tho

PPC) for wide use throughout the province. This Framework was printed and distributed to different agencies from provincial to district levels together with an official letter.

- 8.1.7 APII staff visited Ha Vi Poultry Market in January to understand actual practices of target audiences and conducted several meetings with the VAHIP project to plan potential support from USAID/APII on behavior change. USAID/APII developed the training needs assessment form to understand the BCC training needs of AH officers of Ha Noi SDAH and of Ha Vi market management board. The results of this self-assessment will serve the design of the training on BCC for these audiences that VAHIP project has requested USAID/APII staff to lead.
- 8.1.8 In mid-February, we signed a contract with Quang Tri WU to replicate the BCC training model to three new provinces (Ha Tinh, Quang Binh and Thua Thien-Hue) and to expand the model to promote food safety using the same approach of behavior change determinants and incentives.
- 8.1.9 In March, three TOT courses on BCC theory and application in promotion of human health behaviors were conducted by the Quang Tri BCC trainer team for the WU network of Ha Tinh, Quang Binh and Thua Thien-Hue provinces. The participants also included provincial human health and animal health workers from VAHIP projects in Ha Tinh and Thua Thien-Hue. These trained participants from VAHIP/WB were expected to lead their own communication activities to improve biosecurity practices in markets and slaughter points in their provinces.
- 8.1.10 Right after the completion of the TOT courses, Quang Tri BCC trainers worked closely with the newly trained WU staff in the three new provinces to prepare training materials and BCC tools for communicators. These diffusion training courses for communicators will be co-funded with the WU in April, focusing on behaviors selected by each province. This will be followed by interpersonal communication and community-based activities on the prioritized behaviors on food safety, life skills, and reproductive health care and other specific provincial topics in the next quarter. The Quang Tri BCC trainers will provide coaching and training on monitoring in the new provinces as well.
- 8.1.11 With technical assistance from an Abt headquarters economist, we conducted a BCC costing survey to review expenditures and activities implemented in target provinces with trainers and communication activities in March. We calculated local partners' contributions including both in-kind and cash contributions. The final report will include a road map with a costing for consideration for further funding and execution by interested individual projects and/or provinces for scale up and replication, and will be available in Quarter three.

8.1.12 Behavior change activities at supply chain nodes (Hoa Mac market and Hue-Thanh slaughtering point in Ha Nam; Ngoc Xuan Centralized Slaughterhouse in Can Tho) included:

- Conducted the 3rd supportive monitoring activity at Hoa Mac market and Hue-Thanh slaughter point by a multi-disciplinary team of local partners including Veterinary officers and BCC trainers as well as USAID/APII staff.
- Shared a summary report on the results of three supportive monitoring trips for behavior change at Hoa Mac market and Hue-Thanh slaughter point. Substantial changes in behavior have been observed in these two models such as cleaning the selling place, tables and tools as well as off-floor slaughtering. However, problems still remain, such as management of water and waste or wearing gloves while slaughtering and selling poultry. Continued supportive monitoring by local partners is required.
- Continued to develop posters for Hoa Mac market to promote the application of other desired behaviors among poultry vendors. A new set of posters promoting three more behaviors on hygiene and food safety will be field tested and manufactured in April.
- Met with Can Tho SDAH to review project achievements and their enforcement role in sustaining behavior changes at Ngoc Xuan so that it can serve as a training platform for replication of the USAID/APII model.
- Observed the slaughtering process in Ngoc Xuan on March 19 to identify problems and met with slaughterers on the next days to discuss and prepare action plan for improvements. Pending problems were promoting off-floor de-feathering and not leaving blood on the floor. Slaughterers committed that they would rearrange the slaughtering area in a way to facilitate off-floor practices.

8.2 Challenges and Solutions

8.2.1 The development of a module for teachers of Vocational Training Schools of Farmer's Union is a challenging task because the module has to satisfy both the technical requirements of an effective BCC methodology and the requirements of the VFU in order for them to officially introduce the module into their training system. This has caused some delays compared with initial planning but the BCC module will be available for approval by June 2013.

8.2.2 Building capacity needs time and practice. The BCC training model replication was well received by the WUs in the three new provinces of Ha Tinh, Quang Binh and Thua Thien-Hue. They need a lot of technical support and coaching from the Quang Tri BCC trainer team and USAID/APII's BCC team. These three provincial WUs are

also under time pressure to implement their annual communication activities in line with the guidance and targets from the national WU.

9. Monitoring and Evaluation (M&E)

USAID/APII's M&E work aims to strengthen existing systems in the provinces, and help close existing gaps between grassroots level M&E and provincial-national levels M&E and reporting. It also aims to facilitate and guide project implementation towards achievement of impacts to contribute to achieving the objectives articulated in USAID's Avian and Pandemic Influenza (API) Performance Management Plan (PMP). In addition, USAID/APII acts as the repository for PMP indicators collected under USAID's API initiatives, taking the lead in providing analysis and reporting on this data.

9.1. Achievements

- 9.1.1. To document in-province sustainability and replication of the achievements supported by USAID/APII including following-up with demonstration models, USAID/APII developed a quarterly report template and requested partners in our five focus provinces to report on the project's achievements in their province and share this report with the project.
- 9.1.2. Met with Ha Nam DARD in March to review Year four activities, collaboration and coordination in collecting, updating and sharing sustainability and replication of project's achievement.
- 9.1.3. A similar meeting was implemented with a former leader of the USAID/APII Provincial Coordination Unit (PCU) in Hung Yen in March. Both sides agreed to continue USAID/APII activities scheduled for Year four of the project and to carry out the activity of collecting, updating and sharing the project information.

9.2. Challenges and Solutions

- 9.2.1. It's foreseen that the process of updating and sharing the sustainability and replication of project's information in Ha Nam would not be done smoothly because of the absence of coordination between sectors in Ha Nam province after the phasing out of the Ha Nam PCU from October 2012.

10. Finance and Administration

10.1 Achievements

- 10.1.1 Managed all aspects of the finance and administration and all subcontracts and consultant agreements effectively. The procedures were streamlined during the course of the year.
- 10.1.2 USAID/APII continues to submit routine deliverables to USAID, including quarterly progress reports, quarterly financial reports,

semi-annual and annual reports etc. The F&A team support the technical teams in managing all subcontracts and consultants.

10.1.3 A better tracking system has been set up for the last year of Project including expenditures, travel, supplies, inventory, procurement, staff leave, subcontracts and consultants was developed.

10.1.4 Throughout Quarter three the project has been in the process of recruiting new F&A staff to replace the ones who have left.

10.2 Challenges and Solutions:

10.2.1 Year four brings a unique set of challenges; implementing our contractual requirements and preparing for close out in September. We will continue to work to disseminate APII programs and activities to new provinces and districts until July, at which time our focus will shift to close out activities. This indicates a compressed timeline in which to complete all program activities (approximately nine total, four remaining after Quarter two)

10.2.2 F&A and the Technical team work closely to submit SOW for approval and to negotiate with Subcontractors/Consultants for them to start at the earliest possible time so that we can achieve close out for programmatic activities in July 2013.

10.2.3 When new staff are on board, the Project will need to spend a lot of time to train them and get them up to speed as soon as possible.

10.2.4 To mitigate delays, the COP meets with all subcontractors prior to signing to insure they understand our limitations and that we will not be able to extend them under any circumstance.

11. Success Stories

11.1 Replication of Infection Prevention and Control for health care facilities in Can Tho City

Can Tho is stepping up efforts to improve medical care for the city's population of more than 1.2 million as well as people from neighboring provinces through a training program aimed at reducing hospital acquired infections, one of the leading causes of death in Vietnam. Using local funds, Can Tho has deployed a team of infection control trainers developed by the USAID/APII project and utilized the USAID/APII infection control training curriculum to replicate the USAID/APII training for an additional 139 healthcare staff from 21 different general and specialized healthcare facilities. Through the training, these healthcare staff have significantly enhanced their knowledge and skills on infection control, empowering them to protect their own health as well as the health of in- and out-patients and their family members who are using healthcare facilities in Can Tho.

Under USAID's AI Mekong and APII activities, selected staff from hospital facilities belonging to the Can Tho Department of Health (DOH) were trained as infection prevention and control trainers and supported to carry out initial training activities in pilot locations within Can Tho. The USAID/APII infection prevention and control activities in Can Tho also contributed to the

development of a new training curriculum on infection prevention and control focused on healthcare workers in district and commune healthcare facilities, which has now been adopted by the Ministry of Health (MOH) for nationwide application.

A healthcare worker in Can Tho demonstrating hand hygiene

Building on the training and other activities on infection prevention and control that were previously supported by USAID/APII in Can Tho, the city's health authorities have been continuing to utilize the trainers and the USAID/APII training curriculum to strengthen infection prevention and control in other healthcare facilities using local funding resources.

As outlined in an official report dated January 2013 from Can Tho DOH, since October 2012 four training courses on infection prevention and control have been organized for infection control staff from health care facilities. These training courses were organized in different general and specialized city and district healthcare facilities of Can Tho,

including Thot Not District Hospital, O Mon District Hospital, Can Tho City General Hospital and Can Tho City Traditional Medicine Hospital.

A total of 139 participants have completed the training courses, coming from 21 different healthcare facilities, as follows:

- Nine district hospitals and health centers
- Nine specialized provincial hospitals and health centers, including the following specialized facilities: pediatrics; ear, nose and throat; dentomaxillofacial; TB and lung disease; mental health; blood transfusion and hematology; cancer; dermatology; traditional medicine).
- Two private general hospitals from Can Tho City and one private general hospital from the neighboring province of Bac Lieu.

For each training course, the actual situation of the host institution in relation to infection prevention and control was used as a practical example for the training. The training aimed to address the real needs of infection control officers in these healthcare facilities, both in relation to patient care and also protecting healthcare workers from daily infection risks.

The results of pre- and post-testing of the participants in the training courses reported by DOH indicated significant improvements in knowledge about infection prevention and control in healthcare facilities.

Monitoring the infection control activities in Can Tho in April 2013

11.2 Peer-to-Peer Education Replicates USAID/APII's BCC training model in new provinces

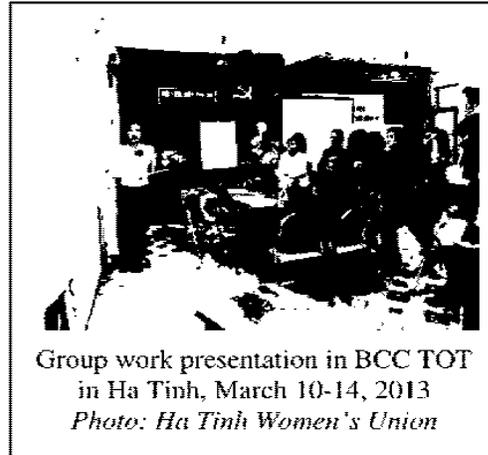

During February and March 2013, the provincial BCC Trainer Team from Quang Tri conducted three training of trainer (TOT) courses on BCC theory and techniques in Ha Tinh, Quang Binh and Thua Thien-Hue provinces, introducing USAID/APII's model outside of the projects original five focus provinces. These TOT courses reached 63 key staff from the provincial Women's Unions (WU), Sub-Departments of Animal Health (SDAH) and Centers for Health Education and Communication in these provinces.

The Quang Tri BCC Trainer Team overcame two significant challenges to implement these trainings. First, the team quickly moved from being training recipients over the past three years, to a training role in which they had to confidently pass on their knowledge of BCC theory and practices. Secondly, and perhaps more importantly, as provincial officials they were required to assume the role of teacher with their peers as opposed to more junior staff.

Preparation and facilitation of the training and learning activities required a lot of energy from the Quang Tri team, who quickly learned that the trainees could ask difficult questions. The Quang Tri team applied a peer education approach, and after the TOT courses they supported the trainees from each

province to develop small group discussion guides based on the specific desired behaviors identified by the participants. The topic areas varied significantly between each province, ranging from food safety to life skills and women and children's health.

Overall, participants were pleased with the training and noted that it had been a good fit for their communication objectives. The TOT course not only provided knowledge but also created an active learning atmosphere. The training method required and created opportunities for participants to practice their communication skills and to analyze social issues, which they found quite different from other training courses they had attended. The trainers' facilitation skills kept the interest of the participants, who even stayed longer than the program in order to prepare their practical demonstration exercises. "The success of this training was that it could change our behavior toward in-service training and that it really stimulated our learning attitude. This training will be followed by diffusion training for communicators at the local level and we strongly believe that we will bring the same spirit to the local level, to our members and our community," said Mrs. Nguyen Thi Tuyet Minh, Vice-Chairperson of Quang Binh WU at the closing ceremony of the training. Using the WU's communication programs as case studies also helped the participants to know how to apply the training in their future work as communicators and trainers.

Group work presentation in BCC TOT
in Ha Tinh, March 10-14, 2013
Photo: Ha Tinh Women's Union

The TOT courses provided a very good demonstration of the value of a peer-to-peer education approach, and successfully built the competency of the trainees. Based on the TOT courses and the small group discussion guides for each province, the three newly established provincial trainer teams are conducting diffusion training for communicators who will lead small group discussions with women on the desired behaviors prioritized by each WU's network.

Through helping other provinces to learn about BCC theory and methodology and to build new BCC trainer teams, Quang Tri WU and its BCC trainer team have strengthened their training capacity and widened their knowledge on prevention and control of AI and EIDs as well as on promotion of other health behaviors related to environmental hygiene, life skills and women and children's health. The success of this cooperation will certainly enhance Quang Tri WU's expertise, reputation and coaching role within the national WU network in future.

1. Achievements

USAID's Avian and Pandemic Influenza Initiative (APII) commenced activities on October 1, 2009. The first twelve months of implementation focused on: getting the project up and running, mobilizing key staff; identifying, engaging and guiding sub-contractors; and developing relationships with multiple partners in the five focus provinces (Can Tho, Kien Giang, Quang Tri, Ha Nam and Hung Yen) and at central level (e.g. MARD, MOH, FAO, WHO, AFAP, VNRC, PAHI, STOP AI, Infection Control Societies,). Below is an overview of activities and achievements during Year 1, outlined by management and technical areas.

1.1 Coordination and Collaboration

Provincial level

- 1) Signed MOUs with the five focus provinces between Nov. 10 and Dec. 4, 2009. Based on experiences and lessons learned during the AI Mekong Initiative, the team followed a clear step-by-step process with the provinces to develop the MOUs. There was a general feeling in the APII project of good teamwork and that the relationships with the provincial authorities generally got off to a good start. The process involved a broad range of stakeholders and interactive dialogue to help lay the foundation for future commitment and local ownership, which is key for future sustainability and scaling-up efforts.
- 2) Developed Provincial Implementation Plans (PIPs) with the provincial counterparts in January 2010, approved by the Provincial People Committees. A PIP is considered an official project document attached to the MOU outlining a framework for project implementation.
- 3) Established Provincial Coordination Units (PCUs) in each province. The PCUs are chaired by provincial leaders, typically the Vice Chairman of the Provincial Peoples Committee or the Director or Vice Director of the Provincial Department for Agriculture and Rural Development (DARD). Member representatives are appointed from related organizations responsible for implementing and guiding project activities in the province. The PCU assumes the highest level of ownership and decision-making on project implementation in the province. The PCUs typically meet every month to get update on the progress implementation and do planning and monitoring of field activities.
- 4) Developed provincial guidelines for field implementation and monitoring together with the provincial counterparts. The guidelines outline the steps and procedures for sub-contractors to execute their work in cooperation with the PCUs and provincial partners. At the same time, the guidelines provide PCUs with tools to coordinate and supervise all activities.
- 5) Engaged full-time Provincial Coordinators funded by either FAO (Kien Giang, Quang Tri, Ha Nam) or APII (Can Tho, Hung Yen) to assist the PCUs.
- 6) Opened Project Offices within Can Tho and Quang Tri DARDs, each staffed with an APII Project Manager. Together with the Head Office in Hanoi these satellite offices provided logistical and financial management support to provincial activities.

- 7) Organized joint meetings with FAO, USAID and PCUs in some of the focus provinces (when busy schedules permitted) on provincial implementation, coordination and lessons learnt.

Central level

- 8) The initial idea of establishing a Technical Advisory Group under MARD was replaced by a more pragmatic approach of operating via/with strategically located partners such as PAHI, FAO and WHO with more immediate access to central level planners and decision-makers, and the development of a detailed advocacy strategy was initiated.
- 9) The technical teams participated actively in and contributed to relevant national workshops and technical working groups under PAHI (including the BCC Working Group and the Bio-security Working Group).
- 10) Established close working relationships with key international partners such as FAO and WHO resulting in better coordination and communication. Agreed with FAO on clearer divisions of work e.g. in surveillance where FAO focuses its inputs at upper (national, provincial, district, commune) levels, whereas APII targets grassroots/village levels, the two thus complementing one another and working to strengthen the overall national system. Similarly established close working relationships with a wide range of national and local partners through subcontracts.

1.2 Avian Influenza Preparedness and Response Plans

- 1) Attended H2P's Table-top exercises in Ha Nam to gain experience for future activities and to see where and how to integrate behavior change communication into provincial pandemic response plans.
- 2) Attended IOM's table-top exercise on Preparedness and Response Plans in Tay Ninh, to gain experience for future activities.
- 3) Met with USAID and representatives of the International Federation of the Red Cross on how to subcontract Vietnam Red Cross (VNRC) for optimum use of USAID-funding and minimal overlap between APII and the Humanitarian Pandemic Preparedness (H2P) project implemented by VNRC and ending in August 2010. Initiated talks on the next steps for partnering with VNRC early in Year 2.

1.3 Early Warning Systems & Surveillance

Key achievements are presented in terms of preparation, capacity building, network establishment and maintenance, and advocacy and policy dialogue.

Preparation:

- 1) Conducted a rapid assessment on the status of surveillance systems in the three new focus provinces (Kien Giang, Quang Tri, Ha Nam) and proposed the Community-Based Surveillance (CBS) approach for the five focus provinces.

- 2) Reviewed the CBS model developed under A1 Mekong Initiative and the provincial surveillance processes in Quang Tri, Ha Nam and Kien Giang's to inform the development of APII's CBS approach and plan.
- 3) Provided technical assistance to the Centre for Community Health and Injury Prevention to implement CBS approaches in Thai Binh and Long An Provinces funded by the VAHIP project of MoH.
- 4) Had discussions with FAO to work towards aligning surveillance approaches and develop joint plans for implementation in animal health surveillance. It was agreed that: APII and FAO would work together to finalize district and commune selection processes based on the risk-based approaches; APII and FAO would jointly organize a national workshop to introduce the CBS model; FAO would train commune chief AHWs and APII would train both village AHWs and human health workers, key informants and private sector partners in 123 communes; APII and FAO would jointly launch and implement the CBS model in 5 focus provinces.
- 5) Finalized the APII CBS approach taking into consideration the sustainability of the program. The approach is using and strengthening existing animal and human health networks at commune and village level and link the disease information from the CBS into the existing surveillance in national human and animal health systems.
- 6) Finalized the list of districts and communes (in collaboration with FAO) for CBS implementation using the risk based approaches. The total of selected communes is 123 in which Hung Yen is selected 24 communes in 4 districts, Ha Nam 16 communes in 2 districts, Quang Tri 26 communes in 4 districts, Can Tho 24 communes in 5 districts, and Kien Giang 33 communes in 4 districts.

Capacity building:

- 1) Held a 5-day TOT course for provincial health and animal health counterparts in APII CBS model implementation for 20 provincial human and animal health staffs (four per focus province).
- 2) Made detailed plans for CBS training of collaborators, key informants, and private sector agents in all five provinces.
- 3) Completed the roll-out of training for CBS networks in 123 communes in the five focus provinces, for around 1850 collaborators.

Network establishment and maintenance:

- 1) Prepared CBS materials/toolkits for distribution to collaborators during model launches.
- 2) Maintained CBS collaborator networks in 123 communes through monthly network meetings (from May in Quang Tri and Hung Yen; from July in Can Tho and Kien Giang; and from August in Ha Nam), rapid reporting on suspected cases and monthly reporting. The very latest information suggests that 2118 sick and dead poultry and 1132 SARI cases were reported by collaborators during July – September!

- 3) Supported regular monitoring visits by provincial and district level human and animal health staff.
- 4) Organized a national workshop with FAO to introduce the CBS model to national and provincial counterparts with 78 participants from the national level (MoH, MARD, NIHE, Public Health and Agriculture Universities, VA), the five focus provinces, and representatives of international organizations including CDC, WHO, CDC/GMS, CARE, and USAID.
- 5) Organized 18 CBS launch ceremonies in 18 districts with participation of more than 1800 collaborators from 123 communes, commune and district human and animal health authorities, media, and local government representatives. During the launches, the local authorities showed their recognition and approval of the network by giving their own (written) recognition of the networks in the form of a decision. The launches also made the collaborators proud to be members of the networks helping the community detect and report suspected cases of AI. During the launches fact sheet and provincial press releases were distributed to journalists and communication workers at national, provincial and district levels.
- 6) Commune loud-speaker broadcasts aired scripts introduced the collaborator network to communities. In addition, CBS toolkits including handbooks, reporting forms, bags, and T-shirts were provided for collaborators to assist them with their work.

Advocacy and policy dialogue:

- 1) Engaged a senior national surveillance expert to visit the field, attend launches and meet with provincial health and animal health staff and officials to show the importance of CBS in bridging the gap between community and central levels.
- 2) Upon request, APII provided technical assistance to the Centre for Community Health and Injury Prevention and shared the CBS approach with the VAHIP project of MoH to implement the CBS model in Thai Binh and Long An Provinces (for more details see success stories at the end of this report).
- 3) Conducted a costing/sustainability study in order to document and provide information on the cost (financial and human resources) of reproducing the model.
- 4) Conducted a series of individual meetings with FAO, WHO and national experts in both animal and human health sectors to discuss how the model can move beyond the AI towards events-based surveillance and how to simplify the model for easier adoption and replication in year 2.

1.4 Infection Control and Case Management

- 1) Organized and conducted a national workshop to share the lessons learned in infection control (IC) and case management (CM) under the AI Mekong Initiative and prepared plans for future case management and infection control activities.
- 2) Subcontracted Ho Chi Minh Infection Control Society for implementation of activities in this technical area.

- 3) Rapid assessments were conducted in 12 district hospitals in five provinces to inform the intervention.
- 4) IC activities in four districts of the AI Mekong Initiative were maintained.
- 5) Finalized CM training materials and guidelines and conducted TOT for provincial health staff on case management.
- 6) Introduced the National Infection Control Circular to health workers in target districts. Two workshops were organized in Can Tho and Kien Giang for IC staff in all district hospitals with some staff from provincial hospitals also attending. Partnered with Johnson and Johnson Medical in this effort with Johnson and Johnson supporting travel and accommodation for national trainers and training materials.
- 7) Prepared IC training curriculum and guidelines based on recommendations for IC implementation at district hospitals.

Advocacy and policy dialogue:

- 1) Met regularly with WHO to discuss how best to coordinate and collaborate on IC and CM support.
- 2) Met with national experts of MoH to show the APII approach on IC activities – with its focus on districts and commune levels which most other IC intervention programs have not yet targeted.
- 3) Met with USAID and IC programs of PEPFAR to explore scope for collaboration and exchanges of experiences and lessons learnt on general versus more disease specific IC interventions and programs.

1.5 Animal Response Efforts

This work focused on AHW capacity building under subcontracts with AFAP and VVA in collaboration with provincial S-DAHs.

- 1) During the last quarter of 2009 a review of the data collected in 2009 under the AI Mekong Initiative (and by AED in focus provinces) was conducted in order to provide baseline information on poultry production, AI virus outbreaks, and AHW and Animal Extension Worker (AEW) networks. This data helped inform subsequent work-planning in the five focus provinces.
- 2) AFAP completed an extensive Training Needs Assessment (TNA) for AHWs and AEWs in the five focus provinces during March-June in consultation with SDAHS and PAFECS in the five focus provinces.
- 3) AFAP rolled out support to AHW networks with monthly meetings and refresher trainings in 15 districts of the five focus provinces from June 2010, reaching a total of more than 1200 AHWs (800 male and 400 female). Aside from AI the trainings covered a wide range of common diseases including Porcine Reproductive and Respiratory Syndrome (PRRS) which recently swept through Vietnam with severe

impact on pig/poultry farmers and of major concern to authorities. Relevant training modules were adapted from DAH's most recent training curriculum.

- 4) AFAP conducted five TOT courses for local trainers (114 trainees from SDAHs and PAFECs; 42 female and 72 male) to help prepare SDAHs to take over and extend the training into other districts.
- 5) APII distributed 2000 AHW Logbooks to 05 provinces and initiated distribution of 1200 Vet tool kits to AHWs in 15 districts. The AHW Logbook and Vet Tool kit designs were adopted by VAHIP project for replication in 11 provinces.
- 6) Subcontracted with the Veterinary Association (VA) in February 2010 to strengthen its existing national association network, support AHW networks in selected pilot districts and explore ways to involve the private sector by tapping into networks of private AHWs ('para-vets') through public private partnership activities with companies such as GreenVet, Tien Thanh, Nam Thai, Merial, Hung Nguyen, NAVETCO and HANVET.
- 7) VA implemented 36 joint training courses for AHWs in 6 districts of Can Tho and Hung Yen from April 2010 ('old' districts from Ai Mekong, different from the districts covered by AFAP);
- 8) Distributed nearly 6500 technical magazines (Vietnam Veterinary Magazine, Poultry Magazine, Poultry Newsletter) through VA to 315 AHW commune boards in 21 districts in the five provinces. Set up 15 information desks to help AHWs access new technology and technical information. Analysis of data on their performance is forthcoming.
- 9) The work implemented through AFAP and VA was shared with local, national and international counterparts and partners during two national workshops for sustainable development of AHW networks in July and September, one organized under APII and one organized by DAH. The capacity building support to AHWs and AEWs comes at a time of increased national focus on the critical role of AHWs, both public and private, in providing better services to the livestock sector in future. This presents opportunities for APII to influence relevant upcoming legislation such as the new Veterinary Law expected in 2012.

1.6 Biosecurity

- 1) In conjunction with the TNA for AHWs a TNA for AEWs was completed in consultation with NAFEC/PAFEC yielding useful recommendations for enhancing bio-security skills and knowledge. AEWs are recognized as a good resource for training of farmers on bio-security and bio-safety through good farming practices.
- 2) The Rural Development Center (RUDEC) of MARD was subcontracted to conduct a 'Supply Chain Risk Assessment' in the five focus provinces. The findings were disseminated to representatives of key regulatory authorities at the national and provincial levels and international partners through dissemination workshops in July.
- 3) The risk assessment further informed/guided the 'Provincial Strategic Planning Workshops on HPAI Risk Reduction along Poultry Supply Chains' held towards the

end of Year 1 with FAO and local public and private stakeholders. These workshops resulted in lists of priority (high risk) nodes and risk reduction measures for supply chain interventions and demonstration model development.

- 4) A desk review of the regulatory framework was conducted by a national consultant.
- 5) A rapid risk assessment was conducted in the five focus provinces (and in Ha Tay province where the largest live bird market of Ha Vy and several hatcheries are located). Findings were shared with the DLP and through the Biosecurity Working Group co-managed by FAO-DLP.
- 6) In collaboration with FAO, the Poultry Association, and VA, current bio-security training materials were collected for review. A plan to develop training materials for smallholder commercial (sector 3) farmers was prepared in collaboration with NAFEC and DLP. Representatives from the two organizations were engaged as consultants for bio-security training material development.
- 7) Two proposals for bio-security and certification model development for sector 3 farmers were drafted together with RUDEC and the Department for Economics Environment and Farming systems (DEEFS) of the National Institute of Animal Husbandry together with the Poultry Association. This work is expected to be contracted to these organizations in Year 2.
- 8) Drafted a Project Strategy and Implementation Framework 2010-12 and an integration matrix to guide an integrated animal health/human health/BCC supply chain approach.
- 9) Under the VA subcontract, and assisted by national consultants, reviewed the AED curriculum on AI prevention for hatcheries, slaughterers, market vendors, cooked food vendor was and developed an updated version to train around 400 supply chain vendors what focus on bio-security and bio-safety.
- 10) Participated actively in Biosecurity Working Group and other technical meetings.

1.7 Behavior Change Communication

Central level

- 1) Organized a one-day training course on the theory and application of behavior change communication (BCC) in December in Hanoi with 20 participants from AFAP, VNRC, NAFEC, NCHEC, VVA, and all APII technical staff.
- 2) Attended BCC working group meetings and acted as the focal point for BCC material cataloguing. A list of collected materials, including legislative documents and strategies from all agencies in the working group, including MARD, was developed for uploading to PAHI's website. Hard and soft copies were collected for filing in APII's library.
- 3) Completed BCC activities assessment, the findings will orient the planning of Year 2 BCC activities.

- 4) Conducted a one-day training for 30 people including journalists from national agencies (who previously attended FAO's training and IMCAPI's orientation) and communications staff from NAFEC, NCHEC and provincial CHEC's on BCC and messaging. The course also provided technical information for API stories. The training concluded with a planning session on next steps for journalists to provide better coverage on API prevention and related APII activities. Follow-up with the journalists in September showed that they have started to write articles, and prepare video clips about the CBS model.
- 5) Conducted a three-day BCC training for 30 people representing the project's main national stakeholders including VNRC, WU, VVA, Poultry Association, Farmer's Association, NAFEC, NCHEC, AFAP, RUDEC, DEEFS, and PCs.
- 6) Conducted a five-day training course for master trainers on BCC for 30 key staff from the five focus provinces, representing human and animal health, provincial communication bodies (such as PAFEC and PCHEC), mass organizations (WU and RC). The master trainers subsequently organized TOT courses for district level trainers. The province and district trainers will participate in the design and implementation of BCC related activities in Year 2.
- 7) Following the provincial reduction strategy workshops to identify key (high risk) nodes and intervention points in selected poultry supply chains, the BCC team organized planning workshops with key leaders of health, animal health sectors, Red Cross, Women Union, etc. during Sep in Can Tho. The outcomes were lists of agreed priority behaviors for priority supply chain nodes and lists of proposed BCC activities/target audiences and timing. The workshops will be followed by FGD and IDI with target audiences to identify barriers and motivators for target audiences to apply desired behaviors.
- 8) Prepared video clips introducing the CBS model, the role of CBS collaborators and the five steps of hand washing for CBS provincial launching ceremonies.
- 9) Together with the AH component, worked with VAHIP to transfer and replicate AI Mekong and APII successes in VAHIP's provinces. The bio-security booklet on Mr. Mau raising chicken to was distributed in VAHIP provinces and USAID provided authorization for VAHIP to reprint the AHW logbook.
- 10) Began exploring the development of an APII website with Abt HQ.

Provincial level

- 1) To continue BCC activities supported under the AI Mekong Initiative and AI BCC projects during the pre-Tet period (Dec. 2009 -- March 2010), the following activities were undertaken:
 - o Reviewed all BCC activities and documents under the AI Mekong Initiative and the AI BCC project through meetings with AED, AED's partners, and local counterparts from the five focus provinces. Conducted a rapid needs assessment of AI BCC gaps in the five focus provinces through a desk review of KAP surveys of local authorities. Agreed with the five focus provinces on AI BCC pre-

Tet Campaigns and organized BCC planning workshops at provincial and district levels. Implemented pre-Tet BCC campaigns in the five focus provinces (including TOT refresher courses, refresher trainings for commune and village communicators, community events, display of 300 sets of outdoor posters distribution of 1,100 bags and 750 T-shirts at market kiosks, small group discussions with around 800 sector three farmers, radio spots on district radio and commune, communication kiosks at main markets, distribution of 3300 wall poster calendars). Calendars focused on the three key messages and provided the provincial hotline numbers from the GETS project. Organized BCC review meetings/workshops in four focus provinces (except Kien Giang) for sharing of experiences and lessons learnt.

- 2) Promoted an integrated approach to Human and Animal Health BCC through post-testing of CBS toolkits with village collaborators in Can Tho and Hung Yen.
- 3) Aired radio spots and commune loudspeaker system announcements (Sep.-Oct. 2010), promoting CBS collaborator networks (prepared with the HH team) to reinforce the recognition and roles of CBS collaborators.
- 4) Organized API training for key local authorities (e.g. village heads) in communes (Aug-Oct 2010), aiming to equip local authorities with basic knowledge on API.
- 5) Completed the assessment of provincial communication activities in all five provinces. The findings were presented at provincial BCC planning workshops to guide Year 2 activities. The assessments also provided useful information to the provinces on the current status of their API communications status while highlighting the need for one integrated communication plan for the whole province in future.

1.8 Other Cross-Cutting Issues

- 1) Conducted a desk survey on TOT skills followed by data analysis to provide an overview of potential local trainers, their capacity in TOT for the various components and likely roles in upcoming training courses across APII.
- 2) Prepared and shared a Project Training Profile (PTP) internally between components, which outlines training course process, standard forms for course planning and notification, monitoring and evaluation, checklists, participant's lists, and so forth. This PTP will be updated regularly based on training experiences and M&E outputs.
- 3) With short-term technical assistance from Abt's HQ, prepared a gender strategy and plan, and trained APII and counterpart staff in gender awareness.
- 4) With short-term technical assistance from Abt's HQ (incl. their Environmental Compliance Advisor) prepared and Environmental Mitigation & Monitoring Plan (EMMP).

M&E activities

- 5) Submitted the APII PMP to USAID in November. A first update (of this 'living' document) was made in April with short-term technical assistance from Abt's M&E

specialist and a second update is attached to this annual report, reflecting recent in changes in project scope and direction (e.g. more emphasis on an integrated multi-sector approach along poultry supply chains).

- 6) Implemented a joint training workshop with FAO to introduce the USAID PMP and APII PMP frameworks to provincial and national counterparts.
- 7) Provided inputs for USAID PMP developments led by MEASURE e.g. on data collection tools.
- 8) Finalized the selection of districts and communes for implementation of project activities in five provinces. Collected basic information in targeted communes and districts
- 9) Developed monitoring forms for provincial counterparts/PCU members for monitoring visits of APII activities.
- 10) Drafted an initial outline for a web-based M&E database system for the APII project and for M&E data from other USAID-supported AI initiatives.

2. Challenges and Solutions

The project faced various challenges during the Year 1, such as: establishment of close working relationships and coordination of activities with a wide range of key partners and counterparts; implementation through subcontracts and consultant agreements; and filling staff gaps. Below is an overview of specific challenges and solutions, outlined by management and technical areas.

2.1 Coordination and Collaboration

- 1) APII was without a resident Project Director from Dec. 2009 till April 2010. This partly explains the relatively slow start-up and some of the early deficiencies in coordinating with key international partners (e.g. FAO). The situation did improve during the second half of the year, as staff gaps were filled. The speed of implementation picked up and coordination improved overall through frequent meetings and interactions/communication with key partners. The project recognizes that there is scope for further improvement including changes in attitudes towards collaboration. This may entail more frequent meetings to agree on clear divisions of responsibilities, encourage a more open sharing of plans and (draft) documentation, and model constructive/positive and open dialogue as a way towards better cooperation.
- 2) Coordination with international partners remained a challenge with different cost norms/policies, communication styles, and busy work schedules within a complex project context. The project did make deliberate efforts to foster closer relationships, particularly with FAO (the main international partner). The project will continue to pursue this line in Year 2 for better harmonization especially on supply chain activities, CBS work, IC/CM efforts, and on cost norms. In general, APII will focus

on activities at lower provincial/grassroots levels, whereas FAO (and WHO) will focus on the upper provincial and national levels.

- 3) It is worth noting here that based on past experience and donor behaviors, provinces typically expect donor-funded projects to set up project management units with resources allocated to provincial counterparts and provision of financial incentives (such as topping-up allowances). APII operates under a set of rules that does not allow this kind of support. To clarify this and level the expectations among counterparts who are accustomed to different donor behavior often takes considerable time and extended dialogue.
- 4) The early signing of provincial MOUs, although hailed as a success story, also had its own problems. The process gave rise to some false/unmet expectations among key provincial counterparts e.g. the expectation that they would receive direct fund transfers to manage implementation of activities. This subsequently led to frustrations and complaints when it turned out that the project was not in a position to advance or transfer funds to government institutions (which otherwise is the way they normally operate). This quite sensitive and charged issue (to do with power and control) was largely resolved during the latter parts of the year through face-to-face meetings and open dialogue.
- 5) The role/function of the PCUs remained problematic during Year 1, to some extent because of the 'false expectations' mentioned above. Several PCUs were large compared to the smaller number of member organizations with which APII was able to work directly in implementation. The role and composition of the PCU will be evaluated and revisited in connection with the preparation of MOUs in Year 2.
- 6) The 'dividing up' of PCs, with APII funding two and FAO funding three positions, led to complications with PCs generally prioritizing APII or FAO activities respectively, rather than promoting closer coordination, cooperation and sharing of information. It also led to inconsistencies in the levels of involvement by PCs in the PCUs. Towards the end of the year it was agreed with USAID and FAO that APII should fund all five PCs from Year 2 in an attempt to promote a more consistent approach. The PC TOR will be revisited together with FAO and will emphasize the role of joint coordination of all USAID-funded activities in the provinces in Year 2.
- 7) APII is generally perceived by national counterparts as an 'INGO'. This represents a challenge in terms of gaining access to and directly influencing policy/decision-making processes. The initial idea of establishing a Technical Advisory Group under MARD (with APII acting as a Secretariat) was replaced by a more pragmatic approach of operating via/with strategically located partners such as PAHI, FAO and WHO with more immediate access to central level planners and decision-makers. Support to PAHI was extended and the partnership secretariat is well established inside MARD.
- 8) Most activities were subcontracted out to local and national partners, through Professional Service Agreements (PSAs). Direct implementation requires APII to obtain a PACCOM license, which currently is being sought through a local law firm. However, even with a PACCOM license APII will continue to subcontract most of its work as direct implementation would necessitate a substantial increase in staffing that

is unlikely to be approved. The entry of PSAs with quasi-government organizations required separate approval by USAID's Regional Office in Bangkok, a process which took a fair amount of time. The PSA mechanism, whereby partners are reimbursed on the basis of previously agreed deliverables and budget, turned out to be an unfamiliar and to some degree uncomfortable mechanism for local and national partners. It took much effort and time during Year 1 for all involved, including APII directors, to familiarize themselves with this new contractual arrangement and the learning/adjustment process is ongoing. Local organizations are accustomed to receiving advances, but APII does not have the flexibility to advance/transfer funds to partners only to reimburse upon receipt of agreed and approved deliverables. This presents a dilemma for organizations with little or no working capital, like APII's partners.

- 9) APII did not pursue the option of PSAs with government agencies as this requires higher level approval in USAID (beyond the regional office in Bangkok) and is a time-consuming process. Instead, the project opted for alternative options such as individual consultant contracts with government staff. This process however requires formal letters of 'leave without pay', which in many cases proved difficult to obtain. At the moment there appear to be no easy ways to contract government institutions (other than those with quasi-government status and mandate to generate income under Decree 115) and their staff to work with APII.
- 10) Management and administration (incl. modifications) of sub-contracts generally consumed more time than anticipated and is a new learning experience for all involved, including APII's technical teams, who in many cases found the admin burden unexpectedly high. It is anticipated that subcontract management will improve significantly in Year 2 as project staff and partners gain first-hand experience and continue to build trust and stronger working relationships.
- 11) The bureaucratic nature of the subcontracting process, with approvals required in both Abt's HQ and in USAID (incl. the regional office in Bangkok in some cases) at times resulted in a lengthy, time-consuming and somewhat frustrating implementation experience during Year 1. Now that procedures are clearer and better understood and general approval has been provided (e.g. by the regional office in Bangkok for subcontracting a range of quasi-government organizations) the sub-contracting process is expected to run more smoothly in Year 2. The limited capacity of many potential partners does however remain an ongoing concern. APII will increasingly opt for open, competitive and widely advertised bidding processes in Year 2 in order to (hopefully) identify more high caliber subcontractors.

2.2 Avian Influenza Preparedness and Response Plans

- 1) In order to avoid overlap or duplication of efforts with the USAID-supported H2P project implemented by VNRC, and due to the busy schedule of VNRC preoccupied with emergencies and disasters (such as flooding in central Vietnam) the subcontracting of PPP activities to VNRC was deferred till Year 2. While VNRC is well located strategically to handle this activity, the organization does have limited human resources to cover a large number of provinces. Further consultations with

VNRC and USAID may be required before an agreement can be entered and the PPP work subcontracted to VNRC.

2.3 Early Warning Systems & Surveillance

- 1) Collaboration and coordination with FAO on CBS approaches was an on-going issue in Year 1, but the situation improved significantly during the course of the year with frequent meetings, sharing of information and clear delineation of responsibilities being agreed upon. APII works at grassroots levels and FAO at higher provincial and national levels, with Chief AHWs being the shared point of contact.
- 2) The change from direct implementation to subcontracting, in this case with Provincial Red Cross associations, gave rise to confusion and new challenges in working with local partners who lack capacity, who may not be 'professional' in a foreign/business sense of the word, and who generally have little or no working capital and therefore find it very difficult to work on the principle of cost reimbursement. Assuming that APII obtains the necessary license for direct implementation in Year 2, we may consider reverting to this approach but only to a limited extent as the project does not have enough staff for full-scale direct implementation. The more feasible option, and the one that will be pursued in Year 2, is working through partners at the central level with sufficient capacity.

2.4 Case Management and Infection Control

- 1) A shortage of available human resources and contracting capacity among some intended partners caused a slowdown in the subcontracting process.

2.5 Animal Response Efforts

- 1) The development of the AFAP subcontract was more cumbersome than anticipated. Although a temporary Letter of Agreement signed in February (the actual subcontract was not signed until late May 2010) did help kick-start AFAP's input, the work remained well behind schedule throughout Year 1.
- 2) Both of the main sub-contractors (AFAP and VA) generally needed more time than anticipated to familiarize themselves with APII's subcontracting procedures and AFAP -- as an international NGO -- needed time to establish collaborative working relationships with provincial counterparts.

2.6 Biosecurity

- 1) RUDECs risk assessment work also took longer to complete than anticipated causing delays in overall progress of the bio-security work.
- 2) National level supply chain management occurs through several points, and is not the responsibility of a single ministry or agency. Working with national level planners and policy makers on supply chain issues will be challenged by fragmented and at

times unclear institutional set-ups and mandates. Even where responsibilities fall within the mandate of a single line ministry it is not always certain which agency is directly responsible. This applies for instance to hatcheries. APII will work closely with other strategically located partners (such as FAO) and engage in relevant forums (e.g. Technical Working Groups under PAHI) to leverage influence with planners and decision/policy makers.

2.7 Behavior Change Communication

- 1) Coordination with the AI BCC project to transfer materials -- radio spots, the "Three Good Things" template etc. -- took more time than expected. APII will, however, now be in a much better position to design an effective BCC campaign and materials with local partners.
- 2) Initially it took longer than anticipated to establish PCUs and to authorize a focal point agency (e.g. WU) to implement pre-Tet BCC campaigns under PSAs. This caused initial delays in BCC activities but the situation has since improved and the process is expected to run more smoothly in future campaigns.
- 3) The above-mentioned delays moved some activities too close to Tet with some provinces having to scale down BCC interventions. For example there were no radio spots in Kien Giang and no road shows in any of the focus provinces. In future the project will know better what to expect and should be able to prepare well in advance.
- 4) There was also a delay in the planned publishing of quarterly API Newsletters. As a part of the capacity and leadership building, the intention was to involve two government communication bodies, namely NAFEC and NCHCEC under MARD and MOH respectively, for co-editing and reviewing of articles and news items. The SOW was agreed and a budget was drafted, but as the approval process through USAID for a PSA with a government agency looked to become a lengthy affair the idea was temporarily put on hold, while alternative options were being considered. However, it has proven difficult to identify suitable alternatives and the idea of subcontracting NAFEC and NCHCEC may be revived in Year 2.
- 5) The posters (with the three key messages) which were hung at public places typically lasted for some months only. Villagers suggested that we instead promote key behaviors through wall calendars that they will see every day at home rather than, or as complementary to, only having posters in public places. The project subsequently transformed the posters into wall calendars, adding hotline numbers supported by the FAO GETS project in the process.
- 6) It took longer time to prepare and get approval on subcontracts (PSAs) with provincial mass organizations than foreseen. Furthermore, the subcontracting organizations were faced with limited human resources to implementing the contracts which affected both the speed and quality of work.

2.8 Other Cross-Cutting Issues

Staffing

- 1) Finding qualified candidates for the CBS Manager and M&E Manager positions proved more difficult than anticipated. A CBS Manager was eventually identified and joined the project during the last quarter of Year 1. The project also identified an M&E Manager who unfortunately and unexpectedly resigned within a week and decided to return to his old job for loyalty reasons. A new (strong) candidate was identified and is set to join the project in November 2010. Overall, these delays caused an excess workload for the Director HH/M&E.
- 2) Similarly, it proved difficult to attract a qualified Training Manager despite several attempts and interviews. The need for this position is now being reviewed and reconsidered. If feasible, the scope and title of the position may be altered in view of the direction the project is taking in Year 2 (more focus on supply chain strengthening). The Animal Health team has a very high work load with only two full-time staff on board and needs additional human resources to manage its many subcontracts and animal health activities.
- 3) The Partner Coordination Manager, who joined in the middle of Year 1 and whose position was turned into Policy Advocacy Manager, resigned towards the end of Year 1. The scope of this position will be reviewed and reconsidered early in Year 2.

Cost Norms

- 1) Cost norms remained a sore point due in part to some differences between APII and key partners, e.g. FAO. FAO follows the broadly accepted UN-EU guidelines, which APII cannot adopt (due to Abt policies), but ongoing efforts are being made to keep APII's norms closely with these guidelines. The UN-EU guidelines cover upper national-provincial levels but do not offer detailed information for activities at grassroots levels. The grassroots levels are however well covered in the APII cost norms and these rates are shared with and generally applied by FAO.

Introduction

This report presents the main achievements, challenges and solutions/lessons learnt for USAID's Avian and Pandemic Influenza Initiative (APII) during Year 2, October 2010 – September 2011.

Year 2 saw the project reach full level of implementation in all areas, including animal health, human health and behavior change communication. Activities are implemented via subcontracts as Abt's current license does not accommodate for direct implementation. This carries its own unique challenges as it often is difficult to find subcontractors capable of delivering quality work on time, and strengthening the capacity of subcontractors has therefore become a vital part of APII's work.

The project progressed well in most of the seven main focus areas:

- 1) Animal Health Worker (AHW) Capacity Building;
- 2) Agricultural Extension Worker (AEW) Capacity Building;
- 3) Poultry Supply Chain Strengthening;
- 4) Community-Based Surveillance (CBS);
- 5) Infection Control / Case Management (IC/CM);
- 6) Pandemic Preparedness Planning (PPP); and
- 7) Behavior Change Communication (BCC). BCC is now well integrated into the work of the animal health and human health components.

Year 2 was also the year where the project started orienting itself towards advocating for the wider adoption and sustained implementation of models, beyond the life of the project. Adoption, adaptation, replication and up-scaling of APII innovations by public and private partners is considered the real measure of success for the project. This will require a sustained advocacy and promotional effort for which the project has started preparing itself in close consultation with USAID and API partners.

Below follows a description and discussion of the main achievements, challenges of Year 2.

1. Animal Health Worker (AHW) Capacity Building

The goal is to develop an AHW capacity building package that is adopted by relevant public-private agencies at national and/or provincial levels, and to develop a standard Terms of Reference for AHWs for adoption by Provincial Peoples Committees (PPCs) and the Ministry of Agriculture and Rural Development (MARD).

Year 2 focused on completing and transferring the training package for wider adoption and on establishing well-functioning networks of capable public and private animal health workers in and beyond project areas. The subcontractors included the Australian Foundation for the Peoples of Asia and the Pacific (AFAP) on training/capacity building and the Vietnamese Veterinary Association (VVA) on AHW network development and advocacy.

1.1 Achievements

- 1.1.1 With a new Country Director and field staff onboard, AFAP strengthened its performance and collaboration with provincial counterparts, notably the Sub-departments of Animal Health (SDAH) and the Provincial Agriculture and Fisheries Extension Centers (PAFEC) through lessons learned meetings, technical seminars, planning workshops, and participation in Provincial Coordination Unit (PCU) meetings.
- 1.1.2 The AH team updated the AHW Training of Trainers (TOT) package to include lesson plans, presentations, pre- and post-test questions, visual aids, etc. The package is based firmly on the training manual issued by DAH in 2010 and the work was done in consultation with DAH and FAO. Additional modules on bio-security, basic surveillance and zoonotic diseases emphasizing participatory training and learning by doing were developed together with SDAHs and local consultants. The materials were shared with DAHs epidemiology division for feedback and with WCS/PREDICT (awaiting input from them on a zoonosis module. Finalization and dissemination is scheduled for early in Year 3.
- 1.1.3 The AHW TOT package was successfully tested in Quang Tri through a 30-days training course for 25 new village AHWs. The participants received certificates co-signed by the Director of SDAH and APII. We expect that graduates will become part of Quang Tri's provincial Decision 25 (from 2009) to strengthen the AHW network and provide allowances beginning in 2012. APII will continue to work with Quang Tri on the implementation of this decision.
- 1.1.4 Held a lessons learned workshop on AIHW training curriculum development and AHW training together with the Agricultural College and Vocational Training Center in Quang Tri and the SDAHs from Quang Tri, Ha Nam and Can Tho. This included discussion on formalization of AHW training and certification. Follow-ups with stakeholders and Sub-Departments of Labor, Invalids and Social Affairs who have local funds for career development in vocational training centers is planned in Year 3, together with finalization and adoption of AHW TORs.
- 1.1.5 The first round TOTs for 100 provincial AHW trainers was completed in the five pilot provinces. As many as 20% of these trainers have already become involved in monthly refresher trainings for AHWs as a part of a coaching scheme.
- 1.1.6 AHW monthly meetings and refresher trainings were conducted in all 15 pilot districts throughout the year covering more than 31 topic areas. Approximately 1,000 AHWs participated every month (reaching around 60% of all AHWs in these locations). The model of combining refresher trainings and monthly meetings was well received by AHWs and district/provincial staff. Beginning in February, in response to a request from Can Tho SDAH and DVS, refresher trainings were conducted in two new districts of Can Tho (Ninh Kieu - Binh Thuy and Cai Rang) on a cost-share basis. APII covered the costs of trainers while local counterparts covered travel costs for participants. Similar arrangements were adopted in

seven districts of Ha Nam, Hung Yen and Quang beginning in September 2011. As a result, starting in October 2011 APII will only provide support for trainer preparation and logistics in all provinces.

- 1.1.7 As a part of the plan to strengthen AHW networks and share experiences across districts, AFAP staff, the Animal Health technical team and the SDAHs facilitated a number of technical seminars on how to conduct effective and efficient AHW meetings, veterinary stations and networks. The workshops provided opportunity for Veterinary staff to exchange information, share experiences and work out solutions. 261 representatives from 45 District Veterinary Stations and five SDAHs in the pilot provinces participated.
- 1.1.8 In late April, we signed new subcontract with VVA, focusing on strengthening their organizational capacity and assisting to establish AHW networks with public and private partners. In early June, VVA shared its first draft "Vietnam Veterinary Association Strategy for Sustainable Development period 2011-2015" with provincial SDAHs for comments and feedback. A review workshop was conducted on 26th September in Hanoi (with representatives from 21 provinces in attendance). A final version of the VVA Strategy 2011-2015 will be printed and distributed early in Year 3.
- 1.1.9 Activities to strengthen the VVA branch network at Quang Tri started in May 2011 in three districts. A Handbook for Provincial VVA Network Development was developed from lessons learned in Quang Tri for wider use.
- 1.1.10 Mailboxes and information desks were provided to 45 DVSSs in the five focus provinces to help encourage information access and sharing within AHW networks. Poultry Magazines was distributed to village AHW teams through this mechanism.

1.2. Challenges and Solutions

- 1.2.1 With MARDs Decision 37, DAH now has a '*Community Animal health Division*' – effectively a division for public veterinary health. The new division officially opened in June 2011. The APII and AIMekong projects have actively been encouraging this development over the past five years. However, none of the SDAHs in the five focus provinces have established their own division as otherwise guided by Decision 37. We have found that veterinary staff assigned to oversee this work typically do not have sufficient training or experience in institutional development. This makes it difficult to advocate with SDAH's and DVSSs on AHW network strengthening. APII will continue to advocate on this issue in collaboration with strategic partners such as FAO, DAH and VVA.
- 1.2.2 Local funds for further capacity building of AHWs are generally very scarce. Despite adopting the Provincial Decision No. 25 (in 2009) on AHW network development in Quang Tri which provides for AHW allowances beginning in 2012, the province has not yet allocated funds for this in the 2012 budget. APII will continue to follow up with SDAH, DARD and the Provincial People's Committee (PPC) in Quang Tri to

advocate for inclusion of AHW monthly allowances in the 2012 budget and offer related Technical Assistance (TA) on AHW network capacity building.

2. Agricultural Extension Worker (AEW) Capacity Building

The goal is to develop and transfer to the National Agriculture Extension Center (NAEC) and Provincial Agriculture and Fisheries Extension Centers (PAFEC) an AEW bio-security training package for small commercial poultry producers, which has been fully tested, including costing, and verified for wider adoption and replication in the national-provincial extension system.

Year 2 focused on package testing and completion and assisting partners in adaption and adoption.

2.1 Achievements

- 2.1.1 After the final Review Workshop on the Biosecurity Training Package in April 2011, which included more than 20 participants from NAEC, MARD poultry research centers, FAO, VAHIP, ASVELIS, VIPA and VVA, and the final round of feedback from the Biosecurity Working Group members, the Biosecurity Training Package was printed in late August 2011 and distributed to target audiences.
- 2.1.2 Two Training of Master Trainers workshops on biosecurity for small commercial farmers were co-hosted with NAEC for 48 participants from NAEC, DLP, poultry research centers, and PAFECs (15 provinces). Selected master trainers are expected to conduct diffusion training in Year 3 (and beyond) to increase small commercial farmer's knowledge on biosecurity and good husbandry practices.
- 2.1.3 In collaboration with PAFECs, four TOTs for Farmer Trainers on biosecurity for small commercial farmers were organized in Ha Nam, Hung Yen, Quang tri, Can Tho and Kien Giang with a total of 125 participants from district and provincial extension centers. The training covered updated concepts of bio-security in small scale poultry; means to improve hygiene and reduce risks through good poultry production practices; and basic training skills with farmers groups. Following this, ten small group discussions for farmers in Ha Nam have been conducted as a first step in the diffusion training. Other provinces will follow early in Year 3.
- 2.1.4 The training package has attracted the interest of PAFECs in other provinces and APII received official requests for support to adoption and training from Soc Trang, An Giang, Bac Lieu, Vinh Long, Dong Thap, Dac Nong, Dac Lac, from Continuing Education Development Center (a local NGO) and Thai Nguyen University. A short term plan to support adoption in An Giang and Soc Trang was agreed. In addition the HCMC office of NAEC adopted the risk factor and biosecurity modules of the

curriculum into their own 2011 water fowl production and biosecurity training program and materials.

- 2.1.5 APII received a proposal from Vietnam Poultry Association (VIPA) on sustainable development of the poultry sector through a series of regional-national workshops, endorsed by the Department of Livestock Production (DLP). The proposal also included support to strengthening of the association's network and promotion of biosecurity practices within their local networks of poultry clubs, adopting the APII biosecurity training package as the training tool. APII is reviewing the proposal in consultation with FAO and will consider options for subcontracting VIPA in Year 3.

2.2 Challenges and Solutions

- 2.2.1 Working closely with NAEC/PAFECs is necessary to help institutionalize the training/extension packages. This is a time-consuming process which requires diplomacy, patience and perseverance in order to forge and maintain close relationships with these agencies. Under MARD's new funding strategy NAEC will compete with other bidders, including private service providers, for extension funds. This may reduce the scope for replication through NAEC' but could perhaps open up opportunities for adoption and uptake of APII extension materials thorough private partners. APII will explore this and partnering with NGOs and Civil Society Organizations (CSOs).

3. Poultry Supply Chain Strengthening

The goal is to develop demonstration models in key (high risk) nodes along supply chains, together with related documents (protocols, guidelines, training materials) for wider replication by national and provincial agencies as well as other development projects/programs.

During the first half of Year 2 a set of technical protocols (including conceptual design drawings and Bills of Quantities with estimated construction costs) were developed for the selected demonstration models. The technical protocols address veterinary public health, hygiene/sanitation, and bio-security/bio-safety issues for animals and humans within, before and after the nodes, in light of the existing regulatory framework and ongoing efforts in Vietnam.

3.1 Achievements

- 3.1.1 The live and plucked bird poultry sections of Dong Ha City central market in Quang Tri were selected for development of a demonstration model. The technical protocols and proposal were completed including all technical drawings and bill of quantities (BQ). Abt's Environmental Compliance Adviser visited Dong Ha market (as well as the centralized slaughterhouses in Can Tho and Kien Giang) in April and submitted Environmental Assessment Checklists and an updated Environmental Mitigation & Monitoring Plan (EMMP) to USAID. A second environmental impact assessment report for upgrading the poultry sections

in Dong Ha market was finalized by a local company as requested by the provincial Department of Environment. A stakeholder agreement was elaborated and signed with the Market Management Board (MMB) and the PCU. An open bidding process for a construction company to implement the upgrade was conducted, and a contract signed with Bach Long Vy Company. The construction is expected to be complete around early November 2011. A training program for traders, vendors and slaughterers and a plan to promote the market upgrade using media and other promotional tools were prepared.

- 3.1.2 Following the “Provincial Strategy Workshop for Risk Reduction in Supply Chains” in Ha Nam in March (after late signing of MOU), APII and local counterparts undertook field trips to potential demonstration model sites. To help leverage SDAH’s recently acquired fund of approximately VND 120-150,000,000 for veterinary hygiene and public inspection services in Duy Tien district market and small home-based slaughterhouses, APII and SDAH prepared a joint proposal for upgrading these nodes. If approved, APII support to this upgrade work will start in Year 3.
- 3.1.3 Upgrade options and drawings were completed for improvements to the Ngoc Xuan centralized slaughterhouse in Can Tho, which has 21 operators which is expected to cost about VND 1.8 billion. Joint investment options were reviewed and Ngoc Xuan Enterprise committed to cover around 55% of the cost under a proposed Grant Agreement with APII.
- 3.1.4 Technical drawings, protocols, and BQ were completed for an upgrade of Phu Nong centralized slaughterhouse in Kien Giang. The total cost of upgrading one processing line and auxiliary works is estimated at around USD 20,000.
- 3.1.5 The Animal Health team conducted two one-week (six day) advanced courses for 45 veterinary staff and poultry inspectors from Can Tho and representatives from Hung Yen and Ha Nam provinces. The training focused on updating them on recent regulations about slaughtering practices. In Year 3, the project plans to modify the course and transfer it to the national veterinary system for regional level trainings.
- 3.1.6 Economic analyses and preparations of business plans for Dong Ha Market and Phu Nong and Ngoc Xuan centralized slaughterhouses were initiated assisted by Abt’s Agricultural Economist.
- 3.1.7 A local consultant undertook a slaughterhouse supply chain mapping/analysis in Kien Giang and Can Tho. The results were shared at a workshop in Can Tho in July with counterparts and partners.
- 3.1.8 In provinces where centralized poultry slaughtering is not yet in place or planned, the best interim/transition option may be upgrading of veterinary hygiene conditions in home-based slaughter facilities. In Quang Tri province, two workshops for upgrading options in home based slaughtering were organized and a first assessment of the scope for upgrading home-based slaughter facilities was conducted. Visits to Ha Nam and Hung Yen for preliminary planning were also done.

- 3.1.9 Two study tours were conducted in collaboration with VIPA, DLP and provincial PCUs with 40 participants from central government authorities, incl. DAH, DLP, the Food Hygiene and Safety Administration of MOH, provincial representatives of DARDs, SDAHs, and SDFHF (Hung Yen, Ha Nam, Hanoi, Bac Giang, Bac Ninh Quang Tri, Can tho, Kien Giang) as well as private entrepreneurs (slaughterhouse owners from Quang Tri, Hung Yen and Ha Nam) and journalists. The first event provided an opportunity for participants to identify firsthand the points of HPAI/EID risk exposure in poultry supply chains in seven different provinces (Hanoi, Hung Yen, Quang Tri, Tien Giang, HCMC, Can Tho and Kien Giang). The second study tour brought participants to different nodes in the poultry supply chain in Long An, Tien Giang (STOP AI model) and Ho Chi Minh City including slaughterhouses and markets of varying sizes/scales. A list of interventions to support risk reduction and improve compliance for supply chain entrepreneurs was prepared in each province as a result.
- 3.1.10 The Animal Health team met with potential partners such as LIFSAP, to exchange information and explore options for collaboration e.g. through the exchange or transfer of demo models.
- 3.1.11 APII and FAO met frequently and developed a 'collaboration matrix' to identify and designate intervention nodes and responsibilities.
- 3.1.12 The Supply Chain Manager (North), Mrs. Nguyen Thai Hoa, joined the team on April 4 and the Supply Chain Manager (South), Mrs. Tran Thi Oanh, joined in August as new staff.

3.2 Challenges and Solutions

- 3.2.1 While provincial counterparts clearly are very interested in the demonstration models, most provinces have no 'master plans' that demarcate future locations e.g. for centralized poultry slaughterhouses and markets. In addition, the processes for local authorities to approve construction are very complex, involving multiple stakeholders with reference to different regulations. APII is learning along the way and adjusting accordingly.
- 3.2.2 Circular 14 on inspection, issued by MARD in March 2011, keeps Vietnam moving in the direction of industrialized slaughterhouses. While following this guidance will be a challenge, it is also an opportunity as it will classify slaughterhouses in Vietnam into A, B and C classes and provides detailed checklists for inspection. It has also focused the attention of DARD and local authorities on the need to improve veterinary, hygiene, sanitary and food safety standards at slaughterhouses. Similarly, the new Food Safety Law coming into effect in July 2011 has provided a strengthened regulatory framework with all the challenges and opportunities this entails for a project like APII. APII continues to work closely with FAO, DAH and other relevant partners on how to operationalize -- or implement -- the emerging regulatory framework.
- 3.2.3 A key challenge is ensuring sustainability of biological hazard risk reduction measures and the replicability of demo models in other provinces. To this end the project has adopted the following principles:

- Incorporate simple improvements/upgrades with minimal cost. The improvements aim to correct gross errors or implement prioritized measures for preventing or minimizing the risk for transmission and spread of biological hazards (HPAI, EIDs, food-borne pathogens);
- Ensure sustained interest in biological hazard risk reduction practices by giving full attention to stakeholders' socio-economic interests (i.e. livelihoods and business/entrepreneurship focus).

3.2.4 Phu Nong slaughterhouse in Kien Giang recently experienced some specific challenges – namely a decrease in the volume of poultry slaughtered in the past 2-3 months, a seemingly low level of interest and commitment from SDAH, and a lack of interest from the slaughter house owners in upgrading if the throughput/volume cannot be guaranteed. APII will review the new situation carefully before deciding how best to proceed.

3.2.5 Profit margins from poultry slaughtering are small especially in small scale operations like in Hung Yen, Ha Nam and Quang Tri province. It can therefore be difficult to motivate the owners and operators of small businesses to invest in improved poultry slaughtering facilities. The emerging signs of commitment from local government agencies e.g. to support development of livestock processing projects in Ha Nam do provide some encouraging signs, but APII will need to carefully review and monitor the local situation before committing itself to supply chain investments.

3.2.6 Despite prolonged discussions and negotiations with Asvelis regarding APII support to the supply chain activities developed under STOP AI, we did not manage to agree on a partnership. APII may decide to follow-up directly with the STOP AI entrepreneurs in Year 3 to assess the current situation, any support needs, and how to best capture and capitalize on the lessons learned and successful outcomes of the STOP AI project.

4. Community-based Surveillance (CBS)

The community-based surveillance (CBS) model engages both human health workers and animal health workers as village level Collaborators and fills an important gap in the national surveillance system by providing up-to-date grassroots level information through active surveillance.

The goal of this activity is to complete a CBS package, including training materials/tools, job descriptions, budget, and recommendations for adoption and scale-up into the provincial/ national surveillance system for both the human and animal health sectors.

In year 2 APII continued to strengthen the 123 CBS networks, expanded the scope from an AI to an events-based model, conducted a mid-term review, supported refresher trainings for Collaborators on emerging infectious and zoonotic diseases, and made preparations for phasing out support, evaluating and transferring the model.

4.1 Achievements

- 4.1.1 The Centre for Community Health and Injury Prevention (CCHIP) was subcontracted to implement CBS field work in close collaboration with provincial counterparts and supervised by the Human Health team.
- 4.1.2 The project continued strengthening CBS Collaborator networks through support to active/passive surveillance for rapid reporting of suspected cases, to monthly network meetings, and to exchange of surveillance information between human health and animal health at grassroots level. Support was phased out completely after July 2011 in 24 'old' communes of Hung Yen and Can Tho where AI Mekong had initiated the networks, but maintained elsewhere through September 2011 when the support will be phased out.
- 4.1.3 We met frequently with FAO to collaborate and coordinate.
- 4.1.4 The Human Health team conducted a CBS mid-term review in four provinces (Quang Tri, Kien Giang, Can Tho and Hung Yen) in December 2010. The review found that the model contributes to the ability of the surveillance system to detect suspected cases and convey useful information upwards. Collaborators reported 4,936 AI suspected cases in humans and 11,452 in poultry. Local partners appreciate the approach and have assumed new roles and responsibilities. General public awareness has increased, and Collaborators are being credited for their efforts and are building trust in the community as effective service providers. While the model builds on existing human resources, important challenges remain in terms of developing closer collaboration between the human and animal health sectors, and institutionalizing the model (including funding) with local resources.
- 4.1.5 APHI hosted Mid-term Review Findings workshops in the focus provinces to review findings and recommendations for the next phase of CBS interventions. The project secured agreement from provincial human and animal health counterparts to expand the CBS model to an events-based surveillance system, including other EIDs.
- 4.1.6 An advanced TOT course was held February 14-15, 2011 for 21 participants from provincial Preventive Medicine Centers, SDAHs, and Quang Tri Village Health Association. The course covered training skills, AI, EIDs as well as skills related to identifying EID and AI events. Diseases covered included HPAI, Influenza-like Illnesses, Dengue Fever, Cholera, Newcastle Disease in chicken, Duck Plague, Porcine reproductive and respiratory syndrome (PRRS) or 'blue ears' in pigs, and Foot and Mouth Disease (FMD) in livestock.
- 4.1.7 Following the TOT, 62 diffusion courses were implemented in March 2011, for more than 2000 commune health providers, AHWs and Collaborators (village health workers) in all 123 project communes. AFAP trained AHWs and Collaborators associated with our CBS work in veterinary skills/techniques and disease therapies.
- 4.1.8 The CBS handbook for Collaborators was reviewed and updated with EID surveillance information and revised reporting forms for quick and

convenient reporting of suspected events in animals and humans. CBS handbooks and raincoats were distributed to Collaborators.

- 4.1.9 An updated list of CBS Collaborators in the 5 provinces was made available with support from CCHIP. The list indicated an average Collaborator turn-over rate of 11%, ranging from 4% - 26%. Can Tho showed the lowest average dropout rate of 4%. More in-depth analysis will be done to inform future activities and prevent high levels of turnover or dropouts.
- 4.1.10 Between March 2011 – August 2011, Collaborators detected and reported the following number of suspected cases at the commune level which were subsequently confirmed at higher levels:
- 0 AI cases in humans
 - 9 AI outbreaks in poultry; 7 confirmed (in Quang Tri)
 - 17,201 cases of influenza-like illnesses
 - 328 cases of Dengue fever
 - 11,599 cases of Newcastle disease (in chicken)
 - 6,950 cases of Duck plague
 - 73 cases of FMD (in livestock)
 - 127 cases of PRRS (in pigs)

This data, especially the seven confirmed outbreaks of AI in poultry flocks detected and reported by animal health Collaborators in Quang Tri and subsequently confirmed by lab tests, indicate that the CBS model is working to correctly and efficiently to identify EIDs.

- 4.1.11 Surveillance data from monthly surveillance reports of 246 village Collaborator meetings in the five provinces was collected, reviewed, and analyzed. Feedback was sent to PC/PCUs and their members (PMCs, SDAHs and DVSSs) as well as to APII field offices. This helps the provinces strengthen their overall surveillance.
- 4.1.12 The following abstracts and presentations were accepted for national and international events:
- A presentation entitled “Sustaining Community-Based Surveillance (CBS) for early detection and response to Avian Influenza and Emerging Infectious Diseases (EIDs)”, was given by the Technical Director for Human Health at the Global Health Council’s 38th Annual International Conference on “Global Health: Securing a Healthier Future in a Changing World”, June 13-17, 2011 in Washington DC (http://www.globalhealth.org/conference_2011/)
 - A presentation entitled “*Building and sustaining the Community Based Surveillance Model (CBS): A Midterm Review and Sustainability Analysis*” was given by the Technical Director for Human Health at “The Joint DAH-FAO Information Sharing Meeting” Hanoi, June 2011.
 - Two abstracts were accepted for poster presentations at the American Public Health Association (APHA) conference in November, 2011: <http://apha.confex.com/apha/139am/webprogram/Paper242729.html>; <http://apha.confex.com/apha/139am/webprogram/Paper242716.html>

4.1.13 A CBS 'mini-evaluation' was conducted in Hung Yen by a US intern to investigate how the CBS network functions; its relevance, effectiveness, sensitivity adaptability; linkages between human and animal health sectors and with the early warning system; and to collect evidence for wider expansion and sustainability. The final report is expected in November, 2011. This 'mini-evaluation' will feed into the larger final evaluation of the CBS model which planned for December 2011 - January 2012.

4.2 Challenges and Solutions

- 4.2.1 The provincial based subcontractors lacked adequate human resources including surveillance experience and were replaced by CCHIP in 2011.
- 4.2.2 The turnover rate for CBS Collaborators, while fairly low, still required effort to recruit replacements. Many of the animal health Collaborators who dropped out were weak on veterinary skills. New replacements were identified and supplement training courses and on-the-job training provided. We also implemented a better screening process for new AH Collaborators.
- 4.2.3 Including additional EIDs into the reporting forms required the APII team and local provincial health and animal health staff to constantly provide on-the-job training for the Collaborators. Once the Collaborators became accustomed to the new forms, they found them user-friendly. In addition, the new reporting forms were better aligned with the national surveillance systems' forms and reporting systems.

5. Infection Control/Case Management (IC/CM)

The goal is to develop an IC/CM 'model' with training package/tools, guidelines etc. which has been tested/verified (including cost study), for wider adoption in Vietnam.

In Year 2, APII disseminated the district level IC model (including training package, tools, and guidelines) and SARI/AI case management guidelines for village, commune and district levels to MOH and provincial authorities beyond the five focus provinces and to other development partners, for wider adoption.

5.1 Achievements

- 5.1.1 Subcontracted Ho Chi Minh City Infection Control Society (HICS) in 2010 and Hanoi Society on Infection Control (HANSIC) in 2011 to implement field activities guided by the Human Health team.
- 5.1.2 Completed two four-day training courses for IC assurance teams and their networks in Kien Giang and Can Tho on: 1) implementing adapted IC protocols/ guidelines in district hospitals and commune health stations; 2) IC surveillance; and 3) IC principles and standard precautions. Fifty-four local health staff participated.

- 5.1.3 Eight two-day training courses on basic IC/CM principles and compliance for 244 district health staff were completed.
- 5.1.4 Completed four one-day training courses on basic IC/CM principles and compliance for 114 commune and village health workers.
- 5.1.5 HANSIC organized a TOT course for 20 human health providers from nine district and provincial hospitals, plus two representatives from DOD and PEPFAR.
- 5.1.6 Two private companies provided medical masks, PPEs, alcohol hand rubs for all IC training activities at district hospitals organized by HANSIC.
- 5.1.7 APII staff and HANSIC finalized the district hospital IC activity plans and IC Situation Analysis tools and sent them to provincial DOHs and eight district hospitals in the five provinces. The tools will be used for baseline assessments and monitoring compliance during the interventions.
- 5.1.8 IC materials procured by the project (hand rub gel, liquid hand-wash, surface cleaning liquid, racks for hand rub dispensers, masks) were distributed to eight district hospitals.
- 5.1.9 Infection prevention education materials (three types of posters) were distributed to eight district hospitals and the five provincial DOHs.
- 5.1.10 Conducted IC interventions in eight district hospitals, including the following activities: review and re-structure of the IC staff, IC trainings for all district health workers, supply of IC materials and strengthening of IC monitoring practices.
- 5.1.11 Held monitoring meetings with the hospital leaders and IC teams from the intervention district hospitals to review the status of IC improvement to date, discuss how to move forwards and plan for upcoming months.
- 5.1.12 APII's human health technical director presented a paper entitled "*Infection control situation from three districts in Quang Tri: Findings from the rapid assessment*" at the June Infection Control Workshop organized by Hue ICS.
- 5.1.13 IC model cost analysis was conducted with the support from Abt HQ staff.
- 5.1.14 Provincial trainers conducted 16 roll-out training courses on CM in five provinces for about 480 commune health workers. These training courses provided attendees with basic knowledge and skills regarding care of AI and Severe Acute Respiratory Infection (SARI) and provided health workers an opportunity to practice management and referral protocols.
- 5.1.15 Delivered a training course on how to conduct an IC assessment for 30 assigned IC staffs from 14 hospitals in collaboration with Can Tho DOH. The training provided an introduction and practice on IC assessment tools. Following the training, IC assessments will be done early in Year 3 in all hospitals to review organizational structures, equipment, knowledge, and IC practices.
- 5.1.16 Project representatives attended the "Training Workshop in Health Care Epidemiology and Surveillance" organized by MOH/WHO in Hanoi. This workshop reviewed basic epidemiological methods for surveillance of

Healthcare Associated Infection and actions for the implementation of IC surveillance in hospitals in Vietnam.

5.2 Challenges and Solutions

- 5.2.1 HANSIC is short of human resources and not familiar with the type of contract APII can offer (Firm Fixed Price PSA). The APII team has had to work extra closely with them on implementation of the subcontract. HANSIC has great professional expertise, but lacks some of the coordination, oversight and administrative skills needed to handle the contracting process. As a result APII is considering an alternative subcontract with the Vietnam Nursing Association (VNA) instead.
- 5.2.2 There are still low levels of knowledge and practice of IC measures among healthcare providers. Infrastructure to promote IC interventions in district hospital settings remains low as well. IC is often seen to be activities related to cleaning, laundry, disinfection, and waste management as opposed to a public health and hospital management issues. As a result, staffs assigned to IC teams often have skill levels below that required of an IC specialist. To address this, the APII team is working closely with subcontractors and intervention hospitals to provide training, close monitoring, coaching and guidance in order to help hospitals fulfill their IC needs according to MOH guidance/Circular No 18.
- 5.2.3 In order to be sustainable and successful, IC interventions must be integrated into and support the hospital's routine work. Therefore, some planned activities such as hand washing, IC compliance monitoring, and training had to be adapted to the real situation at each hospital, in some cases slowing down the process of the intervention. For example, one-day training courses were broken into smaller sections in order to fit work schedules.

6. Pandemic Preparedness Planning (PPP)

The goal is to develop PPPs in selected focus provinces, introduce the package in other provinces, and advocate for its wider adoption throughout Vietnam. In Year 2, APII developed an MOU with VNRC to revise, test and finalize improved PPPs for wider replication.

In Year 2, APII signed a subcontract with VNRC to revise, test and finalize an improved PPP in Kien Giang province for wider replication.

6.1 Achievements

- 6.1.1 Multi-sector PPP situation analyses were conducted in Quang Tri, Kien Giang, Can Tho and Hung Yen by a national consultant working with DOHs, PMCs, DARDs, SDAHs, and provincial Red Cross.
- 6.1.2 A subcontract for PPP related work was signed with Vietnam Red Cross Federation (VNRC) to implement field activities guided by the Human Health team, focusing on Kien Giang province.

- 6.1.3 VNRC had several meetings with the leaders of local Red Cross, PMC, DARD and PCs in the five focus provinces to get their commitment in development and implementation of PPP plans and local implement activities.
- 6.1.4 VNRC hosted a workshop on PPP design and implementation. About 50 representatives from international organizations, Ministries and Provincial Pandemic Prevention Committees, DOH and Red Cross were given an introduction on the new concept of “whole of society” PPP approach and Business continuity Planning (BCP) and shared the findings of recent situation analysis on PPP in 5 focus provinces as well as experiences/ lessons learnt from the H2P project. The participants discussed and agreed on the timeframe, mechanisms and steps for implementation of PPP activities through collaboration between VNRC and provincial partners.
- 6.1.5 Kien Giang PPC organized a PPP development workshop for about 30 representatives from Provincial Departments, Provincial Military Agency and social organizations (such as Red Cross, Women’s Union, Farmers Union). The workshop introduced the concept of the “whole of society” PPP approach and shared the experiences/lessons learned from Ha Nam’s PPP development process.
- 6.1.6 APII team members participated in the PPP workshop hosted by MOH for the human health and agriculture sectors. Findings and gaps in PPP within other sectors were shared. The findings from PPP situation analysis of APII in four project provinces (except Ha Nam, where the PPP was recently revised by VNRC under the H2P project) were also shared for reference and comments.

6.2 Challenges and Solutions

- 6.2.1 VNRC was very busy with humanitarian and emergency activities, such as flooding in Central Vietnam, during late 2010/early 2011. They are generally short on human resources and must give priority to emergencies over more routine work such as that being offered under the APII subcontract. In addition there were delays due to VNRC’s lack of familiarity with subcontracting mechanisms (Firm Fixed Price PSA without fund advances). Both parties are however committed to see this subcontract through and VNRC has so far shown good commitment and performance after entering the subcontract.
- 6.2.2 The current PPPs of provinces mainly focus on health with little or no mentioning of other sectors. The whole society approach and the business continuity plan (BCP) concept are not well understood by local counterparts and yet to be adopted in the PPP framework. APII will work closely with VNRC and Kien Giang province to incorporate these new elements in the PPP.
- 6.2.3 PPP revision and approval by provincial authorities requires multi sectorial involvement and good coordination and facilitation will be key to success. The APII team will work closely with VNRC, local counterparts and international partners on this.

7. Cross-Cutting Issues

Behavior Change Communication (BCC)

The BCC work aims to identify appropriate behaviors and messages for key target audiences and to strengthen the BCC capacity of national and provincial stakeholders. The BCC work feeds into and helps integrate and enhance the work of the other technical components in animal and human health, notably around the poultry supply chains.

Year 2 aimed to build up provincial BCC teams who can take the lead in designing, implementing and evaluating future BCC campaigns, and increasingly involve local media in communicating AI/EID and lessons learned to a broader audience. BC activities were carefully integrated in particular into CBS and supply chain activities.

7.1 Achievements

At national level

- 7.1.1 Entered subcontracts for Year 2 with Women's Union in Ha Nam and Kien Giang, Provincial Humanity Center under Red Cross in Hung Yen, Women's Union in Quang Tri (a new subcontractor) and CEFACOM (Research Center for Family Health and Community Development) in Can Tho. Women's Union in Can Tho did not have sufficient human resources to carry on the work from Year 1.
- 7.1.2 Conducted planning workshops with key local stakeholders in four provinces (except Ha Nam) to design Year 2 BCC activities. The workshops provided consensus on the number of desired behaviors and on barriers and motivators, which in turn were used to develop appropriate key messages for target audiences. Due to the late entry of MOU and risk reduction strategy development in Ha Nam, the BCC planning workshop was cancelled in this province. Instead the results from Hung Yen and Quang Tri were used to inform and guide the activities in Ha Nam
- 7.1.3 Developed the Year 2 BCC Strategy (a living document) based on the results of the Year 1 risk assessment, the risk reduction strategies, and the results of the BCC assessment. The Year 2 strategy focuses on the seasonal BCC campaign and closer integration of BCC work into the animal health and human health components. The BCC seasonal campaign was targeted for Feb-June. The strategy was shared with FAO and WHO for technical verification and feedback.
- 7.1.4 Developed four discussion guides with supply chain target audiences including live bird and plucked market vendors, collectors/traders, and slaughterers. These discussion guides embedded insights, inputs and contributions from provincial BCC trainers, health, animal health, agricultural extension officers, and stakeholder representatives in Can Tho, Kien Giang and Quang Tri through design workshops. Inputs and comments were also solicited from national reviewers/experts in NAEC, DAH, DLP (MARD) and NCHEC (MOH) through their participation in

the design and review workshops and written inputs/feedbacks. These discussion guides will be used by BCC Interpersonal Communicators to facilitate small group discussions with target audiences and help encourage the application of good practices.

- 7.1.5 Designed Year 2 BCC materials (calendar, flipcharts, logo, BCC theme, pocket guides to facilitate and organize for community events, small group discussion with small and medium commercial poultry farmers, notebook with BCC theme) together with BCC and artwork consultants. All materials were pre-tested in Can Tho (for Southern materials) and Hung Yen (for Northern materials). They were printed and distributed to target audiences. Other BCC promotional materials such as raincoat, shirts and pens with BCC theme and messages were designed and produced and used during various BCC events to distribute to target audiences. These promotional materials were also used for human health and animal health activities. FAO and WHO were consulted for technical verification.
- 7.1.6 Engaged national communication experts from MOH and MARD to help with BCC materials revision and design, mentor provincial/district BCC trainers, and support provincial officers in developing provincial communication guidelines on API and EID (Can Tho and Ha Nam).
- 7.1.7 Conducted a TOT refresher course on communication skills and BCC materials in February for seasonal campaigns for 22 provincial and district master trainers from the five focus provinces. These trainers trained local communicators and facilitators of community events and discussion forums during the BCC campaign from February to June.
- 7.1.8 Conducted two advanced TOT courses for provincial and district trainers of Can Tho, Kien Giang & Quang Tri in September on BCC theory, facilitation skills update and use of discussion guides in priority nodes. These trained trainers/interpersonal communicators will facilitate small group discussions in priority nodes in Year 3.
- 7.1.9 To prepare manpower for BCC seasonal campaign, more than 100 communicators selected among animal health workers, human health workers and Women's Union members from the commune level of the five provinces were trained on BCC and facilitation skills using a discussion flipchart. These trained communicators were to conduct small group discussion with target audience on desired behaviors promoted during BCC seasonal campaign (hand washing, reporting suspected cases and buying and selling healthy poultry). About 120 facilitators and organizers of Community Events were trained in on facilitation and organizational skills.
- 7.1.10 BCC seasonal campaigns were completed in five focus provinces. Activities included:
 - Distribution of wall calendars addressing three key priority desired behaviors to small and medium poultry producers/Sector 3 Farmers (S3F);

- Small group discussions with S3F (480 producers in Can Tho, 600 in Kien Giang, 480 in Ha Nam, 480 in Hung Yen, 600 in Quang Tri). The farmers participated in three sessions, one per desired behavior; and
 - 42 community events at commune level (4 Community Events in Can Tho, 12 in Hung Yen, 6 in Ha Nam, 8 in Kien Giang, 12 in Quang Tri) with an estimated 300-500 participants/community event
- 7.1.11 The BCC seasonal campaigns were completed with a two-day review workshop in each province to determine lessons learned for the upcoming activities and collect comments on BCC materials used during the campaign for refinement. The final workshop was conducted in Can Tho in late June. Results of these review workshops will be taken into consideration to design BCC campaign for Y3 and the future BCC activities.
- 7.1.12 Conducted training courses on communication skills and counseling for all CBS Collaborators in Quang Tri (more than 300 Collaborators) and selected CBS Collaborators (around 60 Collaborators) in four districts of Can Tho; around 250 Collaborators (240) for two districts of Ha Nam; 150 Collaborators for two districts of Kien Giang and number of Collaborators for Hung Yen province. The trainings were designed to improve CBS Collaborators' service delivery skills. The effectiveness of these trainings will be assessed before deciding to continue for the remaining CBS Collaborators in Year 3.
- 7.1.13 Developed first drafts of Can Tho and Ha Nam's Integrated Communication Strategy, 2011-2015. The development of these Communication Strategies were led by selected provincial officers from SDAH, Center of Preventive Medicine, CHEC (also known as 'T4G'), and Agricultural Extension, Women's Union (Ha Nam) with support from APII, MARD and MOH, FAO and PAHI. These drafts of Provincial Integrated Communication Strategies also received contributions from representatives of different neighboring provinces, organizations and agencies such as Bac Ninh's DARD, Quang Tri's and Ha Nam's WUs. It is expected these provincial Integrated Communication Strategies will be ready early in Year 3. These Integrated Communications Frameworks guide the planning of future AI and EID disease-related communication activities in low risk situations and during pandemic and containment periods.
- 7.1.14 Provided coaching to BCC provincial trainer teams in all five of focus provinces to prepare training plan and materials on all BCC related trainings such as communication skills and counseling for CBS Collaborators; trainings on facilitation and organizational skills for communicators (as AH and HH workers) and for Community Event MCs and organizers.
- 7.1.15 Completed a qualitative study with poultry consumers in Can Tho, Ha Nam, Kien Giang and Quang Tri. The topline report and full report were drafted. The results will help orient APII supply chain activities on the consumer (demand) side, in Year 3.

- 7.1.16 Engaged national journalists (VTC16), provincial journalists (T4g, local newspapers and TV) on the Animal Health bio-security study tour in Northern and Southern provinces. This resulted in various articles and broadcasts. For all BCC events such as training, planning workshops, and community events local journalists were engaged and articles/televised broadcasts were issued in Ha Nam, Hung Yen, Kien Giang and Quang Tri.
- 7.1.17 Facilitated by provincial subcontractors, the provincial media regularly published articles and broadcast news briefs on local BCC activities (APII is maintaining a catalogue and database).
- 7.1.18 Completed the collection of API materials from various sources and passed these on for uploading on the PAHI website.
- 7.1.19 Developed and shared the Year 2 press relations plan with USAID.
- 7.1.20 Compiled and edited weekly updates and success stories to USAID.
- 7.1.21 With support from Abt home office staff and inputs from all technical teams, APII's BCC transition Strategy for Year 3 (and beyond) was drafted.

7.2 Challenges and Solutions

- 7.2.1 Encountered difficulties finding a suitable local subcontractor on Year 2 BCC activities in Can Tho as the provincial WU was short on human resources. Identified CEFACOM (Research Center for Family Health and Community Development) a national NGO based in Hanoi through competitive bidding as a suitable replacement and signed the subcontract in March. The BCC seasonal campaign got delayed about two months in Can Tho. The subcontract preparation process often takes longer than envisaged to complete and the Firm Fixed-Price PSA mechanism is still difficult for many subcontractors to accept/adjust to.
- 7.2.2 The selection of local subcontractors (Quang Tri, Kien Giang and Ha Nam Women's Union; Hung Yen Red Cross Humanity Center) to conduct Year 2 activities was still considered optimal for local ownership and sustainability reasons. However, working with these subcontractors faced many challenges due to their limited capacity and the ongoing need therefore for APII to build capacity in our subcontractors.
- 7.2.3 The BCC Year 2 planning workshop in Ha Nam was cancelled due to the late MOU renewal and the PSA with Ha Nam Women's Union was modified to address this. Nevertheless, Ha Nam Women's Union is a very strong and proactive branch and they managed to complete BCC campaign activities same time as other provinces.
- 7.2.4 It was a long approval process to get national officers (from MOH, MARD) on board as consultants to review BCC materials, but we succeeded in the end (including the required 'leave without pay letters').
- 7.2.5 The three-day training courses for small group discussion communicators on basic facilitation skills and the one-day trainings for Community Event facilitators and organizers were found to be insufficient. We are considering adding more days and more materials for participants to role

play and practice facilitation of discussions with flipcharts on desired behaviors.

- 7.2.6 Through the reports of BCC campaign activities and review workshops, we determined that provincial subcontractors need more analytical thinking and writing skills. Even with hands-on coaching, templates and guidance from the BCC team, it was still hard for them to document and show results and achievements during the review workshop. Building capacity for provincial trainers and subcontractors requires more time than previously envisaged. The same applies to writing skills of local trainers preparing the Provincial Integrated Communication Plans. The writing teams will need more supervision/technical support from APII consultants and the BCC team than expected.
- 7.2.7 For the Provincial Integrated Communication Plan development in Can Tho it was hard to mobilize support and involvement from representatives of all key provincial agencies to participate in this collective work. The BCC team will continue to work more closely with the writing group, the subcontractor, and Can Tho PCU on this.
- 7.2.8 Recently, provincial leaders have found it increasingly difficult to mobilize local resources for AI and EID prevention activities, because of other priorities and the lack of a national plan for AI/EID prevention. The officially approved APEID 2011-2015 is expected to help provide the framework needed to get support and funding.
- 7.2.9 Post-training support to and monitoring of CBS Collaborators having received training on communication and counseling skills is needed to ensure participants can contribute more to promotion of AI and EID prevention practices through their daily interaction with households. This can be integrated into their monthly CBS network meetings.
- 7.2.10 Provincial BCC trainers had difficulties preparing training plans and materials and the BCC team had to spend more time than anticipated to assist trainings team and ensure quality. This capacity building needs more time and practice. A TOT course on basic skills such as preparing training objectives and delivery of competency-based adult training, writing skills (evidence based reports, evidence-based articles), monitoring skills, using monitoring checklists and observations for lessons learning and improvement might also be a good investment.
- 7.2.11 Preparation of BCC materials for supply chain nodes audiences will not begin until improved supply chain nodes were activated.
- 7.2.12 Low risk perception among decision-makers also constitutes a challenge, e.g. collaboration with the communication sub-committee of the National Steering Committee for Human Influenza Pandemic Control and Preparedness (NSCHP) -- and one that APII cannot influence much. National level bodies remain more committed and accustomed to responding to outbreaks.
- 7.2.13 The project cancelled the development and dissemination of the 'One Health Newsletter' via the communication sub-committee because of the low risk perception and likely non-sustainability of the activity.

Provincial Coordination and Implementation

7.3 Achievements

- 7.3.1 The MOUs with five provincial authorities were signed early in Year 2 creating favorable conditions for implementation in Year 2.
- 7.3.2 Soon after USAID's approval of the Year 2 work plan APII organized planning workshops and prepared provincial implementation plans (PIP) together with partners and counterparts. The PIP is an official project document attached to the provincial MOU and used as a framework for project implementation.
- 7.3.3 Conducted quarterly, bi-annual and annual review/planning workshops in the focus provinces with counterparts, subcontractors and FAO.
- 7.3.4 Continued support Provincial Coordination Units (PCUs) and joint Provincial Coordinator (PCs) in the five focus provinces.
- 7.3.5 Improved performance of PCUs and PCs led to increased local buy-in and general improvements in quality of field work/implementation.
- 7.3.6 Enhanced capacity and performance (including monitoring) of two satellite offices in Can Tho and Quang Tri similarly helped up the overall performance and quality of implementation by partners. Bi-monthly meetings with field staff and PCs provided more timely updates on the challenges and progress in each province. The close monitoring by project field staff, PCs, and PCU members provided feedback to project management and PMP data.
- 7.3.7 Facilitated field visits by APII staff, consultants, USAID and other partners as well as two large study tours.
- 7.3.8 Ensured compliance with all requirements for legal operation of the project in provinces (obtained license for operation in province; timely submission of semi-annual reports to DOFA and provincial authorities).
- 7.3.9 Achieved near or in excess of 100% disbursement vis-à-vis MOU budgets and PIP targets in all five provinces, to the satisfaction of provincial counterparts and authorities.

7.4 Challenges and Solutions

- 7.4.1 Changes in leadership, PCU chairmanship, and provincial counterpart agency personnel in Ha Nam and Hung Yen caused some delays and challenges early in Year 2. The (new) relationships improved significantly during the course of the year.
- 7.4.2 The Project Area Manager (North) was terminated in January 2011. Finding a replacement took longer than expected. The new staff has settled in well.
- 7.4.3 The PC in Hung Yen resigned and was replaced in March 2011. A new PC was appointed but the performance has not been convincing. Same applies to the PC in Ha Nam province.

- 7.4.4 Varying levels of participation and commitment by PCU members also represented an ongoing challenge. During the year, project staff and PCs approached the designated organizations (SDAHs, PMCs, PAFECS, etc.) in an effort to increase participation and accountability. Improvements were seen in Quang Tri, Can Tho and Ha Nam in particular. However, gaps remain and more local advocacy work is required.
- 7.4.5 Close communication and sharing of information between PCs and FAO's Focal Points (FP) remained a challenge for various institutional reasons. The PCs remained more loyal to APII and the FPs to FAO/DAH, for understandable reasons. FAO and APII organized joint meetings/workshops to help remedy the situation, but the issue persisted. The fact that PCs and Focal Points have varying levels of seniority in the institutions they are seconded from further complicates the issue. The PC/FP set-up will be reviewed and revised in Year 3, with the aim of gradually facing out these positions (speed may vary across provinces).

National Coordination & Policy Dialogue

The overall aim of APII is to develop successful new models and approaches, which are adopted, adapted, replicated and scaled up by public and private partners. Institutional adoption and local ownership of APII's innovative products is considered a key measure of success for the project.

This is a big challenge given the many competing priorities and fund/budget restrictions that local counterparts and partners generally face, not least in a time of 'low risk perception' with regards to AI. The project is using a wide range of tools and skills to access and influence partners and to identify new (and sometimes unanticipated) opportunities for promoting and transferring its products.

In Year 2, the project initiated the development of a comprehensive advocacy strategy to provide an overall picture of the challenge ahead and lay out advocacy road maps for each of the project's thematic areas. During the course of the year, the project team began to shift focus from implementation at grassroots level to addressing the bigger questions of how to sustain the interventions without project support. This process will be intensified from the start of Year 3 as APII transitions from implementation to 'handing over'.

7.5 Achievements

- 7.5.1 Developed APII's Advocacy Strategy and shared this living document with USAID and API partners including PAHI. The process helped generate a clearer picture (vision) within the APII team of where the project is heading and what results and outcomes to aim for along the way.
- 7.5.2 The Animal Health team maintained close contact with FAO as well as with other partners (e.g. LIFSAP, STOP AI) for coordination and collaboration. LIFSAP in particular have indicated interest in collaboration and technical protocols being prepared by APII.

- 7.5.3 The Animal Health team also maintained close contact and dialogue with DAH, DLP and NAEC including key individuals who may play important roles as ‘champions’ in the adoption of APII products. The team also engaged with representatives of provincial and regional bodies who can help promote the work and facilitate wider adoption.
- 7.5.4 The Animal Health initiated engaged with provincial agricultural colleges/ universities and vocational training centers (notably in Quang Tri) for formal training and certification of local AHWs. These relationships need to be explored and developed further in Year 3.
- 7.5.5 The Animal Health team continued to build relationships with private associations (VVA, VIPA) who potentially could play a significant role as lobbying organizations with AMRD agencies.
- 7.5.6 The Human Health team worked closely with FAO on surveillance and with WHO, MOH, DOD and PEPFAR on IC activities.
- 7.5.7 The Human Health team engaged with a number of strategically positioned individuals and private institutions at central, regional and provincial levels who can help promote the transfer of CBS and IC models in Year 3.
- 7.5.8 The BCC team stepped up its dialogue with API partners. FAO and WHO were regularly consulted for technical verification on AH and HH related BCC issues.
- 7.5.9 The BCC team continued to participate actively in the BCC Working Group
- 7.5.10 The BCC team continued to engage and journalists and mass media.

7.6 Challenges and Solutions

- 7.6.1 The fact that APII and Abt for that matter, in the eyes of many decision-makers ranks as an NGO increases the challenge and emphasizes the need for strategic partnerships with API partners (FAO, WHO, PAHI) and other like-minded projects such as LIFSAP.
- 7.6.2 Engaging with the private sector – as in corporate business – remains a challenge to APII and its API partners. APII struggles to see or identify obvious or straightforward options for public-private-partnerships. The project will continue to follow the work of the public-private-partnership working group and explore options guided short-term experts. Aside from the corporate sector APII is engaging with a wide range of private sector actors along the supply chain including commercial smallholders, traders, collectors, slaughterhouse owners and operators, and market vendors as well as livestock associations.

Monitoring & Evaluation

In Year 2, the guiding principle for the M&E work was to strengthen existing systems in the provinces and help close gaps between grassroots level M&E and provincial-national levels M&E and reporting. This included discrete capacity building activities such as training in data collection, analysis, and interpretation/

use, support to database development, and the development of tools, guidelines, etc. to help provide evidence for replication and up-scaling. This work will continue in Year 3.

APII furthermore acts as the repository for PMP indicators collected under USAID's API program, providing analysis and reporting on the data. In Years 1-2 MEASURE supported this work.

7.7 Achievements

- 7.7.1 The M&E team supported and provided oversight of ongoing monitoring, evaluation and quality assurance on the APII project. This involved data collection, management, analysis and reporting, training and follow-up with staff, subcontractors and local partners on monitoring mechanisms, quality assurance, evaluation tools development process and survey methodology, and use of data for decision-making.
- 7.7.2 Compiled Year 1 PMP data from API partners and reviewed data collection processes, PMP indicators, and data collection templates, in close collaboration with MEASURE and API partners.
- 7.7.3 In May 2011, on behalf of USAID/Vietnam, APII organized the "USAID Vietnam's HPAI and EPT PMP Data Collection Review Workshop", attended by 39 representatives from USAID, API partners, PAHI and local counterparts. Findings challenges were shared among stakeholders. Following the workshop, APII discussed with MEASURE on revisions of indicators and the need for a data base. It is expected that a revised set of indicators and PMP database will be available soon from MEASURE so that data collection by API partners for Year 2 can be initiated on time.
- 7.7.4 Developed the APII project Log-Frame linking activities and outputs to outcomes and impacts and will establishing the baseline for future results and impact assessments. PMP indicators reported by APII were incorporated into the Log-frame. New indicators, particularly at outcome level were added. After the USAID's partners' planning meeting in August 2011, the Log-frame was revised and updated to reflect APII strategy and work plan for the third year. The Log-Frame has now effectively replaced and superseded the PMP table in reporting. Data for APII performance monitoring was collected regularly and updated.
- 7.7.5 Developed mini Log-frames/M&E frameworks for detailed monitoring, evaluation and reporting on specific activities in supply chains which are not well captured within the PMP framework. Conducted an assessment of Dong Ha live bird market and Ngoc Xuan Slaughterhouse to obtain baseline data before interventions. Post-assessment will be done after upgrading and BCC campaign to keep track on the improvements of bio-security/bio-safety practices.
- 7.7.6 Strengthened the system for quality assurance. A detailed guideline for Activity Implementation Monitoring ('AIM Guidelines') and related tools were developed. Training on quality assurance and monitoring tools was conducted for project staff and local partners. With these tools, the monitoring approach and methods were standardized and quality of

monitoring improved. Immediate feedback from local partners and project staff was provided more frequently and interactions among the teams on the monitoring results were promoted. In general, it was found out that the project activities were performed with good quality.

- 7.7.7 Conducted rapid assessment of quality of trainings conducted in Year 1. The identified strengths include standardization of the approach and process in conducting training activities in each component. Some weaknesses that were identified, including: 1) “SMART” key performance indicators are not routinely defined to measure the effectiveness of each training course during the development process; 2) Pre-tests and post-tests (or simply post-tests in some cases) are not used systematically; 3) Training plans do not include post-training follow-up plans to support trainees in the application of their new knowledge and skills in the workplace; and 4) There is no system to conduct post-training assessments of trainees’ ability to apply skills and behaviors learned in their work. Action briefs based on the rapid assessment results to guide the development of SMART objectives, indicators and targets and a system for post-training assessment and follow-up were prepared. These were shared at a USAID Health Partners’ meeting for a discussion on quality assuring, sustaining and institutionalizing “good capacity building”. As a result of this activity, project staff has paid more attention on defining objectives and indicators to measure outputs of a training course.
- 7.7.8 Subcontracted Asian Management and Development Institute (AMDI), a local organization to conduct the post-training assessment. Purpose is to determine the results, outcomes and (where feasible) the impact of the trainings conducted so far, and to identify motivators and barriers to application of new skills and knowledge among trainees. The final report will be ready in Year 3.
- 7.7.9 Reviewed SOWs and deliverables of all subcontractors and program implementation to help ensure that M&E issues are adequately addressed in all work
- 7.7.10 Reviewed SOWs and deliverables of all subcontractors to help ensure that M&E issues are adequately addressed in all work.
- 7.7.11 Provided inputs on methodologies, protocols and tools of CBS review, CBS mini-evaluation and KAP survey to help ensure these studies/survey are technically sound.

7.8 Challenges and Solutions

- 7.8.1 Baseline indicators need to be identified and included in the Log-frame where possible. However, as the project did not conduct a baseline survey before or during start-up it may be difficult to arrive at a complete baseline. The situation analysis report produced in AI Mekong project and previous KAP surveys did not always align with these indicators. Proxy indicators will be used if possible, in the process of establishing (retroactively) the general baseline for APII.

- 7.8.2 Quality of activities is affected by various factors such as subcontractor's capacity and performance, commitment of local partners, technical assistance and coaching by technical teams, and capacity of project implementers in local areas (e.g. local trainers/CBS Collaborators). Quality varies across provinces and components. This requires constant attention, follow-up and tailored solutions, including continuous basic or advanced training for local partners. Sustained quality improvement is a long-term process.
- 7.8.3 The project's interventions are diverse and at times complex. To monitor performance and measure effectiveness of each intervention requires a range of methods and approaches.
- 7.8.4 It takes time and effort to develop a comprehensive database for data retrieval. Currently raw data of certain activities such as training tests, training evaluation results, KAP surveys are stored in multiple places. The M&E team is developing a more systematic and centralized data storage/Management Information System (MIS) for easy access and retrieval of data and information during and after the project.
- 7.8.5 There were challenges in coordinating PMP data collection for the API program. The workshop on with USAID's API partners in May identified the following: (1) unclear operational definition and/or lack of alignment with the Government's existing record keeping system in some indicators; (2) Quality of collected data has weaknesses such as limited data validity/reliability and precision, especially of the indicators on local training; (3) Difficult coordination among many facilities, inconvenient data collection template, and limited access to data source, especially of those data on local training/interventions; and (4) Linkage between the PMP and current existing government's record keeping system and usefulness of each PMP indicator for the local program management are not very clear, especially to the local partners. To address these issues, efforts should be made not only at micro-level such as tool improvement and training for local partners on indicators and data collection, but also at macro-level such as participatory multi-sector approaches, enhancing management and coordination of information systems, and promoting data use for decision making. In putting into practice these efforts, a training course on data based decision making (DDM) for local decision makers is planned for Year 3.

Administration & Finance

7.9 Achievements

- 7.9.1 Recruitment of project staff was completed including two Supply Chain Managers, a replacement for the Project Area Manager (North), a new Strategic Communications Manager (in lieu of the Policy Advocacy Manager who resigned), two F&A Assistants in the field offices and an Administration Manager in the Hanoi Office.

- 7.9.2 Managed the finance and administration aspects of all subcontracts and consultant agreements effectively after the procedures were streamlined during the course of the year.
- 7.9.3 Shorter turnaround time with the Regional Contracting Officer also helped improve the Consultant recruitment process during the course of the year.
- 7.9.4 Overall the project saw an increase in the expenditure rate of around 50% compared with Year 1 and progressed well on this account given the caps on human resources and the available implementation mechanisms (i.e. sub-contracting).

7.10 Challenges and Solutions:

- 7.10.1 Retroactive approval for AFAP Year 1-2 Consultants pending with USAID. Will follow-up.
- 7.10.2 Lack of a clear understanding of the conditions for 'Grants Under Contract' (GUC) will cause some delays in supply chain work. The project will explore subcontracting options instead, but this is a time-consuming process.
- 7.10.3 Application for registration with Paccom (to open up for direct implementation) still pending. Will continue to follow up.
- 7.10.4 According to Ernst & Young, APII cannot obtain VAT exempt status on locally procured goods and services. This was communicated to USAID. Awaiting USAID's reply and will continue to follow-up.
- 7.10.5 The available sub-contracting mechanisms remain a challenge to partners particularly those with little working capital or capital reserves and little experience in contracting with international development partners/donors. No immediate alternatives or solutions available other than to continue to work closely with the subcontractors to prepare contracts and fulfill their obligations under contracts.
- 7.10.6 The Biodata form also continues to challenge new consultants. APII staff's still have to provide careful guidance.

8. Success Stories

8.1 Partner uptake of APII Biosecurity Training Package broadens its reach nationwide

Good poultry husbandry practices are an essential tool to preventing the spread of emerging infectious and zoonotic diseases by increasing biosecurity on farms. To capitalize on this efficient prevention method, the Avian and Pandemic Influenza Initiative worked with USAID's other API partners including the National Agriculture Extension Center (NAEC), to develop a biosecurity training package to be delivered by agriculture extension workers. The training package contains technical protocols, discussion flipcharts and comic books explaining improved biosecurity farming practices for raising chicken and ducks.

Expanding the reach of the project, NAEC and some provincial branches recently has agreed to begin disseminating the training materials in provinces not originally targeted by the project, and to incorporate the materials into their own national training system. The first step in this broader dissemination occurred in April and then in August when a series of training of extension worker trainer events were held in Ha Noi and Ho Chi Minh City respectively. Approximately 50 provincial agriculture extension system trainers from more than 20 provinces in the Red River and Mekong River deltas attended the training. Consequently, An Giang, Soc Trang and Ba Lieu provinces also requested the course for trainers. In September, a training of farmer trainers course for key staff in An Giang and Soc Trang's provincial agricultural and extension centers was prepared with APII's biosecurity training package for implementation in early October 2011. An Giang is planning to follow up with diffusion trainings for their commune level extension staff using local funds.

Formal national and provincial level adoption of the package into NAEC's training system will be key to ensuring the sustainability of APII's interventions and future scale up of biosecurity improvement interventions in the public system. APII is also exploring options for adoption with non-government partners.

APII has also shared the package with the Wildlife Conservation Society to explore options for collaboration with the EPT programs PREDICT and RESPOND. It is hoped that the package can help inform training on EIDs originating in wildlife and the interface between wildlife, humans and livestock.

8.2 Proactive Community-Based Surveillance System allows for early detection and timely control of Highly Pathogenic Avian Influenza in Quang Tri

The most effective way to control avian influenza (AI) and mitigate its effects on human health and livelihoods is early detection. A good surveillance system allows suspected cases to be identified early before an outbreak spreads.

The Community Based Surveillance (CBS) model developed by APII aims to assist communities in mitigating the effects of AI and other EIDs by identifying outbreaks where they occur and feeding them quickly into the national surveillance system.

A CBS Collaborator visits a home to follow up on a rumor and observe the chickens.

In order to continuously build capacity for CBS network, refresher training courses and monthly meeting have been designed to provide technical update on AI and emerging infectious diseases (EIDs) such as foot-and-mouth disease (FMD) in livestock and dengue in humans. These monthly meetings also help foster links in reporting and information sharing between village animal health and human health collaborators.

Animal health collaborators are furthermore offered monthly refresher training on a broader range of zoonotic and animal diseases such as streptococcus suis, rabies, liver fluke, swine fever, piglet diarrhea, erysipelas suum, E. coli and cattle pasteurellosis. For many participants it is the first time they receive update training since graduation.

Since the launch in August 2010, Quang Tri province has developed a particularly strong CBS network which includes 301 collaborators covering 152 villages and 26 communes. In March 2011, an HPAI outbreak was prevented following a suspected case in Hai Que commune, Hai Lang district. From June to Aug. 2011, another 8 suspected HPAI cases were reported by CBS collaborators in Gio Quang and Gio Mai communes, Gio Linh district. These cases were all confirmed by upper level lab reports. The duck flocks were culled and the outbreaks contained.

CBS animal health collaborators benefit from being able to provide better services to members in their community and building trust with clients

WHO	World Health Organization

Introduction

This report presents the main achievements, challenges and solutions for USAID's Avian and Pandemic Influenza Initiative during the first quarter of Year 2, Oct.–Dec. 2010.

The report is divided into the following thematic sections:

1. Animal Health Worker Capacity Building
2. Agricultural Extension Worker Capacity Building
3. Poultry Supply Chain Strengthening
4. Community-Based Surveillance
5. Infection Control / Case Management
6. Pandemic Preparedness Planning
7. Cross-Cutting Issues
8. Success Stories

1. Animal Health Worker (AHW) Capacity Building

The goal is to develop an AHW capacity building package that is adopted by relevant public-private agencies at national and/or provincial levels, and to develop a standard Terms of Reference for AHWs for adoption by PPCs and MARD.

Year 2 will focus on completing and transferring the training package for wider adoption and on establishing well-functioning networks of capable public and private animal health workers in and beyond project areas. The subcontractors include AFAP on training/capacity building and VVA on AHW network development and advocacy.

1.1 Achievements

1.1.1 Extended the Year 1 subcontract with AFAP into October–November and initiated the modified contract for Year 2 in December. The working relationship with AFAP has recently improved. AFAP now has a new Country Director and new field staff onboard and has strengthened its in-country team overall. AFAP is also engaging more closely with provincial counterparts, notably the Sub-DAHs and PAFECs through lessons learnt meetings, and participated actively in the Year 2 planning workshops with all key provincial partners.

1.1.2 The AHW TOT package, which is based firmly on the new training manual issued by DAH in 2010 was updated. Additional modules on bio-security, basic surveillance and zoonotic diseases were developed together with Sub-DAH's. Testing of the TOT package was initiated in Quang Tri through a 30-days training course for 25 AHWs. Emphasis was given to participatory training and learning by doing. All participants are expected to receive certificates co-signed by the Director of Sub-DAH. The (improved) training materials will be presented to and shared with DAH early in 2011.

1.1.3 Entered into dialogue provincial-based Agricultural Colleges and Vocational Training Centers and, who can provide formalize AHW training and certification (while Sub-DAH can issue AHW licenses).

1.1.4 Conducted AHW refresher training courses in all 15 pilot districts.

1.1.5 SOW was prepared for a new subcontract with Vietnam Veterinary Association (VVA) to continue their work on institutional strengthening and AHW network establishment with public and private partners.

1.2 Challenges and Solutions

1.2.1 The subcontracts with AFAP and VVA are running behind schedule. The APII team will continue to work very closely with both subcontractors in order minimize further delays.

1.2.2 DAH and Sub-DAH's have no function or division in charge of AHW network development, and any staff(s) assigned for this task are often not specialized in such work. This makes it difficult to advocate with Sub-DAH's and District Veterinary Stations (DVS) for AHW network strengthening. APII will continue to pursue this agenda with DAH and Sub-DAH leaders in close collaboration with relevant and strategically located partners, such as FAO and VVA. There is growing recognition of the need for grassroots-based AHW development.

2. Agricultural Extension Worker (AEW) Capacity Building

The goal is to develop and transfer to NAEC and PAFECS an AEW bio-security training package for small commercial poultry producers, which has been fully tested (incl. costing) and verified, for wider adoption and replication in the national-provincial extension system.

2.1 Achievements

2.1.1 The AEW bio-security training package was drafted in Year 1. During Q1 of Year 2 drawings and visual aids were completed by NAEC local consultants and artists together with a set of flipcharts and comic stories. Two technical review workshops were scheduled for January 2011 in Hanoi and HCMC, to be followed by field testing in February 2011.

2.2 Challenges and Solutions

2.2.1 Each region has different traditions and habits in poultry production and a training/extension package should ideally reflect this. APII has prepared separate materials on chicken production for the north and duck production for the south which need careful field testing for effective promotion of good husbandry practices. The training materials development is slightly behind schedule as managing subcontractors and consultants proves to be a continuing challenge.

2.2.2 Working closely with NAEC/PAFECS is necessary to help institutionalize the training/extension packages. This is a time-consuming process which requires diplomacy and patience in order to forge and maintain close relationships with these agencies.

3. Poultry Supply Chain Strengthening

The goal is to develop demonstration models in key (high risk) nodes along supply chains, together with related documents (protocols, guidelines, training materials) for wider replication by national and provincial agencies as well as other development projects/programs.

During Year 1 key intervention nodes and lists of priority risk reduction measures were identified together with public and private stakeholders. To guide the actual, practical risk reduction efforts in each of the nodes a set of technical protocols (incl. conceptual designs and drawings) will be developed for the demonstration models. The technical protocols will address veterinary public health, hygiene/sanitation, and bio-security/bio-safety issues for animals and humans in/around the nodes, in light of the existing regulatory framework and ongoing efforts in Vietnam.

The project also plans to provide support to the continuation of STOP AI supply chain work and is in the process of preparing subcontract with ASVELIS.

3.1 Achievements

3.1.1 Several field visits were made to potential demonstration slaughterhouses (Can Tho and Kien Giang) and the live bird market in Dong Ha (Quang Tri). The conceptual drawings and technical protocols drafted for live bird markets and centralized slaughterhouses were shared with APII partners in a technical workshop. The workshop brought together key stakeholders (including DAH, DLP, FAO, VAHIP, ASVELIS, etc.) and the materials presented were very well received. VAHIP expressed interest in potentially adopting some of the protocol work.

3.1.2 An in-country study tour was conducted in collaboration with VIPA and DLP, with 22 participants from government authorities, incl. DAH, DLP, the Food Hygiene and Safety Administration of MOH, provincial representatives of DARDs, Sub-DAHs, and SDFHF as well as private entrepreneurs and journalists. The event provided an important opportunity for participants to identify firsthand the points of HPAI/EID risk exposure in poultry supply chains in seven different provinces (Hanoi, Hung Yen, Quang Tri, Tien Giang, HCMC, Can Tho and Kien Giang). As an outcome of the tour a list of interventions to support risk reduction and improve the compliance of supply chain entrepreneurs was prepared.

3.1.3 Several meetings took place between APII and FAO resulting in a detailed 'collaboration matrix' (a living document).

3.2 Challenges and Solutions

3.2.1 While provincial counterparts clearly are very interested in the demonstration models the provinces have no 'master plans' that clearly demarcate future locations e.g. of centralized poultry slaughterhouses and poultry markets. This may affect APII's work and could cause some delays. In Can Tho, following several rounds of discussions with the PCU and Sub-DAH, the final decision on where to develop the slaughterhouse demonstration unit has not yet been made. APII will stay well informed on

this and only support upgrades of existing/prioritized facilities in line with PCU/DARD recommendations.

4. Community-Based Surveillance (CBS)

The goal is to complete a CBS package, including training materials/tools, job descriptions, budget, and recommendations for adoption and up-scaling in the provincial-national surveillance system, in both the human and animal health sectors.

The CBS model is being implemented in 123 communes of 18 districts and 5 provinces since the beginning of 2010. During Year 2 APII will: conduct a midterm review; conduct refresher trainings to add other emerging infectious and zoonotic diseases; connect to the poultry supply chain strengthening efforts by using high risk nodes (smallholder commercial farms, hatcheries, traders, slaughterhouses, markets) for events based surveillance, early warning and responses; gradually phase out support to community-based CBS networks to test their sustainability and potential for up-scaling; and conduct final evaluation (incl. costing) of the model for wider replication and uptake at provincial and national levels.

4.1 Achievements

4.1.1 Maintained CBS collaborator networks in 123 communes of 18 districts in 5 provinces. Between September-December collaborators reported 2545 suspected cases in humans and 9334 in animals. However, no AI outbreaks were confirmed.

4.1.2 Worked with FAO for continued coordination, technical verification, and talks on how to better link grassroots level reporting into the provincial-national system. It was agreed to maintain (at least) quarterly FAO-APII meetings on surveillance.

4.1.3 Identified the Centre for Community Health and Injury Prevention (CCHIP) as the subcontractor for Year 2, through a competitive bidding process.

4.1.4 Conducted a CBS mid-term review, incl. 65 semi-structured group/individual interviews with 257 stakeholders in four provinces (excl. Ha Nam). The assessment provided evidence on network collaborator activities, identified strengths and weaknesses in the current model, and gave recommendation for improvements. The results will be presented to provinces for further discussion and feedback in January 2011.

4.1.5 Entered into dialogue with the Village Health Worker Association and the Medical College of Quang Tri on potential collaboration and expansion of CBS work through the Village Health Worker, Association which reaches out to all villages in Quang Tri.

4.2 Challenges and Solutions

4.2.1 Carefully analyze the findings of the mid-term review and follow-up where necessary on identified gaps/weaknesses in the model.

4.2.2 The relatively low capacity and shortage of human resources among local subcontractors required the APII Human Health team to work closely with them to support, coach, and guide their work. This in itself constitutes an important local capacity building input by the project, but one that may cause some delays in implementation.

4.2.3 Linking the reporting at grassroots level to the provincial-national surveillance system, though the Chief/Commune AHW's with whom both APII and FAO work, remains a challenge. APII will continue to address this issue in close consultation with FAO and the provincial Sub-DAHs and District Veterinary Stations.

4.2.4 Separate meetings of animal and human health workers do not necessarily promote multi-sector collaboration. However, this reflects the way the system currently operates -- a system that is not easily changed. APII will continue to explore options for closer integration of animal and human health activities in close consultation with local stakeholders and national experts.

5. Infection Control/Case Management (IC/CM)

The goal is to develop an IC/CM 'model' with training package/tools, guidelines etc. piloted and tested/verified (including costing), for wider adoption in Vietnam.

In Year 2, IC/CM activities will aim to disseminate the APII district level IC model (including training package, tools, and guidelines) and SARI/AI case management guidelines for village, commune and district levels to MOH and provincial authorities beyond the five focus provinces as well as to other development partners, for wider adoption.

5.1 Achievements

5.1.1 Completed two four-day training courses for IC assurance teams and their networks, in Kien Giang and Can Tho for 54 health staff. The courses covered the following topics: (1) Implementation of adapted IC protocols/guidelines in district hospitals and commune health stations; (2) IC surveillance; and (3) IC principles and standard precautions

5.1.2 Completed eight two-day training courses on basic IC and CM principles and compliance for 244 district level health staff.

5.1.3 Completed four one-day training courses on basic IC and CM principles and compliance for 114 commune and village health workers.

5.1.4 Initiated dialogue with the PEFAR program to explore collaboration on IC activities. During the next trainings (in Hanoi), APII will invite participants from PEPFAR provinces.

5.2 Challenges and Solutions

5.2.1 It took longer than expected to develop the subcontract in this area. This is a general observation (subcontracts taking longer to initiate than expected) that will be taken into in future planning and projections.

6. Pandemic Preparedness Planning (PPP)

The goal is to develop PPPs in selected focus provinces, introduce the package in other provinces, and advocate for its wider adoption throughout Vietnam.

During Year 1, Vietnamese Red Cross (VNRC) who is the selected subcontractor for this work, implemented USAID's Humanitarian Pandemic Preparedness (H2P) project with civil society organizations in Ha Nam and Quang Tri. Following this, VNRC started reviewing the status of PPPs in the five focus provinces in collaboration with APII. In Year 2, APII plans to enter an MOU with VNRC to revise, test and finalize improved PPPs for wider replication.

6.1 Achievements

6.1.1 Prepared MOU with VNRC and submitted to VNRC for comments and feedback.

6.1.2 Developed/revised tools and planned for implementing the PPP situation analysis in the provinces.

6.2 Challenges and Solutions

6.2.1 VNRC was occupied with humanitarian and emergency activities (incl. flooding in Central Vietnam) and did not have time/resources to finalize the MOU with APII. As a mass organization under the Fatherland Front, VNRC was furthermore awaiting the outcome of the 11th Party Congress in January 2011 before entering any new commitments. The nature of VNRC's work, including focus on emergency responses, can make it a particular challenge to implement a subcontract with VNRC.

7. Cross-Cutting Issues

Behavior Change Communication (BCC)

The BCC work aims to identify appropriate behaviors and messages for key target audiences and to strengthen the BCC capacity of national and provincial stakeholders. The BCC work feeds into and helps integrate and enhance the work of the other technical components in animal and human health.

7.1 Achievements

7.1.1 Closer integration of BCC activities into animal and human health activities, e.g. in the supply chain work.

7.1.2 Developed the Year 2 BCC Strategy (a living document) based on the results of the Year 1 risk assessment, the risk reduction strategies, and the results of the BCC assessment. The Year 2 strategy focuses on the seasonal BCC campaign and closer integration of BCC work into the animal health and human health components. The strategy was shared with FAO and WHO for technical (i.e. animal/human health) verification and feedback.

7.1.3 Conducted planning workshops with key local stakeholders in four provinces (except Ha Nam) to design Year 2 BCC activities. The workshops provided consensus on the number of desired behaviors and on barriers and motivators, which in turn were used to develop appropriate key messages for target audiences.

7.1.4 Prepared subcontracts for Year 2 BCC activities: Women's Union in Ha Nam, Kien Giang and Quang Tri (i.e. same as in Year 1) and the Provincial Humanity Center under Red Cross in Hung Yen. The subcontractor in Can Tho is to be determined.

7.1.5 Completed BCC TOT trainings for district trainers (representing AH, Animal extension, HH, and communication bodies) in Quang Tri, Can Tho and Ha Nam. The trainings were conducted by provincial Master Trainers.

7.1.6 Designed Year 2 BCC materials (calendar, flipcharts, logo, BCC theme, guidelines for community events, etc.) together with BCC and artwork consultants, and identified vendors for printing and distribution. FAO and WHO were consulted for technical verification.

7.1.7 Pre-tested the above BCC materials in Can Tho (for Southern materials) and Hung Yen (for Northern materials).

7.1.8 Completed the collection of API materials from various sources and passed these on for uploading on the PAHI website.

7.1.9 Engaged national journalists (VTC16), provincial journalists (from Centers for Health Communication and Education/T4g), and local newspaper and TV journalists television on the Animal Health bio-security study tour in Northern and Southern provinces. This resulted in articles and broadcasts.

7.1.10 Developed and shared the Year 2 press relations plan with USAID.

7.1.11 Provided frequent updates/success stories to USAID.

7.2 Challenges and Solutions

7.2.1 Encountered difficulties in finding local subcontractor to implement Year 2 BCC activities in Can Tho. Currently working with CEFACOM (Research Center for Family Health and Community Development), a national NGO based in Hanoi to take on this activity. Subcontract preparation generally takes longer than envisaged.

7.2.2 The BCC Year 2 planning workshop in Ha Nam was cancelled due to the pending MOU renewal in Ha Nam (see also 'Provincial Implementations' section below). The PSA with Ha Nam Women's Union in Year 2 was modified to address this (Note: subcontract modification can be a time-consuming process).

7.2.3 Difficult to get national officers to give technical inputs into project activities such as reviewing BCC materials, as we are constrained in the way we can compensate their efforts. We are working to find suitable ways to bring them on board in close consultation with the F&A team and the Project Director, but the options are limited. This constraint could also affect the production of newsletters with/through NAEC and NCHEC.

Provincial Coordination and Implementation

7.3 Achievements

7.3.1 Signed MOUs for Year 2 with Can Tho, Kien Giang, Quang Tri and Hung Yen provinces. Ha Nam pending due to changes in leadership.

7.3.2 Worked with subcontractors to prepare provincial work plans and conducted provincial planning workshops, with all APII components and local partners fully involved, in Kien Giang, Dec. Can Tho, and Quang Tri (Note: Hung Yen workshop held in early January; Ha Nam to follow – see also 7.4.2 below).

7.3.3 Submitted provincial implementation plans for PCU for approval in Kien Giang, Can Tho and Quang Tri.

7.3.4 Identified and engaged Provincial Coordinators in consultation with counterparts in four provinces (Ha Nam still pending).

7.3.5 Relocated project offices in Can Tho and Quang Tri from within DARDs to privately rented premises, for compliance and easy/equal access by all partners.

7.4 Challenges and Solutions

7.4.1 The contract for the Project Area Manager (North) was terminated by mutual consent due to unsatisfactory performance. The recruitment process for a replacement was initiated. The ideal candidate will be a more senior person with management experience, a proven track record in dealing with provincial counterparts, and prepared to relocate to Ha Nam or travel extensively to the field.

7.4.2 Changes in leadership in Ha Nam meant that no persons were yet assigned as PCU Chair and Vice-Chair. It was therefore not possible to sign the MOU for Year 2 or conduct the Risk Reduction and Year 2 planning workshops in Ha Nam. As a result some activities were temporarily suspended. APII's Deputy Director for Provincial Implementation maintained close dialogue with Ha Nam leaders for a resolution early in 2011.

7.4.3 Close communication between the shared APII-FAO Provincial Coordinators and FAOs Focal Points/Field Coordinators remains a challenge. The APII partners are aware of this and the institutional issues involved, and are looking for ways to improve the situation. The Provincial Coordinators are expected to play a key role in coordination.

7.4.4 Field level coordination at the 'programmatic' level, i.e. across USAID's activities, also remained a challenge. The APII partners are making good efforts to improve the situation including shared review and planning workshops, as well as more joint visits, where feasible, to promote a more programmatic approach.

7.4.5 Provincial budgets and plans for the following fiscal/calendar year are prepared during June-September. This is the time for APII to advocate for allocation of local funds to models and interventions advanced by the project. Staffs, however, are not yet well versed in the local decision-making processes. The project teams will work to better anticipate and prepare for this important period of the year, in order to take advantage of opportunities for sustaining APII work at the local level beyond the lifetime of the project. This includes early preparation for upcoming costing studies.

National Coordination & Policy Dialogue

7.5 Achievements

7.5.1 Developed the APII Advocacy Strategy with inputs from technical teams and others. This 'living document' was shared with USAID and API partners.

7.5.2 Generated a clearer picture (vision) within the APII team of where the project is heading and what achievements (milestones) to target along the way.

7.5.3 The AH team maintained close and frequent contact with FAO in particular, as well as with other relevant initiatives (e.g. VAHIP, STOP AI) for coordination and collaboration on supply chains and related work.

7.5.4 The HH team worked closely with FAO on surveillance, with WHO and MOH on IC activities and provided inputs on an IC assessment at a VAHIP project planning workshop. The HH Team maintains regular communications with partners and has agreed to hold (at least) quarterly meetings on coordination of surveillance activities with FAO.

7.5.5 The BCC team stepped up its dialogue with API partners, during the reporting period. FAO and WHO are now regularly consulted for technical verification on AH and HH related BCC issues. The BCC team also continued to participate actively in the BCC Working Group.

7.6 Challenges and Solutions

7.6.1 Coordination with many partners remains an ongoing challenge. APII will continue to participate actively in and contribute to/enhance the profile of relevant working groups. APII will maintain close interaction with FAO and WHO on technical issues through regular communications/exchanges and meetings, and where feasible through joint activities and events.

7.6.2 Gaining access to decision- and policy-makers is a challenge for an initiative that is often perceived as an 'NGO-effort'. APII will continue to engage closely with API partners and through them in its advocacy work. More active participation in PAHI working groups will also be pursued. Other options such as working with MARD's International Support Group (ISG) will be explored in consultation with USAID.

Monitoring & Evaluation

7.7 Achievements

7.7.1 Recruited the M&E Manager who has settled in well and quickly.

7.7.2 Worked closely with MEASURE and USAID's partners to review and improve the PMP data collection tools (ongoing albeit behind schedule).

7.7.3 Reviewed and updated the project's PMP. Collected and entered data. Developed related databases.

7.7.4 Initiated the drafting of a project Logical Framework, or 'Log-frame', which more clearly links activities and outputs to outcomes and impacts and will help establish the baseline for future results and impact assessments.

7.7.5 Developed detailed guidelines for Activity Implementation Monitoring ('AIM Guidelines') and related tools and shared these with staff, subcontractors and local partners.

7.7.6 Reviewed APII SOWs to help ensure that M&E issues are adequately addressed in all work.

7.7.7 Provided training to field-based Project Area Managers and Provincial Coordinators on M&E with focus on performance monitoring and quality control.

7.8 Challenges and Solutions

7.8.1 The current PMP does not show clearly the causal pathways from inputs to outcomes and impacts and the baseline indicators have not been identified specifically. To solve this, the project is developing a Logical Framework, or 'Log-frame'. Baseline indicators will be identified and included in the Log-frame where possible. However, as the project did not conduct a baseline survey before or during start-up it may be difficult to arrive at a complete baseline. Some reverse engineering (assisted by USAID) may be needed.

7.8.2 The project interventions are diverse and complex. To monitor performance and measure effectiveness of each intervention area requires a range of methods and approaches.

Administration & Finance

7.9 Achievements

7.9.1 Recruited the M&E Manager and a new F&A Assistant in Can Tho. Initiated the recruitment process for a new Strategic Communications Manager (to replace the Policy Advocacy Manager who departed in November), two Supply Chain Managers (for North/Central and for South), an F&A Manager for the Quang Tri Office, a Finance Officer and an IT Officer (the latter is a shared position with the HPI project).

7.9.2 Revised the TOR for Provincial Coordinators in close consultation with FAO and recruited four Provincial Coordinators (except in Ha Nam) for Year 2.

7.9.3 Facilitated that move of two provincial satellite offices (Can Tho, Quang Tri) from DARDs to independent locations in rented premises.

7.9.4 Developed and entered subcontracts with AFAP for AHW/AEW work, CCHIP for CBS work, Hanoi Infection Control Society for IC work, and with provincial Women's Union and Red Cross for BCC activities in four provinces (Can Tho pending). Trained subcontractors on related finance and compliance issues.

7.9.5 Prepared SOWs and entered a number of consultant agreements with national and international short-term consultants.

7.9.6 Revised the project's cost norms (in close consultation with FAO).

7.9.7 Prepared and submitted the Year 1 report to USAID.

7.10 Challenges and Solutions

7.10.1 The project is frequently questioned and challenged by partners, counterparts and subcontractors on its subcontracting mechanism. The Firm Fixed-Price Subcontract, whereby subcontractors are reimbursed on the basis of submission and approval of agreed deliverables is an unfamiliar contract form. Partner agencies have no working capital and are accustomed to working on the basis of fund advances. This, however, is not possible under APII. The issue is causing a significant element of discomfort among subcontractors, despite the fact that PSAs are designed in ways that trigger early releases of significant funds. Project staffs continue to go to great lengths to explain the policies and conditions under which the project is operating in an effort to generate more goodwill and appreciation. The project is succeeding in entering and completing most planned subcontracts so far, albeit often with delays which are due partly to the contracting mechanism.

7.10.2 The project is often facing a limited choice of relatively weak subcontractors. Building capacity in local subcontractors is one of the products of the project, but does cause a slow-down in implementation. Direct implementation (DI) as opposed to working through subcontractors is not a realistic option given the current legal status of APII and the level of staffing. APII is working on a registration with PACCOM to give more scope and flexibility for DI.

7.10.3 Another challenging point is the cost norms. APII is striving towards financial sustainability by keeping activity/field costs comparatively low. The project is repeatedly being compared with other donor-funded initiatives and found by most partners and counterparts to be less flexible and less 'competitive' (e.g. due to the fact the project provides no allowances/salary topping up to government staff). It makes APII a less attractive project in the eyes of local partners and may unfortunately be causing reduced local commitment/ownership. Again, the project staffs expend great efforts to explain the rationale and underlying principles and policies, in an effort to develop greater mutual understanding, acceptance, and commitment. It helps when USAID representatives are present to help clarify with counterparts.

7.10.4 Most subcontractors and consultants find the required biodata forms difficult to complete and the F&A team often has to go through several reiterations before the forms are ready for submission to Abt's HQ.

7.10.5 Delays in higher-level decisions concerning for instance staff salary increases (pending since June 2010) are discouraging and potentially demotivating for staffs.

8. Success Stories

Multi-Sector and Participatory Work Planning in Provinces

During the first quarter of Year 2 APII signed new MOUs with Can Tho, Hung Yen, Kien Giang and Quang Tri provinces and held provincial planning workshops with participation of local public/private stakeholders, subcontractors, and international partners. Multiple sectors were represented including animal health, human health, information/communication, civil society and poultry supply chain actors.

In Year 1 local counterparts had expressed some concern and dissatisfaction with coordination and information sharing. This year's planning workshops marked an effort to improve on these accounts as a prerequisite for more effective implementation and stronger local ownership.

From Kien Giang Annual Planning Workshop, Dec. 2010.

The planning workshops included a review of Year 1 and lessons learnt followed by presentations and discussions of proposed activities in Year 2. The process helped level expectations as to what the project can and cannot provide and generate consensus on the implementation mechanisms and the way forward in Year 2.

The PCU Vice-chair in Quang stressed that "...Each PCU member is responsible to collaborate and provide instruction back to his/her own agency to involve in the assigned component. S/he should review the plan from the subcontractor to provide comments to make the activities more relevant to and meet the needs of the locality. S/he should lead the monitoring work done by all subcontractors in order to ensure the quality and bring effectiveness to the people of Quang Tri in prevention of AI specifically and livestock diseases in general, and to ensure the regulations of the Government of Viet Nam and of Quang Tri are followed...".

In order to maintain close relations between the many actors and agencies involved, it was agreed to hold monthly/bi-monthly meetings with Provincial Coordination Units (PCU) and quarterly meetings involving districts and communes in future.

Subcontractors are expected to join the meetings to which international partners are also invited. The joint FAO-APII Provincial Coordinators are tasked to play a very proactive role in all this together with FAO's Focal Points in the Sub-Departments of Animal Health and APIIs provincial implementation team.

Communes Become Vigilant in Tracking Bird Flu

(Posted on <http://vietnam.usaid.gov/node/272> in Dec. 2010)

USAID is supporting new teams of villagers who, for the first time, are filling a crucial gap in the avian influenza reporting chain that boosts Vietnam's ability to quickly detect and prevent the spread of avian influenza at the grassroots level.

One of them is Nguyen Van Van, who works in Dai Hoa commune in Vietnam's central Quang Tri Province. A veteran village animal health worker with 20 years of veterinary service experience, he is one of nine community based surveillance collaborators in Dai Hao village helping 60 families. Before May 2010,

these village animal health workers worked independently and provided private services to households on vaccination and selling veterinary medicines. Coordinated and trained, they do a better job.

Each month, Van makes two or three visits to up to 160 households, providing animal health services such as poultry vaccination and foot and mouth disease prevention as well as instruction on how villagers can spot abnormal signs in their poultry flocks.

Vietnam is one of the hardest hit countries when it comes to bird flu. Since 2004, they have had to cull 45 million chickens and ducks, most of them early on. Fifty-nine people have died of avian influenza.

Vietnamese authorities moved quickly and effectively to launch mass vaccinations of poultry and have successfully managed the situation so far. It remains vital however, to build up a strong national surveillance systems for early detection and action, starting in communities and extending to the national level.

"There is the gap between the official surveillance system and the surveillance at community level," said Do Huu Dung, Deputy Head of the Epidemiology Division, in the Department of Animal Health, Ministry of Agriculture and Rural Development. "The Vietnamese Government is looking for a relevant community-based surveillance model that fills this gap and has the collaboration between animal health and health sectors."

Van and his colleagues are helping to fill this gap, and villagers increasingly understand their role.

"We actively reported to village animal health workers and human health workers to have immediate solution in order to minimize economic loss then we could be compensated from local authorities," said farmer Le Quan Dinh. "The vet services are helpful. We reported to them (village health animal health worker

Van, right, explains how to recognize abnormal signs in duck. Photo: Nguyen Thanh Dien at USAID's Avian and Pandemic Influenza Initiative.

and health worker) who then came immediately. We strongly believe in this network's capability."

In his first few months' time as a community collaborator, Van has identified more than 15 households, each with five to 10 sick and dead poultry, and reported them to the surveillance network. He also provides services to the neighboring communes.

With the community-based collaborator networks, USAID's Avian and Pandemic Influenza Initiative is developing one of the essential building blocks in Vietnam's national surveillance system. By training and equipping village human health and animal health workers, the project is strengthening the surveillance system from the grassroots with a unique approach that combines human and animal health efforts to fight bird flu and other emerging infectious diseases and pandemic threats.

So far 1,778 collaborators have been trained in five provinces and 123 communes across Vietnam. From July to September 2010, they reported more than 2,218 sick and dead poultry and 1,131 suspected acute respiratory infection cases in humans, many of which may have otherwise gone unreported.

With the recognition of the commune governing People's Committee and radio spots explaining the network, the community is more aware about the collaborators and the services they provide. By 2012, Quang Tri Province will enroll these village animal health workers into the state system and provide a salary to entrench the surveillance network in the communities, where these trained eyes and ears can more effectively stop sick poultry in their tracks.

WHO	World Health Organization

Introduction

This report presents the main achievements, challenges and solutions for USAID's Avian and Pandemic Influenza Initiative during the first quarter of Year 2, Oct.–Dec. 2010.

The report is divided into the following thematic sections:

1. Animal Health Worker Capacity Building
2. Agricultural Extension Worker Capacity Building
3. Poultry Supply Chain Strengthening
4. Community-Based Surveillance
5. Infection Control / Case Management
6. Pandemic Preparedness Planning
7. Cross-Cutting Issues
8. Success Stories

1. Animal Health Worker (AHW) Capacity Building

The goal is to develop an AHW capacity building package that is adopted by relevant public-private agencies at national and/or provincial levels, and to develop a standard Terms of Reference for AHWs for adoption by PPCs and MARD.

Year 2 will focus on completing and transferring the training package for wider adoption and on establishing well-functioning networks of capable public and private animal health workers in and beyond project areas. The subcontractors include AFAP on training/capacity building and VVA on AHW network development and advocacy.

1.1 Achievements

1.1.1 Extended the Year 1 subcontract with AFAP into October–November and initiated the modified contract for Year 2 in December. The working relationship with AFAP has recently improved. AFAP now has a new Country Director and new field staff onboard and has strengthened its in-country team overall. AFAP is also engaging more closely with provincial counterparts, notably the Sub-DAHs and PAFECs through lessons learnt meetings, and participated actively in the Year 2 planning workshops with all key provincial partners.

1.1.2 The AHW TOT package, which is based firmly on the new training manual issued by DAH in 2010 was updated. Additional modules on bio-security, basic surveillance and zoonotic diseases were developed together with Sub-DAH's. Testing of the TOT package was initiated in Quang Tri through a 30-days training course for 25 AHWs. Emphasis was given to participatory training and learning by doing. All participants are expected to receive certificates co-signed by the Director of Sub-DAH. The (improved) training materials will be presented to and shared with DAH early in 2011.

1.1.3 Entered into dialogue provincial-based Agricultural Colleges and Vocational Training Centers and, who can provide formalize AHW training and certification (while Sub-DAH can issue AHW licenses).

1.1.4 Conducted AHW refresher training courses in all 15 pilot districts.

1.1.5 SOW was prepared for a new subcontract with Vietnam Veterinary Association (VVA) to continue their work on institutional strengthening and AHW network establishment with public and private partners.

1.2 Challenges and Solutions

1.2.1 The subcontracts with AFAP and VVA are running behind schedule. The APII team will continue to work very closely with both subcontractors in order minimize further delays.

1.2.2 DAH and Sub-DAH's have no function or division in charge of AHW network development, and any staff(s) assigned for this task are often not specialized in such work. This makes it difficult to advocate with Sub-DAH's and District Veterinary Stations (DVS) for AHW network strengthening. APII will continue to pursue this agenda with DAH and Sub-DAH leaders in close collaboration with relevant and strategically located partners, such as FAO and VVA. There is growing recognition of the need for grassroots-based AHW development.

2. Agricultural Extension Worker (AEW) Capacity Building

The goal is to develop and transfer to NAEC and PAFECS an AEW bio-security training package for small commercial poultry producers, which has been fully tested (incl. costing) and verified, for wider adoption and replication in the national-provincial extension system.

2.1 Achievements

2.1.1 The AEW bio-security training package was drafted in Year 1. During Q1 of Year 2 drawings and visual aids were completed by NAEC local consultants and artists together with a set of flipcharts and comic stories. Two technical review workshops were scheduled for January 2011 in Hanoi and HCMC, to be followed by field testing in February 2011.

2.2 Challenges and Solutions

2.2.1 Each region has different traditions and habits in poultry production and a training/extension package should ideally reflect this. APII has prepared separate materials on chicken production for the north and duck production for the south which need careful field testing for effective promotion of good husbandry practices. The training materials development is slightly behind schedule as managing subcontractors and consultants proves to be a continuing challenge.

2.2.2 Working closely with NAEC/PAFECS is necessary to help institutionalize the training/extension packages. This is a time-consuming process which requires diplomacy and patience in order to forge and maintain close relationships with these agencies.

3. Poultry Supply Chain Strengthening

The goal is to develop demonstration models in key (high risk) nodes along supply chains, together with related documents (protocols, guidelines, training materials) for wider replication by national and provincial agencies as well as other development projects/programs.

During Year 1 key intervention nodes and lists of priority risk reduction measures were identified together with public and private stakeholders. To guide the actual, practical risk reduction efforts in each of the nodes a set of technical protocols (incl. conceptual designs and drawings) will be developed for the demonstration models. The technical protocols will address veterinary public health, hygiene/sanitation, and bio-security/bio-safety issues for animals and humans in/around the nodes, in light of the existing regulatory framework and ongoing efforts in Vietnam.

The project also plans to provide support to the continuation of STOP AI supply chain work and is in the process of preparing subcontract with ASVELIS.

3.1 Achievements

3.1.1 Several field visits were made to potential demonstration slaughterhouses (Can Tho and Kien Giang) and the live bird market in Dong Ha (Quang Tri). The conceptual drawings and technical protocols drafted for live bird markets and centralized slaughterhouses were shared with APII partners in a technical workshop. The workshop brought together key stakeholders (including DAH, DLP, FAO, VAHIP, ASVELIS, etc.) and the materials presented were very well received. VAHIP expressed interest in potentially adopting some of the protocol work.

3.1.2 An in-country study tour was conducted in collaboration with VIPA and DLP, with 22 participants from government authorities, incl. DAH, DLP, the Food Hygiene and Safety Administration of MOH, provincial representatives of DARDs, Sub-DAHs, and SDFHF as well as private entrepreneurs and journalists. The event provided an important opportunity for participants to identify firsthand the points of HPAI/EID risk exposure in poultry supply chains in seven different provinces (Hanoi, Hung Yen, Quang Tri, Tien Giang, HCMC, Can Tho and Kien Giang). As an outcome of the tour a list of interventions to support risk reduction and improve the compliance of supply chain entrepreneurs was prepared.

3.1.3 Several meetings took place between APII and FAO resulting in a detailed 'collaboration matrix' (a living document).

3.2 Challenges and Solutions

3.2.1 While provincial counterparts clearly are very interested in the demonstration models the provinces have no 'master plans' that clearly demarcate future locations e.g. of centralized poultry slaughterhouses and poultry markets. This may affect APII's work and could cause some delays. In Can Tho, following several rounds of discussions with the PCU and Sub-DAH, the final decision on where to develop the slaughterhouse demonstration unit has not yet been made. APII will stay well informed on

this and only support upgrades of existing/prioritized facilities in line with PCU/DARD recommendations.

4. Community-Based Surveillance (CBS)

The goal is to complete a CBS package, including training materials/tools, job descriptions, budget, and recommendations for adoption and up-scaling in the provincial-national surveillance system, in both the human and animal health sectors.

The CBS model is being implemented in 123 communes of 18 districts and 5 provinces since the beginning of 2010. During Year 2 APII will: conduct a midterm review; conduct refresher trainings to add other emerging infectious and zoonotic diseases; connect to the poultry supply chain strengthening efforts by using high risk nodes (smallholder commercial farms, hatcheries, traders, slaughterhouses, markets) for events based surveillance, early warning and responses; gradually phase out support to community-based CBS networks to test their sustainability and potential for up-scaling; and conduct final evaluation (incl. costing) of the model for wider replication and uptake at provincial and national levels.

4.1 Achievements

4.1.1 Maintained CBS collaborator networks in 123 communes of 18 districts in 5 provinces. Between September-December collaborators reported 2545 suspected cases in humans and 9334 in animals. However, no AI outbreaks were confirmed.

4.1.2 Worked with FAO for continued coordination, technical verification, and talks on how to better link grassroots level reporting into the provincial-national system. It was agreed to maintain (at least) quarterly FAO-APII meetings on surveillance.

4.1.3 Identified the Centre for Community Health and Injury Prevention (CCHIP) as the subcontractor for Year 2, through a competitive bidding process.

4.1.4 Conducted a CBS mid-term review, incl. 65 semi-structured group/individual interviews with 257 stakeholders in four provinces (excl. Ha Nam). The assessment provided evidence on network collaborator activities, identified strengths and weaknesses in the current model, and gave recommendation for improvements. The results will be presented to provinces for further discussion and feedback in January 2011.

4.1.5 Entered into dialogue with the Village Health Worker Association and the Medical College of Quang Tri on potential collaboration and expansion of CBS work through the Village Health Worker, Association which reaches out to all villages in Quang Tri.

4.2 Challenges and Solutions

4.2.1 Carefully analyze the findings of the mid-term review and follow-up where necessary on identified gaps/weaknesses in the model.

4.2.2 The relatively low capacity and shortage of human resources among local subcontractors required the APII Human Health team to work closely with them to support, coach, and guide their work. This in itself constitutes an important local capacity building input by the project, but one that may cause some delays in implementation.

4.2.3 Linking the reporting at grassroots level to the provincial-national surveillance system, though the Chief/Commune AHW's with whom both APII and FAO work, remains a challenge. APII will continue to address this issue in close consultation with FAO and the provincial Sub-DAHs and District Veterinary Stations.

4.2.4 Separate meetings of animal and human health workers do not necessarily promote multi-sector collaboration. However, this reflects the way the system currently operates -- a system that is not easily changed. APII will continue to explore options for closer integration of animal and human health activities in close consultation with local stakeholders and national experts.

5. Infection Control/Case Management (IC/CM)

The goal is to develop an IC/CM 'model' with training package/tools, guidelines etc. piloted and tested/verified (including costing), for wider adoption in Vietnam.

In Year 2, IC/CM activities will aim to disseminate the APII district level IC model (including training package, tools, and guidelines) and SARI/AI case management guidelines for village, commune and district levels to MOH and provincial authorities beyond the five focus provinces as well as to other development partners, for wider adoption.

5.1 Achievements

5.1.1 Completed two four-day training courses for IC assurance teams and their networks, in Kien Giang and Can Tho for 54 health staff. The courses covered the following topics: (1) Implementation of adapted IC protocols/guidelines in district hospitals and commune health stations; (2) IC surveillance; and (3) IC principles and standard precautions

5.1.2 Completed eight two-day training courses on basic IC and CM principles and compliance for 244 district level health staff.

5.1.3 Completed four one-day training courses on basic IC and CM principles and compliance for 114 commune and village health workers.

5.1.4 Initiated dialogue with the PEFAR program to explore collaboration on IC activities. During the next trainings (in Hanoi), APII will invite participants from PEPFAR provinces.

5.2 Challenges and Solutions

5.2.1 It took longer than expected to develop the subcontract in this area. This is a general observation (subcontracts taking longer to initiate than expected) that will be taken into in future planning and projections.

6. Pandemic Preparedness Planning (PPP)

The goal is to develop PPPs in selected focus provinces, introduce the package in other provinces, and advocate for its wider adoption throughout Vietnam.

During Year 1, Vietnamese Red Cross (VNRC) who is the selected subcontractor for this work, implemented USAID's Humanitarian Pandemic Preparedness (H2P) project with civil society organizations in Ha Nam and Quang Tri. Following this, VNRC started reviewing the status of PPPs in the five focus provinces in collaboration with APII. In Year 2, APII plans to enter an MOU with VNRC to revise, test and finalize improved PPPs for wider replication.

6.1 Achievements

6.1.1 Prepared MOU with VNRC and submitted to VNRC for comments and feedback.

6.1.2 Developed/revised tools and planned for implementing the PPP situation analysis in the provinces.

6.2 Challenges and Solutions

6.2.1 VNRC was occupied with humanitarian and emergency activities (incl. flooding in Central Vietnam) and did not have time/resources to finalize the MOU with APII. As a mass organization under the Fatherland Front, VNRC was furthermore awaiting the outcome of the 11th Party Congress in January 2011 before entering any new commitments. The nature of VNRC's work, including focus on emergency responses, can make it a particular challenge to implement a subcontract with VNRC.

7. Cross-Cutting Issues

Behavior Change Communication (BCC)

The BCC work aims to identify appropriate behaviors and messages for key target audiences and to strengthen the BCC capacity of national and provincial stakeholders. The BCC work feeds into and helps integrate and enhance the work of the other technical components in animal and human health.

7.1 Achievements

7.1.1 Closer integration of BCC activities into animal and human health activities, e.g. in the supply chain work.

7.1.2 Developed the Year 2 BCC Strategy (a living document) based on the results of the Year 1 risk assessment, the risk reduction strategies, and the results of the BCC assessment. The Year 2 strategy focuses on the seasonal BCC campaign and closer integration of BCC work into the animal health and human health components. The strategy was shared with FAO and WHO for technical (i.e. animal/human health) verification and feedback.

7.1.3 Conducted planning workshops with key local stakeholders in four provinces (except Ha Nam) to design Year 2 BCC activities. The workshops provided consensus on the number of desired behaviors and on barriers and motivators, which in turn were used to develop appropriate key messages for target audiences.

7.1.4 Prepared subcontracts for Year 2 BCC activities: Women's Union in Ha Nam, Kien Giang and Quang Tri (i.e. same as in Year 1) and the Provincial Humanity Center under Red Cross in Hung Yen. The subcontractor in Can Tho is to be determined.

7.1.5 Completed BCC TOT trainings for district trainers (representing AH, Animal extension, HH, and communication bodies) in Quang Tri, Can Tho and Ha Nam. The trainings were conducted by provincial Master Trainers.

7.1.6 Designed Year 2 BCC materials (calendar, flipcharts, logo, BCC theme, guidelines for community events, etc.) together with BCC and artwork consultants, and identified vendors for printing and distribution. FAO and WHO were consulted for technical verification.

7.1.7 Pre-tested the above BCC materials in Can Tho (for Southern materials) and Hung Yen (for Northern materials).

7.1.8 Completed the collection of API materials from various sources and passed these on for uploading on the PAHI website.

7.1.9 Engaged national journalists (VTC16), provincial journalists (from Centers for Health Communication and Education/T4g), and local newspaper and TV journalists television on the Animal Health bio-security study tour in Northern and Southern provinces. This resulted in articles and broadcasts.

7.1.10 Developed and shared the Year 2 press relations plan with USAID.

7.1.11 Provided frequent updates/success stories to USAID.

7.2 Challenges and Solutions

7.2.1 Encountered difficulties in finding local subcontractor to implement Year 2 BCC activities in Can Tho. Currently working with CEFACOM (Research Center for Family Health and Community Development), a national NGO based in Hanoi to take on this activity. Subcontract preparation generally takes longer than envisaged.

7.2.2 The BCC Year 2 planning workshop in Ha Nam was cancelled due to the pending MOU renewal in Ha Nam (see also 'Provincial Implementations' section below). The PSA with Ha Nam Women's Union in Year 2 was modified to address this (Note: subcontract modification can be a time-consuming process).

7.2.3 Difficult to get national officers to give technical inputs into project activities such as reviewing BCC materials, as we are constrained in the way we can compensate their efforts. We are working to find suitable ways to bring them on board in close consultation with the F&A team and the Project Director, but the options are limited. This constraint could also affect the production of newsletters with/through NAEC and NCHEC.

Provincial Coordination and Implementation

7.3 Achievements

7.3.1 Signed MOUs for Year 2 with Can Tho, Kien Giang, Quang Tri and Hung Yen provinces. Ha Nam pending due to changes in leadership.

7.3.2 Worked with subcontractors to prepare provincial work plans and conducted provincial planning workshops, with all APII components and local partners fully involved, in Kien Giang, Dec. Can Tho, and Quang Tri (Note: Hung Yen workshop held in early January; Ha Nam to follow – see also 7.4.2 below).

7.3.3 Submitted provincial implementation plans for PCU for approval in Kien Giang, Can Tho and Quang Tri.

7.3.4 Identified and engaged Provincial Coordinators in consultation with counterparts in four provinces (Ha Nam still pending).

7.3.5 Relocated project offices in Can Tho and Quang Tri from within DARDs to privately rented premises, for compliance and easy/equal access by all partners.

7.4 Challenges and Solutions

7.4.1 The contract for the Project Area Manager (North) was terminated by mutual consent due to unsatisfactory performance. The recruitment process for a replacement was initiated. The ideal candidate will be a more senior person with management experience, a proven track record in dealing with provincial counterparts, and prepared to relocate to Ha Nam or travel extensively to the field.

7.4.2 Changes in leadership in Ha Nam meant that no persons were yet assigned as PCU Chair and Vice-Chair. It was therefore not possible to sign the MOU for Year 2 or conduct the Risk Reduction and Year 2 planning workshops in Ha Nam. As a result some activities were temporarily suspended. APII's Deputy Director for Provincial Implementation maintained close dialogue with Ha Nam leaders for a resolution early in 2011.

7.4.3 Close communication between the shared APII-FAO Provincial Coordinators and FAOs Focal Points/Field Coordinators remains a challenge. The APII partners are aware of this and the institutional issues involved, and are looking for ways to improve the situation. The Provincial Coordinators are expected to play a key role in coordination.

7.4.4 Field level coordination at the 'programmatic' level, i.e. across USAID's activities, also remained a challenge. The APII partners are making good efforts to improve the situation including shared review and planning workshops, as well as more joint visits, where feasible, to promote a more programmatic approach.

7.4.5 Provincial budgets and plans for the following fiscal/calendar year are prepared during June-September. This is the time for APII to advocate for allocation of local funds to models and interventions advanced by the project. Staffs, however, are not yet well versed in the local decision-making processes. The project teams will work to better anticipate and prepare for this important period of the year, in order to take advantage of opportunities for sustaining APII work at the local level beyond the lifetime of the project. This includes early preparation for upcoming costing studies.

National Coordination & Policy Dialogue

7.5 Achievements

7.5.1 Developed the APII Advocacy Strategy with inputs from technical teams and others. This 'living document' was shared with USAID and API partners.

7.5.2 Generated a clearer picture (vision) within the APII team of where the project is heading and what achievements (milestones) to target along the way.

7.5.3 The AH team maintained close and frequent contact with FAO in particular, as well as with other relevant initiatives (e.g. VAHIP, STOP AI) for coordination and collaboration on supply chains and related work.

7.5.4 The HH team worked closely with FAO on surveillance, with WHO and MOH on IC activities and provided inputs on an IC assessment at a VAHIP project planning workshop. The HH Team maintains regular communications with partners and has agreed to hold (at least) quarterly meetings on coordination of surveillance activities with FAO.

7.5.5 The BCC team stepped up its dialogue with API partners, during the reporting period. FAO and WHO are now regularly consulted for technical verification on AH and HH related BCC issues. The BCC team also continued to participate actively in the BCC Working Group.

7.6 Challenges and Solutions

7.6.1 Coordination with many partners remains an ongoing challenge. APII will continue to participate actively in and contribute to/enhance the profile of relevant working groups. APII will maintain close interaction with FAO and WHO on technical issues through regular communications/exchanges and meetings, and where feasible through joint activities and events.

7.6.2 Gaining access to decision- and policy-makers is a challenge for an initiative that is often perceived as an 'NGO-effort'. APII will continue to engage closely with API partners and through them in its advocacy work. More active participation in PAHI working groups will also be pursued. Other options such as working with MARD's International Support Group (ISG) will be explored in consultation with USAID.

Monitoring & Evaluation

7.7 Achievements

7.7.1 Recruited the M&E Manager who has settled in well and quickly.

7.7.2 Worked closely with MEASURE and USAID's partners to review and improve the PMP data collection tools (ongoing albeit behind schedule).

7.7.3 Reviewed and updated the project's PMP. Collected and entered data. Developed related databases.

7.7.4 Initiated the drafting of a project Logical Framework, or 'Log-frame', which more clearly links activities and outputs to outcomes and impacts and will help establish the baseline for future results and impact assessments.

7.7.5 Developed detailed guidelines for Activity Implementation Monitoring ('AIM Guidelines') and related tools and shared these with staff, subcontractors and local partners.

7.7.6 Reviewed APII SOWs to help ensure that M&E issues are adequately addressed in all work.

7.7.7 Provided training to field-based Project Area Managers and Provincial Coordinators on M&E with focus on performance monitoring and quality control.

7.8 Challenges and Solutions

7.8.1 The current PMP does not show clearly the causal pathways from inputs to outcomes and impacts and the baseline indicators have not been identified specifically. To solve this, the project is developing a Logical Framework, or 'Log-frame'. Baseline indicators will be identified and included in the Log-frame where possible. However, as the project did not conduct a baseline survey before or during start-up it may be difficult to arrive at a complete baseline. Some reverse engineering (assisted by USAID) may be needed.

7.8.2 The project interventions are diverse and complex. To monitor performance and measure effectiveness of each intervention area requires a range of methods and approaches.

Administration & Finance

7.9 Achievements

7.9.1 Recruited the M&E Manager and a new F&A Assistant in Can Tho. Initiated the recruitment process for a new Strategic Communications Manager (to replace the Policy Advocacy Manager who departed in November), two Supply Chain Managers (for North/Central and for South), an F&A Manager for the Quang Tri Office, a Finance Officer and an IT Officer (the latter is a shared position with the HPI project).

7.9.2 Revised the TOR for Provincial Coordinators in close consultation with FAO and recruited four Provincial Coordinators (except in Ha Nam) for Year 2.

7.9.3 Facilitated that move of two provincial satellite offices (Can Tho, Quang Tri) from DARDs to independent locations in rented premises.

7.9.4 Developed and entered subcontracts with AFAP for AHW/AEW work, CCHIP for CBS work, Hanoi Infection Control Society for IC work, and with provincial Women's Union and Red Cross for BCC activities in four provinces (Can Tho pending). Trained subcontractors on related finance and compliance issues.

7.9.5 Prepared SOWs and entered a number of consultant agreements with national and international short-term consultants.

7.9.6 Revised the project's cost norms (in close consultation with FAO).

7.9.7 Prepared and submitted the Year 1 report to USAID.

7.10 Challenges and Solutions

7.10.1 The project is frequently questioned and challenged by partners, counterparts and subcontractors on its subcontracting mechanism. The Firm Fixed-Price Subcontract, whereby subcontractors are reimbursed on the basis of submission and approval of agreed deliverables is an unfamiliar contract form. Partner agencies have no working capital and are accustomed to working on the basis of fund advances. This, however, is not possible under APII. The issue is causing a significant element of discomfort among subcontractors, despite the fact that PSAs are designed in ways that trigger early releases of significant funds. Project staffs continue to go to great lengths to explain the policies and conditions under which the project is operating in an effort to generate more goodwill and appreciation. The project is succeeding in entering and completing most planned subcontracts so far, albeit often with delays which are due partly to the contracting mechanism.

7.10.2 The project is often facing a limited choice of relatively weak subcontractors. Building capacity in local subcontractors is one of the products of the project, but does cause a slow-down in implementation. Direct implementation (DI) as opposed to working through subcontractors is not a realistic option given the current legal status of APII and the level of staffing. APII is working on a registration with PACCOM to give more scope and flexibility for DI.

7.10.3 Another challenging point is the cost norms. APII is striving towards financial sustainability by keeping activity/field costs comparatively low. The project is repeatedly being compared with other donor-funded initiatives and found by most partners and counterparts to be less flexible and less 'competitive' (e.g. due to the fact the project provides no allowances/salary topping up to government staff). It makes APII a less attractive project in the eyes of local partners and may unfortunately be causing reduced local commitment/ownership. Again, the project staffs expend great efforts to explain the rationale and underlying principles and policies, in an effort to develop greater mutual understanding, acceptance, and commitment. It helps when USAID representatives are present to help clarify with counterparts.

7.10.4 Most subcontractors and consultants find the required biodata forms difficult to complete and the F&A team often has to go through several reiterations before the forms are ready for submission to Abt's HQ.

7.10.5 Delays in higher-level decisions concerning for instance staff salary increases (pending since June 2010) are discouraging and potentially demotivating for staffs.

8. Success Stories

Multi-Sector and Participatory Work Planning in Provinces

During the first quarter of Year 2 APII signed new MOUs with Can Tho, Hung Yen, Kien Giang and Quang Tri provinces and held provincial planning workshops with participation of local public/private stakeholders, subcontractors, and international partners. Multiple sectors were represented including animal health, human health, information/communication, civil society and poultry supply chain actors.

In Year 1 local counterparts had expressed some concern and dissatisfaction with coordination and information sharing. This year's planning workshops marked an effort to improve on these accounts as a prerequisite for more effective implementation and stronger local ownership.

From Kien Giang Annual Planning Workshop, Dec. 2010.

The planning workshops included a review of Year 1 and lessons learnt followed by presentations and discussions of proposed activities in Year 2. The process helped level expectations as to what the project can and cannot provide and generate consensus on the implementation mechanisms and the way forward in Year 2.

The PCU Vice-chair in Quang stressed that "...Each PCU member is responsible to collaborate and provide instruction back to his/her own agency to involve in the assigned component. S/he should review the plan from the subcontractor to provide comments to make the activities more relevant to and meet the needs of the locality. S/he should lead the monitoring work done by all subcontractors in order to ensure the quality and bring effectiveness to the people of Quang Tri in prevention of AI specifically and livestock diseases in general, and to ensure the regulations of the Government of Viet Nam and of Quang Tri are followed...".

In order to maintain close relations between the many actors and agencies involved, it was agreed to hold monthly/bi-monthly meetings with Provincial Coordination Units (PCU) and quarterly meetings involving districts and communes in future.

Subcontractors are expected to join the meetings to which international partners are also invited. The joint FAO-APII Provincial Coordinators are tasked to play a very proactive role in all this together with FAO's Focal Points in the Sub-Departments of Animal Health and APIIs provincial implementation team.

Communes Become Vigilant in Tracking Bird Flu

(Posted on <http://vietnam.usaid.gov/node/272> in Dec. 2010)

USAID is supporting new teams of villagers who, for the first time, are filling a crucial gap in the avian influenza reporting chain that boosts Vietnam's ability to quickly detect and prevent the spread of avian influenza at the grassroots level.

One of them is Nguyen Van Van, who works in Dai Hoa commune in Vietnam's central Quang Tri Province. A veteran village animal health worker with 20 years of veterinary service experience, he is one of nine community based surveillance collaborators in Dai Hao village helping 60 families. Before May 2010,

these village animal health workers worked independently and provided private services to households on vaccination and selling veterinary medicines. Coordinated and trained, they do a better job.

Each month, Van makes two or three visits to up to 160 households, providing animal health services such as poultry vaccination and foot and mouth disease prevention as well as instruction on how villagers can spot abnormal signs in their poultry flocks.

Vietnam is one of the hardest hit countries when it comes to bird flu. Since 2004, they have had to cull 45 million chickens and ducks, most of them early on. Fifty-nine people have died of avian influenza.

Vietnamese authorities moved quickly and effectively to launch mass vaccinations of poultry and have successfully managed the situation so far. It remains vital however, to build up a strong national surveillance systems for early detection and action, starting in communities and extending to the national level.

"There is the gap between the official surveillance system and the surveillance at community level," said Do Huu Dung, Deputy Head of the Epidemiology Division, in the Department of Animal Health, Ministry of Agriculture and Rural Development. "The Vietnamese Government is looking for a relevant community-based surveillance model that fills this gap and has the collaboration between animal health and health sectors."

Van and his colleagues are helping to fill this gap, and villagers increasingly understand their role.

"We actively reported to village animal health workers and human health workers to have immediate solution in order to minimize economic loss then we could be compensated from local authorities," said farmer Le Quan Dinh. "The vet services are helpful. We reported to them (village health animal health worker

Van, right, explains how to recognize abnormal signs in duck. Photo: Nguyen Thanh Dien at USAID's Avian and Pandemic Influenza Initiative.

and health worker) who then came immediately. We strongly believe in this network's capability."

In his first few months' time as a community collaborator, Van has identified more than 15 households, each with five to 10 sick and dead poultry, and reported them to the surveillance network. He also provides services to the neighboring communes.

With the community-based collaborator networks, USAID's Avian and Pandemic Influenza Initiative is developing one of the essential building blocks in Vietnam's national surveillance system. By training and equipping village human health and animal health workers, the project is strengthening the surveillance system from the grassroots with a unique approach that combines human and animal health efforts to fight bird flu and other emerging infectious diseases and pandemic threats.

So far 1,778 collaborators have been trained in five provinces and 123 communes across Vietnam. From July to September 2010, they reported more than 2,218 sick and dead poultry and 1,131 suspected acute respiratory infection cases in humans, many of which may have otherwise gone unreported.

With the recognition of the commune governing People's Committee and radio spots explaining the network, the community is more aware about the collaborators and the services they provide. By 2012, Quang Tri Province will enroll these village animal health workers into the state system and provide a salary to entrench the surveillance network in the communities, where these trained eyes and ears can more effectively stop sick poultry in their tracks.

WHO	World Health Organization

Introduction

This report presents the main achievements, challenges and solutions for USAID's Avian and Pandemic Influenza Initiative during the third quarter of Year 2, April-June 2011.

The report is divided into the following thematic sections:

- 1 Animal Health Worker (AHW) Capacity Building
- 2 Agricultural Extension Worker (AEW) Capacity Building
- 3 Poultry Supply Chain Strengthening
- 4 Community-Based Surveillance (CBS)
- 5 Infection Control / Case Management (IC/CM)
- 6 Pandemic Preparedness Planning (PPP)
- 7 Cross-Cutting Issues
- 8 Success Stories

1. Animal Health Worker (AHW) Capacity Building

The goal is to develop an AHW capacity building package that is adopted by relevant public-private agencies at national and/or provincial levels, and to develop a standard Terms of Reference for AHWs for adoption by Provincial Peoples Committees (PPCs) and the Ministry of Agriculture and Rural Development (MARD).

Year 2 will focus on completing and transferring the training package for wider adoption and on establishing well-functioning networks of capable public and private animal health workers in and beyond project areas. The subcontractors include AFAP on training/capacity building and the Vietnamese Veterinary Association (VVA) on AHW network development and advocacy.

1.1 Achievements

- 1.1.1 Finalized the AHW Training of Trainers (TOT) package for printing including lesson plans, presentations, pre- and post-test questions, visual aids, etc. The package is based firmly on the new training manual issued by the Department of Animal Health (DAH) in 2010.
- 1.1.2 Completed the first round TOTs for 125 provincial trainers in five pilot provinces. 16 trainers were furthermore invited to participate in AHW monthly refresher trainings as a part of a coaching scheme.
- 1.1.3 Held a lessons learned workshop on AHW training curriculum development and training with representatives of Quang Tri-based Agricultural Colleges and Vocational Training Centers and other project provinces' SDAHs. This included discussion on formalization of AHW training and certification. A stronger commitment from other local authorities including Sub-Departments of Labor, Invalids and Social Affairs (which have local funds for career development in vocational training centers) and SDAHs/DARDs is needed to create a joint effort to replicate trainings locally. Next steps to be explored.

- 1.1.4 AHW monthly meetings and refresher trainings were conducted in all 15 pilot districts throughout the quarter. In total more than 30 training sessions have been conducted in 17 districts with about 1000 AHW participants each month.
- 1.1.5 As part of the replication plan, beginning in February, cost shared refresher trainings have been conducted in two districts of Can Tho (Ninh Kieu-Binh Thuy and Cai Rang). APII covered trainer fees and local counterparts covered travel costs. SDAHs have requested additional trainings for non-project districts in Can Tho (3), Hung Yen and Quang Tri (3). Detailed plans and mechanisms for cost sharing were discussed in these three provinces, and we are consulting with USAID on how APII can best facilitate this.
- 1.1.6 As a part of the plan to strengthen AHW networks and share experiences across districts, AFAP staff and the Animal Health technical team facilitated six technical seminars on conducting AHW meetings and defining a "good" veterinary station were held between April and June, in conjunction with the SDAHs. Attendees included representatives from 45 District Veterinary Stations (DVS) and five SDAHs.
- 1.1.7 Signed new subcontract with VVA in late April, focusing on institutional strengthening and AHW network establishment with public and private partners. In early June, VVA shared its first draft "Strategy for Sustainable Development 2011-2015" with provincial SDAHs to get comments and feedback. A review workshop is planned in September in Hanoi.
- 1.1.8 Activities to strengthen the Sub-VVA network at Quang Tri started in May 2011 in three districts. A Handbook for Provincial VVA Network Development will be developed in Q4 including the lesson learns from Quang Tri sub-VVA network implementation.
- 1.1.9 Thirty Mailboxes and Information Desks were provided to all district Veterinary Stations in the five focus provinces to increase information access and sharing within AHW networks

1.2. Challenges and Solutions

- 1.2.1 DAH and SDAH's have no function or division in charge of AHW network development. Staff assigned to this task are often not specialized in such work. This makes it difficult to advocate with SDAH's and DVS for AHW network strengthening. APII invited some DAH staff from Hanoi and Vinh to attend some of the seminars with DVS in Can Tho and Quang Tri but more effort will be needed to pursue this agenda with DAH and SDAH leaders. This includes close collaboration with strategic partners such as FAO and VVA. There is growing recognition of the need for grassroots-based AHW development within the sector.

2. Agricultural Extension Worker (AEW) Capacity Building

The goal is to develop and transfer to the National Agriculture Extension Center (NAEC) and Provincial Agriculture and Fisheries Extension Centers (PAFEC) an AEW bio-security training package for small commercial poultry producers, which has been fully tested, including costing, and verified for wider adoption and replication in the national-provincial extension system.

2.1 Achievements

- 2.1.1 Held a Final Review Workshop of the Biosecurity Training Package (developed in Year 1, and finalized in Year 2 Q1) in April with more than 20 participants from NAEC, the poultry research centers, FAO, VAHPI and ASVELIS. A final version was developed with inputs from Biosecurity Working Group Members and is now ready for printing.
- 2.1.2 Co-hosted a four-day Master Trainer TOT Workshop on Biosecurity for small commercial farmers in April in Hanoi with NAEC for 24 participants from NAEC, DLP, poultry research centers, and PAFECs (10 provinces). The master trainers will conduct diffusion training to increase small commercial farmer's knowledge on biosecurity and good farming practices at farm level.
- 2.1.3 In collaboration with the PAFECs, four TOTs for Farmer Trainers on biosecurity for small commercial farmers were organized in Ha Nam, Hung Yen, Can Tho and Kien Giang with total of 100 participants from district and provincial extension Centers. The training covered updated concepts of bio-security in small scale poultry; means to improve hygiene and reduce risks through good poultry production practices; and basic training skills to provide diffusion training to farmers later on.
- 2.1.4 Five planning workshops were conducted in collaboration with PAFEC to gather information on the need and discuss opportunities study the costs of implementing diffusion biosecurity training.
- 2.1.5 With the support of DLP, Vietnam Poultry Association (VIPA) submitted a proposal for policy/sector workshops on sustainable development and strengthening of the association's network in order to promote biosecurity practices in small poultry commercial farms. In June, APII and FAO met with DLP and VIPA to discuss further. A subcontract is being prepared with VIPA to implement some of these activities.

2.2 Challenges and Solutions

- 2.2.1 Working closely with NAEC/PAFECs is necessary to help institutionalize the training/extension packages. This is a time-consuming process which requires diplomacy, patience and perseverance in order to forge and maintain close relationships with these agencies. However, MARD's strategy may affect NAEC's centralized power and therefore replication of the trainings as well as local funding. An alternative approach needs to be identified which may be more focused on PAFECs and other provincial sources. Will continue to dialogue and explore with MARD/NAEC/PAFECs.

- 2.2.2 VIPA have demonstrated their ability to coordinate with MARD institutions such as DLP, DAH and NAEC. However, detailed plans and agreement need to be discussed before a sub-contract can be developed and signed based on the APII project approach and focus. FAO will be consulted in that process.

3. Poultry Supply Chain Strengthening

The goal is to develop demonstration models in key (high risk) nodes along supply chains, together with related documents (protocols, guidelines, training materials) for wider replication by national and provincial agencies as well as other development projects/programs.

During Year 1 key intervention nodes and lists of priority risk reduction measures were identified together with public and private stakeholders. During the first half of Year 1, to guide the actual, practical risk reduction efforts in market and centralized slaughterhouse, a set of technical protocols (incl. conceptual designs drawings and Bill of Quantities with estimated construction costs) were developed for the related demonstration models. The technical protocols address veterinary public health, hygiene/sanitation, and bio-security/bio-safety issues for animals and humans before and after the nodes, in light of the existing regulatory framework and ongoing efforts in Vietnam.

3.1 Achievements

- 3.1.1 Following the "Provincial Strategy Workshop for Risk Reduction in Supply Chains" in Ha Nam in March (after late signing of MOU), APII and local counterparts undertook field trips to potential demonstration model sites. To leverage the SDAH's recently acquired fund (~120-150,000,000 VND) for veterinary hygiene and public inspection services in Duy Tien's district market and small home-based slaughterhouses, APII and SDAH are now preparing a joint proposal for these nodes as part of APII's demo model development plan.
- 3.1.2 The Dong Ha live/plucked poultry market demo model plans progressed well through frequent visits and intense meetings/ negotiations with key stakeholders. The technical proposal was completed including all technical drawings and bill of quantities.
- 3.1.3 A tripartite Stakeholder Agreement was prepared and is ready for signing by the Dong Ha City Market Management Board, Quang Tri PCU, and APII.
- 3.1.4 Following a request by local authorities, a technical review/ endorsement of the technical drawings by a local agency was processed.
- 3.1.5 Abt's Environmental Compliance Adviser, Mr. Peter Chandonait, visited Dong Ha market and the centralized slaughterhouses in Can Tho and Kien Giang in April and submitted Environmental Assessment Checklists and an updated Environmental Mitigation & Monitoring Plan (EMMP).
- 3.1.6 A second environmental assessment report for Dong Ha market was finalized by a local company as requested by the provincial Department of Environment.

- 3.1.7 An open bidding process for a construction company to implement the poultry market upgrade was initiated and APII is close to signing a contract with the selected company.
- 3.1.8 Drawings were completed for upgrading Ngoc Xuan centralized slaughterhouse in Can Tho. A grant agreement has been drafted and the final proposal is expected in early Q4. APII is happy to report a high level of commitment from the slaughter house owner to implement Circular 14 on inspection.
- 3.1.9 Preparations for a training course for inspectors are under way in coordination with Can Tho SDAH guided by Dr. Yap.
- 3.1.10 Technical drawings, protocols, and bills of quantities were completed for an upgrade of Phu Nong centralized slaughterhouse in Kien Giang. A final draft grant agreement was prepared and shared with stakeholders for comments
- 3.1.11 Economic analyses and preparations of business plans for Dong Ha Market and Phu Nong and Ngoc Xuan centralized slaughterhouses were initiated assisted by Eliot Masters (Agricultural Economist, Abt)
- 3.1.12 A slaughterhouse supply chain mapping/analysis in Kien Giang and Can Tho was undertaken by a local consultant (Nguyen Ngoc Huan). The draft report will be shared at a workshop in Can Tho in July.
- 3.1.13 Paid a visit with USAID to the LIFSAP project and started exploring the possibilities for collaboration and exchange/transfer of demo models. Now that the Technical team has finally arrived (in late June) APII will explore opportunities further.
- 3.1.14 The Supply Chain Manager (North), Mrs. Nguyen Thai Hoa, joined the team on April 4 as a long-term staff.

3.2 Challenges and Solutions

- 3.2.1 While provincial counterparts clearly are very interested in the demo models, most provinces have no 'master plans' that demarcate future locations e.g. for centralized poultry slaughterhouses and markets. In addition, the processes for local authorities to approve construction are very complex, involving multiple stakeholders with reference to different regulations. APII is learning along the way and adjusting accordingly.
- 3.2.2 Circular 14 on inspection, issued by MARD in March 2011, keeps Vietnam moving in the direction of industrialized slaughterhouses. While following this guidance will be a challenge, it is also an opportunity as it will classify slaughterhouses in Vietnam into AB and C classes and provide detailed checklists for inspection. It has also focused the attention of DARD and local authorities on the need to improve veterinary, hygiene, sanitary and food safety standards at slaughterhouses.
- 3.2.3 Similarly, the new Food Safety Law coming into effect in July 2011 will provide a strengthened regulatory framework with all the challenges and opportunities this entails for a project like APII.

- 3.2.4 A key challenge is ensuring sustainability of biological hazard risk reduction measures and the replicability of demo models in other provinces. To this end the project has adopted the following principles:
- Incorporate simple improvements/upgrades with minimal cost. The improvements aim to correct gross errors or implement prioritized measures for preventing or minimizing the risk for transmission and spread of biological hazards (HPAI, EIDs, food-borne pathogens)
 - Ensure sustained interest in biological hazard risk reduction practices by giving full attention to stakeholders' socio-economic interests (i.e. livelihoods and business/entrepreneurship focus).
- 3.2.5 Phu Nong slaughterhouse in Kien Giang recently experienced some specific challenges – namely a decrease in the volume of poultry slaughtered in the past 2-3 months, a seemingly low level of interest and commitment from SDAH to ban home-based slaughterhouses and promote slaughterhouse centralization, and a lack of interest from the slaughterhouse owners in upgrading if the throughput/volume cannot be guaranteed. The technical proposal for needs to be developed further to identify alternative solutions.
- 3.2.6 Discussions/negotiations with ASVELIS on APII support to STOP-AI supply chain activities continued. It looks like a subcontract may be initiated around October 2011.
- 3.2.7 The recruitment/approval process of a Supply Chain Manager (South) is taking longer than expected. A candidate has been identified and awaiting a final reply from Bangkok.

4. Community-based Surveillance (CBS)

The goal of this activity is to complete a CBS package, including training materials/tools, job descriptions, budget, and recommendations for adoption and scale-up in the provincial-national surveillance system. During Year 2 APII set out to: conduct a midterm review of the model; conduct refresher trainings for CBS collaborators including other emerging infectious and zoonotic diseases; connect to the poultry supply chain strengthening efforts by using high risk nodes (smallholder commercial farms, hatcheries, traders, slaughterhouses, markets) for events based surveillance, early warning and responses; gradually phase out support to community-based CBS networks to test their sustainability and potential for scale-up; and conduct a final evaluation (including costing) of the model for wider replication and uptake at provincial and national levels.

4.1 Achievements

- 4.1.1 Provided update and supplemental training courses in Quang Tri and Kien Giang for CBS collaborators who were unable to attend the last update training on EIDs (in Q2).
- 4.1.2 Revised CBS handbooks and raincoats were distributed to CBS collaborators. The revised handbook includes revised reporting forms for quick and convenient reporting of suspected events in animals and humans.

4.1.3 CBS collaborator networks continue to be active – conducting monthly network meetings, and filing rapid reports of suspected cases and monthly reports. Between April and June, the collaborators detected and reported the following incidences at the commune level to be confirmed by district level authorities:

- 0 suspected-AI cases in human
- 3705 ILI cases
- 104: Dengue fever cases
- 15 suspected AI-outbreaks in poultry
- 521 New Castle cases
- 309 Duck Plague cases
- 44 Foot and Mouth disease cases
- 25 Blue Ears cases

Surveillance data from monthly surveillance reports of 246 village collaborator meetings in the 5 provinces was collected, reviewed, and analyzed. Feedback sent to related individuals (PCs, PAMs) and relevant organizations including provincial and district level preventive medicine centers, SDAHs and DVSs.

4.1.4 APII staff visited and awarded the CBS collaborator who first detected the suspected cases in Quang Tri which had been confirmed as an outbreak of bird flu in March.

4.1.5 An updated list of CBS collaborators in the 5 provinces was made available with support from CCHIP. Initial observation from this list indicates an average turn-over rate of 11%, ranging from 4% - 26% depending on the province. In Can Tho there is a 4 % drop-out rate (indicating that the Collaborators are not replaced). More in-depth analysis will be done to inform future activities and prevent high levels of turn over or drop out.

4.1.6 To promote and share lessons learned from APII, abstracts for presentations were accepted at international and national events:

- “Sustaining Community-Based Surveillance (CBS) for early detection and response to Avian Influenza (AI) and Emerging Infectious Diseases (EIDs)” presented by the Technical Director HH/M&E during a round table discussion at the Global Health Council’s 38th Annual International Conference on Global Health: Securing a Healthier Future in a Changing World, June 13-17, 2011 in Washington DC (http://www.globalhealth.org/conference_2011/).
- Two abstracts were accepted for poster presentations at the American Public Health Association (APHA) conference which will be held in September. The papers are shown at the APHA website as the following links:

<http://apha.confex.com/apha/139am/webprogram/Paper242729.html>;
<http://apha.confex.com/apha/139am/webprogram/Paper242716.html>

- Technical Director for HH/M&E participated in and have a presentation on CBS at “THE JOINT DAH-FAO INFORMATION SHARING MEETING”

4.2 Challenges and Solutions

- 4.2.1 CBS diffusion trainings and the BCC campaign occurred at the same time, stretching both APII staff and provincial counterpart staff thin and making it a bit difficult to ensure quality because there was simply not enough time/man power to do all of the monitoring that would be optimal.
- 4.2.2 The turnover rate for CBS collaborators, while fairly low, still required effort to replace staff. This is particularly true for animal health workers in Can Tho. The rate was higher in this case because animal health collaborators less often had veterinary skills, and dropped out more often. However, new replacements were identified and supplement training courses and on-the-job training implemented. We have also implemented a better screening process for Animal Health workers to help mitigate the turnover rate in the future.
- 4.2.3 Including additional EIDs into the reporting forms required the APII team and local provincial health and animal health staff to constantly provide on-the-job training for the collaborators. Once the collaborators became accustomed to the new forms, they have found them user friendly.

5. Infection Control/Case Management (IC/CM)

The goal is to develop an IC/CM ‘model’ with training package/tools, guidelines etc. piloted and tested/verified (including costing), for wider adoption in Vietnam.

In Year 2, IC/CM activities aim to disseminate the APII district level IC model (including training package, tools, and guidelines) and SARI/AI case management guidelines for village, commune and district levels to MOH and provincial authorities beyond the five focus provinces as well as to other development partners, for wider adoption.

5.1 Achievements

- 5.1.1 The plan for infection control (IC) activities at district hospitals and tools for an IC situation analysis were finalized with Hanoi Society of Infection Control (HANSIC) and sent to provincial Department of Health and eight selected district hospitals of the five provinces. The tools will be used for baseline assessments and monitoring compliance during the intervention.
- 5.1.2 IC materials (hand rub gel, liquid hand-wash, surface cleaning liquid, racks for hand rub tube, masks) were distributed to eight district hospitals.
- 5.1.3 Monitoring meetings were held with the IC teams from the five intervention district hospitals, and facilities visited to see how infection control measures were being implemented during the first round of interventions and plans for moving forward discussed.
- 5.1.4 APII’s human health technical director presented a paper titled: *“Infection control situation from 3 districts in Quang Tri: Findings from the rapid*

assessment.” in June at the Infection Control Workshop in Hue which was organized by Hue Infection Control Society.

5.2 Challenges and Solutions

- 5.2.1 Knowledge about, and practice of, infection control measures among healthcare providers, as well as the existence of infrastructure to promote IC interventions in district hospital settings, are still low. IC is often considered to be activities related to cleaning, laundry, disinfection, and waste management as opposed to a public health and hospital management issue. As a result, staffs assigned to IC teams have skill levels below that required of an IC specialist. To address this, the team is working closely with subcontractors and intervention hospitals to provide training, behavior change communication, close monitoring, coaching, and guidance in order to help hospitals fulfill their IC needs according to MOH guidance/Circular No 18.
- 5.2.2 In order to be sustainable and successful, IC interventions must be integrated into and support the hospital’s routine work. Therefore, some planned activities had to be adapted to the real situation at each hospital, in some cases slowing down the process of the intervention.
- 5.2.3 HANSIC has great professional expertise, but lacks some of the coordination, oversight and administration skills needed to handle the contracting process without close support and coach from the team.

6. Pandemic Preparedness Planning (PPP)

The goal is to develop PPPs in selected focus provinces, introduce the package in other provinces, and advocate for its wider adoption throughout Vietnam. In Year 2, APII developed an MOU with VNRC to revise, test and finalize improved PPPs for wider replication.

6.1 Achievements

- 6.1.1 Field data was collected and the PPP situation analysis completed. Synthesized results of the findings will be used for intervention steps.
- 6.1.2 A subcontract for PPP related work was signed with VNRC on June 30 and sent to VNRC for signature. We expect it to be completed early in Q4. The work will focus on Kien Giang province.

6.2 Challenges and Solutions

- 6.2.1 The process for subcontracting with VNRC was slow due to the paperwork and negotiation process.

7. Cross-Cutting Issues

Behavior Change Communication (BCC)

The BCC work aims to identify appropriate behaviors and messages for key target audiences and to strengthen the BCC capacity of national and provincial

stakeholders. It directly feeds into and helps integrate and enhance the work of the other technical components in animal and human health.

7.1 Achievements

- 7.1.1 To prepare manpower for BCC seasonal campaign, more than 100 communicators selected among animal health workers, human health workers and Women's Union members from the commune level of the five provinces were trained on BCC and facilitation skills using a discussion flipchart. These trained communicators were to conduct small group discussion with target audience on desired behaviors promoted during BCC seasonal campaign (hand washing, reporting suspected cases and buying and selling healthy poultry). About 120 facilitators and organizers of Community Events were trained in on facilitation and organizational skills.
- 7.1.2 BCC materials including Northern and Southern flipcharts to facilitate small group discussions, pocket guides to organize and facilitate small group discussion with small and medium poultry producers and community event (Northern and Southern versions), raincoats, T-shirts, pens, and notebooks were produced and distributed.
- 7.1.3 BCC seasonal campaigns were completed in five focus provinces. Activities included:
- distribution of wall calendars addressing three key priority desired behaviors to small and medium poultry producers (S3F);
 - small group discussions with S3F (480 producers in Can Tho, 600 in Kien Giang; 480 in Ha Nam, 480 in Hung Yen, 600 in Quang Tri participated three times in the group discussion) facilitated by trained communicators and
 - 42 community events at commune level (4 Community Events in Can Tho; 12 in Hung Yen; 6 in Ha Nam; 8 in Kien Giang; 12 in Quang Tri) with an estimated 300-500 participants/each community event.
- The BCC seasonal campaigns were completed with a two-day review workshop in each province to determine lessons learned for the upcoming activities and collect comments on BCC materials used during the campaign for refinement. The final workshop was conducted in Can Tho in late June.
- 7.1.4 Provided coaching to BCC provincial trainer teams of Quang Tri, Can Tho and Ha Nam to prepare training plan and materials on communication skills and counseling for all CBS collaborators.
- 7.1.5 Conducted training courses on communication skills and counseling for all CBS collaborators in Quang Tri (more than 300 collaborators) and selected CBS collaborators (around 60 collaborators) in four districts of Can Tho. The trainings were expected to improve CBS collaborators' service delivery skills.
- 7.1.6 Conducted design workshops with provincial BCC trainers, health and animal health officers, and stake holder representatives in Kien Giang in Quang Tri to brainstorm ideas for the design of BCC materials for poultry

slaughterers, slaughterpoint owners, live bird and plucked market vendors, and collectors. Discussion guides are in the development process by the BCC team and consultants.

- 7.1.7 Organized a design workshop to help Can Tho develop its Provincial Integrated Communication Plan. Hosted by Can Tho's PCU, the workshop benefited from multi-sector and multi-level contributions of representatives from MOH, MARD (NAEC, RAHO 7); PAHI, DARD of Bac Ninh province, APII, and representatives of Can Tho Animal Health, Health, Communication Agencies and Can Tho mass-organizations. Participants agreed on the outline, the writing group and the process to get this plan officially approved by the PPCs.
- 7.1.8 Regularly published articles, news on BCC activities implemented in provinces and lessons learned through provincial newspapers.
- 7.1.9 During this reporting period, the KAP survey protocol was developed together with a request for proposals. A research firm, Nielsen, was selected through an open bidding process to undertake KAP survey which will happen in the next quarter.
- 7.1.10 A scope of work was developed with USAID's approval to promote seven selected desired behaviors on hand-washing and environmental sanitation for prevention of AI and EIDs through TV spots in a joint effort with UNICEF, Lien Aid and the Center for Rural Water Supply and Environmental Sanitation (NCERWASS).

7.2 Challenges and Solutions

- 7.2.1 Three-day training courses for small group discussion communicators were proven to only provide communicators with very basic facilitation skills. One-day trainings for Community Event facilitators and organizers were insufficient. We will consider adding more days for participants to role play and practice facilitating discussion using flipcharts to promote desired behaviors. Having training guides on interpersonal communication could be very helpful for provincial trainers to conduct their training.
- 7.2.2 Through the reports of BCC campaign activities and review workshop, we determined that provincial subcontractors need more analytical thinking and writing skills. With hands-on coaching, templates and guidance from BCC team, it was still hard for them to document and show results and achievement during the review workshop. Building capacity for provincial trainers and subcontractors took time and sometimes created tension when trying to make short deadlines.
- 7.2.3 Despite Can Tho having started developing their Provincial Integrated Communication Plan before Ha Nam, it was hard to mobilize support and involvement from representatives of all key provincial agencies to participate in this collective work. We have agreed that the BCC team will work more closely with the writing group and subcontractors and that difficulties or issues will be regularly reported to the PCU to help identify solutions, as needed.
- 7.2.4 The development of the Ha Nam Communication Plan was delayed due to recruitment of a national consultant to support the province and APII in

this work. The BCC team decided to start the work without support from a consultant.

- 7.2.5 Provincial leaders find it difficult to mobilize local resources for AI and EID prevention activities, because of other priorities and the lack of a national plan for AI/EID prevention.
- 7.2.6 Post-training support and monitoring for trained CBS collaborators should be done to ensure participants can contribute more to promotion of AI and EID prevention practices through their daily interaction with households. Experience and issues can be integrated into their monthly CBS network meetings.
- 7.2.7 Provincial BCC trainers had difficulties preparing training plans and materials: The BCC team had to spend a lot of time virtually and physically in the provinces to provide assistance to each training team and each training to ensure quality.
- 7.2.8 Preparation of BCC materials for target supply chain nodes audiences could not begin until prioritized supply chain nodes in the provinces were identified. This led to some delays of BCC integrated activities at nodes which will spill into Year 3.
- 7.2.9 It is harder to collaborate with national level especially with the communication sub-committee of the National Steering Committee for Human Influenza Pandemic Control and Preparedness (NSCHP) and MOH when the risk situation and risk perception are low. National level bodies are more committed and accustomed to responding to outbreaks.

Provincial Coordination and Implementation

7.3 Achievements

- 7.3.1 Field visits were organized for USAID and Abt HQ to visitors:
 - USAID's Communications Adviser attended a community event in Ha Nam province;
 - Kathleen Flanagan (Abt's CEO) and Susan Scribner (Abt Portfolio Manager) visited project activities in Can Tho and Quang Tri provinces.
- 7.3.2 Updates were provided to the PCUs on a monthly basis covering the project implementation plan in order to engage provincial organizations in monitoring, supporting and disseminating project successes.
- 7.3.3 Organized Semi-annual Review Workshops in 5 target provinces that helped strengthen ownership and participation of PCU and provincial counterparts in reviewing project performance and sharing lessons learned from the last eight months in order to improve implementation plan for the second half of the year 2 (Hung Yen - May 20, Kien Giang - May 26, Can Tho - May 27, Quang Tri - June 7 and Ha Nam – June 17).
- 7.3.4 Following current Vietnamese regulations, semi-annual reports on project implementation were prepared for each of 5 provinces and submitted to provincial authorities for their information and monitoring in June.

- 7.3.5 Complied with all requirements for legal operation of the project in provinces (obtained license from Can Tho Department of Planning and Investment.)
- 7.3.6 Organized bi-monthly meetings of PI team (April 14th and May 30th) with all PCs and PAMs from 5 provinces. These regular bi-monthly meetings serve to help provide timely updates on the progress and implementation plans in each province, as well as provide PI staff with technical updates that are necessary for them to monitor and support project activities in the provinces.
- 7.3.7 Maintained close communication with provincial stakeholders for smooth model implementation in the provinces. This helps ensure that: logistic and administration needs are prepared and complied with, technical designs are shared and agreed upon with partners, and sites and participants are identified for model implementation in a timely way.
- 7.3.8 Shared weekly work plans for PCs with FAO.

7.4 Challenges and Solutions

- 7.4.1 A new PC began work in Ha Nam in March 2011. At the beginning of his tenure the PCU members were not receiving timely and informative updates on the project implementation, limiting PCU participation. This problem was discussed at the semi-annual review workshop (June 17th), and the PC has committed to prioritizing the provision of timely updates to the PCU with monthly reports and plans.
- 7.4.2 The rice harvesting season in June constrained implementation of activities in the field, because most provincial partners are from the agriculture sector and were focused on the harvest.
- 7.4.3 The National Election on May 22nd also delayed community activities..
- 7.4.4 General comments from review workshops showed that: after nearly eight months of implementation, about 2/3 of Year 2 activities had been completed according to plan, however disbursement had reached only 55% of the provincial budget. This indicates high pressure for the next quarter.

National Coordination & Policy Dialogue

7.5 Achievements

- 7.5.1 The AH team maintained close contact with FAO in particular, as well as with other partners (VAHIP, LIFSAP, ASVELIS) for coordination and collaboration on supply chains and related work. VAHIP and LIFSAP have indicated interest in our supply chain demo models. Need to follow up with both. LIFSAP Technical Consultants arrived in-country in June.
- 7.5.2 The AH team finalized the bio-security training package in close collaboration with NAEC, PAFECs and Bio-security Working Group members.
- 7.5.3 The AH team maintained close dialogue with DAH on the development of an improved training package for AHWs/Vets.

- 7.5.4 The AH team continued to work on new relationships with province based agricultural colleges/universities and vocational training centers for formal training and certification of local AHWs, in collaboration with SDAHs who will certify grassroots level AHWs.
- 7.5.5 The HH team continued to work closely with FAO on surveillance.
- 7.5.6 The HH team continued to work closely with WHO and MOH on IC activities.
- 7.5.7 The HH team stepped up the efforts to enter a contract with VNRC on PPP work.
- 7.5.8 The BCC team stepped up its dialogue with API partners and BCC working group members, incl. the sub-committee on communications under MOH.
- 7.5.9 The BCC team worked with DAH, NAEC, NCHCE, the Sub-Committee on Communication (MOH), FAO, WHO and PAHI to promote a 'One Health' approach in A/EID prevention reflected e.g. in the Integrated Communication Plans being developed with Can Tho and Ha Nam provinces.
- 7.5.10 The BCC team maintained close contact with provincial mass-media including provincial radio, TV and journal and tracked their articles routinely.
- 7.5.11 It is now becoming standard routine across all three technical teams to consult with FAO and WHO for technical verification on AH, HH related issues.
- 7.5.12 The PI team kept FAO well informed of provincial plans and the weekly activity schedules of the joint PCs.

7.6 Challenges and Solutions

- 7.6.1 Coordination with multiple partners and gaining access to decision-makers remains a challenge, not least due to the prevailing perception of Abt being an NGO, but APII is benefiting from personal networks, collaboration with FAO and WHO, close contact with the USAID mission, and growing awareness and recognition of its work. Options such as working with MARD's International Support Group need to be explored in consultation with USAID.
- 7.6.2 The fact that some of FAOs international staffs are leaving in the coming months may pose a new challenge to the coordination. APII will maintain close contact with the FAO office on the way forward.

Monitoring & Evaluation

APII's M&E work aims to strengthen existing systems in the provinces, and help close existing gaps between grassroots level M&E and provincial-national levels M&E and reporting. In addition, APII acts as the repository for PMP indicators collected under USAID's API initiatives, providing analysis and reporting on this data.

7.7 Achievements

- 7.7.1 APII compiled USAID's PMP data submitted by FAO and WHO for Year 1 and by FAO and APII for the first six months of Year 2. The process of data collection, compilation and analysis helped review the PMP and identify issues related to indicators' relevance, operational definition, means of verification, data validity, availability and accessibility and data collection mechanism.
- 7.7.2 On behalf of USAID/Vietnam, APII organized "USAID Vietnam's HPAI and EPT PMP Data Collection Review" workshop in May attended by 39 representatives from USAID, USAID's partners, PAHI and local partners. In this workshop results of data compilation and analysis were presented.
- 7.7.3 APII released an RFP for bidders on a post-training assessment.
- 7.7.4 Data for APII performance monitoring was collected regularly and updated into the Project's Log-frame per annex. Training related documents and data are being compiled and centralized systematically which will be useful for desk review in the upcoming post-training assessment and retrieving in future.
- 7.7.5 Quality assurance related measures were promoted. As one such measure, the M&E Manager joined with different teams to monitor and strengthen quality of activity implementation in the field through providing technical assistance and coaching to local partners (for example, BCC trainers and CBS collaborators) on-site. Through these trips, quality related issues, as well as capacity building needs for local partners, were identified and feedback provided immediately to the project management. Additional tools such as a trainer's assessment and quality assurance tools were introduced. In parallel, AIM (activity implementation monitoring) reports/checklists submitted by local partners and project staff were compiled and analyzed bi-monthly. Various valuable findings related to activity quality, performance and capacity of sub-contractors, local partners, local trainers and project implementers at grass root level cross components were obtained.
- 7.7.6 An M&E mini-framework for the live bird market in Quang Tri province was assessed, with collaboration between the M&E and AH teams.

7.8 Challenges and Solutions

- 7.8.1 The workshop on USAID/Vietnam's HPAI and EPT PMP Data Collection identified the following issues:
- A number of PMP indicators still have unclear operational definition and/or lack of alignment with the Government's existing record keeping system. These issues were discussed during the USAID's PMP workshop for PMP review and revision.
 - Quality of collected data has weaknesses such as limited data validity/reliability and precision, especially of the indicators on local training.

- Data collection process has issues related to difficult coordination among many facilities, inconvenient data collection template, and limited access to data source, especially of those data on local training/interventions.

- Linkage between the PMP and current existing government's record keeping system and usefulness of each PMP indicator for the local program management are not very clear, especially to the local partners.

Efforts need to be made to address these issues in order to collect valid data that will be useful for preventing and controlling HPAI and EPT across sectors, organizations, and funders/donors. This will require not only micro-level measures such as tool improvement and training for local partners on indicators and data collection but also at the macro-level such as participatory multi-sector approaches, enhancing management and coordination of information systems, and promoting data use for decision making.

7.8.2 Baseline data for certain indicators in the project's log-frame are not available. The situation analysis report produced in AI Mekong project and previous KAP surveys did not always align with these indicators. Proxy indicators will be used if possible, in the process of establishing (retroactively) the general baseline for APII.

7.8.3 Quality of activities is effected by various factors such as subcontractor's performance, commitment of local partners, technical assistance and coaching by technical teams, capacity of project implementers in local areas (e.g. local trainers/CBS collaborators) and even the nature of the system (e.g. human health vs. animal health). Due to this, issues related to quality vary across provinces and components. This requires constant attention, efforts and tailored solutions, including continuous and advanced training for local partners. In turn quality improvement and sustainability are long-term processes.

Administration & Finance

7.9 Achievements

7.9.1 Recruited Admin Manager. Ms. Nguyen Minh Son.

7.9.2 Recruited Strategic Communications Manager (in lieu of Policy Advocacy Manager), Ms. Tran Thanh Binh.

7.9.3 Recruited Supply Chain Manager (North), Ms. Nguyen Thai Hoa. Supply Chain Manager (South) is pending USAID approval.

7.9.4 Mentored and trained new F&A Assistants in field offices.

7.9.5 Managed all subcontracts and consultant agreements.

7.10 Challenges and Solutions:

7.10.1 Lengthy approval procedures for consultants and new staff following the new directions. Affects implementation.

7.10.2 Completion of the biodata form continues to be a challenge for most consultants despite repeat trainings and guidance by the F&A team.

causing delays. Disclosing salary information is sometimes counter-cultural. The F&A team will continue and where necessary step up the guidance.

- 7.10.3 Unfamiliarity with the subcontracting concept, formats and procedures causing delays. The fact that there is no Vietnamese version of the contract (only signed in English) is met with some reluctance. Low capacity among some subcontractors adds to the challenge.
- 7.10.4 The market for animal health consultants is limited. Many potential candidates are Government staffs, who 1) require leave without pay letters which can be difficult to obtain, and 2) typically have a history of low government salary making it difficult for the project to justify hiring them on a competitive market-based salaries. Some consultants are declining for these reasons.
- 7.10.5 The challenge with BCC and human health consultants on the other hand is that they often have a salary history that places them above the USAID threshold level, requiring separate approval.
- 7.10.6 Many counterparts continue to consider APII cost norms to be too low and inflexible, when comparing us with other donor funded interventions. This regularly causes complaints and frictions.
- 7.10.7 We did not obtain a license with Paccom, due to the fact that Abt is a for-profit entity rather than an NGO. Alternatives are now being considered by Abt headquarters.
- 7.10.8 According to Ernst & Young, APII cannot obtain VAT exempt status on locally procured goods and services. This was communicated to USAID.

8. Success Stories

8.1 Innovative and User-friendly BCC Materials Help Communicators Share Information about AI and EIDs

Communicators facilitate a small group discussion with flipcharts.

Based on the results of the API BCC Campaign Assessment conducted during the summer of 2010, as well as inputs from local government officials, the project developed and carefully pre-tested a set of BCC materials for the 2010-11 campaign. These materials included wall

calendars for small and medium scale poultry producers, flip charts and

how-to guides for small group discussions, how-to guides for facilitating and organizing community events, as well as promotional materials including raincoats, t-shirts, pens and notebooks highlighting the BCC campaign's theme "Healthy Poultry Benefits the Family and the People" and encouraging the three "good behaviors": hand washing, reporting sick or dead poultry and buying and selling only healthy poultry.

To educate and promote the good behaviors among all actors of the poultry supply chain who are at risk of exposure to HPAI and other emerging infectious diseases, and who at the same time are also well-positioned to help prevent disease transmission, the project recruits and trains BCC trainers and communicators. While animal health, human health and communication officers have been tasked with these type activities in the past, most have not had sufficient job aids and support documents to assist them previously. In the final assessment of the BCC Campaign review, the communicators praised the usefulness and uniqueness of the materials. In particular they found the step-by-step instructions for implementing activities and inputs on preparing for logistical needs and even decorations for the events very innovative and helpful. In addition they noted that the flip charts and wall calendars were user-friendly and that the color images were very attractive. For example, it was stated that villagers generally receive leaflets that get thrown away, however, the APII wall calendar is more practical and sustainable, sharing motivating messages with the target audience every time they check the date.

The BCC materials' usefulness has also allowed the messages to go beyond the originally targeted audience. Mr. Nguyen Van Son, a teacher in the Thuy Lieu Secondary school, Go Quao district, in Kien Giang saw a communicator using a flipchart for a small group discussion. He was impressed by the ease of use, and the messaging in the flip chart, and asked for permission to use the materials with his students during extra-curricular activities.

8.2 Integrated Follow-up after Small Group Discussions helps promote changes in behavior in addition to increase awareness about Risk Reduction for AI/EIDs

The BCC Campaign Assessment conducted during the summer of 2010 confirmed that while awareness about AI prevention has improved, low risk perception prevails. In an attempt to improve changes in prevention behaviors, not just awareness, the 2010-11 Seasonal BCC Campaign focused on addressing behavior change determinants for our key target audiences related to their uptake of AI/EID prevention practices by emphasizing the potential benefits to their livelihoods from risk-reduction actions.

As a means to do this, the project trained Communicators to facilitate small group discussions and to promote behavior change through inter-personal communication with small and medium sized commercial poultry producers and farmers. Over a six to seven week period each group of producers/farmers were invited to participate in three discussion sessions at which barriers and motivators for the use of risk-reduction practices were discussed. Each session focused on a specific behavior or risk reduction measure that the farmers should use on their farms. The Communicators then conducted follow-up observation visits to 10-30% of attendees. During these visits they used a checklist of promoted behaviors to see if participants had understood the lessons taught during the small group discussions, and that they were also changing their practices. They then discussed in detail the barriers that the farmers encounter when trying to apply risk reduction practices and brainstormed ways to overcome and address these barriers.

During the follow-up visits, Communicators often had opportunities to directly observe the farmers washing their hands, one very basic risk reduction practice. Follow-up visits confirmed that 75-90% of households visited are washing their hands after contact with poultry, and many are also encouraging their family and neighbors to do so as well (20-60%). Unfortunately, because of the limited time available for, and the timing of follow-up visits, Communicators were unable to actually observe other risk reduction practices (reporting sick or dead poultry to CBS collaborators and only buying or selling only healthy poultry). The upcoming APII KAP study will provide additional information on the behavior changes.

Many of the Communicators trained this year are also CBS Collaborators. As CBS Collaborators, these particular Communicators will have additional opportunities to observe reporting of sick or dead poultry, and to follow-up with small group discussion attendees. By training CBS Collaborators in BCC skills we have increased the opportunities for informal follow-up and enhanced local skills and capacity for promoting risk reduction behaviors while conducting surveillance in the communities.

A small commercial farmer washes her hands after touching chickens during a follow-up visit.

Executive Summary

This report presents the main activities, achievements, challenges and solutions for USAID's Avian and Pandemic Influenza Initiative (APII) during the first six months of Year 2, October 2010 – March 2011.

Overall the project is making good progress in most areas. While the emphasis is still very much on developing 'field' level models, the focus is gradually beginning to shift towards exploring mechanisms for adoption and replication and influencing planners/decision-makers to sustain the efforts beyond the project's lifetime.

Most activities are being outsourced to subcontractors with APII technical teams guiding and providing quality assurance, supported by short-term experts. The restricted choice of subcontracting modalities remains a challenge however, and combined with the challenges in finding good consultants and often longer than expected preparation and approval processes this is resulting in some delays. The innovative nature of the work also means that predicting and adhering to (optimistic) plans, timeframes and targets often remains difficult. Below is a status summary of the main thematic areas.

Animal Health Worker (AHW) Capacity Building: through the AFAP subcontract and in close dialogue with Department of Animal Health (DAH) and Sub-Departments of Animal Health (SDAHs), APII is finalizing an improved training package, based on DAH's 2010 manual for training of AHWs. Opportunities for formal training and certification of AHWs by provincial Agricultural Colleges/Universities and Vocational Training Centers and licensing by SDAHs are now being explored.

Agricultural Extension Worker (AEW) Capacity Building: together with the National Agricultural Extension Centre (NAEC) and provincial extension centers APII is in the process of finalizing an AEW training package on improved farm-level bio-security to be applied in the five focus provinces and beyond.

Poultry Supply Chains Strengthening: three high risk nodes have been identified for development of demonstration models incl. the poultry market in Dong Ha City, Quang Tri and two centralized slaughterhouses in Kien Giang and Can Tho. Conceptual designs for physical upgrades/construction are nearly ready for approval and tendering. Technical protocols for guiding and monitoring operations have been prepared. The development of training programs for key public and private stakeholders has begun. On top of this, APII is negotiating with ASVELIS to support continuation of USAID's STOP AI work under new a subcontract.

Community-Based Surveillance (CBS): this period we moved the CBS model to an events-based surveillance model covering HPAI, Influenza-like Illnesses, Dengue Fever, Cholera, and Newcastle Disease in chickens, Plague in ducks, Porcine Reproductive and Respiratory Syndrome (PRRS or 'blue ears) in pigs, and Foot and Mouth Disease (FMD) in livestock. Rapidly nearing the time for testing to what extent/how the model can be sustained without APII support. A suspected Highly Pathogenic Avian Influenza (HPAI) outbreak was reported by a CBS collaborator and subsequently confirmed in Quang Tri.

Infection Control/Case Management (IC/CM): APII completed a series of training courses with HCMC and Hanoi Infection Control Societies (subcontractors) and are now in the process of planning for roll-out at district and commune levels. In addition we forged a new partnership with PEPFAR, which may lead to the adoption of improved IC/CM practices beyond APII's focus provinces.

Pandemic Preparedness Planning (PPP): the completion of a subcontract with VNRC was delayed due to VNRC's disaster relief commitments (e.g. flooding in central Vietnam) and other events. The subcontract is expected to be signed in April, some months behind schedule. A PPP situation analysis was prepared in the meantime by an independent consultant.

Cross-Cutting Issues: the Year 2 BCC strategy with key messages was developed in close consultation with provinces and other key partners and preparations were made for the BCC campaigns in May-June. This included development of materials, implementation of TOT followed by diffusion training, and working with media. In addition we started work on communication guidelines in consultation with FAO for Can Tho and Ha Nam. The 'One Health' Newsletter work with communication agencies in the Ministry of Health (MOH) and Ministry of Agriculture and Rural Development (MARD) is behind schedule in part due to challenges in engaging with and remunerating government officials and in part due to a temporary staffing gap on the BCC team. Lastly, we initiated Knowledge, Attitudes and Practices (KAP) survey preparations.

APII signed new memoranda of understanding (MOUs) with all five focus provinces; facilitated by the Provincial Implementation Team (Ha Nam was delayed due to leadership changes). Provincial Coordinators with joint APII-FAO terms of reference and responsibilities were engaged. The two satellite offices in Can Tho and Quang Tri shifted location from within DARDs to independent premises with easier access for all partners, public and private alike. The relationships with key provincial stakeholders remain good, although complaints regarding the 'strict' cost norms and the fact that APII does not provide allowances to government offices remain a sore point.

The M&E work is now progressing well with the M&E Manager on board since November. A Log-Frame for the whole of APII is being prepared and will capture PMP indicators. Some of the activities on APII, such as the supply chain work, which address broader economic and livelihoods issues are not easily captured within the PMP framework and require development of separate "mini Log-Frames."

The F&A team was strengthened considerably with two F&A Assistants on board in the two satellite offices and a new Administrative Manager scheduled to join the team in April. This should help ease some of the constraints around the management of subcontracts and consultants.

1. AHW Capacity Building

The goal of this component is to develop an AHW capacity building package that is adopted by relevant public-private agencies at national and/or provincial levels, and to develop a standard Terms of Reference for AHWs for adoption by Provincial People's Committees (PPCs) and MARD.

Year 2 focuses on completing and transferring the training package for wider adoption and on establishing well-functioning networks of capable public and private animal health workers in and beyond project areas. The subcontractors include AFAP for training and capacity building and Vietnam Veterinary Association (VVA) for AHW network development and advocacy.

1.1 Achievements

- 1.1.1 The Year 1 subcontract with AFAP was extended through November, 2010 and APII initiated a new/modified contract for Year 2 in December, 2010. With a new Country Director and field staff on board, AFAP has strengthened its in-country team. AFAP is now engaging more closely with provincial counterparts, notably the SDAHs and Provincial Agriculture and Fishery Extension Centres (PAFECs) through lessons learned meetings, technical seminars, planning workshops, and Provincial Coordination Unit (PCU) meetings, etc.
- 1.1.2 The AHW Training of Trainers (TOT) package, which is based firmly on the training manual issued by DAH in 2010, was updated. Additional modules on bio-security, basic surveillance and zoonotic diseases emphasizing participatory training and learning by doing were developed together with SDAHs and local consultants. The materials were shared with DAH and are scheduled for final review in April, 2011.
- 1.1.3 Tested the TOT package in Quang Tri through a 30-days training course for 25 AHWs (all participants did received certificates co-signed by the Director of SDAH).
- 1.1.4 The first TOT for provincial trainers is being prepared for April 2011 for the five focus provinces plus 3-5 additional provinces.
- 1.1.5 Began discussions with Agricultural Colleges and Vocational Training Centers to develop a formal AHW training and certification (while Sub-DAH can issue AHW licenses). Quang Tri may spearhead this process.
- 1.1.6 AHW monthly meetings and refresher training courses were conducted in all 15 pilot districts. Topics included bio-security and good husbandry practices, disease surveillance and common poultry diseases such as Duck Plague, Duck Hepatitis, Newcastle, etc. From February, AFAP began testing a more cost effective for refresher trainings model in two districts in Can Tho province. In this model, APII provides no allowances for participants, only trainers' fees, room rental and stationery/materials support.

- 1.1.7 To strengthen AHW networks, three technical seminars were conducted with SDAHs, on 'How to manage a good AHW meeting' Similar Seminars will take place every two months in all 5 provinces.
 - 1.1.8 A scope of work (SOW) and a Professional Services Agreement (PSA) were developed for a new subcontract with VVA to continue their work on institutional strengthening and AHW network establishment with public and private partners. This is expected to commence in April 2011.
- 1.2 Challenges and Solutions
- 1.2.1 The subcontracts with AFAP and VVA are running behind schedule due to staffing and consultant recruitment/approval issues. The APII team will continue to work very closely with both subcontractors in order to minimize any further delays.
 - 1.2.2 DAH and SDAH's do not currently have a designated function or division/department in charge of AHW network development. Where vet staff are assigned to this oversee this task, they typically do not have a background or training in institutional development. This makes it difficult to advocate with SDAH's and District Veterinary Stations on AHW network strengthening. APII will continue to work with DAH/SDAH leaders, in close collaboration with key partners such as FAO and VVA, to address this issue. Happily, there is growing recognition of the need for grassroots-based AHW development throughout the national-provincial animal health system.

2. Agricultural Extension Worker (AEW) Capacity Building

The goal is to develop an AEW bio-security training package for small commercial poultry producers, which has been fully tested (including costing), verified and transferred to NAEC and PAFECs for wider adoption and replication within the national-provincial extension system.

2.1 Achievements

- 2.1.1 The AEW bio-security training package was drafted in Year 1. During Q1 of Year 2 drawings, visual aids, flipcharts, and comic stories were completed by NAEC consultants and artists. A technical review workshop was held in January, 2011 in HCMC followed by field testing in March. A second review workshop is planned for April followed by a TOT for Master Trainers in collaboration with NAEC and members of the Bio-security Working Group in preparation for eventual dissemination by the NAEC/PAFEC system.

2.2 Challenges and Solutions

- 2.2.1 Each region has different traditions and habits in poultry production and a training/extension package should reflect this. APII has prepared separate materials on chicken production for the north and

duck production for the south which need careful field testing for effective promotion of good husbandry practices.

- 2.2.2 We are slightly behind schedule in developing the training materials. Working closely with NAEC/PAFECs to help 'institutionalize' the training/extension packages is a time-consuming process which requires diplomacy and patience in order to forge and maintain close relationships with these key partner.

3. Poultry Supply Chain Strengthening

We aim to develop demonstration models in key (high risk) nodes along supply chains, as well as related documents (protocols, guidelines, training materials) for wider replication by national/ provincial agencies and other development projects/programs.

During Year 1 key intervention nodes and lists of priority risk reduction measures and public/private stakeholders were identified. To guide the actual, practical risk reduction efforts in each node, demonstration models will be developed in Year 2. Aside from physical upgrades of facilities this includes development of technical protocols on veterinary public health, hygiene/sanitation, and bio-security/bio-safety and related training of public and private partners.

The project also plans to provide support to the continuation of STOP AI supply chain work.

3.1 Achievements

- 3.1.1 Completed Risk Reduction Strategy Workshops with public and private partners and identified key intervention nodes (model demonstration sites) in the main poultry supply chains of all five provinces. The workshops were planned and conducted with FAO inputs. The workshop in Ha Nam was delayed till March due to late signature of an MOU.
- 3.1.2 Made multiple site visits to centralized slaughterhouses in Can Tho and Kien Giang, home-based slaughter points in Quang Tri, live bird/poultry meat markets in Quang Tri and Ha Nam, and poultry shops/restaurants in Hung Yen for verification of demo sites, and discussions of interventions including financing. A local architect and the international bio-security consultant provided significant inputs.
- 3.1.3 Prepared draft conceptual drawings and technical protocols for two centralized slaughterhouses (Can Tho, Kien Giang) and the live bird/poultry meat market in Dong Ha (Quang Tri) and shared with all partners on several occasions (including a large technical workshop in December 2010 with DAH, DLP, FAO, VAHIP, and ASVELIS). VAHIP and LIFSAP have expressed interest in adopting some of the protocol work.
- 3.1.4 Prepared final proposals for upgrading the poultry section of Dong Ha market (Quang Tri) and two centralized slaughterhouses in Kien

Giang and Can Tho with complete technical drawings and bills of quantities in close consultation with key local counterparts and partners (public and private). Drafted Stakeholder Agreements. The proposals are almost ready for tender/bidding by local construction companies.

- 3.1.5 Initiated development of a risk reduction training program for supply chain actors.
- 3.1.6 Prepared for environmental assessments for the demonstration sites.
- 3.1.7 Held frequent meetings with FAO and developed a 'collaboration matrix' (a living document) for the supply chain work.

3.2 Challenges and Solutions

- 3.2.1 While provincial counterparts are clearly very interested in the demonstration models, most have no 'master plan' that clearly demarcates future locations of centralized poultry slaughterhouses and poultry markets. In addition to this we are finding/learning that approval and screening procedures for construction work are very complex, involve many agencies and must take into account many regulations. The fact that the regulatory framework is fragmented and emerging poses an additional challenge.

For instance in Can Tho, following several rounds of discussions with the PCU and SDAH over the past few months, the final decision on where to locate the demonstration unit is still pending due to inter-agency disagreement. Similarly, in Dong Ha, after several meetings and conversations, it is still not clear whether an environmental report is required by local authorities before commencing any upgrade work in the market.

- 3.2.2 APII is working on a subcontract with ASVELIS to continue the STOP AI work with APII support. Developing the PSA is taking longer than expected because of prolonged negotiations over rates and fees.

4. Community-Based Surveillance (CBS)

We intend to complete a CBS package with training materials/tools, job descriptions, budget, and recommendations for adoption and scale-up into the provincial/national surveillance system for both the human and animal health sectors.

During Year 2 the project is continuing to maintain CBS networks, will conduct a mid-term review, is supporting refresher trainings for collaborator to include additional emerging infectious and zoonotic diseases, and integrate into the poultry supply chain strengthening efforts by using high risk nodes (smallholder commercial farms, hatcheries, traders, slaughterhouses, markets) for events based surveillance and early warning/responses. The mid-term review will inform any efforts to advocate for wider replication and uptake at provincial and national levels.

4.1 Achievements

- 4.1.1 Continued maintenance of CBS collaborator networks in 123 communes in 18 districts in the five focus provinces from October to December 2010 with monthly network meetings, rapid reports of suspected cases and monthly reports, exchanging surveillance information between human health and animal health at grassroots level. From October to December, collaborators reported 2545 suspected cases in humans and 9334 in poultry. However, all no AI outbreaks were confirmed.
- 4.1.2 Subcontracted the Centre for Community Health and Injury Prevention (CCHIP) to implement IC/CM field work in 2011 guided by the Human Health team.
- 4.1.3 Held frequent update meetings with FAO on CBS implementation in an effort to collaborate and coordinate technical effort. Continued effort to ensure a mutual understanding of surveillance efforts is needed.
- 4.1.4 Conducted CBS mid-term review in four provinces (Quang Tri, Kien Giang, Can Tho and Hung Yen). The review found that the model contributes to increasing the 'sensitivity' of the surveillance system, i.e. its ability to detect and convey useful information. Collaborators reported 4,936 AI suspected cases in humans and 11,452 in poultry. Our grassroots partners appreciate the approach and have appropriately taken on their new roles and responsibilities. General public awareness has increased, and collaborators are being credited for their efforts and gaining more trust of the community as effective service providers. While the model builds on existing human resources, important challenges remain in terms of developing closer collaboration between the human and animal health sectors, and institutionalizing the model (including funding through local resources.) In the new near future, we will continue our efforts to develop an events-based approach which includes AI and other important EIDs, and turn our attention towards advocacy and policy dialogue.
- 4.1.5 Held review/planning workshops in the focus provinces to present the CBS mid-term review findings and recommendations for the next phase of the CBS intervention. The project secured agreement from provincial health and animal health counterparts to expand the CBS model to an events-based surveillance system, including other EIDs.
- 4.1.6 Explored the possibility of expansion of CBS work through Quang Tri Village Health Worker Association reaching out to all villages in Quang Tri province. The Association sent two participants to the CBS TOT training in Hanoi in February with their own funding.
- 4.1.7 Held advanced TOT course in Hanoi, February 14-15, 2011 for 21 participants from provincial Preventive Medicine Centers, SDAHs, and Quang Tri Village Health Association. The course covered training skills, AI, EIDs and events-based surveillance skills for HPAI, Influenza-like Illnesses, Dengue Fever, Cholera, Newcastle

Disease in chicken, Duck Plague, PRRS ('blue ears) in pigs, and Foot and Mouth Disease (FMD) in livestock.

- 4.1.8 This was followed by 62 diffusion/roll-out courses around March, for more than 2000 commune health providers, AHWs and collaborators in all 123 project communes. AFAP trained AHWs and Collaborators (village health workers) associated with our CBS work in veterinary skills/techniques and disease therapies.
- 4.1.9 CBS handbook for collaborators was reviewed and updated with EID surveillance information. . The handbook will be distributed in April.
- 4.1.10 A suspected HPAI outbreak was detected and reported in a household in Hoi Yen village, Hai Que commune, Hai Lang district, Quang Tri by an animal health collaborator – Mr. Do Van Hung. The case was confirmed as an HPAI outbreak in early March (see story in Section 8).
- 4.1.11 The abstract "*Sustaining Community-Based Surveillance (CBS) for early detection and response to Avian Influenza (AI) and Emerging Infectious Diseases (EIDs)*" was accepted for the Global Health Council's 38th Annual International Conference "Securing a Healthier Future in a Changing World", June 13-17, 2011 in Washington DC. This is a great opportunity for APII to present its work to a wider, international audience.

4.2 Challenges and Solutions

- 4.2.1 The Provincial Red Cross was initially supposed to subcontract many of these activities. However, due to a lack of human resources with appropriate surveillance experience, the CCHIP was identified to take their place in late 2010.
- 4.2.2 We had a turnover rate of 5% among collaborators, mainly in animal health. Replacements were identified and updated right away through on-the-job training.

5. Infection Control/Case Management (IC/CM)

The goal is to develop an IC/CM 'model' with training package/tools, guidelines etc. which can be piloted and tested/verified (including costing), for wider adoption.

In year 2, the aim is to assist the MOH, provincial authorities and other development partners in disseminating the district level IC model and SARI/AI CM guidelines at village, commune and district levels beyond the five focus provinces.

5.1 Achievements

- 5.1.1 Subcontracted Hanoi Society on Infection Control (HANSIC) to implement field activities guided by the Human Health team.
- 5.1.2 Completed two four-day training courses for IC assurance teams and their networks in Kien Giang and Can Tho on: 1) implementing adapted IC protocols/ guidelines in district hospitals and commune

health stations; 2) IC surveillance; and (3) IC principles and standard precautions. Fifty-four local health staff participated.

- 5.1.3 Completed eight two-day training courses on basic IC/CM principles and compliance for 244 district health staff (79 male, 165 female).
 - 5.1.4 Completed four one-day training courses on basic IC/CM principles and compliance for 114 commune and village health workers (59 male, 55 female).
 - 5.1.5 Met with PEPFAR to explore collaboration on IC activities.
 - 5.1.6 Held an IC TOT course with participation of 20 human health providers from nine district and provincial hospitals, plus two representatives from DOD/PEPFAR's and USAID's partners.
 - 5.1.7 Two private companies committed to provide medical masks, PPEs, alcohol hand rubs for all IC training activities at district hospitals organized by HANSIC.
 - 5.1.8 Planned for IC model roll out in eight district hospitals of five provinces.
 - 5.1.9 Participated in the Healthcare Acquired Infection Surveillance workshop by WHO/MOH. This brought direction to implementing IC activities
 - 5.1.10 Participated in the IC and Pandemic Management in Hospitals workshop and the IC Circular Implementation review workshop to participate in the development of a Master Plan on IC for 2011-2015 funded by DOD/PEPFAR.
- 5.2 Challenges and Solutions
- 5.2.1 HANSIC is somewhat short of human resources and not familiar with the type of contract APII can offer (Firm Fixed Price PSA). The team has had to work closely with them to support.

6. Pandemic Preparedness Planning (PPP)

The goal is to develop PPPs in the selected focus provinces, introduce the package in other provinces, and advocate for wider adoption throughout Vietnam.

During the first project year, Vietnamese Red Cross (VNRC) implemented USAID's Humanitarian Pandemic Preparedness (H2P) project with civil society organizations in Ha Nam and Quang Tri. Following this, VNRC started reviewing the status of PPPs in the five focus provinces through an APII subcontract. In Year 2, we aim to assist APII focus provinces to revise, test and finalize improved PPPs, through a subcontract with VNRC.

6.1 Achievements

- 6.1.1 Multi-sector PPP situation analyses were conducted in Quang Tri, Kien Giang, Can Tho and Hung Yen by a national consultant working with DOHs, Preventive Medicine Centers, DARDs, SDAHs, and provincial Red Cross. A draft report was prepared.

- 6.1.2 In late March, discussions were finalized establishing a subcontract with VNRC for PPP activities. The PSA expected to be signed in April.

6.2 Challenges and Solutions

- 6.2.1 VNRC was very busy with humanitarian and emergency activities, such as flooding in Central Vietnam, during late 2010/early 2011. They are generally short on human resources and must give priority to emergencies over more routine work such as that being offered under the APII subcontract. In addition there were delays due to VNRC's lack of familiarity with subcontracting mechanisms (Firm Fixed Price PSA without fund advances). Both parties are however committed to see this subcontract materialize and APII does not immediately see alternative candidates for a subcontract.

7. Cross-Cutting Issues

Behavior Change Communication (BCC)

The BCC work aims to identify appropriate behaviors and messages for key target audiences and to strengthen the BCC capacity of national and provincial stakeholders. The BCC work feeds into and helps integrate and enhance the work of the other technical components in animal and human health, notably around the poultry supply chains.

7.1 Achievements

- 7.1.1 Developed the Year 2 BCC Strategy (a living document) based on the results of the Year 1 risk assessment, the risk reduction strategies, and the results of the BCC assessment. The Year 2 strategy focuses on the seasonal BCC campaign and closer integration of BCC work into the animal health and human health components. The BCC seasonal campaign is targeted for May-June. Efforts are being made to establish team of BCC trainers in provinces who will conduct training for local communicators and facilitators of BCC activities. The strategy was shared with FAO and WHO for technical verification and feedback.
- 7.1.2 Conducted planning workshops with key local stakeholders in four provinces (except Ha Nam) to design Year 2 BCC activities. The workshops provided consensus on the number of desired behaviors and on barriers and motivators, which in turn were used to develop appropriate key messages for target audiences. Due to the late entry of MOU and risk reduction strategy development in Ha Nam, the BCC planning workshop was cancelled in this province. Instead the results from Hung Yen and Quang Tri were used to inform and guide the activities in Ha Nam.
- 7.1.3 Entered subcontracts for Year 2 with Women's Union in Ha Nam and Kien Giang, Provincial Humanity Center under Red Cross in Hung Yen, Women's Union in Quang Tri (a new subcontractor) and CEFACOM (Research Center for Family Health and Community

Development) in Can Tho. Women's Union in Can Tho did not have sufficient human resources to carry on the work from Year 1.

- 7.1.4 Completed TOT trainings for district trainers (representing Animal Health, Animal Extension, Human Health, and communication bodies) in Quang Tri, Can Tho and Ha Nam. The trainings were conducted by provincial Master Trainers.
- 7.1.5 Designed Year 2 BCC materials (calendar, flipcharts, logo, BCC theme, guidelines for community events, small group discussion with small and medium commercial poultry farmers, notebook with BCC theme) together with BCC and artwork consultants. All materials were pre-tested in Can Tho (for Southern materials) and Hung Yen (for Northern materials). They were printed and are being distributed to target audiences. Other BCC promotional materials such as raincoat, shirts and pens with BCC theme and messages were designed and are now being produced. These promotional materials will be also used for human health and animal health activities. FAO and WHO were consulted for technical verification.
- 7.1.6 Conducted a TOT refresher course on communication skills and BCC materials for 22 provincial and district master trainers from the five focus provinces who in turn will train local communicators and facilitators of community events and discussion forums. The activities will target key supply chain nodes. APII Project Area Managers attended the TOT and will help coach/guide local subcontractors.
- 7.1.7 Conducted Year 2 BCC implementation planning workshops in all five focus provinces, with partners and counterparts from provincial to village level, to discuss and get consensus on the detailed plans for Year 2 BCC activities, related monitoring/quality assurance mechanisms and related media activities.
- 7.1.8 Identified a technical team composed of provincial officers from SDAH, Center of Preventive Medicine, CHEC (also known as 'T4G'), and Agricultural Extension to develop Can Tho's communication guideline on API and EIDs with the support from APII, MARD and MOH experts. This activity will be led by APII together with FAO. The same process is planned for Ha Nam.
- 7.1.9 Engaged national journalists (VTC16), provincial journalists (T4g, local newspapers and TV) on the Animal Health bio-security study tour in Northern and Southern provinces. This resulted in various articles and broadcasts. For all BCC events such as training, planning workshops, and community events local journalists were engaged and articles/televised broadcasts were issued in Ha Nam, Hung Yen, Kien Giang and Quang Tri.
- 7.1.10 Identified national communication experts from MOH and MARD to help with BCC materials revision and design, review One Health Newsletter articles, mentor provincial/district BCC trainers, and support provincial officers in developing provincial communication guidelines on API and BID (Can Tho and Ha Nam).

- 7.1.11 Completed the collection of API materials from various sources and passed these on for uploading on the PAHI website.
- 7.1.12 Developed and shared the Year 2 press relations plan with USAID. Provided weekly updates and success stories to USAID.

7.2 Challenges and Solutions

- 7.2.1 Encountered difficulties finding local subcontractor on Year 2 BCC activities in Can Tho. Provincial Women's Union lacks human resources. Instead identified CEFACOM (Research Center for Family Health and Community Development) a national NGO based in Hanoi through competitive bidding. Subcontract signed in March. The BCC seasonal campaign was delayed about two months in Can Tho. The subcontract preparation process generally continues to take longer than envisaged and the Firm Fixed-Price PSA is difficult for many subcontractors to accept/adjust to.
- 7.2.2 The BCC Year 2 planning workshop in Ha Nam was cancelled due to the late MOU renewal. The PSA with Ha Nam Women's Union was modified to address this (Note: subcontract modification can be a time-consuming process). Nevertheless Ha Nam Women's Union expect to complete BCC campaign activities same time as other provinces (Ha Nam Women's Union is very strong and proactive).
- 7.2.3 Difficult to get national officers to give technical inputs into project activities such as reviewing BCC materials, as we are limited in the way we can compensate their efforts. We are working to find suitable ways to bring them on board in close consultation with the F&A team and the Project Director, but the options are limited. This constraint could affect the planned newsletter production with NAEC and NCHEC. With national experts from MOH and MARD coming on board as consultants and a new Strategic Communication Manager coming on board in April we expect this area of work to move forward soon, albeit behind schedule.

Provincial Coordination and Implementation

7.3 Achievements

- 7.3.1 Signed MOUs for Year 2 with all five provinces. Changes in Ha Nam leadership meant that the MOU was not signed until March.
- 7.3.2 Worked with counterparts and subcontractors to prepare provincial work plans and conducted Year 2 provincial planning workshops in Kien Giang, Can Tho, and Quang Tri (Dec 2010), Hung Yen (Jan 2011), and Ha Nam (March 2011).
- 7.3.3 Finalized the provincial implementation plans together with the PCUs for approval by local authorities. All but Can Tho were approved this quarter.
- 7.3.4 Identified and engaged joint APII-FAO Provincial Coordinators in close consultation with counterparts in all five focus provinces.

- 7.3.5 Continued to work closely with FAO on provincial coordination and cooperation with emphasis on closer relationships between PCs and FAO focal points.
- 7.3.6 Organized PCU quarterly meetings to review the roles and functions of PCUs and agree on clear mechanism and formats for monthly planning and reporting.
- 7.3.7 Worked closely with provincial counterpart agencies and subcontractors on implementation and monitoring of activities.
- 7.3.8 Initiated weekly work plans for Project Area Managers (PAM) and PCs on a weekly basis. PCs are shared with FAO and work according to a joint Terms of Reference.
- 7.3.9 Relocated project offices in Can Tho and Quang Tri from within DARDs to privately rented premises, for compliance and easy/equal access by all partners. It was decided in the end not to open a satellite office in Ha Nam as it proved too difficult to find a new Project Area Manager willing to be based in Ha Nam.

7.4 Challenges and Solutions

- 7.4.1 The contract for the PAM (North) was terminated by mutual consent due to unsatisfactory performance. The recruitment of a suitable replacement took longer than expected and the support to and coordination in Hung Yen and Ha Nam provinces suffered somewhat as a result of this gap in staffing
- 7.4.2 Changes in leadership in Ha Nam meant no appointments of PCU Chair and Vice-Chair until March, when the Year 2 MOU was finally signed. In the meantime the Deputy Director for Provincial Implementation maintained close dialogue with Ha Nam leaders to help ensure good working relationships.
- 7.4.3 Close communication between the shared APII-FAO Provincial Coordinators and FAOs Focal Points/Field Coordinators remains a challenge for various institutional reasons. The API partners are aware of this and working on ways to improve the situation.

National Coordination & Policy Dialogue

7.5 Achievements

- 7.5.1 Developed APII's Advocacy Strategy and shared this 'living document' with USAID and API partners. This process helped generate a clearer picture (vision) within the APII team of where the project is heading and what achievements and outcomes (milestones) to aim for along the way
- 7.5.2 The AH team maintained close contact with FAO in particular, as well as with other partners (VAHIP, LIFSAP, STOP AI) for coordination and collaboration on supply chains and related work. VAHIP and LIFSAP have indicated interest in the supply chain work, notably the technical protocols being prepared by APII.

- 7.5.3 The AH team prepared for submission of an updated bio-security training package, developed in close collaboration with NAEC, to the Bio-security Working Group at its next meeting.
 - 7.5.4 The AH team is maintaining close dialogue with DAH on the development of improved training materials for AHW/Vets.
 - 7.5.5 The AH team is also working on developing new relationships with provincial agricultural colleges/universities and vocational training centers for formal training and certification of local AHWs.
 - 7.5.6 The AH team organized an in-country study tour in collaboration with VIPA and DLP, with 22 participants from government authorities, incl. DAH, DLP, the Food Hygiene and Safety Administration of MOH, DARDs, SDAHs, and SDFHF as well as private entrepreneurs and journalists. The event provided an opportunity for participants to identify firsthand the points of HPAI/EID risk exposure in poultry supply chains in seven provinces (Hanoi, Hung Yen, Quang Tri, Tien Giang, HCMC, Can Tho and Kien Giang).
 - 7.5.7 The HH team worked closely with FAO on surveillance, with WHO and MOH on IC activities and provided inputs on an IC assessment at a VAHIP project planning workshop. PEPFAR representatives attended the IC TOT workshop in March.
 - 7.5.8 The BCC team stepped up its dialogue with API partners. FAO and WHO are now regularly consulted for technical verification on AH and HH related BCC issues. The BCC team also continued to participate actively in the BCC Working Group.
- 7.6 Challenges and Solutions
- 7.6.1 Coordination with multiple partners and gaining access to decision-makers remains a challenge, but APII is benefiting from personal networks, collaboration with FAO and WHO, and growing recognition of its work. Other options such as working with MARD's International Support Group (ISG) need to be explored in consultation with USAID.

Monitoring & Evaluation

In Year 2, the guiding principle for the M&E work is to strengthen existing systems in the provinces, and help close existing gaps between grassroots level M&E and provincial-national levels M&E and reporting. This includes discrete capacity building activities such as training in data collection, analysis, and interpretation/use, support to database development and web-based data management where feasible, and the development of tools, guidelines, etc. to help provide evidence for replication and up-scaling where appropriate.

APII will act as the repository for PMP indicators collected under USAID's API initiatives, provide analysis and report on this data. This involves collaboration with MEASURE on data collection, management, analysis and reporting, training

and follow-up with staff, subcontractors and local partners on monitoring mechanisms, quality assurance, and use of data for decision making.

7.7 Achievements

- 7.7.1 Worked closely with MEASURE and USAID's API partners to review and improve the PMP data collection tools. The M&E team developed forms for data collection, conducted training to PCs and guided them to collect data for project Year 1 and the first six months of the Year 2.
- 7.7.2 The data collection process identified key issues which can be helpful in a future PMP review e.g. in a workshop with API partners.
- 7.7.3 Developed a draft APII project Log-Frame which links activities and outputs to outcomes and impacts and will help establish the baseline for future results and impact assessments. PMP indicators reported by APII were incorporated into the Log-frame. New indicators, particularly at outcome level were added. The Log-Frame is intended to replace the PMP table in future reporting.
- 7.7.4 Developed mini Log-Frames/M&E frameworks for more detailed monitoring, evaluation and reporting on specific activities e.g. around CBS and supply chain interventions.
- 7.7.5 Developed databases for basic socio-demographic information of intervention sites, CBS, PMP and trainings. The database are frequently updated and reviewed. Other databases to store more detailed information on APII activities are in the process of being finalized.
- 7.7.6 Developed detailed guidelines for Activity Implementation Monitoring ('AIM Guidelines') and related tools and shared these with staff, subcontractors and local partners. The tools are being used in the field by all relevant stakeholders to monitor quality of activities as well as to coach and build up capacity for local trainers and grassroots implementers.
- 7.7.7 Conducted rapid assessment of quality of trainings conducted in Year 1, with technical assistance from Abt's Headquarters. The identified strengths include standardization of the approach and process in conducting training activities in each component. Some weaknesses that were identified include 1) "SMART" key performance indicators are not routinely defined to measure the effectiveness of each training course during the development process; 2) Pre-tests and post-tests (or simply post-tests in some cases) are not used systematically; 3) Training plans do not include post-training follow-up plans to support trainees in the application of their new knowledge and skills in the workplace; and 4) There is no system to conduct post-training assessments of trainees' ability to apply skills and behaviors learned in their work
- 7.7.8 Drafted action briefs based on the rapid assessment results to guide the development of SMART objectives, indicators and targets and a system for post-training assessment and follow-up. Currently, APII is

identifying local institutions to assist in post-training assessment and follow-up activities to improve the quality of the training and approaches to institutionalize to local capacity building for API prevention, control and response.

- 7.7.9 Disseminated the assessment results to APII staff and partners at a USAID Health Partners' meeting for a discussion on quality assuring, sustaining and institutionalization "good capacity building".
- 7.7.10 Reviewed SOWs for technical assistance and program implementation to help ensure that M&E issues are adequately addressed in all work.
- 7.7.11 Provided training to field-based Project Area Managers and Provincial Coordinators on M&E with focus on performance monitoring and quality control. Trainings were subsequently diffused to local partners.
- 7.7.12 Provided inputs and suggested methodologies for CBS reviews and KAP survey as well other related research/studies.

7.8 Challenges and Solutions

- 7.8.1 Baseline indicators need to be identified and included in the Log-frame where possible. However, as the project did not conduct a baseline survey before or during start-up it may be difficult to arrive at a complete baseline. APII will work with key partners and the client to address this issue.
- 7.8.2 The project interventions are diverse and complex. To monitor performance and measure effectiveness of each intervention area requires a range of methods and approaches. As a result, we are focusing our quality performance reviews on concrete activities – beginning with training, CBS and BCC campaigns. We will then plan to move on to examine supply chain interventions, and facility based IC interventions.
- 7.8.3 It will take time and effort to develop a comprehensive data base for a specific activity/component and the entire project if it is to be fully useful for data retrieve and analysis in future. Currently, raw data of certain activities such as training tests, training evaluation results, KAP surveys are stored in multiple places. The M&E team will follow-up for a more systematic and centralized data storage which is easily accessible by/to the project.
- 7.8.4 There were challenges to coordinating with the health sector to collect data to inform the PMP. Training data is not a regular part of the government's MIS; therefore, access to the original training data in each agency was limited or original data had been lost, which affects data validity. A review with partners and counterparts may help address this. APIIs supply chain work which addresses issues related to economics and livelihoods is not well captured in the current PMP framework. This prompted the development of a separate mini Log-Frame to capture the outputs, outcomes and potential impact of this important work.

Finance & Administration

7.9 Achievements

7.9.1 New staff on board:

- Project Area Manager for Hung Yen/Ha Nam, Mr. Nguyen Kim Hai (replacing Mr. Ninh) – joined the team in late March;
- Two F&A Assistants: Mrs. Ha Thanh Lan joined the office in Can Tho in December and Mrs. Nguyen Thi Hong joined the team in Quang Tri in January.

In addition we prepared for the arrival of new staff joining in Q3:

- Supply Chain Manager (North), Mrs. Nguyen Thai Hoa.
- Administration Manager (Ha Noi), Mrs. Nguyen Minh Son.
- Strategic Communication Manager (Ha Noi), Mrs. Tran Thanh Binh, following a lengthy search for a replacement of the Partner Relations Manager who left in November 2010.

We are still searching for a Supply Chain Manager for the South.

7.9.2 Opened and equipped new satellite offices Can Tho and Quang Tri, in independent locations outside of DARD.

7.9.3 Managed multiple Subcontracts and Consultant Agreements for all components.

7.10 Challenges and Solutions

7.10.1 Hiring local consultants above their current rate or above the FSN scale requires CO approval. Since CO approvals have entailed long waiting periods that are not conducive to the pace of project activities, APII has tried to minimize the number of approval requests. However, this is making it difficult for APII, in an increasingly competitive market, to attract and engage high caliber national consultants on time. This applies to independent consultants and consultants on subcontracts (e.g. CEFACOM, AFAP).

7.10.2 The fact that there are less than two years left on the project is making it increasingly difficult to attract new high caliber staff.

7.10.3 Many counterparts consider the APII cost norms to be strict/low, and we continue to receive direct and indirect complaints from them.

7.10.4 Many subcontractors find the subcontracting instrument difficult to work with, particularly those that have little or no working capital.

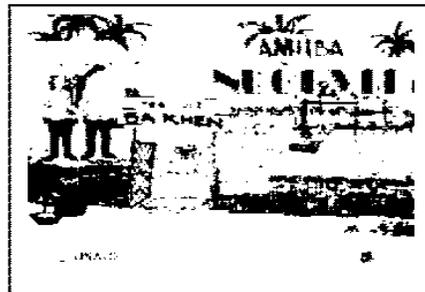

7.10.5 Still working on a PACCOM license (very lengthy process).

7.10.6 Still working through Ernst & Young to clarify VAT status (another very lengthy process).

8. Success Stories

8.1 National Extension System Plans to Disseminate APII Bio-security Training Packages to a broader audience.

The Avian and Pandemic Influenza Initiative has developed a training package on biosecurity practices for chicken and duck farms to be used by agricultural extension workers in educating farmers about the best practices for poultry raising to prevent the spread of diseases including Avian Influenza. Throughout this process, the National Agricultural and Extension Center (NAEC) has been an integral partner in the packages' development, contributing directly to the design of the materials and their review.

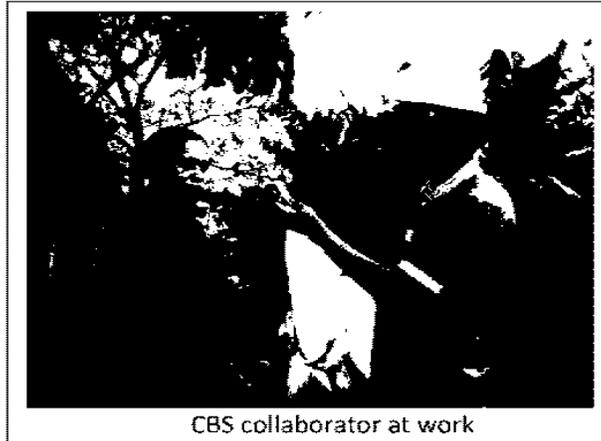

Recently, NAEC has also agreed to expand the reach of the APII project by disseminating the materials in five provinces not targeted by the project, and to incorporate the materials into their own (national) training system. A TOT is planned for April, which will include trainers from ten provinces, as a first significant step in taking the APII materials beyond the five focus provinces.

NAEC's adoption of the materials into their own training system will be key to ensuring the sustainability of APII's interventions and future scale up of biosecurity improvement interventions.

8.2 Community-Based Surveillance System established by USAID's Avian and Pandemic Influenza Initiative helps to identify Avian Influenza before outbreak spreads

The most effective way to control avian influenza (AI) and mitigate its effects on human health and livelihoods is early detection. A good surveillance system allows suspect cases to be identified early before an outbreak spreads.

CBS collaborator at work

In early March 2011, Mr. Vo Van Hung, a village animal health worker trained by the Avian and Pandemic Influenza Initiative (APII) as a Community-Based Surveillance Collaborator, successfully identified suspected cases of AI in a duck flock in the Quang Tri province of central Vietnam. While the farmer and Mr. Hung originally suspected that the ducks were suffering from duck Plague during his first visit, on the next day Mr. Hung was alarmed by the number of birds in the flock that had died, and identified symptoms that might be consistent with AI. He reported the cases to the Commune Chief Animal Health Officer and the District Veterinary Station, who came and confirmed with blood tests that the ducks died from the highly pathogenic H5N1 strain of AI. The district and village animal health workers culled the flock and disinfected the farm and neighboring areas according to national guidelines to prevent additional infections. They also notified the local human health authorities to be on alert for human cases.

APII works to identify, prevent, and control influenza outbreaks in both animals and humans. This happens in close collaboration with FAO and WHO under a USAID Avian and Pandemic Influenza partners program. A key activity under this program is the implementation of the Community Based Surveillance (CBS) system. The national disease surveillance systems for human and animal health operate between the commune and national levels. The CBS system, implemented under APII is designed to extend surveillance down to the village level. Through the CBS system, volunteer "Collaborators" – usually public animal and human health workers, but also private sector actors and general community members – serve as key informants for groups of households in a village. They are trained to identify typical symptoms of AI both in humans and poultry, as well as other suspected emerging infectious diseases like foot and mouth disease, dengue fever, and cholera, and report information about possible

cases in their respective areas. USAID's AI Mekong Initiative (2006-2009) implemented the CBS system in two provinces, and APII expanded CBS to three additional provinces. The CBS system was officially launched in Quang Tri in August of 2010.

Highly Pathogenic Avian Influenza (HPAI) cases are rare but the impact on farm incomes and human health can be significant. Therefore, it is particularly notable that the CBS system established by the APII project correctly identified suspect cases and responded appropriately. This successful identification will help further promote the CBS system to Vietnamese counterparts, and stimulate their interest in ensuring that the community level system is strengthened and interacts well with existing national surveillance systems. Because of the publicity around this case, a second outbreak was identified early and addressed in a neighboring commune shortly thereafter. Despite the rarity of HPAI, Vietnam is still experiencing regular outbreaks in poultry and occasional human deaths.

8.3 Community based “Edu-entertainment” events on the benefits of Healthy Poultry to the Health of the Community Create an Opportunity for Commune Level Collaboration.

As part of the Avian and Pandemic Influenza Initiative’s “Healthy Poultry – Profit Family – Profit Community” BCC campaign in the spring of 2011, provincial partners have been conducting “edu-entertainment” community events targeting all community members, including the various actors of poultry supply chains. To date, 22 of 42 community events have been conducted in 22 communes of 15 districts of the five focus provinces of the project. These events have created an opportunity for community level cooperation and coordination in order to create lively and interesting events for the community at large.

Various commune level stakeholders were involved in the implementation of each event. For example, members of the Commune AI Steering Committees include chairmen/vice chairmen of Commune People’s Committee, representatives from animal and human health workers and other representatives from mass organizations at commune level. This committee, working closely with the APII provincial BCC trainer teams, developed task lists with clear roles for individual agencies to plan and implement the community events. They also worked together to form an acting troupe, modifying APII designed drama scripts on three desired behaviors – Washing your hands after contact with poultry, buying and selling only healthy poultry, and reporting sick animals and humans – and adding songs and dances celebrating their communities. Following each drama, an interactive discussion session reinforced the messages and allowed audiences the chance to share practical experiences.

These community events benefited from a clear plan and designation of responsibilities. The Commune People’s Committees play the lead role, complemented by Women’s Union and other mass organizations (such as the Youth Union and Farmers’ Association) playing a coordinating role and the provision of significant technical support by the animal and human health sectors. This collaboration enabled the successful development and implementation of the events, which have and will continue to reach 200-600 people each.

Introduction

This report presents the main achievements, challenges and solutions/lessons learnt for USAID's Avian and Pandemic Influenza Initiative (APII) during Year 3, Quarter 1 (October - December 2011).

The report is divided into the following thematic sections:

1. Animal Health Worker (AHW) Capacity Building
2. Agricultural Extension Worker (AEW) Capacity Building
3. Poultry Supply Chain Strengthening
4. Community-Based Surveillance (CBS)
5. Infection Control / Case Management (IC/CM)
6. Pandemic Preparedness Planning (PPP)
7. Cross-Cutting Issues
8. Success Stories.

1. Animal Health Worker (AHW) Capacity Building

The goals are to develop an AHW capacity building package and an AHW network model that is adopted by relevant public-private agencies at national and/or local levels, and to develop a standard Terms of Reference for AHWs for adoption by Provincial Peoples Committees (PPCs) and the Ministry of Agriculture and Rural Development (MARD).

The first quarter of Year 3 focused on completing and transferring the AHW training package for wider adoption and on establishing well-functioning networks of capable public and private animal health workers in and beyond project areas. Subcontractors included AFAP and Vietnam Veterinary Association (VVA).

1.1 Achievements

- 1.1.1 The Year 2 subcontract with AFAP was extended through November, 2011 to cover ongoing activities in the field including AHW monthly meetings and refresh trainings for current and new districts as well as biosecurity training for farmers.
- 1.1.2 AFAP's work plan for the remainder of Year 3 promotes development of provincial strategies to maintain monthly meetings and refresher training for grassroots AHWs without APII financial support. The plan also includes an AHW training model for replication in other provinces and districts. AFAP and APII will continue to work together on the challenge of getting local government to allocate funds for adoption of the AHW model.
- 1.1.3 Under the AFAP subcontract training for new AHWs in Quang Tri was conducted on a cost-share basis with AHWs taking care of lunch themselves and local authorities supporting travel.

- 1.1.4 A lessons learned-cum-advocacy workshop on training of and TORs for AHWs was conducted on 22-23 Nov 2011 in Quang Tri with participation of Quang Tri-based AHW agencies (incl. Agricultural Colleges and Vocational Training Centers) other project province SDAHs and SDAHs of Thanh Hoa, Nghe An, Ha Tinh, Quang Binh, Thua Thien Huc, Quang Nam as well as representatives of DAH and RAHO3. This included discussion on formalization of AHW training and certification. The workshop provided a lively forum for discussions on recommendations for AHW TOR and how to facilitate training for AHWs in future. Quang Tri SDAH informed that the PPC has decided to allocate 1 billion VND (~USD 50,000) on the provincial budget for training of AHWs in Quang Tri in 2012. A clear indication of the province's commitment to adopt and replicate the AHW training model/package.
- 1.1.5 AHW monthly meetings and refresher trainings were conducted in all 15 pilot districts plus 9 new districts during Sep-Oct 2011 in Can Tho (2 districts), Hung Yen (2 districts), Ha Nam (3 districts) and Quang Tri (2 districts). It was agreed that from Oct 2011 APII will refrain from funding ongoing activities in pilot districts except supporting local trainers lecture preparation and course logistics (venue, stationery). The rest is now covered by local resources.
- 1.1.6 VVA finalized and disseminated their 2011-2015 Strategy in October 2011 within the national network. Mr. Dang Huu Hung, a representative from VUSTA noted in an official speech at a large VVA event: *"This is considered as a shining pearl in the development of various associations and it is very practical. Your lessons learned should be documented and shared with other associations to help strengthening our capacity."*
- 1.1.7 Using Quang Tri as a good model, VVA mobilized other provinces to develop the VVA network coverage. As result of this, a number of provinces have now registered to open their own Veterinary and Husbandry Associations such as Thai Nguyen, Bac Giang, Bac Ninh, and Quang Binh. Bac Giang Veterinary and Animal Husbandry Association hosted a large (VVA-funded) ceremony on December 15 with 422 members and more than 100 public and private guests. The event was recorded as a success story for APII during this quarter.
- 1.1.8 VVA in collaboration with Thua Thien Hue SDAH organized a workshop on "Cooperation of Government Administrative Bodies and Private Sector in Building Capacity for Local Veterinaries" on October 1, 2011. The workshop was chaired by VVA and Thua Thien Hue DARD with participation of 46 representatives of provincial SDAHs from Quang Binh, Quang Tri, Thua Thien Hue, Da Nang, Quang Nam, Quang Ngai and Bac Giang, and from private feed and drug companies. Participants discussed strengthening local AHW networks, training for vets, challenges in managing AHWs and vet service delivery by private AHWs.

1.2. Challenges and Solutions

- 1.2.1 Allocation of local funds for training of AHWs remains a big issue. While Quang Tri DARD will receive 1 billion VND on the provincial budget for

AHW training in 2012 (for implementation of the provincial decision no. 25 of 2009 to implement and strengthen AHW networks) many other provinces have no clear picture or plans yet in this area. Can Tho appears to be interested but while SDAH is committed to maintaining the refresher training and monthly meetings, no funds have yet been allocated on the provincial budget as far as APII is informed. APII will continue to follow-up and advocate in this area, including with other provinces.

- 1.2.2 APII and SDAHs will need to continue to work with DARDs and PPCs and advocate for inclusion of AHW support in the 2013 annual budget cycle, for which plans and negotiations will be initiated in June 2012. TA and other support from APII may well be needed (and justified so not to lose momentum) in the coming months to help position the AHW model for wider adoption provincial resource allocations.

2. Agricultural Extension Worker (AEW) Capacity Building

The goal is to develop an AEW bio-security training package for small commercial poultry producers, which is adopted by the national-provincial extension system, and by other partners.

2.1 Achievements

- 2.1.1 In collaboration with PAFECs, four TOTs for Farmer Trainers on biosecurity for small commercial farmers were organized in Ha Nam, Hung Yen, Quang tri, Can Tho and Kien Giang with total of 100 participants from district and provincial extension centers, preparing the provinces for further roll out/replication. Following this 10-12 small group discussions per province for farmers in Ha Nam, Hung Yen, Quang Tri, Can Tho and Kien Giang were conducted to test and cost implementation. A total of 292 male and 239 female farmers attended the 52 courses in the five provinces. AFAP and APII staff dialogued actively with PAFECs to encourage pilot provinces to replicate the training further. Can Tho and Kien Giang have included further diffusion training in their work plans but no concrete financial commitments have yet been made.
- 2.1.2 Integration of biosecurity training for farmers in communication plans was promoted by the AH and BCC teams for adoption in Year 3 BCC PSAs in all pilot provinces.
- 2.1.3 In response to a request from An Giang and Soc Trang provinces, a TOFT course for farmer trainers was conducted October 1-3 in An Giang. 21 trainees from An Giang and 3 from Soc Trang province attended. The total number of farmer trainers trained mostly from provincial and district agricultural and extension centers now stands at 127. After this course, An Giang started to provide diffusion training for their extension staff at commune level and poultry farmers using local funds and using the biosecurity training package developed by APII.

- 2.1.4 The finalized biosecurity training package was distributed in pilot provinces and prepared for wider introduction through NAEC into high risk provinces. The training package seems to attract much attention and APII receive official requests for further support and training on this package from many PAFECs including Soc Trang, An Giang, Bac Lieu, Vinh Long, Dong Thap, Dac Nong, Dac Lac, as well as a local NGO ('Trung tam giao duc thuogn xuyen Hoa Binh') and Thai Nguyen University. Plans for roll out in new provinces are being made with AFAP.
- 2.1.5 The NAEC office in HCMC adopted parts of the training curriculum into water fowl biosecurity training documents in the regional 2011 program.
- 2.1.6 With support of DLP, Vietnam Poultry Association (VIPA) submitted a proposal to APII for livestock sector workshops and strengthening of the association in order to promote biosecurity practices within their farmer club networks. The APII biosecurity training package is to be used as the official training tool. A subcontract is being prepared with VIPA in consultation with FAO and DLP.

2.2 Challenges and Solutions

- 2.2.1 Working closely with NAEC/PAFECs is necessary to help institutionalize the training/extension package. This is a time-consuming process which requires diplomacy, patience and perseverance in order to forge and sustain close relationships. MARD's recent strategy of opening up the competitive bidding for extension funds to not only NAEC and PAFECs but also private enterprises will have implications for our work and will influence our strategy to promote replication of our AEW package. We will need to include NGOs, Civil Society Organizations and private entities in our advocacy and partnership efforts. This may provide an opportunity for some novel and unconventional public-private-partnerships.
- 2.2.2 VIPA have demonstrated their ability to coordinate with MARD institutions such as DLP, DAH and NAEC. However, the association is still in need of substantial and sustained capacity strengthening. APII plans to help initiate and spearhead this process through the proposed subcontract.

3. Poultry Supply Chain Strengthening

The goal is to develop biosecurity/biosafety demonstration models in key (high risk) nodes along supply chains, together with related documents (protocols, guidelines, training materials) which are adopted, adapted and replicated by public agencies, private partners and/or other development projects and programs elsewhere.

The key nodes for direct APII interventions in Year 3 are:

- Dong Ha live bird and poultry meat market in Quang Tri;
- District market in Ha Nam;

- Ngoc Xuan centralized poultry slaughterhouse, Can Tho City;
- Phu Nong centralized poultry slaughterhouse, Rach Gia City, Kien Giang;
- Home-based slaughter points around Dong Ha market, Quang Tri;
- Small slaughter points around Duy Tien district market, Ha Nam;

3.1 Achievements

- 3.1.1 The upgrade of the poultry sections in Dong Ha Market by a local construction company was completed in Nov 2011, co-funded by APII, the Market Management Board (MMB) and the vendors. A launching event was conducted on December 5 with representatives of Quang Tri province, neighboring provinces, DAH, VIPA, DLP, LIFSAP, FAO, USAID and APII. A success story was published on USAID's website.
- 3.1.2 A training session on risk reduction and good practices was conducted before the re-opening. A total 38 participants attended including vendors, MMB representatives, district veterinary staff and cleaning staff. A follow-up training plan to provide further risk reduction knowledge and good practice skills for key stakeholders developed.
- 3.1.3 Together with BCC team and local media, a plan to further promote the improved Market was developed. A video (w. photos) documenting the Dong Ha Market upgrade and 'before and after' was prepared.
- 3.1.4 Technical drawings, protocols, and bills of quantities were completed for an upgrade of Phu Nong centralized slaughterhouse in Kien Giang and Ngoc Xuan slaughterhouse in Can Tho. However, the plan to use Grants Under Contract as the financing vehicle was abandoned following USAID's advice and replaced with a Stakeholder Agreement procedure. This caused a significant delay. The bid for the Ngoc Xuan upgrade was prepared and advertised in late December.
- 3.1.5 Following the in-country study tour in late September 2011 to slaughterhouses in the south (incl. STOP AI sites), provincial participants prepared action plans and recommendations for: strengthening risk mitigation measures at slaughter points; improving provincial regulations; developing slaughter point models and management roles of district vet stations; and strengthened collaboration between provincial SDAHs and stakeholders including slaughterhouse owners for control of poultry slaughter and transportation, including agreement and commitment of owners on renovation of slaughter facilities.
- 3.1.6 Based on the Veterinary Inspectors training courses in Can Tho, September 2011, a third course was conducted in HCMC for participants from the Mekong Region. This 'Advanced Training Course for Inspectors on Veterinary Hygiene and Risk Reduction in Poultry Slaughterhouses' was implemented together with HCMC Veterinary Inspection Center and FAO and took place from December 19-23. 26 participants from provinces in the Mekong Region (including LIFSAP partners) and RAHO's 6-7 as well as DLP representatives attended the course. APII received positive

feedback from the Veterinary Inspection Center and suggestions for further training courses for local inspectors from SDAH representatives.

- 3.1.7 Invited LIFSAP's consultant team to Abt's office to exchange information and discuss potential collaboration especially in Hung Yen (where we both operate) and other provinces. APII shared various materials including risk assessment reports, supply chain node prototype designs, small group discussion flipcharts etc. and continued throughout the quarter to invite LIFSAP along to relevant events (such as Vet. Inspector training courses, Dong Ha Market reopening, workshops, etc.).

3.2 Challenges and Solutions

- 3.2.1 While provincial counterparts clearly are very interested in the demo models, most provinces have no 'master plans' that demarcate future locations e.g. for centralized poultry slaughterhouses and markets. In addition, the processes for local authorities to approve construction are very complex, involving multiple stakeholders and complex regulatory frameworks which are not always well understood by all or straightforward to implement. APII is still learning along the way and adjusting plans and expectations accordingly
- 3.2.2 Profit margins from poultry slaughtering are small especially in small scale slaughtering operations. It is understandably hard to persuade the small private entrepreneurs to invest in facility upgrades without some form of 'subsidy' (financial support) in this environment. Micro-finance options in the commercial financial sector (banks, MFIs) are rarely available.
- 3.2.3 Successfully upgrading the poultry sections in Dong Ha Market was an important milestone. However, follow-up in order to see sustained change behaviors and improve operations and food safety remains vital. This needs the continued commitment of SDAH and MMB with APII support. The APII team has prepared and initiated a training/follow-up plan for key stakeholders notably market vendors.

4. Community-based Surveillance (CBS)

The goal is to develop an events-based grassroots surveillance package, including training materials/tools and job descriptions for grassroots 'collaborators', which is adopted, adapted and scaled-up in the provincial-regional-national surveillance system with local resources.

4.1 Achievements

- 4.1.1 From October 2011, APII ceased providing financial support to CBS networks in Ha Nam, Hung Yen, Can Tho and Kien Giang provinces. Only support in Quang Tri, where the province will start providing monthly allowances for AHWs from the provincial budget in 2012, was maintained in order not to lose momentum before provincial takeover.

- 4.1.2 Signed a contract with Quang Tri Livestock Production and Veterinary Association (QTLVA) to continue monitoring, supervising, maintaining and supporting the CBS collaborator networks in Quang Tri from Oct. to Dec, 2011. From Jan. 2012 onwards the province is expected to assume responsibility for supporting/maintaining CBS collaborators and networks.
- 4.1.3 Handover meeting between CCHIP (previous subcontractor) and QTLVA (new subcontractor) October 24, 2011. The meeting provided opportunity for two subcontractors to share learning, insights and experiences on CBS implementation and discuss the challenges and possible solutions.
- 4.1.4 CBS workshop in Quang Tri to share experiences with other/new districts and communes in the province. Included experience sharing and field visits to see the CBS model at work. Participants also discussed plans and feasibility for model expansion to all communes and districts in Quang Tri.
- 4.1.5 Drafted agenda for national dissemination/advocacy workshop on CBS for API partners comments and feedback.
- 4.1.6 Conducted an assessment in Quang Tri on human health - animal health cross-sector collaboration and coordination and knowledge/use of human health - animal health services among sector three farmers. The assessment was done by an international intern supported by the APII team. Preliminary findings were shared with local partners in Quang Tri. The final report is forthcoming and will provide inputs to the larger CBS evaluation currently being prepared.
- 4.1.7 Two SOWs for an international consultant and a local subcontractor to evaluate the CBS model were approved by USAID. APII completed the selection process and initiated preparations with the selected consultant and subcontractor. We expect the final report to be ready within April 2012.
- 4.1.8 An economist from Abt's Home Office updated the previous costing of the CBS model costing, including a cost-benefit analysis. This study will complement the final evaluation of the CBS model to be presented in advocacy events later in 2012.
- 4.1.9 Had two posters (Annexes 5 and 6) on the CBS work presented at the American Public Health Association (APHA) conference in Washington DC Oct 29 – Nov 2, 2011:
<http://apha.confex.com/apha/139am/webprogram/Paper242716.html>
<http://apha.confex.com/apha/139am/webprogram/Paper242729.html>
- 4.1.10 The APII Technical Director for Human Health Delivered a lecture on the CBS model for 11 visiting undergraduate students from the University of North Carolina at Chapel Hill, USA. The students also visited the field work to see the CBS model at work in Ha Nam.

4.2 Challenges and Solutions

- 4.2.1 In Year 3, APII will focus on CBS model evaluation and advocating for its wider adoption with local resources. A major advocacy event was initially

slated for February but will likely take place in April-May 2012. The process of engaging consultant and subcontractor for the CBS evaluation took longer than anticipated. In addition, the advocacy work is quite complex this type of work in many ways new to the team (i.e. a learning process for APII).

5. Infection Control/Case Management (IC/CM)

The goal is to develop a model (with training tools, guidelines etc.) for implementation of Circular 18 at the local level, which is adopted more widely in Vietnam.

5.1 Achievements

- 5.1.1 Met with WHO to exchange IC work plans and information on the latest advances in the National Program Development on infection and prevention control. Reviewed scope for collaboration between the two APII partners.
- 5.1.2 The SOW for Viet Nam Nursing Association (VNA) on APII infection control activities in year 3 was approved by USAID. VNA will work closely with APII technical staff, national IC experts and WHO in collaboration with MoH and 3 IC Societies (Hanoi, Hue, and Ho Chi Minh) to share IC model with other provinces in regional workshops. VNA will furthermore revise/finalize the training materials, curriculum and practical handbooks for district hospitals and submit MOH for formal approval before advocating for replication/application in more than 600 district hospitals throughout the whole country. The subcontract with VNA was prepared for approval by Abt's Head Office.
- 5.1.3 Conducted monitoring visits and provided technical assistance to Gio Linh district hospital in October 2011 in collaboration with Hue Infection Control Society (ICS) experts. The results of this work are posted on the Website of Hue ICS: http://www.husic.org.vn/vn_tin-tuc/thoi-su/hoat-dong-ksnk-tai-by-gio-linh-tinh-quang-tri-91-husic.aspx
- 5.1.4 Can Tho provincial Department of Health (DOH) applied APII's assessment tools and methodology to conduct IC infection control status for other hospitals in in Can Tho including provincial and specialized hospitals using their own resources. The results of the assessment will not only help them understand current situation of IC practices but also develop their action plans for IC improvement.
- 5.1.5 Met with the DOH in Quang Tri, Can Tho and Kien Giang to review results of IC interventions in selected district hospitals and IC assessments in other hospitals on IC organizational structure, hospital equipment, knowledge and practice of health workers. The assessments were done by DOH with technical support from APII (methodology, tools, etc.).
- 5.1.6 All 8 intervention hospitals in 5 provinces informed that (thanks to APII's support) their IC activities were ranked excellent or very good and among highest scores in the annual evaluation by DOHs.

- 5.1.7 USAID delegation visited Gio Linh district hospital on December 5, 2011. During the visit, the delegation had opportunities to observe IC activities and interact with the hospital board of directors and IC specialists.
- 5.1.8 Meetings with Can Tho and Kien Giang DOHs on December 5-7 to discuss support to IC activities and get ideas from the provinces on future IC implementation. The provinces appreciate APII support and the development of good demonstration for other district hospitals to learn and replicate.
- 5.1.9 Invited WHO and MOH IC experts to Kien Giang province to visit Thot Not district hospital supported under USAID's AI Mekong Initiative and Go Quao district hospital supported by APII. The team also had chance to visit a non-intervention district hospital in Hon Dat district. During the visit, the experts had chances to observe and discuss with the hospital board of directors and IC specialist's achievements and lessons learned, success stories from IC interventions supported by APII and to compare intervention with non-intervention hospitals.
- 5.1.10 APII is planning for a final evaluation of the IC activities in including an assessment of cost effectiveness in the second quarter of Year 3. The SOWs for consultants were prepared for USAID approval.

5.2 Challenges and Solutions

- 5.2.1 All hospitals and DOHs were busy at the end of year with little time for IC activities. To support the hospitals and DOH, APII's team undertook field monitoring visits to help integrate IC activities into the DOH annual evaluation.
- 5.2.2 The upcoming SOW for VNA's subcontract was approved but the process of contract preparation required more time than expected. It is typically the budget negotiations and the preparations of CVs, Biodata, and leave without pay letters that cause delay. Many partners are unfamiliar with the formats and procedures and are not comfortable revealing salary histories.

6. Pandemic Preparedness Planning (PPP)

The goal is to develop PPPs in selected pilot province(s), introduce the package in other provinces, and advocate for its wider adoption in Vietnam.

6.1 Achievements

- 6.1.1 Met with WHO to discuss PPP collaboration in Year 3, including how APII and WHO will support the Government to revise the PPP with inclusion of business continuity planning (BCP).
- 6.1.2 Organized a PPP workshop November 15-17 for representatives from local authorities including people's committees, animal and human health agencies and mass organizations. Participants discussed the new concept of "whole-of-society" approach and developed a framework for multi-sector involvement in the design and implementation of their PPP.

Following the workshop, the Kien Giang PPC assigned members to the writing team including technical staff from different sectors to draft the provincial PPP outline.

- 6.1.3 Compiled inputs and comments on the outline of Kien Giang's PPP from APII technical experts, national consultants and API partners.
- 6.1.4 Presented the revised PPP outline to VNRC and Kien Giang representatives. The outline was subsequently finalized and VNRC and local counterparts initiated the full writing process. The first draft is expected for comments and review after Tet.
- 6.1.5 Finalized the revision of training materials for community leaders with WHO inputs. The training materials focus on three main topics: concepts of influenza and pandemic; community planning for pandemic preparedness; and business continuity planning and livelihood maintenance plans during the difference phases of a pandemic.
- 6.1.6 Organized four training courses for community leaders in Ly Nhan, Duy Tien, Binh Luc and Thanh Liem districts, Ha Nam from December 16-26, 2011. The training provided basic knowledge for community leaders on pandemic influenza and community preparedness for pandemics. Sixteen similar courses will be organized in Hung Yen, Can Tho, Kien Giang and Quang Tri in the next quarter.

6.2 Challenges and Solutions

- 6.2.1 It took a month to obtain feedback and comments on the PPP outline from API partners and local experts. This, and other delays, led to the late of submission of VNRC deliverables and was followed by a subcontract modification.
- 6.2.2 The "whole-of-society" approach and the business continuity planning concept adopted in Kien Giang's PPP are both new to the province and to VNRC. APII technical staff, with inputs from WHO, worked very closely with VNRC and provincial counterparts to provide technical support in the development of the PPP.

7. BCC and Cross-Cutting Issues

Behavior Change Communication (BCC)

The BCC work aims to identify appropriate behaviors and messages, integrate these into the work of the animal and human health components, and strengthen the BCC capacity of national and provincial stakeholders, enabling them to carry on BCC activities beyond the life-time of the project.

7.1 Achievements

- 7.1.1 Finalized the KAP qualitative survey of poultry consumers in 4 provinces of Can Tho, Ha Nam, Kien Giang and Quang Tri. The results helped to design follow-up activities with poultry consumers such as forums for

poultry supply chain stakeholders in Dong Ha market and monthly meetings with poultry vendors and transporters in Dong Ha market to follow up on behavior changes.

- 7.1.2 Designed and produced BCC promotional materials including aprons and hair bandeau for poultry vendors in Dong Ha Market.
- 7.1.3 Finalized the seven steps discussion guides for vendors in Dong Ha market with technical inputs from MOH, MARD, WHO and FAO. These guides will be used by provincial BCC specialists to help the five focus provinces develop their own discussion guides on new bio-security behaviors and facilitate small group discussions farmers in the year 3 campaign. They will similarly be shared with other provinces during advocacy events and BCC transition strategy dissemination workshops.
- 7.1.4 Organized a Consultation Workshop on the Year 3 BCC Strategy in Da Nang with participation of key leaders and officers from Ha Nam, Kien Giang and Quang Tri. The outcomes of workshop helped promote new and innovative BCC activities (e.g. excellent poultry farmer competitions) and local contributions in Year. This workshop was a first step in the BCC transition strategy to position provincial partners to carry out their own BCC work post-APII.
- 7.1.5 Conducted Year 3 implementation planning workshops during December in 4 provinces (except Hung Yen, slated for January 2012). The workshops helped provinces to think through the Year 3 transition strategy and prepare their BCC plans including campaigns, follow-up on farm level biosecurity, new activities such as farmer competition, exploring options for provincial counterpart funding contribution in implementing Y3 BCC activities, etc. and prepare proposals for the 2013 budget to be submitted in June 2012.
- 7.1.6 Provided technical guidance and support to the review and finalization of provincial proposals for Year 3 BCC activities in all five focus provinces. These proposals will be turned into subcontracts.
- 7.1.7 Finalized and submitted the Can Tho's Multi-sector Communication Guide to the PCU for approval. The development of this document was led by Can Tho's BCC specialists from SDAH, PAFEC, CHEC (T4G) with involvement of experts from DLP, DAH, NAEC, NCHCE, the MOH sub-committee for communication and with inputs from FAO and CDC.
- 7.1.8 Supported the Central Committee for Popularization and Education to integrate AI and EIDs into their regional workshops in Ha Noi on Oct. 20 and in HCMC on Oct. 27 for 577 representatives from 63 provinces including Communist Party Committees, government bodies (such as Ministries of Foreign Affairs, Justice, Central Committee of External Relations, Home Affairs., Education and Training, Agricultural and Rural Development, Health, etc.), the military sector, provincial CPEs, and information centers of universities and associations. The training helped raise awareness on AI/EID prevention and emerging zoonotic diseases. Monitoring visits were conducted to several provinces (Hau Giang, Can Tho, Ha Nam, Quang Tri, Son La, Ha Noi, Hai Phong, Vinh Phuc, Phu

Tho) to observe diffusion training and discuss how to secure local funds, especially from the provincial CPEs for further training in provinces.

7.1.9 Seven TV spots were filmed by Minh Studio for airing on national TV around Tet in Jan. – Feb. 2012.

7.1.10 Implementation of KAP survey (behind schedule – see below).

7.2 Challenges and Solutions

7.2.1 Limitations in writing skills and analytical thinking among provincial subcontractors were reconfirmed through their participation as members of the writing team developing Can Tho's Multi-sector Communications Guide and also through their progress reports and activity proposals. This partly explains the delay in some activities. Other reasons include pre-occupation of writing team members (from PAFEC, SDAH, PCHCE, PMC) with other work. Recognizing the weaknesses, provinces have asked APII to provide training on writing skills and proposal writing in Year 3.

7.2.2 The filming of TV spots was delayed because of the tight schedule of the Goodwill Ambassador Mr. Xuan Bac.

7.2.3 APII's planning and budget cycle does not match with that of the Government making it more difficult to get the timing right and call for local contributions in cash to implement APII models.

7.2.4 The KAP quantitative survey on supply chain actors, implemented by Nielsen (subcontractor) started later than planned, August instead of April after a prolonged subcontractor recruitment process. APII worked closely with Nielsen to finalize questionnaires and do spot checking on field work to help ensure quality of Nielsen's work. With a sample of 2340 poultry supply chain actors including small and medium commercial farmers, breeders, slaughterers, vendors and transporters, data entry took time for Nielsen to complete and for APII to double check (to verify quality). The topline report was completed after significant revisions by the APII team with inputs from Abt's Head Office. A full report is expected to be available for final comments within Feb. 2012.

Provincial Coordination and Implementation

APII's provincial implementation (PI) team works closely with the animal health, human health and BCC technical teams to coordinate field activities implemented by subcontractors, develop/test successful models at provincial and grassroots level, and advocate for their wider adoption with local public and private partners. The PI team operates out of the main office in Hanoi covering activities in northern Vietnam and through two satellite offices in Quang Tri for activities in central Vietnam and Can Tho for activities in southern Vietnam.

Provincial Coordination Units (PCUs), representing the body of key provincial counterparts and civil society, were established in Year 1 in the five focus provinces (Ha Nam, Hung Yen, Quang Tri, Can Tho and Kien Giang). Each province has a Provincial Coordinator (PC) appointed jointly with FAO and funded by APII. The PCs are typically seconded from a provincial

agricultural/livestock agency. The PCs work closely with the PI team, coordinate their efforts with FAO's focal points, and report to the PCUs.

7.3 Achievements

- 7.3.1 Signed MOU addendums for Year 3 with all five focus provinces.
- 7.3.2 Worked closely with provincial subcontractors to prepare work plans with emphasis on dissemination and advocacy activities.
- 7.3.3 Worked with FAO to prepare agenda for provincial planning workshops in December 2011 - January 2012 (Ha Nam will be postponed till after Tet).
- 7.3.4 With FAO, extended the contracts for Provincial Coordinators (PCs) until Jan. 2012. Further contract extension to be agreed with USAID and FAO.
- 7.3.5 Worked with PCUs on the strategy for APII supported activities in Year 3 to explain change in focus from implementation to advocacy and replication with local resources, and get provincial buy-in.

7.4 Challenges and Solutions

- 7.4.1 Collaboration between the shared APII-FAO PCs and FAOs Focal Points (FPs) remains a challenge due to local institutional issues. Maintaining both PCs and does generate balanced goodwill towards both APII and FAO.
- 7.4.2 Initial delays in contract extensions for PCs caused concern among PCUs and PCs. The provinces were pleased to retain the PCs and are aware of the plans to phase out the PCs within Year 3.

National Coordination & Policy Dialogue

The goal in Year 3 is to increase the focus on ways and mechanisms to transfer packages/models/approaches to public and private partners for adoption, adaptation, replication and up-scaling. The project consults and coordinates closely with API partners in this effort.

7.5 Achievements

- 7.5.1 The advocacy matrix and plan of action was updated in close consultation with the other teams.
- 7.5.2 Provided inputs into the Dong Ha market re-opening. The upgraded poultry sections are expected to promote enhanced food safety and improved biosecurity practices and serve as a model for others to see, learn from, adopt/adapt and replicate.
- 7.5.3 Co-facilitated the BCC Working Group and drafted a Plan of Action to revitalize the Working Group in Year 3 and beyond. This action plan will be executed in collaboration with PAHI, partners and counterparts and

aims to transition the governance of the body to national counterparts for sustained life of the BCC Working Group.

- 7.5.4 SOW to recruit an international expert on a part-time basis was developed to help implement, facilitate and drive the advocacy work and policy dialogue forward.

7.6 Challenges and Solutions

It will be a challenge to implement advocacy events and (the crucial) follow-up in the remaining project period; will require effective team work and good collaboration with key partners and counterparts. APII will aim for events to be convened and models promoted by local-national partners and counterparts to strengthen their commitment and ownership.

- 7.6.1 There are not many projects working on AI and EIDs currently making it difficult to sustain momentum in the BCC Working Group. APII and PAHI will review and update the member list and advocate for better mechanisms to engage in particular government counterparts in the Working Group. The NAISC/subcommittee for communication could potentially play a key role in governing and sustaining Working Group.

Monitoring & Evaluation

APII's M&E work aims to strengthen existing systems in the provinces, and help close existing gaps between grassroots level M&E and provincial-national levels M&E and reporting. In addition, APII acts as the repository for PMP indicators collected under USAID's API initiatives, providing analysis and reporting on this data.

In Year 3, M&E focuses on gathering data and evidence for showing the results of project implementation, especially the project's outcomes and effectiveness of the project models. Continuous capacity building for local partners to enhance sustainability will be conducted, based on the recommendations of the post-training assessment. The Project will continue to work closely with USAID's API partners to revise/update the result framework and PMP as well as to compile and analyze PMP data.

7.7 Achievements

- 7.7.1 Collected Year 2 PMP data from API partners for entry into database to be provided by MEASURE.
- 7.7.2 Continued to update and fine-tune the project Log-frame.
- 7.7.3 Worked closely with AMDI (subcontractor) conducting the post-training assessment. The assessment aims to determine the results, outcomes and (where feasible) the impacts of the training conducted so far and identify motivators and barriers to application of new skills and knowledge among trainees. The field work was completed by AMDI and the final report is expected to be ready by mid-February.

- 7.7.4 Continued to provide oversight of ongoing monitoring, evaluation and quality assurance of activities on the APII project. Monitoring checklists are analyzed in Excel for a systematic review of quality of activities.
- 7.7.5 Provided inputs to SOWs and deliverables on the KAP survey and other assessments in order to help ensure technical soundness in APII's work.

7.8 Challenges and Solutions

- 7.8.1 To manage and ensure quality of delivery from subcontractors is often a 'painstaking' process with much time and effort spent by APII staff from the beginning to the end and final deliverable. It requires frequent communication, close monitoring, careful checking, guidance and mentoring to help ensure that we receive products of acceptable quality throughout. Very often we end up spending far more time than expected on assuring quality of work by subcontractors. An important lesson learned is the need to have clear and well elaborated deliverables from the outset.
- 7.8.2 The PMP database with revised indicators set is not yet available from MEASURE. This has caused a delay in the entry and compilation of PMP data, received from API partners (FAO and WHO).

Administration & Finance

APII continues to submit routine deliverables to USAID, including quarterly progress reports, quarterly financial reports, semi-annual and annual reports etc. The F&A team support the technical teams in managing all subcontracts and consultants.

7.9 Achievements

- 7.9.1 All subcontracts and consultants are now better tracked by the F&A team helping to prepare contract modifications in advance (and reduce need for retroactive approvals). Technical teams are regularly updated and reminded of due dates for upcoming deliverables.
- 7.9.2 Smooth coordination and communication with USAID and quicker approvals/turnaround times help reduce delays.
- 7.9.3 Internal communications in APII on recruitment of consultants and preparations of subcontracts have improved.

7.10 Challenges and Solutions:

- 7.10.1 Satisfactory completion of USAID's Contractor Employee Biographical Data Sheet ('Biodata') is still a big challenge for new consultants often causing delays in consultant recruitment or entry of subcontracts. Many consultants are reluctant to reveal for instance salary history.

- 7.10.2 Obtaining 'leave without pay letters' also continues to be a challenge and regular cause of delays in consultant recruitment.
- 7.10.3 Many Subcontractors find it difficult to prepare technical proposals that meet the required standards. The need to involve local partners and the limited market for subcontractors gives APII little choice to pick and choose quality partners.
- 7.10.4 Many subcontractors submit unrealistic (inflated) budgets that need several rounds of negotiations and rechecking before they are acceptable.
- 7.10.5 Many Subcontractors struggle to submit quality deliverables. Follow-up and mentoring by the APII team is often required to meet minimum standards and minimize delays. In other words, we continue to spend much time and effort capacity building subcontractors.
- 7.10.6 Some approvals have required several back and forth communications between APII and Bangkok (e.g. retroactive approval of AFAP staff and consultants for Years 1-2; disposal list). The processes consume a fair amount of time.

8. Success Stories

8.1 Capacity building efforts come to fruition as Bac Giang Animal Husbandry and Veterinary Association achieves self- financing

Over the last two years, supported by USAID's Avian and Pandemic Influenza Initiative (APII), Vietnam Veterinary Association (VVA) has gradually been building its capacity towards becoming a self-sustained private association.

VVA recently finalized a five year development strategy (2011-2015) to help establish and strengthen central and provincial branches as more independent entities that can conduct workshops, train networks of animal health workers and provide other much needed services in the livestock sector.

Members of BAVA Executive Board

As an outcome of this, on Dec. 15 2011 and following decision number 1670/QĐ-UBND of Nov. 2011, the Bac Giang Provincial Branch hosted a formal launching ceremony with more than 500 participants representing the private, corporate and government sectors.

"This is considered a shining pearl in the development of various associations and it is very practical. Your lessons learned should be documented and shared with other associations to help strengthening our capacity", said Mr. Dang Huu Hung, a representative from VUSTA during VVA's annual review meeting on Nov. 30.

BAVA is best described as a civil society organization under VVA and the Provincial Technical and Science Union. BAVA will disseminate knowledge, transfer new techniques on poultry, offer vocational training, and provide counseling and assessment of legal documents and poultry development project proposals for provincial partners and authorities. The association is thus set to play a unique role as a bridge between corporate business, livestock producers, animal feed and drug and vaccine dealers and local government agencies.

With nearly VND 600 million put forward as capital by its members at the launch ceremony, Mrs. Huyen, member of the BAVA Executive Board proudly noted: *"This shows that the establishment of BAVA really meets the real needs of the local community as well as the expectations of its members".*

8.2 APII's supports realization of Circular 18 on Infection Control Improvement – a case of Thot Not district hospital, Can Tho

Infection control (IC) is a challenge that every hospital faces, no matter where it is located. To help ensure hospitals in Viet Nam remain safe places for patients to seek care, the Ministry of Health issued Circular 18 in Dec, 2009. The Circular specifically mandates IC implementation activities in hospitals such as hand hygiene, sterilization during surgery/procedure, cleaning, disinfection and sterilization of devices and equipment for medical care and treatment of instruments, equipment and supplies etc.

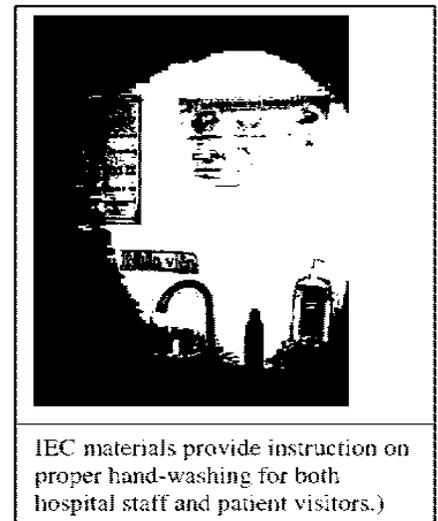

As with most circulars, Circular 18 does not include detailed operational guidelines on how to implement IC work at the hospital level. From May 2012 APII has supported 8 district hospitals in five focus provinces to implement important actions through collaboration with HCMC infection control and Ha Noi Society for Infection control (HANSIC). These actions have included improved instrument and linen processing and waste management, increased use of personal protective equipment, standardized facility disinfection, and standard cleaning practices to prevent the spread of infectious disease within the confines of the institutions.

APII, in close collaboration with Bach Mai hospital, HANSIC and HCMC Infection Control Society has helped provincial Departments of Health (DOH) train and engage more staff in proper IC work. This also includes development of training materials on IC procedures and training of 20 master trainers to conduct diffusion trainings in their hospitals. To support the interventions APII also provided IC supplies including alcohol hand rub, masks and IEC materials/posters to the hospitals.

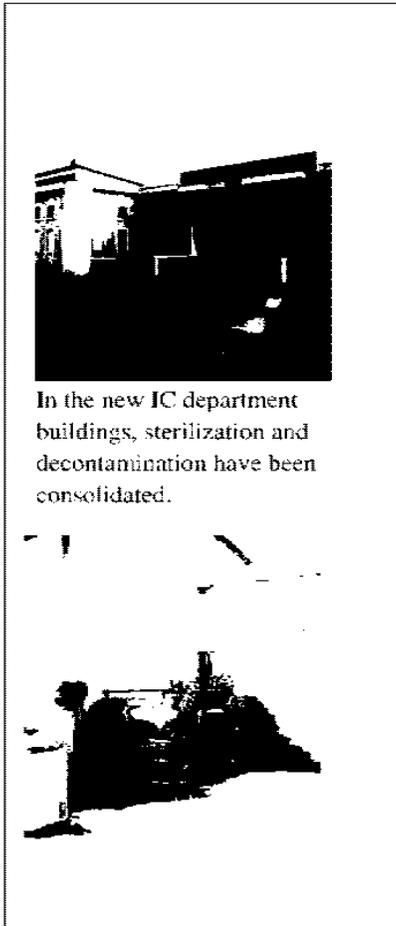

As in other hospitals receiving training on IC and case management, Thot Not district Hospital – a 250 bed hospital in Can Tho – recently established an IC committee consisting of 15 hospital staff who meet monthly to review work done and plans for improvement. This was done in compliance with Circular 18.

With support from APII, antiseptic/alcohol hand rub is now readily available in all patient rooms, and IEC materials are posted throughout the hospital.

“Working with the APII project helped us to see that all staff were uniformly trained and informed about IC, and to establish a monitoring and tracking system for IC” according to Thot Not Hospital director, Dr. Le Duc Long (December 2011).

IEC materials provide instruction on proper hand-washing for both hospital staff and patient visitors.)

In the new IC department buildings, sterilization and decontamination have been consolidated.

In 2011 the hospital moved into new buildings, which facilitated IC improvements. For example, 70 percent of rooms now have sinks for hand washing. The new facilities allow for easy decontamination and sterilization of equipment and supplies from all departments in the new IC department building. The new separate, dedicated IC building was built to house proper cleaning areas and autoclaves, as well as a packaging area. Dr. Long notes that creating this centralized unit allows the hospital to ensure consistent quality and manage the steps of decontamination efficiently.

Despite the strides made in the hospital, challenges still exist in improving IC. The physical arrangement of rooms and infrastructure, even in Thot Not's new building, create barriers to optimal IC and is costly to change. Hospitals need to work with their DOH's and Boards of Directors to find money in the budget to make these changes little by little over the next few years. While APII has provided chemical solutions for both surface sanitization and hand washing, hospitals need to plan and budget for keeping these in their pharmacies in future. Ongoing

behavior change and correction of misunderstandings, for example regarding how to dispose of sharps and when it is necessary to use gloves, will need to be reinforced through supportive supervision and refresher trainings in order to continue to build on and reinforce the correct behaviors learned in the APII trainings. As always, there is need for follow-up in order to see the improvements sustained.

In 2012, APII and HANSIC are working with Vietnam Nursing Association (VNA) to hand over the IC package with training materials, tools, and guidelines to provincial and national counterparts. VNA will work closely national IC experts, WHO/MOH and three regional IC Societies (Hanoi, Huc, and Ho Chi Minh City) for wider adoption and presenting this package to MOH for formal approval.

Avian and Pandemic Influenza

Introduction

This report presents the main achievements, challenges and solutions/lessons learnt for USAID's Avian and Pandemic Influenza Initiative (APII) during the first six months of Year 3 (October 2011 – March 2012).

The report is divided into the following thematic sections:

1. Animal Health Worker (AHW) Capacity Building
2. Agricultural Extension Worker (AEW) Capacity Building
3. Poultry Supply Chain Strengthening
4. Community-Based Surveillance (CBS)
5. Infection Control / Case Management (IC/CM)
6. Pandemic Preparedness Planning (PPP)
7. Cross-Cutting Issues
8. Success Stories.

1. Animal Health Worker (AHW) Capacity Building

The goals are to develop an AHW capacity building package and an AHW network model that is adopted by relevant public-private agencies at national and/or local levels, and to develop a standard Terms of Reference for AHWs for adoption by Provincial Peoples Committees (PPCs) and the Ministry of Agriculture and Rural Development (MARD).

The first half of Year 3 focused on completing and transferring the AHW training package for wider adoption and on establishing well-functioning networks of capable public and private animal health workers in and beyond project areas. Subcontractors included AFAP and Vietnam Veterinary Association (VVA).

1.1 Achievements

- 1.1.1 The Year 2 subcontract with AFAP was extended through November, 2011 and a Year 3 sub-contract developed and signed to cover ongoing activities in the field including AHW monthly meetings and refresher trainings for current and new districts as well as biosecurity training for farmers. The current subcontract ends in June 2012 and may be subject to extension.
- 1.1.2 AFAP's work promotes development of provincial strategies to maintain and expand monthly meetings and refresher training for grassroots AHWs. Training for new AHWs in Quang Tri was conducted on a cost-share basis with AHWs taking care of lunch themselves and local authorities supporting travel.
- 1.1.3 Quang Tri PPC has allocated 1 billion VND (~USD 50,000) on the provincial budget for training of AHWs in Quang Tri in 2012. This is a clear indication of the province's commitment to adopt and replicate the AHW training model/package.

- 1.1.4 A local consultant was recruited to help AFAP develop an E-book for the AHW training manual. A first version of the E-book is expected in May. The hard copy will be printed in the coming quarter after final revision.
- 1.1.5 A lessons learned-cum-advocacy workshop on training of and TORs for A lessons learned-cum-advocacy workshop on training of and TORs for AHWs was conducted 22-23 Nov 2011 in Quang Tri with participation of Quang Tri-based AHW agencies (incl. Agricultural Colleges and Vocational Training Centers), SDAHs of other focus provinces and of new provinces Thanh Hoa, Nghe An, Ha Tinh, Quang Binh, Thua Thien Hue, Quang Nam as well as representatives of DAH and RAHO3. The workshop included discussion on formalization of AHW training and certification.
- 1.1.6 VVA finalized and disseminated their 2011-2015 Strategy in October 2011 within the national network. Bac Giang Veterinary and Animal Husbandry Association hosted an event with 422 members and more than 100 public and private guests. The event highlighted the success of APII's support to VVA. Mr. Dang Huu Hung, a representative from Vietnam Union of Science and Technology Associations (VUSTA) noted in his speech that *"This is considered as a shining pearl in the development of various associations and it is very practical. Your lessons learned should be documented and shared with other associations to help strengthening our capacity."* A new subcontract to further network expansion is being prepared with VVA.

1.2. Challenges and Solutions

- 1.2.1 Allocation of local funds for training of AHWs remains a big issue. While Quang Tri DARD has allocated 1 billion VND on the provincial budget for AHW training in 2012 (for implementation of the provincial decision no. 25 of 2009 to implement and strengthen AHW networks) many other provinces have no clear plans yet to do so. SDAHs in Can Tho, Hung Yen and Ha Nam have expressed commitment to maintaining the refresher training and monthly meetings, but no funds have yet been allocated in the provincial budget to APII's knowledge. Currently, most of the local contribution has been provision of free meeting venues by District Veterinary Stations (DVS) and the voluntary participation of AHW without compensation, allowances or travel support. APII will continue to follow-up and advocate in this area, including reaching out to other provinces and consider cost-sharing TOTs (subject to USAID approval).
- 1.2.2 APII and SDAHs will need to continue to work with DARDs and PPCs and advocate for inclusion of AHW support in the 2013 annual budget cycle, for which plans and negotiations will be initiated in June 2012. TA and other support from APII may well be needed (not to lose momentum) in the coming months to help position the AHW model for wider adoption with provincial resource allocations.

2. Agricultural Extension Worker (AEW) Capacity Building

The goal is to develop an AEW bio-security training package for small commercial poultry producers, which is adopted by the national-provincial extension system, and by other partners.

The first six months of Year 3 focused on package completion and dissemination.

2.1 Achievements

- 2.1.1 In collaboration with PAFECs, four TOTs for Farmer Trainers on biosecurity for small commercial farmers were organized in the five focus provinces in Quarter 1 with a total of 100 participants from district and provincial extension centers, preparing the provinces for further roll out/replication.
- 2.1.2 Following the TOTs small group discussions for farmers were conducted to test and cost implementation. A total of more than 500 farmers attended 52 courses in the five focus provinces. AFAP and APII staff dialogued actively with PAFECs to encourage pilot provinces to replicate the training further. Can Tho is currently planning diffusion in May and June.
- 2.1.3 The finalized biosecurity training package was distributed in the five pilot provinces and through NAEC to more than 40 high risk provinces. APII receive official requests for further support and training on this package from PAFECs in Soc Trang, An Giang, Bac Lieu, Vinh Long, Dong Thap, Dac Nong, Dac Lac, as well as a local NGO ("Trung tam giao duc thuogn xuyen Hoa Binh") and Thai Nguyen University. An advocacy event followed this in Q3, which will be reported on in the next quarterly report.
- 2.1.4 Integration of biosecurity training for farmers in provincial communication plans was promoted by the AH and BCC teams for adoption in Year 3 BCC PSAs in all pilot provinces. The next quarterly progress report will help document how successful this effort has been so far.
- 2.1.5 Vietnam Poultry Association (VIPA) entered a new contract with APII for livestock sector workshops and strengthening of the association in order to promote biosecurity practices within their farmer club networks. APII is working with VIPA to prepare two national workshops: i) Biosecurity and sustainable development of garden chicken to be chaired/hosted by DLP; ii) Current food safety situation in markets and slaughterhouses in Vietnam chaired/hosted by DAH. FAO has been brought up to date on all of these events.

2.2 Challenges and Solutions

- 2.2.1 Working closely with NAEC/PAFECs is necessary to help institutionalize the training/extension package. This is a time-consuming process which requires diplomacy, patience and perseverance in order to forge and sustain close relationships. MARD's recent strategy of opening up to competitive bidding the allocation/awarding of extension funds to not only

NAEC and PAFECs but also private enterprises will have implications for our work and will influence our strategy to promote replication of our AEW package. We will include NGOs, Civil Society Organizations and private entities as well in our advocacy and partnership efforts. This may provide opportunities for some novel and unconventional public-private-partnerships.

- 2.2.2 VIPA has demonstrated their ability to coordinate with MARD institutions such as DLP, DAH and NAEC. However, the association is still in need of substantial and sustained capacity strengthening. APII will continue to support this process through the subcontract.

3. Poultry Supply Chain Strengthening

The goal is to develop biosecurity/biosafety demonstration models in key (high risk) nodes along supply chains, together with related documents (protocols, guidelines, training materials) which are adopted, adapted and replicated by public agencies, private partners and/or other development projects and programs elsewhere.

The key nodes for APII interventions in Year 3 are:

- Dong Ha live bird and poultry meat market in Quang Tri;
- District market in Ha Nam;
- Ngoc Xuan centralized poultry slaughterhouse, Can Tho City;
- Home-based slaughter points around Dong Ha market, Quang Tri;
- Small slaughter points around Duy Tien district market, Ha Nam.

3.1 Achievements

- 3.1.1 The upgrade of the poultry sections in Dong Ha Market by a local construction company was completed in Nov 2011, co-funded by APII, the Market Management Board (MMB) and the vendors. A launch event was conducted on December 5 with representatives of Quang Tri province, neighboring provinces, DAH, VIPA, DLP, LIFSAP, FAO, USAID and APII. A success story was published on USAID's website.
- 3.1.2 A training session on risk reduction and good practices was conducted before the re-opening market for vendors, MMB representatives, district veterinary staff and cleaning staff. Follow-up trainings on bio-security, bio-safety and business development are provided at regular (usually monthly) intervals. Continued 'hand-holding' is absolutely necessary (and a positive thing) in order to see sustained behavior changes materialize.
- 3.1.3 Technical drawings, protocols, and bills of quantities were completed for an upgrade of Phu Nong centralized slaughterhouse in Kien Giang and Ngoc Xuan slaughterhouse in Can Tho. However, the initial plan to use Grants Under Contract as the financing vehicle was abandoned following USAID's advice and replaced with a Stakeholder Agreement procedure. This caused a significant delay. The Ngoc Xuan (Can Tho) upgrade is

scheduled to start in April, whereas the slaughterhouse work in Kien Giang looks less promising, partly due to lack of buy-in and commitment from provincial counterparts.

- 3.1.4 Two slaughter points in Dong Ha, both supplying the live bird market, were selected for upgrades and demonstration model development. Technical proposals and stakeholder agreement were prepared.
- 3.1.5 A similar approach is underway in Ha Nam with plans for upgrading a district market and one home based slaughter point.
- 3.1.6 Based on the Veterinary Inspectors training courses in Can Tho, September 2011, a third course was conducted in HCMC for 26 participants from the Mekong Region in December. This 'Advanced Training Course for Inspectors on Veterinary Hygiene and Risk Reduction in Poultry Slaughterhouses' was implemented together with HCMC Veterinary Inspection Center and FAO. Participants included LIFSAP counterparts, RAHO 6-7 staff, and DLP representatives. APII received positive feedback suggestions for further training courses elsewhere.
- 3.1.7 APII actively shared materials including risk assessment reports, supply chain node prototype designs, small group discussion flipcharts etc. with LIFSAP and continued throughout the reporting period to invite LIFSAP and VAHIP representatives along to relevant events for closer collaboration and experience/lessons learned sharing.

3.2 Challenges and Solutions

- 3.2.1 While provincial counterparts clearly are very interested in the demo models, most provinces have no 'master plans' that demarcate future locations e.g. for centralized poultry slaughterhouses and markets, which makes it difficult for them to commit resources in this area. In addition, the processes for local authorities to approve construction are very complex, involving multiple stakeholders and complex regulatory frameworks which are not always well understood by all or straightforward to implement. APII is still learning along the way and adjusting plans and expectations accordingly.
- 3.2.2 Profit margins from poultry slaughtering are small especially in small scale slaughtering operations. It is understandably hard to persuade the small private entrepreneurs to invest in facility upgrades and without some form of 'subsidy' (financial support) in this environment. Micro-finance options in the commercial financial sector (banks, MFIs) are rarely available. Many small entrepreneurs appear to be comfortable where they are without plans to expand. Cost-cutting measures seem a more appealing way forward to improve business and increase profits. This also implies cutting private costs on environmental safeguarding and food safety related measures. Sustained awareness raising is necessary combining stick-and-carrot for more attention to public goods issues.
- 3.2.3 APII continues to reach out to and invite partners such as LIFSAP and VAHIP. Partners rarely reciprocate however. USAID may need to step in and help promote the dialogue at donor level.

4. Community-based Surveillance (CBS)

The goal is to develop an events-based grassroots surveillance package, including training materials/tools and job descriptions for grassroots 'collaborators', which is adopted, adapted and scaled-up in the provincial-regional-national surveillance system with local resources.

The first six months of Year 3 focused on phasing out CBS implementation at the field level, preparing and initiating the CBS evaluation, and advocacy activities.

4.1 Achievements

- 4.1.1 In October 2011, APII ceased providing financial support to CBS networks in Ha Nam, Hung Yen, Can Tho and Kien Giang provinces. Only support in Quang Tri, where the province will start providing monthly allowances for AHWs from the provincial budget in 2012, was maintained in order not to lose momentum before provincial takeover.
- 4.1.2 APII held a handover meeting in October between CCHIP (previous subcontractor) and Quang Tri Livestock Production and Veterinary Association (QTLVA), the new subcontractor on CBS in Quang Tri. QTLVA continued monitoring, supervising, maintaining and supporting the CBS collaborator networks in Quang Tri from until end of December. From Jan. 2012 onwards the province is expected to assume responsibility for supporting/maintaining CBS collaborators and networks. As of January 2012 animal health collaborators have received a monthly allowance from the provincial budget, following Decision 25 of Quang Tri PCC. The CBS evaluation now underway will provide insights into the extent to which CBS activities in Quang Tri and elsewhere are being sustained.
- 4.1.3 Supported by the APII team an international (Australian) intern conducted an assessment in Quang Tri on human health - animal health cross-sector collaboration, coordination and knowledge/use of human health - animal health services among sector three farmers. The University of Sydney awarded a high distinction for the thesis work submitted towards a Masters' degree and is now encouraging the student to submit to a peer reviewed journal for publication.
- 4.1.4 An economist from Abt's Home Office updated the previous costing of the CBS model costing, including a cost-benefit analysis. This study will complement the final evaluation of the CBS model.
- 4.1.5 Prepared for and initiated the CBS evaluation led by an International Consultant working with and guiding a local subcontractor (AMDI). The evaluation aims to identify whether the CBS system is effective in enabling timely detection, reporting, and investigation of, and response to, animal and human disease events with outbreak potential, as well as the feasibility and barriers for sustained adoption, adaptation and replication of the CBS system in Viet Nam. Both quantitative and qualitative evaluation methods are being applied.

- 4.1.6 Prepared for a national workshop in Hue in early April on the CBS model, lessons learned and recommendations on the way forward.
- 4.1.7 Had two posters (Annexes 5 and 6) on the CBS work presented at the American Public Health Association (APHA) conference in Washington DC Oct 29 – Nov 2, 2011:
<http://apha.confex.com/apha/139am/webprogram/Paper242716.html>
<http://apha.confex.com/apha/139am/webprogram/Paper242729.html>
- 4.1.8 The APII Technical Director for Human Health Delivered a lecture on the CBS model for 11 visiting undergraduate students from the University of North Carolina at Chapel Hill, USA. The students also visited the field work to see the CBS model at work in Ha Nam.

4.2 Challenges and Solutions

- 4.2.1 The firm initially identified to implement the subcontract for the CBS evaluation withdrew and another company (AMDI) was identified as a suitable replacement. The change in subcontractor caused some delay in implementation but the evaluation is progressing well. As is usually the case, APII staff have spent considerable time on quality assuring subcontractor work.

5. Infection Control/Case Management (IC/CM)

The goal is to develop a model (with training tools, guidelines etc.) for implementation of Circular 18 at the local level, which is adopted more widely in Vietnam.

The first six months of Year 3 focused on preparing and initiating a subcontract with the new IC subcontractor, Vietnam Nurses Association (VNA). The highlight was a series of regional workshops on IC advocacy and replication in Hanoi, Hue and Ho Chi Minh City in late March/early April chaired by MOH, VNA and Infection Control Societies, and covered by local and national media.

5.1 Achievements

- 5.1.1 Signed a contract with VNA to implement APII IC activities in Year 3. The work progressed well culminating with three regional workshops with key stakeholders on IC advocacy and replication in Hanoi, Hue, and Ho Chi Minh City in late March/early April. The events were chaired by MOH, VNA together with the regional Infection Control Societies. This was aired on O2TV and uploaded to the T5G/NCHEC website (<http://www.t5g.org.vn/Default.aspx?u=dt&id=3706>). The media clip was subtitled for wider dissemination. A media advisory and press release were made available and shared.
- 5.1.2 VNA conducted a training needs assessment and review of current IC status in the five focus provinces during February. Findings were shared in the above-mentioned IC workshops.

- 5.1.3 IC evaluation conducted by an international consultant from Abt Head Quarters and a local consultant. Preliminary findings were presented in the IC workshops. The final report will be available soon.
- 5.1.4 Conducted monitoring visits and provided technical assistance to Gio Linh district hospital in October 2011 in collaboration with Hue Infection Control Society (ICS) experts. The results of this work are posted on the Website of Huc ICS: http://www.husic.org.vn/vn_tin-tuc/thoi-su/hoat-dong-ksnk-tai-bv-gio-linh-tinh-quang-tri-91-husic.aspx
- 5.1.5 Can Tho provincial Department of Health (DOH) applied APII's assessment tools and methodology to conduct IC infection control status for other hospitals in in Can Tho including provincial and specialized hospitals using their own resources. The results of the assessment will not only help them understand current situation of IC practices but also develop their action plans for IC improvement.
- 5.1.6 Meetings were conducted with the DOH in Quang Tri, Can Tho and Kien Giang to review results of IC interventions in selected district hospitals and IC assessments in other hospitals on IC organizational structure, hospital equipment, knowledge and practice of health workers. The assessments were done by DOH with technical support from APII (methodology, tools, etc.).
- 5.1.7 The annual DOH evaluations ranked all eight APII intervention hospitals' in the five provinces IC activities excellent or very good and among highest scores.
- 5.1.8 USAID delegation visited Gio Linh district hospital on December 5, 2011. During the visit, the delegation had opportunities to observe IC activities and interact with the hospital board of directors and IC specialists.
- 5.1.9 Invited WHO and MOH IC experts to Kien Giang province to visit Tho Not district hospital supported under USAID's AI Mekong Initiative and Go Quao district hospital supported by APII. The team also had chance to visit a non-intervention district hospital in Hon Dat district. During the visit, the experts were able to observe and discuss with the hospital board of directors and IC specialist's achievements and lessons learned, success stories from IC interventions supported by APII and to compare intervention with non-intervention hospitals.

5.2 Challenges and Solutions

- 5.2.1 All hospitals and DOHs were busy at the end of the year with little time for IC activities. To support the hospitals and DOHs, the APII team undertook field monitoring visits to help integrate IC activities into DOH annual evaluations.
- 5.2.2 The process of subcontract preparation with VAN required more time than expected. Budget negotiations and the preparations of CVs, Biodata, and leave without pay letters typically cause delays.

- 5.2.3 It required extra take time and effort to get the necessary involvement of MOH but the result justified this strategy as seen in the regional IC workshops.

6. Pandemic Preparedness Planning (PPP)

The goal is to develop PPPs in selected pilot province(s), introduce the package in other provinces, and advocate for its wider adoption in Vietnam.

The first six months of Year 3 focused on developing the Kien Giang PPP with the new concepts and gathering the comments and inputs from relevant sectors, local organizations, and national and international experts.

6.1 Achievements

- 6.1.1 Met with WHO to discuss PPP collaboration in Year 3, including how APII and WHO will support the Government to revise the PPP with inclusion of business continuity planning (BCP).
- 6.1.2 Organized a PPP workshop November 15-17 for representatives from local authorities to discuss the new concept of “whole-of-society” approach and develop a multi-sector framework for the design and implementation of their PPP.
- 6.1.3 Compiled inputs and comments on Kien Giang PPP outline and drafts from technical experts, national consultants and API partners.
- 6.1.4 Finalized the revision of training materials for community leaders with WHO inputs. The training materials focus on three main topics: concepts of influenza and pandemic; community planning for pandemic preparedness; and business continuity planning and livelihood maintenance plans during the difference phases of a pandemic.
- 6.1.5 Engaged an experienced local consultant to work closely with VNRC and provide technical inputs on PPP revisions, finalization and dissemination process and help ensure the quality of the PPP activities.
- 6.1.6 Ten PPP training courses for about 250 community leaders were organized by VNRC in Ha Nam, Hung Yen, Quang Tri, Kien Giang and Can Tho. The training provided basic knowledge for community leaders on pandemic influenza and community preparedness for pandemics (such as preparedness for health, livelihood, essential services provision, business continuity planning, etc.).
- 6.1.7 A preparation meeting was organized in Kien Giang on the table top exercise plan. The plan with some scenarios was drafted with experiences shared from Ha Nam experts. The table-top exercises are scheduled for early May.

6.2 Challenges and Solutions

- 6.2.1 It took a time to obtain feedback and comments on the PPP outline from API partners and local experts. This, and other delays (including flooding

in Kien Giang), led to the late of submission of VNRC deliverables and was followed by a subcontract modification (time-wise extension).

- 6.2.2 The “whole-of-society” approach and the business continuity planning concepts adopted in Kien Giang’s PPP are new to the province and to VNRC. APII technical staff, with inputs from WHO, worked very closely with VNRC and provincial counterparts to provide technical support in the development of the PPP.

7. BCC and Cross-Cutting Issues

Behavior Change Communication (BCC)

The BC work aims to identify appropriate behaviors and messages, integrate these into the work of the animal and human health components, and strengthen the BCC capacity of national and provincial stakeholders, enabling them to carry on BCC activities beyond the life-time of the project. The second ‘C’ concerns APII’s advocacy and policy dialogue work.

The first six months of Year 3 focused on the development of BCC transitional strategy and plans in the five focus provinces where local partners will take the ownership and leadership in designing, implementing, monitoring and evaluating their future campaigns and other BC efforts. Local partners and BCC trainer teams were provided coaching and mentoring by the APII team to develop their own BCC materials including discussion guides and training plans targeting to small and medium commercial farmers for improved biosecurity practices and recommended behaviors prioritized by line ministries and provinces to prevent AI and EIDs.

7.1 Achievements

- 7.1.1 Organized a Consultation Workshop on the Year 3 BCC Strategy in Da Nang with participation of key leaders and officers from Ha Nam, Kien Giang and Quang Tri. The outcomes of workshop helped promote new and innovative BCC activities (e.g. excellent poultry farmer competitions) and local contributions. This workshop was a first step in the BCC transition strategy to position provincial partners to carry out their own BCC work post-APII.
- 7.1.2 Conducted Year 3 implementation planning workshops in December in the five focus provinces. The workshops helped provinces to think through the Year 3 transition strategy and prepare their BCC plans including campaigns, follow-up on farm level biosecurity, new activities such as farmer competition, identifying provincial counterpart funding contribution in implementing Year 3 BCC activities, etc.. and prepare proposals for the 2013 budget to be submitted in June 2012.
- 7.1.3 Provided technical guidance and support on the review and finalization of provincial proposals for Year 3 BCC activities in all five focus provinces. These proposals served as the basis for developing Year 3 BCC SOWs for each province which subsequently were turned into subcontracts for local BCC subcontractors of Ha Nam, Hung Yen, Kien Giang and Quang Tri.

- 7.1.4 Designed and produced BCC promotional materials including aprons and hair bandeau for poultry vendors in Dong Ha Market during the market launch event.
- 7.1.5 Guided two small group discussions (SGD) with live bird and plucked poultry vendors of and two monthly meetings with poultry clubs at Dong Ha market facilitated by Quang Tri BCC trainers with coordination and support from Dong Ha market management board. In these monthly meeting, participants also have opportunity to receive technical update on important health check-up and improvement of recordkeeping and business plan.
- 7.1.6 Finalized and produced the seven-step discussion guides for live bird and plucked poultry vendors in Dong Ha market with technical inputs from MOH, MARD, WHO and FAO. These guides are being used by provincial BCC trainer team in Quang Tri in group discussion to promote desired behaviors among these vendors. The guides also serve as reference for all focus provinces to develop their own discussion guides on new bio-security behaviors and will be used by trained communicators to facilitate small group discussions with farmers in this Year 3.
- 7.1.7 Provided technical assistance to Quang Tri Women's Union (WU) to organize their 'Three Clean Movement Ceremony', part of a National Program on Building New Rural Areas, which utilize BCC trainer team's efforts, applies BC interactive approaches and integrates desired behaviors for AI/EIDs prevention in the WU network.
- 7.1.8 Finalized the seven-step discussion guides for poultry slaughterers and collectors to be used by provincial BCC specialists leading small group discussions in APII supported slaughterhouses/points.
- 7.1.9 Prepared for the upcoming training on proposal development and writing skills (in May) for key staff from the five focus provinces and other interested provinces, national agencies and organizations. This training is scheduled to be completed in May 2012 with ongoing coaching and follow-up so that provincial teams can develop their proposals ready to be submitted to their PPC in June 2012.
- 7.1.10 Provided technical assistance to build capacity of provincial trainer teams in Can Tho, Ha Nam, Hung Yen, Kien Giang and Quang Tri.
- 7.1.11 Can Tho's Multi-sector Communication Guide was endorsed by the PCU before submission to Can Tho People's Committee for approval and dissemination to interested institutions in Can Tho and neighboring provinces. The development of this document was led by Can Tho's BCC specialists from SDAH, PAFEC, CHEC (T4G) with involvement of experts from DLP, DAH, NAEC, NCHCE, the MOH sub-committee for communications and with inputs from FAO and CDC.
- 7.1.12 In the process of designing Ha Nam provincial Integrated Behavior Change Communication Plan for print out and distribution in April – May, including a dissemination workshop.
- 7.1.13 Worked with Centre Committee for Popularization and Education (CCPE) to provide training on AI and EIDs prevention for more than 500

participants from 63 provinces and cities in the whole country. The diffusion training courses in CCPE network in 63 provinces/cities were included in provincial monthly plans submitted to CCPE. The monitoring visits made by CCPE to 13 provinces found that nearly 100 articles and 60,300 internal news on A/EIDs prevention were disseminated and 59 times aired on provincial TVs and 48 times broadcasted through local radio systems.

- 7.1.14 In collaboration with National Center for Rural Water Supply and Environmental Sanitation (NCERWASS), UNICEF and Lien Aid, worked with Minh studio, a local media firm to develop and air seven TV spots on hand-washing and sanitation practices related to raising, slaughtering and selling poultry. These spots were aired on provincial TV channels and will be used for discussion with sector three farmers, market vendors and slaughterers in project and demonstration sites.
- 7.1.15 Completed a qualitative Knowledge, Attitudes and Practice (KAP) study of poultry customers in 4 provinces of Can Tho, Ha Nam, Kien Giang and Quang Tri. Results served to inform USAID/APII activities design, for example they were extracted to discuss with related provinces on Year 3 BCC activities (e.g poultry stakeholders forum) on food safety practices. The qualitative KAP study was conducted by a national expert.
- 7.1.16 A large quantitative KAP survey was completed by a subcontractor (Nielsen) guided carefully by APII. More thorough analysis of key indicators is underway by staff in Abt's home office. A final report that combines findings from the quantitative and qualitative KAP studies will be submitted to USAID in the next reporting period.

7.2 Challenges and Solutions

- 7.2.1 Limitations in writing skills and analytical thinking among provincial subcontractors were reconfirmed through their participation as members of the writing team developing Can Tho's Multi-sector Communications Guide and also through their progress reports and activity proposals. This partly explains the delay in some activities. Other reasons include pre-occupation of writing team members (from PAFEC, SDAH, PCHCE, PMC) with other work. Recognizing the weaknesses, provinces have asked APII to provide training on writing skills and proposal writing in Year 3.
- 7.2.2 Exploring local contributions to implement Year 3 BCC activities required discussions and negotiations, which delayed provincial implementation of activities. Intensive technical assistance from APII staff and strict schedule management helped manage the delays.
- 7.2.3 Unlike other provinces, it took time to reconsider a local subcontractor who is likely to take the ownership and leadership for subsequent communication program on BCC work in Can Tho. However, CEFACOM was nominated again by the PCU as the quality of their work is appreciated. The disadvantage is that CEFACOM may have weaker connections with other agencies in the province than a local subcontractor. Key CEFACOM staff were not available until April 2012 so the APII BCC

team initiated the work with BCC trainer team in Can Tho to develop their own BCC materials for their future campaign(s).

- 7.2.4 The KAP survey outsourced to Nielsen required far more inputs, checking and quality assurance by the APII team than envisaged. Illustrates once more the point that APII plays an important (and somewhat unrecognized) role in building the capacity of subcontractors. This needs to be better documented and written up in future.

Provincial Coordination and Implementation

APII's provincial implementation (PI) team works closely with the animal health, human health and BCC technical teams to coordinate field activities implemented by subcontractors, develop/test successful models at provincial and grassroots level, and advocate for their wider adoption with local public and private partners. The PI team operates out of the main office in Hanoi covering activities in northern Vietnam and through two satellite offices, one in Quang Tri for activities in central Vietnam and one in Can Tho for activities in southern Vietnam.

Provincial Coordination Units (PCUs), representing the body of key provincial counterparts and civil society, were established in Year 1 in the five focus provinces. Each province has a Provincial Coordinator (PC) appointed jointly with FAO and funded by APII. The PCs are typically seconded from a provincial agricultural/livestock agency. The PCs work closely with the PI team, coordinate their efforts with FAO's focal points, and report to the PCUs.

7.3 Achievements

- 7.3.1 Signed MOU addendums for Year 3 with all five focus provinces.
- 7.3.2 Worked closely with the APII technical teams to facilitate an integrated approach at the field level.
- 7.3.3 Worked closely with provincial subcontractors to prepare work plans with emphasis on dissemination and advocacy activities.
- 7.3.4 Cooperated with FAO in preparing and conducting provincial planning workshops.
- 7.3.5 Worked with FAO to extend the contracts for Provincial Coordinators (PCs) until June 2012.
- 7.3.6 Worked with PCUs to enhance their commitment to the strategy of Year 3 shifting focus from implementation to advocacy and replication with local resources and getting provincial buy-in.
- 7.3.7 Worked closely with provincial partners to review the models and draw lessons learned and field-based evidence for advocacy.
- 7.3.8 Organized stakeholder consultation workshops in the focus provinces to and supported provincial partners in preparing their inputs and presentations at the CBS review workshop in Hue (held in early April).

7.4 Challenges and Solutions

- 7.4.1 Need and justification for continued support to PCUs to be reviewed and determined.
- 7.4.2 Future of PCs beyond June 2012 to be considered and decided with USAID and FAO. The provinces are well aware of the plans to phase out the PCs within Year 3.
- 7.4.3 Maintaining provincial interest and commitment as APII continues to withdraw its support to implementation and shifts towards advocacy for adoption and uptake increasingly with local resources.

National Coordination & Policy Dialogue

The goal in Year 3 is to increase the focus on ways and mechanisms to transfer packages/models/approaches to public and private partners for adoption, adaptation, replication and up-scaling. The project consults and coordinates closely with API partners in this effort.

The first six months of Year 3 focused on updating the advocacy strategy and action plan and supporting strategic communications and project promotion in (upcoming) advocacy events.

7.5 Achievements

- 7.5.1 Facilitated the BCC working group meeting in March 2012 where BCC working group members shared their communications plans and common interests in AI and EIDs prevention in 2012 and beyond (under the AIPED framework) including scope for further collaboration maximize efforts and resources.
- 7.5.2 Prepared media advisories and press releases for (upcoming) advocacy event on APII's IC, CBS and AEW work. The IC workshop in Hanoi in late March was aired on O2TV and websites (including NCHEC). The TV clip was subtitled in English and shared with USAID for wider dissemination.
- 7.5.3 Prepared an advocacy matrix for APII advocacy activities and shared with USAID and API partners for inputs and feedback.
- 7.5.4 Engaged an international expert as Advocacy/Policy Dialogue Advisor. This input is already bearing fruits and boosting APII's communications work.

7.6 Challenges and Solutions

- 7.6.1 APII's planning and budget cycle does not match that of the Government making it more difficult to get the timing right and call for local funding to adopt, adapt and implement models developed with APII. The APII team needs to be well prepared and think/plan ahead with partners and counterparts.

Monitoring & Evaluation

APII's M&E work as a critical component linked with all other program's components in the project's strategic plan and framework to strengthen existing systems for AI/EIDs detection, prevention and management in the focus provinces. In addition, APII acts as the repository for PMP indicators collected under USAID's API initiatives, providing analysis and reporting on this data.

In Year 3, M&E focuses on gathering data and evidence for showing the results of project implementation, especially the project's outcomes and effectiveness of the models. Continuous capacity building for local partners to enhance sustainability will be carefully considered, based on the recommendations of the post-training assessment.

The Project will continue to work closely with USAID's API partners to revise/update the result framework and PMP as well as to compile and analyze PMP data.

7.7 Achievements

- 7.7.1 Collected Year 2 PMP data from API partners for entry into database to be provided by MEASURE. Contributed to finalizing the revised indicators and database with MEASURE's lead.
- 7.7.2 Continued to provide oversight of ongoing monitoring, evaluation and quality assurance of activities on the APII project. Monitoring checklists are analyzed in Excel for a systematic review of quality of activities.
- 7.7.3 Continued to update and fine-tune the project Log-frame.
- 7.7.4 Worked closely with AMDI (subcontractor) conducting the post-training assessment in November 2011. The assessment aims to determine the results, outcomes and (where feasible) the impacts of the training conducted so far and identify motivators and barriers to application of new skills and knowledge among trainees. The assessment applied self-administered questionnaires on knowledge, attitudes and practices combined with focus group discussions and in-depth interviews for 1316 trainees, 220 trainers, and 59 local animal and human health officers. Overall, it identified a high level of knowledge and positive attitudes in all groups eight months to a year after the training courses. High percentages of trainees self-reported applying almost all gained skills with a high level of confidence. The assessment also acknowledged the working mechanism for AI prevention through hand-in-hand cooperation between AH, HH and communication sectors as a promising way to create long-term impact.
- 7.7.5 Provided inputs to SOW and deliverables on the KAP survey and other assessments in order to help ensure technical soundness in APII's work.

7.8 Challenges and Solutions

- 7.8.1 To manage and ensure quality of delivery from subcontractors is often a 'painstaking' process with much time and effort spent by APII staff from

the beginning to the end and final deliverables. It requires frequent communication, close monitoring, careful checking, guidance and mentoring to help ensure that we receive products of acceptable quality throughout. Very often we end up spending far more time than expected on assuring quality of work by subcontractors. An important lesson learned is the need to have clear and well elaborated deliverables from the outset. APII needs to document this effort and highlight any related 'capacity building success stories'.

- 7.8.2 The PMP database with revised indicators set is not yet available from MEASURE. This has caused a delay in the entry and compilation of PMP data from API partners (FAO and WHO). USAID is following up with MEASURE.
- 7.8.3 The post-training assessment identifies important challenges such as assuring standards and quality of training activities conducted through various sub-contractors; training on skills and competencies; assessment on skills, competencies, training outcomes and impacts; and sustaining changes and improvements after training. Key barriers for sustainability at institutional and individual levels include a lack of regular incentives (e.g. salary or allowances) for public AHWs possibly leading to high turnover of the trained AHWs; shortage of resources, standardized tools and frameworks for follow-up, coaching and continued on-site training and learning. The assessment recommends involving local partners in all stages, discussing with the partners on a follow up strategy as well as advocating for policy development to create an enabling environment for a higher sustainability.
- 7.8.4 The project is unable to maintain project-specific reporting mechanisms after the CBS piloting to obtain data for the indicators on AI suspected cases in Animal Health and Human Health (USAID PMP 1.3 and 2.7). These indicators are not a regular indicator in the national surveillance system. In the Human Health Sector, the '24 Communicable Diseases Form' does not include AI. In Animal Health, disease reporting goes down to commune level only. Moreover, the investigation and appraisal records are usually prepared only for the events which are confirmed positive by lab tests and/or where control measures are taken later on. Records are not kept on suspected, unconfirmed cases.

Administration & Finance

APII continues to submit routine deliverables to USAID, including quarterly progress reports, quarterly financial reports, semi-annual and annual reports etc. The F&A team supports the technical teams in managing all subcontracts and consultants.

The first six months of Year 3 focused on the management of expenses versus budget, subcontracts and consultants and early preparations for Project Close Out.

7.9 Achievements

- 7.9.1 Smooth coordination and communication with USAID/Vietnam and quick approval turnaround time from USAID that helps to facilitate the process better.
- 7.9.2 Improved APII internal communication regarding the procurement process of consultant and subcontract that help the team works more efficient.
- 7.9.3 USAID Vietnam was very supportive and proactive in SOW approval and planning activities of Project for Year 3 that help project in its work plan for subcontracts and consultants. APII regularly update USAID on the revise timeline of any subcontract and consultant.

7.10 Challenges and Solutions:

- 7.10.1 New approval procedures sent by Bangkok were extremely helpful and helped speed up the approval process.
- 7.10.2 With only six months left on the project some staff have left (Technical Director for Human Health, Admin Assistant, F&A Assistant – Can Tho office) giving extra work to an already stretched team. Will need to focus on way to keep remaining staff motivated and be prepared for stop-gap measures if/where necessary. A senior HPI staff was brought in on 30% to help close the gap after the Technical Director for Human Health.
- 7.10.3 May need to think of replacements for vacant positions, albeit it may be difficult to attract new 'long-term' staff with the amount of time left.

8. Success Stories

8.1 APII training package assists An Giang in improving biosecurity practices

In 2011, An Giang People's Committee approved the project "developing biosecurity poultry production in An Giang period 2011-2013" which aims to improve biosecurity and food safety practices in poultry production. To implement this, the An Giang provincial Agriculture and Extension center (PAFEC) included 79 training courses for 2,000 poultry raising households and 22 intensive training courses for 600 members of 66 newly established cooperative groups into their 2011 plan and budget.

Master Trainer in Action at a TOT Course

The USAID/APII project assisted PAFEC in this endeavor. During October-December 2011, the project hosted a two-day training of trainers (TOT) course in Long Xuyen for 25 agriculture extension workers on biosecurity measures and application of training packages (trainers' flipcharts, guidebooks and comic books) with farmers. Following the training of trainers course, the newly trained trainers

organized 35 biosecurity courses reaching more than a thousand small and medium commercial poultry farmers in 11 districts in An Giang and 11 courses for 329 poultry cooperative members.

Preliminary findings from USAID/APII's recent study on cost and benefits of the biosecurity training package shows that knowledge and skills learned from these trainings are being put into practice. Early data indicates that for poultry farmers, there has been a 5-10% decrease in the number of sick poultry. Similarly, poultry production productivity has increased by up to 19% thanks (in part) to the application of improved biosecurity measurements.

As a result of the training undertaken in 2011, An Giang PAFEC is organizing another 44 biosecurity training courses for 1,320 households under the "Developing biosecurity poultry production in An Giang period 2011-2013." The PAFEC project also plans to set up 66 poultry raising cooperative groups by the end of 2012, and has requested additional assistance from USAID/APII, including additional training packages for both trainers and farmers.

Introduction

This report presents the major achievements, challenges and solutions/lessons learned for USAID's Avian and Pandemic Influenza Initiative (USAID/APII) during Year four, covering the period from October 2012 to August 2013. In preparation for the close out of the project contract, project activities and staffing levels were significantly reduced in beginning in July 2013. The shortened period of coverage in this report reflects project activity levels.

Year four saw the project complete the transition, which commenced during Year three, to full implementation of the project, with a focus on adoption and adaptation of projects throughout Vietnam of key models that were previously developed and tested by the project in the five original focus provinces. We continued with the three major focus areas: animal health (AH), human health, and behavior change communication (BCC). Activities were implemented via subcontracts, as Abt's current license does not accommodate direct implementation. Working in this way required attention to identifying subcontractors capable of delivering quality work on time, and strengthening the capacity of subcontractors as a vital part of USAID/APII's work, in order to fulfill our objectives for Year four in a timely way and to achieve close out of programs.

The project progressed well in most of the eight main focus activities:

1. Coordination and Policy Dialogue
2. Human Health Surveillance
3. Case Management and Infection Control (IC) Capacity Building
4. Pandemic Preparedness
5. Animal Health Surveillance
6. Animal Health Worker (AHW) Capacity Building and Agricultural Extension Worker (AEW) Capacity Building
7. Supply Chain (Poultry Supply Network) Strengthening
8. Behavior Change Communication (BCC).

In Year four the project focused strongly on the wider adoption and sustained implementation of models, leading to ongoing impact beyond the life of the project. Adoption, adaptation, replication and scaling up of USAID/APII innovations by public and private partners are considered the real measures of success for the project. In order to achieve this, the project carried out sustained advocacy and promotional campaigns in close consultation with USAID and APII partners. These campaigns achieved very strong results across key components and models developed by the project, particularly in relation to Infection Control, Animal Health Worker (AHW) Capacity Building and Agricultural Extension Worker (AEW) Capacity Building, Supply Chain (Poultry Supply Network) Strengthening and Behavior Change Communication (BCC). What follows is a description and discussion of the main achievements and challenges of Year four.

1. National Coordination and Policy Dialogue

Under National Coordination and Policy Dialogue we have three goals to achieve by the end of Year four:

- Improved coordination in order to improve highly pathogenic Avian Influenza HPAI prevention and control
- Sustained dialogue, coordination and lesson sharing on communications in Vietnam at a national level
- National communication framework revised in line with Avian Influenza, Pandemic Preparedness and other Emerging Infectious Diseases (2011-2015) (AIPED), officially approved by National Steering Committee for Avian Influenza (NSCAI), and applied by all members in planning and implementation.

1.1 Achievements

- 1.1.1 Developed and executed an advocacy plan and matrix as well as the communication strategy with support from an international expert, David Payne, as Advocacy/Policy Dialogue Advisor to boost project advocacy and communications work.
- 1.1.2 Developed six briefs on key models established to present in the project final dissemination workshop and to share widely for further adoption and adaption.
- 1.1.3 USAID/APII representatives attended, provided technical comments and shared experiences in several national/regional workshops on Infection Control (IC) (see Section 3 below).
- 1.1.4 IC training curriculum and IC training material developed with USAID/APII supported in line with the National Action Plan on IC Strengthening at Health Facilities (2013-2015). The Infection Control training materials are the official standard documents for training in health system in the whole country.
- 1.1.5 Supported NAEC to chair the quarterly meetings of the One Health Communication Network (formerly known as the Avian Influenza BCC Working Group) through development of meeting agenda and worked presenters to prepare for their presentation.
- 1.1.6 Attended in design meetings and provided inputs to the One Health Communications Network (OHCN).
- 1.1.7 Provided comments and inputs into the development of the National Strategic Framework for Communications on Emerging Infectious Diseases 2013-2015 facilitated by Partnership on Avian and Human Influenza (PAHI) Secretariat.
- 1.1.8 Participated and presented on communication results in the other PAHI Secretariat's support advocacy events including the national One Health conference on Enhancing Coordination on Emerging Infectious Diseases in Vietnam: building on the avian influenza response for a One Health approach in April 2013.

1.1.9 Regularly participated in Biosecurity Working Group, giving presentations on our lessons learned and the results of animal health and communication work.

1.1.10 Communicated project results to the wider audience through media advisories and press releases. Tracked aired clips and news and shared with partners and USAID.

1.2 Challenges and Solutions

1.2.1 During the first three years, the USAID/APII focused its work primarily at the provincial level. During Year four, the project has shifted its focus on working more with national stakeholders such as technical departments in key ministries in order to advocate that they endorse the models, to create supportive conditions for provinces to continue and replicate the models, and to adopt the models for application within ongoing national programs.

2. Human Health Surveillance

The human health surveillance model was developed over the first three years of the project as part of an integrated approach to community-based surveillance (CBS) in the five USAID/APII focus provinces: Can Tho, Ha Nam, Hung Yen, Kien Giang and Quang Tri. Following the findings of the external evaluation of CBS activity conducted during Year three of the project, the human health surveillance model has been separated from the AH surveillance model to promote its adoption, adaptation, replication and scale up during the final year of the project.

The goal of USAID/APII activities in Year four was to support national/provincial policies that facilitate community level surveillance and to replicate the relevant model in both current focus provinces and new provinces.

To get these goals, the USAID/APII had worked closely with National Institute of Hygiene and Epidemiology (NIHE) to develop a detail plan on implementing human health surveillance activities in Year four. A Statement of Work (SOW) had been submitted and approved by USAID, following a competitive bidding process. However, we were informed that the General Department of Preventive Medicine in Ministry of Health (MOH) plans to assess Circular 48 in 2013, that overlaps to our plan with NIHE and USAID/APII was requested not to conduct activities related to Circular 48 for the time being because of certain sensitive internal issues. USAID/APII decided to cancel the intended activities with NIHE and shifted those designated monies elsewhere.

2.1 Achievements

2.1.1 Promising initial achievements were recorded in Year four with the development of a detailed plan and SOW and bidding process. However, as noted above it was not possible to proceed with this subcontract.

2.2 Challenges and Solutions

- 2.2.1 The predictability and reliability of information from MOH is out of USAID/APII's and NIHE's control. We therefore decided that it was necessary to end the contract with NIHE.

3. Case Management and Infection Control (IC) Capacity Building

The Year four goals were to assist the Government of Vietnam (GVN) in replicating a training model to assist health facilities in implementing Circular 18 and to explore and foster opportunities for training institutions to incorporate the USAID/APII infection control-training module within their curricula.

3.1 Achievements

- 3.1.1 Continued the subcontract with Vietnam Nursing Association (VNA) to implement Year four IC activities. The subcontractor collaborated with MOH and three IC Societies in Hanoi, Hue, and Ho Chi Minh City (HCMC) to replicate the IC training model for in-service and pre-service systems.
- 3.1.2 Advocated for the MOH's Administration of Medical Services (AMS) to issue official letters endorsing implementation of the IC training package developed with the support from USAID/APII and approved by MOH for grassroots level:
- On February 27, 2013, the MOH issued a letter to require all 63 Departments of Health (DOHs) in Vietnam and 34 national hospitals under the management of MOH to develop and implement provincial/hospital action plans on strengthening IC activities in healthcare facilities, including IC training for health care workers in public and private sectors.
 - On March 1, 2013, the MOH issued a letter about supportive monitoring trips to 13 hospitals in eight provinces where key staff was trained with support from USAID/APII in 2012 to support provincial DOHs and hospitals on strengthening their IC practices including training for healthcare workers.
 - On August 9, 2013, the Vice Minister of Health approved the IC practical handbook developed with the support from USAID/APII with the Decision 2289/QĐ-BYT.
- 3.1.3 Three supportive monitoring trips were conducted in April 2013 by MOH and VNA, covering 13 hospitals in eight provinces including four Northern provinces, two Central provinces and two Southern provinces. The monitoring team reviewed provincial IC activities in 2012 and IC plans for 2013. The monitoring team together with provincial DOH leaders also visited district hospitals to review the IC system, IC diffusion training and IC practices at these hospitals. Significant improvements were noted, including in the reinforcement of the hospital IC system, diffusion training, planning, updating IC regulations, supplying disposable towels and enhancing IC practices at health care facilities. More attention should be paid to IC planning

and to supervision of compliance to IC standards. The eight hospitals that received support from USAID/APII in 2011 were assessed to have better compliance and practices than the other hospitals covered by the supportive monitoring visits.

- 3.1.4 Three six-day regional Training of Trainer (TOT) courses were conducted in March and April with total 91 participants from 16 new provinces and 17 nursing/medical schools in Hanoi, Hue and HCMC. In addition to updated IC knowledge, participants also gained knowledge on adult leaning methods and worked on their diffusion training plans. A one-day field study at the national hospitals provided participants with an opportunity to observe actual IC practices and demonstrated how to conduct Hospital Acquired Infection (HAI) surveillance and how to monitor compliance with IC practices in health facilities. They also had opportunities to practice teaching with their own lesson plans, which they then applied following the training through IC diffusion training courses in their provinces and medical and nursing schools.
- 3.1.5 Approximately 6,000 copies of the IC training materials and 2,500 copies of the IC training curriculum were supplied to 63 provincial DOHs and about 60 medical/nursing schools to support and encourage them in self-replication of the USAID/APII's IC training model within the healthcare system and in training institutions.
- 3.1.6 During the period from March to July, with the technical support from MOH, VNA and USAID/APII, 37 out of 63 provincial DOH throughout the country developed and shared their action plans for 2013-2015 on strengthening IC activities at healthcare facilities and their 2013 training plans on IC for workers at health facilities in their respective locations. All training courses included in these plans will use the IC material supported by USAID/APII, and will mainly utilize local funds to carry out these training courses.
- 3.1.7 In October and November 2012, Can Tho DOH conducted four training courses on IC with local fund for 140 participants from all 21 hospitals in Can Tho including nine provincial hospitals, nine district hospitals, two private hospitals in Can Tho and one private hospital in Bac Lieu, a neighboring province. These hospitals contributed to the costs from their local budgets. The trainers of these four training courses were those trained by the USAID/APII in July 2012 and used IC training material developed by USAID/APII and approved by MOH.
- 3.1.8 On May 6-9, a provincial TOT course on IC was conducted in Dong Thap General Hospital for 120 participants from 16 hospitals, including four provincial hospitals, four specific hospitals and eight district hospitals. In additional to updated IC knowledge and skills, participants also learned about the design and practice of cross-sectional studies on HAI. The trainers for this course were those trained by the USAID/APII in April 2013, together with a national expert from the HCMC Infection Control Society. IC training materials for the course were provided by USAID/APII. Dong

Thap's DOH and Johnson & Johnson Vietnam co-funded this course.

- 3.1.9 During the period from May to July, USAID/APII provided copies of the IC training materials and contributed 30% of the training cost to conduct nine provincial TOT courses on IC in four new provinces of Binh Dinh, Quang Nam, Nghe An and Lam Dong. The provincial DOH contributed the remaining 70 percent of the costs for these courses. Two hundred and sixty participants from the 108 hospitals, including 40 provincial general and specialized specific hospitals, 62 district hospitals and six private hospitals had an opportunity to update their IC knowledge and skills in the class and they had one day to learn about HAI surveillance and IC practice compliance in provincial hospitals. The trainers for this course were those trained by the USAID/APII in 2012-2013.
- 3.1.10 In July, HCMC DOH conducted four training courses on IC for around 300 leaders of IC departments, chief of nurse and IC staff from all 149 healthcare facilities. The training cost was paid from local funds. USAID/APII provided copies of the IC training materials for these courses. The trainers for these courses were those trained by the USAID/APII in 2012-2013 and IC specialists from HCMC's IC Society. Some other provinces and cities have also prepared plans on IC training to commence in August, including Hanoi and Hue.
- 3.1.11 Attended and/or supported IC training curriculum copies, IC training material copies developed by USAID/APII for participants in several workshops and training courses:
- In October 2012, the "Workshop on the National Action Plan on IC Strengthening at Health Facilities sine now to 2015" chaired by the MOH Vice Minister in Hanoi. In the workshop, USAID/APII introduced the IC training model as a means to achieve national plan objective: "Up to 2015, at least 80% of health care workers in health care facilities will be trained on basic Infection Control".
 - In October 2012, the "IC Scientific Conference" hosted by MOH's Administration of Medical Service in Hanoi. The participants had the opportunity to share research and new IC guidelines. After the meeting, these guidelines were distributed and implemented in all health facilities. All updated issues on IC were included in the IC training material developed with USAID/APII supported and they will be disseminated in IC diffusion training courses.
 - On October 25 and 26, 2012: the "National Workshop on Nursing Science" and "National Review Workshop of Vietnam Nursing Association" led by the MOH and VNA. Achievements of VNA -USAID/APII collaboration and IC training material were introduced with high appreciation of participants.

- In March, five-day training course on “Infection Control in Hospital Settings” conducted by Military Medical Department in Vietnam Ministry of Defense in Hanoi. This training provided update on international, US and National Hospital-focused IC practices and hospital pandemic preparedness.
- In March, the “Infection Control Training Program for Vietnam’s Healthcare Workforce” workshop conducted by MOH and VNA in Hanoi for 17 military hospitals and eight medical/nursing schools. In this workshop, the MOH introduced existing IC training materials and introduced the draft IC training curriculum for the schools. Participants, who included directors of medical/nursing schools, were very interested in USAID/APII’s IC training materials and were planning to adapt this material for use in their schools.
- In April, the “National Workshop on Sharing the Experience of Nursing Education” hosted by MOH and VNA in Pham Ngoc Thach Private Medical School in HCMC. More than 210 participants from 26 medical/nursing schools and 37 hospitals nationwide attended this event. The USAID/APII also supported Dr. Phi Nguyet Thanh from the Training and Education Department of MOH to make a presentation on the training curriculum for nurses and how in-service training institutions can apply the IC training materials developed by USAID/APII and approved by MOH.
- In May, the “Scientific Workshop for the Central Region on Infection Control and Patient Safety” was conducted in Hue by the Hue National General Hospital and the Hue Infection Control Society (HUSIC) with approximately 300 participants from around 100 hospitals. USAID/APII supported for printing the Journal of Clinical Medicine with detail introduction of IC training curriculum and IC material developed by USAID/APII and approved by MOH. The journal was distributed to all workshop’s participants, hospitals and medical schools in the central region.
- In June, the “Scientific Workshop on Infection Control for the Northern Region” co-chaired by MOH, Bach Mai hospital and the Hanoi Society for Infection Control (HANSIC). More than 350 participants from around 100 hospitals including some national hospitals, district hospitals and specialized hospitals had an opportunity to share experiences and to develop their skills on IC, as well as being updated with new technical information. During the workshop, participants also discussed the IC situation in hospital as well as IC training for health care system. The USAID/APII staff shared the status of the nationwide IC training model’s replication in provinces and in training institutions following the TOT courses conducted in 2012 and 2013.

3.1.12 With technical support from USAID/APII, the Au Lac Private Nursing School in Hue and the Phu Yen Medical Secondary School

issued Decisions on adapting the USAID/APII-MOH IC training materials to their training program for nurse, physician students. Two full credits for IC theory and practice with 60 sessions were used to train 220 nurses and 150 physicians in Au Lac School and 100 nurses in Phu Yen School in the school year 2012-2013.

- 3.1.13 Advocated 17 training institutions attended TOT in 2012-2013 including Vinh Long Medical College, Can Tho Medical College, HCMC University on Medicine and Pharmacy, and Hong Bang University, Soc Trang Medical Secondary School, Duy Tan University, Hanoi Medical College, Thanh Tay University, Vinh Medical University, Hue Medical College, Hai Duong Medical Technical University, Nam Dinh Nursing University, Quang Nam Medical College, An Giang Medical Secondary School, Binh Dinh Medical College, Thanh Hoa Medical College and the Nguyen Tat Thanh University in HCMC to issue official letters on revising their IC training program to adapt the IC training curriculum and material developed with support from USAID/APII.
- 3.1.14 With the technical support from USAID/APII and VNA, Hanoi Medical College and Hong Bang University not only reviewed their curriculum and apply the new material but also developed 10 detail lesson plans for the new IC training curriculum. Hanoi Medical College also developed the detailed IC fundamentals and conducted training course for all clinical teacher in the school.
- 3.1.15 Advocated the South West Asia Technical and Economic Secondary School, a private school, in HCMC issued a letter on adapting the IC training curriculum and IC training materials in their training program since school year 2013-2014 on July 15, 2013. This increases the number of private schools up to six out of 20 schools, which have been integrating the USAID/APII IC training material into their training program. The revised training program will be applied in 20 schools for around 17,000 students in school year 2013-2014.
- 3.1.16 Conducted the “Workshop on Strengthening Infection Control Training Programs in Nursing and Medical Schools” co-chaired by VNA, MOH and USAID/APII in Hanoi in June. The workshop had 44 participants coming from WHO, the Department of Science Technology and Training of MOH, the Military Medical Department of Ministry of Defense and 28 medical and nursing universities, colleges and schools. Workshop participants had an opportunity to share their IC training curricula and materials as well as information about student IC practicums in hospitals. One public medical college and one private medical school shared their experience on integrating USAID/APII’s IC training into their training program with technical support from VNA. Participants agreed that strengthening IC training in medical schools is necessary and the IC training curriculum and IC training material developed by USAID/APII and approved by MOH are good reference documents for schools to develop their own IC training curricula and materials.

Participants from medical and nursing schools shared their expectations on institutionalizing the IC training curriculum and IC materials in their institutions through additional TOT courses on IC for their teachers.

3.1 Challenges and Solutions

- 3.1.1 The process of finalizing the VNA contract took longer than anticipated due to year-end time commitments and the large number of meetings and workshops on IC that took place during the early fall, requiring the attention of both USAID/APII and VNA staff. While these meetings caused delays, they were also opportunities for USAID/APII to share the IC training model with in-service and pre-service systems, leading to several fruitful conversations with provincial DOHs and training institutions, some of whom have expressed great interest in the IC curriculum and materials.
- 3.1.2 The USAID/APII required subcontractors to submit their reports in English, which took additional time for VNA to write, revise and translate the deliverables prior to submission.
- 3.1.3 The Ministry of Education and Training (MOET) has issued an outline of the training curriculum for nurses, which includes a required two credits on IC; however, as of the publication of this report, there is no similar requirement for medical students. In addition to working closely with MOH, VNA and other partners to introduce and integrate the IC training model into the nursing training program, the human health team introduced USAID/APII materials to medical schools for reference in IC lessons within other subject courses and encouraged them to develop an optional course on IC for medical students.

4. Pandemic Preparedness Planning (PPP)

The Year four goals were to introduce PPP packages to other provinces, and to advocate for wider adoption of PPP throughout Vietnam.

4.1 Achievements

- 4.1.1 Conducted a national dissemination workshop in Hanoi on October 31, 2012 to introduce new approaches for developing and revising PPPs, share experiences from the process of developing and improving Kien Giang's provincial plan, and identify recommendations for improving provincial plans. Participants in the workshop included the Vietnamese Red Cross (VNRC), provincial Departments of Animal Health (DAHs), General Department of Preventive Medicine (GDPM), the Central Propaganda Department/Committee, the HCMC Institute of Hygiene and Public Health, Vietnam Avian and Human Influenza Control and Preparedness Project (VAHIP), FAO, WHO, PAHI, USAID/APII and USAID, as well as representatives from Hung Yen, Ninh Binh, Bac Ninh, Bac Giang, Hai Phong, Hoa Binh, Ha Tinh, Nam Dinh, Bac Kan, Thanh Hoa, Ha Nam, Quang Tri and Kien Giang. After the

workshop, USAID/APII worked with interested provinces to support the revision of provincial PPP.

- 4.1.2 Subcontracted with Humanitarian Center, Hung Yen Red Cross Association to implement Year four PPP activities. The subcontractor coordinated with Hung Yen authorities, representatives of all related sectors and mass organizations to revise provincial PPP with the new concepts of “whole of society” approach and Business Continuity Plan (BCP).
- 4.1.3 Advocated the Hung Yen Provincial People’s Committee (PPC) to issue an official letter assigning Hung Yen Red Cross to take the lead in coordination with other relevant departments in the province to revise the provincial PPP.
- 4.1.4 Conducted “PPP Introduction Workshop” hosted by the Hung Yen PPC with participants from Hung Yen PPC, the Provincial Steering Committee on AI Control, Sub-Department of Animal Health (SDAH), and local media agencies. They had opportunity to share experience from PPP revision in other provinces and express the requirements of PPP revision. A detail plan of PPP activities was introduced and approved by all participants. The Hung Yen PPC committed to support these activities.
- 4.1.5 Built an Editorial Team with the approval from the Hung Yen PPC in March. The team consisted of representatives from DOH, Department of Agriculture and Rural Development (DARD), Department of Communication and Information, and Hung Yen Red Cross. This editorial team was responsible for developing a PPP outline and provincial PPP drafts for comments from other sectors.
- 4.1.6 Conducted a PPP training workshop for about 30 participants from various provincial authority agencies and mass organizations on April 5, 2013. Participants had an opportunity to learn about the new concepts of a Whole-of-Society approach and Business Continuity Planning and how to apply them in their PPP. The PPP outline was introduced and approved.
- 4.1.7 Conducted two PPP Review Workshops on April and May in Hung Yen with participants from around 20 agencies and organizations in Hung Yen province, including government management offices, the propaganda agency, the provincial Police Department, mass organizations, media agencies and local staff to review the first and second draft of provincial PPP. New approaches introduced in the draft plan include (i) preparedness planning covering diseases in human and animals, (ii) multi-sectorial involvement and (iii) inclusion of livelihoods, food security and business continuity planning for both during and after a pandemic. The draft compiled all the inputs and comments from participants, national and local organization, WHO and FAO feedback. After revision, the plan was submitted for approval by the People’s Committee of Hung Yen province.

- 4.1.8 On May 22, Hung Yen People's Committee approved the Hung Yen PPP.
- 4.1.9 On June 11-12, Hung Yen People's Committee organized the provincial PPP dissemination workshop in Hung Yen, with the participation of 33 leaders of 24 agencies including provincial departments, nine district People's Committees and mass organizations in Hung Yen. As required by the Vice Chairman of Hung Yen People's Committee, all related Departments and districts in Hung Yen province developed or revised their individual PPPs in July 2013.

4.2 Challenges and Solutions

- 4.2.1 This was the first time that Hung Yen Red Cross implemented this kind of complex activity with the involvement of multiple sectors at provincial level. A plan with detailed activities indicating the persons in charge, expected outputs, and timeline was prepared with support from USAID/APII. The commitment of Hung Yen's People Committee and the effective activities of the Editorial Team played an important role in the success of this activity. In addition, the USAID/APII always worked closely with the Hung Yen Red Cross to strengthen their capacity during the period of the PPP revision.

5. Animal Health (AH) Surveillance

The AH surveillance model was developed over the first three years of the project as part of an integrated approach to community-based surveillance (CBS) in the five USAID/APII focus provinces/cities: Can Tho, Ha Nam, Hung Yen, Kien Giang and Quang Tri. Based on the results of the external evaluation of the CBS activity, which was conducted during Year three of the project, the AH surveillance model has been separated from the human health surveillance model for promotion of adoption, adaptation, replication and scaling up during the final year of the project.

The goal of USAID/APII activities in Year four is to support national/provincial policies that would facilitate community-level surveillance and to replicate the relevant models in both current focus provinces and new provinces.

5.1. Achievements

5.1.1. Supported national/provincial policy that would facilitate community level surveillance and/or events based surveillance:

In Year four, Animal Health surveillance activities were concentrated in the Central region in collaboration with Regional Animal Health Office (RAHO) 3 and a local counterparts in Quang Tri. A scope of work (SOW) was developed for integrating AH surveillance with Animal Health Worker Capacity Building and Supply Chain Model Replication submitted to USAID for approve in the beginning of the second quarter. The Quang Tri Livestock and Veterinary Association were identified to review the USAID/APII AH surveillance model and AHW network model in Quang Tri province beginning in March.

A local consultant, with a strong background in national AH surveillance systems, was also recruited in late March to provide technical assistance to the subcontractor in this area and develop a curriculum for AH surveillance for a regional course planned for April and May 2013.

The USAID/APII AH surveillance model in Quang Tri reviewed by several meetings and workshops with relevant partners conducted to discuss AHW network development and roles (including animal disease surveillance at grassroots level) and was under linkage with local network development policy. A set of animal disease reporting forms has been issued by Quang Tri SDAH to harmonize the reporting forms and enhance the passive surveillance system of the province.

5.1.2. Continued to advocate at the national and provincial level for the adoption of a formal AHW TOR:

A report on the improvement of the AHW network of Quang Tri province, including the adoption of formal Village Animal Health Worker (VAHW) terms of reference (TORs) which specifically included a surveillance task (to detect and to report suspected cases) has been developed and shared. A local consultant was invited to develop this study and his report includes detailed recommendations for an animal disease surveillance-training curriculum to be introduced by the DAH as a reference document. The DAH is expected to adapt the model identified in the report for provinces to develop an AHW network

A regional five-day TOT was conducted in Dong Ha on Animal Disease Surveillance at the Community Level for six provinces in the central region (provinces covered by RAHO 3) with 30 participants (10 Female: 20 Male). RAHO 3 trainers and the Head of the Epidemiology division of the DAH were invited as lecturers and the Quang Tri example was discussed during the course.

5.1.3. Replicated the relevant model in existing provinces and in new provinces

A draft of the Policy Brief on the Quang Tri Case Study and successes in animal health surveillance and AHW Network improvement has been developed and was published in July 2013.

A documentary on the Quang Tri model in animal health network development has been developed by the local Quang Tri Livestock and Veterinary Association in collaboration with the SDAH. It was shared with 26 participants (4 Female: 22 Male) from RAHO 3 and the central provinces in a regional Technical Dissemination Workshop on AHW and network development conducted in Hue on May 21, 2013. As a result of the workshop, the formal commune and village TORs for AHWs, including the specialized surveillance task to detect and to report suspected disease events, has been reviewed by participants.

5.2. Challenges and Solutions

5.2.1. Early desk review of national regulations showed that while a standard operating procedure (SOP) for HPAI has been developed there are a number of variations of surveillance guides available. For example, separate guidance on specific diseases such as porcine reproductive and respiratory syndrome (PRRS), foot and mouth disease (FMD) and TAD-info (Trans-boundary animal disease information) exist. However, with the exception of the SOP for HPAI, these guidelines have gaps, especially at community and village level where commune based surveillance (CBS) can play a vital role in improving detection and reporting of new cases.

Similarly, despite the regulations issued in 2005 specifying 15 animal diseases be included in the mandatory reporting list, only some are regularly reported. The varying SOPs and lack of consistent reporting practices complicates our ability to develop harmonized official guidance or a manual for AH surveillance, which does not conflict with current regulations and guidance but covers all the reportable diseases. The local consultant is expected to make recommendations to address these issues.

5.2.2. Animal disease surveillance improvement for the grassroots level continues to be challenging due to the lack of official legislation to support local network development and the commitment by local authorities of allocated funds from limited annual provincial resources. The new veterinary law expected in the coming year and the new national proposal for Animal Health Sector Development are good initial steps by DAV and MARD to cover the gaps in the regulatory framework and policy directions. It will require a long term strategy and commitment from all levels to be successful given the current weaknesses in the overall veterinary service network.

6. AHW Capacity Building and AEW Biosecurity Training

The goals of the Animal Health Worker (AHW) Capacity Building and Agricultural Extension Worker (AEW) Biosecurity Training activities are to:

- Introduce the AHW training package to new provinces and seek other educational training opportunities
- Introduce the AHW networking model that will be adopted by relevant public-private agencies at national and local levels.
- Introduce the AEW training materials to the National Agriculture Extension Center (NAEC), new Provincial Agriculture and Fishery Extension Centers (PAFEC) and private sector to applying them throughout AEW system.

6.1 Achievements

AHW Capacity Building

- 6.1.1 The year started with negotiations with subcontractor AFAP, which needed pre-approval from USAID for an extension of one more year. The work plan, schedule and budget for Year four were completed in the first quarter and submitted to USAID for approval of the contract modification. A final revised contract was signed with AFAP in January 2013.
- 6.1.2 *Animal Health Worker Networks: Expand the AHW capacity building model:*

The AHW Training Package consists of a hardcopy training manual, which provides a reference for AHWs (an enhanced manual based on the existing DAH Manual) as well as an E-Book version on CD with additional content for trainers and a sample toolkit with standard equipment for AHW service provision.

After the AHW Training package was approved by DAH/MARD, 8,000 hardcopies were printed along with a letter from the DAH Director officially introducing and endorsing them. The Training packages were distributed to 700 district veterinary stations throughout Vietnam between September and October 2012.

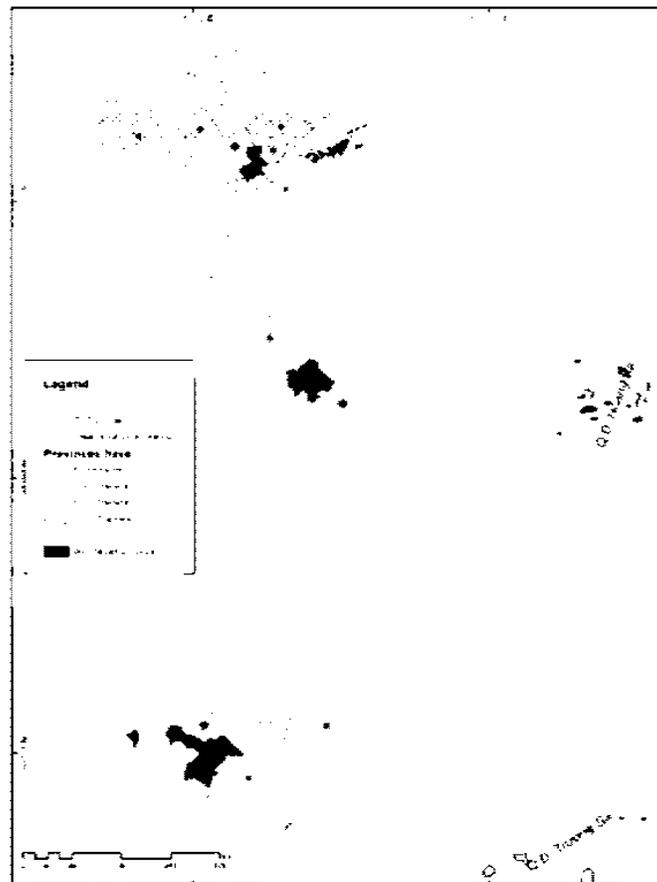

The first advocacy Dissemination Workshop for AHW and Biosecurity Training material for Year four took place on January 11, 2013 in An Giang with the participation of 51 participants from 13 Mekong provincial SDAH and PAFECs as well as representatives of RAHO 6, RAHO 7 and NAEC. During the workshop, the demand to increase knowledge and capacity for AHW in general has been addressed by local counterparts and Mekong SDAH.

On March 5, a second AHW Dissemination Workshop was conducted in Hanoi in collaboration with the Vietnam Farmer Union (VFU) targeting VFU's vocational training centers as well as the private sector. More than 50 participants joined the training, coming from regional and provincial vocational training centers under VFU as well as NGOs and the private sector.

As a result of these dissemination workshops, USAID/APII received requests from 14 provinces, specifically those in RAHOs 6 and 7, for further assistance with TOTs for AHWs from VFU and RAHO 3.

In an effort to replicate the AHW training package more widely and responding to requests from Mekong SDAH and RAHO 3, USAID/APII scaled up the use of AHW training modules through regional TOTs for RAHOs 1, 2, 3, 6 and 7. A total of 159 local trainers were trained during quarters 2 and 3 (51 Female: 108 Males) in 32 new replication provinces and RAHO offices.

Figure 1. Provinces reached with AHW Trainings

6.1.3 *Explore Public Private Partnerships in order to leverage resources and build sustainability for AHW capacity building:*

As a result of cost-shared AHW TOT courses in Moc Chau in Year 3, the Moc Chau Dairy Cattle Company Joint Stock Company (Moc Chau Dairy) has decided to use the diffusion training program for new AH technicians in the Moc Chau area using their own funds. USAID/APII and AFAP worked with Moc Chau Dairy to develop the training curriculum and suggested follow-up coaching by USAID/APII national trainers. This public-private partnership model was initiated with an MOU (Memorandum of Understanding), which indicated that Moc Chau Dairy would contribute to training on animal surveillance, biosecurity and veterinary skills. However, to simplify the paperwork and align more closely with the interests of Moc Chau Dairy, in February it was agreed to just implement the veterinary skills training without a formal MOU. As a result 15 technicians have been trained by a local trainer and were recruited by Moc Chau Dairy to strengthen their AH services.

6.1.4 *Present the AHW training package to relevant ministries and department to advocate for the adoption of the package in vocational training schools:*

Meetings and AHW curriculum presentations with the Ministry of Labor, Invalids and Social Affairs (MOLISA) in March and the early part of Quarter three indicated some interest; however, because of the lengthy processes required for introducing a new curriculum, the adoption of the AHW Training into this system would not be possible during the life of USAID/APII. As an alternative solution, the Farmers' Union vocational training system, which often receives MOLISA funding, was selected as an option. USAID/APII's subcontractor AFAP conducted a TOT course in Hai Duong in late May, reaching seven provincial Farmers' Union Vocational Training Centers with 25 local trainers (13 Female: 12 Males). It is promising to note that these vocational training centers are expected to conduct their own training courses for local AHW using provincial DOLISA funding resources.

Agricultural Extension Worker (AEW) Biosecurity Training

6.1.5 *Support NAEC to officially adopt AEW training manual and training materials and to promote their use within the national agricultural system:*

The AEW capacity building activities in the first quarter of Year four focused on identifying new provinces, and the corresponding local counterparts and dissemination activities, to introduce the AEW Biosecurity training package and prepare for Trainings of Master Trainers/Trainings of Farmer Trainers (TOMTs/TOFTs). While USAID/APII and AFAP could have easily conducted those TOMTs independently, for sustainability purposes it was determined that they should be conducted together with local authorities and Provincial Agriculture and Fishery Extension Centre (PAFEC). An advocacy workshop was planned in quarter two to this end.

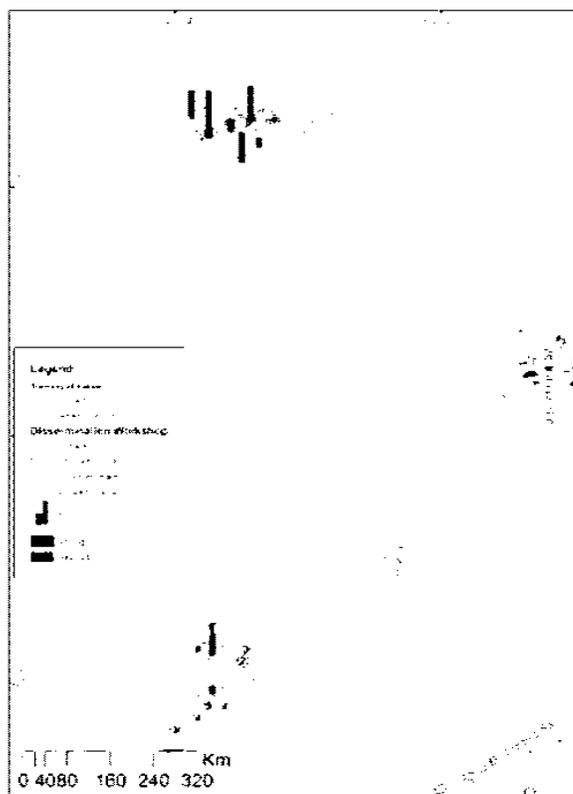

USAID/APII met with the National Agricultural Extension Center (NAEC) to identify ways to facilitate their official adoption of the AEW training manual and training materials and to promote their use within the national agricultural system. USAID/APII introduced the training system to NAEC, outlined the current projects and agreed on follow-up activities required. These activities were incorporated into a draft SOW for the Vietnam Poultry Association (VIPA) to undertake.

Facilitated by VIPA, NAEC completed a review and approval of the biosecurity training package, as well as the formal dissemination of the package through three national and regional biosecurity forums in Quang Ninh (May), Ha Nam (June) and Khanh Hoa (June) to 159 participants (45 Females: 114 Males) from 14 provinces.

In addition, NAEC integrated the Biosecurity Training package into two national projects providing training for farmers: (i) *Establishment of a commune model of animal disease prevention*

and control in Thai Binh, Hai Duong, Vinh Phuc, Thanh Hoa, Bac Ninh, Bac Giang and Hue; and (ii) *Intensive disease prevention for animals* in Hanoi, Thai Binh and Hai Phong. This and the VIPA farmer club training courses have reached 837 farmers (604 Females; 233 Males) with good farming practices and biosecurity training.

Figure 2. Location of Dissemination Workshops

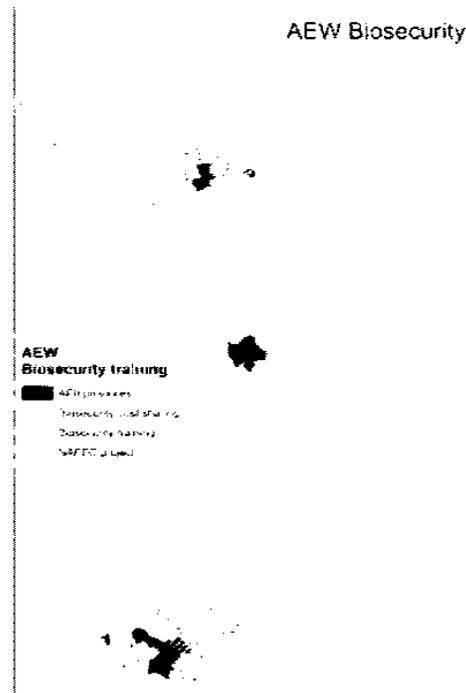

6.1.6 *Scale up use of AEW training through reproduction of materials and TOMT/TOFT as needed:*

The first advocacy Dissemination Workshop on Biosecurity Training packages for Year four took place on January 11, 2013 in An Giang in combination with AHW dissemination as reported above. Participants from most of Mekong PAFECs attended. During this workshop, the An Giang PAFEC and HCMC NAEC office shared the experiences and success of adopting and adapting the training materials for their waterfowl program while introducing the Biosecurity training material. As a result Long An, Tien Giang, ben Tre, Dong Thap, Can tho, An Giang, Sóc Trăng, Hau Giang, Cà Mau, Bac Lieu and Kien Giang provinces requested assistance from local trainers. In April two TOMT courses were then conducted in Hau Giang and Sóc Trăng. Finally the project supported a TOFT

course in Bac Giang in collaboration with NAEC May 2013. During Year four a total of 81 local trainers were trained.

Figure 3. Locations of Biosecurity Trainings

6.1.7 Other replication of AEW/Biosecurity training programs for poultry farmers in additional provinces:

The biosecurity training package was successfully transferred to NAEC's National Waterfowl Development Project (2011-2013). This project, chaired by Mr. Nguyen Van Bac, covers 14 provinces: five provinces in the Hong River Delta including Bac Ninh, Hanoi, Hai Duong, Hung Yen and Hai Phong and nine provinces in the Mekong Delta including Kien Giang, An Giang, Bac Lieu, Cà Mau, Dong Tháp, Long An, Sóc Trăng, Tra Vinh and Tien Giang. We identified 452 farmer-developed demonstration farms with 1,320 duck farmers who were all trained by NAEC with materials adapted from the training package. At this time, 4,680 trainees who are raising ducks for meat and eggs have visited demonstration sites and received training materials. In addition, using local funds and integrating activities into the local vocational training centers program, there were 95 training courses conducted in Bac Lieu (10 courses), Vinh Long (five courses), Tra Vinh (20 courses) and An Giang (60 courses) with total of more than 1,000 people attending (Source: NAEC, National Waterfowl Development Project I, NAEC HCMC office Jan, 2013).

Following a TOFT for 25 local farmer trainers in October 2011, An Giang officially adopted the training package into their provincial project "Developing biosecurity poultry production in An Giang

during the period 2011-2013.” This project is being implemented in 11 districts and towns of An Giang from July 2011 to December 2013. Since December 2011, these farmer trainers have organized 79 courses on biosecurity for poultry production with 2,319 trainees who are raising chicken and ducks for meat and eggs. They also offered 22 courses for 649 members of 66 poultry cooperative groups, providing training on upgrading biosecurity for poultry production. The training materials were also used by trainers for another 55 training courses on animal husbandry organized by the Provincial Agriculture Extension Center in 2011 and 2012 under the national New Countryside (*Nong Thon moi*) development program. (Source: *An Giang PAFEC, Jun 2013*).

6.1.8 *Explore using NAEC's online training programs to disseminate training package:*

NAEC and its counterparts have developed a DVD for on-line training, as recommended by USAID/APII. The final draft version was completed in late June and is planned to be posted on the NAEC website following final approval, which is expected during July 2013.

6.1.9 The Project Management Unit within MARD of the World Bank-supported Vietnam Avian and Human Influenza Prevention and Control Project (VAHIP) has officially requested to reproduce 50,000 copies of the “Bac Mau nuoi ga” (Mr. Mau Raises Chickens) comic book developed as part of USAID/APII’s biosecurity training package for poultry farmers to use in their HPAI awareness raising program in schools during 2013.

6.2 Challenges and Solutions

AHW Capacity Building

6.2.1 The lengthy AFAP approval process had a bit of an effect to the time schedule of AHW and AEW/Biosecurity Training activities in overall. The USAID/APII team worked with AFAP and the local counterparts to speed up implementation after approval.

AEW Biosecurity Training:

6.2.2 It is important for the sustainability and institutionalization of training/extension packages to work closely with NAEC and the PAFECs. This is a time-consuming process, which may not always be the top priority for these organizations and thus requires diplomacy, patience and perseverance in order to forge and maintain close relationships. Obtaining official approval from government authorities was a suggestion from the Deputy Director of NAEC and introducing the AEW/Biosecurity training through NAEC/PAFEC system and national/provincial projects remains a good option for replication of this training package widely and efficiently.

6.2.3 Figures on replication training conducted in additional provinces may not be available in a timely manner where these activities are being funded from local, national or other resources not sourced by

USAID/APII. USAID/APII has tried its best to introduce and train local trainers, distribute the AHW and Biosecurity training packages widely as well as to follow up with SDAH that requested and send their staff to sit in USAID/APII TOT courses with the expectation that diffusion training will then be taken up by local authorities once they appreciate the value of these approaches and the related tools and supporting materials.

7. Supply Chain (Poultry Supply Network) Strengthening

The goals in Year four are to advocate and encourage adoption, adaptation and replication by public agencies, private partners and/or other development projects and programs elsewhere of USAID/APII developed biosecurity/biosafety demonstration models in key (high risk) nodes along the poultry supply chain, together with related documents (such as protocols, guidelines and training materials).

7.1 Achievements

The key activities and achievements of the supply chain work during the third quarter of Year 4 focused on the following activities and nodes:

- 7.1.1. The supply chain activities of Year 4 started with a *Completion and Handover Ceremony of the Upgraded Meat Section in Hoa Mac Market and Poultry Slaughter Point in Hoa Mac town, Duy Tien district, Ha Nam province* on October 26, 2012 by USAID/APII, its counterpart and local authorities. Together with Mr. Hue, a small upgraded slaughtering facility owner, these two upgrades serve as a model for the province and is being used as a demonstration site. It is also a key stepping stone in the long-term restructuring of the livestock slaughtering network including transition to centralized slaughtering, providing a smaller-scale option that adheres to standard risk reduction measures.

Key activities and milestones for the Hoa Mac and Dong Ha Market and Poultry Slaughter Point were summarized into a roadmap for biosecurity improvement as following:

- Mapping and risk assessment of poultry supply chains;
- Provincial Strategic Planning for HPAI Risk Reduction, Prevention and Control along the Poultry Supply Network;
- Assessment, design and upgrading/renovation of infrastructure;
- Training of slaughterers, meat and market vendors
- Communications activities.

These upgraded models have included training on good slaughtering practices and veterinary hygiene assurance for slaughterers, vendors and veterinarians. It has also helped to reduce the potential spread of

disease during the slaughtering, selling and transportation processes. Training was conducted by local SDAH, District Veterinary Station and USAID/APII on good operation, the requirements for infrastructure improvements and was collection and management.

7.1.2. *Technical coaching and monitoring of risk reduction demonstration models in slaughterhouses, slaughter points and live bird markets (LBM) to improve them as a training platform:*

Periodic review meetings were conducted monthly or quarterly until June, 2013 with participation of market management boards (MMB), slaughterhouse/slaughter point owners, the SDAH, Veterinary Inspectors and BCC trainers in different model sites. These visits included observation and recording of behaviors as well as to encouraging the maintenance of good practices at model markets of Dong Ha and Hoa Mac and the model slaughtering facilities in Ha Nam, Quang Tri and Can Tho. In addition, in June 2013, with partial support from USAID/APII, the MMB and vendors in Dong Ha poultry market have repaired some items for better management of waste and to create more space for free vendors.

All of these effort aim to maintain good models and to support their use as a training platform, to encourage wider replication and to be handed over to local related resources. The following is a summary of behavior scores identified on technical monitoring checklists:

Table 1. Behavior Change Summary in Risk Reduction Demonstration Sites

<i>Model site</i>	<i>Positively increased as compared with the baseline*</i>
<i>Dong Ha LBM</i>	19% (in April 2011) - 67% (Nov. 2012) - 69% (June 2013) - 69% (late July 2013)
<i>Hoa Mac Market</i>	12.9% (Sept 2012) - 69.4% (Jan. 2013) - 73% (June 2013) *Using USAID/APII's checklist
<i>Ngoc Xuan Slaughterhouse</i>	48% (Sept. 11, 2012) - 65% (Nov. 27, 2012)
<i>Slaughter points in Dong Ha</i>	Mr. Tien: 32.1% (April 2011) - 60.4% (Nov. 2012) - 32.1% (Apr 2013) - 74% (May 2013) Mrs. Thuy: 43.4% (April 2011) - 58.5% (Nov. 2012) - 43.4% (April 2011) - 72.2% May 2013)
<i>Slaughter points in Ha Nam</i>	Mr. Huc: 35% (Sept. 2011) - 56% (Jan. 2013) 35% (Sept. 2011) - 63% (Jun. 2013) *Using Degree 14 checklist

On November 15, 2012, USAID/APII and SDAH and other local counterparts of Ha Nam province hosted a *Supply Chain Models Technical Review Meeting*. This was a good chance for all sites to review the road map taken over the past two-years of collaboration and to identify achievements. The meeting confirmed that most of the identified and agreed upon indicators have been achieved, for example: successfully upgrading a district model market and a slaughter point that can be used for replication in the other districts

and deployed to new province; increasing the effectiveness of state management of slaughtering and veterinary hygiene inspection activities for slaughter points and the sale of meat products. As a result, the _____ issued a *new provincial decision number 32/2012/QĐ-UBND on the management of animal and animal product slaughtering, transportation and inspection in Ha Nam* on December 13, 2012. After the provincial proposal for 2012-2020 to improve the animal slaughter inspection and the Duy Tien district proposal of slaughter inspection 2011-2012, this was a very positive outcome of the past three years of collaboration between USAID/APII and Ha Nam local authorities.

7.1.3. *Follow up and replication in Quang Tri:*

Using two models of physically upgraded slaughter points as the platform for training, USAID/APII and local counterparts focused on encouraging the replication to other slaughterhouses in Dong Ha city and Quang Tri town. Activities were including provision of training on good poultry slaughtering practices, household visits, technical consultations and provision of some slaughterhouse equipment.

At the same time, the Quang Tri SDAH enhanced the application of veterinary certification by increasing awareness of the value of certification with producers, vendors and consumers. Certification by stamping of poultry products slaughtered with the application good slaughtering practice commenced in the USAID/APII model slaughtering facilities in June 2013. This government effort immediately encouraged the replication of the model. As a result, nine of 12 slaughter points have registered for facility upgraded following the technical recommendations from the SDAH. Some small slaughtering operations will be re-grouped and relocated to selected bigger facilities. To date, two slaughtering facilities have completed upgrading activities. Three others will complete their upgrades within September 2013, and the remainder will continue with technical support from the SDAH. Equipment totaling 183,340,000 VND (~8,700 USD) including 53 pieces of items such as tables, ozone generators, drum pickers, high pressure cleaners and sets of bleeding cones for safer slaughtering practices have been delivered to 11 potential replication slaughterhouse in Quang Tri.

Quang Tri DARD issued the following legal documents during this period: Decision No.286/QĐ-SNN dated May 29, 2013 on Temporary Regulations for poultry slaughtering and poultry production trade in Quang Tri and Official Letter No.494/SNN-CN directing the management of poultry slaughtering, poultry production trade in Quang Tri.

7.1.4. *Follow up and replication in Mekong region (RAHO 6 and RAHO 7):*

Mekong Regional training courses for slaughterhouse owners: USAID/APII aim to introduce the model and encourage risk reduction replacement in Mekong region especially for the provinces where there is no support from VAHIP or LIPSAF. On December 19-

21 and 24-26, 2012, in collaboration with RAHO 7, USAID/APII organized two training courses on Veterinary Sanitation and Food Safety for 58 slaughterhouse owners and selected staff of SDAHs from 13 provinces in RAHOs 6 and 7. These participants had the opportunity to join study tours to slaughtering facilities in Can Tho, Long An and Tien Giang including the USAID/APII supported Ngoc Xuan slaughterhouse model, and the USAID STOP AI supported Go Cong slaughterhouse model. Many slaughterhouse owners in those provinces as well as SDAH showed their interest in replicating the USAID models through official letters calling for support that have been reviewed and incorporated in the plan for provision of technical assistance in the following months.

Following this training and responding to requests submitted by 12 SDAH for case assessments to upgrade 50 small slaughterhouses, USAID/APII experts worked with technical staff from the RAHO and provincial SDAH to assess operations in slaughtering facilities using the checklist and risk assessment matrix issued with Circular 14. The purpose of this assessment was to identify communicable disease and food safety risks and to propose prioritized upgrade options for the slaughtering facilities. The recommendations selected were appropriate, practical and feasible for the facility owners to easily learn from and follow through on during both short-term and long-term periods. Of the 50 slaughterhouses registered in these provinces, 27 facilities were selected for field assessment. Most of these facilities have similar errors: no one-way processing flow, processing on the floor and no separation of dirty and clean areas.

Table 2. Support provided to Mekong slaughterhouses by province

Province	# of assessment requests	# of slaughterhouses visited and consulted	# Of upgrades made*	Notes
RAHO 6				
BR-VT	20 +1 market	3+1 market	2	
Tien Giang	3	3	3	
Ben Tre	2	0	0	
RAHO 7				
Can Tho	2	2	2	
Vinh Long	6	3	3	
An Giang	3	2	1	Need technical support only
Soc Trăng	1	4	1	
Hau Giang	4+1 market	4 + 1 market	0	Provincial plan in 2014
Ca Mau	4	4	1	
Bac Lieu	3	2 +1 market	0	No poultry slaughterhouse
Dong Thap	1	0	0	
Kien Giang	1	1	1	
Total	50 SHs +2 markets	27 SHs + 3 markets	14	

* As of July 2013

A summary report on risk assessment with detailed recommendations was given to the SDAH of each related province and to RAHO staff. In consultation with the RAHOs and SDAHs, it was decided that facilities that completed upgrading before July 2013 would be eligible to receive some equipment and technical assistance from project as an encouragement and support to their improved operations. For the facilities that did not upgrade before July 2013, only technical recommendations will be given and the facility owners can decide by themselves when they want to upgrade. However, based on the recommendations and reports provided by USAID/APII it is expected that local authorities will follow-up on the upgrading of these slaughterhouse after USAID/APII project closes. A total of 23 pieces of equipment (~7,000 USD) were purchased by USAID/APII for handover in July to 13 facilities in eight provinces. This equipment will provide an example for them to replicate in their other processing lines and will contribute to improving good slaughtering practices including veterinary sanitation, risk reduction in disease transmission and cross-contamination and improving poultry food safety.

In addition, responding to the request from three provinces (Bac Lieu, Hau Giang and Ba Ria-Vung Tau), the project visited existing markets where live poultry are sold. No market models were developed due to time constraints but a dissemination workshop was organized for local authorities in Hau Giang province with 18 participants in May 2013. The local authority stated that this experience sharing was a first step towards developing live poultry market models in Hau Giang. Technical documents from the Dong Ha and Hoa Mac models have been shared accordingly.

7.1.5. *Provide technical assistance to the DAH through development of a strategy and accompanying package of how-to guides/protocols for provinces on making upgrades to markets and slaughterhouse:*

A regional approach is one of the key approaches for USAID/APII in the Year four of project. On November 27, 2012 in Can Tho, in cooperation with DLP and FAO, 43 participants from RAHO 7, RAHO 6, DLP, FAO and USAID/APII attended *The 21st Biosecurity Working Group meeting*, funded by USAID/APII and FAO. The meeting focused on (i) the current situation of poultry slaughtering in regions 6&7; (ii) dissemination of USAID/APII's risk reduction, veterinary hygiene and sanitation model at Ngoc Xuan Slaughter House; and (iii) recommendations and suggestions to reduce risks in slaughtering facilities by improving bio-security measures. USAID/APII recommended that training for selected slaughterhouse and slaughter point owners in these regions on risk reduction and food safety improvements in as a follow-up activity of the meeting.

In Quang Tri on December 20 and 21, 2012, in collaboration with Quang Tri WU, USAID/APII organized a two-day *dissemination workshop* in the Northern Central region to promote the use of a multi-sectorial approach to improving food safety of poultry and

poultry products through BCC. More than 60 participants from the central Vietnam WU, FAO and the Ha Tinh, Hai Phong, Thanh Hoa, Quang Binh, Quang Ninh and Thua Thien-Hue province WUs participated in this workshop and visited the upgraded Dong Ha market and slaughter points.

As part of the strategy of DAH and MARD's Legislation Department to review and develop a framework of veterinary technical documents, on May 21, 2013, USAID/APII supported DAH to conduct a Food Safety Workshop on Sharing Experiences and Veterinary Technical Documents. More than 70 participants from national and international agencies and projects working in this field joined together to share their experiences on improving veterinary hygiene and food safety in animal and animal product production, storage, processing and trading. In addition to 32 documents and BCC materials from USAID/APII, 50 books, booklets, posters, training materials, protocols and reports were shared. DAH also took advantage of the workshop to share with provincial participants their new proposal to strengthen government capacity in food safety, zoonotic disease and environmental protection and the function and roles of veterinary public health services system.

Studying Vietnam regulations on slaughtering and taking into account model technical protocols, guidance and risk reduction operations, USAID/APII plan to develop draft Guidelines on Good Hygiene Practices and Good Manufacturing Practices for Slaughtering (GHP/GMP) for general application and advocacy by DAH. A local consultant was recruited in April 2013 conduct this documentary work. The draft version was finalized with inputs from Dr. Henry Yap, USAID/APII's International Consultant on Biosecurity, and was shared with DAH's Division of Veterinary Public Health in July 2013. The document will then be handed over to DAH as an input to their development of the legal framework and policy guidance.

7.1.6. Provide information on other funding options (credit sources) that districts/provinces can use to implement upgrades/new trainings:

A local consultant on microfinance was recruited for a short period of time to conduct a study on funding options for local vendors, slaughterhouse owners to access and getting the loans, which has been shared.

7.1.7. While developing the market model, we determined that there is no checklist for markets within the framework of MARD Decree 14. USAID/APII included it in its plan to provide technical assistance to the DAH to develop checklists specific for markets' food safety checklists. However, due to a lack of clarity in the division of tasks between national agencies, it is not clear whether DAH is responsible for this. A checklist developed for Dong Ha and Hoa Mac market monitoring and evaluation has been shared as reference for DAH's Division of Public Health for the future.

7.1.8. *Support DAH/RAHOs/Provinces to develop and implement trainings for inspectors on good slaughtering practices and certification stamp requirements:*

In Year three, through the process of implementing three training courses on poultry inspection, USAID/APII has developed a curriculum for Advanced Training on Inspection of Poultry and Poultry Products for Food Safety and Sanitation. This training is complement to the existing RAHO inspector certification trainings. The USAID/APII advanced training include the following additional topics such as updated information on AI, EIDs and food borne diseases; poultry supply chain and how disease transmission occurs at key nodes; and the design and operation of poultry slaughtering facilities to enhance sanitation and food safety.

To facilitate the training course implementation and balancing between interest of different parties, RAHO, provincial SDAH and USAID/APII in same case did agreed to formulate a general course that combined the curriculum developed by USAID/APII and RAHO standards course and costs sharing mechanism has been identified to be able to replicate the USAID/APII designed course. The example can be count for Ba Ria Vung Tau and Quang Binh course. In this example, each province SDAH contributed approximately 50 percent of the total training costs for administration and participants while USAID/APII covered the remaining 50%, mostly related to the costs of the trainers and the training materials.

In cooperation with the RAHOs and DAH, the USAID/APII organized seven training courses for 288 inspectors from 17 provinces, as follows: Thanh Hoa (53), Hue (14), Quang Tri (11); Quang Binh (3); Da Nang (12); Quang Nam (9); Binh Dinh (1), Khanh Hoa(1), Phu Yen (1); Quang Ngai (2);, Tien Giang (39), Ben Tre (20), Dong Nai (7), An Giang (36), Soc Trang (34), Hau Giang (40) and Can Tho (5).

Figure 4. Provinces Where Inspectors Were Trained

transportation and slaughtering, on June 14 and 21 two consultation workshops were organized in Hanoi and HCMC, facilitated by DAH. Ninety-six participants from SDAHs and the functional divisions of DARD from northern and southern regions shared experiences on the current complex situation of food safety in relation to slaughterhouses and markets and gave specific comments on the previous draft. DAH planned to incorporate these comments into the final version, which was to be submitted for approval in late July 2013.

In the Mekong project we undertook a mapping poultry slaughter points in the Mekong region. The location and owner's name of slaughtering facilities were collected and included in the reports from the field trips to the Mekong regions that were shared with the SDAH and RAHO. However, due to time and resource constraints and the limitation on the total number of selected small slaughtering facilities for visits, the regional mapping was cancelled.

7.1.11. *Encourage technical groups, provincial authorities, the LIFSAP and VAHIP representatives, and local investors and owners in scaling up and replicating models:*

More than 30 technical protocols, training documents, behavior change communications materials and supply chain documents from USAID/APII were shared in the Technical Document Sharing Workshop on May 24, 2013. These documents were also shared with FAO, VAHIP, LIFSAP and other agencies and projects upon request during the year as appropriate.

In collaboration with VAHIP, a study tour was conducted to Dong Ha live bird market and slaughter points in Dong Ha city in 22-23th July 2013 for 37 VAHIP PMU, SDAHs, MMBs, Veterinary Stations staff and vendors of Hanoi, Thai Binh and Lang Son provinces. The Quang Tri SDAH were updated participants and shared upgrade experiences including difficulties and lessons learned. Feedback from study tour showed that participants appreciated the efforts of Quang Tri SDAH, USAID/APII and Dong Ha Market Management Board in vehicle management for poultry transport, disinfection and clean up of live bird markets and slaughter points. Another study tour is planned for late August 2013 for other VAHIP provinces.

7.2 Challenges and Solutions

7.2.1 For the market models, most of the provinces are facing the problem of controlling and managing live poultry trading in urban areas. Challenges include the need for farmers to sell their poultry products and the traditional cultural and religious practices and habits of consumers to buy live poultry. Many provinces are struggling with management and control of live poultry selling since it is impossible to maintain a taskforce to check all markets during the time period in which live poultry is traded. Some provinces have their own way of managing and organizing live poultry trading. Most of the provinces

have agreed to have a managed poultry market rather than enforcing a total ban on selling of live poultry in markets for now.

- 7.2.2 Profit margins from poultry slaughtering are especially small, and even more so in small-scale slaughtering operations. It is understandably hard to persuade these small private entrepreneurs to invest in facility upgrades without some form of ‘subsidy’ (financial support). Micro-finance options in the commercial financial sector are rare. Many small entrepreneurs appear to be comfortable with their status quo business (size). Cost-cutting measures seem a more appealing way forward to improve business and increase profits. This also implies cutting private costs on environmental safeguards and food safety-related measures. USAID/APII continues to reach out to and invite partners such as LIFSAP and VAHIP to participate in project activities. Partners rarely reciprocate.
- 7.2.3 Upgrading poultry section in markets model for better control and risk mitigation always faces a number of issues such as location and land availability, local policy and priority. More advocacy with local authorities is needed. While technical briefs may help on this, it might take more time to see the replication of market improvements.
- 7.2.4 Training of veterinary inspectors is assigned to regional animal health offices; however, training modules and duration of the training courses vary among regions. USAID/APII worked with RAHO 3, 6 and 7 on these issues and shared fully developed training curriculum for risk reduction at markets and slaughterhouses. Despite some SDAHs’ interest in organizing more inspector trainings RAHOs may have different priorities. Project coordination was required to assist in this. In addition, too many provinces requested to cost share inspector trainings with insufficient notice for USAID/APII to organize a TOT course to help RAHOs train a group of trainers or to help DAH consolidate the training curriculum.

8. Behavior Change Communication (BCC)

By the end of Year four, a team of key BCC trainers/specialists (five to eight people) drawn from animal health, human health and communications agencies as well as mass organizations was left in Can Tho, Ha Nam, Hung Yen, Kien Giang and Quang Tri. They are able to train colleagues not only in their provinces but also in neighboring Provinces such as Ha Tinh, Quang Binh and Thua Thien-Hue. They are able to replicate the BCC work for new issues and with new target audience for example to address safe traffic in Kien Giang and university students in Can Tho. Local BCC teams took over and continued the facilitation of behavior changes among vendors and slaughterers in Ha Nam, Quang Tri and Can Tho.

8.1. Achievements

- 8.1.1 To use in promoting the BCC training model, the USAID/APII conducted a costing exercise about costs of setting-up and maintaining the model.

- 8.1.2 Completed the contract with Quang Tri WU to replicate the BCC training model to three new provinces (Ha Tinh, Quang Binh and Thua Thien-Hue) and to expand the model to promote food safety using the same approach of behavior change communication to other districts of Quang Tri.
- 8.1.2.1 Conducted three TOT courses on BCC theory and application in promotion of human health behaviors for 62 key staff from provincial office of animal health, human health, education and WUs in Ha Tinh, Quang Binh and Thua Thien-Hue provinces.
- 8.1.2.2 Conducted two training of trainer courses for 52 participants from different departments and organizations including the VFU, food safety, animal health, WU, police, and defense. Participants learned about communication skills, adult learning methods and food safety promotion.
- 8.1.2.3 Developed three discussion guides for communicators in Ha Tinh, Quang Binh and Thua Thien Hue on: (i) environmental sanitation, (ii) women's and children's health and (iii) parenting skills; one discussion guide on food safety promotion for communicators in Quang Tri.
- 8.1.2.4 Conducted nine diffusion training courses for 224 communicators who were from the district and commune women's union, the animal health and human health sectors and population and family planning services have learned about BCC theory and techniques and how to use discussion guides on selected behaviors on environmental sanitation, women's and children's health and parenting skills to facilitate small group discussions in their communities.
- 8.1.2.5 With local resources from provinces, between April and July, 4,755 women in 114 communes of Quang Binh, Ha Tinh and Thua Thien Hue attended 312 small group discussions (12-20 persons per group) on prioritized behaviors selected by each province.
- 8.1.2.6 With contribution from Quang Tri WU, organized a costs shared three-day training course on facilitation skills for 30 managerial board leaders/key members of food safety clubs. These trainees then used their updated communication/facilitation skills to facilitate meetings on food safety topics in their 18 clubs and organized five community based events to encourage 400 members each to practicing good food selection practices.
- 8.1.2.7 Quang Tri WU organized a BCC Year four Review Workshop in Thua Thien Hue to review achievement and lesson learned from replication of BCC training to three new provinces of Ha Tinh, Quang Binh and Thua Thien Huc and to news districts in Quang Tri on food safety promotion. The review workshop was also the forum to share the BCC training model developed in AI and EIDs prevention which was successfully adopted to promote changes in other health behaviors including environment health, women's

health. In the workshop, each province also shared communication plan they would maintain and replicate in 2014 using local funds.

- 8.1.2.8 With technical coaching from a Quang Tri BCC trainer, the Ha Tinh BCC trainer team conducted two three-day training courses on facilitation skills for fifty (50) participants from provincial and communes of six districts within the WU's system and provincial police office. These trained participants are responsible to facilitate their communication events to promote 3 priority behaviors selected by Ha Tinh WU in their communities including washing hands before and after processing foods; properly discard disposables; and cleaning community lanes at least once a month.

Replication of BCC training with local fund and resources:

- 8.1.2.9 Quang Tri WU organized three training courses on communication skills for 141 chairwomen of commune WU chapters in Dong Ha Town to improve their communication skills and understanding of BCC theory.

- 8.1.2.10 Followed-up with individual provincial BCC trainers on utilization of BCC knowledge and skills in their daily work, encouraging dissemination of best practices and results, BCC trainers of Can Tho, Kien Giang and Quang Tri applied BCC to conduct activities in other fields rather than avian influenza and EIDs prevention, such as:

- Forums on BCC to prevent and control cancer (Can Tho)
- Guide students to develop communication plans and communication materials (Can Tho)
- BCC in road safety (Kien Giang)
- BCC in mother's education - under the project to educate five million mothers through Vietnam WU (Kien Giang)
- BCC in environment (Kien Giang)

- 8.1.2.11 These BCC trainers were also mobilized to facilitate BCC trainings or communication events by other projects for example: World Vision in Quang Tri and Helvetas in Kien Giang.

- 8.1.3 Supported the NAEC, organized a TOT course for 32 participants from their seven project provinces (Hanoi, Hai Duong, Bac Ninh, Thai Binh, Thanh Hoa, Vinh Phuc and Bac Giang) to apply the BCC techniques and approach in extension work to promote changes toward biosecurity poultry production. In addition to in-class training, participants had a field visit to a private sow farm to analyze the risks of zoonotic diseases as well as solutions for changing behaviors toward good biosecurity practices.
- 8.1.4 Refined, produced and left behind a package of materials for the adoption and replication of BCC training model, include:
- Can Tho and Ha Nam Provincial Communication Plans

- Communication Strategy Development Guide and BCC Training Manual
 - BCC curriculum and participatory training for VFU
 - List of desired behaviors per prioritized target groups
 - Five sets of discussion guides and flipcharts with different supply chain actors (poultry producers, vendors, slaughterers and collectors),
 - Guidebooks on community event and small group discussion,
 - USAID/APII BCC Training Model Poster sets.
 - Posters promoting the application of biosecurity practices at markets and slaughtering facilities,
 - Promotional behavior change designs: T-shirt, pen, notebook, cap, hat, hair bandeau, apron.
- 8.1.5 To facilitate the adoption and replication the BCC training model, the USAID/APII organized two National Dissemination Workshop in Hanoi and Quang Tri. Each workshop gathered 130 participants from nineteen provinces across Vietnam discuss and understand USAID/APII BCC Training Model and lessons learned while applying this model. A package of key BCC materials was briefly presented and distributed to all participants. These two workshops paved the way for the adoption and replication of BCC Training Model by three new central provinces of Ha Tinh, Hue, and Quang Binh and VFU to its all Vocational Training Schools.
- 8.1.6 Two important USAID/APII BCC manuals, the Communication Strategy Development Guide and BCC Training Manual, were disseminated through a National Training Workshop with 32 participants from twelve provinces as well as national bodies including the VFU and the National Center for Health Education and Communication (NCHEC) of MOH. Besides presentation and discussion sessions enabling participants to fully understand these two documents, the training workshop also guided them to apply the Communication Strategy Development Guide in developing their own provincial communication plans.

Adoption and replication of USAID/APII BCC Training Model

- 8.1.7 VFU successfully developed, introduced and disseminated a BCC curriculum for their livestock and culture teachers at their Vocational Training Schools. VFU leadership officially endorsed this curriculum. Its development benefited of technical expertise and coaching from USAID/APII's BCC trainers from Ha Nam, Quang Tri and National Center for Health Education Communication (NCHEC) of MOH as well as from USAID/APII BCC team.
- 8.1.8 Organized three regional TOT courses on BCC and participatory training approach for 80 teachers from 28 provincial Vocational Training Schools and Centers of Bac Ninh, Ha Nam, Hanoi, Hai

Duong, Hoa Binh, Hung Yen, Nam Dinh, Thai Binh, Da Nang, Dac Lac, Hue, Khanh Hoa, Ninh Thuan, Nghe An, Quang Binh, Quang Nam, Quang Tri, Phu Yen, An Giang, Ba Ria Vung Tau, Binh Duong, Binh Phuoc, Binh Thuan, Ca Mau, Kien Giang, Lam Dong, Long An and Tien Giang. These three TOT courses were co-designed and facilitated by BCC trainers of Quang Tri, MOH and VFU.

- 8.1.9 As requested by VAHIP project to adopt BCC training model for Ha Vi market, the USAID/APII BCC team designed and led two-day training course on BCC and application for promoting changes at Ha Vi market for 21 animal health officers from Hanoi and Thuong Tin district and members of Ha Vi market management board (MMB). As planned, the Hanoi SDAH and VAHIP project would follow-up with these participants on planning and implementing BCC activities at Ha Vi market.

Coaching and follow-up on the maintenance of BCC Training Model

- 8.1.10 As agreed with Ha Nam SDAH, leaders of Hoa Mac People's Committee and MMB during planning meeting, USAID/APII supported BCC trainers of Ha Nam; MMB, Animal Health officers and local authorities of Hoa Mac to plan and conduct monitoring activities to observe changes at Hoa Mac market and Hue - Thanh slaughtering facility. The USAID/APII transferred the leadership of routine monitoring of changes to Hoa Mac market management board and commune People's Committee.
- 8.1.11 Hung posters promoting the application of food safety practices among consumers and poultry vendors at Hoa Mac market and promoting off-floor slaughtering at Hue Thanh slaughtering facility.
- 8.1.12 Broadcasted a 20-minute video of the Stakeholder's Forum on Safer Poultry Production and Food Safety on Can Tho City Television. Key issues addressed in the forum including current regulations related to the responsibility of stakeholders to contribute to the safety of poultry products, consumer's experiences while choosing and preparing poultry and practices and efforts of poultry slaughterers, vendors and Ngoc Xuan slaughterhouse owner to contribute to safer poultry products were broadcasted to reach a larger public audience.

8.2 Challenges and Solutions

- 8.2.1 The development of a BCC curriculum for teachers at Vocational Training Schools of VFU was a challenging task because the module had to satisfy both technical requirements of an effective BCC methodology and the requirements of the VFU so that they could approve and officially introduced the curriculum into their training system. The design and delivery of three regional TOT courses on BCC within only five months required huge efforts in planning and coaching. The USAID/APII BCC team had to work closely with the writing team as well as providing intensive technical support to edit the curriculum. This task had some small delays compared with initial planning but completed as planned, finally.

- 8.2.2 In early of year four, the USAID/APH BCC team met and explored with Hanoi Consumer Associations to understand their role in promotion of demanding food safety, and possible link food safety promotion campaign. However, Consumer Associations has no strong links with our models in provinces where the biosecurity models set up including Ha Nam, Quang Tri and Can Tho. Due to limited consultancy options in the region, the USAID/APII cancelled its plan on a press relations/education campaign on food safety and choosing safe poultry regionally.
- 8.2.3 After the MOH IC training has been rolled out, they took the leadership to conduct training follow up and monitoring with key officers and VNA, MOH and provincial departments of health and staff from hospitals where monitoring conducted. So the USAID/APII could not send any BCC trainers in the IC monitoring team at hospitals as planned but we satisfied with the way the local hospitals took lead in their monitoring.

9. Monitoring and Evaluation (M&E)

In Year four of the project, we focused our efforts on activities of advocacy, documentation and expansion achievements obtained in previous years to new areas. These project activities were implemented on the basis of working directly between the project and selected and interested partners/contractors. This working approach helped to make clearly objectives, roles and functions of each party involved in the cooperation. Agreements reached with the project partners and contractors were again defined more accurately in SOWs and PSAs. These improvements contributed effectively to increasing quality and time for implementing the project activities in year four.

9.1 Achievements

- 9.1.1 During Year four, the project continued working with MEASURE and API partners on the data analysis plan and necessary preparation for a “good shape” PMP database for the evaluation of USAID API activities. Based on PMP data knowledge and discussions with FAO and WHO, USAID/APII provided comments on the draft MEASURE-developed data analysis template and discussed with MEASURE about program’s data analysis needs and data reporting requirements. MEASURE follow up to work on necessary improvements of the analysis plan, based on USAID/APII’s comments and the evaluation plan.
- 9.1.2 The project’s Logframe was finalized through refining indicators to reflect selected approaches and interventions in realization of the annual work plans and defining targets for every indicator. An updated Logframe was maintained through Year four.
- 9.1.3 Responding to the request from UAID, data quality assurance (DQA) documents were prepared and submitted to USAID for a number of the project’s indicators in the Logframe for the first three project years using USAID templates.

- 9.1.4 Reviewed and provided comments on project's advocacy plan as well as assigned indicators for monitoring realization of the advocacy plan, linking with the project's PMP/Logframe
- 9.1.5 Reviewed and provided comments and inputs to the SOWs of subcontractors to ensure the planned approaches, interventions and deliverables are aligned with the set targets and pathways articulated in the Work plan and the Logframe.
- 9.1.6 Comments and other inputs were provided to assessment and survey reports and presentations, such as the KAP survey and AHW costing study.
- 9.1.7 All subcontractors/partners' reports on implementation and deliverables were submitted to the project in time and meeting requirements of the project administration and management.
- 9.1.8 Completed update the project training activities in Trainet.
- 9.1.9 A range of specific monitoring activities were carried out as part of the process of completing and reviewing the performance of key USAID/APII models:
 - 9.1.9.1 Worked with technical teams to implement supportive monitoring plans from September to December 2012 at biosecurity demonstration sites in Can Tho and Ha Nam. Developed, tested and implemented a monitoring checklist on biosecurity practices at local meat market in Ha Nam, which will be used for advocacy to DAH for adoption at national level.
 - 9.1.9.2 Compiled monitoring results at Ngoc Xuan from September to December, 2012 that were used in the review meeting on monitoring activities between the project and Can Tho SDAH to define next steps. The summary of the assessment checklists from the four monitoring sessions shows that there has been an improvement of this Slaughterhouse. The percentage of the checklist items meeting biosecurity standards has increased from 48% in September to 65% in November. The design related issues have been resolved.
 - 9.1.9.3 Joined with animal health team to train inspectors in Ha Nam in November 2012. Concepts and principles on supportive supervision activities were introduced to the trainees. After this, trainees practiced role-plays to acquire necessary skills such as two-way communication, active listening and providing constructive feedback to slaughterers.
 - 9.1.9.4 Collaborated with technical teams, conducted a mini-survey on the situation of access to finance of the owners or investors of slaughter points/houses who were attending two training courses on biosecurity. The survey identified that 84.6% of 26 participants who filled in questionnaires faced difficulty in getting finance at the start up of their business. 65.4% have used their own fund (with or without other sources); 38.5% of all never sought for bank' loans and other 50% sought and granted with loan at least

once with annual rate of 12-18%. A number of them mentioned that they would not be able to upgrade the slaughtering facility and improve the working environment without easier access to finance. The findings of this survey are useful as an input for upcoming project support to this target group through providing education and information on the ways to access possible financial sources. The project is going to repeat the survey with the participants of the next similar training course.

- 9.1.9.5 Monitored changes in IC activities at selected hospitals that sent their staff to attend TOT training courses in 2012. The monitoring team consisted of staff from the Administration of Medical Services (AMS) of MOH, the VNA and USAID/APII. The team visited eight DOHs and 13 district hospitals. The monitoring team acknowledged positive changes in attitude and behaviors towards IC management and practices in health facilities.
- 9.1.10 To document in-province sustainability and replication of the achievements supported by USAID/APII including following-up with demonstration models, USAID/APII developed a quarterly report template and requested partners in our five focus provinces to report on the project's achievements in their province and share this report with the project.
- 9.1.11 Met with Ha Nam DARD in March to review Year four activities, collaboration and coordination in collecting, updating and sharing sustainability and replication of project's achievement.
- 9.1.12 A similar meeting was implemented with a former leader of the USAID/APII Provincial Coordination Unit (PCU) in Hung Yen in March. Both sides agreed to continue USAID/APII activities scheduled for Year four of the project and to carry out the activity of collecting, updating and sharing the project information.
- 9.1.13 The SDAH in Ha Nam and in Hung Yen collected and shared reports provided information on the maintaining and expansion of project models within the province as well as limitations and obstacles to the continuation of those interventions. These reports served as helpful references for decision-making and in planning support for the continuation and expansion of the project interventions and their future activities.
- 9.1.14 Developed a reporting template and guidelines for updating and sharing the project information on what has been replicated and maintained after the project ceased its financial support.

9.2 Challenges and Solutions

- 9.1.1 As noted during quarterly reporting in Year four, engaging all relevant sides in the process of USAID PMP review and development of analysis template was time consuming since each side has multiple tasks to coordinate and harmonize. The lack of a macro program data analysis plan for assessing program performance according to USAID's expectations hindered the API partners in determining necessary supplementary data to fill the gaps

in the PMP data, leading to some delays in data analysis and updating.

- 9.1.2 In May 2013 the M&E Manager left to take up a new position. This created some challenges, however the project team pulled together strongly to cover the M&E activities including inputting of raw PMP data into the official Logframe template for USAID.
- 9.1.3 The phasing out of the PCUs in the five original focus provinces in October 2012 created some challenges in the process of updating and sharing the sustainability and replication of project's information. This was address through active follow up with key provincial counterpart agencies such as DARD and SDAH, DOH and the provincial Women's Union chapters, as well as contacts with Provincial Pcople's Committee representatives where necessary.
- 9.1.4 In contrast to the hardware items, it was found to be quite painstaking and challenging to improve 'software' related items at the biosecurity demonstration sites. For examples, in Ngoc Xuan Centralized Slaughterhouse, areas where further improvement could be made were identified in many areas such as disinfection of poultry transportation vehicles, off-floor evisceration, regular water testing, use of toilets and shower room, regular health check-ups for workers, wearing of personal protective equipment, personal hygiene practices, waste water processing and activities on management of by-products in the slaughterhouse according to Standard Regulation QCVN 01-25:2009/BNNPTNT. To address these issues requires multiple approaches including continuous education, technical coaching, supportive monitoring and enforcement. To address these issues, the project continued working with local partners while gradually reinforcing their ownership in managing the sites.
- 9.1.5 It was recognized through the M&E activities that almost all IC health staff in hospital facilities were working part time and many of them did not receive sufficient and systematic training in IC. There was a difference in the level of changes in IC practices from one health facility to another within the same province. This might lead to differences in level of care provided to patients from these facilities.

10. Finance and Administration

10.1 Achievements

- 10.1.1 Managed all aspects of the finance and administration and all subcontracts and consultant agreements effectively. All subcontracts and consultants were closed out.
- 10.1.2 USAID/APII continues to submit routine deliverables to USAID, including quarterly progress reports, quarterly financial reports, semi-annual and annual reports etc. The F&A team support the technical teams in managing all subcontracts and consultants and closing them out.

10.1.3 A better tracking system was set up for the last year of Project including expenditures, travel, supplies, inventory, procurement, staff leave, subcontracts and consultants was developed.

10.1.4 Throughout Quarter Four, F&A has been and will continue working on the close out plan. All subcontractors and consultant contracts successfully closed; Termination agreements have been completed for some staff who finished work in September 2013; procedures for handing over the office in Quang Tri, Can Tho and 5th floor – 72 Xuan Dieu, Hanoi were undertaken. Preparations were made to ship all payment vouchers to the head office in Bethesda.

10.2 Challenges and Solutions:

10.2.1 Year four brings a unique set of challenges: implementing our contractual requirements and preparing for close out in September. We worked to disseminate APII programs and activities to new provinces and districts until July, at which time our focus shifted to close out activities. This indicates a compressed timeline in which to complete all program activities.

11. Success Stories

Central and provincial government officials investigating ways to apply the USAID/APII market and slaughterhouse models in new locations

There are more than 700 live poultry markets currently operating in Vietnam. There is also a strong concern over public health risks including the ongoing avian influenza H5N1 outbreak in Vietnam as well as the recent discovery of the potentially dangerous H7N7 and H7N9 influenza strains in similar poultry markets in China¹. These create a pressing need for practical measures to reduce disease transmission and food safety risks from poultry trading and slaughtering activities in Vietnam and neighboring countries. USAID's Avian and Pandemic Influenza Initiative (USAID/APII) has developed an effective model for reducing public health risks from live poultry trading in public markets that is now being shared widely within Vietnam.

The public health risks from live poultry markets are well established. However, many consumers in countries such as Vietnam strongly prefer to buy live poultry. As a result, completely stopping live

The live poultry market in Dong Ha in 2011, prior to renovation. Photo: Richard Nyberg, USAID

¹ Nature doi: 10.1038/nat

poultry trading in public markets is not feasible in the short-term.

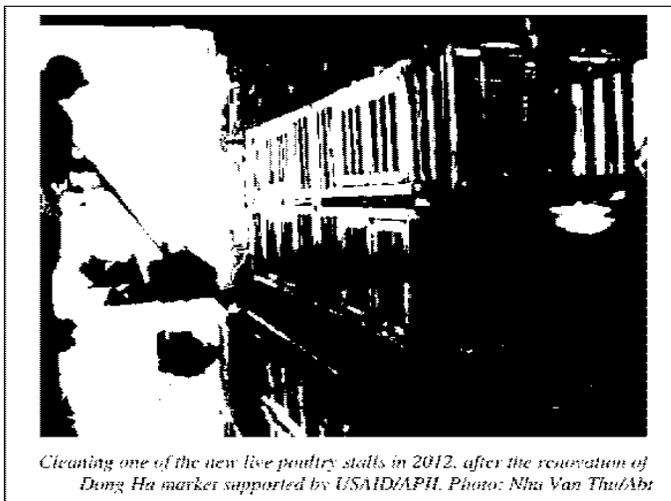

Responding to this reality, USAID/APII has developed and tested a model which focuses on: 1) reducing the risks to human health through separating live poultry from other sections of the market, 2) eradicating dangerous activities like slaughtering poultry inside the market, 3) building better facilities, and 4) promoting safer and more hygienic practices by vendors, transporters and the public.

A public health assessment prior to the USAID/APII interventions found that the Dong Ha market only complied with 19 percent of actions necessary for a healthy market. In two successive assessments after the intervention, compliance had increased to at least 67 percent.

Since USAID/APII's Dong Ha market and small-scale slaughterhouse models were launched in 2012, more than 170 provincial and district officials, market representatives and other stakeholders from 15 provinces and seven national agencies have visited these models.

On July 22-23, 2013, the Ministry of Agriculture and Rural Development (MARD) organized a visit to the USAID/APII models in Dong Ha for 42 representatives from their central Project Management Unit (PMU) as well as from provincial PMUs and Market Management Boards (MMBs) from three cities/provinces (Hanoi, Lang Son and Thai Binh) supported by the Vietnam Avian and Human Influenza Prevention and Control Project (VAHIP) supported by the World Bank. This group included representatives from Ha Vi Poultry Market, a large live poultry market serving Hanoi, where as many as 100,000 birds may be traded on a busy day.

The purpose of the visit was to provide these representatives with examples of successful upgrading of a live poultry market, a plucked poultry market and small-scale slaughtering facilities according to the USAID/APII model, and to share experiences from the process of upgrading these sites, as a basis for applying these results within the VAHIP project locations and to promote the model generally throughout Vietnam.

Cleaning one of the new live poultry stalls in 2012, after the renovation of Dong Ha market supported by USAID/APII. Photo: Nhu Van Thu/Abt

Following the visit, Mr. Pham Viet Anh, an official of the Ministry of Agriculture and Rural Development (MARD) who is in charge of the agriculture component of the VAHIP project, praised the implementation of the upgrading works in the USAID/APII models in Dong Ha, noting that they were appropriate

to the local conditions and represented a positive step in enhancing the safety of poultry trading and slaughtering in Quang Tri province.

Mr. Pham Viet Anh stated, “market vendors in Dong Ha are keeping the market area clean and also cleaning their poultry cages and vehicles daily even though the project has now come to an end. The VAHIP project will keep learning from the measures and implementation approach which has produced these results in order to apply it within our own models.”

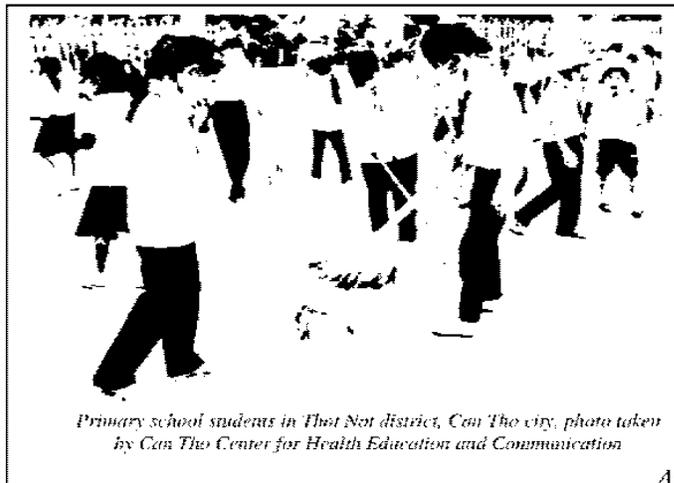

For more information, please refer to USAID/APII’s brochure on the market model.

Providing an Affordable Behavior Change Communication Training Model for the Future

Awarded to Abt Associates in October 2009, the USAID’s Avian and Pandemic Influenza Initiative (USAID/ APII) has developed a BCC training model (for effective promotion of desired health behaviors towards avian influenza and emerging infectious disease prevention among different target audiences including poultry supply chain actors (farmers, market vendors, slaughterers), mothers with children under five, parents of adolescents, housewives and teachers at vocational training schools.

The USAID/APII conducted a cost assessment of this BCC training model to provide a basis for the provincial counterparts who might also develop thematic communication activities in their provinces. The actual costs each year might increase or decrease depending on the number of issues addressed, the types of communication activities selected and the size of target populations. Results showed that estimated cost for a provincial agency or organization to apply the model is approximately \$32,400 during the first year and approximately \$28,800 per year thereafter. The amount for the first year includes the cost of setting up the team and mobilizing expert trainers to provide an initial training for 20-25 key provincial and district communications staff of the agency on BCC techniques and messages. These key experts will be involved in annual planning and review meetings, diffusion training of district, commune and village communicators for each activity, and implementation of media campaigns, small group discussions, community events and other selected activities.

Vietnamese Women’s Unions have shown the sustainability of this in investment. By August 2013, BCC trainer and specialist teams in Can Tho, Kien Giang and Quang Tri were able to gain funds from other sources to sustain their 2013 BCC activities with health providers at health facilities, school

Primary school students in Thot Not district, Can Tho city, photo taken by Can Tho Center for Health Education and Communication

children and university students on environment cleaning and prevention and control of breast cancer and cervical cancer (Can Tho). In addition to endorsement from the Provincial People's Committee according to official letter No 790/ CV-UBND regarding utilization of BCC materials of the USAID/APII to strengthen AI and EIDs prevention and control activities, the Kien Giang Women's Union secured about 600million VND from different sources. These funds will be used to conduct BCC theory and communication skills training for communicators and club leaders on road safety, child nutrition and micro-credit lending.

The Quang Tri Women's Union also applied BCC and communication skills into other routine activities such as the "clean house, clean kitchen and clean lane" movement, life skills training for 1,000 high school students in Le Loi, Dong Ha and Le Quy Don; and organized communication skills training for 141 chairwomen of all 141 commune Women's Unions with their annual funds. The Quang Tri BCC trainer team also collaborated with other international including Plan International, World Vision to integrate promotion of behavior changes on water and sanitation, and safe motherhood issues.

USAID/APII has developed and left behind a practical, affordable and effective model for behavior change communications in Vietnam which provide theory and tools to provincial communication teams to address emerging diseases, food safety and a range of other health issues. The model has been applied in 21 provinces and 28 out of 69 vocational training schools and centers for Viet Nam Farmer's Union.

For more information, please refer to USAID/APII's brochure on the BCC.

Introduction

USAID's Avian and Pandemic Influenza Initiative (APII) was originally a three-year project (Oct. 2009 – Sept. 2012) implemented by Abt Associates. As of July of 2012 the project is in the process of receiving an extension for a fourth year of implementation. The project aims to strengthen the capacity of the Government of Vietnam and its counterparts to identify, prevent, and control influenza outbreaks in both animals and humans. This document outlines the Year 4 (Oct. 2012 – Sept. 2013) annual work plan for APII.

During Years 1-3 the project has focused on developing the following models: Community-Based Surveillance (CBS) for both the human and animal health systems; Infection Control and Case Management (IC/CM) in local hospitals; Pandemic Preparedness Plans (PPP); Animal Health Worker (AHW) capacity building; Agricultural Extension Worker (AEW) biosecurity training capacity building; Poultry Supply Chain (Network) strengthening; and Behavior Change Communication (BCC). In Year 4 the project will sharpen its focus on working with government and organizational partners to replicate and scale up the use of the models throughout Vietnam. For each model we have set an outcome goal or that which we wish to leave behind come September of 2013:

1. **CBS:** The Ministry of Health (MOH) has issued Circular 48 which requires all levels of health care worker (including at the village level) to report communicable diseases. For the Human Health system the focus of Year 4 APII activities will be to assist the MOH as needed to train Village Human Health Workers (VHHW) in identification of A/EID symptoms and to report into MOHs event-based surveillance system. While community level animal health workers do exist in some provinces with provincial support, not all are tasked with surveillance. Our goal for enhancing community level surveillance activities in Year 4 is to build a cadre of Village Animal Health Workers (VAHWs) who have surveillance as a standard task and have the skill set to do so.
2. **IC/CM:** With the presumed adoption of IC training materials to accompany Circular 18 in late 2012, our goal is to assist the MOH in disseminating training materials throughout Vietnam in Year 4.
3. **PPP:** Using the PPPs developed in selected pilot provinces with USAID investment, we will provide technical assistance to those provinces wishing to revise their PPPs to include a one health approach and business continuity planning.
4. **AHW capacity building:** In Year 4 we will continue to support the roll out AHW trainings through the private sector and Government of Vietnam (GVN) training institutions.
5. **AEW biosecurity training capacity building:** The goal is to support National Agriculture Extension Center (NAEC) in disseminating the biosecurity trainings throughout their extension system.
6. **Poultry Supply Chains (Supply Network) Strengthening:** In Year 4 we will use the lessons learned from Poultry Supply Network demonstration nodes to provide a basis for replicating the models in new places. In addition we will

continue to support the models we have enhanced to further hone their improvements and provide additional lessons.

7. **BCC:** In the final year we will continue to support all of the models with BCC integration and roll out the BCC training model to new provinces. (1. Ngoc Xuan SH; 2. Dong Ha LBM and plucked; 3. Dong Ha SPs; 4. Ha Nam SP's; 5. Hoa Mac animal meat section; 6. IC training model)

Policy and advocacy is central to the scale up and institutionalization of our models for long term sustainability. Therefore advocacy activities are integrated throughout each technical area and will be enhanced by our participation in policy coordination activities at the national level. This also includes working with Partnership on Avian and Human Influenzas (PAHI) and enhancing the proposal writing skills of provincial counterparts in order to allow them to develop ongoing activities in the future.

Throughout Year 4 we will work to expand our models into new provinces. Our strategy for reaching new provinces is two-fold: 1) to invite participants from neighboring provinces to dissemination workshops and national events and 2) to specifically target provinces based on similar characteristics to model provinces, risk for AI and EIDs and the possibility of building on other partners' efforts (for example with the Food and Agriculture Organization (FAO) in Regional Animal Health Office 3 (RAHO3). Replication will be promoted through the provision of materials, training for trainers to provide dissemination trainings, assistance in identifying funding sources and general technical assistance to the roll out of activities.

USAID API Results Framework

The work plan is also shaped by USAID's avian and pandemic influenza (API) and emerging pandemic threats (EPT) results framework/performance management plan (PMP):

AO4: Improved Health of the People of Vietnam	
IR3: Increased Capacity to Prevent, Detect and Respond to HPAI and EPT in Animals and Humans	
Sub-IR1	(Increased effectiveness of HPAI and EPT prevention and control in the animal health sector
	Task 1: Strengthen national and provincial surveillance system for HPAI and EPT
	Task 6: Increase preventive veterinary measures in production and markets
	Task 7: Improve attitudes and education related to HPAI and EPT risk
	Task 8: Improve knowledge of HPAI and EPT risk, preventive and control measures in small-scale commercial poultry farmers and market chain participants
	Task 9: Strengthen human capacity in animal health disease control
	Task 10: Strengthen capacity to communicate HPAI and EPT BCC messages
Sub-IR2	Increased effectiveness of prevention and control of human infection with HPAI and EPT

	Task 4: Strengthen human capacity in case management
	Task 5: Strengthen human capacity in infection control
	Task 6: Improve attitudes related to HPAI and EPT risk
	Task 7: Improve knowledge of HPAI and EPT risk, preventive and control measures
	Task 8: Strengthen capacity to communicate HPAI and EPT BCC messages
Sub-IR3	Strengthened policies and systems for improved implementation and management of services and programs
	Task 1: Support development of partner approved national and local plans and SOPs for HPAI and EPT prevention/control
	Task 2: Promote cross-sectoral and cross-border coordination and communication
	Task 3: Support governments in development of evidence based policy, including implementation of special studies
	Task 5: Strengthen involvement of private sector
	Task 7: Scale up provincial and community-based pilot projects
	Task 8: Increase capacity of local governments and communities to plan and test multi-sectoral pandemic preparedness and response activities

APII is furthermore guided by the national framework notably the emerging National Operational Program on Avian Influenza, Pandemic Preparedness and other Emerging Infectious Diseases 2011-2015 (AIPED).

Implementation and Phase-out plan

To reflect the nature of the Year 4 workplan we have revised our operational model. This includes reducing our presence in original five focus provinces with the elimination of the Provincial Coordinators (PC) and Provincial Coordination Units (PCU), and the revision of Project Area Manager's scopes of work to have a more regional focus. In addition, throughout the year we will reduce positions to reflect the nature of our work and the impending contract close. These staffing reductions will begin in month six and continue through the end of the Year. In Q4 we will close our field offices and reduce our staffing numbers by September to those necessary for contractual close out activities.

Below follows a detailed narrative/description of the work planned in Year 4, beginning with a reflection on our expected outcomes by September 2013. As mentioned previously, these expected outcomes are the skills, improvements and programs which we wish to leave behind at the end of the contract. Annexes 1-2 outline planned inputs from international short-term consultants, national short-term consultants and subcontractors. Annex 3 presents the work plan in Gantt Chart format outlining the proposed timeframes and linking the activities to the results framework by their Sub-IR and Task numbers. The results framework is presented in Logical Framework format in Annex 4.

1. Coordination and Policy Dialogue

Under coordination and policy dialogue we have three goals to achieve by the end of Year 4:

- Improved HPAI prevention and control based on improved coordination
- Sustained dialogue, coordination and lessons sharing on communications in Vietnam at a national level
- National communication framework revised in line with AIPED and officially approved by National Steering Committee for Avian Influenza (NSCAI) and applied by all members in planning and implementation

Policy dialogue and advocacy activities are integrated throughout all parts of our Year 4 plan, focused on applying the results of our models at both central and provincial levels. Some specific activities we will undertake to achieve this include: continuing to support central level working groups to promote knowledge sharing and coordination at the national level, participating in PAHI Policy Forums and continuing to support proposal development for continuation of funding for new related activities. Additionally, important to supporting the growth of API programs we will continue to collect, analyze and share program data and monitor our own project's activities.

1.1. Continue to support central level working groups

- We will continue to act as the Secretariat of the One Health Communications Network until December of this year: Providing administrative support and technical expertise to the group as a whole. After December NAEC will take full responsibility for the Secretariat role, and we will continue to participate in the meetings throughout the life of the project.
- The TDBCC and BCC Manager will participate in meetings and provide inputs to the development of the National Communications Framework led by the Chair and Vice-Chair of the One Health Communications Network, supported by the PAHI Secretariat.
- We will actively participate in the Biosecurity Working Group, giving presentations on our lessons learned and the results of our programs when possible.
- We will identify opportunities to participate in and share our results to other related non-API working groups and workshops – in particular with the IC Societies and the Health Partnership Group, as well as through the Vietnam Veterinary and Vietnam Poultry Associations.

1.2. Participate in Policy Forums organized by PAHI

- Our technical staff will participate in activities organized by the PAHI Secretariat, in particular working with other API partners to review the NSCAI.
- We will identify ways to support implementation of the joint circular from MARD and MOH at the provincial level once it has been finalized.

- We will update the APII project advocacy matrix/plan for FY13 and review on a quarterly basis. This will help us plan and participate more actively in the PAHI organized Forums.
- We will participate in the policy coordination meetings organized by PAHI to identify ways to leverage the Policy Forums and role of PAHI to communicate our advocacy messages. PAHI has relationships and insight into our government partners which can be very useful to helping promote the uptake and replication of our models.
- We will support other API partners on activities to improve routine information sharing within and between key systems and contribute to API knowledge management

1.3. Follow up on Year 3 training for focus provinces in proposal writing

- Our technical staff will provide technical reviews/coaching on proposals developed by provinces for taking forward activities and replicating our models. In addition to sustaining some of our interventions, this activity will build the skills of provincial level staff to secure funding for new related activities in the future.

1.4. Collect and analyze API program data

- The M&E Manager will collect data from API partners and analyze it using tools developed by MEASURE Evaluation in Year 3.
- She will also take the lead in updating the USAID results framework and reporting forms.
- We will share reports on the data analyses.
- The M&E Manager will participate in and contribute to PAHI's work on the National AIPED M&E framework throughout the year, supporting the establishment of an effective, nationally-owned system for measuring progress and impact of Vietnam's overall efforts on AI and EIDs under AIPED.

1.5. APII M&E and Quality Assurance (QA)

- We will review and update APII MIS/filing systems as necessary to ensure easy access to project background documents and deliverables.
- The M&E Manager will update APII Performance Monitoring Plan (PMP) log frames to ensure it measures performance on the new activities in Year 4. The DQA will be carried out through the data collection and management process
- The M&E Manager will contribute to project evaluations/assessments of various activities to ensure that they are objective.
- We will share reports on project performance with USAID and other partners when relevant.
- All technical staff will continue to monitor activities with increasing ownership from local authorities as well and review deliverables for QA throughout the year.

2. Human Health Surveillance

By September of 2013 we aim to have contributed to the improved knowledge and skills of village human health workers (VHHW) in order to participate in community level surveillance in several provinces (five original focus provinces and new replication provinces.) In particular it is important to build VHHWs knowledge and skills related to zoonotic diseases, and continue to promote coordination with the animal health sector on surveillance related issues. This builds on successes made through the CBS model throughout Years 1-3.

In order to accomplish this we will support the operationalization of Circular 48 by sharing our experiences and training programs and replicate our model for training health workers developed under the CBS model in Years 1-3.

2.1. Support national/provincial policy that would facilitate community level surveillance and/or events based surveillance

- We will organize a review workshop on Circular 48's implementation as it relates to grassroots level surveillance and to share experiences from the APII provinces. Participants will include APII focus provinces and some newly selected provinces and will aim to encourage provinces to develop a Circular 48 implementation plan for improving the surveillance skills of their VHHWs.
- We will support interested provinces who attend our workshop to develop provincial plans on implementing Circular 48. The BCC trainers and the DOH will be involved in the process which will include developing training plans to improve VHHWs skills and knowledge of EIDs, surveillance techniques and communication skills. Ultimately this will increase the number of VHHW capable of participating in community based surveillance while providing good services/consultation to the households they are visiting.

2.2. Replication of the relevant model in existing provinces and in new provinces

- We will conduct one regional TOT followed by more in-depth TOT courses to develop a cadre of trainers on EIDs and surveillance and communication/consultation skills for VHHWs of APII provinces with participations from selected new provinces. Following these courses we will work closely with provincial preventive medicine center to develop revised provincial plans incorporating elements of Circular 48. This will provide Trainers that will be able to develop "provincial" specific training based on local needs and direction.

3. Case Management and Infection Control Capacity Building

By September 2013 we plan to have accomplished the following:

- Support MOH in their initial roll out of the approved Infection Control and Prevention (IPC) training program to the grassroots level throughout Vietnam
- Increased capacity of private health care center staff for facility level IPC
- Introduced IC programming in pre-service education, including private institutions

- Improved HCW capacity in IPC at public district hospitals, especially in APII intervention provinces (both new and original five)

Essential to achieving this are providing technical assistance and materials to supplement the MOH's roll out, increasing knowledge about IPC programs from District to National referral level hospitals to facilitate Circular 48's operationalization, introducing IPC programs into pre-service education and assisting private institutions in developing and implementing complementary programs.

3.1. Provide TA, materials replication and TOTs to support the roll out of IC trainings according to the MOH IC dissemination training plan as developed.

- We will print and disseminate approved IC training materials to supplement the MOHs roll out.
- We will advocate that the Administration of Health Services issue an official letter to endorse implementation of the approved IC training materials to all provincial DOHs.
- We will provide coaching and ongoing TA to APII focus provinces to continue to strengthen IC programs in existing district hospitals and to disseminate the programs and trainings down to commune level health centers and clinics. This includes training, IC committees, and hand washing supplies.
- We will conduct three regional IC TOT courses for new provinces allowing them to disseminate the trainings in their home provinces.

3.2. Work with VNA, JICA, WHO to support the MOH to host a workshop to introduce IC training materials being developed for various levels of the health system

- We will support the MOH to host a national workshop in Hanoi (or other location as determined) with key IC partners. This workshop will introduce IC training materials that will have been developed for various levels of the health system and identify ways to strengthen IC networking in the future.

3.3. Supplement MOH roll out of training by working with DOH to disseminate materials and support/coach DOH trainers to disseminate in their respective areas

- We will reproduce and provide materials to DOH partners for dissemination trainings.
- We will support and coach DOH trainers as required in rolling out the trainings in new provinces.

3.4. Explore and foster opportunities for private institutions to include APII IC training module in the institution's curriculum.

- We will identify potential nursing schools and other training institutions in which to promote an IC training module.
- We will conduct one TOT course for participants from nursing/ medical schools on IC training for health care workers at district and commune levels.

- We will provide technical support and continue to advocate that nursing and medical schools adopt and integrate IC training into their programs.

3.5. Explore public-private partnership opportunities in implementing IC activities

- We will work with DOH to identify potential private clinics/hospitals to approach with model.
- We will provide TA to DOHs to organize co-implemented and/or co-funded trainings and other activities with private institutions.

4. Pandemic Preparedness

By September of 2013 we plan to have increased GVN awareness about business continuity planning (BCP) and to have increased the number of approved whole-society PPPs nationally within Vietnam. To accomplish this we will work to promote to new provinces the importance of revising and implementing PPPs which incorporate One Health and BCP.

4.1. Work with National and Provincial Authorities where appropriate in collaboration with USAID/VN API partners to revise and implemented existing PPPs (to incorporate One Health and whole of society)

- We will host a national level PPP Lessons Learned Workshop where we will highlight the experiences of Ha Nam and Kien Giang.
- We will provide TA support and supporting documents to provinces that require it to improve or revise their PPPs.
- We will participate in the WHO training/orientation on BCP for government officials as feasible.

5. Animal Health Surveillance

Complementing Human Health Surveillance, by September 2013 we will have improved the village animal health workers' (VAHW) knowledge and skills to participate in community level surveillance in the both new and previous focus provinces. We will also build a nationwide cadre of VAHWs who have surveillance activities as a standard task. These VAHWs will be encouraged to continue to collaborate with VHHWs on identifying zoonotic diseases. To accomplish this we will support national and provincial policies to include surveillance in a standard AHW terms of reference (TOR) and replicate CBS training models where feasible.

5.1. Support national/provincial policy that would facilitate community level surveillance and/or events based surveillance

- We will look for opportunities to engage DAH in AHW network strengthening, with a focus on strengthening surveillance. This can include reviewing the DAH's 2008 proposal on strengthening the AHW network with a focus on surveillance as a task. This proposal, together with the new proposal 2011 on Strengthening the Capacity of the Animal Health sector, will provide direction to SDAHs to make plans and budgets to enhance the system – including surveillance.

- We will convene meetings/workshops drawing on our experience in the focus provinces and the review of existing national documents; in order to identify ways in which DAH and provinces can strengthen AHW networks with a focus on improved surveillance at the community level. If possible, these meetings will be held in regions 3, 6 and 7 to coordinate with the FAO zonal disease control strategy.

5.2. Continue to advocate at the national and provincial level for the adoption of a formal AHW TOR¹

- We will work with DAH and SDAHs to develop formal VAHW TORs that including surveillance task.

5.3. Replication of the relevant model in existing provinces and in new provinces

- We will complete the documentation of the Quang Tri AHW network development case study to be used as a model for provinces with similar characteristics. Specifically we will share lesson learned on AHW worker network development and surveillance activities.
- We will introduce the Quang Tri AHW case study widely through meeting/workshops. We will begin with RAHO 3 provinces and work out to other parts of the country as time and budget allow.
- We will conduct study tours and additional forums to share lessons learned and experiences on AHW network development and surveillance in order to promote the adoption of the model in new provinces.
- We will conduct training courses on AH surveillance at the community level in appropriate provinces, presumably starting in RAHO 3 where we can both build off of similar characteristics to Quang Tri and increase the reach USAID's investment by collaborating with FAO.

6. AHW Capacity Building and AEW Biosecurity Training

By the end of Year 4 we will have introduced the AHW training package introduced in at least 15 provinces and follow up with them on how can they implement diffusion trainings to reach more AHWs who can help address prevention and control of disease. In addition, by September 2013 NAEC will have officially adopted the AEW training materials and be applying them throughout AEW system and we will have developed a cadre of AEWs trained and skilled in poultry farming biosecurity practices who are training farmers. To accomplish these goals, we will expand the AHW capacity building model to new provinces and through Public Private Partnerships and we will work with NAEC to finalize their adoption of adopt the AEW Biosecurity Training model.

6.1. Animal Health Worker Networks: Expand the AHW capacity building model

¹ This activity was listed under AHW and AEW Capacity Building in USAID's scope of work on July 25, 2012.

- We will identify 15 provinces to target with TOT courses and advocacy events to promote the AHW Network model. We will select the provinces based on characteristics similar to those of the provinces where we have had the most success with uptake of the model demonstrating a perceived need as well as political commitment (i.e. provinces similar to Quang Tri) and/or those where the risk is high (based on numbers of poultry, recent outbreaks etc.) In the negotiation process with the new provinces we will assess commitment of the provinces by their willingness to co-fund and co-implement activities from the beginning.
- We will scale up use of AHW training modules through reproducing materials and implementing TOTs for these new provinces

6.2. Explore Public Private Partnerships in order to leverage resources and build sustainability for AHW capacity building

- We will conduct internal meeting to identify possible partners through which to roll out new trainings.
- Once identified we will support these private partners, and others as identified, to extend diffusion trainings (material templates/samples/designs, coaching).

6.3. Present the AHW training package to relevant ministries and department to advocate for the adoption of the package in vocational training schools

- We will meet with and present the curriculum to MOLISA and selected DOLISA other relevant ministries. MOLISA's system will provide an additional system within which to roll out our training program.

6.4. Support NAEC to officially adopt AEW training manual and training materials and to promote their use within the national agricultural system

- We will support NAEC to review, revise and approve biosecurity training package
- We will work with NAEC to formally disseminate biosecurity training package
- We will scale up use of AEW training through reproduction of materials and TOMT/TOFTs
- And we will explore using NAEC's online training programs to disseminate training package.

7. Supply Chain (Poultry Supply Network) Strengthening

There are two goals for September 2013 with regard to Poultry Supply Networks. One is to increase the DAH/DLP, RAHOs and pilot provinces' use of value chain analyses and risk reduction approaches leading to more targeted and effective disease prevention strategies. The second is to have created exemplary slaughterhouses and markets/trading centers using improved practices that can be duplicated in other places. All events are worked in concert with appropriate partners and will cohost where possible. These slaughter houses and markets are

built on lessons learned from previous USAID and other donor investments. Currently, in Year 3, through our subcontractor VIPA, we are helping the DAH to develop a national proposal for slaughterhouse and animal transportation improvement. In Year 4, we will continue work with DAH to implement the program which will have been submitted at the end of September 2012. This will ensure enforcement and wide spread replication of improved practice venues throughout Vietnam.

To reach these goals we will continue to support poultry markets and slaughterhouses where the APII project has implemented upgrades, providing Market Management Boards (MMB's) additional support to enhance the models.

7.1. Monitor behaviors in markets and slaughterhouses and conduct limited follow-up trainings in biosecurity practices needed

- We will continue to periodically visit and check-in with MMBs, SDAH, BCC trainers to observe and document improvements in behaviors and uptake of risk reduction measures in slaughterhouses and markets.
- We will document changes in risk reduction practices at demonstration sites using checklists.
- We will enhance the application of veterinary certification by increasing awareness of and incentives for adhering to risk reduction measures.
- We will provide information on other funding options (credit sources) that slaughter house owners and market vendors can use to implement upgrades and develop their business based on APII good practice models.

7.2. Help MMBs identify and implement any additional changes/upgrades needed

- We will meet with MMBs/SDAH as needed based on monitoring information to identify upgrade needs.
- We will provide technical support and limited financial support to the MMBs for making upgrades, including limited support to construction and equipment.
- We will implement post intervention biological and environmental testing in Ha Nam and Dong Ha markets and collaborate with FAO on LBM Surveillance.

7.3. Provide technical assistance to the DAH through development of a strategy and accompanying package of how-to guides/protocols for provinces on making upgrades to markets and slaughterhouses²

- We will review tools/protocols and make revisions as necessary for general application and to disseminate and advocate for DAH/SDAH's use.
- We will share lessons learned, including costing exercise results, with the DAH for their strategy/proposal development on market and slaughterhouse

² This activity was listed under AHW and AEW Capacity Building in USAID's scope of work on July 25, 2012.

improvement. The development of this strategy will institutionalize market and slaughterhouse improvement into the DAH system.

- We will provide information on other funding options (credit sources) that districts and provinces can use to implement upgrades/new trainings (specifically slaughter point owners).
- 7.4. Provide technical assistance to the DAH to develop checklists (for example food safety checklists for markets) and management protocols for management boards to implement³**
- We will work with SDAHs to share lessons learned on official slaughterhouse checklists/regulations with DAH for their eventual adoption.
 - We will advocate with DAH to adopt live bird market monitoring checklists based on the ones we have developed.
 - We will support the DAH, RAHOs and Provinces to develop and implement trainings for inspectors on good slaughtering practices and certification stamp requirements. To this end we will develop the materials (based on existing materials), provide site visits, and identify lecturers for the partner funded trainings. The training will be focused on complementing inspectors' existing training and skill sets. Once the materials are developed and tested they will be handed over to the relevant RAHOs and SDAHs.
- 7.5. Revisit STOP AI models and disseminate lessons learned and activities sustained post-STOP AI**
- We will document how STOP AI lessons learned have been/are being incorporated into APII supported models.
- 7.6. Work with DAH in coordination with VIPA to develop a roadmap for improving food safety at market places, providing input into its design, and share lessons learned from the slaughterhouse and slaughter point models**
- We will meet with DAH/VIPA to discuss the design of a road map for improving food safety and starting to implement the newly approved plan for slaughterhouse and animal transportation improvement.
 - With the approval of the Market and Animal Transportation Plan, we will help the DAH to complete a mapping of slaughterhouses in Mekong region. This will be based on the lessons learned from the study already conducted in Can Tho and will assist in identifying locations for food safety improvement activities in the near future. Once this is undertaken, as time and budget allow we can extend the mapping exercises to central and northern Vietnam. Finally we will provide this information to WHO to incorporate into their efforts on health mapping.
 - We will evaluate, document and share lessons learned. Our project models will serve as examples of safer slaughtering and trading.

³ This activity was listed under AHW and AEW Capacity Building in USAID's scope of work on July 25, 2012.

- We will host dissemination workshops, in RAHOs 3 and 6/7, coordinated with the FAO zonal disease control strategy, but focused on market and slaughterhouse improvements.

7.7. Encourage technical groups, provincial authorities, the LIFSAP and VAHIP representatives, and local investors and owners in scaling up and replicating models

- We will share checklists, protocols and information about funding widely to partners who may have similar mandates and areas of interest.
- We will invite representatives from organizations with potential to scale up or replicate our models on study tours to visit and understand the components of our models.
- As these other organizations begin to adopt relevant models, we will support their implementation of upgrades. Where appropriate we will also explore microfinance options to promote slaughter house/market upgrades.

8. Behavior Change Communication (BCC)

By September 2013, we will leave behind in each province of Can Tho, Ha Nam, Hung Yen, Kien Giang and Quang Tri, a team of key BCC trainers/specialists (five to eight people) drawn from animal health, human health and communications agencies as well as mass organizations. They have been trained, provided intensive coaching and are able to design, implement and evaluate their own communication programs. We will have improved the behaviors of vendors and slaughterers, and increased demand for poultry raised/marked/slaughtered in a reduced risk environment. To do this we will continue to roll out the BCC trainers' capacity building model and advocate for multi-sectoral use and funding of their positions both in our previous focus provinces as well as in new provinces. We will also continue to incorporate BCC activities (when possible led by provincial BCC trainers/specialists) with each of our other models to enhance the long-term sustainability of the interventions.

8.1. Continue to roll out the BCC trainers' capacity building model to associations and mass organizations, at national and provincial levels, as well as other projects, which can diffuse the training to its own systems

- We will host a workshop with associations and mass organizations to share model and lessons learned and provincial testimonies about the benefits and individual trainer's professional growth of implementing the model and BCC transitional strategy/approach in their provinces, with the goal of having them adopt the model long-term.
- Once the model has been adopted, we will provide TA to associations and mass organizations in its implementation.
- We will explore options to integrate BCC training manual into vocational training curriculum of Farmer's Union.

8.2. Target neighboring provinces that have been invited to the BCC transition strategy review workshops (end of Year 3) and assist them in implementing BCC programs

- We will develop technical brief on processes to build capacity of BCC trainers to share widely in this advocacy process.
- Using the WU network and possibly the FU network we will identify new provinces with whom to advocate adoption of the model. This will also be combined in other model's exchange meeting/visits to other provinces to know their needs and to present our models.
- We will provide TOT's in new provinces/districts and instruct them on processes to build capacity of BCC trainers.

8.3. Advocate for uptake of the model by reviewing the budget allocation, expenditures, and activities implemented in target provinces with trainers and communications

- To use in promoting the model, we will conduct a costing exercise and develop summary document about the costs of its implementation.
- We will provide limited TA and follow-up on the use/application of improved capacity of BCC trainers in their provinces within their respective agencies relating to communication work towards prevention of AI and EIDs, and more broadly where feasible.
- To build their reputation and give them a source for networking and ongoing learning we will connect provincial BCC trainers with the One Health Communication Network. We will do this by circulating meeting notes and inviting the trainers to give presentations on their activities and successes.
- Finally we will work with Provinces to formally recognize the position of BCC Trainers and to acknowledge their capabilities and contributions.

8.4. Support provinces where multi-sectoral communications plans have been approved (in summer of 2012) and where trainer teams are established to submit proposals for funding of communications activities

- We will provide ongoing TA through visits to provinces and BCC Trainers helping implement multi-sectoral communications plans and implementing activities as needs are identified.
- We will coordinate meetings between BCC trainers and the PPC and other related agencies to follow up on their communication proposals submitted after the training course on writing skills and proposal development conducted in Year 3.
- We will support provinces to document and share work through a regional workshop and province-to-province meetings between provinces with similar characteristics to disseminate lessons learned in realization of multi-sectoral communications plans and proposals to use in the development of other communications plans in the future. This workshop and the meetings will be combined with information sharing on provincial pandemic preparedness plan implementation, where appropriate.

8.5. Enhance and facilitate the scale up and replication of other models

- We will support Infection Prevention and Control (IPC) skills-building and model promotion as needed and include BCC trainers into risk

communications trainings, IC training courses, study tours and IPC monitoring at hospitals to provide a sustainable resource to IPC activities.

- After the MOH IC training has been rolled out we will organize teams of MOH/IC Society representatives, a BCC trainers and a local trainers to support IC Prevention teams in organizing one meeting for health care workers to discuss barrier/challenges to IC practices and explore solutions in their respective facilities.
- Based on market/slaughter house monitoring results, we will support BCC trainers to develop BCC interventions in those locations. Providing co-funding in some cases and just TA in others. Most importantly we will link them to MMBs, SDAHs and slaughterhouse/slaughter point owners to become a sustainable resource for program development.
- We will meet with Consumer Associations to exchange information, promote their role in demanding food safety, and link to them to our food safety promotion campaign.
- We will design and implement PR/education campaign on food safety and choosing safe poultry regionally to help increase demand for upgraded markets and slaughterhouses/points targeting consumers and the broader community.
- We will provide TA to slaughterhouse/point operators as requested for promoting their own products. This will be in the form of introducing them to marketing theory, to marketing firms and to resources (credit) for implementing such programs.

8.6. Continue to incorporate the APII trained BCC trainers

- We will refer BCC trainers to participate in APII project activities as BCC program needs are identified.

9. Provincial Implementation and Coordination/Cross Cutting activities

To implement all of the above activities we will need to coordinate internally and with our partners. The following are the means through which we will do so.

- We will host coordination meetings with FAO to plan for provincial level activities and ensure that we can collaborate or align activities when possible.
- The PI team will meet on a bi-monthly basis to plan for activities in the field.
- We will compile a summary of microcredit/micro-lending programs in Vietnam that may be applicable to replication/expansion of APII models. This relates to activities listed throughout the document.
- Develop mechanism for working with provinces to implement the Year 4 workplan.

10. Administration & Finance

APII will continue submit deliverables to USAID as requested. In addition there are several activities which we must implement in order to prepare for contract closure in September.

10.1. Reporting to USAID

- APII will continue to submit routine deliverables to USAID, including quarterly progress reports, quarterly financial reports, semi-annual and annual reports, and a final project closeout report.

10.2. Prepare Project Closeout

- Hold closeout planning meetings (with HQ);
- Prepare for final deliverables;
- Prepare for staff and consultant terminations and/or departures;
- Subcontract closeout;
- Vendor and field office closeout;
- Host End of Project Event
- Inventory and disposition of equipment;
- Inventory and disposition of office files; and
- Prepare final billing.

Introduction

This report presents the main achievements, challenges and solutions/lessons learned for USAID's Avian and Pandemic Influenza Initiative (USAID/APII) during the 3rd quarter of Year four, covering the period from April to June 2013.

The 3rd quarter of Year four saw the project continue the full implementation of all planned Year four programs. We expanded from the original five project focus provinces to cover most of Vietnam. We continued with the three major focus areas: animal health (AH), human health, and behavior change communication (BCC). Activities are implemented via subcontracts, as Abt's current license does not accommodate direct implementation. This carries its own unique challenges as often it is difficult to find subcontractors capable of delivering quality work, and strengthening the capacity of subcontractors has therefore become a vital part of USAID/APII's work. This is especially true in Year four, as we have very limited time to complete our projects and close out the project. In addition, we are working to hand over our models and training programs to our partners for long-term sustainability and future use.

The project progressed well in most of the eight main focus activities:

1. Coordination and Policy Dialogue
2. Human Health Surveillance
3. Case Management and Infection Control (IC) Capacity Building
4. Pandemic Preparedness
5. Animal Health (AH) Surveillance
6. Animal Health Worker (AHW) Capacity Building and Agricultural Extension Worker (AEW) Capacity Building
7. Supply Chain (Poultry Supply Network) Strengthening
8. Behavior Change Communication (BCC).

In Year four we have been making a final push for the wider adoption and sustained implementation of models beyond the life of the project. Adoption, adaptation, replication and scaling up of USAID/APII innovations by public and private partners are considered the real measure of success for the project. In order to achieve this, the project has been carrying out sustained advocacy and promotional campaigns in close consultation with USAID and API partners. These campaigns have achieved very good results across key components and models developed by the project, particularly in relation to Infection Control, Animal Health Worker (AHW) Capacity Building and Agricultural Extension Worker (AEW) Capacity Building, Supply Chain (Poultry Supply Network) Strengthening, and Behavior Change Communication (BCC).

What follows is a description and discussion of the main achievements and challenges of the 3rd quarter of Year four.

1. National Coordination and Policy Dialogue

Under Coordination and Policy Dialogue we have three goals to achieve in Year four:

- Improved coordination in order to improve highly pathogenic Avian Influenza HPAI prevention and control
- Sustained dialogue, coordination and lesson sharing on communications in Vietnam at a national level
- Revision of national communication framework in line with Avian Influenza, Pandemic Preparedness and other Emerging Infectious Diseases (2011-2015) (AIPED), officially approved by National Steering Committee for Avian Influenza (NSCAI), and applied by all members in planning and implementation.

1.1 Achievements

- 1.1.1 Reviewing and taking into consideration the results of our work on specific models, approaches and tools across key components, as well as the experiences from advocacy events in previous years, USAID/APII's models have been disseminated and replicated beyond the focus provinces and also integrated into governmental systems/networks such as MOH (infection control), NAEC/MARD (BCC training), Women's Union, and Farmer's Union. As a result, the project models will continue to have an impact beyond the project's lifespan, contributing to AI and EIDs prevention and control at provincial, regional and national scales. Specific activities and achievements on dissemination and advocacy as well as adoption and replication of the models are outlined in the reporting for each work area below.
- 1.1.2 In line with the advocacy plan and matrix for Year four, and building on the initial one-page briefs sent to USAID in the previous quarter, USAID/APII continued to develop briefing papers on key models and aspects of our work. Six briefing papers are now in the late stage of development, covering Infection Control, AHW Training, Separation of Poultry, Small-scale Poultry Slaughtering Facilities, BCC, and an overview of Training Approaches and Curricula developed by the project. The briefing papers specify approaches and desired achievements for replication.
- 1.1.3 On April 3-4, USAID/APII representatives attended and presented at the *USAID/APII Communications on Health and Avian Influenza through Lessons Learned from Control and Prevention Programs in Vietnam* panel in the National Conference on Applying a One Health Approach to Infectious Disease Risks at the Human-Animal-Ecosystem Interface in Vietnam.
- 1.1.4 On May 3, USAID/APII representatives attended the National Conference on Resource Mobilization for Influenza A (H7N9) Prevention, Control and Preparedness in Vietnam.

- 1.1.5 On May 31, USAID/APII representatives attended and provided technical comments and shared experiences in AI and EIDs prevention and control in PAHI's workshop on Preliminary Findings on the Economic Impact of Infectious Diseases of Livestock in Vietnam.
- 1.1.6 On June 12, USAID/APII representatives attended the overall USAID Vietnam partners' meeting. Before and following the meeting, an overall impact statement on USAID/APII was developed for sharing by USAID with the Ambassador.
- 1.1.7 On June 13-14, USAID/APII representatives attended and contributed to the USAID EPT Partners meeting in Hanoi, including the preparatory discussions on June 13 and the actual meeting with GVN and other counterparts on June 14.

1.2 Challenges and Solutions

- 1.2.1 As noted in the previous report, some changes to key personnel within technical agencies of GVN and other key stakeholders in our advocacy activities, for example due to people reaching retirement age, required the project to engage with new personnel in order to ensure their awareness and understanding of our activities, models and achievements. We have been monitoring these changes and actively reaching out to new personnel, with introductions and briefings from outgoing personnel where possible. We also have the advantage in some cases due to promotions of former counterparts at various levels, meaning that officials who are familiar with our work are now in more senior positions and can leverage the experience and capacity they gained in working with USAID/APII previously to support the wider application and replication of our models.
- 1.2.2 During Year four, we have moved away from direct implementation in the original target provinces and stepped down our previous Provincial Coordination Units (PCU). This shift has required us to take a somewhat different approach to working with these provinces in order to continue engaging with key counterparts to track the replication and scaling up of our models within the provinces, ensuring their cooperation in hosting visiting delegations to view the models and sharing their experiences, and also mobilizing them to share the models with other parties. We have done this during Year four by building on the relationships and results of our work over the past three years and, in a few cases, providing limited support for follow-up activities. This approach has continued to prove very successful in the 3rd quarter of Year four, with counterparts in the original target provinces strongly involved in replicating and sharing our models across the different components as outlined below.

2. Human Health Surveillance

The human health surveillance goal of USAID/APII activities in Year four was to support national/provincial policies that facilitate community level surveillance

and to replicate the relevant model in both initial focus provinces and new provinces.

However, as noted in the previous report, despite promising work on a Statement of Work (SOW) for the National Institute of Hygiene and Epidemiology (NIHE) to implement human health surveillance activities in Year four, which had been agreed in principle by NIHE and approved by USAID, ultimately it was not possible to proceed with this contract as we were informed that the General Department of Preventive Medicine and MOH intended to formulate a separate plan to assess Circular 48 in the future. USAID/APII was requested not to conduct activities related to Circular 48 for the time being because of certain sensitive internal issues. In March USAID/APII cancelled the intended activities with NIHE and shifted the designated monies elsewhere.

2.1 Achievements

2.1.1 No further work was done on this activity in the 3rd quarter.

2.2 Challenges and Solutions

2.2.1 The predictability and reliability of information from MOH are out of USAID/APII's and NIHE's control. We therefore decided that it was necessary to end the contract with NIHE.

3. Case Management and Infection Control (IC) Capacity Building

USAID/APII's IC goals for Year four were to assist GVN in rolling out a training model developed to assist health facilities in implementing Circular 18.

3.1 Achievements

3.1.1 Based on the letter issued by MOH dated March 1, 2013 on supportive monitoring trips to 13 hospitals in eight provinces whose key staff were trained with support from USAID/APII in 2012, a monitoring team including members from MOH, Vietnam Nursing Association (VNA) and USAID/APII conducted three trips to four northern provinces, two central provinces and two southern provinces during April. At the provincial level, the team worked with provincial Departments of Health (DOH) to review their IC activities in 2012 and IC plans for 2013. At the district hospitals, the team reviewed each hospital's structure, human resources, infrastructure and activities for IC in 2012. Improvements have been seen in the reorganization of IC human resources and the enforcement of key IC practices including instrument processing. Diffusion training was conducted to hospital health care workers in 2012. Significant improvements were noted, including in relation to IC structure, IC planning, development of hospital regulations, IC research in hospitals, disposable towel supplying, and IC practices at healthcare facilities. More attention should be paid to IC planning and to supervision of compliance to IC standards. The hospitals that received support from USAID/APII in 2011 were observed to be doing significantly better than other hospitals in IC.

- 3.1.2 On April 12, USAID/APII provided IC training materials to the National Workshop on Sharing the Experience of Nursing Education in Pham Ngoc Thach Private Medical School organized by MOH. More than 210 participants from 26 nursing and medical schools and 37 hospitals nationwide attended this event. USAID/APII also supported Dr. Phi Nguyet Thanh from the Training and Education Department of MOH to make a presentation on the training curricula for nurses and ways in which in-service training institutions can apply the IC training materials.
- 3.1.3 On April 22-27, the 3rd regional and final training of trainers (TOT) course on IC was organized in HCMC for 30 participants from six southern provinces, including An Giang, Dong Nai, Dong Thap, Soc Trang, Tay Ninh and Vinh Long. Participants from 7 medical and nursing schools also attended, including HCMC Medical and Pharmaceutical University, Nguyen Tat Thanh and Hong Bang Private Universities, and the Medical Colleges of Can Tho, Soc Trang, An Giang and Vinh Long. In addition to updated IC knowledge, participants also gained knowledge on adult learning methods and worked on their diffusion training plans. A one-day field study at Pediatric Hospital No. 1 in HCMC gave participants an opportunity to observe IC in practice and to undertake Hospital-acquired Infection (HAI) surveillance and IC compliance monitoring. Micro-teaching during the training provided practicum experience for participants.
- 3.1.4 In April, with technical support from MOH and VNA, the four provincial DOH of Vinh Long, Tay Ninh, Dong Nai and Dong Thap shared their action plans for 2013-2015 on strengthening IC activities at healthcare facilities and their 2013 IC training plans for their health staff. All training courses included in these plans will use the IC material supported by USAID/APII, and will utilize local funds for their running from May to September.
- 3.1.5 On May 2, with technical support from USAID/APII, Phu Yen Medical Secondary School issued an official decision on adapting the USAID/APII IC training materials for use in their training program for nurses, physicians and laboratory technical students, beginning in the 2012-2013 school year. After Au Lac Private Nursing School, this is the second nursing school to issue an official decision on integrating the USAID/APII IC training materials into their training program. The USAID/APII IC training materials have been used to train 100 students to a full credit in IC theory and practice over 32 sessions in school year 2012-2013.
- 3.1.6 On May 6-9, a provincial TOT course on IC was conducted in Dong Thap General Hospital for 120 participants from 16 hospitals, including four provincial hospitals, four specific hospitals and eight district hospitals. In addition to gaining updated IC knowledge and skills, participants also learned about the design and practice of cross-sectional HAI studies. The trainers for this course were those trained by the USAID/APII in April 2013, together with a national

expert from the HCM Infection Control Society. IC training materials for the course were provided by USAID/APII. Dong Thap's DOH and Johnson & Johnson Vietnam co-funded this course.

- 3.1.7 On May 8, the Vinh Long Medical Intermediate School issued an official letter to USAID/APII to adapt the IC training materials to train their nursing and midwifery students through 10 lesson plans over 60 sessions in 2013 and 2014, for 55 nursing students and 270 midwifery students.
- 3.1.8 On May 25 in Hue, Hue National General Hospital and the Hue Infection Control Society (HUSIC) held the Scientific Workshop for the Central Region on Infection Control and Patient Safety, with approximately 300 participants from around 100 hospitals including national hospitals, provincial and district hospitals and specialized hospitals. A detailed introduction to the IC training curriculum and IC material was published in the *Journal of Clinical Medicine*, with support from USAID/APII for printing and distribution to workshop participants and to other hospitals and medical schools in Vietnam's central provinces.
- 3.1.9 The Binh Dinh Nursing Association conducted two provincial TOT courses on IC on May 20-25 and June 3-8 in Binh Dinh, with 50 participants from 21 hospitals including Tuy Hoa National Dermatology Hospital, Binh Dinh Provincial General Hospital, two polyclinics, five specialized hospitals, 11 district hospitals and one private hospital. Participants shared updated knowledge and skills on IC and HAI surveillance in hospitals. The trainers for this course were those trained by USAID/APII in April 2013. USAID/APII provided copies of the IC training materials and contributed 30% of training costs. Binh Dinh DOH contributed the remaining 70% of the costs for the course.
- 3.1.10 During May, a further 20 DOH shared their provincial action plans on strengthening IC activities at healthcare facilities, including diffusion training plans with technical support from MOH and VNA. To date, 30 provinces throughout the country have shared their provincial action plans on IC.
- 3.1.11 In May, Phu Yen Medical College, Vinh Long Medical College, Can Tho Medical College, Ho Chi Minh City University of Medicine and Pharmacy, and Hong Bang University have issued copies of their official letters on integrating USAID/APII's IC training materials into their training programs for students.
- 3.1.12 With co-financing support from USAID/APII, Quang Nam's DOH conducted three provincial TOT courses on IC in Quang Nam from May 27 to June 15. In total, 90 participants from Quang Nam Medical College and 35 hospitals, including 12 provincial hospitals and health facilities, 20 district hospitals and three private hospitals, obtained updated knowledge and skills on IC through a total of three TOT courses for all provincial and district facilities. Provincial

trainers conducted these courses with IC training materials supported by USAID/APII and approved by MOH.

- 3.1.13 On June 7, USAID/APII attended the Scientific Workshop on Infection Control for the Northern Region co-chaired by MOH, Bach Mai Hospital and Hanoi Society for Infection Control (HANSIC). More than 350 participants from about 100 hospitals including several national hospitals, district hospitals and specialized hospitals shared experiences, worked together to develop their skills on IC, and were updated with new technical information. Workshop participants also discussed the IC situation in hospitals as well as IC training for the health care system. USAID/APII staff shared information about the status of IC training replication in different provinces and training institutions following the TOT courses conducted in 2012 and 2013.
- 3.1.14 On June 25, the Workshop on Strengthening Infection Control Training Programs in Nursing and Medical Schools co-chaired by VNA, MOH and USAID/APII took place in Hanoi, with 44 participants from 28 medical and nursing universities, colleges and schools. Participants shared their IC training curricula, materials and student IC practicums in hospitals. One public medical college and one private medical school shared their experiences on integrating USAID/APII's IC training materials into their training programs with technical support from VNA. Participants appreciated the presentations and agreed to integrate USAID/APII's IC training materials into their training programs. Participants also shared their expectations on institutionalizing the IC training curriculum and IC materials at their medical and nursing schools together with additional TOT courses on IC for their teachers.
- 3.1.15 After the first provincial TOT course on IC held in Nghe An from June 10 to June 15, a second similar training course was organized from June 24 to 29 by Nghe An's DOH with co-financing support from USAID/APII. To date, 60 participants from 35 healthcare facilities, including 14 provincial hospitals, 19 district hospitals and two private hospitals, have been able to update their IC knowledge and skills in the class, and to learn about HAI surveillance and IC practice compliance in Nghe An's General Hospital. The IC training materials for the course were supported by USAID/APII.
- 3.1.16 Thirteen training institutions, including Soc Trang Medical Secondary School, Duy Tan University, Ha Noi Medical College, Thanh Tay University, Vinh Medical University, Hue Medical College, Hai Duong Medical Technical University, Nam Dinh Nursing University, Quang Nam Medical College, An Giang Medical Secondary School, Binh Dinh Medical College, Thanh Hoa Medical College, and the Nguyen Tat Thanh University in Ho Chi Minh City, sent official letters to VNA on revising their IC training programs to adapt the IC training curriculum and materials developed with support from USAID/APII in June. This brings the number of institutions to have attended TOT courses in 2012-2013

and since issued official documents on integrating USAID/APII's IC training materials into their training programs to 19. The revised training programs will be begin to be implemented in school year 2013-2014 for about 16,500 students.

- 3.1.17 With technical support from VNA, Hanoi Medical College developed detailed IC fundamentals with 10 lesson plans on IC training for nursing and midwifery students in June, to be applied for more than 700 students from school year 2013-2014.
- 3.1.18 In June, seven DOH shared their provincial action plans on strengthening IC activities at healthcare facilities, including diffusion training plans with technical support from MOH and VNA. To date, 37 provinces throughout the country have shared their provincial IC action plans.

3.2 Challenges and Solutions

- 3.2.1 This year, USAID/APII required subcontractors to submit all reports in English; as a result, VNA took longer than previously to write, revise and translate deliverables before submitting.
- 3.2.2 Ministry of Education and Training (MOET) issued an outline of the training curriculum for nursing training with two credits on IC, however as yet there is still no requirement for IC training in the curriculum for medical students. In addition to working closely with MOH, VNA and other partners to introduce and integrate the IC training model into the nursing training program, the human health team introduced USAID/APII materials to medical schools for reference in IC lessons in other subjects and suggested to the schools develop an optional IC subject for medical students.

4. Pandemic Preparedness Planning (PPP)

USAID/APII's PPP goals for Year four were to introduce PPP packages to other provinces, and to advocate for wider adoption of PPP throughout Vietnam.

4.1 Achievements

- 4.1.1 With the commitment of Hung Yen People's Committee on revising the provincial plan on pandemic preparedness, on April 5 a PPP training workshop was conducted for about 30 participants from various provincial authority agencies and mass organizations. Participants learned about the new concepts of a Whole-of-Society approach and Business Continuity Planning, and how to apply them in their PPP. Following this event, the first draft of PPP for Hung Yen was prepared and shared with relevant sectors in Hung Yen for comment.
- 4.1.2 On April 25, the First PPP Review Workshop was conducted in Hung Yen with 25 participants from various provincial agencies and mass organizations in order to obtain feedback on the first draft of the Hung Yen PPP. New approaches introduced in the draft plan include (i) preparedness planning covering diseases in both humans

and animals, (ii) multi-sectoral involvement and (iii) inclusion of livelihoods, food security and business continuity planning for both pre-pandemic and post-pandemic periods. The second draft of the PPP reflecting comments and inputs from Review Workshop participants was sent to WHO, FAO, and national and provincial agencies and mass organizations for feedback.

- 4.1.3 On May 14, the Second PPP Review Workshop was organized with participants from 20 agencies and organizations in Hung Yen province, including government management offices, the propaganda agency, the provincial Police Department, mass organizations, media agencies and local staff, with the goal of reviewing the second draft of the provincial PPP. Participants discussed and provided comments on completion of the plan. Additional inputs from API partners were collected in order to finalize the PPP. After revision, the plan was submitted for approval by the People's Committee of Hung Yen province.
- 4.1.4 On May 22, Hung Yen People's Committee approved the Hung Yen PPP.
- 4.1.5 On June 11-12, Hung Yen People's Committee organized a provincial PPP dissemination workshop in Hung Yen, with the participation of 33 leaders of 24 agencies including provincial departments, nine district People's Committees, and mass organizations. Participants discussed how to disseminate the provincial plan to their departments, organizations and district networks. As required by the Vice Chairman of Hung Yen People's Committee, all related departments and districts in Hung Yen province will have to develop or revise their individual PPPs before July 15, 2013.
- 4.1.6 During June, USAID/APII closed out the contract with Hung Yen Red Cross after successfully implementing the planned PPP activities in Hung Yen for 2013.

4.2 Challenges and Solutions

- 4.2.1 This was the first time that Hung Yen Red Cross had implemented this kind of complex activity with the involvement of multiple sectors at provincial level. A plan with detailed activities indicating persons in charge, expected outputs, and timeline was prepared with support from USAID/APII's human health team. The commitment of Hung Yen's People Committee and the effective activities of the provincial Editing Team including Hung Yen Red Cross as well as the human health, AH and communication sectors played an important role in the success of this activity. In addition, USAID/APII always worked closely with Hung Yen Red Cross to strengthen their capacity during the period of the PPP revision.

5. Animal Health (AH) Surveillance

During the 3rd quarter of Year four, USAID/APII's AH activities focused on supporting national/provincial policies that would facilitate community-level surveillance and on replicating the relevant models in both the initial focus provinces and new provinces.

5.1 Achievements

- 5.1.1 We conducted meetings and workshops with relevant partners to discuss AHW network development and roles (including animal disease surveillance at grassroots level):

Under the Quang Tri livestock and husbandry contract, APII supported Quang Tri Sub-Department of Animal Health (SDAH) to review the current animal disease surveillance in line with local network development policy. A set of animal disease reporting forms has been issued by Quang Tri SDAH to harmonize the reporting forms and enhance the passive surveillance system of the province.

- 5.1.2 We continued to advocate at regional and provincial levels for the adoption of a formal AHW Terms of Reference (TOR):

A report on the improvement of the AHW network of Quang Tri province, including the adoption of formal Village Animal Health Worker (VAHW) TORs specifically including the surveillance task (to detect and report suspected cases) and a presentation has been developed and is ready for sharing. A local consultant was invited to make a study of this provincial case, and his report with detailed recommendations for an animal disease surveillance training curriculum is expected to be introduced to DAH as a reference document to aid in identifying gaps in animal disease surveillance and a model example for provinces on AHW network development. Official adaptation for diffusion training is expected from DAH.

A regional TOT training course (5 days) was conducted in Dong Ha on Animal Disease Surveillance at Community Level for 6 provinces in the central region (provinces covered by RAHO 3) with 30 participants (10F:20M). RAHO 3 trainers and the Head of DAH's Epidemiology Division were invited as lecturers, and the Quang Tri example was discussed during the course.

- 5.1.3 USAID/APII models of AH surveillance and AHW network improvements were replicated using the existing provinces as models for introduction into new provinces:

A draft of the Policy Brief on the Quang Tri Case Study and successes in AH surveillance and AHW Network improvement has been developed and is planned for publication in July 2013.

A documentary on the Quang Tri model in AH network development has been developed by the local Quang Tri Livestock and Veterinary Association in collaboration with the SDAH, and was shared with 26 participants (4F:22M) from RAHO 3 and central provinces at a regional Technical Dissemination Workshop for RAHO 3 provinces

on AHW network development conducted in Hue on 21 May 2013. As a result of the workshop, the formal VAHW TOR, including the specialized surveillance task of detecting and reporting suspected disease events, has also been reviewed with comments from participants.

5.2 Challenges and Solutions

- 5.2.1 Animal disease surveillance improvement for the grassroots level continues to present challenges due to lack of official legislation supporting local network development and lack of commitment by local authorities of allocated funds from limited annual provincial resources. The new veterinary law that is expected to be issued in the coming year and the new national proposal for Animal Health Sector Development can be considered good initial steps by DAH and MARD to cover gaps in the regulatory framework and policy directions, but they will require long-term strategy and commitment from stakeholders at all levels if success is to be achieved given current weaknesses in the overall veterinary service network.

6. AHW Capacity Building and AEW Biosecurity Training

The goals of the Animal Health Worker (AHW) Capacity Building and Agricultural Extension Worker (AEW) Biosecurity Training activities are to:

- Introduce the AHW training package to new provinces and seek other educational training opportunities
- Introduce the AHW networking model that will be adopted by relevant public-private agencies at national and local levels.
- Introduce the AEW training materials to the National Agriculture Extension Center (NAEC), the new Provincial Agriculture and Fishery Extension Centers (PAFECs) and the private sector and enable them to apply them throughout the AEW system.

6.1 Achievements

- 6.1.1 AHW Networks - Expanding the AHW capacity building model:

Responding to requests from Mekong SDAHs and RAHO 3, USAID/APII scaled up the use of AHW training modules through the introduction of materials in the RAHO 3 dissemination workshop and regional TOT courses for RAHOs 3, 6 and 7. A total of 81 local trainers have been trained in the 3rd quarter (21F:60M) in those TOT for AHW courses with a total of 15 new replication provinces covered.

Taking advantage of the enthusiasm and strong interest of the Farmers' Union vocational training system, USAID/APII's subcontractor Australian Foundation for Peoples of Asia and the Pacific (AFAP) conducted a TOT course in Hai Duong from 29-31 May, reaching seven provincial Farmers' Union Vocational Training

Centers with 25 local trainers. It is promising to note that these vocational training centers are expected to conduct their own training courses for local AHW using provincial funding resources.

- 6.1.2 We supported NAEC to officially adopt the AEW training manual and training materials and to promote their use within the national agricultural system:

NAEC has completed the review and approval of the Biosecurity Training package as well as the formal dissemination of the package to 159 participants (45F:114M) from 14 provinces through three national and regional biosecurity forums in Quang Ninh (May 17), Ha Nam (June 6) and Khanh Hoa (June 15).

In addition, NAEC has integrated the Biosecurity Training package into two national projects providing training for farmers. Together with the VIPA farmer club training courses, a total of 719 farmers (193F:526M) have been reached with good farming practices and biosecurity training in the 3rd quarter.

- 6.1.3 We explored possibilities using NAEC's online training programs to disseminate the training package:

NAEC and its counterparts have developed a DVD for on-line training, as recommended by USAID/APII. The final draft version was completed in late June and is planned to be posted on the NAEC website following final approval, which is expected in July 2013.

6.2 Challenges and Solutions

- 6.2.1 Figures on replication training conducted in additional provinces may not be made available in a timely manner where these activities are being funded from local, national or other resources not sourced by USAID/APII. USAID/APII has endeavored as much as possible to introduce and train local trainers as well as to distribute the AHW and Biosecurity training packages widely with the expectation that diffusion training will then be taken up by local authorities once they appreciate the value of these approaches and the related tools and supporting materials.

7. Supply Chain (Poultry Supply Network) Strengthening

USAID/APII's Supply Chain Strengthening goals in Year four are to advocate and encourage adoption, adaptation and replication of the models. We are working with public agencies, private partners, other development projects and programs of USAID/APII to provide them with biosecurity/biosafety demonstration models, especially in key (high-risk) nodes along the poultry supply chain, together with related documents (such as protocols, guidelines and training materials).

7.1 Achievements

The key activities and achievements of the supply chain work during the 3rd quarter of Year four focused on the following activities and nodes:

- 7.1.1. Monitoring behaviors in markets and slaughterhouses and conducting limited follow-up refresher trainings in necessary biosecurity practices:

Quang Tri:

Periodic review meetings were conducted almost monthly with the participation of market management boards, slaughterhouse/slaughter point owners, SDAH Inspectors, and BCC trainers to observe and record behaviors as well as to encourage the maintenance of good practices at Dong Ha market and the model slaughtering facilities. This effort aims to maintain good models and to support their use as a training platform to encourage wider replication.

During this quarter, USAID/APII and local counterparts focused on encouraging the replication of the model by other slaughterhouses in Dong Ha city and Quang Tri town, through provision of training on good poultry slaughtering practices, household visits, consultations and provision of model equipment. At the same time, Quang Tri SDAH enhanced the application of veterinary certification by increasing awareness of the value of certification among producers, vendors and consumers. Certification by stamping of poultry products slaughtered with the application of good slaughtering practice commenced in USAID/APII model slaughtering facilities in June 2013. This government effort encouraged immediate replication of the model; as a result, 9 out of 12 slaughter points have registered for facility upgrading following technical recommendations from Quang Tri SDAH. Some small slaughtering operations will be re-grouped and relocated to selected bigger facilities. To date, two slaughtering facilities have completed upgrading activities. Three others will complete their upgrading by September, with the remainder continuing with technical support from the SDAH. Fifty-three pieces of equipment with a total cost of 183,340,000 VND (~8,700 USD) including tables, ozone generators, drum pickers, high pressure cleaners and sets of bleeding cones for safer slaughtering practices have been delivered to 11 potential replication slaughterhouses in Quang Tri.

Quang Tri Department of Agriculture and Rural Development (DARD) issued the following legal documents during this period: Decision No. 286/QĐ-SNN dated May 29, 2013 on Temporary Regulations for poultry slaughtering and poultry production trade in Quang Tri, and Official Letter No. 494/SNN-CN directing the management of poultry slaughtering and poultry production trade in Quang Tri.

The Mekong region (RAHO 6 and RAHO 7):

Following up training provided in December 2012 as well as requests submitted by 12 SDAHs for case assessment and recommendations for upgrading 50 small slaughterhouses, USAID/APII experts worked

with technical staff from RAHOs and SDAHs to assess operations in slaughtering facilities using the checklist and risk assessment matrix issued with Circular 14. The purpose of this assessment was to identify communicable disease and food safety risks and to propose prioritized upgrading options for the slaughtering facilities. These recommendations are considered to be the most appropriate, practical and feasible for facility owners to easily learn from and follow in both short-term and long-term periods. Of 50 slaughterhouses registered in these provinces, 27 facilities in 10 provinces under RAHO 6 and RAHO 7 were selected for field assessment. Most of these facilities were found to have common errors in terms of processing flow (not one-way), processing on the floor, and no separation of dirty and clean areas. A summary report on risk assessment with detailed recommendations was given to the SDAH of each related province and to RAHO staff. In consultation with the RAHOs and SDAHs, it was decided that facilities that completed upgrading before July 2013 would be eligible to receive some equipment and technical assistance from the project as an incentive and support for their improved operations. For facilities that did not upgrade before July 2013, only technical recommendations would be given, and facility owners could decide by themselves when to upgrade. However, recommendations and reports provided by USAID/APII suggest that local authorities will follow up on the upgrading of these slaughterhouses following the completion of the USAID/APII project. A total of 23 pieces of equipment with a combined cost of approximately 7,000 USD was purchased by USAID/APII for handover in July to 13 facilities in eight provinces. This equipment will provide an example for the facilities to replicate in their other processing lines and will contribute to improving good slaughtering practices, including veterinary sanitation, risk reduction in disease transmission and cross-contamination, and improving poultry food safety.

- 7.1.2. Providing technical assistance to DAH through development of a strategy and accompanying package of how-to guides/protocols for provinces on making upgrades to markets and slaughterhouses:

As part of the strategy of DAH and MARD's Legislation Department to review and develop a framework of veterinary technical documents, on May 21, 2013 USAID/APII supported DAH to conduct a Food Safety Workshop on Sharing Experiences and Veterinary Technical Documents in Hanoi. More than 70 participants from national and international agencies and projects working in this field came together to share their experiences on improving veterinary hygiene and food safety in animal and animal product production, storage, processing and trading. In addition to 32 documents and BCC materials from USAID/APII, a further 50 books, booklets, posters, training materials, protocols and reports were shared. DAH also took advantage of the workshop to share with provincial participants their new proposal to strengthen government capacity in food safety, zoonotic disease and environmental

protection, and the functions and roles of the veterinary public health services system.

A local consultant was recruited to review tools and protocols and to develop draft Guidelines on Good Hygiene Practices and Good Manufacturing Practices for Slaughtering (GHP/GMP) for general application and advocacy by DAH. The draft version has been finalized with inputs from Dr. Henry Yap, USAID/APII's International Consultant on Biosecurity, and shared with DAH's Division of Veterinary Public Health. A meeting with this Division is planned in July to gather comments. The document will then will be handed over to DAH as an input to their development of the legal framework and policy guidance.

For the market models, most of the provinces are facing the problem of controlling and managing live poultry trading in urban areas. Challenges include the need for farmers to sell their poultry products, traditional cultural and religious practices, and consumers' habit of buying live poultry. Many provinces are struggling with management and control of live poultry selling, since it is impossible to maintain a taskforce capable of checking all markets during the time of live poultry trading. Some provinces have their own ways of managing and organizing live poultry trading. Most of the provinces have agreed to have a managed poultry market rather than attempt to issue and enforce a total ban on sales of live poultry in markets.

USAID/APII continued to share experiences in developing poultry market models and activities in Quang Tri and Ha Nam on several occasions during the 3rd quarter, such as in training courses and workshops. The World Bank-supported VAHIP project is planning to cooperate with USAID/APII to conduct a study tour for around 40 stakeholders to visit USAID/APII's Quang Tri model on July 22-23. Preparations are in place for this event, including sharing of presentations and a field visit.

Responding to requests from three provinces (Bac Lieu, Hau Giang and Ba Ria-Vung Tau), the project visited existing markets in these provinces where live poultry are sold. None of the market models were developed due to time constraints, but a dissemination workshop was organized for local authorities in Hau Giang province with 18 participants. The local authority stated that this experience sharing was a first step towards developing live poultry market models in Hau Giang. Technical documents from the Dong Ha and Hoa Mac models have been shared accordingly.

- 7.1.3. USAID/APII had planned to provide technical assistance to DAH to develop checklists on food safety for markets and management protocols for management boards to implement. However, due to a lack of clarity in the division of tasks between national agencies, it is not clear whether DAH is responsible for this or not.

Checklists from Dong Ha and Hoa Mac markets were shared as references for DAH's Division of Public Health in case they wanted

to prepare a proposal for MARD to add these issues into Decree 14 later as separate forms focused on markets.

- 7.1.4. Supporting DAH/RAHOs/Provinces to develop and implement training courses for inspectors on good slaughtering practices and certification stamp requirements:

In cooperation with the RAHOs and DAH, USAID/APII organized seven training courses for 288 inspectors from 17 provinces, as follows: Thanh Hoa (53); Hue (14); Quang Tri (11); Quang Binh (3); Da Nang (12); Quang Nam (9); Binh Dinh (1); Khanh Hoa (1); Phu Yen (1); Quang Ngai (2); Tien Giang (39); Ben Tre (20); Dong Nai (7); An Giang (36); Soc Trang (34); Hau Giang (40); and Can Tho (5).

The RAHO applied DAH's training contents to provide basic knowledge for inspectors, then requested DAH to grant professional certificates to the trainees. The training contents included updated legislation on veterinary inspection, basic symptoms of diseases, animal inspection, and practical exercises. USAID/APII provided knowledge on good slaughtering practices including risk identification in slaughterhouses, technical requirements for facilities upgrade and operation procedures, and waste management in small and medium poultry processing units.

Documentation on how the USAID/STOP AI project's lessons learned have been and are being incorporated into USAID/APII's models was completed.

- 7.1.5. Working with DAH in coordination with VIPA to develop a roadmap for improving food safety at market places, providing input into its design, and sharing lessons learned from the slaughterhouse and slaughter point models:

In order to finalize the next draft of the National Proposal on Ensuring Food Safety in Livestock Slaughtering and Transportation and to develop a roadmap to 2012-2020 on improving food safety in transportation and slaughtering, on June 14 and 21 two consultation workshops were organized in Ha Noi and HCMC, facilitated by DAH. Ninety-six participants from provincial SDAHs and functional divisions from DARDs from northern and southern regions shared experiences on the current complex situation of food safety in relation to slaughterhouses and markets, and gave specific comments on the previous draft. DAH plans to incorporate these comments into the final version to be submitted for approval in late July 2013.

- 7.1.6. Mapping of poultry slaughter points in the Mekong region: locations and owners' names of slaughtering facilities were collected and included in the reports from the field trips to the Mekong regions that were shared with the SDAHs and RAHOs. However, due to time and resource constraints and limitations on the total number of selected small slaughtering facilities available for visits, the idea of regional mapping was cancelled.

- 7.1.7. Encouraging technical groups, provincial authorities, LIFSAP and VAHIP representatives, and local investors and owners to scale up and replicate models:

As mentioned above, checklists, protocols and technical documents were shared widely in the Technical Document Sharing Workshop in May 24, 2013. Others documents have been shared with FAO, VAHIP, LIFSAP and other agencies and projects on request. In collaboration with VAHIP, USAID/APII is preparing for a study tour planned for July 2013 for 40 VAHIP PMU members and stakeholders from provinces in the north of Vietnam.

Model pictures, video clips and presentations were shared widely in national and regional dissemination workshops and inspector training courses.

- 7.2.2. Training inspectors: the training for veterinary inspectors was assigned by DAH to regional AH offices. However, further review showed that the training modules and duration of the training courses vary among regions. USAID/APII worked with RAHOs 3, 6 and 7 on these particular issues and shared a fully developed training curriculum of risk reduction within markets and slaughterhouses with these RAHOs. In reality, the SDAHs are interested in organizing more training for inspectors, but it is not always a priority for RAHOs to implement the course at a time that works for the SDAHs. Coordination may need to come back through USAID/APII via DAH and hence to the RAHOs and SDAHs. This can be considered a lesson learnt for implementation of such courses. In addition, although too many provinces requested cost sharing training for inspectors at short notice, due to time constraints, USAID/APII was unable to organize advance TOT courses for RAHO trainers in good slaughtering practices, nor could we help DAH to consolidate requests for a standard course.
- 7.2.4. Slaughterhouse upgrades: a great deal of work must be done before facilities and slaughtering operations of small slaughterhouses in the Mckong region meet hygiene standards. Training and study tours can help owners learn how to adapt good slaughtering practices to their own slaughterhouses. However, the costs of upgrading are high, while the benefits from poultry slaughtering are few and illegal slaughtering still persists, presenting significant obstacles to upgrade decisions.

8. Behavior Change Communication (BCC)

In line with the Year four goal, in this reporting quarter we utilized BCC trainer teams established in Can Tho, Ha Nam, Hung Yen, Kien Giang and Quang Tri, to not only continue communication programs in their provinces, including by strengthening their supply chain models, but also to roll out the BCC trainers' capacity building model to new provinces, including Ha Tinh, Quang Binh and Thua Thien Huc, for promotion of new desired behaviors. We also worked with selected BCC trainers from Ha Nam and Quang Tri and from the national level on the development of a BCC module for Vietnam Farmer's Union (VFU) to integrate BCC theory and methodology into the training curriculum for their vocational training system.

8.1 Achievements

- 8.1.1 The BCC curriculum developed by VFU with livestock and culture teachers from five provincial Vocational Training Schools/Centers in Hai Duong, Hung Yen, Thai Binh and Ha Nam and Ha Noi was field pre-tested. Additional comments were solicited through a final review workshop and from communication specialists from national communication and training bodies such as the Academy of Journalism and Communication and the National Center for Health Education and Communication (NCHEC).
- 8.1.2 The BCC curriculum for the Vocational Training Schools/Centers was finalized with official approval from VFU for it to be used by all vocational schools nationwide. The curriculum was printed for use

during three BCC TOT courses for northern, central and southern Vocational Training Schools in order to solicit a final round of comments before official printing and distribution to all VFU Vocational Training Schools in 63 provinces and cities throughout Vietnam.

- 8.1.3 Three regional TOT courses on BCC and the participatory training approach were organized for 80 teachers from 28 provincial Vocational Training Schools and Centers in Bac Ninh, Ha Nam, Ha Noi, Hai Duong, Hoa Binh, Hung Yen, Nam Dinh, and Thai Binh in the northern region; Da Nang, Dac Lac, Hue, Khanh Hoa, Ninh Thuan, Nghe An, Quang Binh, Quang Nam, Quang Tri, and Phu Yen in the central region; and An Giang, Ba Ria Vung Tau, Binh Duong, Binh Phuoc, Binh Thuan, Ca Mau, Kien Giang, Lam Dong, Long An and Tien Giang in the southern region. After each course, the trainer team took away experiences to use in improving the following course.
- 8.1.4 The project supported USAID and Vietnam Television Channel 2 (VTV2) to develop and air a feature story about the Hoa Mac market model. The feature story introduced the changes in infrastructure and meat vendors' behaviors at Hoa Mac Market and a nearby slaughter point towards reducing risks in relation to potential infectious diseases and enhancing veterinary hygiene and food safety.
- 8.1.5 The project supported BCC trainer teams in Quang Binh, Ha Tinh and Thua Thien Hue with coaching from Quang Tri BCC trainer team to conduct nine diffusion training courses for communicators. A total of 224 participants from the Women's Union (WU), the AH and human health sectors and population and family planning services have learned about BCC theory and techniques and how to use discussion guides on selected behaviors on food safety, life skills, and reproductive health care to facilitate small group discussions in their communities.
- 8.1.6 During the April–June period, 3,751 women in 114 communes in Quang Binh, Ha Tinh and Thua Thien Hue attended 243 small group discussions (from 15 to 20 persons per group) on prioritized behaviors selected by each province. Understanding the target audience and their motivators and barriers to adopting the targeted behaviors helped communicators to facilitate discussions focused on their incentives to change.
- 8.1.7 Quang Tri BCC trainers modified training materials and developed a discussion guide on food safety promotion to conduct two TOT courses on the application of BCC to food safety in Quang Tri for 52 participants from different departments and organizations in the province, including the Farmer's Union, Food Safety, Animal Health, Women's Union, Police, and Defense. Participants learned communication skills, adult learning methods, and food safety. These trainers are expected to go on to provide diffusion training for communicators in their own communities and networks. Participants selected key food safety related behaviors to prepare for

communication sessions with their target audiences who are members of food safety clubs.

- 8.1.8 The project organized a National Training Workshop to disseminate two BCC documents – the BCC Training Manual and the BCC Strategy Development Guide. Thirty-two participants including members of BCC trainer teams, communication officers and leaders from 12 provinces as well as national bodies including VFU and MOH's NCHEC. Participants learnt how to use the documents mainly through practicum sessions in which they played the roles of trainers or trainees. They were also guided to use the BCC Strategy Development Guide to develop their own provincial BCC programs.
- 8.1.9 Three posters were pre-tested with meat vendors and market management board members of Hoa Mac market. Final review and printing for installment of these posters at the market are planned for early July 2013.
- 8.1.10 The project led a two-day training course on BCC and application for promoting change at Ha Vi market for 21 AH officers from Ha Noi and Thuong Tin district and members of Ha Vi market management board. As planned, the Ha Noi SDAH and VAHIP project will follow up with these participants on planning and implementing BCC activities at Ha Vi market.
- 8.1.11 The project supported Quang Tri BCC trainer team to organize training for 30 heads of food safety clubs. These communicators then facilitated group meetings with their food safety members and also facilitated eight community-based events on selected desired behaviors with their local resources.
- 8.1.12 In collaboration with the National Agriculture and Extension Centre (NAEC), the project organized a TOT course for 32 participants from 7 provinces covered by an NAEC project (Ha Noi, Hai Duong, Bac Ninh, Thai Binh, Thanh Hoa, Vinh Phuc and Bac Giang) to apply the BCC techniques and approach in extension work to promote changes toward more biosecure production. Participants gained updated knowledge on zoonotic diseases and BCC techniques and methods in class. They also made a field visit to a private sow farm to analyze the risks of zoonotic diseases as well as solutions for changing behaviors toward good biosecurity practices.
- 8.1.13 Replication and sustainability with local funds and resources from other projects:
 - Quang Tri WU organized three training courses on communication skills for 141 chairwomen of commune WU chapters in Dong Ha Town to improve their communication skills and understanding of BCC theory.
 - BCC trainers from Quang Tri Center for Health Communication and Education, in collaboration with World Vision in Quang Tri, organized two training courses on BCC for promotion of water sanitation and environmental hygiene for 61 participants from selected district environmental bureaus,

education and training departments, health centers, commune health stations, and ward People Committees.

- BCC trainers from Quang Tri Center for Health Communication and Education, in collaboration with Plan International in Quang Tri, organized two training courses on BCC for safe motherhood promotion for 30 participants from commune health stations and villages health workers at their project sites.
 - The BCC trainer team from Can Tho Center for Health Communication and Education organized three training courses on “Article Writing and Photo Shooting Skills”, “Development of Radio Spots in Health Facilities”, and “ Health Education Skills” for 95 communication officers from all district and city hospitals in Can Tho.
 - In June, the BCC trainer team from Can Tho Center for Health Communication and Education conducted two workshops on BCC for promoting cancer prevention for 200 women in Thot Not and Phong Dien districts.
 - In June, the BCC trainer team from Can Tho Center for Health Communication and Education conducted one training course on “Advances on Development of Radio Spots in Health Facilities” for 38 outreach network staff from city hospital and provincial Centers for Health Communication and Education in Vinh Long, Hau Giang and Ben Tre.
 - In May, the BCC trainer team from Can Tho Center for Health Communication and Education provided technical support to 30 students of the K36 Public Health Department of Can Tho Medical and Pharmaceutical University on their summer program to develop communication plans and activities, and to develop materials such as leaflets, posters and radio spots.
 - The BCC trainer team from Can Tho SDAH monitored behavior changes at Ngoc Xuan Centralized Slaughterhouse. They also worked together to develop communication materials on disease prevention among poultry and cattle including printing of leaflets to distribute to district AH stations. The topics of these leaflets include H5N1 and H7N9 prevention, FMD prevention in cattle, and PRRS prevention in pigs.
 - BCC trainers from Can Tho Red Cross Association organized one training course on “First Aid and Communication Skills” in May for 40 participants from the Red Cross network in districts and communes.

8.2 Challenges and Solutions

- 8.2.1 Within the limited five month period, USAID/APII supported VFU to develop a BCC curriculum for teachers with a guide for application in designing and delivering training plans for farmers. It was a real challenge to design and deliver three regional TOT courses on BCC within this timeframe. The USAID/APII BCC team

had to work closely with the drafting team and provide intensive technical support to edit the curriculum. However, this task met with some small delays.

- 8.2.2 Applying the BCC training model within the WU system, especially to other provinces, is a real challenge in terms of timing and scheduling in harmonization with their other activities. That is why some activities, such as diffusion training and small group discussion in communities, have been delayed. This led to the delay of the project review workshop, which could not be organized in June as planned.
- 8.2.3 A TOT course for seven provinces supported by NAEC successfully replicated the BCC training model into extension work. This training was highly appreciated by participants. However, the quality of the training could be improved if NAEC had more personnel and more time to spend on preparation prior to the training.

9. Monitoring and Evaluation (M&E)

USAID/APII's M&E work aims to strengthen existing systems in the provinces, and help close existing gaps between grassroots level M&E and provincial and national level M&E and reporting. It also aims to facilitate and guide project implementation towards achievement of desired project impacts and hence the objectives articulated in USAID's Avian and Pandemic Influenza (API) Performance Management Plan (PMP). In addition, USAID/APII acts as the repository for PMP indicators collected under USAID's API initiatives, taking the lead in providing analysis and reporting on this data.

9.1. Achievements

- 9.1.1. Developed a reporting template and guidelines for updating and sharing information on what is replicated and maintained after the project has ceased its financial support.
- 9.1.2. SDAHs in Ha Nam and Hung Yen compiled and shared reports to provide information on the maintenance and expansion of project models within the province as well as on limitations and obstacles to the continuation of those interventions. These reports served as helpful references for decision-making and in planning support for the continuation and expansion of the project interventions and their future activities.
- 9.1.3. Monitored changes in IC activities at selected hospitals which had sent their staff to attend TOT training courses in 2012. The monitoring team consisted of staff from MOH's Administration for Medical Service Management, VNA and USAID/APII. The team visited eight DOHs and 13 district hospitals. The monitoring team acknowledged positive changes in attitude and behavior towards IC management and practices in health facilities.

9.2. Challenges and Solutions

- 9.2.1. It was recognized that almost all IC health staff were working part-time and many did not receive sufficient and systematic training in IC. There were differences in the level of changes in IC practices from one health institution to another within the same province, possibly leading to differences in level of care provided to patients of these facilities.

10. Finance and Administration

10.1 Achievements

- 10.1.1 Managed all aspects of finance and administration (F&A) and all subcontracts and consultant agreements effectively. Procedures were streamlined during the course of the year.
- 10.1.2 USAID/APII continues to submit routine deliverables to USAID, including quarterly progress reports, quarterly financial reports, semi-annual and annual reports, etc. The F&A team support the technical teams in managing all subcontracts and consultants.
- 10.1.3 A better tracking system has been set up for the last year of the project, covering expenditures, travel, supplies, inventory, procurement, staff leave, subcontractors, and consultants.
- 10.1.4 Throughout the 3rd quarter, the project has been in the process of training newly recruited F&A staff.

10.2 Challenges and Solutions

- 10.2.1 Year four brings a unique set of challenges in implementing our contractual requirements and preparing for close-out in September. We will continue to work to disseminate USAID/APII programs and activities to new provinces and districts until July, at which time our focus will shift to close-out activities. This indicates a compressed timeline in which to complete all program activities.
- 10.2.2 F&A and technical teams work closely to submit SOW for approval and to negotiate with subcontractors/consultants for them to start at the earliest possible time so that we can achieve close-out in July 2013.
- 10.2.3 With new staff on board, the project will continue to spend time training them and getting them up to speed.
- 10.2.4 To mitigate delays and ensure efficiency, the COP continues to meet with all subcontractors and TDs.

11. Success Stories

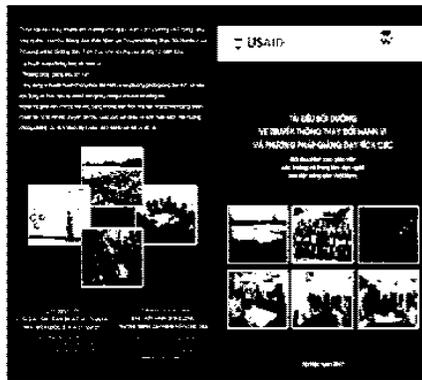

11.1 Replication of our BCC model in 86 vocational training colleges nationwide

All Vietnam's Vocational Training Colleges Adopt USAID/ APII BCC Training Model

Vietnam Farmer’s Union (VFU) has a network of 69 National, Regional and Provincial Vocational Training Schools and Centers with a cohort of 140 teachers teaching livestock production and development to farmers. The VFU Board of Directors sought to update these teachers and enable them to apply active training approaches in their training courses for farmers.

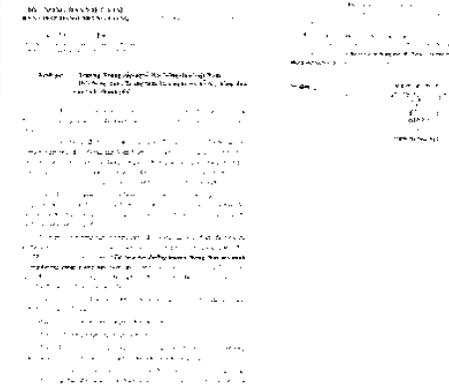

Active training approaches are covered in the USAID/APII’s behavior change communication (BCC) training model which was successfully piloted in five focus provinces, as well as in BCC materials as disseminated and shared in a diffusion workshop during December 2012 in Ha Noi. The representative of VFU’s Board, Ms. Le Thi Thanh Huong, Vice-Dean of National Vocational Training School, attended the diffusion workshop, expressed their willingness to adopt this model and has requested the USAID/ APII to support VFU to develop a BCC curriculum their network of Vocational Training Schools and Centers teachers. Through an intensive five months, a curriculum was

developed by a multi-disciplinary-team of BCC experts including the USAID/ APII BCC trainers from Ha Nam, Quang Tri and the Ministry of Health and with technical inputs from experienced BCC experts from various Vietnamese institutions, including professors at the Academy for Journalism and Communication and experts from

Ministry of Agriculture and Rural Development. In May of 2013 the curriculum was officially endorsed by VFU for its Schools/ Centers nationwide to use in their daily training tasks. Ms. Le Thi Thanh Huong expressed her appreciation of this document saying *“This is the first time we have*

developed a document on BCC and participatory training approaches for our teachers. This will help them share new knowledge and skills and have more attractive and engaging lessons...The document was also highly evaluated from Vietnam Farmer’s Union, an official letter of Vice-President of VFU was issued which required all schools and centers to officially use it in their training vocation for farmers”.

Endorsement letter from Vice chairman of National Farmers’ Union to nationally apply the BCC

In addition to leading the development of the curriculum, the USAID/APII implemented a five-day training of trainers course for 80 teachers from 28 provincial Vocational Training Schools from Northern, Southern and Central regions of Vietnam on BCC theory and participatory approaches. During these courses, participants learned to apply BCC theory and participatory

training approaches during micro-training sessions, they apply in developing lesson plans and delivering trainings on livestock production and culture to farmers who they understand more on their determinants of changes and follow up at household level.

Vietnam Farmer's Union's
National Vocational Training
School

VFU is distributing the BCC curriculum to all remaining schools/ centers. During their periodic meetings, this curriculum will also be presented to the remaining 60 teachers to bring them up to date in the training. Furthermore, VFU committed to coach their teachers from livestock production and culture department to apply BCC and participatory approaches when preparing lesson plan in more interactive and audience-centered manner. They planned to have 60 training courses on livestock production and culture to about 1,800 farmers under the Vocational Training

Project 1956 funded by Vietnamese Government during 2013-2014.

11.2 Application of our poultry slaughtering model in 14 small-scale facilities in the Mekong region

11. USAID/APII Improved Poultry Slaughtering Practices Replicated in the Eight Provinces of the Mekong Region

Between February and June of 2013, USAID/APII used experience and lessons learned from developing poultry market and slaughter point models in Dong Ha city (Quang Tri), Hoa Mac (Ha Nam), Ngoc Xuan (Can Tho) to support thirteen selected poultry slaughter points in the eight Mekong Region provinces to adopt and adapt the slaughter point model to their facilities at their own cost in order to supply safer poultry products to their local markets. This provides evidence that the model is replicable.

At the request of 12 Sub-Departments of Animal Health (SDAH) following the training on good slaughtering practices and promotion of food safety and HPAI prevention measures for animal health workers and slaughter point owners in December 2012, the USAID/APII's Animal Health team worked with the Regional Animal Health Offices (RAHO) 6 and 7 and the SDAHs conducted visits to 27 facilities in the 10 RAHO 6 and 7 provinces. During these visits, the USAID/APII, RAHO and SDAH staff assessed operations in slaughtering facilities using the checklist and risk assessment matrix issued with Circular 14.

The USAID/APII staff, in collaboration with key officers from RAHO 6 and RAHO7, visited each slaughter point to review their knowledge on AI and EIDs prevention. They discussed food safety risks and worked together to prioritize a list of upgrade options. These included one-way processing flow, off-floor

slaughtering and separation of dirty and clean areas. At each household visit, the team provided technical recommendations with explanations of the rationale and suggested facility design change ideas. The owner then made his own decision about which recommended changes to make based on his local resources and personal experiences.

In consultation with the RAHOs and SDAHs, the USAID/APII offered to provide some essential equipment and technical assistance for projects as an encouragement and support them in improving their facilities to include upgrades that were completed before July 2013. As a result 23 items of slaughtering related equipment were donated to the 13 slaughter points by mid-July. The equipment will enable the owners to replicate upgrades to additional processing lines and will contribute to improving good slaughtering practices including veterinary sanitation, risk reduction in disease transmission and cross-contamination and improving poultry food safety.

In light of the implementation of Decision #20 from the Prime Minister dated January 4, 2012 on National Strategy on Food safety, the remaining visited facilities in these provinces who had not yet made plans to upgrade before the close of the USAID/APII activities, will receive technical support and guidance from provincial SDAHs to improve their facilities, taking into consideration of USAID/APII's recommendations.

The slaughter points upgraded with the USAID/APII technical assistance will serve as a training platform and example of feasible changes that can be made by small scale slaughter point owners. Other owners can learn from their peers in order to develop their own safer poultry production.

 2) Upcoming Travel and Concurrence Request: 15

Success Stories..... 16

Achievements this quarter

The Avian and Pandemic Influenza Initiative (APII) commenced activities on October 1, 2009. The first quarter of implementation focused on getting the project up and running – and activities largely centered on hiring staff, establishing the contract, and developing Memoranda of Understanding (MOUs) with focus provinces to establish permission to work in each of them. Below specific activities undertaken during Quarter 1 have been outlined by technical area.

1) Coordination and Collaboration

- MOUs were signed with five focus provinces in November and December 2009 - Hung Yen on November 10, Ha Nam on November 11, Kien Giang on November 25 and Can Tho on November 25, and Quang Tri on December 4. The process for attaining the MOUs was satisfactory for all parties due to the following:
 - Based on experiences and lessons learned during the implementation of the AI Mekong Initiative, the team laid a clear step-by-step process for working with the provinces to develop the MOUs.
 - There was good team work with the provinces during the preparation process, consultations to improve the documents and finalizations of the MOUs.
 - Furthermore Professional presentations introducing project to provincial authority started the relationship off on the right foot.
 - Constructive dialogue with appropriate persons at province who were able to influence the provincial leaders assisted in making the process smooth, as did the reputation and trust created by the AI Mekong Initiative in Can Tho and Hung Yen.
- Provincial organizations, other sectors and various stakeholders were brought into the dialogues with the provinces on the content of MOU, leading to their preparation and commitment to working with APII in the future.
- Detailed activity and implementation plans for the province levels were developed with provincial counterparts.

2) Avian Influenza Preparedness and Response Plans

- Attended IOM's Table-top exercise on Preparedness and Response Plans in Tay Ninh, at USAID/Vietnam's suggestion, to gain experience for future activities.
- Met with USAID/Vietnam and representatives of the International Federation of the Red Cross (IFRC) to come to agreement on how to assign the Vietnam Red Cross' (NVRC) activities in order to maximize USAID-funding and avoid overlap between APII and Humanitarian Pandemic Preparedness (H2P) projects.

3) Early Warning systems for Human and Domestic Poultry Surveillance

- Reviewed the Community-Based Surveillance (CBS) model developed under AI Mekong Initiative and Quang Tri, Ha Nam and Kien Giang's provincial surveillance processes to inform the development of APII's CBS approaches and plan.

- Provided technical assistances for the Centre for Community Health and Injury Prevention to implement CBS approaches in Thai Binh and Long An Provinces under funded by VAHIP project of MoH.
- Met with FAO to discuss and work towards aligning surveillance approaches and to develop joint plans for implementation in animal health surveillance.
- Finalized the APII CBS approach taking into consideration the sustainability of the program.
- Planned and organized with FAO a national workshop to introduce the APII CBS model to national and provincial counterparts. This workshop is scheduled for February 5, 2010.
- Developed a Training of Trainers course for provincial health and animal health counterparts in APII CBS model implementation. The training course is scheduled for the end of January.

4) Case management and infection control procedures for health facilities

- Organized and conducted a national workshop to share the lessons learned in infection control and case management by the AI Mekong Initiative and plans for future case management and infection control activities. Participants from national and provincial level health offices of the five focus provinces attended along with international partners.
- Subcontract negotiations were initiated with Hanoi and Ho Chi Minh Infection Control Societies for implementation of activities in this technical area.

5) Animal Response Efforts

- Reviewed the data collected in 2009 by the AI Mekong Initiative (Hung Yen and Can Tho) and by AED (Kien Giang, Ha Nam and Kien Giang) to provide baseline information on poultry production, AI virus outbreaks and some figures related to animal health workers and extension worker networks to inform workplans for the provinces.
- Designed data collection forms to assess current needs and gaps in understanding of Agriculture Extension Workers and Animal Health Workers. These were sent to the Sub-departments of Animal Health and Province Centers for Agriculture and Forestry Extension.
- Subcontract negotiations were initiated with the Veterinary Association - developed proposal and budgets – for their work in animal health network improvement.

6) Biosecurity

- Prepared for Supply Chain Risk Assessment – developed technical assistance scopes of work and began setting up field visits.
- In collaboration with FAO, the Poultry Association, and the Veterinary Association, collected current training materials related to biosecurity for review.
- Met with and discussed opportunities to coordinate and collaborate with RUDEC, FEEDS and the Poultry Association.
- Met with FAO to discuss and agree upon biosecurity approaches and to develop joint plans for implementation of supply chain activities.

7) Behavior Change Communications

At the national level:

- Organized a one-day training course on the theory and application of behavior change communication (BCC) on Dec. 15, 2009 in Hanoi with participation of 20 people from AFAP, VNRC, NAFEC, NCHEC, the Veterinary Association and all APII technical staff.
- APII BCC staff attended the first BCC working group and acted as the focal point person for BCC material cataloguing. A list of collected materials and legislative documents and strategy from all agencies in the working group, including MARD, has been developed and will be uploaded onto PAHI's website. Hard and soft copies were collected and will be filed in PAHI's library. Updates will be shared during the next BCC group meeting in January 2010.

At the local level:

- To continue BCC activities supported under AI Mekong Initiative and AI BCC projects during the pre-Tet period (Dec. 2009 to Feb. 2010), the following activities were undertaken:
 - The team reviewed all BCC activities under AI Mekong Initiative and AI BCC project through a review of project documents and a number of meetings with AED, AED's partners, local counterparts of the five focus provinces of Can Tho, Ha Nam, Hung Yen, Kien Giang and Quang Tri (most of which occurred during November 2009).
 - A quick needs assessment of avian influenza BCC gaps in the five focus provinces was done during November and December 2009 through a desk review of KAP surveys with related local authorities (Provincial Sub-Department of Animal Health or Provincial AI Steering Committee).
 - Agreements were made with the five focus provinces on avian influenza BCC activities implemented under the pre-Tet Campaigns, and BCC planning workshops / meetings were organized at provincial and district levels of the five provinces in December 2009.
- The following BCC materials were reproduced:
 - 300 sets of outdoor posters (900 posters) for Hung Yen and Can Tho;
 - 150 flipcharts for Can Tho;
 - 1,100 bags and 750 T-shirts for Kien Giang, Ha Nam and Quang Tri;

8) Other Cross Cutting

- The APII workplan was submitted to USAID on October 30, 2009.
- Gender Specialist, Virginia Lambert, traveled to Hanoi to develop a gender strategy and plan, and trained APII and counterpart staff in gender awareness. The strategy will be submitted to USAID in February, 2010.
- Abt Associates headquarters' staff and Environmental Compliance Advisor developed an environmental compliance plan. The plan will be submitted to USAID in February, 2010.
- A project PMP was submitted to USAID on November 24, 2009. An update is expected to take place in March 2010 to align it with USAID/Vietnam's new PMP.

- Development of a training manual was begun which will include forms and guidelines to strengthen training quality across components.
- Developed and began implementation of a Training Needs Assessment for Trainers in all five provinces to feed into the development of the Training of Trainers scheduled to take place in late February/ early March.

Challenges and Solutions

Several challenges faced the implementation of the APII project in Quarter 1. These centered around establishing relationships and modes for collaboration with partners and sub-contractors, recruiting new staff for the project and the time of year in which implementation began.

1) Coordination and Collaboration

- The Project Director was not available for the MOU signing ceremonies in Kien Giang, Can Tho and Quang Tri. Acting Project Director, Timothy Irgens attended the ceremonies in Han Nam and Hung Yen. The ceremonies may have benefitted from the presence of an international Abt staff member.
- The MOUs signed with the provinces were umbrella MOUs that did not include Year 1 implementation plans and budgets, creating a possible confusion about next steps. Meetings with provincial authorities following the signature of the MOUs are clarifying the next steps and outline the plan for moving forward during Year 1.
- The schedule for MOU signings was very tight - Hung Yen on November 10, Ha Nam on November 11, and both Can Tho and Kien Giang on November 25. Advanced planning and coordination made this possible, and the team was able to make the three hour trip from Ken Giang to Can Tho in one day, and all ceremonies took place without incident.
- To maximize resource investment and avoid overlap of activities, collaboration with the FAO is essential for all shared activities. To date details of this collaboration have been a challenge to determine, and discussions have focused on national level collaboration. The development of detailed plans for biosecurity collaboration in each province will assure this management of resources and investment.

2) Avian Influenza Preparedness and Response Plans

- The VNRC, a subcontractor for this activity, already receives USAID funding to implement the IFRC's H2P project which also works on pandemic preparedness and response. In order to avoid duplication of efforts the APII project, USAID and IFRC will coordinate closely to determine which activities will be funded through the VNRC's subcontract on the APII project and which will be funded through the H2P project.

3) Early Warning systems for Human and Domestic Poultry Surveillance

- Both the APII project and the FAO have developed CBS approaches that are similar, but not identical. In order to provide consistent assistance to the GVN, USAID, FAO and APII will need to continue to negotiate the parameters of the CBS model that will be implemented in Vietnam.

4) Animal Response Efforts

- Most of the activities related to Animal Health and Agriculture Extension Workers training are planned to be led by APII proposed sub-contractor AFAP. During Quarter 1, permission to subcontract with AFAP had not yet been granted,

directly affecting the component's progress, specifically delaying the training needs assessment. Pending this approval, APII plans to recruit short term consultant(s) to conduct the assessment, and AFAP will begin activities after approval, based on the consultants' findings.

5) Biosecurity

- National level supply chain management occurs through several points, and is not the responsibility of a single ministry or institution. Policy dialogue will help address this, but working with policy makers at national level on supply chain issues will require coordination. Successful recruitment of the Partner Coordination Manager Position will assist APII in addressing this.

6) Behavior Change Communications

- Coordination with the AIBCC project to transfer materials - radio spots, the "Three Good Things" template etc. – took more time than expected. Therefore reproduction of bags and t-shirts was delayed.
- It took a long time for provinces to establish Project Steering Committees and to authorize a focal point agency (for example the Women's Union) with which the APII project will sign a professional services agreement to implement pre-Tet BCC campaigns. Therefore many BCC activities did not start this quarter, and are instead beginning in January, 2010.
- The fall and early winter seasons proved to be a challenge for this component. The first BCC working group meeting was held in late December, and holidays kept many organizations from turning in their BCC materials as planned.
- Similarly, because of the pre-Tet season, provinces had to prioritize and scale down BCC interventions. For example there were no radio spots in Kien Giang and no road shows in any of provinces.

7) Other Cross Cutting

- Quarter 1 was implemented in absence of several important staff members. A search was conducted in October and November and a Project Director was identified and submitted to USAID for approval at the end of November 2009. The acting Project Director, Timothy Irgens, led the team through the end of November, at which time Susan Scribner the Portfolio Manager from Abt Headquarters managed any approvals and other responsibilities of a Project Director remotely. Similarly the Partner Coordination Manager, M&E Manager and Human Health Officer were recruited for throughout this quarter. Because of the importance of these positions, it was very important to wait for the right person to be found for each position. A candidate for the Partner Coordination Manager has been selected, has accepted an offer and is expected to join the team in Quarter 2. The M&E Manager and Human Health Officer are expected to be identified and recruited in Quarter 2. Furthermore, the Deputy Director for Provincial Implementation was unable to join the team until early December. As a solution the Technical Directors for Human Health and Monitoring and Evaluation, Animal Health and Behavior Change Communication coordinated provincial MOU signing activities until he was able to come on board. Quarter 2

will be implemented with a more complete staff, leading to better allocation of responsibilities.

Plan for Quarter 2

1) Gantt Chart

Table 1. Quarter 2 Gantt Chart which follows displays the expected activities during Quarter 2 of APII Implementation.

Table 1. Quarter 2 Gantt Chart

AIMEBA Code	Activity	Timeline			
		Jan	Feb	Mar	
<i>Pandemic Preparedness</i>					
Avian Influenza Preparedness and Response Plans	PP1	Develop Pandemic Preparedness Plans	x	x	x
	PP1.1	Review Current Pandemic Preparedness Plans and Begin Gap Analysis in Hung Yen, Kien Giang and Quang Tri			x
	PP1.3	Provide input to revising and modifying the National Strategic Plan for Pandemic Response as appropriate and invited.	x	x	x
Coordination and Collaboration	PP2.1	+ Submit provincial workplans to USAID	x		
	PP2.6	Participate in USAID API meetings	x	x	x
	PP2.7	Convene TAG		x	x
		+ Share draft ToR with potential TAG members			x
	PP2.8	Participate in Working Groups	x	x	x
		+ Request/support changes to strengthen as needed and accepted	x		
		+ As appropriate conduct activities in GETS provinces		x	x
	PP2.10	Create Quarterly API Update Newsletters		x	x
PP2.11	Participate in Professional Associations/Agency Meetings, Trainings, and Demonstration events	x	x	x

Success Stories

Signature of Memoranda of Understanding Allows for Prompt Initiation of Activities

The Avian and Pandemic Influenza Initiative signs MOUs with all five provinces within just two months of project award.

A key factor to working successfully in Vietnam is acquiring permission from local governments to conduct activities in their respective geographic jurisdictions. The USAID-funded Avian and Pandemic Influenza Initiative used lessons learned implementing previous influenza prevention projects in Vietnam to attain Memoranda of Understanding (MOU) with each of the five provinces in which it will conduct activities within just two months of commencing the project.

Project and Provincial Staff gather for Signing Ceremony in Quang Tri

The Avian and Pandemic Influenza Initiative project, which began in October 2009, is a three-year initiative aiming to build the capacity of the Government of Vietnam and its counterparts to identify, prevent and control influenza and similar disease outbreaks in both animals and humans. The team understood that a slow process for attaining MOUs would lead to delays in implementation of project activities. To mitigate this concern the project initiated a step-by-step process to fully introduce the new project to provincial officials and ensure their complete understanding of the work to be done, building

relationships of trust which facilitated the process of attaining all the proper signatures. This process included starting with introductory letters explaining the parameters of new project, followed by a visit to each of the provinces - Can Tho, Ha Nam, Hung Yen, Kien Giang, and Quang Tri – to formally introduce the project and share proposed MOU language for feedback and inputs. After these meetings the project and provincial staff continued negotiations by phone and email. By the third week in November two of the MOUs were signed, and the other three provinces followed quickly, with the last signing taking place on December 4, 2009.

In all five provinces, the MOUs were signed by either the vice chairman of People's Committee or the authorized provincial Departments of Agriculture and Rural Development. After signature, the project staff met with each province to discuss and develop detailed implementation plans for year one, allowing work to commence in the provinces by the end of the first quarter of project implementation. Open and early communication with local counterparts in Vietnam proved to be the key to success in starting the Avian and Pandemic Influenza Initiative project efficiently.

"Through the last project's (USAID-funded At Mekong Initiative) activities, cadres from workers from animal health and human health, the women's union and related agencies clearly saw the effectiveness of the models that the project had been developing and implementing over time. Those project activities have contributed to our efforts to prevent avian influenza. That's why the People's Committee of Can Tho has decided to continue with this phase two project" -- Mr. Nguyen Thanh Son, Vice chairman, Can Tho People's Committee

1. Achievements

The Avian and Pandemic Influenza Initiative (APII) commenced activities on October 1, 2009. The first six months of implementation focused on getting the project up and running, hiring staff, establishing the contract and preparing sub-contracts, developing Memoranda of Understanding (MOUs) and building relationships with the five focus provinces (Can Tho, Kien Giang, Quang Tri, Ha Nam and Hung Yen), and preparing provincial work plans. Below is an overview of specific activities undertaken outlined by technical area.

1.1 Avian Influenza Preparedness and Response Plans

- Attended H2P's Table-top exercises in Ha Nam to gain experience for future activities and to see where and how to integrate behavior change communication into provincial pandemic response plans.
- Attended IOM's Table-top exercise on Preparedness and Response Plans in Tay Ninh, to gain experience for future activities.
- Met with USAID/Vietnam and representatives of the International Federation of the Red Cross (IFRC) to come to agreement on how to assign the Vietnam Red Cross' (NVRC) activities in order to maximize USAID-funding and avoid overlap between APII and the Humanitarian Pandemic Preparedness (H2P) projects.
- Initiated negotiations on the VNRC subcontract. The subcontract with VNCR is expected to be signed in the third quarter.

1.2 Coordination and Collaboration

- MOUs were signed with the five focus provinces between Nov. 10 and Dec. 4, 2009. Based on experiences and lessons learned during the AI Mekong Initiative, the team followed a clear step-by-step process for working with the provinces to develop the MOUs. There was a general feeling in the APII project of good teamwork and that the relationships with the provincial authorities generally got off to a good start. The process involved a broad range of stakeholders and interactive dialogue to help lay the foundation for future commitment and local ownership, which is so vital for sustainability and scaling-up.
- Provincial Implementation Plans (PIP) were developed with the provincial counterparts and received approval from Provincial People Committees. The PIP is considered an official project document attached to the MOU and to be used as a framework for the implementation of API activities.
- A Provincial Coordination Unit (PCU) was established in each province. The PCUs are chaired by provincial leaders, typically the Vice Chairman of the Provincial Peoples Committee or the Director or Vice Director of the Provincial Department for Agriculture and Rural Development. It has representatives from related organizations responsible for implementing project activities in the province. The PCU assumes the highest level of ownership and decision-making on project implementation in the province and is being assisted by a Provincial Coordinator funded by either FAO (Kien Giang, Quang Tri, Ha Nam) or APII (Can Tho, Hung Yen).

- Guidelines for Field Implementation and Monitoring were developed and agreed with provincial counterparts and sub-contractors. The guidelines provide steps and procedures for sub-contractors to execute their work in cooperation with the PCUs and provincial partners. At the same time, the guidelines provide PCUs with tools to coordinate and supervise all activities.
- Project Offices were set up in Can Tho and Quang Tri, each manned by an APII Project Manager. Together with the Head Office in Hanoi they provide logistical and financial management support to provincial activities.
- The Partner Coordination Manager joined the APII team during March 2010, and will support the establishment of the Technical Advisory Group (TAG) and help provide secretariat support to TAG from APII.

1.3 Early Warning systems for Human and Domestic Poultry Surveillance

- Conducted a rapid assessment on the status of surveillance systems in the three new focus provinces (Kien Giang, Quang Tri, Ha Nam) and proposed the Community-Based Surveillance (CBS) approach for the five focus provinces.
- Reviewed the CBS model developed under AI Mekong Initiative and the provincial surveillance processes in Quang Tri, Ha Nam and Kien Giang's to inform the development of APII's CBS approach and plan.
- Provided technical assistance to the Centre for Community Health and Injury Prevention to implement CBS approaches in Thai Binh and Long An Provinces funded by the VAHIP project of MoH.
- Discussed with FAO to work towards aligning surveillance approaches and develop joint plans for implementation in animal health surveillance. It was agreed that: APII and FAO will work together in finalizing the districts and communes selection processes based on the risk-based approaches; APII and FAO will jointly organize the national workshop to introduce the CBS model; FAO will train commune chief AHWs and APII will train both village AHWs and human health workers, key informants and private sectors in 123 communes; APII and FAO will jointly launch and implement the CBS model in 5 focus provinces
- Finalized the APII CBS approach taking into consideration the sustainability of the program. The approach will use and strengthen existing animal and human health networks at commune and village level and link the disease information from the CBS into the existing surveillance in national human and animal health systems.
- Finalized the list of districts and communes (in collaboration with FAO) for CBS implementation using the risk based approaches. The total of selected communes is 123 in which Hung Yen is selected 24 communes in 4 districts, Ha Nam 16 communes in 2 districts, Quang Tri 26 communes in 4 districts, Can Tho 24 communes in 5 districts, and Kien Giang 33 communes in 4 districts.
- Organized with FAO a national workshop to introduce the APII CBS model to national and provincial counterparts. There were 78 participants from national level (MoH, MARD, NIHE, Public Health and Agriculture Universities, VA), focus provinces, representatives of USAID partners, and representatives of international organizations including CDC, WHO, CDC/GMS, CARE.

- Developed and organized a 5-day TOT course for provincial health and animal health counterparts in APII CBS model implementation. A total of 20 provincial human and animal health staffs (four per focus province) were trained. The local trainers will play a key role in the rollout of CBS training in five provinces.
- Worked with Can Tho and Hung Yen provinces to make detailed plans for CBS training for different elements of the model such as collaborators, key informants, and private sector agents in March. Similar plans will be made with Ha Nam, Kien Giang, and Quang Tri in April 2010.
- Prepared CBS materials to distribute to collaborators during the upcoming model launch.

1.4 Case management and infection control procedures for health facilities

- Organized and conducted a national workshop to share the lessons learned in infection control and case management by the AI Mekong Initiative and prepare plans for future case management and infection control activities. Participants from national and provincial level health offices of the five focus provinces attended along with international partners.
- Subcontract negotiations were initiated with Hanoi and Ho Chi Minh Infection Control Societies for implementation of activities in this technical area. The process of subcontracting Ha Noi Infection Control Society took longer than expected due to a shortage of human resources and lack of experience in contract development.

1.5 Animal Response Efforts

- During the last quarter of 2009 a review of the data collected in 2009 by the AI Mekong Initiative (and by AED in focus provinces) was conducted in order to provide baseline information on poultry production, AI virus outbreaks, and Animal Health Worker (AHW) and Animal Extension Worker (AEW) networks. This data helped inform work-planning in the five focus provinces.
- While preparing the main sub-contract on APII with the Australian Foundation for Peoples of Asia and the Pacific (AFAP), a temporary Letter of Agreement was signed with AFAP in February 2010 to help kick-start their work. During March AFAP initiated an extensive Training Needs Assessment (TNA) for AHWs and AEWs in the five focus provinces. The survey is set to be completed in mid-April with the analysis and results ready in early May. This will feed directly into a National workshop on strengthening health and extension workers networks at grassroots levels scheduled for late May 2010.
- A Professional Services Agreement (PSA) was entered with the Veterinary Association (VA) in February 2010. The contract enables VA to strengthen their own association network, support AHWs networks in selected pilot districts and explore opportunities to involve the private sector in this by tapping into networks of private AHWs ('Para-vets') through public private partnership activities. Soon after the contract signing VA launched their activities in the five focus provinces. So far technical magazines (Vietnam Veterinary Magazine, Poultry Magazine, Poultry Newsletter) have been distributed to 315 Animal Health Worker (AHW) commune boards in 21 districts in the five provinces. Together with private

companies (GreenVet, Nam Thai), VA has made plans to implement joint training courses for AHWs from 6 districts of Can Tho and Hung Yen starting in April 2010. Together with the Department of Animal Health (DAH) VA is also preparing a National Workshop on strengthening the network of AHWs at the commune and village levels. This will involve participants from provincial Sub-Departments of Animal Health (SDAH) and relevant NGOs such as AFAP and AVSF. Results are expected to be shared with central level Government agencies.

1.6 Biosecurity

- A Sub-contract with the Rural Development Center (RUDEC) under the Ministry of Agriculture and Rural Development (MARD) was prepared to enable RUDEC to conduct the Supply Chain Risk Assessment in five focus provinces. The contract is expected to be approved in April for the risk assessment to get underway in May 2010.
- A rapid risk assessment was conducted in the five focus provinces and Ha Tay where the largest live bird market of Ha Vy and several hatcheries are located. Findings were shared with the Department of Livestock Production and the Biosecurity Working Group. A Supply Chain Risk Assessment Tool was designed, tested and ready to use.
- In collaboration with FAO, the Poultry Association, and the Veterinary Association, current biosecurity training materials were collected for review.
- A plan for developing training materials for smallholder commercial (sector 3) farmers was prepared in collaboration with the National Agriculture & Fishery Extension Center (NAFEC) together with the Department of Livestock Production (DLP). A consultant agreement (CA) was prepared to engage representatives from the two organizations under MARD.
- Two draft proposals for biosecurity and certification model development for farmers sector 3 were developed together with RUDEC and the Department for Economics Environment and Farming systems (DEEFS) of the National Institute of Animal Husbandry together with the Poultry Association. This is expected to lead to the signing of Professional Services Agreements or Consultant Agreements with the organizations.

1.7 Behavior Change Communications

At the national level:

- Organized a one-day training course on the theory and application of behavior change communication (BCC) in December in Hanoi with 20 participants from AFAP, VNRC, NAFEC, NCHEC, the Veterinary Association plus all APII technical staff.
- Attended BCC working group meetings and acted as the focal point for BCC material cataloguing. A list of collected materials, including legislative documents and strategies from all agencies in the working group, including MARD, was developed for uploading to PAHI's website. Hard and soft copies were collected for filing in PAHI's library.

At the local level:

- To continue BCC activities supported under the AI Mekong Initiative and AI BCC projects during the pre-Tet period (Dec. 2009 to Feb. 2010), the following activities were undertaken:
 - Reviewed all BCC activities under the AI Mekong Initiative and the AI BCC project through document reviews and meetings with AED, AED's partners, and local counterparts from the five focus provinces.
 - Conducted a rapid needs assessment during November and December 2009 of avian influenza BCC gaps in the five focus provinces through a desk review of KAP surveys with related local authorities (Provincial Sub-Departments of Animal Health or Provincial AI Steering Committees).
 - Made agreements with the five focus provinces on avian influenza BCC pre-Tet Campaigns, and organized BCC planning workshops at provincial and district levels.
 - Implemented pre-Tet BCC campaigns in the five focus provinces including: BCC TOT refresher courses for 10 provincial and district animal and health officials (Can Tho); one-day refresher training for 32 commune and village communicators; 25 community events at commune level in Hung Yen (12), Can Tho (12) and Ha Nam (1) with drama, poems, songs related to API; displayed 300 sets of outdoor posters (3 different posters) in Hung Yen and Can Tho at strategic locations; distributed 1,100 bags and 750 T-shirts in Kien Giang, Ha Nam and Quang Tri to audiences participating in AI BCC market kiosks; organized 81 small group discussions with around 800 sector three farmers in Can Tho; aired radio spots on district radio and commune loudspeakers in parallel with updated local news written by local animal and health officials for 7-9 weeks in 12 communes/62 villages of Hung Yen, 7 districts/28 communes of Quang Tri, 12 communes/80 villages of Can Tho, and 6 districts radio stations of Ha Nam; organized 29 communication kiosks at the main markets of Quang Tri (10), Ha Nam (12), and Kien Giang (7); and distributed 3300 wall poster calendars to provinces (including target audiences in community events), national and international partners. Specific calendars were designed for each province focusing on three key messages and integrating the provincial hotline number from GETS project.
 - Organized six BCC review meetings/workshops in four focus provinces (except Kien Giang) for sharing of experiences and lessons learnt.
- Promoted an integrated approach to Human and Animal Health BCC through post-testing of CBS toolkits with village collaborators in Can Tho and Hung Yen. The plan is to similarly post-test the biosecurity booklet "Bac Mau nuoi ga" with sector three farmers, in Hung Yen in April. These post-test results will be taken into consideration when producing CBS toolkits and future bio-security training materials.

1.8 Other Cross Cutting

- A desk survey on TOT skills was conducted during February – March 2010. Data analysis will take place in April. The findings will provide an overview of potential local trainers and their capacity in TOT for the various components and help design upcoming training courses across APII.

- A Project Training Profile (PTP) outlining the training course process, standard forms for course planning and notification, monitoring and evaluation, checklists, participant's lists, and so forth, was prepared and shared between technical components in an effort to strengthen the project training database. This PTP will be updated regularly based on training experiences and outputs from the M&E database later on.
- Virginia Lambert, traveled to Hanoi to develop a gender strategy and plan, and trained APII and counterpart staff in gender awareness. The strategy was finalized and submitted to USAID in February, 2010.
- Abt Associates headquarters' staff and Environmental Compliance Advisor developed an environmental compliance plan. The plan was finalized in February, 2010.
- Revised the APII PMP first submitted to USAID in 24th of November to reflect the USAID PMP. The finalization of the PMP will be in April right after the USAID PMP is finalized with technical assistance of Abt home office M&E specialist, Dr. Kathryn Banke.
- Developed monitoring procedures/guidance/mechanisms for provincial counterparts who will conduct monitoring visits of APII activities. The procedures will be integrated into the routine monitoring work in the provinces. The finalization procedures are underway with plans to train the local counterparts in June when the new M&E manager is expected to be on board.
- Drafted ideas/solutions for a web-based M&E database system for the APII project and for M&E data from other USAID-supported AI initiatives. The M&E team plans to work with MEASURE to further develop the M&E system in the third quarter.
- Worked with FAO to prepare a joint training workshop to introduce the USAID PMP and APII PMP frameworks to provincial and national counterparts. The workshop is planned for April 2010.
- Finalized the selection of districts and communes for implementation of project activities in five provinces. Started collected basic information in targeted communes and districts.

2. Challenges and Solutions

Various challenges faced APII implementation during the first six months, notably establishing relationships and modes for collaboration with partners and sub-contractors, and filling gaps in staffing. Below is an overview of specific challenges and solutions outlined by technical area.

2.1 Avian Influenza Preparedness and Response Plans

- VNRC, the main subcontractor for this activity, already receives USAID funding to implement the H2P project of IFRC, which also works on pandemic preparedness and response. In order to avoid duplication of efforts the APII project, USAID and IFRC will coordinate closely to determine which activities will be funded through the VNRC subcontract with APII and which will be funded through the H2P project.

2.2 Coordination and Collaboration

- APII was without a resident Project Director from December 2009 to March 2010. This may partly explain some of the early coordination difficulties with key international partners such as FAO, e.g. in the appointment and work with Provincial Coordinators. Both parties are well aware of the issue and the dialogue has recently intensified in an effort to improve coordination and collaboration, in the interest of all. Joint Job Descriptions for Provincial Coordinators have been prepared and communicated to the provinces and there are plans for more joint field visits.
- The MOUs signed with the provinces were umbrella MOUs that did not include Year 1 implementation plans and budgets, creating possible confusion about next steps. Subsequent meetings with provincial authorities following the signings helped clarify next steps and outline the plan for moving forward during Year 1.
- One issue that probably will continue to cause some distortions and may adversely affect implementation and cooperation with local partners is the fact that APII and FAO follow different per diem and allowance schemes for local counterparts. There is little that the two parties can do about this, other than being mindful of the issue taking it into account for instance when planning provincial activities.
- To maximize resource use and avoid overlap or duplication of efforts, good collaboration with FAO remains essential. The design and implementation of CBS models in 123 communes is a case in point, where FAO focuses its inputs at upper (provincial, district, commune) levels, whereas APII targets village levels, thus complementing one another. Frequent email communications and sharing of Google calendars is helping to improve coordination, and with the new Partner Coordination Manager and the Project Director on board the situation is expected to further improve.
- At the national level, APII is behind schedule with the establishment of the Technical Advisory Group. Again, with the arrival in early April of a new Project Director and the recruitment in late March of the Partner Coordination Manager this situation is expected to improve significantly in the coming months.

2.3 Early Warning systems for Human and Domestic Poultry Surveillance

- Both the APII project and the FAO have developed CBS approaches that are similar, but not identical. In order to provide consistent assistance to the GVN, USAID, FAO and APII will need to continue to negotiate the parameters of the CBS model that will be implemented in Vietnam.
- The collaboration and coordination with FAO to implement the APII CBS approaches still need to improve. Sharing activity plans and ensuring mutual agreement and understanding will be the key to good collaboration.

2.4 Case management and infection control procedures for health facilities

- Lack of human resources and contracting capacity in Ha Noi Infection Control Society caused a slowdown in subcontracting process. Postponement of the trip of International consultant Dr. Susan Coffin may also cause a slow down the process of strengthening infection control procedures. If feasible it may be considered working with locally available consultants and/or extend the scope of work for Ho Chi Minh Infection Control Society to take over some of the intended work of Hanoi infection control society.

2.5 Animal Response Efforts

- The development of the (large) AFAP subcontract was more cumbersome than anticipated. Albeit a temporary Letter of Agreement was entered with AFAP, the work with them is behind schedule. With the new COP onboard in April it is expected that this process soon gain speed.
- The sub-contractors (AFAP and the Veterinary Association so far) generally needed more time than anticipated to familiarize themselves with APII procedures and to establish collaborative working relationships with provincial counterparts.

2.6 Biosecurity

- National level supply chain management occurs through several points, and is not the responsibility of a single ministry or institution. Cross-sector and policy dialogue will help address this challenge, but working with policy makers at national level on supply chain issues will require good coordination. The recent arrival of the both Partner Coordination and the new COP has helped to begin addressing this.

2.7 Behavior Change Communications

- Coordination with the AI BCC project to transfer materials – radio spots, the “Three Good Things” template etc. – took more time than expected. For the next campaign, however, we will now be in a much better to design our own campaign and BCC materials with local partners.
- Similarly it took longer than anticipated for provinces to establish Project Coordination Units (PCU) and to authorize a focal point agency (e.g. the Women’s Union) to implement pre-Tet BCC campaigns under professional services agreements with APII. This caused initial delays in BCC activities but

the situation has since improved and the process is expected to run more smoothly in future campaigns.

- The abovementioned delays moved some activities too close to Tet with some provinces having to scale down BCC interventions. For example there were no radio spots in Kien Giang and no road shows in any of the focus provinces. In future the project will know better what to expect and should be able to prepare well in advance.
- There was also a delay in the planned publishing of a quarterly API Newsletter. As a part of the capacity and leadership building, the intention is to involve two government communication bodies, namely NAEC and NCHEC under MARD and MOH respectively, for co-editing and reviewing of articles and news items. To agree on a possible cooperation mechanism between the three parties required adequate time and patience. The scope of work has now been agreed, a budget has been drafted, a list of audiences has been established, and we are nearing contract signing. We expect to have the first issue of the newsletter ready by late May/early June.
- Our posters (with the three key messages) which were hung at public places typically lasted for some months only. Villagers suggested that we instead promote key behaviors through wall calendars that they will see every day at home rather than, or as complementary to, only having posters in public places. The project subsequently transformed the posters into wall calendars, adding hotline numbers supported by the FAO GETS project in the process.

2.8 Other Cross Cutting

- Development of sub-contracts generally took more time than anticipated and is a new learning experience for all involved. It is anticipated that the performance on subcontract development and management will improve rapidly as the project gains first-hand experience and builds trust and positive relationships with subcontractors and partners.
- The development of an overall cross-component training plan is awaiting the recruitment of Training Manager. So far it has proven difficult to find a suitable candidate for this position, but the issue is being addressed by Senior Management and has high priority.

3. Success Stories

Early Memorandums of Understanding Allow for Prompt Initiation of Activities *The Avian and Pandemic Influenza Initiative signs MOUs with all five provinces within just two months of project award.*

A key factor to working successfully in Vietnam is acquiring permission from local governments to conduct activities in their respective geographic jurisdictions. The USAID-funded Avian and Pandemic Influenza Initiative used lessons learned implementing previous influenza prevention projects in Vietnam to attain Memoranda of Understanding (MOU) with each of the five provinces in which it will conduct activities within just two months of commencing the project.

Project and Provincial Staff gather for Signing Ceremony in Quang Tri

The Avian and Pandemic Influenza Initiative project, which began in October 2009, is a three-year initiative aiming to build the capacity of the Government of Vietnam and its counterparts to identify, prevent and control influenza and similar disease outbreaks in both animals and humans. The team understood that a slow process for attaining MOUs would lead to delays in implementation of project activities. To mitigate this concern the project initiated a step-by-step process to fully introduce the new project to provincial officials

and ensure their complete understanding of the work to be done, building relationships of trust which facilitated the process of attaining all the proper signatures. This process included starting with introductory letters explaining the parameters of new project, followed by a visit to each of the provinces - Can Tho, Ha Nam, Hung Yen, Kien Giang, and Quang Tri – to formally introduce the project and share proposed MOU language for feedback and inputs. After these meetings the project and provincial staff continued negotiations by phone and email. By the third week in November two of the MOUs were signed, and the other three provinces followed quickly, with the last signing taking place on December 4, 2009.

In all five provinces, the MOUs were signed by either the vice chairman of People's Committee or the authorized provincial Departments of Agriculture and Rural Development. After signature, the project staff met with each province to discuss and develop detailed implementation plans for year one, allowing work to commence in the provinces by the end of the first quarter of project implementation. Open and early communication with local counterparts in Vietnam proved to be the key to success in starting the Avian and Pandemic Influenza Initiative project efficiently.

"Through the last project's (USAID-funded Ai Mekong Initiative) activities, cadres from workers from animal health and human health, the women's union and related agencies clearly saw the effectiveness of the models that the project had been developing and implementing over time. Those project activities have contributed to our efforts to prevent avian influenza. That's why the People's Committee of Can Tho has decided to continue with this phase two project" -- Mr. Nguyen Thanh Son, Vice chairman, Can Tho People's Committee

Provincial implementation plans demonstrate the commitment and ownership of local partners in the USAID funded Avian and Pandemic Influenza Initiative

After having successfully signed MOUs with 5 provinces in late 2009, provincial Project Coordination Units (PCUs) have been proactive in developing their own provincial implementation plans, which are now with the Provincial Peoples' Committee for final approval.

The individual implementation plans involve multi-disciplinary/multi-sector teams including both animal health and human health sectors, preventive medicine centers, provincial information and health education centers, and mass organizations such as Women's' Union, Farmer Association, the Horticulturist Association, etc. This participatory approach creates opportunities to prioritize activities of interest and needs in line with the function of each sector.

The ability of the PCUs to discuss and achieve consensus on project activity timelines and implementation plans minimizes intra- and inter-project scheduling conflicts and allows for better allocation of resources and staff time to implement and monitor activities.

These provincial implementation plans serves as a guiding documents for the first year project activities in each province. Thanks to this document, local partners can actively coordinate with other API related projects including other USAID partners working in their provinces. The holistic view of a province-wide plan allows local partners to be more proactive in harmonizing different interests and promoting more systematic changes.

*This is our plan that contains full participation and with detailed comments from all related stakeholders. I am confident to submit PCC for approval, and I think it will be approved very soon. We have had opportunities to discuss and talk through and walk through each content in the last three meeting. We are now very clear of what we each should do, what human health, animal health, women's union, etc should do. We understand our role, what we are expected to accomplish in each role -- being a focal point agency or participating agency. We are all clear of the mechanism of work and coordination. We are all happy with well informed, highly consent planning process and believe that we can do -
Tran Quang Cui -- Vice Chairman Kien Giang PCU*

Community-based surveillance model – a joint effort from the human health and animal health sectors

CBS collaborators make home visits as part of their role

Together with FAO, the Avian & Pandemic Influenza Initiative funded by the U.S. Agency for International Development (USAID) presented a community-based surveillance model to policy makers, provincial stakeholders, representatives from UN agencies and international organizations working on avian influenza at a one-day workshop Ha Noi in early 2010. The workshop allowed participants to share experiences in improved surveillance and develop consensus on lessons learnt. This feedback is now being incorporated into improved Community Based Surveillance (CBS) activities in the

five focus provinces.

The current CBS model promotes the role and strengthens the capacity of grassroots level collaborators, i.e. the village health workers and village animal health workers who are responsible for initial case detection, reporting, and for triggering community level responses to suspected cases. Efforts are being made to help ensure that their work feeds directly into community level CBS activities and from there upwards into the existing national surveillance system. FAO supports CBS activities from the community level upwards. The collaboration between the Avian & Pandemic Influenza Initiative and FAO has so far resulted in joint targeting and implementation of CBS activities in 15 districts/123 communes selected together with the local authorities on the basis of risk profiles.

By demonstrating the merits of an integrated approach, it is hoped that national and provincial counterparts will want to adopt the improved CBS model more widely and continue to work on its improvement. As remarked at the national workshop by Mr. Do Huu Dung, Deputy Head of the Epidemiology Division, Department of Animal Health, in his introductory speech:

'As we all know, there is the gap between the official surveillance system and the surveillance at community level. The Vietnamese Government is looking for a relevant community-based surveillance model that fills this gap and has the collaboration between animal health and health sectors. We expect that the joint effort between Abt and FAO will help to make this model available to be presented to Vietnamese Government in order that it can be replicated to other provinces than simply in project provinces'.

1. Achievements

The sections below outline the activities and achievements of the Avian and Pandemic Influenza Initiative (APII) during the third quarter of year 1 (April-June 2010). Section 3 - 'Success Stories' – provides additional examples of the project's impact.

This quarter marked the arrival of the new Chief of Party (COP)/Project Director in early April, and the continuation of field activities under all components. The Animal Health component focused primarily on training grassroots level animal health workers (AHW) and trainers. The Human Health component's Community Based Surveillance (CBS) completed the roll-out of its training in all provinces except Ha Nam (deferred until July) and made preparations for the launch of CBS collaborator networks. The BCC component conducted a major assessment of earlier BCC activities under the AI Mekong Initiative, APII, and AED's AI-BCC projects. Under cross-cutting issues the establishment of a Technical Advisory Group (TAG) was explored with USAID and the Ministry of Agriculture and Rural Development (MARD). At this point in time it is not clear whether pursuing the establishment of a TAG is the most feasible option for doing advocacy work and aspiring for policy level impact. The following describes specific activities.

1.1 Avian Influenza Preparedness and Response Plans

- a. Continued to prepare and negotiate subcontracts with Vietnamese Red Cross (VNRC) to review the current status of pandemic preparedness plans in each of the five provinces.

1.2 Coordination and Collaboration

- a. The Provincial Coordination Units (PCUs) in the focus provinces continued to play active roles in planning and monitoring field activities (for example there were 75 CBS training courses conducted by provincial trainers and monitored by PCU members in four provinces between April and June.)
- b. Quarterly meetings were held in April with each PCU to finalize provincial implementation plans and introduce guidelines for monitoring procedures and forms that will be used by provincial partners. In June this turned into monthly PCU meetings to provide a more regular on progress update and strengthen forward planning as we approach the end of year 1.
- c. The new Project Director paid visits to and met with the PCUs in five focus provinces during May-June (PCU Quang Tri July 2) in order to get to know the PCUs better and listen to their concerns.
- d. Joint planning meetings were initiated with FAO, including a joint visit to and meeting with the Hung Yen PCU to review project implementation and improve provincial level coordination.
- e. Continued participation in Partnership on Avian and Human Influenza (PAHI) working groups on bio-security and Behavior Change Communication (BCC).
- f. Frequent meetings with partners in the Avian and Pandemic Influenza (API) community (UN Food and Agriculture Organization (FAO), World Health Organization (WHO), Vietnam Avian and Human Influenza Control and Preparedness Project (VAHIP), etc.).

1.3 Early Warning systems for Human and Domestic Poultry Surveillance

- a. Completed the roll-out of training for CBS network in the 83 communes of Hung Yen, Can Tho, Kien Giang and Quang Tri. CBS network training in Ha Nam is ongoing. All the training activities in Ha Nam will be completed by early August.
- b. The CBS materials for collaborators were produced and sent to provinces for distribution along with the CBS launches.
- c. The BCC team completed the design, revision and production of CBS promotional materials, guidelines for CBS radio spot airing at commune loudspeaker system, and the first draft of CBS radio spots.
- d. Regular network surveillance for suspected AI cases in the community and monthly network meetings in Hung Yen, Quang Tri and Can Tho were organized by commune health and animal health staff beginning in May, immediately following the trainings. Other provinces will begin similar activities after their CBS launches which are planned for July/August.

1.4 Case management and infection control procedures for health facilities

- a. Rapid assessments were conducted in 12 district hospitals in five provinces to inform the intervention.
- b. Continued to maintain the infection control activities in the four districts of instituted by the AI Mekong Initiative.
- c. Worked with Bach Mai hospital to negotiate a subcontract. Bach Mai hospital will take the place of the Hanoi Infection Control Society for infection control activities in Hung Yen, Ha Nam and Quang Tri.

1.5 Animal Response Efforts

- a. Subcontractor Australian Foundation for the Peoples of Asia and the Pacific (AFAP) completed the training needs assessment in five focus provinces in consultation with the Department of Animal Health (DAH)/Sub-DAHs/ and the National and Provincial Agriculture and Fishery Extension Centers (NAFEC and PAFEC). The BCC team gave inputs to the training need assessment questionnaire on BCC related-aspects of trainings. Final draft report is available in English and Vietnamese.
- b. Workshop conducted by Vietnamese Veterinarian's Association (VVA) on sustainable development of AHW networks with approximately 40 participants from the five focus provinces, other key provinces and sub-contractors conducted.
- c. The first meetings for AHWs at the District Veterinarian Stations were held in June to prepare for regular monthly meetings and refresher training for commune/village AHWs beginning in June in 15 districts of five provinces, with a total of more than 1,000 AHWs attending. Relevant training modules and curriculum are being adapted. A training of trainers (TOT) course for local trainers was prepared for implementation in Hung Yen and Quang Tri in July.
- d. VVA, partnering with other private companies such as GreenVet and Nam Thai, implemented joint training courses for public and private AHWs in six districts of Can Tho and Hung Yen from April. The training includes 12 courses on different veterinary topics. So far, a total of 200 AHWs have been reached.

- e. 2,173 technical magazines (Vietnam Veterinary Magazine, Poultry Magazine, Poultry Newsletter, etc.) were distributed to 315 AHW commune boards in 21 districts between March and late June.
- f. 2000 AHW logbooks were delivered to the five focus provinces for distribution.
- g. A post-test of the veterinarian tool kit distributed under AI Mekong was conducted and a new, improved tool kit (1,220 sets) is being prepared for distribution to AHWs. The veterinarian tool kit design was shared with VAHIP for replication in their 11 provinces.

1.6 Biosecurity

- a. A national workshop to review bio-security training materials for Sector 3 farmers was held at NAFEC in May with more than 20 participants from NAFEC, Agriculture Universities, National Poultry Institutions, FAO and international NGOs. The bio-security training material development is on-going.
- b. A subcontract with the Rural Development Center (RUDEC) under MARD was prepared and signed for RUDEC to conduct a comprehensive poultry supply chain risk assessment in the five focus provinces, in order to assess risks in major nodes along the different supply chains. The draft report was submitted in early July.
- c. The recruitment process for a local consultant to review the AED curriculum on training in risk reduction for supply chain vendors was initiated. The plan is for VVA to train vendors in the five focus provinces.

1.7 Behavior Change Communications

- a. Completed BCC campaigns assessment: tools development, tools pre-test, tools finalization, field work, final assessment findings.
- b. Collected and reviewed API BCC related research documents and working papers issued by different organizations/agencies including UNICEF, Care International, ASVELIS (Stop AI project), World Bank (VAHIP project); AED (AI-BCC project).
- c. Interviewed those responsible for BCC activities under the above mentioned projects to better understand the BCC activities implemented, successes and constraints related to the implementation of behavior change activities, and various perspectives on BCC activities in an API low risk context.
- d. Hosted a meeting with each of the five PCUs and local subcontractors to present all remaining BCC activities from July-September 2010, Personal Services Agreement (PSA) requirements, and to look for a qualified local subcontractor in each province to run those remaining BCC activities. This partnership approach with local counterparts was highly appreciated by all five PCUs.
- e. Chose local subcontractors in each province and completed PSA documentation, currently awaiting approval from home office and USAID for execution.
- f. Completed the tool/questionnaire for provincial communication plan assessments including communications during pandemics.
- g. Completed exploration, discussion, negotiation with the National Center for Health Education and Communication (NCHEC) on the publication of the first

- quarterly API Newsletter in Vietnamese. Submitted all required papers for the subcontract to be approved by Abt home office and USAID.
- h. In the process of writing desk review part for the BCC assessment.
 - i. Started extracting BCC assessment findings to develop the menu for the coming BCC activities in Year 2.
 - j. The process of preparing press releases and fact sheets on CBS for the launch of the CBS networks in the five provinces in August begun this quarter. This will be done in close consultation with USAID's communication advisor in line with the APII press relations plan.

1.8 Other Cross Cutting Issues

- a. The first draft of an integration matrix for animal health and BCC activities was prepared in May. It is expected that this matrix will help outline year 2 activities, whereby BCC and human health activities are more closely integrated into animal health activities along the poultry supply chain.
- b. A generic training profile for APII was prepared to help provide a more uniform and coherent approach to training across components.
- c. The TOT survey for the five provinces, which was initiated in January under the former training manager, was completed by APII staff working together and shared across components and with sub-contractors.
- d. Revisions were made to the PMP in April to align it with the newly completed USAID PMP, and the final version was submitted to USAID.
- e. In collaboration with FAO, trainings were held for provincial counterparts on M&E concepts, and APII and USAID indicators
- f. Discussions were held with the Measure project on API M&E work. As agreed, Measure will work to develop a tool for APII project as well as for other API partners for data collection. APII will use this form for data collection the five focus provinces and provide feedback to Measure for finalizing the tool.
- g. Discussions were initiated and meetings held with USAID and MARD on the formation a TAG or a Policy Advisory Group (PAG) under MARD, the purpose of which would be to: Advance the inclusion of best practices and approaches in national policies, plans and programs and their replication in other provinces; Advise API partners to ensure that all donor-funded API initiatives support and comply with the Green Book (as well as its follow-on) and other national policies, plans, and programs relevant to avian and pandemic influenza. This was followed by meetings with PAHI suggesting that PAHI is already well positioned to facilitate and further policy-level discussions, potentially rendering the formation of a PAG superfluous. As a result of these talks with PAHI a closer working relationship has been formed. APII and PAHI also prepared a joint SOW for a stakeholder analysis to help inform the preparation of a successor document to the 2006-2010 Integrated National Operational Program for Avian and Human Influenza (the 'Green Book').

2. Challenges and Solutions

The sections below outline the challenges encountered during the third quarter of year 1 (April-June 2010) and proposed solutions.

The key challenges facing APII this quarter were the much longer than expected processes of preparing subcontracts (PSAs) with local partners. The processes are somewhat new to the APII component teams and an unfamiliar way of operating for many of the partners, with some learning and capacity building required to prepare the contracts. In addition to this it remained unclear to what extent APII under USAID rules can enter contracts with organizations whose status is somewhat ambiguous and may be considered civil society or quasi-government. It is expected that clarification of these issues will pave the way for much smoother and faster subcontract management in future.

2.1 Avian Influenza Preparedness and Response Plans

- a. VNRC, the main subcontractor for this component, is intensively working on finishing the Humanitarian Pandemic Preparedness (H2P) project. Therefore we have to wait till July to start to subcontract with VNRC for year 1 activities.

2.2 Coordination and Collaboration

- a. The MOUs signed with the provinces, while an early success because it allowed us to begin work quickly, also caused confusion and incorrect expectations in the provinces on the type of support APII would provide to PCU members. This was related to:
 - provincial expectations that things under APII would continue as they had under the AI Mekong Initiative, e.g. the PCU members expected allowances to cover meals etc. while monitoring APII activities irrespective of the actual activity levels;
 - lack of clarity in formulation of the MOUs leading PCUs to expect that they would receive and manage the US\$90,000 allocation for provincial activities, (rather than APII remaining in full control of the funds);
 - insufficient consultation between APII and USAID during the MOU design process on the commitment to support the operations and equipment for a coordination office in each province - a commitment that could not subsequently be fully met as USAID agreed to operate offices in two provinces only (Can Tho, Quang Tri);
 - a general assumption that this project would work as many other donor projects do and provide various allowances to help top up the salaries of PCU members and compensate for their time/inputs;
 - a subsequent decision, after the MOUs were signed, that FAO rather than APII would support PCs in three provinces (Kien Giang, Quang Tri, Ha Nam).
- b. As a result of the confusion over MOUs, the PCU's (particularly in Hung Yen) expressed frustrations and dissatisfaction. Specifically they complained that the project has not provided support to PCU operations, that it is difficult for the PCUs to report and remain accountable to the PPCs and that APII activities are stretching their fixed government provided budgets. During the provincial visits

and PCU meetings the APII team took note and promised to follow-up on these issues, including retroactively, where relevant and justifiable.

- c. Coordination with FAO has remained a challenge due to busy schedules, the complex nature of projects, and the different ways in which the projects operate (e.g. under different cost norms rules and policies). There were consistent attempts to improve on the coordination through more frequent meetings and communications, and on the whole APII feels that the coordination with FAO has improved. In the future, a clearer delineation of areas of responsibility would be helpful, as presently there is overlap, and in some cases duplication, e.g. provincial training and TOT activities. Despite having issued joint TORs for PCs, there remains a problem that PCs prioritize activities and demands of the party providing their salary. Because MOUs made no mention of coordination between FAO and APII supported activities in the provinces, PCUs act as a parallel structure that serves APII interests only. In some cases the PCs are not members of the PCUs and do not report to the PCUs. The current mode of implementation and coordination with PCs and PCUs needs to be carefully reconsidered as APII prepares to move into year 2.

In order to overcome these challenges it is very important that close consultation and clear communication lines are maintained with key partners, including:

- FAO - especially during the process of preparing and initiating the year 2 work plan and defining a more feasible modus operandi and cooperation mechanism in the provinces.
- Provincial authorities - in deciding on the most effective and efficient provincial set-ups and the best ways to build relationships and maintain good provincial partnerships (including contractual arrangements).
- USAID - to ensure that arrangements and commitments to partners have USAID's full endorsement from the onset.

2.3 Early Warning systems for Human and Domestic Poultry Surveillance

- a. The process to set up an agreement with a local partner is a lengthy one, and while, changing from direct implementation to using local subcontracts will be in the long run more sustainable and more efficient, in the short run it has delayed activities – please see 2.8a.

2.4 Case management and infection control procedures for health facilities

- a. We have decided to switch from the Hanoi Infection Control Society to Bach Mai Hospital as the main subcontractor for this activity for capacity reasons. The process of initiating a new subcontract has therefore delayed some field activities.

2.5 Animal Response Efforts

- a. As with 2.3, please see 2.8a regarding concerns over challenges partnering with local organizations.

2.6 Biosecurity

- a. As with 2.5, please see 2.8a regarding concerns over challenges partnering with local organizations.

2.7 Behavior Change Communications

- a. The process of identifying suitable partner(s) to publish a quarterly API Newsletter started in January 2010. All required papers to sign a PSA were prepared, however we remain unclear as to whether or not we are allowed to partner/contract with a quasi-governmental organization like NCHEC. As of June, the API Newsletter is not yet published as we await subcontract approval via Abt Head Office and USAID.
- b. Partnership/contracting with provincial civil organizations/associations is highly valued by PCUs. However, the process for working with these organizations required open meetings with each province to select potential subcontractors, and subsequent approval by Abt Head Office and USAID, which is a lengthy process.

2.8 Other Cross Cutting

While APII made good progress in many areas we also faced some challenges which slowed down the pace of implementation and progress:

- a. Lengthy subcontractor identification processes: in order to help ensure local ownership and sustainability of interventions by anchoring them with a local partner, APII engages a mixture of partners as subcontractors, including national and provincial level agencies. The process of identifying the right partners and setting up the PSAs is often a lengthy and time-consuming procedure. PSAs are a new concept to APII subcontractors, but they are the required mechanism for subcontracting local partners. The process of establishing PSA with local partners this year required sustained efforts by project staff to explain PSA requirements and time for local civil society associations to familiarize themselves with the procedures of new development partners. As both we and the partners gain experience and feel more comfortable and confident with these contractual arrangements, these processes should run faster and more smoothly.
- b. Lengthy subcontractor approval processes: APII works through a broad range of subcontractors including mass organizations and quasi-government organizations. The status of many of these organizations vis-à-vis USAID subcontracting regulations remained unclear. Abt is in the process of seeking clarification with USAID, but in the meantime several potential subcontracts are on hold.
- c. Weak subcontractors: the capacity to implement and the quality of work varies across subcontractors but is generally lower than expected. This impacts the quantity and quality of the work. AFAP, which is APII's biggest single subcontractor faced personnel constraints after their team leader and country director resigned this quarter. AFAP is in the process of replacing key staff. The overall effect will be a delay in the implementation of APII activities under this subcontract, and therefore some activities will be carried over into year 2.
- d. Multiple level capacity building: the overall capacity building challenge may be greater than initially envisaged. Aside from capacity building the beneficiaries and target groups the project is also challenged by the need to build capacity among many of the subcontractors who implement activities under APII. As we

- move forward into year 2 implementation we will account for this in both timing and deliverables from sub-contractor
- e. Staff recruitment: identifying suitable candidates for the remaining vacancies (M&E Manager, Training Manager) has proven more difficult than anticipated. APII did recruit a highly qualified M&E Manager who unfortunately resigned within a week for unexpected reasons and decided to return to his old job. We are in the process of filling both these gaps.
 - f. Coordination: not only does APII work to coordinate (and integrate) its activities internally across technical components, the project also works to improve the coordination with other partners, notably FAO and WHO. This is a big challenge not least as these international partners work under different mandates, timeframes, and policies/guidelines. Frequent meetings are now being held with key partners for improved communication and coordination.
 - g. Provincial set-ups: the establishment of PCUs has proved a mixed experience. The expectations on the behalf of many PCUs members often do not match well what APII is proposing to deliver. This is partly to do with the way (other) donors and projects typically behave and what they can offer vis-à-vis what APII can offer and what motivates counterparts to engage in donor-funded activities. The value of having provincial coordinators is also questionable. Two of the PCs are paid by APII, whereas three PCs are funded by FAO, and naturally they prioritize APII and FAO activities and demands respectively. None of the five PCs see themselves as coordinators of all USAID API support to the province in the way APII would have hoped. The provincial set-ups will be reviewed and discussed with FAO and USAID and if necessary adjusted in year two.

3. Success Stories

Avian and Pandemic Influenza partners in Vietnam are using USAID program developed tools to reach more people with prevention messages.

The USAID-funded Avian and Pandemic Influenza Initiative and the World Bank-funded Vietnam Avian and Human Influenza Control and Preparedness Project (VAHIP), are two projects working in Vietnam to prevent Avian and Pandemic Influenza (API). This spring, the Avian and Pandemic Influenza Initiative increased its impact by sharing tools such as bio-security booklets for small commercial farmers with VAHIP for distribution to target audiences in their eleven supported provinces. VAHIP's dissemination of the materials increases the reach of USAID-funded materials three-fold.

The materials were developed by the previous USAID-funded AI Mekong Initiative to educate key audiences about behaviors to reduce the risk of spreading avian and other influenzas and were recently revised by the Avian and Pandemic Influenza Initiative. The package of tools included behavior change communication materials, community based surveillance tools, logbooks for animal health workers, and bio-security booklets for small commercial farmers. The bio-security education booklet, for example, outlines specific preventive behaviors that should be taken on farms to prevent the spread of influenzas and other diseases.

The VAHIP project has adopted the bio-security booklet and the veterinarian toolkit box for animal health workers in their eleven provinces. In addition, the Avian and Pandemic Influenza Initiative is currently working closely with the VAHIP project to modify the design of the logbooks for animal health workers for wider dissemination in the VAHIP provinces.

Hoai Nhon Elementary school students in Binh Dinh province read the biosecurity booklet. The booklet was shared with them as part of VAHIP's program in a series of workshops in Binh Dinh, Long An, Thua Thien Hue and Tien Giang in May 2010.

VAHIP was pleased to have access to additional tools to share with their target audiences. In a letter sent to the Avian and Pandemic Influenza Initiative on May 18, 2010, Mrs. Lai Thi Kim Lan, Deputy Director of the VAHIP project noted that: "... We had an impressive final annual ceremony (of Hoai Nhon elementary school), especially thanks to your significant and practical gift, booklets on bio-security. Through their speeches, Mr. John Weaver, representative of VAHIP project and the school principals also expressed their gratefulness to USAID and the Avian and Pandemic Influenza Initiative for sharing its materials..." This cooperation demonstrates one of many opportunities for API partners in Vietnam to increase their reach for preventing API.

The Avian and Pandemic Influenza Initiative (2009-2012), works specifically in five provinces in Vietnam to prevent and reduce the risk of avian and pandemic influenza, and

is implemented by Abt Associates Inc. It is preceded by the Capacity Building to Prevent and Control Avian Influenza in the Greater Mekong Sub-Region Initiative (AI Mekong Initiative) (2006-2009) which worked in Lao PDR and Vietnam, and was also implemented by Abt Associates Inc.

Updated Work Plan for AP11 Year 1 (Oct 2009 - Sep 2010) - as of July 30, 2010						
Code	Activity	Product	Responsible Staff(s)	Original Timeline	Revised Timeline	Remarks
Pandemic Preparedness						
Avian Influenza Preparedness and Response Plans						
PP1	Develop Pandemic Preparedness Plans		TDHH	December - September	June - Sep	All of the following activities will take place in collaboration with H2P project counterparts in Vietnam to avoid overlap and duplication
PP1.1	Review Current Pandemic Preparedness Plans and Begin Gap Analysis in Hung Yen, Kien Giang and Quang Tri	Situation Analysis Report	TDHH/ VNRC	December - March	June - Sep	
PP1.2	Plan for Simulation Exercises in Ha Nam and Quang Tri	Simulation Plans	TDHH/ VNRC	May - September	Year 2	Suggest moving to year 2 as VNRC still busy with USAID-funded H2P project
PP1.3	Provide input to revising and modifying the National Strategic Plan for Pandemic Response as appropriate and invited.		TDHH	December - September	December - September	In collaboration with H2P project. We will propose to the VNRC that we contribute through their steering committee

Coordination and Collaboration						
PP2.1	Attain Extensions in Hung Yen and Can Tho to Continue BCC campaign		TDBCC/ DDPI*	October - November	Completed	
PP2.2	Work with AED to Establish Permission to Continue AI BCC Campaigns in Quang Tri, Ha Nam and Kien Giang		TDBCC/ DDPI	October - November	Completed	
PP2.3	Attain MOUs in Provinces		DDPI*	October - December	November - December	
	+ Send letters to PPCs introducing new project and requesting meeting to discuss MOU		PMHY/HM	October		
	+ Meeting in Can Tho		PMCT/KG and TDHH	November		
	+ Meeting in Hung Yen		PMHY/HM	November		
	+ Draft MOU and continue discussions with PPC in Can Tho		PMCT/KG	November - December		
	+ Draft MOU and continue discussions with PPC in Hung Yen		PMHY/HM	November - December		
	+ Attain formal signature of MOU in Can Tho		PMCT/KG and TDHH	December		
	+ Attain formal signature of MOU in Hung Yen		PMHY/HM	November - December		
	+ Meeting in Quang Tri		TDHH	November		
	+ Meeting in Ha Nam		PMHY/HM	November		
	Meeting in Kien Giang		PMCT/KG	November		
	+ Draft MOU and continue discussions with PPC in Quang Tri		TDHH	November - December		

Updated Work Plan for APII Year 1 (Oct 2009 - Sep 2010) - as of July 30, 2010						
Code	Activity	Product	Responsible Staff(s)	Original Timeline	Revised Timeline	Remarks
	+ Draft MOU and continue discussions with PPC in Ha Nam		PMHY/HM	November-December		
	+ Draft MOU and continue discussions with PPC in Kien Giang		PMCT/KG	November - December		
	+ Attain formal signature of MOU in Quang Tri		TDHH	December - February		
	+ Attain formal signature of MOU in Ha Nam		PMHY/HM	December - February		
	+ Attain formal signature of MOU in Kien Giang		PMCT/KG	December - February		
	+ Submit provincial workplans to USAID for approval		DDPI	January	TBD	To ensure that there is no overlap or duplication of activities
PP2.4	Establish Office in Can Tho		PD/DDFA	October	November	To house Project Manager for Can Tho/Kien Giang
PP2.5	Inception Workshop in Hanoi		PD	November	November	
PP2.6	Participate in USAID API meetings		PCM	Ongoing	Ongoing	
PP2.7	Convene TAG		PCM	November - June	TBD (with key partners)	
	Convene workshop to identify key stakeholders and policy strategy		COP	January	TBD	STTA = Lara Hensley (Abt HQ)
	Share draft Terms of Reference with potential TAG members and secure their agreement to participate		PCM	November - December	TBD	
	Convene initial TAG meeting to introduce project, select priority issues for year 1, and establish committee structure		PCM	January	TBD	
	Facilitate ad hoc committee meetings		PCM	February - September	TBD	
	Training session for TAG members (topic to be determined based on TAG member interests)		PCM	March/April	TBD	
	Semi-annual TAG meeting		PCM	June	TBD	
	Develop workplans to address issues picked.		PCM	April -June	TBD	
PP2.8	Participate in Working Groups		TDAH/ TDHH/ TDBCC	Ongoing	Ongoing	
	+ Review ToRs of Biosecurity, Infection Control Working Groups with convening authorities, esp. purpose, membership, functioning.		TDAH/ TDHH	November - December		
	+ Request/support changes to strengthen as needed and accepted		TDAH/ TDHH	November - February		
	+ Meet with UNICEF, NAFEC and NCHEC to brainstorm ways to support the reconvening of the BCC Working Group		TDBCC	November - December	done	

Updated Work Plan for APII Year 1 (Oct 2009 - Sep 2010) - as of July 30, 2010						
Code	Activity	Product	Responsible Staff(s)	Original Timeline	Revised Timeline	Remarks
	+ Participate regularly in BCC Working Group, providing necessary and appropriate support.		TDBCC	Ongoing	Ongoing	Attended Nov, Jan, and Mar meetings. APII has been taking the lead to collect BCC materials and worked with PAHI to upload in the website for wider reference. However, the question of who and how to maintain this source will be discussed in the next group meeting. From now on APII will take the lead in drafting the agenda to send to PAHI for inviting people. To date, there have been only been representatives from international organizations attending - we will an item on the agenda to address increasing local participation. We will proposal that Neil Boisen (BCC consultant), be a guest.
PP2.9	Engage other API projects in Vietnam for collaboration and transition		All staff as appropriate	November - December	Ongoing	
	+ Engage with STOP AI project to transition activities		TDAH	November - December	Ongoing	
	+ Engage with AI BCC project to transition activities		TDBCC	November - December	Completed	
	+ Engage with partners on GETS to determine role and activities		TDAH	November - December	Ongoing	
	+ Meet with other API projects in country (for example VAHIP)			Ongoing	Ongoing	Plan to follow-up on model slaughterhouse and market approaches

Updated Work Plan for APII Year 1 (Oct 2009 - Sep 2010) - as of July 30, 2010						
Code	Activity	Product	Responsible Staff(s)	Original Timeline	Revised Timeline	Remarks
PP2.10	Create Quarterly API Update Newsletters for Partners	Two newsletters quarterly	TDBCC	January, April, July	PSA on hold for higher-level approval	Vietnamese version for VN partners and English version for international partners See CC2.5 for Success Story submission A series of meetings have occurred since last December with both NAFEC and NCHCE to collaborate on the Vietnamese newsletter, as well as utilize their experience and build the capacity within their networks. Agreement has been reached with NCHCE and a consultant from NAFEC, but because both are quasi-government approval is pending from USAID before implementation.
PP2.11	Participate in Professional Associations/Agency Meetings, Trainings, and Demonstration events		All staff as appropriate	ongoing	Ongoing	e.g. Hanoi and Ho Chi Minh City Infection Control Societies
PP2.12	Participate in International and Regional Conferences to Disseminate and Leverage Project Lessons Learned		All staff as appropriate	ongoing	Ongoing	Dates and participants to be identified on an ongoing basis
PP2.13	Conduct activities in non-focus provinces as appropriate		All staff as appropriate	January - August	Ongoing	In consultation with USAID. Activities could relate to supply chain, cross border, special studies, replication testing.

Total Budget:

\$601,608

Human Surveillance						
Early Warning systems for Human Surveillance						
HS1.1	Develop sustainability plan for CBS		TDHH	December - March	December - March	STTA = Jim Setzer (Abt HQ)
	+ Consultation with stakeholders to review and develop options to improve financial sustainability of CBS model(s)		TDHH	December - March	December - March	Operations research/financial sustainability framework for CBS implementation in project districts
	+ Develop methodologies for roll out of CBS model to test/assess impact of new design on financial sustainability		TDHH	December - March	December - March	
	National workshop to introduce the APII CBS approach to national and provincial audiences.		TDHH	January	January	STTA = Jim Setzer (Abt HQ)

USAID Avian and Pandemic Influenza Initiative

USAID supports hygienic models of meat markets like the one at Hoa Mác in Ha Nam to curb spread of disease

Photo by Richard Nyberg, USAID

The USAID Avian and Pandemic Influenza Initiative (October 2009 – September 2013) strengthens the capacity of the Government of Vietnam and its counterparts to identify, prevent, and control outbreaks of avian influenza and other emerging infectious and zoonotic diseases in animals and humans. Implemented by Abt Associates, the project activities began in the focus provinces of Can Tho, Ha Nam, Hung Yen, Kien Giang, and Quang Tri. The focus has expanded along poultry supply and value chains into other provinces for wider regional effects. Collaborating closely with the Food and Agriculture Organization and World Health Organization (WHO) of the United Nations and the Partnership on Avian and Human Influenza in Vietnam, the project leverages village, commune, district, and provincial experiences and outcomes to provide evidence for planners and policy makers. By sharing lessons learned and advocating for wider adoption of innovative approaches, the project supports Vietnamese authorities and partners in adopting and scaling up models in the following areas:

Animal Health Worker Capacity Building: Based on the manual for veterinarians issued by the Department of Animal Health in 2010, the project has developed a capacity building package for grassroots animal health workers, serving both public and private agents. In addition to its replication to Moc Chau farm in Son La and Ninh Binh provinces, the package has been promoted for wider adoption through the public animal health system and through private associations.

Agricultural Extension Worker Capacity Building: The training package for improved biosecurity among small commercial poultry producers was recently completed. With An Giang and Can Tho provincial agricultural and extension centers to integrate into their annual training plan in 2012, the project continues to support several provinces wanting to adopt and roll out the package through the public extension system, notably in/around the Mekong Delta.

Poultry Supply Chain Strengthening & Risk Reduction: Together with FAO, the project has identified key supply chain nodes for risk reduction and development of replicable demonstration models. Upgrades of the poultry sections in Dong Ha central market (Quang Tri) and a commune market in Ha Nam have been undertaken, and slaughterhouse upgrades were implemented through public-private-partnerships in Quang Tri and Can Tho. Veterinary inspectors and private stakeholders (traders, slaughterers, and vendors) were trained and targeted for improved behaviors on bio-security and food safety. The demonstration models are now being used to educate other partners in Vietnam on making similar upgrades in other locations.

Community-Based Surveillance (CBS): The CBS-model has already been instrumental in the early detection and control of HPAI outbreaks in Quang Tri province, and will be promoted for wider adoption through provincial, regional and national events. The model covers both human and animal health sectors.

Infection Control/Case Management (IC/CM): A refined training package and strengthening approach for district level implementation of Circular 18 has been introduced into eight district hospitals and in June 2012 the Ministry of Health adopted the training materials. The project is supporting the Ministry of Health to roll out training nationwide.

Pandemic Preparedness Plans (PPP): In partnership with Vietnam Red Cross, the project supported Kien Giang to develop their PPP and is promoting this PPP model for wider adoption elsewhere. The PPP work is coordinated with WHO and other international partners.

Behavior Change Communication (BCC): BCC is integrated into all the above-mentioned innovations. The project implemented a transition strategy enabling selected provinces to plan and carry out their own future BCC campaigns and BCC interventions. The project is working with Vietnam Farmer's Union to integrate a BCC training model into their vocational training and to replicate to other Northern Central provinces including Ha Tinh, Hue, and Quang Binh.

TERMINAL PROJECT REPORT

Project Code & Title: 00064004 - Support to Knowledge Management and Policy Dialogue through the Partnership on Avian and Pandemic Influenza (KMP-API)

1. General Information

1.1. General information on the project

- Title and code of the project (in Vietnamese): Hỗ trợ Quản trị Tri thức và Đối thoại Chính sách thông qua Đối tác Phòng chống Cúm Gia cầm và Cúm ở Người (KMP-API) / Award ID: 00064004 / Project ID: 80865
- Title and code of the project (in English): Support to Knowledge Management and Policy Dialogue through the Partnership on Avian and Pandemic Influenza (KMP-API)/ Award ID: 00064004 / Project ID: 80865
- Programme/ project location(s): Ha Noi, Ho Chi Minh, Can Tho, Hue, Lang Son.
- Donor(s): United Nation Development Program (UNDP) through the funding source of USAID
- National Implementing Partner: International coordination Department, Ministry of Agriculture and Rural Development
- Project Owner: Ministry of Agriculture and Rural Development
- Duration: May 2012- September 2013
- Investment Decision: No.1137/QĐ-BNN-HTQT, dated 18th May 2012
- Funding sources: 314,285 USD, including:
 - + Total grant ODA: 300,000 USD
 - + Counterpart funding: 300,000,000 VND (= USD 14,285)

1.2. Project description

- Avian influenza viruses of the H5N1 subtype emerged as a serious cause of disease in poultry and humans in Viet Nam in late 2003. Following on from the previous National Integrated Operational Program for Avian and Human Influenza (OPI), 2006-2010, the Government of Viet Nam, represented by the Ministry of Agriculture and Rural Development (MARD) and the Ministry of Health (MOH), has worked closely with international partners to develop the new Integrated National Operational Program on Avian Influenza, Pandemic Preparedness and Emerging Infectious Diseases (AIPED), 2011-2015. The AIPED 2011-15, approved by the National

Steering Committee for Avian Influenza Control and Prevention under the Decision No. 2735/QĐ-BNN-HTQT dated on 08/11/2011. AIPED was built on the OPI and expanding the focus of capacity-building to apply a One Health approach to avian influenza and other emerging diseases in animals and human

- The period of the project was expected to be a significant transition period for the avian and pandemic influenza (API) work in Viet Nam. Moving from the OPI 2006-2010 to AIPED 2011-2015 represents a key step in the consolidation and institutionalization of API activities, applying lessons and models from the previous period to the continuing challenge of HPAI in the country. Low risk perception, limited incentives for reporting disease outbreaks and competing demands coupled with the transition away from mass subsidized poultry vaccination represent the most significant change in the national context and control strategy since 2005, and require an important set of accompanying actions to manage disease risks and collect and analyze data to assess the ongoing impact of this transition.
- Results are becoming available through 2011 and early 2012 from a range of USAID and other applied research activities and piloting of models across a range of areas within the national API response. There has been a significant investment in these activities, responding to requests from national decision-makers and senior technical experts for a strengthened evidence-base and elaboration of options for national activities. A key focus for the project period was to support and ensure that these lessons are captured and shared in practical, accessible and appropriate ways with decision-makers, experts and other key stakeholders.
- The AIPED 2011-2015 calls for a range of related review activities for API coordination mechanisms of the overall national response, drawing on the lessons from the response to-date to HPAI as well as SARS and pandemic (H1N1) 2009 and considering how these (emergency) mechanisms could be strengthened and potentially restructured for a sustainable approach to national coordination of API and similar diseases.
- The period covered by the project also marks a key point in the ongoing practical transition for both national authorities and international donors from emergency resources to recurrent financing and longer-term capacity building activities on API. At the national level, the Partnership is expected to play a key role in considering the implications of this transition, with a focus on identifying national capacity to sustain and mainstream essential activities and on prioritizing activities and mobilizing local resources – both government and private sector – in the context of diminishing international resources. This transition will require mainstreaming of API activities where

possible into existing institutions and activities, while also advocating where appropriate for the development of new ongoing national activities and areas for new or enhanced international assistance, for example applying lessons to date to API and other emerging zoonotic infectious disease risks in livestock and wildlife diseases.

- According to the initial proposal developed by UNDP together with the national counterpart, this project was expected to commence in October 2011, following on from the Government of Viet Nam/United Nations Joint Programme on Avian Influenza. The Grant Aid agreement between USAID and UNDP for the KMP-PAHI project was signed on December 30, 2011.
- Following the signing of the Grant Aid agreement, UNDP took steps to carry out inception of the project according to the requirements of UNDP and the Government of Viet Nam, as outlined in the Vietnam-United Nations Harmonized Project and Programme Management Guidelines (HPPMG) and in line with the One Plan between the Government of Vietnam and the United Nations for the period 2012-2016. The Government of Viet Nam officially approved the project on May 19, 2012.

1.3 Project objectives and scope

Expected One Plan III Outcome:

Outcome 2.2: By 2016, increased quality and effective management of a comprehensive national health system, including health promotion and health protection, with a focus on ensuring more equitable access for the most vulnerable and disadvantaged groups

Expected One Plan III Output:

Output 2.2.1: Policy advice and technical support provided to strengthen the building blocks of human and animal health systems, including information systems and the generation of evidence, at national and sub-national levels

Based on Expected One Plan III Outcome and output, this project will provide support for launching the AIPED, 2011-2015 and will play a lead role in Avian and Pandemic Influenza (API) knowledge management and policy dialogue between national and international partners and their activities within the framework of AIPED, through the Partnership on Avian and Human Influenza (PAHI). The Project will be comprised of three interrelated objectives:

1. Launching and inception of the AIPED 2011-2015
2. Enhancing API knowledge management and policy dialogue
3. Support to the personnel and operations for KMP-API

1.4. Management arrangements

Project implementation modality: The project was implemented using the Nationally Implementation Modality (NIM) in accordance to the rules and guidelines laid out in the Harmonized Programme and Project Management Guidelines (HPPMG) and Programme and Operations Policy and Procedures (POPP) of UNDP Country Office in Vietnam.

The Ministry of Agriculture and Rural Development (MARD) is responsible for realizing the project outcomes and objectives within the project budget and time scale. The management structure is as follows:

Implementing Partner

As the National Implementing Partner (IP) for the project, MARD is accountable to the Government and UNDP for ensuring (a) the substantive quality of the project, (b) the effective use of both national and UNDP resources allocated to it, (c) the availability and timeliness of national contributions to support project implementation and (d) the proper coordination among all project stakeholders, particularly national parties.

As the day-to-day implementer of project activities, International Cooperation Department (ICD) of MARD is responsible for mobilizing all national and international inputs to support project implementation, organizing project activities in accordance with the agreed work plan, and reporting to MARD and UNDP on the progress as well as financial status of the project.

National Project Director

The National Project Director (NPD) is appointed by the Ministry of Agriculture and Rural Development (MARD) for project implementation and management. NPD is responsible for overall operations and accountable to MARD. NPD is a MARD ICD leader. NPD is responsible for overall implementation to achieve project objectives and is accountable to MARD and UNDP for effective utilisation of project resources. On behalf of MARD, NPD responsible for leading and supervising the project manager.

Project Management Unit (PMU)

The PMU will be responsible for the overall coordination, management, implementation, monitoring & evaluation and reporting of all project activities. The PMU will consist of the following positions:

- National Project Director (NPD, MARD appointed senior official, at directorial level, part-time, 30% of working time)
- Project Deputy-Director (senior International Cooperation Official assigned by MOH on a part-time basis)
- Project Manager (recruited, full-time)
- Knowledge Management Officer (recruited, full-time)
- Secretary (recruited, full-time)
- Project Accountant (recruited, full time)

Project Quality Assurance Role

UNDP Project Officer worked closely with PMU to develop quality criteria for project products/outputs. The PO is in charge of monitoring and evaluating products against the agreed quality criteria. Peer review panel is engaged to assess quality of products/results as required during the project implementation.

2. Results Achieved

2.1. Support to adoption and overall coordination of AIPED 2011-2015:

Official approval of AIPED by the Government of Viet Nam

To follow on from the successful OPI, the Government of Viet Nam, represented by the Ministry of Agriculture and Rural Development (MARD) and the Ministry of Health (MOH), has worked closely with international partners to develop the AIPED 2011-2015. Through the support of PAHI Secretariat, AIPED 2011-2015 document has been approved by NSCAI under the Decree No. 2375/QĐ-BNN-HQTT dated November 08th, 2011 and widely disseminated to key international and national partners and the provincial People's Committee in 63 provinces

The AIPED is considered as the overall framework for national and international activities with the main purpose to sustain the national response to Highly Pathogenic Avian Influenza (HPAI) and to continue to strengthen pandemic preparedness, while beginning to expand the focus of activities to include other infectious disease threats arising at the human-animal-ecosystems interface, applying a One Health approach.

In line with AIPED, KMP-API project has facilitated the consultation on the review of the Partnership and support the approval process for the extension of PAHI and PAHI Secretariat officially extended till 2015.

Strategic framework for public awareness raising and behavior change communications for AIPED 2011-2015.

The AHI Behavior Change Working Group established for the OPI was reviewed the function and mandates and renamed into the One Health (OH) Communication Network (OHCN) to cover the scope mentioned in the AIPED with the chairing role handed over to Government's agency.

With the facilitation of the KMP-API Project, linkages between this group and key national authorities in MARD and MOH have been significantly improved. The chairing role handed over to Government of Viet Nam is considered as a big progress to gradually support the exit strategy. National Agriculture Extension Center chairs every meeting of OHCN with the strong involvement of Communication Subcommittee of NSCHP (MOH). During the period of the project, 04 OHCN meetings were conducted on quarterly basis.

The project cooperated with OHCN to develop a National Strategic Framework for One Health Communications for AIPED 2011-2015, taking into account the lessons from the previous period, low risk perception issues, limited incentives, funding gaps, the evolving context in terms of the disease situation and national response, and the expanded scope and objectives of AIPED 2011-2015 compared to the OPI to convey appropriate and effective messages and communication plans.

National AIPED M&E framework 2012-15 developed, approved & disseminated

The Project collaborated with MEASURE International (funded by USAID) to update and elaborate the national API monitoring framework, including clear definitions for each indicator and proposing national responsible agencies. One consultancy workshop on M&E framework was conducted. The National AIPED M&E framework 2012-15 has been approved by NSCAI under the Decision No. 602/QD-BNN-HTQT dated 25 March 2012 and widely disseminated to national and international partners.

2.2. Application of a One Health approach to emerging infections diseases in Viet Nam

The application of a One Health approach to the national API response was strongly and successfully promoted during the project period, recognizing that the

health of humans, the health of animals (including livestock and wildlife), and the environmental health of ecosystems are inextricably linked. The most achievement is the recognition by the relevant National Steering Committees of the value of applying a One Health approach, including enhanced animal health-human health coordination and alignment and recognition of the role of wildlife and the need for better institutional mechanisms. Key results in this area have been achieved as follows:

- PMAC follow up event on applied the results of the international conference A World United Against Infectious Diseases: Cross-Sectoral Solutions to be conducted in Bangkok, Thailand
- National Conference on applying a One Health approach to infectious disease risks at the human-animal-ecosystem interface held April 3-4, 2013
- Report on One Health stakeholder mapping in Vietnam prepared and presented at the National OH Conference.
- Conference Report developed including the elaboration of Draft National One Health Roadmap for applying a One Health in AIPED 2011-2015 implementation
- 03 briefings to international partners on the H7N9 situation and resource mobilization disseminated

2.3. Enhanced API knowledge management and policy dialogue

During the OPI period, international partners have a range of lessons and results from studies, applied research, pilots and models and other project activities. A range of key outputs including lessons and models are currently becoming available. Some projects are approaching (or potentially approaching) an end and it is an appropriate time to pay close attention to ways in which lessons, findings, results and recommendations need to be captured and shared in practical, accessible and appropriate ways with decision-makers, experts and other key stakeholders in order to ensure both sustainability of key activities and application of results in national institutional structures, systems, policies and plans.

The project closely coordinated with a policy coordination group comprising representatives of USAID and USAID partners as well as other key stakeholders. This group convened at the working level to bring together to share their policy & advocacy plans and activities, and to identify opportunities for exchange and coordination, support the identification of policy topics, experiences, lessons and policy recommendations as well as target audiences, documentation formats and policy advocacy channels and events to enhance API knowledge management and policy dialogue. At least 10 working meetings have been conducted throughout project period.

Information sharing, exchange and policy dialogue between national and international members of the Partnership were supported through meetings, briefings on the meetings of the National Steering Committees for Avian Influenza Prevention and Control and Human Pandemics, the PAHI Website and the PAHI Newsletter. PAHI continues an effective bridge between national and international API partners.

With the support of US Intern on Knowledge Management assigned for a period of 9 weeks plus home-country follow up, the project reviewed the existing API knowledge management and information sharing, collecting key materials from PAHI members to be synthesized and presented on e-library.

The project continued to use the website of the Partnership as a key repository of knowledge and analysis on HPAI, pandemic preparedness and zoonotic infectious disease threats related to the AIPED. Under this activity, the content management and presentation capabilities of the website were upgraded, drawing on effective examples from other networks in different fields in Viet Nam and from other countries. In addition to tapping into existing public and private systems for information dissemination, a supporting newsletter, google calendar and email network was maintained to alert members and stakeholders to new and existing resources and information. 04 edition of Partnership newsletters were developed printed and disseminated to partners on a quarterly basis.

2.4. API Policy Advocacy

In order to enhance knowledge management and policy dialogue, integrate lesson learnt from the previous period, Project worked closely with policy coordination group including representatives of USAID and USAID's partners as well as other key stakeholders to identify key issues for policy advocacy related to the consolidation and institutionalization of investment activities for API and replication of successful models to ensure sustainability of API prevention activities in Vietnam. 06 policy advocacy forums conducted (H5N1 control and

prevention plan 2013-2017(21 Feb 2013), PMAC follow-up event (21 Mar 2013), OH conference (3-4 Apr 2013), H7N9 conference (6 May 2013), Economic study consultation workshop (31 May 2013) and Enhanced coordination and stakeholder mapping workshop (15 July 2013))

Key products of the Project are as follows:

- Consultation input for the National Operation Plan on AI Control and Prevention for the Agriculture Sector, 2013-2017: the Project provides the consultation to support the national review of the HPAI prevention and control strategy in the agriculture sector to be conducted by the Department of Animal Health of the Ministry of Agriculture, and to support the development of the proposal for the strategy for HPAI prevention and control in the coming period 2013-2017.
- OH Conference Report: National Conference on applying a One Health approach to infectious disease risks at the human-animal-ecosystem interface in Viet Nam was conducted in Hanoi on April 3-4, 2013 by the Ministry of Agriculture and Rural Development (MARD) together with the Ministry of Health (MOH) and international partners. The overall purpose of the Conference is to provide an opportunity for the Government of Viet Nam and its partners to highlight national One Health initiatives and take stock of progress and achievements over the previous period as well as ongoing constraints and areas requiring further efforts. Followed up from the OH Conference, OH report together with National One Health Roadmap was prepared.
- Review of national API coordination mechanisms and recommendations for enhancing national coordination of Emerging Infectious Diseases. This review is one key activity of KMP-API Project. The primary focus of the report is on the national steering committees and the related PAHI partnership. Other related coordination mechanisms at the central and provincial levels are also considered, drawing on field trips to three locations in different regions of the country. Based on the review, the report on Enhancing Coordination on Emerging Infectious Diseases in Viet Nam was prepared, including a number of key recommendations and options for the

national coordination mechanism. In parallel, the proposal for future activities of the Partnership and enhancing One Health implementation in Viet Nam was reflected.

- Study on the economic impacts of emerging infectious diseases (EIDs) in livestock in Viet Nam: The report is intended to provide a basis for briefings to national leaders, decision-makers and senior technical and economic experts within relevant sections of the Government of Viet Nam, as well as international donors and technical agencies, contributing to effective prioritization, policy directions and resource allocations related to animal disease prevention, surveillance and response and other related areas.
- Report on mainstreaming and linkages of API activities to One Health and related sectors, activities and networks: This study has mapped out a number of groups of possible and potential stakeholders who have been working and/or willing to work in the concerned areas related to One Health perspectives.
- OH Stakeholder mapping in Vietnam: this report outlines a preliminary mapping of One Health issues, stakeholders and projects in Viet Nam, as presented at the National OH Conference in Hanoi on April 3-4, 2013 by the Ministry of Agriculture and Rural Development (MARD) together with the Ministry of Health (MOH) and international partners for clarifying roles and responsibilities for OH issues, building understanding of OH approach, identifying the key OH partners, the key outcomes and gaps.

3. Financial performance for KMP-API (Year 2012 & 2013)

Allocated resources	Approved Budget (as in the revised AWP)	Actual Expenditure	Delivery rate (%)
Contribution of UN agency (USD):			
Activity 1: Successful launching and rolling out of the AIPED 2011-2012	56,657	63,094	111
Activity 2: Enhanced API knowledge management and policy dialogue and an enabling	141,754	137,687	97

environment for API policy advocacy and strategic discussions			
Activity 3: Supported personnel and operations costs for coordination of national and international partners and activities under AIPED 2011-2015	81,963	79,143	97
GMS 7%	19,626	19,626	
Total 1	300,000	299,550	99.85
Government contribution:	14,285	14,285	100
Total 2	14,285	14,285	100
Subtotal (1+2)	314,285	313,835	99.85

4. Key coordination factors/challenges that affected the implementation of the project

- As in many countries, working between different sectors can be challenging and officials feel that it requires the involvement of senior leaders (PM, Ministers), who are very busy on many issues.
- Formal cross-sectoral collaboration outside of emergency periods remains difficult and lead/collaborating agency roles are not always clear. E.g. despite strong collaboration on AI, the new EID committee in MOH does not include animal health representation.
- While many senior MARD and MOH personnel have now been introduced to One Health concepts, and are open to applying a One Health approach in line with international directions, strong champions within ministries have not yet emerged.
- Taking concrete steps to incorporate issues such as wildlife health is still proving difficult despite initial engagement from MARD leaders

- Involvement of related actors outside human and animal health is still very limited e.g. environmental health, non-health preparedness for public health emergencies, national disaster mechanisms.
- Investments focus mainly on response rather than prevention.
- National resource allocations, particularly for surveillance and prevention, are very limited and usually only provided after a problem emerges.
- International resources are decreasing as attention shifts to other issues.
- Linkages between academia and policy makers remain relatively weak. Peer reviewed publications at an international standard are still very rare, meaning the national evidence base for policy makers is very limited.

5. Lessons Learned

5.1. Lessons Learned under scope of the project

- The approval process in line with the requirements of UNDP and the Government of Viet Nam, as outlined in the Vietnam-United Nations Harmonized Project and Programme Management Guidelines (HPPMG) and in line with the One Plan between the Government of Vietnam and the United Nations for the period 2012-2016 requires a lot of time and effort for advance planning and follow up.
- The project applies a new approach for the United Nations in Viet Nam together with the Government of Viet Nam, which led to some delays in official approval of the project. The KMP-PAHI project was the first new project of UNDP to be approved by the Government of Viet Nam under the new procedures. This new approach may need more support from UNDP and governmental administrative agencies for their guidance to project preparation and implementation.
- The areas of work covered by the Partnership related to different sectors, particularly agriculture and health. The overall supervision of the PAHI Secretariat is provided jointly by the International Cooperation Departments of MARD and MOH.
- Some difficulties and delays have been experienced collecting information and requirement from some of API and EID partners under the Partnership. This challenge indicated the need for greater effort to follow up with these agencies.

- PAHI Secretariat needs to maintain a flexible approach to planning and budgeting to respond to member requests and emerging issues in the context of a Partnership approach.
- Most of project activities should have the participation of API and EID partners therefore the implementation of planned activities depends on the availability of personnel in charge from agencies and related partners. Fixing the time for their participations and commitment is also a challenge.
- The consultancy process may take time for the common consensus, for example a lot of initiatives of project for policy advocacy cannot implemented as the consultancy process among policy advocacy coordination group (PACG) is difficult to reach the consensus as well as full attention.
- The length of project is 16 full months however the mobilization of a number of national and international consultants put a huge workload to project against time constraint. The support from API network to indentify the potential candidates is very helpful.
- The Partnership continues to be identified by members and others as a model for other sectors and areas. The extension of the Partnership in line with period of AIPED is important to support the implementation of AIPED. However, in the context of these different aspects of transition in the national response, there is also a need to review the scope, mandate, membership, name, future activities, levels of integration into national government structures and funding modalities and sources of the Partnership through the remainder of the AIPED implementation period.

Lessons Learned under coordination context in general but closely linked with the project

- Revision of the national coordination mechanism, to establish a unified permanent overall mechanism for prevention and control of zoonotic diseases; High-level chairing (PM/Deputy PM if possible); Clear assignment of roles and responsibilities;
- Strengthened involvement of sectors responsible for non-health preparedness, wildlife health, environmental health & civil society;
- Clear milestones and timeframes for One Health progress (“Roadmap”);
- New mandate for revised Partnership to address One Health coordination;

- Adequate resources, including through recurrent financing, targeted investments, private sector and ODA where necessary;
- Strengthened relationships between policy makers and technical experts, including national and international universities/institutes;
- Stronger focus on prevention, including biosecurity (in both livestock and wildlife value chains) and disease drivers/eco-health;
- Continued attention to avian influenza control and prevention;
- Incorporating specific zoonotic disease prevention and control programs into overall One Health coordination/efforts;
- Continuing and building on effective international cooperation established over the past decade, including IHR and WAHIS reporting and related capacity development activities on surveillance, etc.
- Continuing communication efforts, broadened to One Health, including risk communications capacity building and preparedness and targeted BCC.

OBJECT PROGRESS REPORT

Quarter 1/2013

Project Code & Title: 00064904 - Support to Knowledge Management and Policy Dialogue through the Partnership on Avian and Pandemic Influenza (KMP-API)
 Implementing Partner: Ministry of Agriculture and Rural Development (MARD)

PROJECT INDICATORS AND QUARTERLY TARGETS	ACT OR GROUP OF ACTIVITIES	PLANNED ACTIVITIES AND ACTUAL ACHIEVEMENT	DEGREE OF ACHIEVEMENT (DISBURSEMENT VS PLANNED BUDGET)					Funding issues, reasons for adjustment, emerging issues and recommendations (Note)			
			Fully Completed	In Progress	Not Started	Amount Disbursed (USD)	Planned Amount (USD)		Expenditure rate (%)		
1	2	3	4	5	6	7	8	9	10	11	
Indicator 1: Mechanism for implementation of APIP National Operations Programme on Avian Influenza Pandemic Preparedness and other Emerging Infectious Diseases, APIP 2011-2015 developed.	1	Result 1: Successful launching and rolling out of the APIP 2011-2015	X								
Indicator 2: National Communication Strategy and M&E Framework were developed in the pilot country.	1.1	Disseminate APIP plan to national partners at the central level, to provincial steering committees, and to international partners and other stakeholders and support the roll-out of the national programme				APPR				Completed	
Indicator 3: National Communication Strategy and M&E Framework were developed in the pilot country.	1.2	Collect information on donor and national funding in a matrix for APIP, and provide advice as required on national funding needs and potential funding resources		X		APPR				Partly Completed	
Indicator 4: National Communication Strategy and M&E Framework were developed in the pilot country.	1.3	Review Communication Strategy Framework for pilot, and develop the Strategic Framework for public awareness raising and ECC for APIP 2011-2015					2,000	2,000	100%		
Indicator 5: National Communication Strategy and M&E Framework were developed in the pilot country.	1.3.1	Support the organization of the following OHCN Meeting: online sharing			X					Completed	Increased. Planned Ex. Q2 with consultations of donors
Indicator 6: National Communication Strategy and M&E Framework were developed in the pilot country.	1.3.2	Coordinate with national partners to develop a national plan for consultation of the two Health Strategic Communications Framework for Avian Influenza Pandemic Preparedness and Emergency Response	X			APPR				Completed	Normally, this is regular meeting to be conducted based on the request of the OHCN members and PAH Secretariat support the facilitation of the kind of year. At the present time, it is an exceptional from the OHCN for this activity.
Indicator 7: National Communication Strategy and M&E Framework were developed in the pilot country.	1.3.3	Develop a working meeting to present and coordinate the key elements of the updated Strategic Framework (Detection, Response, Control, etc.)	X			APPR				Completed	The first draft Strategic Framework for OHCN Communications together with its strategy was shared with the OHCN members.

2	Result 2: Analysis 2: Pathways of APH knowledge management and policy dialogue and an enabling environment for APH policy advocacy and strategic interventions								
2.1	Enhance self-knowledge management and information sharing				2,006	2,335	11,040		In progress
2.1.1	Enhance knowledge management and information sharing by conducting a self-knowledge survey (FAM members in support of FAM website update) the specific to scope of FAM website. Conduct key fact-finding mission to support the process of website update		X						APR has website update and information sharing by APR and EHO partners to be implemented regularly in routine work of FAMH Secretariat
2.1.2	Strengthening of International Policies Coordination Committee	X		10,630				Completed	All four 6th meetings of FAMH have been completed in the quarter of each financial year. Also, 17th discussion under preparation for 18th conference, to be conducted on 23 April. FAMH Secretariat build on completed meeting with FAMH members to identify other possible topics for International Information Council. 1. Meeting with FAMH to discuss and compare on the IPRM change 2015-2017 on 21 Feb 2015 in Geneva
2.1.3	Organization of the meeting of Policy discussion coordination group involving FAMH members to review their policy & strategy plans and strategy, and to identify opportunities for exchange and collaboration in the area	X		10,881	2,200	2,332	116,49		2. Meeting with FAMH Secretariat on 21 Feb 2015 in Geneva
2.2	Commission a specific study on priority coordination aspects including on aspects not being directly covered by other partners in their policy action plans, including policy				400	630	136,56		Completed. Love for the best and best development activities
2.2.1	Identification of international consultant (Nacarp) to conduct a study on the coordination, make a presentation on FAMH website and update FAMH website on the approval for the recruitment make a presentation on FAMH website and update FAMH website	X		10,954	2,300	215	136,56		Completed. Love for the best and best development activities
2.2.2	Identification of international consultant (Nacarp) to conduct a study on the coordination, make a presentation on FAMH website and update FAMH website on the approval for the recruitment make a presentation on FAMH website and update FAMH website	X		10,954	2,300	215	136,56		Completed. Love for the best and best development activities
2.2.3	Conduct a study on the coordination and international agencies and preparation of an impact study report on identifying the economic impact of cooperation and best practices (IBDs) in animal at Viet Nam		X						The expert with national and international consultants. In July 2015, from 20th April 2015, UNDP has agreed with the delay of the starting date of the research as the consultant has been late in conducting
2.3	Organize national policy discussion forums for CAH and other FAMH members to discuss on specific policy areas and identify recommendations based on the work results and discussion from FAMH members				4,503	280	6,18	Completed	The title of forum is "FAMH Policy Update Forum in Viet Nam" to be conducted on March 31, 2015 at the Hanoi Hotel, 226 Tr. Quang Trung Street. The forum focused on the feedback and discussion on activities and research needed to apply the best international practices. Guest: Special Representative of Viet Nam
2.3.1	Organize a series of national policy dialogue and forum for CAH and other FAMH members. Specific policy areas of the forum based on the issues identified by Policy Advocacy Coordination Group (PACG)	X		10,881	4,117				The work plan to be made in a early period of quarter 1 in the continuation in the follow up of the activities and implementation to support the progress

Indicator 2: number of APH policy fields developed and dialogues held

Baseline: APHSP has just started and will be rolled out in 2012. There is a need to formalize plans and mechanisms

Project specific target:

- Institution to share project outputs of FAMH Partnership
- Partnership agreements developed on FAMH website and resources updated
- 8-7 policy reports developed
- 4-5 policy dialogues held
- 01 specific study on priority coordination aspects developed

MFA:

- publications of policy fields
- Media coverage

** Note: Funding requests will be reviewed by all policy partners, and will be incorporated in all studies, reviews and coordination mechanisms under the MOU by 2

2.3.2	Transition of the national operational plan to AI support and program based on the decision from the workshop review of AI content and program	X		56849	4/16	280	62.7%	Completed	
2.3.3	Preparation of the report/overview of the first national policy discussion forum	X						In progress	The report for "PMAC" End-of-Evnt on Visa Entry is in progress for negotiation
2.4	Make the design, update, printing and distribution of PAH Newsletter			36884	2/20	-		Completed	
2.4.1	Content collection and preparation of the final logo design	X		36884				Completed	
2.4.2	Complete graphic and layout for the final logo news sheet	X		36884				Completed	
2.4.3	Approval for printing of the final logo newsletter	X		36849				In progress	
2.4.4	Printing and distribution of the final logo news sheet	X		36884	3/20			In progress	
2.4.5	Maintenance and maintenance of PAH website Q1 13	X		36884	5/0			Completed. The website is functional and administered regularly for the internet to be made in the following quarter	
2.5	Carry out specific reviews and studies to enhance coordination, policy and strategic decision-making related to APPED 2013-2015				230	315	136.9%		
2.5.1	Develop the draft report together with the coordination based on the review of coordination mechanisms	X		36884	-			In progress	The draft of final operational consultation has come up with a set of preliminary facts and recommendations. The final report is expected to be submitted in the end of Q3.
2.5.2	Multicultural of the national workshop to conduct the mapping across the team meeting and linkages with related sector, activities and networks, and review of the Partnership support APPED 2013-2015	X			230	315	136.9%	Completed. Terms of the first and subsequent activities	
2.5.2.1	Develop TOR for the support of the network, make adjustment on TOR, web page and news paper, etc.								
	Total for output 2			10490		3,500	32.80		
3	Result 3: Activity 3: Supported personnel and operations cost for coordination of national and international partners and activities under APPED 2013-2015								
3.1	Secretariat Personnel cost.								
3.1.1	Payment to Project Staff			69849	12/01	8,422		In progress	The actual salary payment to be made in the early period of quarter 2 as the circumstances of change of this activity was finalized fully in support the logistic preparation for CHJ conference to be conducted in 2013. Payment R 12,000 is support this work was in progress
3.1.2	PAH Secretariat's Office operations			50849	2/20	1,123	40.8%	Not yet completed	The final payment to be made in the early period of quarter 2 as the accounting to be change with this activity was finalized fully in support the logistic preparation for CHJ conference to be conducted in 2013.
	Total for output 3			15411		9,545	62.07		
	TOTAL			40279		16,175	40.65		

(*) Please specify Other sources of funding if any, e.g. OPF, ADB, WB, a bilateral donor, etc... Please keep each source on one line.

QUARTERLY PROJECT PROGRESS REPORT

Quarter II/2013

Project Code & Title: 00864004 - Support to Knowledge Management and Policy Dialogue through the Partnership on Avian and Pandemic Influenza (KMP-API)

Implementing Partner: Ministry of Agriculture and Rural Development (MARD)

PROJECT OUTPUTS, INDICATORS AND QUARTERLY TARGETS	ACT. OR GROUP OF ACTIVITIES	PLANNED ACTIVITIES AND ACTUAL ACHIEVEMENT	DEGREE OF ACHIEVEMENT			DISBURSEMENT VS PLANNED BUDGET				Pending issues, reasons for adjustment, emerging issues and recommendations /Note
			Fully Completed	In Progress	Not started	Source of funding (*)	Planned Amount (**) (USD)	Expenditure (USD)	Disburse. rate (%)	
1	2	3	4	5	6	7	8	9	10	11
	1	Result 1: Activity 1: Successful launching and rolling out of the AIPED 2011-2015								
	1.1	Disseminate AIPED plan to national partners at the central level, to provincial steering committees, and to international partners and other stakeholders and support the roll-out of the national programme	X			30000	-			Completed
	1.2	Collect information on donor and national funding in a matrix for AIPED, and provide advice as required on potential funding needs and potential funding resources	X			70000	-			Completed
	1.3	Review Communication Strategic framework 2008-2010 and develop the Strategy framework for public awareness raising and BCC for AIPED 2012-2015					23,386	20,024	85.62	
	1.3.1	Support the organization of the follow-up OHCWG Meeting: minute sharing			X	30000	2,226			Not started Normally, this is regular meeting to be conducted based on the request of the OHCN members and PAH Secretariat supports the facilitation of this kind of event. At this quarter, there was no requirement from the OHCN for this activity. It is suggested from the Project that in case there is the request from OHCN partners to conduct the meeting, we will use the meeting room of MARD to save the cost. The cost for this activity will be shifted to other activities that are required over the budget (for example cost of international consultants (2.1.2, 2.2 on ITN9 conference...))

1.3.2	<p>✓</p> <p>Second draft for the One Health (OH) Strategic Communications Framework for Avian Influenza, Pandemic Preparedness and Emerging Infection Diseases, 2012-2015, submitted by international consultant. Based on the review of the second draft by PAHI Secretariat, the payment to international consultant is to be made.</p>	X			19,360	10,569	108,700	Completed	<p>✓</p> <p>Phase completed. As planned, the second draft of the report need to be shared with the members of OHCN and NSCAF for final round of comments and feedback. To do this, the draft report was translated into Vietnamese to members and review. Due to the late response from the members of NSCAF, the second draft has not been revised. Therefore, the activities of editing is still pending until the second draft is synthesized from the feedback of NSCAF. Additionally, the feedback from NSCAF, in general, see no additional comment from NSCAF except for the Ministry of Trade and Industry. ICD has considered how to integrate the comments.</p>
1.4	<p>Support the development and approval of the National M&E Framework for AHPED 2011-2015.</p>				3,280	3,109	94,851		
1.4.1	<p>The National M&E framework to be approved by NSCAF, funded and disseminated to Vietnam GPO's agencies and PAHI's partners.</p>	X			3,280	3,109	94,851	Months completed. The document has been completed in printing and will be ready for dissemination.	
1.5	<p>Support the application of a One Health Approach to the implementation of AHPED 2011-2015.</p>				24,959	25,018	109,24		
1.5.1	<p>Conduct an OH conference to promote the application of a OH approach. In addition, based on the ongoing national One Health processes and activities in Viet Nam, to identify a key set of tasks, steps, and a guideline to support the Government of Viet Nam in establishing a One Health road map and action plan (3-4 April).</p>	X			24,959	25,018	109,24	Completed	
1.6	<p>Reporting and documenting (including translation, editing)</p>	X			700	608	86,86	Completed	
1.7	<p>Domestic travel for project staff</p>		X		680	-	-		Not conducted as there is no requirement from API and FHO partners for PAHI's staff to travel.
1.8	<p>Develop and regularly update the timeline calendar to update PAHI members and other related partners on the key events related/on API in Vietnam and in the world.</p>	X			-	-	-		
	<p>Total for output 1</p>				53,495	48,758	91,97		

Indicator 2: number of API policy briefs developed and dialogues held	2	2.1	2.1.1	2.1.2	2.1.3	2.2	2.2.1	2.2.2	2.2.3	2.2.4
Baseline: APEP has just started and will be rolled out in 2012. There is a need to formulate plans and mechanisms										
Project specific Target: - mechanism to share project outputs at PAHI										
Partnership members developed on PAHI website and resources updated.										
- 6-7 policy reports developed										
- 4-5 policy dialogues held										
- 01 specific study on policy/coordination aspects developed										
MFTV: - publications of policy briefs developed by MARD										
- Media coverage										
** Note: Gender equality will be an element in all policy dialogues with partners, and will be incorporated in all studies/reports and coordination mechanisms under this Activity 2										
Enhanced knowledge management and information sharing										
Enhanced knowledge management and information sharing by commission to collect key materials from PAHI members to upload on PAHI website, upgrade the capacity storage of PAHI website. Collecting key facts/information to support the policy advocacy process.										
Payment to the international policy advocacy based on acceptance of the documentation of proceedings/outputs of the first 2 events organized by PAHI Secretariat (1 & 2)										
Payment to the international Policy Advocacy based on acceptance of the documentation of proceedings/outputs of the National One Health Conference and the mapping of the Health stakeholders (2nd)

Commission a specific study on policy/coordination aspects focusing on aspects not being directly covered by other partners in their policy activities), including policy recommendations.										
Mobilization of the national and international consultants to conduct assignment, develop preparation, visa and other logistic arrangement for the international consultant										
Payment, conducting meetings with stakeholders and preparation of the draft report to disseminate the experience, outputs of ongoing activities, discuss RFDs at meetings in Viet Nam										
Payment to International Consultant Activity 2.2 in AWP, commission a specific study on policy/coordination aspects)										
Payment to National Consultant (Activity 2.2 in AWP, commission a specific study on policy/coordination aspects)										

2.4.2	Content collection and preparation of the third issue newsletter	X							Completed
2.4.3	Complete Content and Layout for the third issue newsletter	X							Completed
2.4.4	Approval for printing of the third issue newsletter	X							Completed
2.4.5	Printing and dissemination of the third issue newsletter	X	3,200	3,176			99,831		Completed
2.4.6	Administration and maintenance of PAH Website. Make updates for Q1, Q2, and Q3	X	1,000	1,004			100,000		Completed
2.5	Carry out specific reviews and studies to enhance coordination, policy and strategic decision-making related to AIPFB 2011-2015		2,845	-			-		
2.5.1.	Complete the draft report together with the recommendations based on the review of coordination mechanisms	X							Completed
2.5.2	Coordination meetings with national and international agencies in Haiti working on AIP and related activities; HDIA partnerships, international ODA partners; and GSV stakeholders working on possibly scheduled issues outside AIP; with private sector, business, academic, and civil society stakeholders working on possibly scheduled issues outside AIP		2,845		X				Partly completed. The workshop was conducted on 15 July, incorporated with the Coordination mechanism review. The consultant has conducted a number of meetings with national and international stakeholders in Haiti during their interview period. For the big workshop with all relevant and key stakeholders based on the discussion between PAH's Secretariat and the consultant, the consultant expected to conduct the workshop to share the preliminary findings on OH management and linkage (this is not the workshop for gathering the information at the start of the consulting work as previous plan). Therefore, this activity is pending until the consultants completed the draft report to share with partners.

Indicator 2: number of API policy briefs developed and dialogues held

Baseline: APPED has just started and will be rolled out in 2012. There is a need to formulate plans and mechanisms

Project specific

Target:

- mechanism to share project outputs of PAHI
- Partnership members developed on PAHI website and resources updated
- 6-7 policy reports developed
- 4-5 policy dialogues held
- 10 specific study

Project Monitoring Sheet: **OSRO/VIE/801/USA**
 Project title: **Gathering Evidence for a Transitional Strategy (GETS) for Highly Pathogenic Avian Influenza (HPAI) H5N1 Vaccination in Viet Nam**
 Reporting period: **September 2010 to March 2011**

Country: Viet Nam
Project title: Gathering Evidence for a Transitional Strategy (GETS) for Highly Pathogenic Avian Influenza (HPAI) H5N1 Vaccination in Viet Nam
Code: OSRO/VIE/801/USA
Budget: USD 4 million
Effective starting date: October 2008
Planned end date: 30 June 2011
<p>Context of the project</p> <p>Viet Nam has been carrying out vaccination of poultry twice a year (October and April) since autumn of 2005 to control epidemic HPAI H5N1 with some considerable empirical evidence of success. However, it has been recognized that this control strategy is not sustainable for the whole country in the long term. Mass vaccination entails a large amount of financial resources from the Government and ties up significant human resources in the agriculture sector. Therefore, an alternative or more likely a parcel of complementary alternative control strategies will have to be devised as Viet Nam moves from initial emergency measures to a period of consolidation and ultimately on to the stated aim of control/eradication beyond 2010 (Green Book). This project is investigating and gathering evidence on alternative vaccination strategies in provinces with high and low risk for HPAI H5N1 outbreaks.</p>
<p>Objective of the project</p> <p>The main objective of the project is to provide field data to the Ministry of Agriculture and Rural Development (MARD) by testing a number of alternative vaccination strategies and the complementary strategy of improved surveillance. This data will assist MARD in its selection of a future vaccination strategy.</p>
<p>Planned Activities for this Reporting Period:</p> <p>Outputs 1&2: Feasibility and logistics to implement a Novel Vaccination Strategy (V2) compared with maintaining Standard Vaccination Strategy (V1), and to withdraw routine vaccination (V0) compared with maintaining Standard Vaccination Strategy (V1)</p> <p><i>Activity 1.1&2.1 Needs assessment undertaken and work plan finalized</i></p> <ul style="list-style-type: none"> • Monitor field activities and make amendments to agreements as required. Test the market survey programme to determine suitability for use in other provinces throughout the country. Hold discussions with the Department of Animal Health (DAH) regarding the interim results and their value in future plans for vaccination. Organize a workshop for discussions regarding the future vaccination strategy for Viet Nam. Present the GETS interim results at this workshop. <p><i>Activity 1.2&2.2 Public awareness campaigns</i></p> <ul style="list-style-type: none"> • Continue round III of the public awareness campaign with televised announcements via five provincial television stations to coincide with the vaccination campaign and ensure that the voices are dubbed in local dialects. <p><i>Activity 1.3&2.3 & 1.4&2.4 Farms identified/sampled</i></p> <ul style="list-style-type: none"> • Continue monitoring of sentinel duck flocks to ensure commitment to the programme. Continue the serum sampling and revised swabbing component of the programme with samples taken and analysed each month. <p><i>Activity 1.5&2.5 Equipment procured including vaccine</i></p> <ul style="list-style-type: none"> • Enquiries are being made regarding the procurement of a mobile real time – polymerase chain reaction (RT-PCR) machine to be used for analysis of the samples from the market survey. <p><i>Activity 1.6&2.6 Training undertaken</i></p> <ul style="list-style-type: none"> • Plan market events at local poultry markets. • Contract a training programme for animal health workers to a national partner. <p><i>Activity 1.7&2.7 Data gathering</i></p> <ul style="list-style-type: none"> • Undertake 2010 Round II vaccination and Round II post-vaccination monitoring. • Monitor data collection and data entry activities in each province to ensure that the Access database is being utilized efficiently.

Output 3: Cost-effectiveness of 'Novel versus Standard' (V2/V1) and 'Standard versus Withdrawal' (V1/V0) Vaccination Strategies undertaken

Activity 3.1 Component planning/oversight

- Perform data analysis during the first nine months of the intervention.

Activity 3.2 Team recruited

- No recruitment planned for this period.

Activity 3.3 Data gathering

- Ongoing data analysis activities.

Output 4: Risk factors are defined for animal outbreaks via case series and/or case-control trial

Activity 4.1 Component planning/oversight

- Undertake market surveys to identify other risk factors, such as traders, and include interviews as well as a collection of samples for analysis.
- Continue monitoring of high-risk mobile duck flocks in all communes in the GETS provinces and ensure vaccination of these flocks. These flocks present a high risk for disease transmission because they shed virus with minimal clinical signs if they are not adequately vaccinated.

Activity 4.2 Training DAH-RAHO and MoH-Regional Health Office (RHO)

- Initiate training of village animal health workers.

Activity 4.3 Operational funds arranged/distributed

- Continue to support outbreak investigation activities, as well as supply chain analysis for risk factors.

Activity 4.4 Data gathering from outbreaks nationwide (64 provinces)

- Continue outbreak investigation activities with attendance at all outbreaks in the GETS provinces and neighbouring provinces by the GETS regional coordinators with the aim of providing accurate disease investigation reports.

Output 5: Sociological behaviours related to V2/V1 and V1/V0 are compared

Activity 5.1 Component planning/oversight

- Undertake further analysis of the behavioural component of the poultry industry survey and the Chief Animal Health Workers (CAHW).

Activity 5.2 Team recruited

- No recruitment will be undertaken during this quarter.

Activity 5.3 Data gathering

- Gather further data on the behaviour of the meat trader.

Output 6: Policy analysis of HPAI strategy including public/private sector collaboration and partnerships is undertaken

Activity 6.1 Component planning/oversight

- Undertake a study to determine the governance of the public/private partnerships including drug shops, meat traders and markets.

Activity 6.2 Team recruited

- Hold discussions with the Centre for Agricultural Policy (CAP) with a view of contracting their services.

Activity 6.3 Data gathering

- Gather data from the study to determine the governance of the public/private partnerships including drug shops, meat traders and markets.

Activities undertaken during the reporting period

Outputs 1&2: Feasibility and logistics to implement a Novel Vaccination Strategy (V2) compared with maintaining Standard Vaccination Strategy (V1), and to withdraw routine vaccination (V0) compared with maintaining Standard Vaccination Strategy (V1)

Activity 1.1&2.1 Needs assessment undertaken and work plan finalized

- Monitored field activities and made amendments to the following agreement: 1. 'Enhanced Reporting' to incorporate the revised cost of sample analyses, 2. 'Re-imbusement' to incorporate production losses in the sentinel duck programme. An agreement with DAH was signed to implement Round 2, 2010 Post Vaccination Monitoring. This monitoring programme was implemented and completed. An agreement was signed to implement the market survey programme. This programme was implemented and completed. Discussions were held with DAH regarding the interim project results and their value emphasized for their future plans for vaccination. A workshop was undertaken regarding the Government of Vietnam's (GoVN's) future vaccination strategy, and the GETS interim results were presented at this workshop. The GoVN draft

future vaccination strategy was announced at the meeting, and the GETS project results had a significant effect on this, as the draft was similar to the GETS intervention.

Activity 1.2&2.2 Public awareness campaigns

- Round III of the public awareness campaign was implemented and completed with televised announcements with voices dubbed in the local dialects via five provincial television stations that coincided with the vaccination campaign.
- A national partner (Communications and Rural Development-CRC) was recruited to undertake Training of Trainers (TOT) and Inter-Personal Communication (IPC) activities throughout the five GETS provinces to ensure the sustainability of the field activities following project completion. All the Department of Veterinary Services (DVS) staff and 86 IPC sessions for poultry farmers and hatchery workers and owners were carried out. Billboards and posters were set up throughout the five GETS provinces to promote the importance of disease reporting and disease control practices.

Activity 1.3&2.3 & 1.4&2.4 Farms identified/sampled

- Continued monitoring of sentinel duck flocks was undertaken to ensure commitment to the programme. The serum sampling and revised swabbing component of the programme with samples taken and analysed each month was completed at the end of Quarter I (Q1) 2011.

Activity 1.5&2.5 Equipment procured including vaccine

- The procurement of a mobile RT-PCR machine to be used for analysis of the samples from the market survey was not undertaken because the company could not provide validation data in time for the start of the survey. Samples were analysed using the regional laboratories as in the rest of the project.

Activity 1.6&2.6 Training undertaken

- Two TOT courses on communication skills for DVS staff were held in Nam Dinh on 4 Jan 2011 (with 28 participants, of which 18 were male and ten were female) and in Soc Trang on 7 Jan 2011 (with 20 participants, of which 16 were male and four were female). Some 86 Interpersonal Communication Sessions for high-risk poultry producers and hatchery workers were held in Quang Binh, Soc Trang, Hau Giang, Ninh Binh and Nam Dinh during January 2011. The total number of participants was 1 986, of which 1 668 were male and 318 female. Please refer to section Activity 1.2 & 2.2.
- FAO completed 43 training workshops for CAHWs on quality technical training for continued capacity building activities and sustainable and successful project implementation. The training for CAHWs was held in GETS provinces with 864 participants, of which 578 were male and 286 were female.

Activity 1.7&2.7 Data gathering

- 2010 Round II vaccination and 2010 Round II post-vaccination monitoring in the GETS pilot provinces were completed.
- Data collection and data entry activities were intensified in each province to ensure that the Access database is being utilized efficiently.

Output 3: Cost-effectiveness of 'Novel versus Standard' (V2/V1) and 'Standard versus Withdrawal' (V1/V0) Vaccination Strategies undertaken

Activity 3.1 Component planning/oversight

- Data analysis was completed for the first nine months of the intervention.

Activity 3.2 Team recruited

- An agreement was signed for implementation of Phase III of the Cost-effectiveness programme.

Activity 3.3 Data gathering

- Field data collection activities were completed for Phase III, and this data will be used to provide a full 12 month cost analysis of the GETS intervention compared to the 12-month period prior to the GETS intervention.

Output 4: Risk factors are defined for animal outbreaks via case series and/or case-control trial

Activity 4.1 Component planning/oversight

- Market surveys were completed in 100 markets across the five GETS provinces to identify other risk factors, such as traders, and included interviews as well as collection of samples for analysis. Laboratory results are available for Nam Dinh, Ninh Binh and Quang Binh. In Nam Dinh, a total of 1 600 ducks from ten districts were sampled and tested in pools of five, and none tested positive for H5N1. In Ninh Binh, 1 280 ducks were sampled in eight districts, all with negative results to H5N1. In Quang Binh, 800 ducks were sampled and tested in pools of five, and a total of ten pools (6.25 percent) tested positive for H5N1. All positive ducks in Quang Binh originated from districts where HPAI vaccination was not compulsory. The

data for the survey are currently being entered into the database prior to be fully analysed.

- The monitoring of high-risk mobile duck flocks was continued in all communes in the GETS provinces to assess vaccination status of these flocks. These flocks present a high risk for disease transmission because they shed virus with minimal clinical signs if they are not adequately vaccinated.

Activity 4.2 Training DAH-RAHO and MoH-Regional Health Office (RHO)

- MARD and MoH district staff were involved in 42 joint training sessions.

Activity 4.3 Operational funds arranged/distributed

- Continue to support outbreak investigation activities, as well as supply chain analysis for risk factors.

Activity 4.4 Data gathering from outbreaks nationwide (64 provinces)

- Outbreak investigation activities continued with attendance of all outbreak sites in the GETS provinces and neighbouring provinces by the GETS regional coordinators with the aim of providing accurate disease investigation reports.

Output 5: Sociological behaviours related to V2/V1 and V1/V0 are compared

Activity 5.1 Component planning/oversight

- During the market surveillance programme, a survey was undertaken of the meat traders attending 100 markets throughout the five GETS provinces.

Activity 5.2 Team recruited

- A national partner was used to undertake the market survey of meat traders.

Activity 5.3 Data gathering

- Data on the meat traders was collected during the market surveillance programme.

Output 6: Policy analysis of HPAI strategy including public/private sector collaboration and partnerships is undertaken

Activity 6.1 Component planning/oversight

- A policy analysis study of the HPAI strategy was undertaken to determine the governance of the public/private partnerships including drug shops, meat traders and markets.

Activity 6.2 Team recruited

- A national partner, CAP, was contracted to undertake the study.

Activity 6.3 Data gathering

- The policy analysis study was implemented and completed.

Planned activities for the next three-month period

Outputs 1&2: Feasibility and logistics to implement a Novel Vaccination Strategy (V2) compared with maintaining Standard Vaccination Strategy (V1), and to withdraw routine vaccination (V0) compared with maintaining Standard Vaccination Strategy (V1)

Activity 1.1&2.1 Needs assessment undertaken and work plan finalized

- The vaccination intervention has been completed. Round II of the market surveillance programme will be contracted to a national partner for implementation and completion during the next quarter.

Activity 1.2&2.2 Public awareness campaigns

- Public awareness activities will be reviewed to determine further activities required.

Activity 1.3&2.3 & 1.4&2.4 Farms identified/sampled

Activity 1.5&2.5 Equipment procured including vaccine

Activity 1.6&2.6 Training undertaken

Activity 1.7&2.7 Data gathering

- Data analysis will be undertaken and completed and final project report prepared.

Output 3: Cost-effectiveness of 'Novel versus Standard' (V2/V1) and 'Standard versus Withdrawal' (V1/V0) Vaccination Strategies undertaken

Activity 3.1 Component planning/oversight

- Data analysis will be undertaken and completed and final project report prepared.

Activity 3.2 Team recruited

Activity 3.3 Data gathering

Output 4: Risk factors are defined for animal outbreaks via case series and/or case-control trial

Activity 4.1 Component planning/oversight

- Data analysis will be undertaken and completed and final project report prepared.

Activity 4.2 Training DAH-RAHO and MoH-Regional Health Office (RHO)

Activity 4.3 Operational funds arranged/distributed

Activity 4.4 Data gathering from outbreaks nationwide (64 provinces)

Output 5: Sociological behaviours related to V2/V1 and V1/V0 are compared

Activity 5.1 Component planning/oversight

- Data analysis will be undertaken and completed and final project report prepared.

Activity 5.2 Team recruited

Activity 5.3 Data gathering

Output 6: Policy analysis of HPAI strategy including public/private sector collaboration and partnerships is undertaken

Activity 6.1 Component planning/oversight

- Data analysis will be undertaken and completed and final project report prepared.

Activity 6.2 Team recruited

Activity 6.3 Data gathering

Main challenges encountered and response provided

- As the project NTE is 30 June 2011, data analysis will be provided in the final report. However, the timeframe remaining does not allow for additional write up and submission for publication in the scientific journals. As it is desirable that results from GETS are provided in the public domain through scientific articles, it is herewith proposed that unspent funds remain with FAO to allow for preparation of manuscripts for submission in international peer review journals.
- Maintaining the commitment of the sentinel duck owners has been a challenge throughout the project. Regular visits by the veterinary authorities and the project regional coordinators have ensured that the majority of the flocks remained in the programme to provide valuable data on circulating virus levels.

Main progress made towards the achievement of project outcomes (from the start of the project activities)

Outputs 1&2: Feasibility and logistics to implement a Novel Vaccination Strategy (V2) compared with maintaining Standard Vaccination Strategy (V1), and to withdraw routine vaccination (V0) compared with maintaining Standard Vaccination Strategy (V1)

- Field missions to all provinces and the vaccine intervention plans were completed. The project work plan was completed and the agreement was reached with DAH/MARD for the intervention programme and the work plan.
- Implementation partners were chosen and guidelines for all field activities were completed. The Letters of Agreement (LoAs) were prepared and signed.
- The intervention was implemented to coincide with the second round of the Viet Nam Government's vaccination programme in October and November 2009.
- Implementation partners for the public awareness programme were contracted, and the initial capacity building training for over 900 district and commune veterinary staff, livestock extension officers and district public health officials was completed.
- "A New Stage" public awareness campaign with the production of audio-visual media products and leaflets was completed. The media release commenced with the local television advertisements starting in the last week of October 2009, which were aired four times per day until the end of December 2009 in the five pilot provinces. Implementation partners for the second stage of the public awareness programme were recruited. The media release products, in forms of three key audio spots, were aired across 717 commune loudspeaker systems, reaching an estimated three million people, and this activity was completed in May 2010.
- Enhanced surveillance, reporting and outbreak response activities, as well as sentinel duck monitoring and post-vaccination monitoring are ongoing in the field, and funds have been transferred to the provinces to support these activities. These activities were reviewed during field missions to each of the five GETS provinces in March 2010, and revised agreements were adopted to streamline project activities.
- Procurement and distribution to the provinces of five vehicles, 42 global positioning systems (GPS) and 714 fridges was completed. For the first time in Viet Nam, continuous vaccine cold chain storage was extended to the commune level throughout the five GETS provinces.
- Data collection activities are being streamlined with the introduction of an Access database in each of the Sub-Department of Animal Health (SDAH) offices in the GETS provinces, and training will be provided on the use of the database.

- During the International Ministerial Conference on Animal and Pandemic Influenza (IMCAPI) from 19 to 21 April 2010, the GETS team arranged a site visit for the United States delegation to IMCAPI and accompanied the delegation to the field. This included a presentation at the SDAH office in Ninh Binh, explaining project activities, as well as a field visit to a duck farm to view the vaccination process.
- Field data collection and data entry procedures were reviewed across the five project provinces, and a database was designed to assist in streamlining the data entry procedure. Refresher training was undertaken for data entry staff in the provinces and for the CAHWs who collect the data.
- Preliminary findings were presented to the Donor (USAID), DAH and other partners including the World Health Organization (WHO), Abt Associates Inc. and SCAPS at a meeting at the USAID office in June 2010. Input were provided by DAH as to their preferred format for the interim report. The interim report was completed and distributed to the DAH and the Donor. Presentation of preliminary results was undertaken at the regional USAID partners meeting in Bangkok. Discussions were held with DAH regarding the interim project results. A workshop was undertaken regarding the GoVN's future vaccination strategy, and the GETS interim results were presented at this workshop. The GoVN draft future vaccination strategy was announced at the meeting, and the GETS project results had a significant effect on this, as the draft was similar to the GETS intervention.
- The GETS project was presented to the Chinese Ministry of Agriculture in March 2011 during the Vietnam/Chinese collaboration meeting held in Beijing. An agreed recommendation from the meeting was that the Chinese MoA should undertake a similar GETS style targeted vaccination trial in China to explore the options for the current mass vaccination strategy.
- The market surveillance programme was implemented and completed across 100 markets throughout the five GETS Provinces. Results will supplement the sentinel duck survey results to provide a clearer picture of the circulating virus.
- A national partner was contracted to undertake TOT and IPC activities throughout the five GETS provinces to ensure the sustainability of the field activities following project completion. Billboards and posters were set up throughout the five GETS provinces to promote the importance of disease reporting and disease control practices.

Output 3: Cost-effectiveness of 'Novel versus Standard' (V2/V1) and 'Standard versus Withdrawal' (V1/V0) Vaccination Strategies undertaken

- The design of the cost-effectiveness component was subsequently reviewed and finalized with the assistance of an international rural economist. Discussions were pursued with a national partner to implement this component, and a work plan and budget were reviewed and finalized. Completion and signing of the LoA with the national partner, SCAPS, facilitated the commencement of field activities and data gathering. The SCAPS team, accompanied by the GETS regional coordinators, visited each of the five pilot provinces and commenced data collection activities. Phase I of the programme was completed.
- Phase II of the cost-effectiveness programme was implemented, and data collection is completed.
- Phase III of the cost-effectiveness programme was implemented, and data collection is completed. The data will be used to provide a full 12-month cost analysis of the GETS intervention compared to the 12 month period prior to the GETS intervention.

Output 4: Risk factors are defined for animal outbreaks via case series and/or case-control trial

- Outbreak response activities were finalized, and accompanying documents were completed.
- Training was undertaken for the GETS Regional Coordinators whose role includes attending all outbreaks within the GETS provinces and in bordering provinces to undertake disease investigation activities.
- An LoA with DAH was finalized and signed and funds were made available for provincial staff for outbreak activities.
- An agreement has been signed with DAH detailing the re-imburement terms for poultry producers in the GETS provinces, following culling of their flocks for HPAI outbreaks. Funds were made available for provincial authorities to fund the re-imburement for eligible flocks.
- Workshops detailing enhanced disease reporting activities were held at the 42 districts involved in the project, and these were attended by 713 chief animal health officers, 178 district veterinary officers,

39 agricultural extension officers and 38 district public health officers; 48 were from SDAH and 14 were from the Regional Animal Health Offices. Supply chain analysis was implemented and completed across four of the five GETS provinces, as well as GPS mapping using the GPS units supplied to each district veterinary station.

- Monitoring of high-risk mobile duck flocks is ongoing and is being undertaken by CAHWs throughout the GETS provinces, and vaccination of these flocks is being pursued. These flocks present a high risk for disease transmission because they shed virus with minimal clinical signs if they are not adequately vaccinated. Early results from Soc Trang have shown that 40 percent of these mobile flocks are unvaccinated.
- The market surveillance programme was implemented and completed using a national partner across 100 markets throughout the five GETS Provinces. Results will supplement the sentinel duck survey results to provide a clearer picture of the circulating virus.

Output 5: Sociological behaviours related to V2/V1 and V1/V0 are compared

- Data collection consisting of attitudinal questionnaires has commenced.
- A national partner was chosen to continue with the implementing of this component and assumed work in January 2010.
- Data collection commenced with an attitudinal questionnaire included in the CAHW post-training questionnaire, and an attitudinal component of the poultry industry survey will address reaction to changes in the vaccination programme in the GETS provinces.
- The poultry farmer survey and the CAHW survey was completed and results are being analysed. These survey results will be used to evaluate potential motivation factors and key determinants for animal health workers and producers, the barriers to behaviour change and the behavioural changes that have occurred as a result of the project intervention.
- The meat trader survey was undertaken by a national partner as part of the market survey covering 100 markets across the five GETS provinces, and this activity has now been completed.

Output 6: Policy analysis of HPAI strategy including public private sector collaboration and partnerships is undertaken

- The governance of private/public partnerships will be investigated and the effect of the interventions on this will be monitored.
- Supply chain analysis and mapping were completed in all of the GETS provinces, and the location of animal health product suppliers was identified. A study will be undertaken to determine the governance of their activities. Governance of the meat traders, as well as markets, will also be reviewed in this study.
- A national partner was selected to continue with the implementation of this component. Discussions were held with CAP in Hanoi regarding central policy decision making procedures, and further discussions will be held with a view to contracting CAP to undertake the governance study.
- A policy analysis study of the HPAI strategy was undertaken to determine the governance of the public/private partnerships including drug shops, meat traders and markets. A national partner, CAP, was selected to undertake the study, and the study was completed.
